

Strengthening Transparency in Regulatory Science (Part 30 - Transparency in Regulatory Decision Making)

Response to Public Comments on

**Proposed Rule [83 FR 18768, April 30, 2018; 85 FR 15396,
March 18, 2020]**

December 2020

Comments, letters, and transcripts of the public hearings are also available electronically through <http://www.regulations.gov> by searching Docket ID EPA-HQ-OA-2018-0259

FOREWORD

This document provides the EPA's responses to public comments on the EPA's Proposed *Strengthening Transparency in Regulatory Science*. The EPA published a Notice of Proposed Rulemaking (NPRM) in the *Federal Register* on April 30, 2018, at 83 FR 18768. In addition to the NPRM, the EPA published a Supplemental Notice of Proposed Rulemaking (SNPRM) on this action in the *Federal Register* on March 18, 2020. The EPA received comments on the NPRM and SNPRM via mail, e-mail, facsimile, and a public hearing held in Washington, DC on July 17, 2018. Copies of all comments and transcripts for the public hearing are available at the EPA Docket Center Public Reading Room. Out of an abundance of caution for members of the public and our staff, the EPA Docket Center and Reading Room was closed to public visitors on March 31, 2020, to reduce the risk of transmitting COVID-19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform while the EPA Docket Center and Reading Room are closed. Comments and transcripts of the public hearing are also available electronically through <http://www.regulations.gov> by searching Docket ID EPA-HQ-OA-2018-0259. For further information and updates on EPA Docket Center services and the current status, please visit us online at <https://www.epa.gov/dockets>.

Just over 950,000 public comments were received on the NPRM and SNPRM. The EPA Docket Center consolidated mass mail campaigns and petitions into single document control numbers (DCNs), resulting in over 22,000 unique comments. Each of these comments was reviewed and significant comments relevant to this action and submitted within the comment period have been summarized and included in this document.

It is possible some responses in the Response to Comments Document may not reflect the language in the preamble and final rule in every respect. Where the response conflicts with the preamble or the final rule, the language in the final preamble and rule controls and should be used for purposes of understanding the scope, requirements, and basis of the final rule. The responses presented in this document are intended to augment the responses to comments that appear in the preamble to the final rule or to address comments not discussed in that preamble. Although portions of the preamble to the final rule are paraphrased in this document where useful to add clarity to responses, the preamble itself remains the definitive statement of the rationale for the revisions adopted in the final rule. In many instances, responses presented in the Response to Comments Document include cross references to responses on related issues that are located either in the preamble or elsewhere in the Response to Comments Document. Accordingly, the Response to Comments Document, together with the preamble and final rule, and the rest of the administrative record should be considered collectively as the Agency's response to all the significant comments submitted on the proposed rule.

Table of Contents

| | |
|--|-----|
| Chapter 1: Legal Authority | 1 |
| 1.1 General Comments..... | 2 |
| 1.1.1 General Legal Authority (Notice of Proposed Rulemaking (NPRM) Comments)..... | 2 |
| 1.1.2 General Legal Authority (Supplemental Notice of Proposed Rulemaking (SNPRM) Comments)..... | 24 |
| 1.2 Housekeeping Statute..... | 65 |
| 1.3 Specific Environmental Statutes | 154 |
| 1.3.1 Clean Air Act (CAA) (NPRM and SNPRM Comments). | 154 |
| 1.3.2 Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) (NPRM and SNPRM Comments)..... | 256 |
| 1.3.3 Safe Drinking Water Act (SDWA) (NPRM and SNPRM Comments). | 286 |
| 1.3.4 Toxic Substances and Control Act (TSCA) (NPRM and SNPRM Comments) | 319 |
| 1.3.5 Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)/ Resource Conservation and Recovery Act (RCRA) (NPRM and SNPRM Comments)..... | 370 |
| 1.3.6 Emergency Planning and Community Right-to-Know Act (EPCRA) (NPRM and SNPRM Comments). | 403 |
| 1.3.7 Clean Water Act (CWA) (NPRM and SNPRM comments)..... | 413 |
| 1.3.8 National Environmental Policy Act (NEPA) (SNPRM Comments) | 442 |
| 1.3.9 Other Environmental Statutes (NPRM Comments)..... | 444 |
| 1.4 Evidence Act (SNPRM Comments) | 475 |
| 1.5 Consistency with the Peer Review Processes Required Under Environmental Statute (NPRM Comments) | 476 |
| 1.6 Administrative Procedures Act (APA) | 488 |
| 1.6.1 APA (NPRM and SNPRM Comments)..... | 488 |
| 1.7 Other Authorities (NPRM Comments) | 630 |
| 1.8 Trying to Achieve Administratively What Could Not be Done Legislatively | 652 |
| 1.9 Other Comments (NPRM Comments)..... | 660 |
| Chapter 2: Purpose and Effects..... | 671 |
| 2.1 Purpose and Effects (NPRM Comments) | 672 |
| 2.1.1 Change in Culture | 672 |

| | |
|---|------|
| 2.1.2 What Problem is the Agency Intending to Fix?..... | 676 |
| 2.1.3 Proposed Rule is Biased..... | 712 |
| 2.1.4 Environmental and Health Protections Would be Decreased | 757 |
| 2.1.5 EPA Would be at Odds with Other Parts of the Federal Government..... | 765 |
| 2.1.6 EPA Would be at Odds with Other National and International Bodies..... | 773 |
| 2.1.7 Proposed Rule is Flawed and Needs to Be Withdrawn/Redone with Feedback from the Scientific Community/Stakeholders | 776 |
| 2.1.8 Other Effects/Impacts | 842 |
| 2.2 Purpose/Basis and Effects (SNPRM Comments) | 859 |
| 2.2.1 Purpose/Basis for Rule..... | 859 |
| 2.2.2 Effects | 889 |
| Chapter 3: Capable of Being Substantially Reproduced, Independent Validation, and Reanalyze | 1008 |
| 3.1 NPRM Replicability, Reproducibility and Reanalysis | 1009 |
| 3.1.1 Proposed Rule Requirement to Make Available Information Necessary for the Public to Replicate Findings (30.5)..... | 1009 |
| 3.1.2 Clarification of the Meaning of Terms Used in the Proposal | 1012 |
| 3.1.3 Replication versus Reproducible versus Reanalysis..... | 1017 |
| 3.1.4 Whether the Ability to Reanalyze, Replicate and Reproduce a Study Should Determine the Quality of the Study | 1020 |
| 3.1.5 Replication-Specific Comments | 1025 |
| 3.1.6 Reproducibility – Specific Comments | 1033 |
| 3.1.7 Replication (or Reproduction) Crisis | 1044 |
| 3.1.8 Reanalysis – Specific Comments..... | 1056 |
| 3.1.9 Recommends Further Consultation to Develop New Rule Addressing Reproducibility and Replicability Concerns | 1061 |
| 3.2 SNPRM Capable of Being Substantially Reproduced; Replication and Reproduction.. | 1062 |
| 3.2.1 Capable of Being Substantially Reproduced; Replication and Reproduction | 1062 |
| 3.2.2 Reanalyze | 1086 |
| 3.2.3 Independent Validation..... | 1103 |
| Chapter 4: Data and Models | 1113 |
| 4.1 NPRM Data and Models – Related Comments | 1115 |

| | |
|---|------|
| 4.1.1 Data and Models; Dose response data and models (§30.2), requirements to the use of dose response data and models underlying pivotal regulatory science (§30.5), and additional requirements (§30.6) | 1115 |
| 4.1.2 Definitions of Research Data (§30.2) and Data | 1300 |
| 4.2 SNPRM Models, Variability/Uncertainty, and Assumptions/Defaults | 1303 |
| 4.2.1 Modeling Definitions | 1303 |
| 4.2.2 Models (General) and Best Science Practices | 1304 |
| 4.2.3 Public Availability of Models/Data | 1307 |
| 4.2.4 Weighting of Models | 1310 |
| 4.2.5 Scope of Models Included | 1311 |
| 4.2.6 Assumptions/Defaults-Variability/Uncertainty | 1312 |
| 4.2.7 Impacts on Older/Existing Models | 1316 |
| 4.2.8 Linear vs Nonlinear Modeling | 1318 |
| 4.2.9 Impacts on Specific Models | 1319 |
| 4.3 SNPRM Data, Variability/Uncertainty, and Assumptions/Defaults | 1321 |
| 4.3.1. Clarity of Proposed Definitions | 1321 |
| 4.3.2 Application of the Rule in Respect to Data | 1332 |
| Chapter 5: Influential Scientific Information; Expansion of Proposal; Determining and Weighting ISI (Supplemental Notice of Proposed Rulemaking (SNPRM)) | 1347 |
| 5.1 Definition of Influential Scientific Information | 1348 |
| 5.1.1 General Support/Dissent for Definition | 1348 |
| 5.1.2 What is Covered by the Definition of Influential Scientific Information | 1349 |
| 5.2 Expansion of Scope to Include Influential Scientific Information | 1352 |
| 5.2.1 General Support/Dissent for Expansion | 1352 |
| 5.2.2 Justification/Necessity for Expanding Scope | 1354 |
| 5.2.3 Application Guidance for EPA Programs | 1355 |
| 5.2.4 Public Comment on Expanded Scope | 1356 |
| 5.3 Determining What Constitutes Influential Scientific Information | 1358 |
| 5.3.1 Limits to EPA’s Application of the Rule | 1363 |
| Chapter 6: Pivotal Science | 1365 |
| 6.1 NPRM Pivotal Regulatory Science | 1366 |
| 6.1.1 How Should the Proposed Rule Apply to Dose Response Data and Models Underlying Pivotal Regulatory Science Developed Prior to the Effective Date? | 1366 |

| | |
|--|------|
| 6.1.2 Could Prospective or Retrospective Application Introduce Bias Regarding the Timeliness and Quality of Scientific Information Available? | 1369 |
| 6.1.3 How Does What this Rule Would Require Compare to Requirements of Environmental Statutes? | 1390 |
| 6.1.4 Recommended Changes to the Definition of Pivotal Regulatory Science at §30.2. | 1393 |
| 6.2 SNPRM Pivotal Science | 1407 |
| 6.2.1 Need for Additional Clarity/Specificity | 1407 |
| 6.2.2 Scope of Pivotal Science..... | 1410 |
| Chapter 7: Publicly Available | 1412 |
| 7.1 Publicly Available, Tiered Access | 1413 |
| 7.1.1 40 CFR 30.2 Definition of Publicly Available | 1413 |
| 7.1.2 40 CFR 30.5: Broad Issues | 1423 |
| 7.1.3 40 CFR 30.5: Option 1 | 1470 |
| 7.1.4 40 CFR 30.5: Option 2..... | 1526 |
| 7.1.5 Ensure Over Time More Availability of Data | 1550 |
| Chapter 8: Research Data..... | 1558 |
| 8.1 Uniform Administrative Requirements..... | 1558 |
| 8.2 Applicability of the Rule to Research Laboratory Samples..... | 1560 |
| Chapter 9: Science That Serves as the Basis for Informing a Final Significant Regulatory Actions | 1561 |
| 9.1 NPRM Regulatory Science (Section 30.2) | 1562 |
| 9.1.1 Ensure that the Regulatory Science is Publicly Available in a Manner Sufficient for Independent Validation (§30.1) | 1562 |
| 9.2 Regulatory Science Means Scientific Information that Provides the Basis for EPA Final Significant Regulatory Decisions (§30.2)..... | 1612 |
| 9.3 EPA’s Regulatory Science Should Be Consistent with the OMB’s Final Information Quality Bulletin for Peer Review (83 FR 18770) | 1615 |
| 9.4 EPA’s Proposed Regulatory Science Requirements Consistency with OMB’s Guidelines for Ensuring and Maximizing Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies (OMB Guidelines)..... | 1615 |
| 9.5 Regulatory Science that Cannot Meet the Requirements of §§30.5 and 30.6 | 1619 |
| 9.6 How Should EPA Address a Circumstance in which EPA Has a Statutory Requirement to Make a Determination for Which Scientific Information Publicly Available Sufficient for Independent Validation Does Not Exist?..... | 1621 |

| | |
|--|------|
| 9.7 How Does What this Rule Would Require Compare to Requirements of Environmental Statutes? (Relates to Chapter 1) | 1623 |
| 9.7.1 Best Available Science | 1623 |
| 9.7.2 Data Quality Act | 1627 |
| 9.7.3 Other | 1629 |
| Chapter 10: Applicability of the Rule | 1632 |
| 10.1 Limiting Requirements to “Significant Regulatory Actions” | 1633 |
| 10.2 Expanding the Scope of Applicability of the Rule | 1635 |
| 10.2.1 Application of the Rule to Other Regulatory Actions | 1636 |
| 10.2.2 Application of the Rule to Agency Guidance | 1638 |
| 10.2.3 Application of the Rule to Proposed Rules, Advanced Notice of Proposed Rulemaking and All Aspects of the Rulemaking Process | 1640 |
| 10.2.4 Individual Party Adjudications, Enforcement Activities, or Permit Proceedings .. | 1643 |
| 10.2.5 Application of the Rule to Actions Relying on Records from Previous Reviews .. | 1648 |
| 10.2.6 Application of the Rule to Specific EPA Programs | 1655 |
| 10.2.7 Application of the Rule to a Limited and Special Class of Laboratory Samples .. | 1670 |
| 10.3 Narrowing the Scope of Applicability of the Rule | 1671 |
| 10.3.1 Narrowing the Scope of the Applicability of the Rule | 1671 |
| 10.3.2 Limiting to “Major” Issues Under the Congressional Review Act or “Economically Signification” Actions Under Executive Order 12866 | 1672 |
| 10.3.3 CAA | 1673 |
| 10.3.4 Other Comments on Narrowing the Scope of Applicability of the Rule | 1673 |
| 10.4 Changes in the Scope of the Science Subject to the Rule | 1674 |
| 10.5 Scope – Phase-In | 1675 |
| 10.5.1 Proposed Rule Does Not Provide for Any Phase-In Time | 1675 |
| 10.5.2 Support Phasing-In of Transparency Requirements | 1676 |
| 10.5.3 Conditional Phase-In Implementation Recommendations | 1677 |
| 10.5.4 Implement Existing Guidance More Fully Before Considering Phasing-In of Rule | 1678 |
| 10.5.5 Phase-In for Use of Past Studies Lacking in Sufficient Transparency | 1679 |
| 10.5.6 States Involvement in Identifying Priorities | 1680 |
| 10.5.7 Transparency Rule Should Never Be Implemented | 1680 |
| 10.6 Scope – Effects on Individual EPA Programs and Exceptions | 1680 |

| | |
|---|------|
| 10.6.1 Proposed Rule Would Have Effects on All/Several EPA Programs | 1681 |
| 10.6.2 Evaluating Effects of Proposal on Environmental Programs and their Implementation is Unnecessary | 1681 |
| 10.7 40 CFR 30.3 - How Do the Provisions of this Subpart Apply?..... | 1682 |
| 10.7.1 Unlimited Discretion and Authority to Decide What “Any Other Type of Agency Action” is or is Not | 1682 |
| 10.7.2 Applicability Covers Studies, Models and Analyses Integral to the Functioning of EPA Regulatory Programs..... | 1683 |
| 10.7.3 Drafted Exclusions from Proposal’s Prohibitions..... | 1684 |
| 10.7.4 Applicability to Government-Funded and/or Beyond Government-Funded Scientific Research..... | 1685 |
| 10.7.5 Data Pivotal to the Basis of a Regulatory Decision | 1687 |
| 10.7.6 No Clear Information on How the Rule will Apply | 1688 |
| 10.7.7 Physical Objects, Drafts and Preliminary Analyses Exclusion | 1689 |
| 10.8 “Regulatory Decisions” Definition at 40 CFR 30.2..... | 1689 |
| 10.8.1 Amend Definition to Remove Limitation of Applicability to Only Final Regulations | 1690 |
| 10.8.2 Proposal is Inconsistent with Regards to What Types of Regulatory Actions Would be Covered | 1690 |
| 10.8.3 Regulatory Decisions Should Also Apply to Permitting Activities..... | 1691 |
| 10.8.4 Recommends that the Regulatory Decisions Definition Include EPA-Focused Criteria | 1691 |
| 10.8.5 Basis for Regulatory Decisions..... | 1692 |
| Chapter 11: Availability of Data and Models | 1694 |
| 11.1. NPRM Transparency and Integrity of Regulatory Decision Making vs. Availability of Raw Data..... | 1694 |
| 11.1.1 Basis for EPA Decision-Making Regarding Use/Non-Use of Studies Not Required to be Transparent..... | 1694 |
| 11.1.2 EPA Actions in Other Areas | 1696 |
| 11.2 SNPRM Data Availability-Related Comments | 1698 |
| 11.2.1 Confidential Business Information, Proprietary Data, or Personally Identifiable Information | 1698 |
| Chapter 12: Administrator’s Exemptions | 1727 |
| 12.1 Exemptions (40 CFR 30.9) (NPRM Comments)..... | 1728 |
| 12.1.1 Legality of Proposed Exemption Provision in 40 CFR 30.9 of the Rule..... | 1728 |

| | |
|---|------|
| 12.1.2 Case-by-Case Administrator Exemption Authority | 1731 |
| 12.1.3 Criteria for Granting Case-by-Case Exemptions | 1744 |
| 12.1.4 Requests for Specific Rule Exemptions | 1752 |
| 12.1.5 Define “Reasonable Effort” | 1754 |
| 12.1.6 Exemption Process Costs | 1754 |
| 12.1.7 Notice-and-Comment Principles Should Inform EPA’s Implementation of the Exemption Process | 1754 |
| 12.2. Administrator Exemptions (SNPRM Comments) | 1755 |
| 12.2.1 Granting of Exemptions is Subject to Bias | 1755 |
| 12.2.2 Rule Would Preclude Consideration of Best Available Science | 1766 |
| 12.2.3 Areas Needing Additional Clarity/Specificity | 1769 |
| 12.2.4 Transparency | 1770 |
| 12.2.5 Retroactivity | 1772 |
| 12.2.6 Support for Exemptions | 1777 |
| 12.2.7 Other Comments | 1778 |
| Chapter 13: Peer Review | 1781 |
| 13.1 NPRM Peer Review-Related Comments | 1782 |
| 13.1.1 Office of Management and Budget (OMB) Final Information Quality Bulletin for Peer Review | 1782 |
| 13.1.2 Independent Peer Review Requirements (40 CFR 30.7) | 1790 |
| 13.1.3 Comparison of the Approach in the Proposed Rule to Existing Scientific Review Processes | 1832 |
| 13.2 SNPRM Independent Peer Review | 1915 |
| 13.2.1 Existing Peer Review Processes and Protocols Are Sufficient | 1915 |
| 13.2.2 Concerns Related to Transparency in EPA’s Peer Reviews | 1920 |
| 13.2.3 Supplemental Proposal Violates the Principles of the OMB Final Information Quality Bulletin for Peer Review | 1922 |
| 13.2.4 Resource Burdens of Peer Review Requirements | 1924 |
| 13.2.5 Considerations of Bias and Independence of Peer Reviewers | 1926 |
| Chapter 14: Implementation (Including Implementation Benefits and Costs) | 1930 |
| 14.1 NPRM Implementation | 1931 |
| 14.1.1 Lack of Clarity How the Rule Would be Implemented | 1931 |
| 14.1.2 Incorporating Stronger Data and Model Access Requirements in Grants and Cooperative Agreements | 1938 |

| | |
|---|------|
| 14.1.3 Building Upon Other Federal Agencies’ Policies Regarding Grantee and Cooperator Requirements | 1947 |
| 14.1.4 Platform for Increasing Public Access to EPA-Funded Data | 1949 |
| 14.1.5 Methodologies and Technologies Designed to Provide Protected Access to Data | 1954 |
| 14.1.6 Other Implementation Issues that May Require Special Consideration | 1983 |
| 14.1.7 Timing of Implementation | 1984 |
| 14.1.8 Impacts on other Federal Agencies, States and Tribes | 1985 |
| 14.1.9 Communications | 1987 |
| 14.1.10 Implementation Costs | 1988 |
| 14.2 SNPRM Implementation..... | 2015 |
| 14.2.1 Inter-organizational Efforts..... | 2015 |
| 14.2.2 The EPA’s Readiness to Implement the Rule..... | 2016 |
| 14.2.3 Implementation Timing/Process | 2017 |
| 14.2.4 Implementation Costs and Benefits | 2018 |
| 14.2.5 Implementation Bias | 2032 |
| 14.2.6 Rule Includes Insufficient Implementation Detail/Clarity..... | 2034 |
| Chapter 15: Statutory and Executive Order Reviews | 2070 |
| 15.1 NPRM Executive Orders | 2070 |
| 15.1.1 Executive Order 12291: Federal Regulation..... | 2070 |
| 15.1.2 Executive Orders 12866: Regulatory Planning and Review, and 13563: Improving Regulation and Regulatory Review | 2071 |
| 15.1.3 Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations | 2075 |
| 15.1.4 Executive Order 13045: Protection of Children | 2080 |
| 15.1.5 Executive Order 13132: Federalism | 2083 |
| 15.1.6 Executive Order 13175: Consultation and Coordination with Indian Tribal Government..... | 2083 |
| 15.1.7 Executive Order 13556: Controlled Unclassified Information | 2084 |
| 15.1.8 Executive Order 13771: Reducing Regulation and Controlling Regulatory Costs | 2085 |
| 15.1.9 Executive Order 13777: Enforcing the Regulatory Reform Agenda..... | 2085 |
| 15.1.10 Executive Order 13783: Promoting Energy Independence and Economic Growth | 2087 |
| 15.2 SNPRM Statutory and Executive Order Requirements | 2090 |
| 15.2.1 Executive Orders..... | 2090 |

| | |
|---|------|
| 15.2.2 Paperwork Reduction Act | 2107 |
| 15.2.3 Additional Related Comments | 2108 |
| Chapter 16: Federal Transparency and Data Integrity Laws | 2110 |
| 16.1 Federal Laws and Law-Related Policies Already Address Data Access Concerns..... | 2111 |
| 16.2 Information Quality Act (IQA) and Implementation Guidelines | 2113 |
| 16.2.1 Information Quality Act..... | 2113 |
| 16.2.2 Proposed Rule Consistency with OMB Information Quality Guidelines | 2113 |
| 16.2.3 EPA Information Quality Guidelines-Specific Comments..... | 2115 |
| 16.3 OMB Circular A-110, Freedom of Information Act..... | 2120 |
| 16.4 Open Data Policy | 2121 |
| Chapter 17: Consistency with Recommendations of Third-Party Organizations Who Advocated for Open Science and Policies Adopted by Major Scientific Journals | 2123 |
| 17.1 Clarification of “takes into consideration the policies or recommendations” | 2124 |
| 17.2 Misrepresentation of Third-Party and Major Scientific Journal Recommendations | 2125 |
| 17.2.1 General Comment Positions on Misrepresentation..... | 2125 |
| 17.2.2 Administrative Conference of the United States’ Study | 2126 |
| 17.2.3 National Academies of Science (NAS) Reports | 2128 |
| 17.2.4 National Research Council Reports | 2131 |
| 17.2.5 Health Effects Institute (HEI) | 2131 |
| 17.2.6 Center for Open Science | 2133 |
| 17.2.7 Risk Assessment Specialty Section of the Society of Toxicology and Dose-Response Specialty Group (DRSG) of the Society for Risk Analysis (SRA) | 2135 |
| 17.2.8 Bipartisan Policy Center Report | 2136 |
| 17.2.9 EPA’s Proposal is inconsistent with policies adopted by major scientific journals | 2138 |
| 17.2.10 Not Representative of Scientific Community Recommendations | 2143 |
| 17.2.11 Cited <i>Economist</i> Article Does Not Support EPA’s Proposal..... | 2145 |
| Chapter 18: Alternative Approaches to the Proposed Rule | 2147 |
| 18.1 Base Policies and Requirements on Existing Guidance | 2147 |
| 18.1.1 National Academy Guidance | 2148 |
| 18.1.2 U.S. Commission on Evidence-Based Policymaking Recommendations | 2150 |
| 18.1.3 Good Laboratory Practice | 2151 |
| 18.1.4 Transparency and Openness Promotion Guidelines | 2153 |

| | |
|--|------|
| 18.1.5 Radiation Effects Research Foundation | 2154 |
| 18.1.6 Federal Data Strategy | 2155 |
| 18.1.7 National Center for Health Statistics Research Data Centers | 2155 |
| 18.2 Approaches Specific to EPA-Funded Research..... | 2155 |
| 18.2.1 Enforce Existing Requirements | 2155 |
| 18.2.2 Update Grant Awards/Cooperative Agreements | 2156 |
| 18.2.3 Use EPA Funding to Enact Change | 2156 |
| 18.3 Suggested Changes to the Rule/Approach..... | 2157 |
| 18.3.1 Make the Rule More General..... | 2157 |
| 18.3.2 Applicability of Science Covered by the Rule..... | 2158 |
| 18.3.3 Additions to the Proposed Rule | 2160 |
| 18.3.4 Subtractions from the Proposed Rule | 2163 |
| 18.3.5 No Action Necessary | 2164 |
| 18.3.6 Delay Rulemaking | 2165 |
| 18.4 Alternative Policies to Increase Transparency in EPA Rulemaking without Releasing Private Data to Public | 2167 |
| 18.4.1 Other Effective Ways to Vet Scientific Results that Do Not Require Public Access to Research Data | 2167 |
| 18.4.2 Weight Studies According to Data Transparency..... | 2169 |
| 18.4.3 Encourage Scientific Community-Led Efforts to Self-Improve Transparency | 2171 |
| 18.4.4 Use Independent Third-Party to Evaluate Study Components, Results, Rules, Data Disclosure Issues..... | 2172 |
| 18.4.5 Increase Financial Incentive Transparency | 2175 |
| 18.4.6 Other | 2176 |
| 18.5 Facilitate Data Publication/Accessibility | 2180 |
| 18.5.1 Public Accessibility to Environmental Databases and Websites that are Easy to Navigate | 2180 |
| 18.5.2 Improve Public Accessibility | 2181 |
| 18.5.3 Make Use of Existing Data Repository (e.g., Rulemaking Docket) | 2182 |
| 18.5.4 Transparency of Published Data | 2182 |
| 18.6 Implement, Emulate or Work with Federal Programs | 2183 |
| 18.6.1 Environmental Protection Agency Policy and Guidance..... | 2183 |
| 18.6.2 Collaborate with Other Agencies/Departments | 2185 |

| | |
|---|------|
| Chapter 19: Comparison of Approach to Hazard, Exposure and Risk Assessment Guidance . | 2190 |
| 19.1 Science and Judgement in Risk Assessment..... | 2190 |
| 19.2 Request for Inclusion of Discussion on How EPA Proposes to Address Exposure Assessments and Risk Characterization Data and Models in the Future..... | 2191 |

Chapter 1: Legal Authority

In the 2018 Proposed Rule, EPA proposed to take the action under several statutes it administers, including Clean Air Act (CAA) sections 103, 301(a), 42 U.S.C. 7403, 7601(a); Clean Water Act (CWA) sections 104, 501, 33 U.S.C. 1254, 1361; Safe Drinking Water Act (SDWA) sections 1442, 1450(a)(1), 42 U.S.C. 300j-1, 300j-9(a)(1); Resource Conservation and Recovery Act (RCRA) sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; Emergency Planning and Community Right-To-Know Act (EPCRA) section 328, 42 U.S.C. 11048; Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; and Toxic Substances Control Act (TSCA), as amended, section 10, 15 U.S.C. 2609. The Agency also states that the action is consistent with requirements in the Administrative Procedure Act (APA) to ensure public participation in the rulemaking process. Additionally, the notice of proposed rulemaking (NPRM) solicits comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation.

The supplemental notice of proposed rulemaking (SNPRM) maintains its authority under the statutes provided in the original proposal. The Environmental Protection Agency (EPA) also notes its 2018 document extending the comment period and announcing a public hearing identifies 5 U.S.C 301 as a source of authority in addition to the statutes cited in the NPRM¹. In addition, the Agency clarifies that the NPRM's reference to RCRA section 7009, 42 U.S.C 6979 should be to RCRA section 8001, 42 U.S.C. 6981; the citation to CERCLA section 116, 42 U.S.C. 9616, should be to CERCLA section 115, 42 U.S.C. 9615; and includes CWA section 501, 33 U.S.C. 1361.

The Agency also states that it is authorized to promulgate this regulation under its housekeeping authority. While EPA acknowledges it is not one of the 15 "Executive Departments" listed at 5 U.S.C 101, the Agency provides that it gained housekeeping authority through the Reorganization Plan No. 3 of 1970, 84 Stat. 2086 (July 9, 1970). According to the Agency, the proposed rule is an internal rule of agency procedure that is intended to be consistent with the statutes that EPA administers and EPA plans to implement this procedural rulemaking in accordance with all applicable statutory and regulatory requirements. While this rule is of internal agency procedure, EPA solicits comment on whether to use its housekeeping authority independently or in conjunction with the clarified environmental statutory provisions.

Several comments were received regarding the legal authority of the NPRM and SNPRM, including the applicability of the cited environmental statutes and EPA's ability to invoke housekeeping authority for the proposed rule. In this section the public comments are organized according to the following topics:

- General Comments
- Housekeeping Statute

¹ EPA. Strengthening Transparency in Regulatory Science; Extension of Comment Period and Notice of Public Hearing Federal Register (83 FR. 24255, May 25, 2018).

- Specific Environmental Statutes
- Evidence Act (SNPRM Comments)
- Consistency with the Peer Review Processes Required Under Environmental Statute (NPRM Comments)
- Administrative Procedures Act (APA) (NPRM and SNPRM Comments)
- Other Authorities (NPRM Comments)
- Trying to Achieve Administratively What Could Not be Done Legislatively
- Other Comments (NPRM Comments)

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID commenter ID numbers (and specific comment excerpt IDs - indicated in brackets) for these commenters are cited throughout this section. In addition, some general comment letters also include comments related to the legality of the NPRM and SNPRM (the Proposal). These comments are summarized in Appendix B. Note that the points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. Therefore, the responses provided in this Chapter adequately address the more general comments received regarding the legal authority and other issues related to the legality of the rule.

1.1 General Comments

1.1.1 General Legal Authority (Notice of Proposed Rulemaking (NPRM) Comments)

Comment [2772-2261]: Commenter (2787) contends that the EPA fails to cite any specific language providing authority for the rule and asks commenters where the authority may be found.

Response: In both the 2018 proposal and the 2020 supplemental proposal, EPA cited several sources of authority and requested comment on those sources or any others that commenters might think appropriate for the final rule. EPA has identified its housekeeping authority, conveyed through Reorganization Plan No. 3 of 1970, as the legal authority for the final rule.

Comment [4531-5099]: Commenter (4541) applauds this proposed rule and find that governing statutes and Executive Orders, not to mention the basics of the scientific method, authorize the proposed Rule and, indeed, have long required it. In not following the proposed Rule in the past, EPA has been flouting governing statutes and Executive Orders, departing from the scientific method, particularly in matters of toxicology and epidemiology, and abusing its authority by ignoring and discarding valid objections to EPA adopted science and the derivative policy and regulatory actions.

Response: EPA appreciates your comment in support of the final rule but disagrees with your assertion that the agency has flouted the law and ignored or discarded valid objections to agency science. EPA uses systematic review and weight of evidence processes to evaluate scientific studies for use in its regulatory decisions and in the development of influential scientific information.

Comment [4871-354]: Commenter (4882) agrees this proposed rule has incorporated appropriate sources of statutory authority and suggest no further source of authority is required.

Response: Thank you for your comment in support of the final rule.

Comment [6106-875]: Commenter (6116) states that on April 30, 2018, EPA published a notice in the *Federal Register* (FR) of a proposed rule that would drastically reduce the types of scientific studies that can be used to inform EPA regulations protecting public health under the guise of improving transparency. The commenter expresses that they are troubled by this proposal, as we believe it would vastly undermine the mission of the EPA, which is to protect human health and the environment. The commenter notes that it is curious that this proposal champions “transparency” when it seems certain to serve the opposite purpose. An example of one of the reasons the commenter states that they oppose the proposed rule includes, but is not limited to the following:

The EPA itself seems to question whether it has the authority to promulgate this rule. The FR notice asks commenters to provide information on what areas of the CAA they feel may demonstrate this type of authority. The EPA should have a solid foundation before it proposes rules and should not have to seek answers for questions about its own authority.

Response: See response to Comment 2772-2261.

Comment [6112-1489]: Commenter (6137) contends that EPA has no authority to limit what scientific information may be considered in making regulatory decisions. The commenter states that no statute authorizes the proposed rule, and EPA lacks any inherent authority to regulate absent a statutory basis. Thus, that commenter suggest that the EPA should proceed to promulgate the Proposed Rule or otherwise limit what science can be considered in regulatory decisions, it will be acting in violation of the law. See 5 U.S.C. § 706(2)(C) (requiring a reviewing court to “hold unlawful and set aside agency action . . . found to be . . . in excess of statutory jurisdiction, authority, or limitations, or short of statutory right”).

The commenter states that the stated statutory provisions upon which EPA relies do not provide authority for the Proposed Rule. The commenter notes that the EPA lists a number of statutes it administers as purported authority for this rule, including “provisions providing general authority to promulgate regulations necessary to carry out the Agency’s functions under these statutes and provisions specifically addressing the Agency’s conducting of and reliance on scientific activity to inform those functions.” See 83 Fed. Reg. 18,769. As discussed in detail below, none of the statutes cited by EPA authorizes this proposed action.² EPA thus lacks authority to promulgate this rule under any statutory regime administered by the Agency, rendering the rule invalid.

Response: In both the 2018 proposal and the 2020 supplemental proposal, EPA cited several sources of authority and requested comment on those sources or any others that commenters

² Even assuming any of the statutory provisions upon which EPA relies provided authority to restrict science – which they do not – at best, the provisions could authorize EPA’s proposed policy only with respect to activities under the particular statute. The provisions could not authorize an across-the-board restriction on science for rulemakings under all statutes.

might think appropriate for the final rule. EPA has identified its housekeeping authority, conveyed through Reorganization Plan No. 3 of 1970, as the legal authority for the final rule.

Also see response to Comment 73-410 in this Response to Comment (RTC) document Section 1.2.2.

Comment [6112-1560]: Commenter (6137) provides that in its notice extending the comment period and adding a public hearing, as an implicit admission that it has not cited sufficient authority for the Proposed Rule, EPA adds a new source of alleged authority, stating that “EPA is proposing this rule under authority of 5 U.S.C. 301, in addition to the authorities listed in the April 30th document.” See 83 Fed. Reg. 24,255, 24,256 (May 25, 2018). Just like with the other statutory provisions upon which it relies, EPA is trying to fit a square peg in a round hole.

Section 301 of Title 5 provides “[t]he head of an Executive department or military department” authority to “prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property.” This provision governs internal organizational and bureaucratic steps required for operations. It allows all agencies to issue regulations to preserve and use their own papers and property. This section is plainly focused on allowing executive agencies to issue rules necessary to carry out the performance of their agencies’ internal workings, not to allow EPA to regulate scientific material in rulemakings.

Indeed, according to the commenter, the “purpose” of this section, “which originated in 1789 as a law ‘to enable General Washington to get his administration underway by spelling out the authority of Government officers to set up offices and to file Government documents’ . . . is to set up merely internal guidelines for a given governmental agency” to perform its job. *United States v. Lewis*, No. C-CR-89-114-01, 1990 WL 11111, *5 (W.D. N.C. Feb. 5, 1990) (citation omitted). That is why it is known as the “Housekeeping Statute,” to literally allow the federal government to set up and keep house. *U.S. ex. Rel. O’Keefe v. McDonnell Douglas Corp.*, 132 F.3d 1252, 1254 (8th Cir. 1998) (citing H.R. Rep. No. 85-1461 (1958), reprinted in 1958 U.S.C.C.A.N. 3352). The Act was amended in 1966 as “codifying the general and permanent laws relating to the organization of the Government of the United States and to its civilian officers and employees.” Pub. L. No. 89-554, 80 Stat. 378 (Sept. 6, 1966).

In *Chrysler Corp. v. Brown*, 441 U.S. 281, 310 (1979), the Supreme Court evaluated the Housekeeping Statute and held that it does not provide statutory authority for substantive regulations. After a brief historical analysis of the provision, the Court wrote:

Given this long and relatively uncontroversial history, and the terms of the statute itself, it seems to be simply a grant of authority to the agency to regulate its own affairs. . . . It is indeed a “housekeeping statute,” authorizing what the APA terms “rules of agency organization procedure or practice” as opposed to “substantive rules.”

Id. at 309–10. Multiple courts have agreed and limited rulemaking under this provision to non-substantive rules. See, e.g., *McDonnell Douglas Corp.*, 132 F.3d at 1256 (citing examples).³

Based on this long line of authority, EPA’s reliance on this authority is sorely misplaced. EPA’s attempt to “construe [this provision] as something more” is a “misuse” that “twist[s]” the statute beyond its intended purpose; EPA may not “twist this simple administrative statute into an authorization for the promulgation of substantive rules.” Id. at 1255 (citing and quoting *Chrysler Corp.*, 441 U.S. at 310 n.41 (quoting H.R. Rep. No. 85–1461 at 7 (1958))).

The Proposed Rule does not relate to the organization of EPA or how it preserves its papers or keeps house. EPA’s exclusion of critical health studies is such a far cry from being necessary to “set up offices” and to “file Government documents,” that reliance on this provision hardly passes the laugh test. As discussed extensively in these Comments, the Proposed Rule is by no means necessary for EPA to perform its job but rather is antithetical to the very statutes it is responsible for effectuating. Accordingly, for the same reasons the general rulemaking authority provisions under all of the environmental statutes EPA cites do not authorize this rule, § 301 likewise does not permit EPA to issue a rule that undermines scientific integrity as well as all of the public health and environmental protections EPA is charged with enforcing.

The EPA’s lack of statutory authority to propose this rule is fatal, as it has no inherent power to act. Indeed, it is well settled that a federal agency “literally has no power to act . . . unless and until Congress confers power upon it.” *La. Pub. Serv. Comm’n v. FCC*, 476 U.S. 355, 374 (1986); see also *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208 (1988) (“It is axiomatic that an administrative agency’s power to promulgate legislative regulations is limited to the authority delegated by Congress.”); *Clean Air Council v. Pruitt*, 862 F.3d 1, 9 (D.C. Cir. 2017) (“[I]t is ‘axiomatic’ that ‘administrative agencies may act only pursuant to authority delegated to them by Congress’” (citation omitted)); *Ohio Dep’t of Medicaid v. Price*, 864 F.3d 469, 476 (6th Cir. 2017) (“Agencies, after all, are creatures of statutory authority.” (citation and internal quotations omitted)). This is because, under the Constitution, Congress is the branch of government with lawmaking power. *City of Arlington, Tex. v. FCC*, 569 U.S. 290, 317 (2013) (noting that an agency has no lawmaking power unless Congress delegates that power to it). “The legislative power of the United States is vested in the Congress, and the exercise of quasi-legislative authority by governmental departments and agencies must be rooted in a grant of such power by the Congress and subject to limitations which that body imposes.” *Chrysler Corp.*, 441 U.S. at 302. Thus, EPA only has rulemaking power to the extent that Congress delegated it such power. *Lyng v. Payne*, 476 U.S. 926, 937 (1986) (“an agency’s power is no greater than that delegated to it by Congress.”)

³ See, e.g., *In re Bankers Tr. Co.*, 61 F.3d 465, 470 (6th Cir. 1995) (Federal Reserve Board regulation requiring subpoenaed party to refuse production of confidential Federal Reserve Board information, contrary to Federal Rule of Civil Procedure 34, was not authorized by the Housekeeping Statute and “exceed[ed] the congressional delegation of authority”); *Exxon Shipping Co. v. U.S. Dep’t of Interior*, 34 F.3d 774, 776–78 (9th Cir. 1994) (Housekeeping Statute did not authorize regulations allowing agency to withhold deposition testimony of federal employees); *In re Cincinnati Radiation Litig.*, 874 F. Supp. 796, 826–27 (S.D. Ohio 1995) (Housekeeping Statute did not authorize 1953 Defense Department directive on the use of human volunteers in experimental research); *McElyea v. Sterling Med., Inc.*, 129 F.R.D. 510, 514 (W.D. Tenn. 1990) (Housekeeping Statute did not give Department of Navy authority to create general discovery privilege for persons under its jurisdiction).

Moreover, the fact that Congress has given EPA the authority to regulate in a certain area does not mean that it has general authority to make any rule within that area. This argument has been squarely rejected:

The [agency's] position in this case amounts to the bare suggestion that it possesses plenary authority to act within a given area simply because Congress has endowed it with some authority to act in that area. We categorically reject that suggestion. Agencies owe their capacity to act to the delegation of authority from Congress.

Am. Library Ass'n. v. FCC, 406 F.3d 689, 708 (D.C. Cir. 2005) (quoting *Ry. Labor Executives' Ass'n v. Nat'l Mediation Bd.*, 29 F.3d 655, 670 (D.C. Cir. 1994)) (internal quotations omitted; emphasis in original); see also *Liberty Mut. Ins. Co. v. Friedman*, 639 F.2d 164, 169 (4th Cir. 1981) ("a court must reasonably be able to conclude that the grant of authority contemplates the regulations issued." (citation and internal quotation marks omitted)). "[T]he power to issue regulations is not the power to issue any regulations." *Nat'l Mining Ass'n v. U.S. Dep't of the Interior*, 105 F.3d 691, 694 (D.C. Cir. 1997). In light of the statutory limitation on EPA's authority to restrict science in the way it proposes to do (see *infra*, Section IV of the commenters' comment letter), any general rulemaking authority on which it might otherwise try to rely does not authorize the Proposed Rule. See, e.g., *Nat. Res. Def. Council, Inc. v. Reilly*, 976 F.2d 36, 40-41 (D.C. Cir. 1992) (refusing to allow EPA to rely on general rulemaking authority to trump specific limitations on its authority because a vague "open-ended power" does not "trump the specific provisions of the [Clean Air] Act"; and "EPA's construction of the statute is condemned by the general rule that when a statute lists several specific exceptions to the general purpose, others should not be implied." (citation and internal quotation marks omitted)).

Accordingly, EPA has no general or inherent authority permitting it to lawfully adopt the Proposed Rule or otherwise limit what science may be considered in the rulemaking process. It, therefore, must be acting pursuant to some grant of authority by Congress for the Proposed Rule to be lawful. Yet none of the stated authorities upon which EPA relies provides the necessary authority to promulgate this rule.⁴ Given that EPA has no statutory authority to issue the Proposed Rule, its action is *ultra vires*. See, e.g., *McDonnell Douglas Corp.*, 132 F.3d at 1257 ("An agency's promulgation of rules without valid statutory authority implicates core notions of the separation of powers, and we are required by Congress to set these regulations aside." (citing cases finding *ultra vires* agency action)). The Proposed Rule is therefore unlawful.

Response: See responses to Comments 31-135, 32-144 and 73-410 in RTC document Section 1.2.2.

Comment [6116-1117]: Commenter (6141) asserts that the Proposal for scientific transparency is consistent with the objectives and requirements of existing federal environmental statutes and administrative policies. Most importantly, the CAA and other major federal environmental statutes provide EPA with broad authority to establish procedures, requirements, and criteria for adopting rules, regulations, and policies for how the Agency adopts new regulations, rules, and

⁴ EPA may not now add any new authority (if any exists) to try to save this action, as doing so would violate public notice-and-comment requirements under the statutes cited herein, as well as under the Administrative Procedure Act.

guidance. For example, section 301(a) of the CAA provides the EPA Administrator with broad authority to establish regulations “as are necessary to carry out... the functions” under the CAA, while section 307(d) provides extensive authority on the manner in which EPA may conducting notice and comment rulemakings, including provisions for ensuring a robust rulemaking record and adequate opportunities for public participation.⁵ The other relevant federal environmental statutes also provide EPA broad authority for the establishment of procedures, requirements, and criteria for how it establishes implementing rules, regulations, and policies.⁶ The commenter supports EPA’s proposal to use this authority to establish new rules for ensuring the transparency and public availability of the underlying scientific data and other important supporting documentation used by EPA in its regulatory actions.

Response: Thank you for your comment in support of the rulemaking. See responses to Comments 31-135 and 73-410 in Section 1.2.2 of the RTC document.

Comment [6125-1849]: Commenter (6150) agrees that EPA has sufficient legal authority under existing environmental statutes to issue this rulemaking to strengthen the transparency of the science supporting regulatory activity. EPA lays out substantive legal support for this action in the Proposed Rule.⁷ Further, EPA’s obligation under the Data Quality Act is to “maximiz[e] the quality, objectivity, utility, and integrity of information” and, as importantly, “establish administrative mechanisms allowing affected persons to seek and obtain correction of information maintained and disseminated by the agency.”⁸ These provisions can only be met if the public has access to the data, models, and methodologies used by EPA and underlying research used by EPA to justify new and existing regulations.

Response: Thank you for your comment in support of the rulemaking.

Comment [6149-2754]: Commenter (6174) provides that there is no basis in existing bedrock environmental laws that authorizes EPA to limit science considered in rulemaking processes. EPA cites several key laws as a justification for this current proposal to limit or constrain the

⁵ As a general matter, CAA section 307(d) imposes more stringent transparency requirements for public notice and comment than those requirements imposed under section 553 of the APA. See CAA section 307(d)(3) (providing that notice of proposed rulemaking shall not only comply with the public notice requirements of APA section 553(b), but also be “accompanied by a statement of its basis and purpose” which shall include “the factual data on which the proposed rule is based,” “the methodology used in obtaining the data and in analyzing the data,” and “the major legal interpretations and policy considerations underlying the proposed rule”). See also, *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 519 (D.C. Cir. 1983) (stating that CAA § 307(d)(3) “requires a much more detailed notice of rulemaking” than does the APA); *Union Oil Co. of Cal. v. EPA*, 821 F.2d 678,681-82 (D.C. Cir. 1987) (noting that the CAA establishes “new procedural requirements for EPA rulemaking” that are “more stringent than those previously applicable under the Administrative Procedure Act,” including a requirement that “EPA . . . establish a detailed ‘rulemaking docket’ that . . . must provide the entire basis for the final rule”).

⁶ See e.g., Clean Water Act sections 104, 501, 33 U.S.C. 1254, 1361; Safe Drinking Water Act sections 1442, 1450(a)(1), 42 U.S.C. 300j-1, 300j-9(a)(1); Resource Conservation and Recovery Act sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; Comprehensive Environmental Response, Compensation, and Liability Act (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; Emergency Planning and Community Right-To-Know Act section 328, 42 U.S.C. 11048; Federal Insecticide, Fungicide, and Rodenticide Act sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; Toxic Substances Control Act, as amended, section 10, 15 U.S.C. 2609.

⁷ 83 FR 18769 and 18773, listing eight federal environmental statutes that provide specific legal authority.

⁸ 44 U.S.C. Section 3501(1); 67 F.R. 8453 and 8459.

science it can consider. Nowhere in the cited statutes is there any basis for demanding access to raw data, nor does this relate sensibly to any definition of best available science. Rather it undermines the use of best available science as called for in numerous environmental statutes including the CAA. Further, there is no basis in the statutes for politically appointed administrators to choose which science will be considered and which may not be.

The CAA, for example, has requirements to update pollution standards that provide for an adequate margin of safety for public health. This determination can only be reliably made using the best available science. However, this proposal would prevent EPA from using the best available information to set science-based pollution standards that would provide for an adequate margin of safety. EPA should not cite the CAA as an appropriate source of statutory authority.

In sum, there is no statutory authority for EPA to rely on to censor or constrain science. Indeed, quite the opposite. Further, such an effort would only serve to undermine EPA's essential role.

Response: EPA is not relying on the substantive environmental statutes as authority for the final rule. See responses to Comments 32-144, 48-381 and 73-410 in RTC document Section 1.2.2.

Comment [6155-586]: Commenter (6125) states that EPA lists 14 statutory provisions as support for its proposal.⁹ On examination, these are all either general rulemaking authorities or general research authorities; none of them has anything to do with how to use science in decision-making.¹⁰ Moreover, the proposal does not expressly say--as a well-drafted and genuinely transparent proposal should-- that it will only apply to the programs under the cited statutes (although that may be implicit), much less discuss in any way the policies those programs embody or why the proposed per se rule would be a proper exercise of discretion under each statute. Indeed, the cited provisions, virtually the only statutory authority the proposal cites as support, are irrelevant to the per se issue.

Response: EPA is not relying on the substantive environmental statutes as authority for the final rule. See response to Comment 73-410 in RTC document Section 1.2.2.

Comment [6155-588]: Commenter (6125) contends that any rule must have a lawful basis. The proposal does not even attempt to show that it does. It claims "discretionary authority" for its proposed approach but identifies no source for such authority. It evades that question by purporting to list "statutes and provisions specifically addressing the agency's conducting of and reliance on scientific activity to inform those functions" FR 18769 (emphasis added). It does not

⁹ They are: Clean Air Act sections 103,301(a), 42 U.S.C. 7403, 7601(a); Clean Water Act sections 104, 501, 33 U.S.C.1254, 1361; Safe Drinking Water Act sections 1442, 1450(a)(1), 42 U.S.C.300j-1, 300j-9(a)(1); Resource Conservation and Recovery Act sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1),6979; Comprehensive Environmental Response, Compensation, and Liability Act (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660;Emergency Planning and Community Right-To-Know Act section 328, 42U.S.C. 11048; Federal Insecticide, Fungicide, and Rodenticide Act sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w;and the Toxic Substances Control Act, as amended, section 10, 15 U.S.C. 2609. 83 Fed. Reg. 18769

¹⁰ One apparent exception appears to be RCRA 7009, which addresses labor standards and not science and which is incorrectly included on the list; a more carefully drafted proposal would have used the correct citation to research authority, RCRA 8001.

explain how those provisions authorize the wholesale redefinition of science. All the provisions cited either authorize research, or general rulemaking not tied to any specific purpose.

EPA's proposal would, by operation of law, change the standards for using science in issuing covered rules under all of the listed substantive regulatory authorities. It would thereby make in advance a critical part of the regulatory decision in any covered proceeding, namely the decision how to weigh available studies to best evaluate scientific evidence. This is a decision that has previously been made by detailed case-by-case review in the rulemaking itself. Until today, such decisions have been made after considering the substantive goals of the particular statutory provision involved, guided by the attitude toward scientific evidence embodied in that provision, and striving for conformity with any applicable procedural requirement. The affected provisions are the relevant statutory authorities that EPA's proposal should have cited and discussed, in order to show its consistency with their mandates. EPA's citations to general provisions are insufficient because it is axiomatic that a "general grant of authority cannot trump specific statutory provisions". *NRDC v. EPA*, 749 F. 3d 1055, 1064 (D.C. Cir. 2014); *API v. EPA*, 52 F. 3d 1113, 1119 (D.C. Cir. 1995) (same).

The agency's failure to do this is by itself a fatal flaw in this proposal. It is EPA's duty, not EPN's, to identify and discuss these provisions. However, it is clear from even a brief look that these provisions require EPA to consider all the best available science, without authorizing, or even mentioning any of the per se restrictions based on "transparency" that EPA has proposed to use as a universal overriding rule. For these reasons, EPA must justify its proposal as a proper exercise of its authority under each of the statutory provisions whose operation it would affect - provisions that the agency does not even cite. It is the job of the proposer, not the commenters, to survey these provisions and provide the needed justification.

In several of the listed statutes Congress has explicitly told EPA how to use science in decision-making.

- SDWA 1412(b)(3)(A) addresses EPA's "use of science in decision-making" by providing that risk assessments "shall" use "the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices."
- The EPCRA, 42 USC 11023(d)(2)(C) mandates that a determination whether to add a substance to list of "extremely hazardous substances" "shall be based on generally accepted scientific principles or laboratory tests or appropriately designed and conducted epidemiological or population studies available to the Administrator."
- The CWA, 33 USC 1314(a)(1) mandates that the Administrator "shall develop and publish ... criteria for water quality accurately reflecting the latest scientific knowledge" "on the kind and extent of all identifiable effects on health or welfare" in setting water quality standards;
- CAA 108(a)(2) specifies that "air quality criteria for an air pollutant shall accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air."

- The TSCA 15 USC Section 2605 (h) provides that “the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science.”

These provisions all use mandatory language directing EPA to use reliable and relevant scientific information -- and further specify how to do so. They all direct that decisions regarding protection of public health be based on the full range of relevant scientific information, in some cases specifying how to identify what information to use. None of them give EPA discretion to ignore such information for any of the reasons set forth in the proposal.

Response: EPA is not relying on the substantive environmental statutes as authority for the final rule. See response to Comment 73-410 in RTC document Section 1.2.2.

Comment [6157-898]: Commenter (6127) provides that there is no legal or environmental basis for the agency to add restrictions and ignore available information about the risks of pollution.

Response: The final rule does not require EPA to ignore available information on pollution risks. Under the rule, EPA will give greater consideration to pivotal science based on an evaluation of study quality factors and data availability. See responses to Comments 32-144, 34-155 and 48-381 in RTC document Section 1.2.2.

Comment [6163-827]: Commenter (6133) states that EPA has unsurprisingly failed to cite a single statute that provides any basis for the Proposal. What statutes EPA does cite conflict with the Proposal, because they require EPA either to consider the best available science (which may be based on data that cannot be made public) or to regulate to protect public health and the environment (which cannot be done if critical science is ignored simply because the underlying data cannot be made public). Similarly, none of the other sources EPA cites provide legal or logical support for the Proposal.

Response: EPA is not relying on any of the substantive environmental statutes cited in the 2018 and 2020 proposals as authority for the final rule. See response to Comments 32-144, 48-381 and 73-410 in RTC document Section 1.2.2.

Comment [6163-1046]: Commenter (6133) asserts that it is clear from the above that the Proposal violates the law and must be withdrawn. There is no support for the Proposal in any of the statutes EPA cites, and in fact, those statutes conflict with the Proposal, as do other statutes that EPA failed to mention at all. Further, none of the other sources cited provide legal or logical support for the Proposal. The Proposal also suffers from a host of other problems: its definitions are vague; it is an unexplained reversal from prior agency policy; it handles Confidential Business Information (CBI) in a capricious manner; it treats other types of agency actions inconsistently; and it fails to analyze disproportionate impacts on communities of color, low-income communities, and children.

In the alternative, if EPA decides to move ahead with this reckless, unjustified, and unlawful effort to censor the science that EPA may consider, and must consider, to protect Americans' health and environment, the agency must first issue a supplemental proposal and actual administrative record to cover the multitude of issues, evidence, and specific regulatory text for

which EPA fails to provide fair notice. The Proposal fails to provide fair notice or justifications addressing numerous issues that our comments detail—from an absence of any statutory authority, to failures to address statutory authorities that the Proposal squarely contravenes, to failures to provide reasoned explanations, including basic justifications for EPA’s numerous departures from past practices. The Proposal fails to propose specific regulatory text addressing numerous implementation elements, as well as issues that are touched upon only in passing in the preamble (*e.g.*, non-linearity, and linear, non-threshold (LNT)). Apart from all of the significant substantive and procedural defects from which the Proposal suffers, it still manages to be a shockingly shoddy effort missing actual regulatory text and supporting legal, factual, scientific, and technical information that would provide fair notice to the public.

Response: EPA disagrees that the final rule violates the law. Further, EPA addressed many of the significant comments on the 2018 proposal in the 2020 supplemental proposal. Both notices included regulatory text and provide fair notice to facilitate public comment. Also see responses to Comments 31-135 and 73-410 in RTC document Section 1.2.2.

Comment [6163-1101]: Commenter (6133) states that the law is clear that EPA may adopt rules only if those rules are based on statutory authority delegated by Congress. EPA may not invent statutory authority where none exists, nor adopt regulations lacking statutory authority merely because EPA believes that to be better policy. See, *e.g.*, *Massachusetts v. EPA*, 549 U.S. 497, 535, 127 S. Ct. 1438, 1463 (2007) (“EPA must ground its reasons for action or inaction in the statute.”); *La. Pub. Serv. Comm’n v. FCC*, 476 U.S. 355, 374 (1986) (stating “agency power to act” is shaped by how “Congress confers power upon it”). Agencies need especially clear congressional delegations of authority to create regulatory exemptions. See *New York v. U.S. EPA*, 413 F.3d 3, 41 (D.C. Cir. 2005) (stating that the agency needs “clear congressional delegation” to support an exemption). EPA identifies no such delegations, certainly not the clear delegations required by law, for the Proposal.

EPA lists seven statutes as the basis for the Proposal. But none of the various statutes cited provides support for the rule’s provisions, definitions, requirements, or exemptions. Rather, EPA invents statutory authority where none exists, and creates proposed regulatory text out of thin air. In most cases, EPA simply cites its general authority for rulemaking under the statutes. But that general authority alone cannot provide a basis for the rule, especially when, as explained in section V, the rule would conflict with the requirements of each of the statutes. See *New York v. U.S. EPA*, 413 F.3d 3, 40–42 (D.C. Cir. 2005). In other instances, it appears that EPA just searched the statutes for the word “research” and then cited those sections without any further analysis.

Response: EPA is not relying on any of the environmental statutes cited in the 2018 and 2020 proposals as authority for the final rule. See response to Comment 73-410 in RTC document Section 1.2.2.

Comment [6163-5113]: Commenter (6133) contends that there is no statutory authority for EPA to “conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the Office of Management and Budget (OMB) Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described

therein.” The federal statutes that EPA lists as putative authority for the Proposal provide no authority for proposed § 30.7. See 83 Fed. Reg. at 18,769/2 (citing CAA sections 103, 301(a), 42 U.S.C. 7403, 7601(a); CWA sections 104, 501, 33 U.S.C. 1254, 1361; SDWA sections 1442, 1450(a)(1), 42 U.S.C. 300j–1, 300j– 9(a)(1); RCRA sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; CERCLA (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; EPCRA section 328, 42 U.S.C. 11048; FIFRA sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; and TSCA, as amended, section 10, 15 U.S.C. 2609, and the APA). The claimed authorities that EPA lists do not mention peer review or even allude to the concept. *Id.* Neither the Proposal nor accompanying docket materials identify any provision of any federal statute that authorizes EPA to promulgate proposed § 30.7. Our own research revealed no provision of any federal statute that authorizes EPA to promulgate proposed § 30.7.

Response: None of the statutory provisions cited by the commenter prohibits EPA from conducting additional peer review of studies the agency evaluates as support for significant regulatory decisions and ISI. That said, the final rule provides that if EPA determines that studies have already undergone adequate peer review, EPA will not conduct de novo independent peer review. Adequate peer review is peer review that is consistent with both OMB’s and EPA’s peer review guidance. The intent of the rule is for EPA to go beyond current OMB/EPA guidance by recognizing that peer review that actually examined the underlying data will lead to even more confidence in the results of a peer reviewed study and that pivotal science that has had this deeper peer review will be given greater consideration in study quality weighting.

The final rule states in § 30.3 that “[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.” Additionally, EPA intends to promulgate future science transparency rules under its substantive environmental statutes that may address peer review requirements consistent with those authorities.

Comment [6428-1351]: Commenter (6450) states that the proposed rule is not merely a disastrous policy choice, given its threats to public health and the integrity of EPA decision-making, but it is plainly unlawful. EPA clearly lacks the authority to issue the proposal. EPA cites to various provisions in federal law to justify its authority but, in virtually every case, the agency refers to sections that authorize or mandate EPA to undertake research, not to impose arbitrary limitations on the scientific data that informs public health decisions. EPA also cites to statutory provisions authorizing it to promulgate rules “necessary” to achieving the goals of relevant statutes but restricting the use of sound science is neither necessary nor consistent with the statutory goals of protecting clean air, clean water, and a safe environment. Indeed, the proposed rule directly contradicts the specific mandate of numerous federal laws, such as the SDWA and the TSCA, which require EPA to use the “best available” science or all “reasonably available” science and information in its decision-making.

Response: EPA is not relying on any of the substantive environmental statutes cited in the 2018 and 2020 proposals as authority for the final rule. See response to Comment 73-410 in RTC document Section 1.2.2.

Comment [6894-3629]: Commenter (6916) notes that the APA further requires that a notice of proposed rulemaking contain “reference to the legal authority under which the rule is proposed.” 5 U.S.C. § 553(b)(2). “[T]he required specification of legal authority must be done with particularity,” and “must be sufficiently precise to apprise interested persons of the agency’s legal authority to issue the proposed rule.” *Global Van Lines*, 714 F.2d at 1298 (quoting H.R. Rep. No. 1980, at 24 (1946) and U.S. Dept. of Justice, Attorney General’s Manual on the APA 29 (1947)). EPA has also failed to meet this requirement.

In both the April 30, 2018 notice of proposed rulemaking and the May 25, 2018 notice extending the comment period, EPA discusses statutory authority for the proposed rule, citing to a number of provisions, largely from statutes it implements. 83 Fed. Reg. at 18,769; 83 Fed. Reg. 24,255, 24,256 (May 25, 2018). In particular, EPA invokes the CAA, CWA, SDWA, EPCRA, FIFRA, TSCA, CERCLA, and RCRA. 83 Fed. Reg. at 18,769.

But rather than identify legal authority with particularity, the cited statutory provisions mainly set forth EPA’s broader authorities to conduct research and promulgate regulations. Few of the cited provisions actually address EPA’s ability to pick and choose amongst valid scientific information, studies, and techniques in its formation of environmental standards and modeling, and none authorize the wholesale preclusion of probative, relevant studies, as EPA proposes here. Tellingly, in the proposal itself, EPA requests assistance to determine “whether additional or alternative sources of authority are appropriate bases for the proposed regulation.” *Id.* at 18,771. EPA’s inability to identify specific statutory authority for its proposed action falls far short of the APA’s standard for notice and comment rulemaking, as would any ultimate reliance on statutory authority EPA has failed to cite. See *Global Van Lines*, 714 F.2d at 1297-99.

Response: See response to Comment 25-96 in the APA Section 1.6.1.2 of the RTC document.

Comment [6895-3186]: Commenter (6919) contends that EPA, like all federal agencies, is a creature of statute, and “may act only pursuant to authority delegated ... by Congress.”¹¹ But the Proposal fails to state clearly under what authority EPA is proposing these rules, providing only a list of statutes that require the Agency affirmatively to take scientific information into account, but not explaining why they would offer the Agency authority to disregard certain relevant studies.¹² Indeed, EPA seems unsure of its authority, requesting comment on “additional or alternative sources of authority.”¹³

Nor does the EPA Administrator’s authority “to prescribe such regulations...as are necessary to carry out the Agency’s functions”¹⁴ present an opening to disregard relevant information, as EPA suggests. To the contrary, courts have held that the Administrator must take into account all relevant studies in the record.¹⁵ Other CAA sections, not cited by the Agency, lay out and define

¹¹ *Clean Air Council v. EPA*, 862 F.3d 1, 9 (D.C. Cir. 2017).

¹² See generally, Dan Farber, “The Questionable Legal Basis of the ‘Transparency’ Rulemaking,” (Apr. 30, 2018), <http://legal-planet.org/2018/04/30/the-questionable-legal-basis-of-the-transparency-proposal/>.

¹³ 83 Fed. Reg. at 18,769.

¹⁴ *Id.*

¹⁵ See, e.g., *Am. Petroleum Inst. v. Costle*, 665 F.2 1176, 1187 (D.C. Cir. 1981) (in setting NAAQS based on an ‘adequate margin of safety’ to protect public health, the Administrator must consider all relevant studies revealed in

some of the Administrator’s rulemaking “functions under the Act” as requiring for example, the use of “the latest scientific knowledge useful in indicating the kinds and extent of all identifiable effects on public health or welfare...”¹⁶ So, the Proposal to permit him to disregard some studies is contrary not only to his general rulemaking authority, but to his specific authority to, inter alia, set the National Ambient Air Quality Standards (NAAQS) based on the “latest scientific knowledge.”¹⁷

The seminal CAA air quality standard-setting provisions have twice been held not to require the release of data underlying studies relied on by the Agency, as discussed above. Indeed, in both situations, the court has described such release as “unnecessary and unjustified.”¹⁸

The Proposal also is inconsistent with the overall precautionary nature of the CAA.¹⁹ Congress did not intend EPA to limit itself to considering only ‘sure things’ but asks the Administrator to protect the public against uncertain dangers due to exposure to air pollution. Primary NAAQS are to be set with an “adequate margin of safety,”²⁰ meaning that “the Administrator need not regulate only the known dangers to health but may ‘err’ on the side of overprotection.”²¹ This precautionary approach is reflected also in the various technology-forcing sections of the Act, which Senator Muskie said “may [require] that people and industries will be asked to what seems to be impossible at the present time.”²² Under this scheme, the Administrator must consider all relevant studies placed in the record, and “may apply his expertise to draw conclusions from suspected, but not completely substantiated, relationships between facts, from theoretical projections from imperfect data, from probative preliminary data not yet certifiable as ‘fact’ and the like,”²³ in order to protect public health as Congress intended. This context simply does not authorize the Administrator to decline to consider any studies – but particularly not those representing the best available science – because the underlying data is confidential.

Response: EPA is not relying on any of the substantive environmental statutes cited in the 2018 and 2020 proposals as authority for the final rule. See response to Comment 73-410 in RTC document Section 1.2.2.

Comment [6896-3231]: Commenter (6916) provides that the Proposal claims to be “consistent with the principles underlying the APA”.²⁴ But, the Proposal does not clearly identify the authority under which it is promulgated, is so vague as to undermine the ability to meaningfully

the record, not only the studies favoring a particular position). The Agency’s Proposal does not define the word “relevant” to exclude studies based on confidential data, nor could it argue that human health findings are not relevant to an assessment of human health effects.

¹⁶ 42 U.S.C. § 7408(a)(2), describing the criteria document that must form the basis for a NAAQS setting process under CAA section 109, 42 U.S.C. § 7409.

¹⁷ *Id.*

¹⁸ See *supra* at note 12 [of commenters letter].

¹⁹ *NRDC*, 902 F.2d at 968 (describing the “precautionary nature” of the CAA).

²⁰ 42 U.S.C. § 7409(b)(1).

²¹ *Env’tl. Def. Fund v. EPA*, 598 F.2d 62, 80-81 (D.C. Cir. 1978).

²² *Union Elec. Co. v. EPA*, 427 U.S. 246, 258-59 (1976).

²³ *NRDC*, 902 F.2d at 968.

²⁴ 83 Fed. Reg. at 18,769. CAA rulemaking has governing requirements found in the Act, 42 U.S.C. § 7607d) (1). To the extent that what EPA is attempting to argue is that this Proposal is not covered by 42 U.S.C § 7607(a)(1), but is consistent with the APA, that too is incorrect.

comment, and in its substance contradicts the APA requirement that agencies must consider all the relevant matter presented in a rulemaking record.²⁵

As discussed above, the CAA does not authorize the Proposal, which is clearly aimed at limiting the studies EPA can rely on and consider in CAA rulemaking. Additionally, APA section 553(b)(2) requires a proposed rule to provide a “reference to the legal authority under which the rule is proposed.” While the Proposal’s preamble lists various statutes the Agency claims support its action, a closer look reveals that none of those sections actually authorizes EPA to disregard scientific studies.²⁶ Certainly that is the case for the CAA sections listed by the Agency in the Proposal, including the general rulemaking authority under the Act which requires the evaluation of all material in the record. EPA’s suggestion that it has “general authority” to make rules to comply with its obligations is similarly unavailing here, as the general authority does not exist to make rules that are outside EPA’s statutory obligations, or in violation of them²⁷ – and a rule that would enable EPA to disregard relevant studies in a CAA rulemaking record is clearly outside the Agency’s authority. Nowhere does the Act permit EPA to limit its own access to relevant science.

Significant issues are presented in the Proposal only in the broadest terms, despite an APA requirement that a proposed rule includes “the terms and substance of the proposed rule or a description of the subjects and issues involved,” 5 U.S.C. § 553(b)(3), and with enough specificity “to permit interested parties to comment meaningfully.”²⁸ As noted supra [in their comment letter], we assume (as we must, given no other information from the Agency), that the Proposal is aimed at precluding EPA’s reliance on studies for which the data are not made public. That is the natural reading of the proposed regulatory language, which is the most choate information offered in the Proposal. But even that reading is not certain, given the very broad discretionary nature of the exemptions provided for in the rule text (see, *e.g.*, 83 Fed. Reg. 18,774, proposed 40 C.F.R. § 30.9, giving the Administrator the ability to grant an exemption to the data publication requirement if that is “impracticable,” which is undefined in the Proposal). As a result, it is unclear how this rule would apply to EPA decision making, and how it would be different than the Agency’s current protocol for considering studies relevant to specific rulemaking proposals.

As one example, EPA alludes to “transparency” multiple times, but without defining what that concept means, or explaining why it believes existing statutes, regulations, guidelines and protocols fail to meet it.²⁹ While asserting an interest in “ensur[ing] that the data and models underlying science is [sic] publicly available in a manner sufficient for validation and analysis,”³⁰ there is no more specific statement explaining how that would be implemented or

²⁵ 5 U.S.C. § 553(c).

²⁶ 83 Fed. Reg. at 18,769 (listing statutory sections but not explaining why the cites authorize the Proposal).

²⁷ See *Am. Petroleum Inst.*, 52 F.3d at 1119 (“EPA cannot rely on its general authority to make rules necessary to carry out its functions when a specific statutory directive defines the relevant functions of EPA in [an] area”).

²⁸ *Honeywell Int’l, Inc. v. EPA*, 372 F.3d 441, 445 (D.C. Cir. 2004).

²⁹ In 83 Fed. Reg. at 18,768-18,774, EPA includes 13 preamble references to “transparency,” and one rule text reference, at proposed 40 C.F.R. § 30.7, without providing any indication of the intended meaning of that term. Also see generally, Dan Farber, “Pruitt’s Utterly Opaque Transparency Proposal,” (Apr. 26, 2018), available at: <https://legal-planet.org/2018/04/26/pruitts-utterly-opaque-transparency-proposal/>.

³⁰ 83 Fed. Reg. at 18,769.

why releasing confidential health and business information is necessary. Nor is the Agency's rationale completely clear in the Proposal. When commenters are left to guess, that is not lawfully sufficient notice of the subjects and issues involved.

Section 553(c) of the APA requires that when finalizing a proposed rule, and after taking comment, an agency must "consider[] the relevant matter presented" in the record.³¹ To the extent that the Proposal envisions authorizing EPA to ignore or disregard or not to consider some studies submitted during a rulemaking comment period, such Agency action would be taken in direct violation of this provision of the APA.³² Nor is there any basis in the APA for EPA to decide to exclude or prohibit the consideration of otherwise relevant matter because it is based on confidential information not available to the general public.

Response: See response to comment 25-96 in APA Section 1.6.1.2 of this document.

Comment [6900-3485]: Commenter (6921) contends that while EPA has sufficient legal authority across all of its environmental statutes to issue this important rulemaking, the Forum believes EPA can strengthen the foundation of the rule by including statute-specific provisions or by supplementing the rule with statute specific rulemakings. This will allow EPA to link the transparency requirements to the specific regulatory authorities in each environmental statute and to tailor the data access requirements, if necessary, to the specific rulemaking and data gathering provisions.

Response: Thank you for your comment in support of the final rule. EPA intends to promulgate future transparency rules under the substantive environmental statutes that it administers. Those rules will tailor transparency requirements as appropriate for each statute. See response to Comment 73-410 in RTC document Section 1.2.2.

Comment [8750-1430]: Commenter (9227) asserts that agencies are creatures of Congress; "an agency literally has no power to act . . . unless and until Congress confers power upon it." *Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 374 (1986); *see Am. Library Ass'n v. FCC*, 406 F.3d 689, 691 (D.C. Cir. 2005) ("It is axiomatic that administrative agencies may issue regulations only pursuant to authority delegated to them by Congress."). EPA points to a smattering of statutes as allegedly authorizing the Proposal.³³ None of these authorities, however, authorize EPA to promulgate a one-size-fits-all regulation governing how the agency will consider science under its various statutory authorities, which is perhaps why EPA solicits comment on whether additional authorities might exist to authorize its Proposal. The varied statutes that the Proposal cites have different requirements as to the agency's obligations when considering science. Compare CAA § 108(a) (standards must "reflect the latest scientific knowledge useful in indicating" health and welfare effects)³⁴ with TSCA § 4(f) (Administrator must consider "*any other information available*")³⁵ with SDWA § 1412(b)(1)(B)(ii)(II)

³¹ 5 U.S.C. § 553(c).

³² NRDC, 902 F.2d at 971 ("the Administrator must take into account all the relevant studies revealed in the record and make an informed judgment based on available evidence") (internal citations omitted) (emphasis added).

³³ 83 Fed. Reg. at 18769.

³⁴ 42 U.S.C. § 7408(a).

³⁵ 15 U.S.C. § 2603(f).

(Administrator must consider “the best available public health information”).³⁶ The Proposal gives no explanation of how any of the provisions it cites provide authority for the Proposal, much less how all of them authorize identical requirements.

For example, EPA cites the CAA, § 301, 42 U.S.C. § 7601, as purportedly granting authority for the Proposal.³⁷ The authority granted by section 301(a), however, applies only to the CAA and, in any event, is not broad enough to encompass this Proposal. Section 301 provides that “[t]he Administrator is authorized to prescribe such regulations subject to section 307(d) as are *necessary* to carry out his [or her] functions under this Act.”³⁸ The courts have consistently “decline[d] to read ... open-ended power into section 301,”³⁹ and instead have required that regulations promulgated under section 301 be both necessary and appropriate.⁴⁰ As discussed in more detail below, EPA’s Proposal here is not necessary, and instead directly conflicts with several other provisions of the CAA. It is axiomatic that a “general grant of authority cannot trump specific statutory provisions.”⁴¹

Nor does Congressional authorization to conduct or fund research authorize EPA to ignore research in regulatory decision-making. Accordingly, provisions like TSCA § 10, which directs that the “Administrator shall ... conduct such research, development, and monitoring as is necessary to carry out the purposes of this [Act],”⁴² and CAA § 103, which authorizes the agency to conduct and support research,⁴³ plainly do not authorize the Proposal.

Response: EPA is not relying on any of the substantive environmental statutes cited as authority in the 2018 and 2020 proposal. See response to Comment 73-410 in RTC document Section 1.2.2.

³⁶ 42 U.S.C. § 300g-1(b)(1)(B)(ii)(II), (b)(1)(A)(i); see also, 42 U.S.C. § 300g-1(b)(3)(A)(i) (“the Administrator shall use. . . the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices”).

³⁸ 42 U.S.C. § 7601(a)(1) (emphasis added).

³⁹ *Nat. Res. Def. Council v. Reilly*, 976 F.2d 36, 41 (D.C. Cir. 1992).

⁴⁰ E.g., *Alabama Power Co. v. Costle*, 636 F.2d 323, 403 (D.C. Cir. 1979) (finding an EPA rule unauthorized under section 301, and concluding that “[a]n extension of PSD permit requirements beyond the wording of the Act is therefore neither necessary nor appropriate to carry out EPA’s functions under the Act.”); *Nat. Res. Def. Council v. EPA*, 22 F.3d 1125, 1148 (D.C. Cir. 1994) (“[S]ection 301 does not provide the Administrator ‘carte blanche authority to promulgate any rules, on any matter relating to the Clean Air Act, in any manner that the Administrator wishes,’” and instead “allow[s] the promulgation of rules that are necessary and reasonable to effect the purposes of the Act.”) (quoting *Citizens to Save Spencer County v. EPA*, 600 F.2d 844, 873 (D.C. Cir. 1979)); *Nat. Res. Def. Council v. EPA*, 749 F.3d 1055, 1063 (D.C. Cir. 2014) (“[W]e have consistently held that EPA’s authority to issue ancillary regulations is not open-ended, particularly when there is statutory language on point.”); *North Carolina v. EPA*, 531 F.3d 896, 922 (D.C. Cir. 2008), on reh’g in part, 550 F.3d 1176 (D.C. Cir. 2008) (striking down a regulation promulgated under Section 301 because EPA could not demonstrate that it was “necessary” to fulfill the purposes of the Act).

⁴¹ *Nat. Res. Def. Council v. EPA*, 749 F.3d 1055, 1063-64 (D.C. Cir. 2014); *API v. EPA*, 52 F.3d 1113, 1119 (D.C. Cir. 1995) (same).

⁴² 15 U.S.C. § 2609(a), cited at 83 Fed. Reg. at 18769.

⁴³ 42 U.S.C. § 7403, cited at 83 Fed. Reg. at 18769.

Comment [9066-1894]: Commenter (6188) notes that EPA cites numerous statutory provisions to support this rulemaking,⁴⁴ but none provides authority for the agency to promulgate the Proposed Rule.

Generally, the statutory provisions EPA invokes fall into one of two categories: (1) provisions authorizing EPA to conduct research in furtherance of statutory objectives and (2) general provisions authorizing the EPA Administrator to promulgate regulations as necessary to achieve the purposes of a given statute. None of these statutory references provides the requisite authority for adoption and implementation of the Proposed Rule.

As a basis for authority to promulgate the Proposed Rule, EPA points to provisions authorizing the establishment of research and development programs pursuant to each of the federal environmental laws EPA administers. But these statutory references are unavailing. Each statute directs EPA to set up research programs and to undertake specific activities attendant to the administration of those programs, but none governs—or even references—the extent to which research should be used in regulatory decision-making by EPA. Further, any regulatory authority EPA may have under the referenced provisions is limited to the individual research and development programs in question and does not extend to unrelated research by outside parties. In other words, the cited provisions allow EPA to set up its own research programs, but do not create authority to place limitations on how research, whether conducted or financed by EPA or produced by an outside party, is used to set regulatory standards.

For example, EPA purports to derive authority for the Proposed Rule from CAA § 103. That provision simply authorizes EPA to establish a national research and development program for the prevention and control of air pollution and, as part of that program, to conduct and promote the coordination of research and studies relating to the causes, effects, extent, prevention, and control of air pollution. 42 U.S.C. § 7403(a)(1). The section authorizes specific activities of the Administrator in establishing such a program, none of which includes limiting the scope of reviewable data, research, or studies when undertaking regulatory action. The section has no bearing on how or to what extent EPA utilizes research in regulatory decision-making processes.

Response: EPA is not relying on any of the substantive environmental statutes cited as authority in the 2018 and 2020 proposal. See response to Comment 73-410 in RTC document Section 1.2.2.

Comment [9066-1895]: Commenter (6188) contends that the rulemaking authority provided by provisions authorizing the EPA Administrator to promulgate regulations “as necessary to carry out his functions” under various environmental statutes does not extend to actions that would undermine, rather than further, the relevant acts’ directives. See 42 U.S.C. § 7601(a) (CAA); 33 U.S.C. § 1361 (CWA); 42 U.S.C. § 300j-9(a)(1) (SDWA); 42 U.S.C. § 6912(a)(1) (RCRA); 42 U.S.C. § 9615⁴⁵ (CERCLA); 42 U.S.C. 11048 (EPCRA); 7 U.S.C. § 136w (FIFRA). As

⁴⁴ EPA cites the following provisions as authority for the rulemaking: 42 U.S.C. § 7403, 42 U.S.C. § 7601(a), 33 U.S.C. § 1254, 33 U.S.C. § 1361, 42 U.S.C. § 300j-1, 42 U.S.C. § 300j-9(a)(1), 42 U.S.C. § 6912(a)(1), 42 U.S.C. § 6979, 42 U.S.C. § 9616, 42 U.S.C. § 9660, 42 U.S.C. § 11048, 7 U.S.C. § 136r(a), 7 U.S.C. § 136w, and 15 U.S.C. § 2609.

⁴⁵ The Proposed Rule appears to have mistakenly referenced 42 U.S.C. § 9616.

discussed in greater detail below, both the intent and the language of the Proposed Rule are in direct opposition to the statutory requirements of these environmental statutes, which seek to protect public health and the environment.

The Proposed Rule, apparently mistakenly, also cites as authority 42 U.S.C. § 6979, a labor standards provision within the RCRA requiring certain prevailing wage standards to be met on construction projects receiving EPA grants, and 42 U.S.C. § 9616, a section of the CERCLA requiring listing and evaluation of facilities and commencement of remedial activities for listed facilities. Neither one of these sections is relevant to the Proposed Rule or to research activities more generally. Inclusion of these mistaken cites in the Proposed Rule's laundry list of "authorizing" provisions highlights the absence from that list of any statutory language that provides clear authority for a rule of this unprecedented breadth and import and the hasty nature of this rulemaking process.

In sum, EPA offers no legal authority upon which to base a rulemaking of this significance.

Response: EPA is not relying on any of the substantive environmental statutes cited as authority in the 2018 and 2020 proposal. See response to Comment 73-410 in RTC document Section 1.2.2.

Comment [9078-3508]: Commenter (6194) provides that "[I]t is 'axiomatic' that 'administrative agencies may act only pursuant to authority delegated to them by Congress.'" *Clean Air Council v. EPA*, 862 F.3d 1, 9 (D.C. Cir. 2017). Multiple statutes administered by EPA direct the agency to consider and utilize science. While the type of science to be considered, *e.g.*, best science or best available science, and the process for considering science, *e.g.*, as one of multiple, discrete factors or as part of broader balancing analyses, varies across statutes, nowhere do these statutes suggest that "best" science is limited to that for which associated raw data is available to the public.⁴⁶ Courts have concurred. See, *e.g.*, *American Trucking Ass'n v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002) (finding that the CAA imposes no requirement for EPA to "obtain and publicize the data underlying published studies on which the Agency relies" and that "requiring agencies to obtain and publicize the data underlying all studies on which they rely 'would be impractical and unnecessary.'" (internal citations omitted). The EPA may not read into a statute a requirement that makes its implementation impractical.⁴⁷

Nor do the statutes administered by EPA have a concept akin to the Proposal's "pivotal regulatory science." EPA is now attempting to re-interpret multiple statutes with virtually no analysis. Such reinterpretation would read new requirements into well-established statutes decades after their passage in a manner inconsistent with EPA's historic positions. If Congress had intended to create additional subcategories of regulations or science as suggested by the Proposal, it would have done so.

⁴⁶ This is not to suggest that scientists and others should not continue to do everything they can to make studies accessible and transparent, or that EPA should not encourage that behavior. But there are already many mechanisms in place within government, academia, professional organizations, and more, to promote these objectives.

⁴⁷ See, *e.g.*, SCALIA & GARNER, *supra* note 2, at 63 ("A textually permissible interpretation that furthers rather than obstructs the document's purpose should be favored.").

The Proposal's creation of a new category of regulation, "regulatory decisions," and new categories of science— "pivotal regulatory science" and "regulatory science"—rely on factors that Congress did not authorize or intend EPA to consider. When Congress wanted to place additional emphasis on certain types of or access to science it did so;⁴⁸ not establishing subcategories of regulations or science tied to the availability of underlying data was a deliberate decision by Congress, not an oversight that EPA can write-in to the statutes.⁴⁹ Hence, the Proposal would change EPA's interpretation of multiple statutes that govern the agency's consideration and use of science by creating new subcategories of science and regulations. None of the statutes referenced by EPA support the Proposal's suggestion to redefine regulations or science, much less require EPA to pursue the course it has proposed.

Response: See response to Comment 73-410 in RTC document Section 1.2.2.

Comment [9078-3548]: Commenter (6194) contends that the Proposal would prevent EPA from relying on the best available information in discharging its duties. EPA is charged with developing regulations that provide societal benefits by reducing harm to human health and the environment from the presence of chemicals in air, soil, drinking water, food, and consumer products. The Proposal implicates research that is central to making such determinations; creating an obstacle to the consideration of such science is contrary to both primary statutory directives and requirements to conduct cost benefit analyses. Likewise, according to the commenter, the EPA fails to address how it could implement a regulation that is inconsistent with federal requirements and standards governing the use of science across agencies.⁵⁰

The commenter notes that the statutory requirements to develop health-based standards and conduct cost-benefit analyses EPA acknowledges that it must use the "best available science" in all of its regulatory actions.⁵¹

This directive is embodied in multiple statutes implemented by EPA and is reflected in other environmental statutes, further illustrating Congress' conceptualization of "best" available science. Broadly speaking, there are three basic types of statutory requirements that the EPA and other agencies consider scientific information. First, there are requirements that the agency consider the "best available science." Second, there are requirements that the agency consider particular factors, including scientific factors. Third, there are requirements that the agency balance economic costs or technological feasibility against public health, environmental, or other benefits that must be scientifically assessed. The precise terminology regarding the required use of science may, as illustrated below, vary across statutes, but what these provisions have in common are requirements for EPA and other agencies to use scientific information that is "best,"

⁴⁸ This is not surprising given that, as an initial matter, releasing underlying data will generally not improve the quality of resulting reports, studies, or analyses, and therefore will not do anything to render any individual study "better." But cf. note 42 [of their comment letter].

⁴⁹ See, e.g., notes 44 & 45 [of their comment letter].

⁵⁰ Moreover, as discussed herein, the Proposal would flip the existing default by automatically excluding the best scientific research, rather than admitting science and then deciding if circumstances exist that warrant excluding a study. The status quo makes more sense than creating a blanket preclusion of valid studies and then allowing their use only by going through a timely and expensive exemption process.

⁵¹ EPA, Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18,768, 18,769 (Apr. 30, 2018) (citing Exec. Order No. 13,563, 76 Fed. Reg. 8,321 (Jan. 21, 2011)).

not simply adequate, and “available.” The commenter provides that following examples of statutory directives regarding the use of science by the EPA and other Agencies.

- **SDWA** [42 U.S.C. § 300g1(b)(3)(A)]: EPA must use “[t]he best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices,” and “[d]ata collected by accepted methods or best available methods (if the reliability of the method and the nature of the excision justifies use of the data).”
 - [42 U.S.C. § 300g1(b)(1)(b)(ii)]: EPA must use “best available public health information” in determining whether to regulate contaminants.
- **CWA** [33 U.S.C. § 1321(a)(27)]: Some provisions dealing with oil and hazardous substances on the Gulf Coast require “best available science.”
- **TSCA** [15 U.S.C. § 2625(h)]: “In carrying out sections 2603, 2604, and 2605 of this title, to the extent that the Administrator makes a decision based on science, the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science”.
- **Magnuson– Stevens Fishery Conservation and Management Act (MSA)** [16 U.S.C. § 1851(a)(2)]: “Conservation and management measures shall be based upon the best scientific information available.”
- **Endangered Species Act (ESA)** [16 U.S.C. § 1536(a)(2)]: In consultation to ensure no jeopardy to endangered or threatened species, “each agency shall use the best scientific and commercial data available.”
 - [16 U.S.C. § 1536(c)(1)]: Advice that an endangered or threatened species may be present in a location should be “based on the best scientific and commercial data available.”
 - [16 U.S.C. § 1536(h)(2)(b)(i) 16 U.S.C. § 1533(b)(1)(A)]: Permanent exceptions shall be given to prevent extinction of species “based on the best scientific and commercial data available.” The Secretary must determine whether a species is a threatened or endangered based upon “the best scientific and commercial data available.”
- **Marine Mammal Protection Act (MMPA)** [16 U.S.C. § 1371(a)(4)(C)]: “If the Secretary determines, using the best scientific information available, that certain forms of deterrence have a significant adverse effect on marine mammals, the Secretary may prohibit such deterrent methods, after notice and opportunity for public comment, through regulation under this chapter.”
 - [16 U.S.C. § 1371(a)(3)(A)]: The decision to waive the ban on taking must be based on the “best scientific evidence available and in consultation with the Marine Mammal Commission.”

None of these statutory provisions link the concept of the “best available science” to the availability of underlying raw data, nor can such a limitation be read into the statutes. Where Congress wanted to direct EPA’s decision regarding what science to consider or how—it did so.⁵² When Congress wanted to link “best available science” to data being publicly available—it

⁵² See, e.g., Toxic Substances Control Act, 15 U.S.C. § 2625(h) (directing EPA to consider, as applicable, the following factors: “(1) the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the

did so.⁵³ Thus, if Congress had wanted to put a blanket limitation on EPA's consideration of science for which underlying data is not publicly available, it clearly knew how to do so—and it chose not to.

As EPA has previously explained, the agency would be unable to fulfill statutory mandates if it could not consider studies that follow federal laws and ethical standards regarding the privacy of patient and individual data:

(If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. . . . [S]uch data are often the property of scientific investigators and are often not readily available because of the proprietary interests of the investigators or because of arrangements made to maintain confidentiality regarding personal health status and lifestyle information of individuals included in such data. Without provisions of confidentiality, the possibility of conducting such studies could be severely compromised.⁵⁴)

Examples of EPA statutory mandates that could be impeded by the Proposal include (i) the development of standards to control emissions from burning hazardous waste fuels under the RCRA “as may be necessary to protect human health and the environment,” 42 U.S.C. § 6924(q)(1); and (ii) determinations of whether hazardous sites need to be placed on the CERCLA National Priorities List (NPL). With respect to the latter, CERCLA provides that, if a health assessment indicates that a release or threatened release may pose a serious threat to human health, the Administrator of the Agency for Toxic Substances and Disease Registry (ATSDR) shall “notify the Administrator of EPA who shall promptly evaluate such release or threatened release in accordance with the hazard ranking system . . . to determine whether the site shall be placed on the National Priorities List.” 42 U.S.C. § 9604 (i)(6)(H). The commenter note that health assessments provided by ATSDR to EPA on a scheduled basis are exempt from peer review as a prerequisite to submission.

intended use of the information; (2) the extent to which the information is relevant for the Administrator's use in making a decision about a chemical substance or mixture; (3) the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented; (4) the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and (5) the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models”); see also Comprehensive Environmental Response, Compensation, and Liability Act, 42 U.S.C. § 9604(i)(10) and (13) (providing that the Agency for Toxic Substances and Disease Registry give EPA specified data and information for review biennially and requiring that “[a]ll studies and results of research conducted under this subsection (other than health assessments) shall be reported or adopted only after appropriate peer review”).

⁵³ See, e.g., Clean Water Act, 33 U.S.C. § 1321(a)(27) (defining “best available science” in the context of natural resource protection and restoration projects on the Gulf Coast as science that: “(A) maximizes the quality, objectivity, and integrity of information, including statistical information; (B) uses peer-reviewed and publicly available data; and (C) clearly documents and communicates risks and uncertainties in the scientific basis for such projects”).

⁵⁴ National Ambient Air Quality Standards for Particulate Matter, 62 Fed. Reg. 38,652, 38,689 (Jul. 18, 1997).

The Proposal would also cut EPA off from information needed to complete the cost-benefit analysis of regulations required under certain statutes and government-wide requirements.⁵⁵

Not only would the Proposal impede EPA's fulfillment of its statutory duties, it would also be contrary to judicial precedent, which holds that "best available science" includes "all existing scientific evidence relevant to the [agency] decision [in question]." *Ecology Ctr., Inc. v. U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006) (quoting *Heartwood, Inc. v. U.S. Forest Serv.*, 380 F.3d 428, 436 (8th Cir. 2004)). While agencies need not produce new evidence,⁵⁶ they must seek out information and "cannot ignore existing data." *Id.* (emphasis added). Even if an agency is anticipating the arrival of better evidence, it must act on the basis of the evidence it currently has.⁵⁷ Many of the fundamental public health studies on which EPA has based key rules and standards under the statutes are studies for which the raw data was not or could not have been released. Nonetheless these studies have been examined and validated,⁵⁸ as will future studies. Arbitrarily cutting off consideration of a category of science is inconsistent with EPA's statutory obligations.⁵⁹

Response: See response to Comments 32-144, 34-155, 48-381 and 73-410 in RTC document Section 1.2.2.

Comment [9217-3544]: Commenter (9225) asserts that equally problematic, the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA's authority. This includes, but is not limited to, the CAA; CWA; TSCA; Frank R. Lautenberg Chemical Safety for the 21st Century Act (LCSA); SDWA; FIFRA; and more. Substantively, the rule violates numerous public health and environmental provisions contained in these laws, as well as requirements to use the best available science or to consider all available information, while procedurally, it violates the APA and a number of other laws that set forth specific procedures EPA must follow during its rulemaking process. It also lacks an environmental justice analysis even though the rule will have the greatest impact on low-income and minority communities that benefit from protections based on the very studies the rule

⁵⁵ See, e.g., Exec. Order No. 13,783, 82. Fed. Reg. 16,093 (Mar. 31, 2017) ("It is also the policy of the United States that necessary and appropriate environmental regulations . . . are of greater benefit than cost, when permissible, . . . and are developed through transparent processes that employ the best available peer-reviewed science and economics."); see also 42 U.S.C. § 7411(a)(1) (CAA provision requiring EPA to consider costs when establishing performance standards for new stationary sources of pollution); 42 U.S.C. § 7412(n)(1)(A) (CAA provision directing EPA to regulate power plants if such regulation is "appropriate and necessary," which includes consideration of costs); 42 U.S.C. § 300g-1(b)(3)(C) (SDWA provision establishing requirements for health risk reduction and cost analysis under which quantifiable and non-quantifiable benefits of a proposed rule must be measured against its cost); 15 U.S.C. § 2605(c)(2)(A)(iv) (TSCA provision requiring EPA to consider "the reasonably ascertainable economic consequences" of a proposed rule).

⁵⁶ See *Friends of Blackwater v. Salazar*, 691 F.3d 428, 435 (D.C. Cir. 2012) (quoting *Sw. Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000)) ("[U]nder the 'best ... data available' standard, 'the Secretary has no obligation to conduct independent studies.'").

⁵⁷ See, e.g., *San Luis & Delta-Mendota Water Auth. v. Jewell*, 747 F.3d 581, 630 (9th Cir. 2014) ("[T]he fact that science must advance further before the complicated ecosystem interactions in the Bay-Delta are fully understood does not necessarily mean that the Fish and Wildlife Service failed to rely on the best available science.")

⁵⁸ See the Harvard Letter [, *supra* note 6 [of letter]].

⁵⁹ The Proposal is also arbitrary in suggesting that science that cannot be used in setting regulations could still be used in individual permitting decisions.

restricts from consideration when setting exposure limitations for pollution and toxic chemicals. Simply put, the proposal cannot withstand legal scrutiny.

Response: See responses to Comments 32-144, 48-381 and 73-410 in RTC document Section 1.2.2. Also see response 48-502 in the APA Section 1.6.1.2 of the RTC document.

Comment [6092-476]: Commenter (6102) notes that as EPA takes strides to increase transparency, it is imperative that the agency assure full compliance with all statutory requirements for the protection of privacy, the confidentiality of research participants, the protection of proprietary data and the confidentiality of business information. The EPA should continue to explore and develop protocols to code or de-identify data sets to make them available while fully protecting privacy. Given these challenges, the NAM recommends the EPA explore ways to tailor requirements on a statute-by-statute basis as appropriate.

Response: EPA intends to promulgate future transparency rules under the substantive environmental statutes that it administers. Those rules will tailor transparency requirements as appropriate for each statute. See response to Comment 73-410 in RTC document Section 1.2.2.

Comment [6894-3619]: Commenter (6915) notes that EPA asks, “whether alternative or additional regulatory or other policy vehicles are appropriate to establish and implement these policies, and whether further regulatory or other policy vehicles on the programmatic or statutory level would be appropriate as alternative or additional steps.” (83 FR 18771). It is EPA’s job to identify and describe these alternatives, and to explain why it has put forward its particular proposal: it may not, at this late stage, ask amorphous questions on policy design.

Response: EPA disagrees that it was inappropriate or impermissible for the agency to seek comment on alternative methods to implement this policy besides rulemaking.

Comment [6425-2389]: Commenter (6447) asserts that EPA has not identified any legitimate justification for this proposal, has failed to support the proposal with any kind of administrative record, and has failed to obtain support for the proposal from its own Science Advisory Board (SAB), rendering it arbitrary and capricious. Moreover, the proposal violates existing law. For these reasons, and because it is clear that the proposal would undermine EPA’s mission and public health, we are strongly opposed. EPA should not create any new restrictions on the use of scientific information.

Response: EPA provided a rationale for the rule in the 2018 proposal and expanded and clarified its justification for the rule in the 2020 supplemental proposal. EPA also sought and received input on the rule from the SAB. The rule does not limit the studies the agency may consider in actions to satisfy its mission to protect human health and the environment.

1.1.2 General Legal Authority (Supplemental Notice of Proposed Rulemaking (SPNRM) Comments)

Comment [29-121]: Commenter (11184) writes that EPA lacks authority for the proposed rule and SNPRM.

The SNPRM changes the authority EPA claims to rely on for the proposal, however either way, the proposal remains unlawful. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301. 85 Fed. Reg. at 15404. The preamble says EPA is taking comment on whether to use 5 U.S.C. § 301, which the SNPRM calls EPA's housekeeping authority, independently or in conjunction with statutory provisions cited in the proposed rule and corrected in the SNPRM's preamble. 85 Fed. Reg. at 15398. The fact that EPA is still considering and asking what authority it can rely on for the proposed rule, twenty-two months after the initial proposed rule, shows that EPA does not have such authority. The SNPRM's statements on authority continues EPA's pattern of making rules first and searching for a justification later (which it still has not provided for this rulemaking). As the NTAA explained in its 2018 comments: In order to protect human health and environment, EPA must have a solid foundation before it proposes rules and rulemaking as such portrays the agency's naivete in seeking answers for questions about its own authority.

First, none of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking. In most cases, EPA simply cites its general authority for rulemaking under the statutes. Still that general authority alone cannot provide a basis for the rule, especially when, as here, the rule would conflict with the requirements of each of the statutes. Courts have made clear that "EPA cannot rely on its gap-filling authority to supplement [a statute's] provisions when Congress has not left the agency a gap to fill." *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); *see also New York v. US EPA*, 413 F.3d 3, 40-42 (D.C. Cir. 2005). EPA otherwise cites to statutes describing research programs established by the agency, with no relation to or authorization for the requirements the SNPRM seeks to create. The KBIC also disagrees with EPA's reliance on 5 U.S.C. § 301 because 1) it is questionable whether § 301 applies to EPA as EPA is not one of the fifteen "Executive Departments" listed at 5 U.S.C. § 101, and 2) the proposed rule and SNPRM are not merely internal rules of agency procedure—they would significantly impact every aspect of EPA's scientific and regulatory work, the individuals who contribute to that work, and the Tribes and communities who rely on it.

The KBIC appreciates the SNPRM's recognition that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control." 85 Fed. Reg. at 15398. This statement alone should lead EPA to withdraw the proposed rule and SNPRM; the requirements conflict with every statute EPA administers and would cause EPA to unlawfully exclude valid scientific research from its work.

Response: As discussed in the final rule preamble at Section I. C, EPA is not claiming authority under the Federal Housekeeping Statute, 5 U.S.C. § 301. Rather, EPA maintains that the Reorganization Plan No. 3 of 1970, which established EPA, transferred authority to EPA that is equivalent to Federal housekeeping authority.

This is a procedural rule because it exclusively governs EPA's internal affairs and does not regulate any person or entity outside of EPA. *See Chrysler Corp. v. Brown*, 441 U.S. 281, 302 (1979). EPA is not interpreting, applying, or citing as authority any of the substantive environmental statutes that it administers. EPA plans to issue subsequent rulemakings implementing this procedural rule, some of which may be substantive and therefore subject to

judicial review. If implementing this procedural rule will result in a conflict with an environmental statute that EPA administers, then this procedural rule will yield under § 30.3.

Comment [48-441]: Commenter (12727) writes that as they explained in their comments on the 2018 proposal, none of the environmental statutes EPA identifies in the original proposal authorize EPA to issue the proposed rule or otherwise promulgate a one-size-fits-all regulation governing how the agency will consider science under its various statutory authorities.⁶⁰ EPA gives no explanation of how *any* of the provisions it cites provide authority for the 2018 proposal and Supplemental Notice, much less how all of them authorize identical requirements despite their varied obligations for considering science. Not only is there still no authority for EPA’s pan-statutory proposal, but the 2018 proposal as supplemented would force EPA to more broadly violate a diversity of obligations to consider science under the different environmental laws.⁶¹ While the specifics of the requirements vary, Congress has often commanded EPA to utilize the “best available science” for its policies, which necessitates consideration of the full range of available science. The proposal would restrict consideration of science and cause EPA to violate both its general statutory obligations to consider all available data when undertaking rulemakings as well as the specific requirements to consider science under the respective environmental statutes.⁶²

The Supplemental Notice multiplies this defect, broadly expanding the regulation to cover “data and models underlying pivotal regulatory science and pivotal science used to support significant regulatory decisions and influential scientific information, respectively, not simply dose-response data and dose-response models”—effectively hamstringing the agency from considering the best available science across its full portfolio of actions to protect the environment and public health, and impeding its ability to gain a better understanding of the threats to public health and the environment.⁶³ Nothing in the Supplemental Notice remedies this expansive defect or even attempts to reduce it.

Response: See response to comment 29-121.

Comment [48-479]: Commenter (12727) notes that several environmental statutes require EPA to ground its decision-making in scientific evidence. The CAA, for example, mandates that “[a]ir quality criteria . . . accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare,” 42 U.S.C. § 7408(a)(2), and the Toxic Substances Control Act requires the Administrator to “make decisions . . . based on the weight of the scientific evidence,” 15 U.S.C. § 2625(i).⁶⁴

The originally proposed regulatory language (§§ 30.3, 30.5) violated these statutory commands by preventing EPA from relying on a study as “pivotal regulatory science . . . used to justify significant regulatory decisions” if dose-response data or models underlying the study were not

⁶⁰ EDF 2018 Comments at 13-14; see also Earthjustice 2018 Comments at 18-31.

⁶¹ See *supra* note 127.

⁶² *Id.*

⁶³ 85 Fed. Reg. at 15,401.

⁶⁴ Physicians for Soc. Responsibility, 2020 U.S. App. LEXIS 12727, at *3-4; see also *id.* at *26 (“EPA operates pursuant to multiple statutory mandates requiring that its decisions rest on various formulations of ‘the best available science.’ 15 U.S.C. § 2625(h).”).

publicly available, without regard to whether the study had been validated by other means.⁶⁵ The Supplemental Notice exacerbates these violations by expanding the proposed regulation's scope (§§ 30.3, 30.5) to not just pivotal *regulatory* science used to justify significant *regulatory* decisions, but also "pivotal science supporting influential scientific information."⁶⁶

Response: See response to comment 29-121.

Comment [48-490]: Commenter (12727) writes that just as EPA is required to consider all available science when making its regulatory decisions, governing environmental and public health statutes likewise require EPA to consider all available science when releasing ISI, which often forms the basis for the agency's regulatory decisions. For example:

CAA section 108 instructs EPA to establish air quality criteria that "accurately reflect the latest scientific knowledge,"⁶⁷ which criteria, in turn, must inform NAAQS.⁶⁸

The TSCA directs that, in implementing the Act's testing requirements, manufacturing and processing notice requirements, and requirements for the prioritization, risk evaluation, and regulation of chemical substances and mixtures, EPA must make its decisions "based on the weight of the scientific evidence."⁶⁹ Likewise, in carrying out EPA's responsibilities under TSCA, "the Administrator shall use scientific information . . . employed in a manner consistent with the best available science."⁷⁰ Numerous other TSCA provisions emphasize EPA's obligation to consider all reasonably available scientific information when implementing TSCA's requirements.⁷¹

The CWA instructs that EPA's water quality criteria must "accurately reflect[] the latest scientific knowledge" on a variety of factors.⁷²

The SDWA generally requires EPA to use "the best available, peer-reviewed science,"⁷³ and to use the "best available public health information" when deciding whether to regulate a particular contaminant.⁷⁴

A rule that prohibits EPA from considering (or that downgrades) valid, high quality scientific studies when generating ISI such as the products identified above would contravene the above-noted statutory directives regarding EPA's obligation to consider all available science.

Response: See response to comment 29-121.

Comment [48-495]: Commenter (12727) writes that there are also many circumstances under which EPA develops [ISI] with broad applicability to multiple programs or varying governmental actions that have yet to be identified. Such products include Integrated Risk Information System (IRIS) chemical reviews by EPA’s Office of Research and Development (ORD) (*e.g.*, the 2019 “IRIS Toxicological Review of Ethyl Tertiary Butyl Ether (ETBE)”⁷⁵ and “IRIS Toxicological Review of Tert-Butyl Alcohol (TBA)”⁷⁶), and reports by EPA’s Office of Chemical Safety and Pollution Prevention (*e.g.*, “Continuing Development of Alternative High-Throughput Screens to Determine Endocrine Disruption, Focusing on Androgen Receptor, Steroidogenesis, and Thyroid Pathways”⁷⁷). EPA’s application of the proposed public disclosure regulations to such products is especially pernicious because it would likely be impossible—or at least, immensely burdensome—to determine at the time that the ISI is utilized in agency decision-making whether, in developing the ISI, EPA omitted from consideration (or gave lesser weight to) valid scientific studies that EPA is obligated to consider fully under the relevant statutory or regulatory provisions.

For example, the purpose of ORD’s IRIS chemical reviews is to support EPA’s mission of protecting public health and the environment by identifying and characterizing the health hazards of chemicals found in the environment.⁷⁸ [...] Among other things, EPA uses this information to help set national standards under TSCA,⁷⁹ the CAA,⁸⁰ the SDWA,⁸¹ and the EPCRA,⁸² and to clean up hazardous sites under CERCLA.⁸³ But none of these statutes allow EPA to ignore valid, pivotal scientific studies based solely on the fact that underlying data or models are not publicly available. If ORD is forced to exclude consideration of such studies when developing its IRIS chemical reviews, EPA’s reliance on these reviews when taking actions under these statutes would be unlawful and arbitrary unless EPA combs through the report and available science to confirm that all valid studies have been considered.⁸⁴ The need to undertake such a comprehensive review of ISI before relying upon it would fundamentally undermine the purpose of preparing ISI for general use by EPA’s various programs, offices, and regions. Thus, beyond the numerous statutory violations described above.

Response: See response to comment 29-121.

⁷⁹ See, *e.g.*, 82 Fed. Reg. 7432, 7446 (Jan. 19, 2017).

⁸⁰ See, *e.g.*, 79 Fed. Reg. 60,238, 60,246 (Oct. 6, 2014).

⁸¹ See, *e.g.*, 79 Fed. Reg. 62,716, 62,735-36 (Oct. 20, 2014).

⁸² See, *e.g.*, 59 Fed. Reg. 61,432, 61,444-45 (Nov. 30, 1994).

⁸³ See, *e.g.*, 53 Fed. Reg. 51,962 (Dec. 23, 1988) (§ 2.2.1.1).

⁸⁴ This outcome is especially likely if EPA succeeds in promulgating the proposed rule solely under the Housekeeping Statute and deferring any analysis of whether the rule violates the requirements of federal environmental and public health statutes until EPA takes an action specifically under one of these statutes. Unfortunately, by the time EPA is taking action that relies upon ISI like an IRIS report, it would be extremely difficult to remedy the violation, since the entire report would need to be reviewed and likely redone.

Comment [48-503]: Commenter (12727) writes that EPA must withdraw the Supplemental Notice as inconsistent with its substantive obligations to use the best available science. Apparently anticipating these conflicts, EPA concedes that:

"This internal agency procedure is intended to be consistent with the statutes that EPA administers and EPA plans to implement this procedural rulemaking in accordance with all applicable statutory and regulatory requirements. . . . Nonetheless, in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control."⁸⁵

This rationale is vague and meaningless. As an initial matter, EPA has not explained how its rule is “intended to be consistent with” the statutes it administers, nor has it attempted to identify the areas of conflict it anticipates, which renders its promise to yield to their requirements arbitrary.⁸⁶ Even if it had offered some indication of the conflicts it foresees, its protean response is ineffectual: to the extent that the agency seeks to inoculate its rule against legal challenges based on these statutory violations, any invalid application—of the many that would proliferate upon implementation—would doom the rule.⁸⁷ EPA cannot insulate its unlawful policy from challenges by promising to yield in the future to statutory and regulatory requirements.⁸⁸

Nor does EPA enhance its rule with the mere suggestion that its options for considering studies in some circumstances “improve consistency” with statutes requiring use of the best available science.⁸⁹ Aside from the inherent flaws in these approaches, discussed in greater detail occasional compliance with statutory requirements cannot render its rule lawful.⁹⁰ To correct the numerous statutory violations documented above,⁹¹ EPA must conform its actions to the directives Congress imposed; partial alignment will not suffice.

Response: See response to comment 29-121. The purpose of the savings clause is to clarify the scope of the rule and how it will be implemented by EPA. Specific standards set by the various environmental statutes will be discussed as appropriate when EPA develops subsequent rulemakings implementing this final procedural rule. As explained above, EPA is not relying on the substantive environmental statutes as authority for this rule. See the final rule preamble discussion at Section I. C.

⁹¹ See Section III.A, *supra*.

Comment [48-600]: Commenter (12727) writes that EPA’s failure to characterize costs and benefits necessarily precludes the agency from assessing whether the costs are disproportionate to the benefits, a finding that could render the proposal arbitrary and capricious.⁹² As described below, this failure extends to harms that the proposal would inflict upon the public at large, vulnerable populations, the research community, and the agency.⁹³ EPA does not identify any statutory authority that could justify its failure to assess the costs and benefits of the proposed rule, and it is certain that the agency could not rely on a radical use of a generally applicable statute like the Housekeeping Act in order to evade well-established requirements of administrative law.

Response: Because this final rule is internal and purely procedural, it will not impose any direct costs or benefits outside of EPA.

Comment [54-249]: Commenter (11361) writes that in addition to asserting that the EPA can introduce these changes under its housekeeping authority, the EPA also lays the groundwork in this SNPRM to subvert public comment in the future. The EPA states that it is “considering how to proceed, apart from this supplemental proposal, to establish regulations interpreting provisions of, and/or exercising substantive rulemaking authority delegated to it by programmatic statutes.”⁹⁴ Creating regulations specifically about how the EPA interprets or carries out its statutes could result in a process whereby many, perhaps all, new environmental regulations pursuant to the EPA’s statutes, including the CAA and CWA, would be considered internal procedures and thus give the EPA leeway to circumvent the APA’s required notice-and-comment rulemaking. The EPA has been acting with an aggressive deregulatory agenda for the last three years.⁹⁵ This action not only shuts the public out of federal environmental decisions but could lay the groundwork for discarding all of the EPA’s regulatory accountability. They firmly oppose the establishment of regulations that could allow the EPA to circumvent notice-and-comment rulemaking.

Response: Any substantive regulations issued under the environmental statutes that EPA administers will be subject to notice and comment rulemaking as required in the APA.

Comment [73-412]: Commenter (11576) writes that the environmental statutes cited in the Supplemental Notice offer no support for the proposed rule.

In its original notice, of course, the EPA made no attempt to rely on any kind of “housekeeping” power.⁹⁶ Instead, the agency said it was “propos[ing] to take this action under authority of the statutes it administers, including provisions providing general authority to promulgate regulations necessary to carry out the Agency’s functions under these statutes and provisions specifically addressing the Agency’s conducting of and reliance on scientific activity to inform

⁹² See *Michigan v. EPA*, 135 S. Ct. 2699, 2707 (2015) at 2710.

⁹³ See *id.* at 2707 (“[C]ost’ includes more than the expense of complying with regulations; any disadvantage could be termed a cost.”).

⁹⁴ EPA, “Strengthening Transparency in Regulatory Science” SNPRM, 15398.

⁹⁵ EPA, “EPA Deregulatory Actions,” www.epa.gov/laws-regulations/epa-deregulatory-actions. Accessed March 7, 2020.

⁹⁶ Original Proposal, 83 Fed. Reg. at 18,769.

those functions[.]”⁹⁷ The EPA went so far as to list the specific statutory sections that it believed its rule could rest on, citing:

CAA sections 103, 301(a), 42 U.S.C. 7403, 7601(a); CWA sections 104, 501, 33 U.S.C. 1254, 1361; SDWA sections 1442, 1450(a)(1), 42 U.S.C. 300j–1, 300j–9(a)(1); RCRA sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; CERCLA (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; EPCRA section 328, 42 U.S.C. 11048; FIFRA sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; and TSCA, as amended, section 10, 15 U.S.C. 2609.⁹⁸

None of these provisions offered any support for the proposed rule—and many were at odds with it. As noted during the prior comment period, “restricting sound science is neither necessary nor consistent with the ... goals” of the referenced environmental statutes.⁹⁹ A few of the citations, moreover, appeared to be entirely irrelevant.¹⁰⁰

With its supplemental notice, the EPA appears to abandon its misguided effort to rely on the laws it had previously cited, stating that it no longer “propose[s] to interpret provisions of a particular statute or statutes that it administers[.]”¹⁰¹ At the same time, however, the notice declares that the agency is still “taking comment on whether to use its housekeeping authority independently as authority or in conjunction with the environmental statutory provisions cited as authority in the 2018 proposed rulemaking[.]”¹⁰² And it also corrects two of the citations included in the agency’s earlier list, “clarifying that the citation to the Resource Conservation and Recovery Act ... section 7009, 42 U.S.C. 6979, should be to ... section 8001, 42 U.S.C. 6981[.]” and “the citation to the CERCLA ... section 116, 42 U.S.C. 9616, should be to ... section 115, 42 U.S.C. 9615[.]”¹⁰³

Given the EPA’s inconsistent statements regarding the relevance of the statutory provisions it has cited, it is not at all clear what the public is being asked to comment on. What is clear, however, is that the agency’s two new citations do nothing to support the proposed rule. As none of the environmental statutes the agency has cited provide a legal basis for the proposed action, the EPA would get nowhere in trying to use them “in conjunction” with the agency’s asserted and inapposite housekeeping authority.¹⁰⁴

Response: See response to comment 29-121.

Comment [79-527]: Commenter (12427) writes that there is no statutory requirement or deadline for the proposed rule for “Strengthening Transparency in Regulatory Science” or its

⁹⁷ Id.

⁹⁸ Id.

⁹⁹ August 2018 Coalition Comments at 2-3, 17-30.

¹⁰⁰ Id. at 26-27 (noting that 42 U.S.C. § 9616 establishes goals for the EPA “to begin assessment and remediation of facilities on the National Priorities List, and is entirely irrelevant” to the proposal); id. at 30 (noting that 42 U.S.C. § 6979 “pertains to labor standards related to wages for laborers and mechanics[.]” and is accordingly “inapposite”).

¹⁰¹ Supplemental Notice, 85 Fed. Reg. at 15,398.

¹⁰² Id.

¹⁰³ Id. at 15,397.

¹⁰⁴ Id. at 15,398.

supplemental notice. In fact, there is no statutory mandate for this proposed rule, at all. Thus, there is no requirement or need for this rule or its supplemental notice. The proposed rule and supplemental notice should be withdrawn.

Response: EPA identified a need to standardize its internal process for considering the availability of data and models underlying pivotal science used in its significant regulatory decisions and ISI so that EPA can promulgate future regulations in a more efficient and transparent manner. EPA decided to meet that need by issuing a housekeeping regulation. As explained in the final rule preamble at Section I. C, EPA’s Reorganization Plan transferred the authority to issue housekeeping regulations to EPA, and EPA is issuing this procedural rule in accordance with that authority.

Comment [81-584]: Commenter (12715) writes that the proposed rule conflicts with fundamental statutory requirements to use the best available science and citation to “housekeeping” authority cannot cure that defect.

Whether EPA is arbitrarily barring consideration of scientific studies or information with nonpublic underlying data or data that are not able to be independently validated, or arbitrarily ascribing less weight to such studies or information, neither approach constitutes “housekeeping,” and neither comports with statutory requirements that EPA use the best available science. To reiterate from the 2018 Comments, EPA’s obligation with respect to the use of scientific information is clear: it must base its decisions on such criteria as the latest scientific knowledge, the best available, peer-reviewed science, and/or generally accepted scientific principles or laboratory tests. To cite just a few examples, in performing its duties, EPA must rely on: “the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices,” SDWA of 1996, 42 U.S.C. § 300g-1(b)(3)(A)(i); the “best available science,” TSCA, 15 U.S.C. § 2625(h); “the latest scientific knowledge,” CWA of 1977, 33 U.S.C. § 1314(a)(1), and CAA of 1970, 42 U.S.C. § 7408(a)(2); and “generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies,” EPCRA, 42 U.S.C. § 11023(d)(2). EPA has repeatedly emphasized the importance of this fundamental precept, including in its 2018-2022 strategic plan, which states that one of the agency’s priorities is to “identify, assess, conduct, and apply the best available science to address current and future environmental hazards.”¹⁰⁵

These statutory requirements apply to all aspects of EPA’s decision-making, including its scientific evaluations, adoption of regulatory standards, and development of policies. They do not permit what EPA proposes here: to either exclude or give less weight to scientific studies or information based on criteria—availability of the underlying data and ability to independently validate underlying data—that are not determinative of whether the studies or information constitute the best available science. Agencies may not adopt or implement regulations that conflict with the statutes under which they are promulgated, and an agency’s interpretation of those statutes must always at least be reasonable. See *Chevron, U.S.A., Inc. v. Nat. Res. Def. Council, Inc.*, 467 U.S. 837, 842-44 (1984). Furthermore, neither 5 U.S.C. § 301 nor any other

¹⁰⁵ U.S. Env’tl. Prot. Agency, Working Together: FY 2018-2022 EPA Strategic Plan, (2018) at page 42, <https://www.epa.gov/sites/production/files/2019-09/documents/fy-2018-2022-epa-strategic-plan.pdf>.

purported housekeeping authority allows EPA to negate these statutes' fundamental, substantive, and common-sense commands. And even assuming EPA has some inherent housekeeping authority, it cannot rely on a general grant of rulemaking authority to promulgate regulations or develop policies that are otherwise inconsistent with more specific statutory directives. *Glob. Van Lines, Inc. v. Interstate Commerce Comm'n*, 714 F.2d 1290, 1293-97 (5th Cir. 1983).¹⁰⁶

Finally, EPA acknowledges that the statutes it administers would control in the event of a conflict between the proposed rule and those statutes, see 85 Fed. Reg. at 15,398, but that caveat cannot save the proposed rule. First, the core principle of the proposed rule is facially invalid, i.e., there is no circumstance in which it would be acceptable for EPA to exclude or give less weight to relevant, probative scientific studies, models, or other information that have been validated through peer review, on the sole basis that the underlying data are not publicly available or are not able to be independently validated. EPA cannot save an invalid rule by including what amounts to a waiver procedure, because the "essence of waiver is the assumed validity of the general rule." *Alltel Corp. v. Fed. Commc'n Comm'n*, 838 F.2d 551, 561 (D.C. Cir. 1988). Second, the agency's essential duty in rulemaking is to exercise its subject matter expertise to enact rules that implement and further the purposes of the statutes Congress has assigned it to administer. *Chevron*, 467 U.S. at 842-44. This does not include proposing rules without first determining the source of legal authority but instead asking commenters to supply that information. Third, the agency must propose its rules with specificity and be clear as to the programs, regulations, and information to which they will apply. 5 U.S.C. § 553(b)(3); *Home Box Office, Inc.*, supra, 567 F.2d at 35-36.

Response: See response to comment 29-121. EPA identified applicable authority in the proposal (83 FR 18768), the supplemental (85 FR 15396), and the final rule *Federal Register* notice. [See Docket No. EPA-HQ-OA-2018-0259].

EPA also requested public comment on whether the authority EPA identified was appropriate. Requesting public insight on a proposed path forward is part and parcel of the notice and comment process.

Comment [82-695]: Commenter (12464) writes that both alternatives are inconsistent with the statutes directing which data EPA must consider in certain contexts. As they explained in a previous comment letter, many statutes require EPA to consider science in its decision-making, without any reference to whether such science is based on studies with raw data that is publicly available.¹⁰⁷ For example, under the CAA, EPA must set and review the NAAQS for six common pollutants.¹⁰⁸ In setting these standards, the CAA instructs EPA to use "the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects [of air

¹⁰⁶ EPA's citation to Clean Water Act, CERCLA, and RCRA provisions granting authority to promulgate rules to carry out the agency's responsibilities under those statutes, 85 Fed. Reg. at 15,397, is also unavailing. Restricting consideration of the best science is neither necessary nor consistent with those statutes' goals of protecting human health and the environment.

¹⁰⁷ ELPC Multi-Clinic Comments, supra note 2, at 13-17.

¹⁰⁸ 42 U.S.C. § 7409.

pollution] on public health or welfare.”¹⁰⁹ Thus, a conflict would arise between the statutory language and the reduced-weight alternative if EPA gave less weight to a study that was “the latest scientific knowledge” on a relevant question merely because the raw data from that study is not publicly available. The same conflict would exist with the proposed tiered-access system, if the “latest scientific knowledge” came from a study with raw data to which researchers have not or could not grant restricted access.

Response: See response to comment 29-121.

Comment [82-834]: Commenter (12464) writes that the Proposal is similarly substantive as it “relocates the metes and bounds” of “best available science” requirements under the multiple environmental statutes that EPA implements. Specifically, the Proposal not only changes “how” EPA performs environmental decision-making under these statutes, but it also changes “what” studies EPA must consider as “best available science” when issuing ISI and making significant regulatory decisions. Indeed, the Supplemental Notice acknowledges that the purpose of the proposed rule is “to establish an agency-wide approach to ensure that the data and models underlying EPA’s significant regulatory decisions are publicly available.” 85 Fed. Reg. at 15,398.

Response: See response to comment 29-121.

Comment [82-865]: Commenter (12464) writes that the Proposal is inconsistent with EPA’s duties under multiple statutes and executive orders. They pointed out many of these conflicts in comments on the Initial Proposal,¹¹⁰ but the Supplemental Notice continues to make the same errors. Moreover, some changes introduced in the Supplemental Notice exacerbate the problems.

Response: See response to comment 29-121. EPA issued this rulemaking consistent with its obligations under all applicable executive orders.

Comment [84-1403]: Commenter (11390) writes that the proposed rule falls outside EPA’s rulemaking authority.

Despite EPA’s assertion that the amended Proposed Rule governs “internal agency procedures” and “does not regulate any entity outside the Federal government,” the Proposed Rule is, in fact, a substantive regulation. It will profoundly impact how EPA interacts with regulated parties by changing how the agency performs its core functions.

“It is axiomatic that an administrative agency’s power to promulgate legislative regulations is limited to the authority delegated by Congress.” *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208 (1988). EPA steps far beyond that authority in the SNPRM, proposing a regulation that

¹⁰⁹ Id. § 7408(a)(2). Other examples of statutes that require EPA to use scientific information include the Safe Drinking Water Act, which requires EPA to use “the best available, peer-reviewed science,” id. § 300g-1(b)(3)(A)(i), and the Toxic Substances Control Act, which requires EPA to make decisions “based on the weight of the scientific evidence,” 15 U.S.C. § 2625(h), (i); see also Clean Water Act, 33 U.S.C. § 1314(a)(1) (requiring EPA to set water quality criteria that “accurately reflect[] the latest scientific knowledge” on a variety of factors).

¹¹⁰ See ELPC Multi-Clinic Comments, *supra* note 2, at 5-8.

would change the way the agency engages in virtually any decision-making or scientific process—outside of agency adjudications and enforcement activities—whether or not that process ultimately leads to the adoption of regulations. EPA has revised the Proposed Rule to cite the agency’s housekeeping authority as its basis to regulate. But EPA has no statutory authority to issue the Proposed Rule, either through the Housekeeping Statute or via other environmental statutes EPA has previously cited.

EPA also continues to cite to numerous provisions in environmental statutes to support this rulemaking,¹¹¹ but none provides authority for the agency to promulgate the Proposed Rule. Generally, these provisions fall into one of two categories: (1) provisions authorizing EPA to conduct research in furtherance of statutory objectives and (2) general provisions authorizing the EPA Administrator to promulgate regulations as necessary to achieve the purposes of a given statute. None of these statutory references provides the requisite authority for adoption and implementation of the Proposed Rule.

EPA points to provisions authorizing the establishment of research and development programs pursuant to each of the federal environmental laws EPA administers. But these statutory references are unavailing. Each statute directs EPA to set up research programs and to undertake specific activities attendant to the administration of those programs, but none governs—or even references—the extent to which research should be used in regulatory decision-making by EPA. Further, any regulatory authority EPA may have under the referenced provisions is limited to the individual research and development programs in question and does not extend to unrelated research by outside parties. In other words, the cited provisions allow EPA to set up its own research programs, but do not create authority to place limitations on how research, whether conducted or financed by EPA or produced by an outside party, is used to set regulatory standards.

For example, EPA purports to derive authority for the Proposed Rule from CAA § 103. That provision simply authorizes EPA to establish a national research and development program for the prevention and control of air pollution and, as part of that program, to conduct and promote the coordination of research and studies relating to the causes, effects, extent, prevention, and control of air pollution. 42 U.S.C. § 7403(a)(1). The section authorizes specific activities of the Administrator in establishing such a program, none of which includes limiting the scope of reviewable data, research, or studies when undertaking regulatory action. The section has no bearing on how or to what extent EPA utilizes research in regulatory decision-making processes.

The rulemaking authority provided by provisions authorizing the EPA Administrator to promulgate regulations “as necessary to carry out his functions” under various environmental statutes does not extend to actions that would undermine, rather than further, the relevant acts’ directives. See 42 U.S.C. § 7601(a) (CAA); 33 U.S.C. § 1361 (CWA); 42 U.S.C. § 300j-9(a)(1) (SDWA); 42 U.S.C. § 6912(a)(1) (RCRA); 42 U.S.C. § 9615 (CERCLA); 42 U.S.C. 11048

¹¹¹ EPA incorporated into the SNPRM its citations from the original Proposed Rule: 42 U.S.C. §7403, 42 U.S.C. § 7601(a), 33 U.S.C. § 1254, 33 U.S.C. § 1361, 42 U.S.C. § 300j-1, 42 U.S.C. § 300j9(a)(1), 42 U.S.C. § 6912(a)(1), 42 U.S.C. § 6979, , 42 U.S.C. § 9660, 42 U.S.C. § 11048, 7 U.S.C. §136r(a), 7 U.S.C. § 136w, and 15 U.S.C. § 2609. It also clarified that prior citations to 42 U.S.C. §6979 and 42 U.S.C. § 9616 should be to 42 U.S.C. § 6981 and 42 U.S.C. § 9615, respectively.

(EPCRA); 7 U.S.C. § 136w (FIFRA). As discussed in greater detail below, both the intent and the language of the Proposed Rule are in direct opposition to the statutory requirements of these environmental statutes, which seek to protect public health and the environment.

In sum, EPA offers no legal authority upon which it may lawfully base a rulemaking of this significance.

Response: See response to comment 29-121. As discussed in the final rule preamble at Section I. C, this is a procedural rule governing EPA's internal affairs. It does not regulate or affect the legal rights and obligations of parties outside of the agency, and therefore is not a substantive rule. An internal rule of agency procedure is not substantive merely because it may indirectly affect the voluntary behavior of parties outside of the agency. *See American Hosp. Ass'n v. Bowen*, 834 F.2d 1037, 1051 (D.C. Cir. 1987) (“[A]gency rules that impose ‘derivative,’ ‘incidental,’ or ‘mechanical’ burdens upon regulated individuals are considered procedural, rather than substantive”).

This procedural rule does not impose requirements on external scientists. Instead, this rule exclusively regulates EPA employees. It is not intended to impose burdens on external scientists who want EPA to consider their research when making significant regulatory decisions or developing ISI, particularly since the final rule does not require EPA to categorically exclude studies for which the data is not available. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. That means that the agency will consider all relevant studies when taking covered actions.

While it is entirely possible that this procedural rule may influence how scientists choose to conduct their studies or present their research to EPA, that potential incidental effect does not render the rule substantive. *See James A. Hurson Assocs., Inc. v. Glickman*, 229 F.3d 277, 280 (D.C. Cir. 2000) (noting that a procedural rule “covers agency actions that do not themselves alter the rights or interests of parties, although it may alter the manner in which the parties present themselves or their viewpoints to the agency.”) (internal quotation marks and citations omitted).

Comment [89-799]: Commenter (11403) writes that the proposed rule is not based on any valid statutory authority and is arbitrary and capricious.

EPA's 2018 version of this rule cited a hodgepodge of statutory authority, none of it valid. EPA at least corrected the obvious typographical errors from the previous version. However, those edits still do not grant EPA the authority to restrict science from all regulatory decision-making processes within the agency. EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, “Congress . . . does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes.”¹¹² EPA does not

¹¹² *Whitman v. American Trucking Ass'ns, Inc.*, 531 U.S. 457 (2001).

have the authority to alter the fundamental details of all of its regulatory schemes based on such vague provisions of law.

Section 103 of the CAA directs EPA to “conduct, and promote the coordination and acceleration of, research, investigations, experiments, demonstrations, surveys and studies” on air pollution.¹¹³ Curtailing the use of science based on arbitrary notions of transparency does the opposite of what Section 103 requires.

Section 301(a) of the CAA gives the Administrator authority to “prescribe such regulations as are necessary to carry out his functions” relating to the CAA.¹¹⁴ This catch-all provision certainly provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is “necessary” to the carrying out of functions under the CAA.

Section 1442 of the SDWA generally authorizes the Administrator to “conduct research, studies, and demonstrations relating to the causes, diagnosis, . . . and other impairments of man resulting directly or indirectly from contaminants in water, or to the provision of dependably safe supply of drinking water . . .”¹¹⁵ This section does not authorize EPA to exclude science based on a perceived lack of transparency or support any other aspect of the proposed rule.

Section 1450(a)(1) of the SDWA states, “The Administrator is authorized to prescribe such regulations as are necessary or appropriate to carry out his functions under this subchapter.”¹¹⁶ This catch-all provision provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is “necessary” to carrying out the functions under the SDWA.

Section 2002(a)(1) of the RCRA authorizes the Administrator to “prescribe, in consultation with Federal, State, and regional authorities, such regulations as are necessary to carry out his functions under this chapter. . .”¹¹⁷ This catch-all provision provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is “necessary” to carrying out functions under the RCRA.

Section 8001 of the RCRA provides EPA with authority to conduct and assist with research relating to the handling of waste management and recovery.¹¹⁸ The section includes a provision stating, “the Administrator shall establish a management program or system to insure the coordination of all such activities and to facilitate the process of development of sound new technology (or other discoveries) from the research phase, through development, and into the demonstration phase.”¹¹⁹ Not only does section 8001 not provide EPA with authority to promulgate this regulation, the requirement to facilitate the development of new science

¹¹³ 42 U.S.C. § 7403.

¹¹⁴ 42 U.S.C. § 7601(a).

¹¹⁵ “Safe Drinking Water Act,” 42 U.S.C. § 300j-1.

¹¹⁶ “Safe Drinking Water Act,” 42 U.S.C. § 300j-9(a)(1).

¹¹⁷ “Resource Conservation and Recovery Act,” 42 U.S.C. § 6912(a)(1).

¹¹⁸ See “Resource Conservation and Recovery Act,” 42 U.S.C. § 6981.

¹¹⁹ Id. at § 6981(b)(1)(A).

contradicts the proposed rule's restrictions on science. Limiting scientific research only serves to hinder development of new science, not facilitate it.

Section 115 of the CERCLA and Executive Order 12580 authorize the President to delegate duties under CERCLA and designate EPA as the statute's administrator.¹²⁰ This delegation provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is necessary to carrying out the functions under CERCLA.

Section 311 of the CERCLA directs the Administrator in the use and development of research and training tools.¹²¹ The section does not mention transparency of data or give any other indication that it authorizes EPA to promulgate the proposed rule.

Section 328 of the EPCRA states, "The Administrator may prescribe such regulations as may be necessary to carry out this chapter."¹²² This catch-all provision provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is "necessary" to carrying out functions under the EPCRA.

Section 25(a)(1) of the FIFRA authorizes the Administrator "to prescribe regulations to carry out the provisions of this subchapter."¹²³ This general authorization section of FIFRA differs from that of the other statutes listed because it actually does specify some considerations the Administrator must give when promulgating regulations. For example, it states, "Such regulations shall take into account the difference in concept and usage between various classes of pesticides, including public health pesticides, and differences in environmental risk and the appropriate data for evaluating such risk between agricultural, nonagricultural, and public health pesticides."¹²⁴ Unlike the other general grants of rulemaking authority, this provision clearly intends to offer detail and guidance on the nature of the rulemaking authority that the provision grants. As it does not mention restriction of scientific data, there is no indication that EPA has authority to undertake the proposed rule under this section.

Section 136r(a) of the FIFRA directs the Administrator to conduct research to carry out the purposes of the statute.¹²⁵ The section states, "The Administrator shall also take care to ensure that such research does not duplicate research being undertaken by any other Federal agency." The section does not state that EPA can ignore sound science if the raw data is not publicly available.

Section 10 of the TSCA grants the Administrator authority on research, development, collection, dissemination, and utilization of data.¹²⁶ There is no mention of any type of research or data that warrants exclusion in order to carry out the purposes of the statute.

¹²² "Emergency Planning and Community Right-To-Know Act," 42 U.S.C. § 11048.

¹²³ "Federal Insecticide, Fungicide, and Rodenticide Act," 7 U.S.C. § 136w.

¹²⁴ *Id.*

¹²⁵ "Federal Insecticide, Fungicide, and Rodenticide Act," 7 U.S.C. § 136r(a).

¹²⁶ "Toxic Substances Control Act," 15 U.S.C. § 2609.

Section 501 of the CWA states, “The Administrator is authorized to prescribe such regulations as are necessary to carry out his functions under this chapter.”¹²⁷ This catch-all provision provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is “necessary” to carrying out functions under the CWA.

In short, none of the statutory provisions cited by EPA provide authority for the proposed rule. The proposed rule fails at step one under *Chevron v. Natural Resources Defense Council* since it is unreasonable to believe that any statutory general grant of authority or any mention of EPA’s oversight of other science or research programs would enable EPA to conduct rulemaking in a way that is altogether inconsistent with the rule of law. None of the cited provisions provide the authority sought by EPA, and as such the proposed rule should be withdrawn.

Response: See response to comment 29-121.

Comment [93-854]: Commenter (11395) writes that the requirements in the proposed regulation are inconsistent with specifications in several of the environmental statutes cited in the SNRPM. In addressing this issue, the SNRPM says, “in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.” However, there is no attempt to delineate those conflicts or to explain how an environmental statute can serve as legal authority for a regulation that conflicts with important provisions of that statute. NESCAUM also strongly disagrees with the application of the Housekeeping Statute as an authority for a regulation with significant, far-reaching implications.

Response: See response to comment 29-121.

Comment [97-900]: Commenter (11479) writes that the proposed rule, as modified in the supplemental notice, would clearly interfere with the agency’s use of the best available science. For example, the policy violates laws like the TSCA and the SDWA because of the statutory requirement to use the “best available science.” That requirement does not make exception for the agency to effectively ignore certain scientific information of high quality simply because the unanalyzed data cannot be made public for reasons of privacy, confidentiality, or intellectual property. According to judicial precedent, “best available science” is defined as “all existing scientific evidence relevant to the decision” and a body of evidence that “cannot ignore existing data.”¹²⁸ In addition to the “best available science” requirements, TSCA also requires EPA to take into consideration information “that is reasonably available to the Administrator.”¹²⁹ EPA’s own regulations define that term as “information that EPA possesses or can reasonably generate, obtain, and synthesize . . . , whether or not that information is confidential business information, [sic] that is protected from public disclosure...”¹³⁰ Not only would this proposed rule conflict with TSCA’s mandate to consider the best available science, it would challenge the method by which EPA can review the weight of the scientific evidence, which in rulemaking for TSCA is

¹²⁷ “Clean Water Act,” 33 U.S.C. § 1361.

¹²⁸ *Ecology Ctr., Inc. v. U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006)

¹²⁹ 15 USC 2625(k)

¹³⁰ 40 CFR 702.33

defined by a systematic review method.¹³¹ These reviews consider the entire body of scientific evidence, so the exclusion of certain studies based on whether the raw data and models are publicly available would render these reviews, as mandated, impossible.

Further, the CAA has requirements to update pollution standards that provide for an “adequate margin of safety” to protect public health.¹³² This determination can only be reliably made using the best available science. This proposal would, however, prevent EPA from using the best available science to set pollution standards that would provide for an adequate margin of safety, because the proposal excludes studies where the raw data and other underlying information cannot be made public. Because of this, EPA should not cite the CAA as a source of statutory authority. Further, the CAA encourages a close partnership with the National Academy of Sciences (NAS) and other independent scientific institutions. When EPA is considering a proposal to reinterpret how it uses science in regulatory decisions, it should first and foremost consider comments from and engage with NAS and similar bodies, which, for this rule, EPA did not.

In fact, virtually all of EPA’s statutory mandates require the use of the best available scientific evidence. Congress did not state in any of these laws that the agency shall only consider scientific evidence derived from studies where the underlying unanalyzed data is publicly available, nor that the evidence considered should be solely at the Administrator’s discretion.

Response: See response to comment 29-121.

Comment [101-962]: Commenter (11482) writes that the proposed rule likely violates federal laws that require the EPA to use the best scientific information available to it. EPA has a duty to use the best scientific information available under several laws. For example, the TSCA requires EPA to operate “in a manner consistent with the best available science” and make regulatory decisions based on the weight of the scientific evidence.¹³³ Numerous court cases have weighed in on the best available science standard in the context of numerous different federal laws. For example, courts have found that the agency must use the best science that is available to it at the time of the decision, not the best that might be available to it at some time in the future.¹³⁴

Importantly, the critical actor under the best available science standard is the agency — the standard requires the use of the best science that is available to the agency, not necessarily available to the public. Excluding science that is available to the agency but not available to the public would thus be a violation of “best available science” provisions.

Under federal law, the agency must find a way to continue using the best available scientific data and models available to it, regardless of whether those data and models are publicly available.

¹³⁴ *Chlorine Chemistry Council v. EPA*, 206 F.3d 1286 (D.C. Cir. 2000).

Excluding science whose raw data are not in the public domain runs counter to the “best available science” doctrine and is thus illegal.

Response: See response to comment 29-121.

Comment [114-1002]: Commenter (11392) notes that EPA is proposing that the Agency will only use pivotal science if the data is available in a manner sufficient for independent validation, including, for studies with restricted data and models, if there is tiered access to these data and models.

EPA addresses the limitations to publishing CBI and personally identifiable information (PII) by proposing "tiered access" to the underlying data and models deemed too sensitive to publish. The SNPRM describes tiered access as "creating multiple versions of a single dataset with varying levels of specificity and protection." This proposal is vague and impracticable. If EPA expects researchers to implement this system, then the Agency is creating enormous new requirements for the research community.

First, this undermines EPA's claim that the rule "would not regulate the conduct or determine the rights of any entity outside the federal government." This would undercut the already dubious notion that this rule falls under the Agency's authority under the Federal Housekeeping Statute. Furthermore, describing such requirements simply as "multiple versions of a single dataset with varying levels of specificity and protection" is excessively vague for such a monumental overhaul of how the Agency considers science in its rulemaking. If the intent is for the researcher to determine the appropriate level of access, who would determine whether a researcher's determined access levels appropriately met the requirements of the rule? Would researchers be expected to review the applications for reanalysis in perpetuity? Has a cost analysis been done to assess the burden this rule would place on researchers and on the institutions hosting the data? What happens if a research team has since disbanded? Does EPA expect researchers in other countries to work with the Agency to manage such a data access system so their studies can be used by the United States government? If EPA intends for the scientific community to adopt — and potentially implement — these dataset and access requirements, it is not offering researchers a meaningful description of the parameters on which they can comment.

The SNPRM references a pilot project with the Centers for Disease Control (CDC) involving a secure data enclave for sensitive EPA datasets. If EPA intends to use CDC resources to implement this rule, the Agency's argument that it is merely an internal procedure matter is far more complicated than stated. Was CDC involved in writing this rule? Do they have the resources to host EPA's data and models and moderate tiered access? Will CDC be making the decision as to who can access the data and at what level? Will CDC be reviewing applications for access? The SNPRM does not address any of these questions. If EPA intends to make its arrangement with the CDC permanent, and establish the CDC as the host of a secure data enclave for studies considered in Agency rulemaking, EPA must clearly articulate its rationale for partnering with a separate federal agency rather than performing the work internally. EPA must also describe how such an unusual arrangement would be structured. It must be clear that the CDC is involved in this rulemaking.

If, instead, the Agency plans on instituting and maintaining a "tiered access" system of its own, a host of implementation questions are unanswered in the text of the supplemental. Where will such a system be housed within the Agency? EPA is not a data management agency — does it have the capability to manage a large amount of sensitive data? Does EPA have a robust cybersecurity strategy? The Secret Science Reform Act of 2014, a legislative precursor to this SNPRM, was estimated by the Congressional Budget Office (CBO) to cost "\$250 million annually over the next few years" should it have passed into law¹³⁵ — how much will this SNPRM cost, and what money will EPA use to undertake a project of this magnitude that has not been authorized by Congress? Does EPA have staff who are capable of running this system? How many people will EPA need to hire? How will members of the public apply to access the sensitive data? Who at EPA will determine external access to the data, and at what tier? Who at EPA will determine what parts of the datasets belong in each tier of the system? How will this address restrictions put on PII protected by the Health Insurance Portability and Accountability Act, the National Institutes of Health (NIH), and Institutional Review Boards (IRB), which contain no applicable "tiered access" exemptions from privacy requirements? The Agency's solicitation for public comments on this matter is insufficient given the paucity of details on this proposed solution to the publication limitations of sensitive data.

Response: This procedural rule does not require researchers to implement the tiered data access system or provide that EPA will use CDC resources to implement that system. See responses to comments 29-121 and 84-1403.

Comment [114-1427]: Commenter (11392) writes in regard to the environmental statutory provisions cited in the proposed rule and the SNPRM, they echo the point made by many commenters in response to the proposed rule: Congress has repeatedly mandated that EPA must use the best available science to inform its regulatory process. This is a legal obligation, a clear-cut directive from Congress, and that supersedes any "general authority... to carry out the Agency's functions" under the various environmental statutes.¹³⁶

Response: See response to comment 29-121.

Comment [123-1046]: Commenter (11491) notes that EPA has requested comment on what legal authority it should rely on for this rulemaking. As EPA acknowledges, it lacks authority to supersede the requirements of its substantive statutes. Nor does the Agency purport to amend its prior regulations interpreting its substantive authorities.¹³⁷ While EPA cites its housekeeping authority in Reorganization Plan 3 of 1970,¹³⁸ this authority is for internal management purposes only. Accordingly, the Supplemental Notice acknowledges that, where the Proposed Rule

¹³⁸ *Id.* (citing 5 U.S.C. App.).

conflicts with law or implementing regulations, the law or implementing regulations will control.¹³⁹ It does not appear that EPA’s substantive statutes or its housekeeping authority authorize the blanket approach to scientific transparency set forth in the Proposed Rule and Supplemental Notice. Therefore, we anticipate that the Proposed Rule will cause confusion and uncertainty in application, which will in fact undermine regulatory transparency and business certainty, a purported goal of this Agency. For this reason, as well, we urge EPA not to finalize this rulemaking.

Response: See response to comments 29-121 and 84-1403.

Comment [125-1089]: Commenter (11495) writes that EPA’s Supplemental Notice is at odds with provisions of multiple environmental statutes which require the Agency to consider certain high-quality scientific information. For example, the SDWA requires that the issuance of national drinking water regulations be based on the “best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices.”¹⁴⁰ TSCA requires the EPA Administrator to ensure that evaluation and regulation of toxic substances is “consistent with the best available science” and to use all scientific information that is “reasonably available” when making related decisions.¹⁴¹ The CWA and the CAA require that water and air quality criteria determinations be based on the “latest scientific knowledge.”¹⁴² Lastly, EPCRA requires that some actions “be based on generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies.”¹⁴³

Each of these provisions directs EPA to incorporate a certain quality of scientific information into its rulemaking decisions made pursuant to the statute. In particular, these requirements are designed to ensure the scientific validity of the information upon which EPA bases its actions. Mandating a high-quality scientific basis for regulatory actions is necessary to guarantee the best possible protections for public health and welfare and to minimize partisan influence in scientific decision-making.

The Supplemental Notice, however, would impermissibly prohibit the agency from considering of relevant and high-quality scientific studies whenever the data underlying the study are not publicly available—in direct contravention of the statutory directives that mandate, for example, consideration of the “best available science.” None of the provisions requires, or even suggests, that EPA only consider information that is publicly available. It strains the plain meaning of words like “best,” “latest,” and even “appropriate” to suggest that they permit the unscientific requirement that all data be publicly available.

¹³⁹ Id.

¹⁴⁰ 42 U.S.C. § 300g-1(b)(3)(A)(i) (emphases added).

¹⁴¹ 15 U.S.C. § 2625(h), (k) (emphases added).

¹⁴² 33 U.S.C. § 1314(a)(1); 42 U.S.C. § 7408(a)(2) (emphasis added).

¹⁴³ Id. § 11023(d)(2) (emphases added).

EPA “cannot ignore available . . . information.”¹⁴⁴ Courts have held that “best available data” requirements “prohibit[] [an agency] from disregarding available scientific evidence that is in some way better than the evidence [it] relies on.”¹⁴⁵ Furthermore, a plaintiff may establish a violation of a “best available science” requirement by “point[ing] to any scientific evidence that the agency failed to consider.”¹⁴⁶ The Supplemental Notice would undoubtedly preclude EPA from considering certain studies and scientific information that is “better” or the “best available,” simply because the study’s underlying data is not publicly available, thereby failing to satisfy Congressional directives and undermining the quality of regulatory decisions.

Likewise, EPA cannot avoid the statutory directives to consider high-quality scientific information simply by assigning a lesser weight to such information when the underlying data are not publicly available, as the Agency alternatively proposes. The Supplemental Notice’s alternative proposal is designed to have largely the same pernicious effects as flatly prohibiting consideration of studies lacking publicly available data. Just as with the primary proposal, EPA’s alternative proposal would limit the agency’s consideration of the best available science in making important regulatory decisions, and is, therefore, arbitrary, and capricious.

The effect of the Proposed Rule is inconsistent with EPA’s view that the Supplemental Notice is “intended to be consistent with the statutes that EPA administers and EPA plans to implement this procedural rulemaking in accordance with all applicable statutory and regulatory requirements.”¹⁴⁷ EPA attempts to resolve this inconsistency by stating that “in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”¹⁴⁸ However, as discussed below, EPA lacks the statutory authority to issue a rule this broad, even when it claims that it will avoid statutory conflicts.

Response: See response to comment 29-121.

Comment [125-2205]: Commenter (11495) writes that neither the environmental statutes nor the federal Housekeeping Statute suggests that EPA, in deciding how it will handle scientific information, can reject or attribute lesser weight to scientific evidence that otherwise meets those criteria solely because the underlying data are not publicly available. EPA’s Proposed Rule both lacks sufficient legal authority and unlawfully contradicts the environmental statutes that the Agency is tasked with implementing.

Response: See responses to comments 29-121 and 84-1403.

Comment [127-1209]: Commenter (11497) notes that the EPA has an obligation to adhere to the fundamental mandates of its authorizing statutes, which require the agency to promulgate regulatory decisions based on the “best available science.” On behalf of the 1 in 8 women who will be diagnosed in their lifetime and the 40,000 lives that are lost each year in the U.S., the EPA must ensure that the best available science informs implementation of the national laws so as to prevent this devastating disease. This proposal seriously undermines EPA’s inclusion, consideration and use of the best available science and thus takes a hard step away from that goal.

Response: See response to comment 29-121.

Comment [130-1137]: Commenter (11884) writes that presumably, EPA hopes to evade the important environmental laws (including NEPA provisions) by styling the Trio¹⁴⁹ as mere housekeeping provisions, but nothing in the history of the housekeeping statute suggests that Congress intended it to permit agencies to undercut statutes that enshrine important policies like CERCLA, FIFRA, NEPA, RCRA, and TSCA. Accordingly, the SNPRM and Trio are neither authorized by the Housekeeping statute nor, if they were, could be given effect if given the Trio’s conflict with such important environmental laws.

Response: See responses to comments 29-121 and 84-1403.

Comment [131-1884]: Commenter (11890) writes that this rule and supplement constitute a dramatic change to the data the agency will consider as part of its science assessment and regulatory work, and as such would be inappropriate and illegal to adopt under internal housekeeping rules. We believe the proposed rule could have serious adverse impacts across the wide range of environmental laws that are critical to protecting public health.

Response: A rule is substantive if it has legal force and effect on individual rights and obligations. See *Chrysler Corp. v. Brown*, 441 U.S. 281, 302 (1979). As discussed in the final rule preamble at Section I. C, this is a procedural rule governing EPA’s internal affairs. It does not regulate or affect the legal rights and obligations of parties outside of the agency, and therefore is not a substantive rule.

A rule is not substantive solely because it is a fundamental change of agency policy. The cases so holding are distinguishable from these circumstances. In *Mendoza v. Perez*, 754 F.3d 1002, 1021 (D.C. Cir. 2014), plaintiffs challenged a series of letters issued by the Department of Labor (DOL) which set forth special procedures for certifying foreign agricultural workers as temporary workers under the H-2A visa program. The court stated that “[a] rule is [substantive] if it supplements a statute, adopts a new position inconsistent with existing regulations, or otherwise effects a substantive change in existing law or policy.” However, that statement was in response to the defendants’ claim that the letters merely interpret existing regulations. The court’s point there was that the letters do much more than that.

¹⁴⁹ Note: The term “Trio” collectively refers to the Rule, SNPRM, and the Rule to the extent modified by the SNPRM.

The court also cited *Shalala v. Guernsey Mem'l Hospital*, 514 U.S. 87, 100 (1995) for the proposition that rules that represent a major shift in law or policy are substantive. In that case, the Supreme Court agreed with defendants that the rule at issue was an interpretive rule but acknowledged that notice and comment would have been required had the rule adopted a position inconsistent with the agency's existing regulations.

Thereafter, the court turned to defendants' alternative argument that the letters are procedural rules. As part of that discussion, the court pointed out that "[p]rocedural rules 'do not themselves alter the rights or interests of parties, although [they] may alter the manner in which the parties present themselves or their viewpoints to the agency.'" *Id.* at 1023 (quoting *Batterton v. Marshall*, 648 F.2d 694, 707 (D.C. Cir. 1980) (second alteration in original)). The court then observed that the letters "do not merely describe how the Department will evaluate H-2A applications, but they set the bar for what employers must do to obtain approval." The court ultimately held that in so doing, the letters substantially affect the rights of interested private parties. In other words, the court did not hold that the letters were substantive rules because they changed Departmental policy, but rather because they imposed requirements on persons outside of the agency.

The 10th Circuit stated in *Rocky Mountain Helicopters, Inc. v. F.A.A.*, 971 F.2d 544, 547 (10th Cir. 1992), that a rule is substantive if it "changes existing law, policy, or practice" out of context. In that case, the Federal Aviation Administration (FAA) informed the plaintiff that its pilots would no longer be allowed to wear night vision goggles. However, in that case, the FAA claimed that the letter was an interpretive rule, as opposed to a substantive rule, and the court ultimately agreed on grounds that the letter did not change existing law, policy, or practice. So again, the broad statement that commenters rely on is in the context of a court determining whether a rule is interpretive, not procedural. It makes sense for courts to point out where an allegedly interpretive rule does more than simply articulate the agency's interpretation of existing regulations.

Finally, substantive rules are not the only means for agencies to effect a change in existing policy. Agencies can also issue procedural and interpretive rules that articulate a policy shift. Nevertheless, the APA clearly differentiates procedural and interpretive rules and statements of policy from substantive rules. *See* 5 U.S.C. § 553 (exempting procedural and interpretive rules from notice and comment procedures).

Comment [133-1160]: Commenter (11894) writes that EPA now claims authority to base its data restriction proposal not just on the provisions of specific EPA laws that we addressed in our opening comments, but also on the general federal Housekeeping Statute, 5 U.S.C. § 301. This provision, enacted by the first Congress, provides that the head of an executive department or military department may prescribe regulations for the government of his department, the conduct of his employees, the distribution and performance of its business, and the use and preservation of its records, papers, and property. As the Supreme Court has recognized, this language only authorizes rules that govern internal agency operations and cannot be used to justify a legislative rule. In an attempt to bring the proposed science restrictions within that purpose, EPA's proposal states that it does not regulate any entity outside the federal government. Rather, they claim that the proposed requirements would modify the EPA's internal procedures regarding the

transparency of science underlying regulatory decisions and that this rule would not regulate the conduct or determine the rights of any entity outside the federal government. Their position is that it exclusively pertains to the internal practices of the EPA. (85 FR 15398).

EPA specifically states that its proposal does *not* interpret or rely on the specific regulatory provisions of the various EPA statutes, despite the flood of comments it received demonstrating that these were indisputably the governing statutory authorities. But in a backhanded acknowledgment of a possible problem, the proposal states that this internal agency procedure is intended to be consistent with the statutes that EPA administers and EPA plans to implement this procedural rulemaking in accordance with all applicable statutory and regulatory requirements. Nonetheless, it says that in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control. *Id.*

Response: See response to comment 29-121.

Comment [133-1171]: Commenter (11894) writes that EPA’s proposal does not discuss any substantive provisions of regulatory statutes. However, it attempts to insulate itself against conflict with them by providing that:

[I]n the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.

EPA provides neither substantive legal standards nor procedures for making this shell game of a determination. Rather, it is an entirely lawless and cynical ploy. It calls on EPA to “balance” between an approach to data evaluation that is illegal because it rests neither on statutory authority nor on responsible analysis and the approach the law prescribes. The next step will be to argue that because EPA has given itself authority to sometimes not do the illegal thing, its authority to do the illegal thing should be sustained.

All this shows that EPA is well aware of the probability that the authorities on which it rests its proposal do not support it, and that any rule remotely like its proposal could only rest on the substantive provisions of the various regulatory statutes describing the types of data that can be used as rulemaking support.

It also makes clear how EPA will try to defuse this issue without ever actually confronting it. If such an “in case of conflict” provision were to take effect, EPA quite predictably would use it to uphold its data bar in most cases, hoping to prevail not on the merits, but because of the presumption of regularity given to government action and lack of opposition due to the expense and uncertainty of differing with the government. In extreme cases, EPA could back down. And if it should lose in an individual case, that could always be blamed on misapplication of the “in case of conflict” provision, not on any defect in its structure. This gambit does nothing to preserve the rule’s legality, failing for the same reason that the initially proposed case-by-exception fails: a subsequent promise to cure an arbitrary result does nothing to cure that illegality. See *Ameren Services v FERC* 880 F. 3d 571, 584 (DC Cir 2018):

We once described an agency's effort to offer future rulemaking as a response to a claim of agency illegality as an "administrative law shell game," *Am. Tel. & Tel. Co. v. FCC*, 978 F.2d 727, 732 (D.C. Cir. 1992), a phrase the Supreme Court thought apt. See *MCI Telecomm. v. Am. Tel. & Tel. Co.*, 512 U.S. 218, 222, 114 S.Ct. 2223, 129 L.Ed.2d 182 (1994).

Compounding this illegality is the absence of any discussion of either the substantive criteria or the procedural mechanisms by which EPA would determine whether this censored-science rule would be inconsistent with its actual statutory authorities. An agency's empty reference to adherence to statutory factors is not reasoned decision-making. See *Philadelphia Gas Works v. FERC*, 989 F.2d 1246, 1251 (D.C. Cir. 1993) (for FERC to utter the words 'unique facts and circumstances' and 'equity,' ... as a wand waved over an undifferentiated porridge of facts, leaves regulated parties and a reviewing court completely in the dark as to the core of FERC's reasoning and its relationship to past precedent"); *Verizon Cos. v. FCC*, 570 F.3d 294, 304 (D.C. Cir. 2009) ("These conclusory statements that such factors are being considered cannot substitute for the reasoned explanation that is wanting in this decision"); *American Gas Ass'n, v. FERC*, 593 F.3d 14, 19 (D.C. Cir. 2010) ("A passing reference to relevant factors, however, is not sufficient to satisfy the Commission's obligation to carry out reasoned and principled decision-making. The Commission must fully articulate the basis for its decision.")

Response: See response to comment 48-503.

Comment [133-1176]: Commenter (11894) asks, what are the legal authorities under which EPA prepares the studies that would be affected, and how do they support this step? All government actions must be authorized by law. Yet this proposal does not even mention that topic, much less discuss how the statutory language (whatever it might be) supports such restrictions on studies prepared under its authority

Response: EPA discussed its legal authority for this action in the preamble of the proposal at Section I. C and modified that authority as discussed in the preamble of the supplemental notice at Section I. B, and the preamble of the final rule at Section I. C.

Comment [141-1273]: Commenter (11911) states that there's no doubt the finalization of the Strengthening Transparency in Regulatory Science (STRS) Rule would have a substantive impact by severely impairing the EPA's ability to protect public health and the environment.

If finalized, the STRS Rule would substantively violate a number of environmental statutes. Both the ESA and, for example, call on the EPA to use the "best scientific... data available" when issuing regulations;¹⁵⁰ the TSCA requires the "best available science."¹⁵¹ This mandate means the agency cannot "disregard[] available scientific evidence that is in some way better than the evidence [it] relies on."¹⁵² The agency must not "ignore available studies, even if it disagrees with or discredits them."¹⁵³ In another example, NAAQS under the CAA air must be set at a

¹⁵⁰ 16 U.S.C. § 1536(a)(2); *Cascadia Wildlands v. Thrailkill*, 806 F.3d 1234 (9th Cir. 2015).

¹⁵¹ 15 U.S.C. § 2625(h).

¹⁵² *Kern Cty. Farm Bureau v. Allen*, 450 F.3d 1072, 1080 (9th Cir. 2006) (quoting *Sw. Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C.Cir.2000)).

¹⁵³ *San Luis & Delta-Mendota Water Auth. v. Locke*, 776 F.3d 971, 995 (9th Cir. 2014).

level “requisite to protect public health,” and must “accurately reflect the latest scientific knowledge” including “all identifiable effects [of the pollutant] on public health or welfare.”¹⁵⁴

Further, under the APA, an agency must not “fail[] to consider an important aspect of the problem”¹⁵⁵ or neglect to “consider[] relevant factors”¹⁵⁶ when issuing regulation. If the EPA were to ignore whole categories of scientific studies in reaching a regulatory decision, the agency would surely run afoul of longstanding Supreme Court precedent.¹⁵⁷ The Proposed STRS Rule and accompanying SNPRM cannot constitute an end-run around the procedural requirements of the APA or the Congressional mandate of environmental statutes.

Response: Any impacts on third parties that result from this final rule are not enough to render it substantive. See responses to comments 29-121 and 84-1403. This final rule will enhance EPA’s ability to consider the pivotal science underlying its significant regulatory decisions and ISI in the most transparent way possible. As discussed at Section III. E of the final rule preamble, EPA will apply a weighting approach when considering pivotal science, not a categorical exclusion. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. That means that the agency will consider all relevant studies when taking covered actions.

Comment [147-1315]: Commenter (12399) notes that the supplemental states that the rule would not apply when its provisions “conflict” with statutory law. Obviously, laws prevail over agency rules, so this stated exclusion is not necessary. In any case, it is not clear that any law on the books would prevent the agency from ensuring that any science it uses meets basic scientific transparency standards. And in the unlikely situation that questions arise, this issue should remain within the purview of the courts to determine whether a conflict exists. Including this provision appears to do nothing more than give the Administrator an excuse to waive the rule for rather arbitrary reasons.

Response: See response to comment 48-503. Here, the Administrator’s discretion to exempt certain studies on an ad hoc basis from the final rule’s requirements comes from section 30.9 of the final rule, not the savings clause. That section clearly outlines the circumstances under which the Administrator may grant exemptions, enumerates several factors that should inform that determination, and requires the Administrator to document the rationale for the exemption.

Comment [159-1404]: Commenter (12430) writes that U.S. EPA administers and enforces most of the country’s foundational environmental laws, including the CAA, CWA, SDWA, RCRA, CERCLA, EPCRA, FIFRA, and TSCA. These laws include statutes that expressly require U.S. EPA to consider the best available science. If adopted, the SNPRM would violate these statutes.

¹⁵⁴ 42 U.S.C. §§ 7409, 7408(a)(2).

¹⁵⁵ *Motor Vehicle Mfrs. Ass’n v. State Farm Mut. Auto. Ins.*, 463 U.S. 29, 43 (1983).

¹⁵⁶ *Michigan v. EPA*, 135 S. Ct. 2699, 2706 (2015).

¹⁵⁷ In particular, if the agency were attempt to rollback or relax preexisting environmental regulations that rely on studies without publicly available data, courts would require the agency to provide a “reasoned explanation... for disregarding facts... that underlay... the prior policy.” *FCC v. Fox Television Stations, Inc.*, 556 U.S. 502, 516 (2009).

Response: See response to comment 29-121.

Comment [159-1406]: Commenter (12430) writes that the SNPRM does not address or even acknowledge the statutes that affirmatively require U.S. EPA to consider the best available science. It instead invokes additional statutes that it claims provide authority for the proposed rule. It argues that the rule may be authorized by the Federal Housekeeping Statute, by certain substantive statutes, or by a combination of the two. But the statutes the SNPRM cites do not address the use of science and certainly do not allow U.S. EPA to disregard its express statutory mandates to use best available science.

Response: See response to comment 29-121.

Comment [175-1574]: Commenter (12471) writes that environmental statutes separately provide the Administrator with substantive policy-making authority to weigh information appropriately in the regulatory process. Increased transparency resulting from the Transparency Rule's procedural framework may be one of the factors that the Administrator considers when using that authority. The Transparency Rule's framework would remain purely procedural. Even when considered as part of the regulatory process specified in an environmental statute, the framework would add no new substantive requirements to that process.

Increasing transparency assessments does not diverge from the requirement that the Administrator use the best science in reaching regulatory decisions. In fact, the opposite is true. Scientific transparency is critical to reproducibility, which is, in turn, a central tenant of the scientific process. Without a common framework to increase transparency, the Administrator's process to factor transparency and reproducibility, core components of the scientific method, in the regulatory process could be arbitrary and capricious.

Response: EPA agrees that this final rule is purely procedural and directs EPA to weigh public availability of the pivotal science underlying EPA's significant regulatory decisions among other factors enumerated in the final rule. Regarding the environmental statutes that EPA administers, see response to comment 29-121.

Comment [181-1622]: Commenter (12699) writes that the EPA should rely on both the substantive environmental statutes and the housekeeping authority.

The EPA would not be implementing these statutes properly if it were using flawed science in the promulgation of its rules. To highlight one example, it is useful to reexamine the U.S. Supreme Court case *Michigan v. EPA*.¹⁵⁸ In discussing the "appropriate and necessary" language in 112(n)(1)(A) of the CAA,¹⁵⁹ the U.S. Supreme Court argued "[o]ne would not say that it is

¹⁵⁸ *Michigan v. EPA*, 135 S. Ct. 2699 (2015), <https://www.law.cornell.edu/supremecourt/text/14-46> (last visited May 18, 2020).

¹⁵⁹ § 112(n)(1)(A) of the Clean Air Act; 42 U.S. Code § 7412(n)(1)(A), <https://www.govinfo.gov/content/pkg/USCODE-2013-title42/html/USCODE-2013-title42-chap85-subchapI-partAsec7412.htm> (last visited May 18, 2020) [Link dead, alternative link provided <https://www.law.cornell.edu/uscode/text/42/7412>].

even rational, never mind “appropriate,” to impose billions of dollars in economic costs in return for a few dollars in health or environmental benefits.”¹⁶⁰

Similarly, it would not be rational for the EPA to use science for these very costly policies without even knowing whether the science is credible. Nor would it be rational for the agency to fail to take every possible step to ensure scientific accuracy, including making underlying information available to the public (especially since the EPA is well aware of the problems that pervade the science). Making the information available to the public is not some nice gesture to appease the public. It is a critical step to help the agency itself get necessary feedback to better assess the science.

Response: EPA has elected to rely solely on housekeeping authority equivalent to the Federal Housekeeping authority, which was transferred to EPA in EPA’s Reorganization Plan. See response to comment 29-121.

EPA would like to clarify that the final rule does not require EPA or the public to make data and models publicly available. However, EPA agrees that it is important for the pivotal science underlying EPA’s significant regulatory decisions and ISI to be as transparent as possible.

Comment [181-1624]: Commenter (12699) writes that there is also a practical reason for utilizing these environmental statutes as statutory authority for the rule. It should help affected parties to enforce EPA’s compliance with the rule. Relying upon the housekeeping authority alone might make this regulation covering internal procedures more difficult to enforce. Regarding this enforcement concern, the EPA should learn some lessons from the Information Quality Act (IQA). It is extremely important that the rule itself have clear and objective requirements, without creating so much flexibility and discretion that there is nothing for a court to enforce.¹⁶¹ In addition, by having clear requirements, this will limit future administrations from getting around the rule.

To its credit, the EPA is undertaking this extremely important transparency initiative. It would do a disservice to the public and the agency itself if the rule has no “teeth” and is simply ignored whenever it is convenient for future administrations.

Response: See response to comment 29-121.

Comment [183-1822]: Commenter (12702) notes that while the Supplemental Notice is proposing to allow non-public data to be used when public data are unavailable, the notice makes clear that EPA would have wide discretion to determine whether and when to do so. They remain concerned that this discretion could decrease the consistency and certainty of how certain data are treated. Additionally, such treatment could conflict with requirements under existing statutes

¹⁶⁰ *Michigan v. EPA*, 135 S. Ct. 2699 (2015), <https://www.law.cornell.edu/supremecourt/text/14-46> (last visited May 18, 2020).

¹⁶¹ This is not to suggest that the IQA does not have requirements, because it does. However, the discretion in the IQA has created problems for judicial review. As for the EPA’s transparency rule, clear requirements would make it less likely for a court to even try and assert there is nothing to enforce.

and Court decisions. This concern applies even if EPA chooses to rely upon its housekeeping authority as proposed in the supplemental notice.

Response: Section 30.9 of the final rule outlines the circumstances under which the Administrator may grant exemptions, enumerates several factors that should inform that determination, and requires the Administrator to document the rationale for the exemption. Conflict analyses will be conducted and discussed as appropriate when EPA develops subsequent rulemakings implementing this final procedural rule. See the final rule preamble discussion at Section III.G.

Comment [184-1660]: Commenter (12707) writes that the proposed structure is arbitrary and capricious and will lead to outcomes that do not fulfill the agency's statutory mandate and will, therefore, be vulnerable to legal challenge. EPA should continue to apply the rigorous standards the agency has used over many decades of issuing lifesaving standards and let stakeholders engage in the process that is full and open with regards to science.

By setting forth unnecessary and confusing restrictions on the kinds of studies it can consider in developing significant rules under critical environmental and public health laws from air pollution standards to water quality issues to chemical regulation in consumer products, EPA is undermining its ability and duty to meet statutory obligations.

Response: As discussed in the final rule preamble at Section III.D, EPA will apply a weighting approach when considering pivotal science, not any categorical exclusions. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. That means that the agency will consider all relevant studies when taking covered actions. Regarding EPA's obligations under the statutes it administers, see response to comment 29-121.

Comment [184-1661]: Commenter (12707) writes that the Federal Housekeeping Statute alone or in conjunction with existing bedrock environmental laws does not authorize EPA to limit science considered in rulemaking processes. EPA's supplemental proposal is a second failed attempt at justifying an effort to limit or otherwise constrain its own ability to use the best available public health studies and science from outside EPA. The effort in the initial proposal to ground so-called "transparency" in bedrock environmental laws was exposed as untenable. EPA's addition of the Federal Housekeeping Statute to the mix and recitation of new sections of several environmental laws does not strengthen EPA's case. Whether or not EPA has 301 housekeeping authority is irrelevant. The statute authorizes EPA to control its own internal documents or materials; the statute and its authorities are not applicable to the long-standing public health studies EPA has relied upon to protect public health through the notice and comment rulemaking process.

EPA's justification that this action to constrain science or leave science up to the political whims of the administrator is about internal agency procedure does not hold. This proposal is not about internal paperwork, but about whether or not EPA can fulfill its core mission consistent with bedrock environmental laws.

Response: See response to comment 29-121.

Comment [184-1662]: in addition to the Housekeeping Statute, the supplemental proposal points to specific provisions of several key laws (RCRA, CERCLA and the CWA) as a justification for limiting or constraining the science it can consider. Nowhere in the cited statutes or sections is there any basis for demanding access to raw data or otherwise disqualifying long standing studies, nor does this relate sensibly to any definition of best available science. Rather it undermines the use of best available science as called for in numerous environmental statutes including the CAA.

The CAA, for example, has requirements to update pollution standards that provide for an adequate margin of safety for public health. This determination can only be reliably made using the best available science. However, this proposal would prevent EPA from using that information to set science-based pollution standards that would provide for an adequate margin of safety. EPA should not cite the CAA as an appropriate source of statutory authority. The added confusion of the supplemental proposal, including so-called tiered access or EPA's ability to consider some research over what has long been considered "best available science" based upon the availability of data, does not legitimize the proposal.

In sum, there is no statutory authority, with or without the Housekeeping Statute, for EPA to rely on to censor or constrain science. Further, finalizing this effort will only serve to undermine EPA's essential role and create confusion over which studies will be considered and how they will be valued to set standards that directly impact public health and the quality of our air and water. Many of these uncertainties are recognized in EPA's own Science Advisory Board's April 28, 2020 letter.

Response: See response to comment 29-121.

Comment [187-1701]: Commenter (12720) writes that the law is clear that EPA may adopt rules only if those rules are based on statutory authority delegated by Congress. EPA may not invent statutory authority where none exists, nor adopt regulations lacking statutory authority merely because EPA believes that to be better policy. See, e.g., *Massachusetts v. EPA*, 549 U.S. 497, 535, 127 S. Ct. 1438, 1463 (2007) ("EPA must ground its reasons for action or inaction in the statute."); *La. Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 374 (1986) (stating "agency power to act" is shaped by how "Congress confers power upon it"). Agencies need especially clear congressional delegations of authority to create regulatory exemptions. See *New York v. U.S. EPA*, 413 F.3d 3, 41 (D.C. Cir. 2005) (stating that the agency needs "clear congressional delegation" to support an exemption). EPA identifies no such delegations, certainly not the clear delegations required by law, for either the 2018 Proposal or the Supplemental Proposal.

Response: See response to comment 29-121.

Comment [187-1714]: Commenter (12720) writes that EPA attempts to paper over this arbitrary abuse of discretion by noting that the rulemaking is intended to "be consistent with the statutes that EPA Administers and ... all applicable statutory and regulatory requirements." *Id.* The agency goes on to note that "in the event the procedures outlined in this proposed rulemaking

conflict with the statute that EPA administers, or their implementing regulations, the statutes and regulations will control.” Id. While it is certainly true that a rulemaking that conflicts with statutory authority would be struck down as arbitrary and capricious, EPA’s statements here do nothing to “fix” the Proposal nor render it a valid exercise by the Agency. An administrative action that is arbitrary and capricious and an abuse of discretion does not change character through this type of Agency statement – the EPA does not get to pick and choose the statutory authorities it chooses to follow. Rather, Congress makes laws, and those laws contain certain proscriptions and prescriptions that the Agency to whom Congress has delegated rulemaking authority must follow. Implicit in EPA’s recognition of the potential for “conflict” with statutes and implementing regulations is the understanding that this rule is arbitrary, capricious, and an abuse of the Agency’s discretion. Neither the substantive statutes described above, nor the housekeeping authority, authorize the rulemaking.

Response: See response to comment 48-503.

Comment [187-1717]: Commenter (12720) writes that the Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposed regulatory definition, “Capable of being substantially reproduced.” 85 Fed. Reg. at 15,405 (proposed 40 CFR § 30.2). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of commenter’s letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

Response: See response to comment 29-121.

Comment [187-1720]: Commenter (12720) writes that the Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposed regulatory definition, “Data.” 85 Fed. Reg. at 15,405 (proposed 40 CFR § 30.2). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

Response: See response to comment 29-121.

Comment [187-1733]: Commenter (12720) writes that the Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal to apply “the provisions of this part” to “data and models, underlying pivotal science supporting influential scientific information and/or underlying pivotal regulatory science used to justify significant regulatory decisions regardless of the source of funding or identity of the party conducting the science.” 85 Fed. Reg. at 15,405 (proposed 40 CFR § 30.3). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

Response: See response to comment 29-121.

Comment [187-1734]: Commenter (12720) writes that the Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal to condition “EPA’s use of data and models underlying pivotal regulatory science and pivotal science” on any of the criteria, restrictions or provisions in proposed section 30.5, Option 1. 85 Fed. Reg. at 15,405 (proposed 40 CFR § 30.5, Option 1). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

The Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal that, “[w]hen promulgating significant regulatory decisions or finalizing influential scientific information, the Agency will only use pivotal regulatory science and/or pivotal science that includes studies with restricted data and models (i.e., those that include CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects) if there is tiered access to these data and models in a manner sufficient for independent validation, and studies that do not include restricted data and models if the data and models are publicly available in a manner sufficient for independent validation.” 85 Fed. Reg. at 15,405 (proposed 40 CFR § 30.5, Option 1). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

The Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal that, “Information is considered ‘available in a manner sufficient for independent validation’ when it includes the information necessary to understand, assess, and reanalyze findings,” including the six listed examples in proposed section 30.5(a) through (f). 85 Fed. Reg. at 15,405 (proposed 40 CFR § 30.5, Option 1). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

The Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal to condition “EPA’s use of data and models underlying pivotal regulatory science and pivotal science” on any of the criteria, restrictions or provisions in proposed section 30.5, Option 2. 85 Fed. Reg. at 15,405 (proposed 40 CFR § 30.5, Option 2). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

The Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal that, “When promulgating significant regulatory decisions or finalizing influential scientific information, the Agency will, other things equal, give greater consideration to studies where the underlying data and models are publicly available in a manner sufficient for independent validation.” 85 Fed. Reg. at 15,405 (proposed 40 CFR § 30.5, Option 2). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

The Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal that, “[w]hen promulgating significant regulatory decisions or finalizing influential scientific information,” “[t]he Agency will also give greater consideration to studies based on data and models that include confidential business information, proprietary information or PII if these data and models were available through restricted access, such as through a secure data enclave, in a manner sufficient for independent validation.” 85 Fed. Reg. at 15,405 (proposed 40 CFR § 30.5, Option 2). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

The Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal that, “[w]hen promulgating significant regulatory decisions or finalizing influential scientific information,” “the Agency will identify those studies that are given greater consideration and provide a short description of why greater consideration was given.” 85 Fed. Reg. at 15,405 (proposed 40 CFR § 30.5, Option 2). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

The Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal that, “Information is considered ‘available in a manner sufficient for independent validation’ when it includes the information necessary to understand, assess, and reanalyze findings,” including the 5 listed examples in proposed section 30.5(a)(1) through (5). 85 Fed. Reg. at 15,405-406 (proposed 40 CFR § 30.5, Option 2). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See *supra* at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

The Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal that “[t]he provisions of this section apply to data and models underlying pivotal regulatory science or pivotal science regardless of who funded or conducted the underlying data, models, or other regulatory science or pivotal science.” 85 Fed. Reg. at 15,406 (proposed 40 CFR § 30.5, Option 2). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See *supra* at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

The Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal that “[w]hen promulgating significant regulatory decisions or finalizing influential scientific information,” and “[w]here data and models are controlled by third parties, EPA may work with those parties to endeavor to make the data and models available in a manner that *complies with this section*.” 85 Fed. Reg. at 15,406 (proposed 40 CFR § 30.5, Option 2) (emphasis added). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See *supra* at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

Response: See response to comment 29-121.

Comment [187-1735]: Commenter (12720) writes that the Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal to condition “the use of data and models underlying pivotal regulatory science and pivotal science” on any of the criteria, restrictions or provisions in proposed section 30.6. 85 Fed. Reg. at 15,406 (proposed 40 CFR § 30.6). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See *supra* at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

The Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal to “give explicit consideration to high quality studies, including but not limited to those that explore: A broad class of parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity.” 85 Fed. Reg. at 15,406 (proposed 40 CFR § 30.6). “5 U.S.C. 301; 5 U.S.C. App.;

Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

Response: See response to comment 29-121.

Comment: Comment [187-1736]: Commenter (12720) writes that the Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any regulation based on the proposal to “conduct independent peer review on all pivotal regulatory science used to justify significant regulatory decisions and on all pivotal science underlying influential scientific information, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein,” prior to or instead of considering that science without independent peer review. 85 Fed. Reg. at 15,406 (proposed 40 CFR § 30.7). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

Response: See response to comment 29-121.

Comment [187-1737]: Commenter (12720) writes that the Supplemental Proposal and original Proposal lack any statutory authority or other legal authority to adopt any of proposed part 30, including any proposal to allow the Administrator to “grant an exemption to this part on a case-by case basis if he or she determines that compliance is impracticable because technological barriers render sharing of the data or models infeasible, the development of the data or model was completed or updated before [EFFECTIVE DATE OF FINAL RULE] or making the data and models publicly available would conflict with laws governing privacy, confidentiality, CBI, or national and homeland security.” 85 Fed. Reg. at 15,406 (proposed 40 CFR § 30.9). “5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086” in no way provides that authority. See supra at III.I of the commenters’ comment letter. Nor do any of the organic environmental statutes that EPA cites in the Proposal or Supplemental Proposal.

Response: See response to comment 29-121.

Comment [198-1907]: Commenter (3549) writes that as a baseline, whether working on “significant regulatory actions,” “influential scientific information,” or anything requiring the consideration of science, EPA must base its decisions on the best available science. Anything less is nonsensical, arbitrary, and in violation of the environmental laws EPA is charged with implementing. The SNPRM does not maintain this baseline, but instead provides for ways EPA would exclude and lessen consideration of the best available science. Therefore, the SNPRM, along with the proposed rule, must be withdrawn. See, e.g., 42 U.S.C. § 300g-1(b)(1)(B)(ii), (3)(A) (SDWA provisions requiring regulation of contaminants based on best available science); 15 U.S.C. § 2625(h) (TSCA provision requiring the use of best available science); see also 83 Fed. Reg. at 18,769 (“The best available science must serve as the foundation of EPA’s regulatory actions.”).

Response: See response to comment 29-121. The supplemental did not provide that EPA can exclude or lessen consideration of high-quality studies and this final rule provides that EPA will weigh public availability of underlying scientific data among other enumerated factors.

Comment [198-1928]: Commenter (13549) the SNPRM changes the authority EPA claims to rely on for the proposal, however either way, the proposal remains unlawful. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301. 85 Fed. Reg. at 15404. The preamble says EPA is taking comment on whether to use 5 U.S.C. § 301, which the SNPRM calls EPA's housekeeping authority, independently or in conjunction with statutory provisions cited in the proposed rule and corrected in the SNPRM's preamble. 85 Fed. Reg. at 15398. The fact that EPA is still considering and asking what authority it can rely on for the proposed rule, twenty-two months after the initial proposed rule, shows that EPA does not have such authority. The SNPRM's statements on authority continues EPA's pattern of making rules first and searching for a justification later (which it still has not provided for this rulemaking). As the NTAA explained in its 2018 comments: In order to protect human health and environment, EPA must have a solid foundation before it proposes rules and rulemaking as such portrays the agency's naiveté in seeking answers for questions about its own authority.

First, none of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking. In most cases, EPA simply cites its general authority for rulemaking under the statutes. Still that general authority alone cannot provide a basis for the rule, especially when, as here, the rule would conflict with the requirements of each of the statutes. Courts have made clear that "EPA cannot rely on its gap-filling authority to supplement [a statute's] provisions when Congress has not left the agency a gap to fill." *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); see also *New York v. U.S. EPA*, 413 F.3d 3, 40-42 (D.C. Cir. 2005). EPA otherwise cites to statutes describing research programs established by the agency, with no relation to or authorization for the requirements the SNPRM seeks to create. The Band also disagrees with EPA's reliance on 5 U.S.C. § 301 because 1) it is questionable whether § 301 applies to EPA as EPA is not one of the fifteen "Executive Departments" listed at 5 U.S.C. § 101, and 2) the proposed rule and SNPRM are not merely internal rules of agency procedure—they would significantly impact every aspect of EPA's scientific and regulatory work, the individuals who contribute to that work, and the Tribes and communities who rely on it.

The Band appreciates the SNPRM's recognition that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control." 85 Fed. Reg. at 15398. This statement alone should lead EPA to withdraw the proposed rule and SNPRM; the requirements conflict with every statute EPA administers and would cause EPA to unlawfully exclude valid scientific research from its work.

By way of example, in CAA Section 108(a)(2), Congress requires EPA to issue air quality criteria for air pollutants to "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air." 42 U.S.C. § 7408(a)(2). The SNPRM does not claim that studies that have not publicly released all their underlying data, such as those linking air pollution to mortality and disease, do not accurately reflect the latest scientific

knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air. If EPA were to exclude such studies from consideration when issuing air quality criteria, it would be in violation of the CAA.

Response: See response to comment 29-121. EPA requested comment on the authorities it identified to solicit public input as part of the notice and comment exercise, not as a signal that the authorities identified were inapposite. Indeed, viewing requests for comment as concessions that the underlying rule is arbitrary and capricious would be contrary to the purpose of providing notice and comment. EPA also notes that EPA discusses the justification for this rule in the final rule preamble at Sections III.D and E.

Comment [200-2215]: Commenter (12412) writes that the SNPRM changes the authority EPA claims to rely on for the proposal, however either way, the proposal remains unlawful. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301. 85 Fed. Reg. at 15404. The preamble says EPA is taking comment on whether to use 5 U.S.C. § 301, which the SNPRM calls EPA's housekeeping authority, independently or in conjunction with statutory provisions cited in the proposed rule and corrected in the SNPRM's preamble. 85 Fed. Reg. at 15398. The fact that EPA is still considering and asking what authority it can rely on for the proposed rule, twenty-two months after the initial proposed rule, shows that EPA does not have such authority. The SNPRM's statements on authority continues EPA's pattern of making rules first and searching for a justification later (which it still has not provided for this rulemaking). As they explained in their 2018 comments: In order to protect human health and environment, EPA must have a solid foundation before it proposes rules and rulemaking as such portrays the agency's naiveté in seeking answers for questions about its own authority.

First, none of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking. In most cases, EPA simply cites its general authority for rulemaking under the statutes. Still that general authority alone cannot provide a basis for the rule, especially when, as here, the rule would conflict with the requirements of each of the statutes. Courts have made clear that "EPA cannot rely on its gap-filling authority to supplement [a statute's] provisions when Congress has not left the agency a gap to fill." *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); *see also New York v. U.S. EPA*, 413 F.3d 3, 40-42 (D.C. Cir. 2005). EPA otherwise cites to statutes describing research programs established by the agency, with no relation to or authorization for the requirements the SNPRM seeks to create. Little Traverse Bay Bands of Odawa Indians (LTBB) disagrees with EPA's reliance on 5 U.S.C. § 301 because 1) it is questionable whether § 301 applies to EPA as EPA is not one of the fifteen "Executive Departments" listed at 5 U.S.C. § 101, and 2) the proposed rule and SNPRM are not merely internal rules of agency procedure—they would significantly impact every aspect of EPA's scientific and regulatory work, the individuals who contribute to that work, and the Tribes and communities who rely on it.

LTBB appreciates the SNPRM's recognition that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control." 85 Fed. Reg. at 15398. This statement alone should lead EPA to withdraw the proposed rule and SNPRM; the requirements conflict

with every statute EPA administers and would cause EPA to unlawfully exclude valid scientific research from its work.

By way of example, in CAA Section 108(a)(2), Congress requires EPA to issue air quality criteria for air pollutants to “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air.” 42 U.S.C. § 7408(a)(2). The SNPRM does not claim that studies that have not publicly released all their underlying data, such as those linking air pollution to mortality and disease, do not accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutants in the ambient air. If EPA were to exclude such studies from consideration when issuing air quality criteria, it would be in violation of the CAA.

Response: See response to comment 198-1928.

Comment [201-1983]: Commenter (12474) writes that the SNPRM changes the authority EPA claims to rely on for the proposal, however either way, the proposal remains unlawful. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301. 85 Fed. Reg. at 15404. The preamble says EPA is taking comment on whether to use 5 U.S.C. § 301, which the SNPRM calls EPA’s housekeeping authority, independently or in conjunction with statutory provisions cited in the proposed rule and corrected in the SNPRM’s preamble. 85 Fed. Reg. at 15398. The fact that EPA is still considering and asking what authority it can rely on for the proposed rule, twenty-two months after the initial proposed rule, shows that EPA does not have such authority. The SNPRM’s statements on authority continues EPA’s pattern of making rules first and searching for a justification later (which it still has not provided for this rulemaking). As they explained in their 2018 comments: In order to protect human health and environment, EPA must have a solid foundation before it proposes rules and rulemaking as such portrays the agency’s naiveté in seeking answers for questions about its own authority.

First, none of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking. In most cases, EPA simply cites its general authority for rulemaking under the statutes. Still that general authority alone cannot provide a basis for the rule, especially when, as here, the rule would conflict with the requirements of each of the statutes. Courts have made clear that “EPA cannot rely on its gap-filling authority to supplement [a statute’s] provisions when Congress has not left the agency a gap to fill.” *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); see also *New York v. U.S. EPA*, 413 F.3d 3, 40-42 (D.C. Cir. 2005). EPA otherwise cites to statutes describing research programs established by the agency, with no relation to or authorization for the requirements the SNPRM seeks to create.

The NTAA also disagrees with EPA’s reliance on 5 U.S.C. § 301 as:

1) It is questionable whether § 301 applies to EPA as EPA is not one of the fifteen “Executive Departments” listed at 5 U.S.C. § 101, and

2) The proposed rule and SNPRM are not merely internal rules of agency procedure— they would significantly impact every aspect of EPA’s scientific and regulatory work, the individuals who contribute to that work, and the Tribes and communities who rely on it.

The NTAA appreciates the SNPRM’s recognition that “in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.” 85 Fed. Reg. at 15398. This statement alone should lead EPA to withdraw the proposed rule and SNPRM; the requirements conflict with every statute EPA administers and would cause EPA to unlawfully exclude valid scientific research from its work.

By way of example, in CAA Section 108(a)(2), Congress requires EPA to issue air quality criteria for air pollutants to “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air.” 42 U.S.C. § 7408(a)(2). The SNPRM does not claim that studies that have not publicly released all their underlying data, such as those linking air pollution to mortality and disease, do not accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air. If EPA were to exclude such studies from consideration when issuing air quality criteria, it would be in violation of the CAA.

Response: EPA is not relying on 5 U.S.C. § 301 for its authority. See response to comment 29-121. See also responses to comments 84-1403 and 198-1928.

Comment [205-2037]: Commenter (13788) writes that the Federal Housekeeping Statute cannot be used to authorize rules that limit the scope of EPA’s responsibilities under other statutes. The *Chrysler* Court was clear that “[section] 301 does not authorize regulations limiting the scope of [the Trade Secrets Act]” (the statute under consideration in that case), or of any other substantive statutory authority.¹⁶² Similarly, the Federal Housekeeping Statute cannot authorize regulations limiting the scope of environmental statutes.¹⁶³ If finalized, this rule would limit EPA’s ability to evaluate and use the best available science to support its regulatory decisions, thereby undermining its ability to fully implement its responsibilities as mandated under environmental statutes. It therefore cannot be a valid exercise of the authority granted by the Federal Housekeeping Statute.

Neither the Federal Housekeeping Statute nor the IQA provide authority or justification for a rule that would significantly impede and disrupt EPA’s ability to fulfill its statutory mandates. For example, the air quality criteria EPA is required to issue when reviewing the NAAQS under the CAA takes the form of an integrated science assessment (ISA), in which the Agency evaluates the latest science on public health and environmental effects of criteria pollutants. The ISA document is considered a highly influential scientific assessment (HISA), which is a subset of

¹⁶² *Chrysler v. Brown*, 441 U.S. 281, 312 (1979) (internal citation omitted).

¹⁶³ *Chrysler v. Brown*.

the ISI governed by the IQA guidance.¹⁶⁴ Subjecting the ISA to the requirements of this rule and SNPRM would result in the exclusion of important, longstanding public health studies from consideration, because the human health data on which they are based, and which makes them of value, is not publicly available as contemplated by the proposed rule. Such a result would directly conflict with the CAA's mandate that the air quality criteria reflect the latest scientific knowledge.

The Agency claims that “[i]n the event the procedures outlined in this part conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”¹⁶⁵ EPA fails, however, to explain how the Agency will define and identify such conflicts and ensure that staff do not follow the proposed rule. This is a significant question that EPA entirely fails to discuss.¹⁶⁶

Response: See response to comment 29-121. As discussed in the final rule preamble at Section I.C because this is purely a procedural rule, EPA will discuss the statutes that EPA administers in forthcoming substantive rulemakings under those statutes.

Comment [205-2038]: Commenter (13788) writes that tot one of the other environmental statutes cited as potential authority by EPA actually authorizes this rule.¹⁶⁷ At most, many of the provisions cited by EPA generally allow the agency to promulgate regulations in order to implement various statutes, with many requiring that the regulations be necessary.¹⁶⁸ However, EPA has not shown how this rule would further the implementation of any statute, much less how the rule is necessary to fulfill any statutory responsibilities, and the fact that the Agency has not considered such a rule necessary until now suggests the opposite. Under the CAA, the most important scientific studies and models for use in evaluating the public health effects of air pollution are those that are based on actual human health data—much of which cannot be publicly available due to the confidentiality requirements imposed by other federal statutes and the agreements under which the data is provided to researchers. For CAA rulemaking then, any of the approaches EPA is proposing actively undermine the Agency's use of the best science in making decisions that promote and protect the public health and welfare—the fundamental purpose of the CAA.

If Congress had intended EPA to prioritize data transparency over the quality of scientific information in its regulatory decision-making, it could have written that requirement into the

¹⁶⁸ See, e.g., Clean Air Act § 301(a), 42 U.S.C. § 7601(a) (“The Administrator is authorized to prescribe such regulations as are necessary to carry out his functions under this chapter.”); Clean Water Act § 501(a), 33 U.S.C. § 1361(a) (authorizing the Administrator to “prescribe such regulations as are necessary to carry out his functions under this chapter.”); Comprehensive Environmental Response, Compensation, and Liability Act § 115, 42 U.S.C. § 9615 (authorizing the President “to promulgate any regulations necessary to carry out the provisions of this subchapter.”); Emergency Planning and Community Right-To-Know Act § 328, 42 U.S.C. § 11048 (“The Administrator may prescribe such regulations as may be necessary to carry out this chapter.”).

statutes. In the absence of such a requirement and as required by law, EPA should prioritize quality in accordance with the various “mandates requiring that its decisions rest on various formulations of the best available science.”¹⁶⁹

Response: See response to comment 29-121.

1.2 Housekeeping Statute

Comment [9-34]: Commenter (10020) writes that the Proposed Notice of Supplemental Rulemaking is new rulemaking, not a revision of any prior proposal.

As such, it simply does not fall within your agency "housekeeping authority." Moreover, your proposed new rulemaking does not meet the requirements of the APA. Your Proposed Notice of Supplemental Rulemaking recites on its face that you want to add a definition of "publicly available." This in itself is new rulemaking, not a revision of any prior proposal. As such, it simply does not fall within your agency "housekeeping authority" and is not only unauthorized but is invalid at least to that extent and for that reason. Moreover, your proposed new rulemaking is simply not authorized or valid under the requirements of the APA. In short, your proposed new definition of "publicly available" is simply unauthorized as a part of the housekeeping authority you invoke in your subject Notice of Proposed Supplementary Rulemaking. When treated as newly proposed rulemaking, your proposal is of course subject to the requirements of the APA. It does not meet them. It must be withdrawn or rejected for that reason alone.

Response: This purely internal procedural final rule is not subject to APA notice and comment requirements, including the requirement to publish a notice of proposed rulemaking and request comment on that proposed action. See 5 USC 553(b)(A). Nevertheless, EPA elected to initiate notice and comment on both the procedural rule NPRM and SNPRM. As its title implies, the SNPRM supplements the NPRM by making the changes and clarifications outlined in the SNPRM preamble at Section I.C. It is not a new rulemaking. Regardless the additional round of notice and comment provided on the SNPRM is equivalent to that which would have been available for an NPRM initiating a new rulemaking.

Comment [13-51]: Commenter (10944) strongly opposes the 2020 supplemental to the proposed rule, Strengthening Transparency in Regulatory Science. EPA housekeeping authority should not be used to unravel existing regulations that have been instrumental in promoting public health in the US.

The supplemental rule contains new definitions and changes that are dangerous to public health, adding to the already harmful original rule. EPA housekeeping authority should not be used to limit environmental science. I urge you to reconsider the changes proposed by the supplemental rule in the interest of all Americans.

Response: The rule will apply to future rulemakings. EPA intends to continue relying on the high-quality studies to support its significant regulatory decisions and ISI. EPA has explained

¹⁶⁹ *Physicians for Social Responsibility v. Wheeler*, No. 19-5104, 2020 U.S. App. LEXIS 12727 at *27 (D.C. Cir. Apr. 21, 2020).

that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to studies where the underlying data and models are available for independent validation.

Comment [16-182]: Commenter (10048) notes that the SNPRM seeks comment on whether to use “housekeeping” authority for the proposed rule. The proposed rule is substantive and beyond the scope of housekeeping authority. They note, the Supreme Court held, “Section 301 is a “housekeeping statute,” authorizing rules of agency organization, procedure, or practice as opposed to “substantive rules.” There is nothing in the legislative history to indicate that 301 is a substantive grant of legislative power to promulgate rules authorizing the release of trade secrets or confidential business information.” *Chrysler Corp. v. Brown*, 441 U.S. 281 (1979).

Response: The final rule is a rule of agency procedure and practice. The rule applies only to EPA and does not obligate or affect the rights of any outside parties. EPA does not intend to release trade secrets or CBI when implementing the rule. The rule governs only how EPA will consider studies used to develop significant regulatory decisions and ISI.

Comment [20-75]: Commenter (10753) writes that the EPA misleadingly suggests that the Trio is a minor housekeeping matter. Nothing can be further from the truth. Indeed, even if analyzed separately, each of the three elements of the Trio is far more than a housekeeping matter. Each element is in effect a dramatic procedural change that has dire substantive impacts. Obviously, none of the elements of the Trio can be adopted as a housekeeping matter. Cf. The EPA’s ‘Censored Science’ Rule Isn’t Just Bad Policy, It’s Also Illegal, J. Goodwin, 11-22-2019 <https://sensiblesafeguards.org/the-epas-censored-science-rule-isnt-just-bad-policy-its-also-illegal/> (attached).

By restricting sensible scientific inquiry, the EPA effectively is proposing to ignore any and all evidence that undercuts its proposals. While the editors’ numerous prior comments made this clear, an example may be helpful. Dr. Frank Kline, formerly professor of the medical schools of both USC and UC Irvine, explained how the Rule will frustrate good science. See Dr. Kline’s statement included at <https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-8817>.

As an integral part of the editors’ objections to each element of the Trio, they incorporate by reference every objection stated in the following comment briefs:

<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-0561>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-1037>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-3132>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-3133>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-4879>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-5164>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-5183>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-5184>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-5421>

<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-6107>

<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-6113>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-6801>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-8279>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-8178>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-8817> (Collectively, these 16 formal comment briefs are referred to as “the Comments”).

Response: EPA will not categorically exclude any studies from consideration when promulgating significant regulatory decisions or developing ISI. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. That means that the agency will consider all relevant studies when taking covered actions.

Comment [22-77]: Commenter (10975) writes as to “statutory authority” – the disingenuously-entitled “Transparency” rule is not appropriately issued under the authority of the internal agency “house-keeping” statute. Housekeeping rules issued without full rulemaking cannot have legal effect upon third parties outside the government. But the effect of this proposed rule would be to prevent scientific researchers outside of the government from meaningfully submitting their highly relevant work essential in federal initiatives to control disease and other public health necessities. In some cases, this provision will frustrate the business and contractual undertakings of non-profit scientific entities providing services to federal agencies. The preclusion, for irrational, harmful partisan purposes, of scientists’ effective submission of scientific data, moreover, may violate their First Amendment right to petition the government, by pre-emptively blocking the effectiveness of such submissions without regard to their substance and merit.

Response: Nothing in this rule would prevent scientists from submitting their data and studies to EPA. Scientists can also submit their studies for consideration during the public comment period for a significant regulatory decision or during peer review of ISI. Further, the rule does not address or affect business or contractual undertakings of any outside entities. The final rule addresses how EPA will consider the relevant scientific studies when promulgating significant regulatory decisions or developing ISI subject to the rule. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation.

Comment [25-94]: Commenter (10972) writes that the APA requires that the agency in its notice refer to the legal authority under which a rule is proposed. Section 553(b)(2). This requirement cannot be hedged away by asking for comment on the issue. This SNPRM suggests that it is under the EPA’s Housekeeping authority. These rules cannot fit under the housekeeping authority. They are not merely procedural as they encode a substantive value judgment and have great substantive effects on the rights and interests of parties. In the circumstances, the EPA’s legal authority ought to have been identified in the applicable substantive provisions. Not only does the EPA implicitly acknowledge the great substantive effects of these proposed rules, but it also explicitly notes substantive provisions that it believes could be applicable. The provisions

providing legal authority must be correctly identified as such in order to meet the APA's legal requirements.

Identifying the correct legal authority is also important because provisions for issuance of substantive regulations often carry with them requirements unique to them. Notwithstanding the desire to discuss authority under various substantive statutes, the EPA has clearly not complied with the unique rulemaking requirements of some of these statutes. Whatever the Housekeeping authority may entail, it cannot provide a means to avoid the procedural requirements of the legal provisions authorizing a proposed rule.

Seeking to operate on the housekeeping authority is particularly inappropriate in this case where genuine scientific transparency makes different substantive demands under different laws and in different sectors. The SNPRM indicates that the EPA is aware of conflict between some of the statutes it administers and the proposed rule. A claim to be acting under those statutes cannot be sustained in such circumstances. Nothing is achieved by asserting that the statutes control if there is conflict between such statutes or their regulations and the proposed regulations; that regulations cannot be contrary to applicable statutes is trite law, but it can never empower actively passing rules contrary to the statute allegedly empowering them. The Housekeeping authority cannot allow such an effect. Regulations ought to elucidate statutes and facilitate the achievement of statutory goals, not to obfuscate statutory goals.

Response: The commenter claims that the rule is not procedural because it “encodes a substantive value judgment.” The D.C. Circuit held that a rule is required to undergo full notice and comment proceedings if it “also encodes a substantive value judgment or puts a stamp of approval or disapproval on a given type of behavior.” *American Hosp. Ass’n v. Bowen*, 834 F.2d 1037, 1047 (D.C. Cir. 1987); see also *Air Transport Ass’n of America v. DOT*, 900 F.2d 369, 376 (D.C. Cir. 1990). Even if this applies, EPA satisfied any such requirement because the agency promulgated the rule after undergoing notice and comment. Additionally, the final rule does not categorically exclude any relevant studies from consideration. EPA will evaluate and weigh studies determined to be pivotal regulatory science, using the criteria in § 30.5, which will allow all high-quality studies to be factored into the agency’s development of significant regulatory decisions and ISI.

EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, EPA does not rely on, interpret, or apply provisions of a particular statute or statutes that it administers. EPA will undertake such efforts in forthcoming substantive actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule.

EPA identified potential sources of legal authority in both the NPRM and SNPRM (Refs 5-7). Therefore, EPA did in fact meet any obligation under the APA to cite a source of authority. Furthermore, this is a purely procedural rule for reasons already discussed and therefore not subject to the APA’s notice and comment requirements; EPA elected to nevertheless request public comment on various aspects of the rule, including whether the sources of authority already identified were appropriate. This was not improper under the APA.

Comment [31-135]: Commenter (9493) writes that even in the absence of an unprecedented pandemic, the proposed rule would not be one that could be adequately addressed in only thirty days. This fact is evident in the reach and complexity of the EPA’s significantly revised proposal:

The EPA’s new proposal appears to rest on a new theory for why the agency is even authorized to promulgate such a rule. According to the notice, the EPA is now attempting to rely on a “housekeeping authority” rooted in the Federal Housekeeping Statute, Reorganization Plan No. 3, or both, maybe. While the EPA mentioned the housekeeping statute when it extended the first comment period, it now seems to be relying on a more amorphous “housekeeping authority.” (83 FR 15397-98). It is also unclear whether the EPA is relying on this asserted authority exclusively, or whether it intends to include a host of environmental statutes as additional authority for the rule. As the EPA has acknowledged in its notice, reliance on this new theory of authority calls for additional consideration and comment.

Response: EPA is authorized to promulgate this procedural rule under its authority to promulgate housekeeping regulations governing its internal affairs (hereinafter, “housekeeping authority”). EPA is relying on this housekeeping authority and not the environmental statutes as authority for the final rule. Because EPA proposed this authority in the supplemental notice, no additional notice and comment is necessary.

The Federal Housekeeping Statute provides that “[t]he head of an Executive department or military department may prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property.” 5 U.S.C. 301. As the Supreme Court discussed in *Chrysler Corp. v. Brown*, the intended purpose of section 301 was to grant early Executive departments the authority “to govern internal departmental affairs.”¹⁷⁰ As the Supreme Court further notes, section 301 authorizes “what the [APA] terms ‘rules of agency organization, procedure or practice’ as opposed to substantive rules.”¹⁷¹

While EPA is not one of the 15 “Executive departments” listed at 5 U.S.C. 101, EPA gained housekeeping authority equivalent to that granted to Executive departments in section 301 through the Reorganization Plan No. 3 of 1970, 84 Stat. 2086 (July 9, 1970), which created EPA. The Reorganization Plan established the Administrator as “head of the agency,” transferred functions and authorities of various agencies and Executive departments to EPA and gave EPA the authority to promulgate regulations to carry out the transferred functions.

Section 2(a)(1)-(8) of the Reorganization Plan transferred to EPA functions previously vested in several agencies and Executive departments including the Departments of the Interior and Agriculture. Section 2(a)(9) also transferred so much of the functions of the transferor officers and agencies “as is incidental to or necessary for the performance by or under the Administrator of the functions transferred” and provided that “[t]he transfers to the Administrator made by this section shall be deemed to include the transfer of [] authority, provided by law, to prescribe

¹⁷⁰ *Chrysler Corp. v. Brown*, 441 U.S. 281, 309 (1979).

¹⁷¹ *Id.* at 310.

regulations relating primarily to the transferred functions.” The Federal Housekeeping Statute was existing law at the time the Reorganization Plan was enacted.

The Office of Legal Counsel (OLC) has opined that the Reorganization Plan “convey[s] to the [EPA] Administrator all of the housekeeping authority available to other department heads under section 301” and demonstrates that “Congress has vested the Administrator with the authority to run EPA, to exercise its functions, and to issue regulations incidental to the performance of those functions.”¹⁷²

Courts have considered EPA to be an agency with federal housekeeping authority. The U.S. Court of Appeals for the Second Circuit, in *EPA v. General Elec. Co.*, 197 F.3d 592, 595 (2d Cir. 1999), found that “the Federal Housekeeping Statute, 5 U.S.C. 301, authorizes government agencies such as the EPA to adopt regulations regarding ‘the custody, use, and preservation of [agency] records, papers, and property.’” The Fourth Circuit Court of Appeals, in *Boron Oil Co. v. Downie*, 873 F.2d 67, 69 (4th Cir. 1989), held that the district court exceeded its jurisdiction where it compelled testimony contrary to duly promulgated EPA regulations which EPA argued were authorized by section 301. The Second and Fourth Circuits did not directly address whether it was an “Executive department”, but rather assumed that EPA has authority to issue housekeeping regulations under section 301. Indeed, if EPA did not possess such authority, whether under section 301 or otherwise, EPA would not be able to carry out its daily functions which would in turn preclude EPA from exercising its duties as a federal regulatory agency. The same would hold true for other regulatory agencies that are not listed as an Executive department under section 101.

Even if the Federal Housekeeping statute does not directly apply to EPA, the agency’s Reorganization Plan provides the authority to promulgate housekeeping regulations. As indicated by the case law and the OLC Opinion, it has long been presumed that EPA has been granted the authority to promulgate housekeeping regulations, whether pursuant to section 301 or equivalent housekeeping authority.

The Reorganization Plan does not expressly state that the authority to promulgate regulations is limited to the transferred functions, but rather that it relates primarily to the transferred functions. To argue that EPA’s housekeeping authority is limited to carrying out only those functions explicitly transferred in the Reorganization Plan is to accept the statutory maxim that “the explicit mention of one thing is the exclusion of another.” Courts routinely reject this principle because it is based on the faulty premise that the drafters of a statute considered and rejected all possible alternative or supplemental provisions. See, e.g., *National Petroleum Refiners Ass’n v. FTC*, 482 F.2d 672, 676 (D.C. Cir. 1973) (noting that the maxim is “increasingly considered unreliable”); see also *Am. Trucking Ass’n v. United States*, 344 U.S. 298, 309-310 (1953) (rejecting the same principle when evaluating plaintiffs claim that the Interstate Commerce Commission (ICC) did not have the authority to power, control, regulate, or affect leasing practices because that authority was not explicitly named in the ICC’s authorization statute). The court in *American Trucking* rejected the same principle when evaluating plaintiffs claim that the

¹⁷² Authority of EPA to Hold Employees Liable for Negligent Loss, Damage, or Destruction of Government Personal Property, 32 O.L.C. 79, 2008 WL 4422366 at *4 (May 28, 2008) (“OLC Opinion”)

ICC did not have the authority to power, control, regulate, or affect leasing practices because that authority was not explicitly named in the ICC's authorization statute.

Comment [141-1273]: Commenter (11911) writes that EPA is not authorized to promulgate the Strengthening Transparency in Regulating Science (STRS) Rule under its housekeeping authority, as the finalized Rule itself would substantively violate a number of environmental statutes. Further, EPA neglects its mandate under Executive Order 12,866 by failing to account for the social and environmental harms STRS Rule's finalization would generate.¹⁷³

EPA is not authorized to promulgate the STRS Rule under its housekeeping authority. The Housekeeping Act provides that "[t]he head of an Executive department... may prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody use, and property." 5 U.S.C. 301. As the Supreme Court has made clear, the purpose of section 301 is to grant Executive departments "authority to govern internal department affairs.... as opposed to substantive rules."¹⁷⁴

Courts have repeatedly rejected agency attempts, including recent ones,¹⁷⁵ "to twist [the Housekeeping Act, a] simple administrative statute[,] into an authorization for the promulgation of substantive rules."¹⁷⁶

Response: See response to Comment 31-135.

Comment [32-144]: Commenter (11182) notes that EPA is also taking comments on whether to use its housekeeping authority independently as authority or in conjunction with the environmental statutory provisions cited as authority in the 2018 proposed rulemaking (as clarified in the SNPRM). EPA claims it is not seeking to interpret its own statutory authority and that the changes proposed in the SNPRM are authorized under its housekeeping authority. They strongly disagree. The proposed rule creates arbitrary criteria for exclusion of studies considered pivotal science on the basis of use of confidential medical data. The SNPRM significantly increases the number of studies potentially excluded from consideration or subject to down-weighting by the proposed rule, thus far exceeding simple matters of administrative discretion. That the rule is intended to apply to studies in which the potential financial impacts are anticipated to exceed \$500,000,000.00 further demonstrates a level of complexity in excess of that intended to be managed through administrative housekeeping alone.

For these reasons the commenter strongly opposes both the use of the housekeeping provisions to make the changes envisioned in the SNPRM and the proposed ability of the administrator to exempt or not exempt scientific research for consideration by EPA, no matter what aspects of the research are used in the decision-making.

¹⁷³ Exec. Order No. 12,866, 58 Fed. Reg. 51,735 (Oct. 4, 1993).

¹⁷⁴ *Chrysler Corp. v. Brown*, 441 U.S. 281, 309-10 (1979).

¹⁷⁵ *New York v. United States Dep't of Health & Human Servs.*, 414 F. Supp. 3d 475, 513 (S.D.N.Y. 2019) (finding HHS could not promulgate a rule pursuant to Housekeeping Act authority as the Rule was "largely substantive" and the agency's "characterization of the Rule as solely ministerial cannot be taken seriously.")

¹⁷⁶ *Id.* quoting *U.S. ex rel. O'Keefe v. McDonnell Douglas Corp.*, 132 F.3d 1252, 1255 (8th Cir. 1998).

Response: Implementation of the final rule will not result in the categorical exclusion of any relevant studies from consideration. EPA will evaluate studies determined to be pivotal science, using the criteria in § 30.5, which will allow all high-quality studies to be factored into the agency's development of significant regulatory decisions and ISI. The criteria are based on EPA's *Framework for Human Health Risk Assessment to Inform Decision Making* (Ref. 69). EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. Studies identified as pivotal science where the underlying data and models are available for independent validation will be given greater consideration than pivotal science lacking data and model transparency. The EPA will document why a particular study or studies received lesser consideration. An Administrator's exemption can be requested so that pivotal science whose underlying data and models is not, or cannot be, made publicly available can be given greater consideration.

Comment [34-155]: Commenter (11192) writes that the EPA claims to have authority to make extensive changes to how the agency uses science in its decision-making through the Federal Housekeeping Statute, and dwells on this point in the SNPRM for several paragraphs.¹⁷⁷ Remarkably, the EPA suggests that this rule, which ignores established processes for evaluating scientific merit and would impact every regulation under the EPA's authority, is not a "substantive rule."¹⁷⁸ The EPA asserts that the proposed rule "exclusively pertains to the internal practices of the EPA"¹⁷⁹ and fails to mention that the EPA relies extensively on studies conducted by other entities, and indeed, is mandated to consider outside research under both the CAA and CWA. The EPA does not address how the application of the proposed rule could impact its ability to faithfully execute its statutory responsibilities under these acts; it simply makes reference to its intention to be consistent with its other statutes.¹⁸⁰ As the EPA repeatedly asserts that this proposed rule deals with internal EPA processes, the EPA invites public comment about whether to pursue this proposed rule under only its housekeeping authority, or under its housekeeping authority along with its other statutory authorities, and conspicuously does not invite comment about whether or not invocation of the housekeeping authority is appropriate at all.¹⁸¹ Let it be clear: a rule of this breadth, with impacts extending into all significant agency decisions and actions, should by no means be considered a basic agency procedure and housekeeping.

Response: The final rule describes how EPA will consider studies underlying significant regulatory actions and ISI based on data and model availability and study quality factors. Those factors are found in the agency guidance document entitled *Framework for Human Health Risk Assessment to Inform Decision Making*. (Ref. 69) and are already used by EPA to evaluate outside research.

¹⁸¹ *Id.*

Comment [38-185]: Commenter (10751) writes that as they explained their prior comments this week, the EPA has expanded its proposal to stifle good science by publishing a SNPRM. In general, the SNPRM expands the Rule so as to further hamstring good scientific inquiry. For example, the SNPRM improperly purports to hide both scientific data and models as a minor agency housekeeping matter. Obviously, the Rule, the SNPRM, and the Rule to the extent modified by the SNPRM (collectively referred to as the Trio) is far more than an internal agency housekeeping matter.

Response: Nothing in the final rule will lead to the suppression of scientific data and models. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. Additionally, the Administrator's exemption in § 30.9 can be used to allow greater consideration for pivotal science where the underlying data and models are not publicly available.

Comment [40-193]: Commenter (10751) notes that in the SNPRM, EPA states:

Seventh, the EPA is proposing the option of using its housekeeping authority independently as authority for taking this action or in conjunction with the environmental statutory provisions cited as authority in the 2018 proposed rulemaking (as clarified in this supplemental proposal). The Agency continues to consider whether it is appropriate to rely on its authority in the above-referenced environmental statutory provisions (potentially in conjunction with its housekeeping authority). The Agency will consider comments on this issue submitted in response to the 2018 proposal and in response to this SNPRM. Section 301 authority as transferred to EPA in Reorganization Plan No. 3 of 1970 provides appropriate authority for EPA to promulgate regulations that govern internal agency procedures. This action establishes internal agency procedures governing how EPA employees will handle studies when the data and models underlying science that is pivotal to EPA's significant regulatory decisions and/or influential scientific information are or are not publicly available.

Unfortunately, neither time nor the space permitted in public comments like this one permit a full discussion of the legal errors in the SNPRM much less in the Trio. However, it is self-evident that the Trio is both legally invalid and improper.

Congress expressly provided that in the housekeeping provisions of 5 U.S. Code § 301. Departmental regulations.

The head of an Executive department or military department may prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property. This section does not authorize withholding information from the public or limiting the availability of records to the public.” (Pub. L. 89–554, Sept. 6, 1966, 80 Stat. 379.) <https://www.law.cornell.edu/uscode/text/5/301>

While careful analysis of the section's every clause would further demonstrate that the Trio is void ab initio, a plain reading the last sentence suffices. It states: "This section does not authorize withholding information from the public or limiting the availability of records to the public." In the present case, the Trio try to limit the availability of good scientific information of the public. Cf., e.g., Dr. Kline's statement included at <https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-8817>.

This result directly conflicts with the express directions of Congress.

Nor is consideration of the canons of statutory construction necessary to conclude that each element of the Trio is invalid. As the editors explained in their prior comment briefs, both NEPA and the relevant environmental statutes require that the EPA disclose good scientific information to the public. This policy of fulsome disclosure is antithetical to the Trio.

<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-0561>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-1037>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-3132>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-3133>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-4879>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-5164>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-5183>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-5184>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-5421>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-5995>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-6107>

<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-6801>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-8279>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-8178>
<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-8817>

(Collectively, these 16 formal comment briefs are referred to as "the Comments").

Of course, detailed consideration of the canons of statutory construction also compel the conclusion that the Trio are invalid.

For example, the plain meaning of section 301 is that: "This section does not authorize withholding information from the public or limiting the availability of records to the public."

As another example, the clear legislative intent of the underlying environmental statutes is to protect both human health and the environment; the Trio, by contrast, seeks to squelch the truth and bury valid science.

Even if one were to make the absurd assumption that Congress enacted the Trio into law, it is clear that any reviewing court would necessarily conclude that it must invalidate the Trio to avoid the absurd (an unconstitutionally irrational) result of ignoring good science.

Response: The purpose of the rule is to increase transparency of the science EPA uses to support its significant regulatory decisions and ISI. Nothing in the final rule will lead to the suppression of scientific data and models or otherwise withhold information from the public or limit the availability of records to the public. As described in § 30.5, EPA will identify those studies that are given lesser consideration and provide a short description of why lesser consideration was given. The public can provide comments on that issue and can also raise additional studies that it believes the agency should have considered during the comment period on a proposed rule. Additionally, the Administrator’s exemption in § 30.9 can be used to allow greater consideration for pivotal science where the underlying data and models are not publicly available.

Comment [48-375]: Commenter (12727) writes that EPA’s attempt to rely on the Housekeeping Act¹⁸² as a source of authority directly contradicts the statute’s explicit allocation of these housekeeping authorities to “Executive departments”—which EPA is not. The statute provides that “the head of an Executive department or military department may prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property.”¹⁸³ By its terms, this statute authorizes an executive department “to regulate its own affairs” through “rules of agency organization procedure or practice.”¹⁸⁴

EPA is not an “Executive department” within the meaning of section 301. As EPA acknowledges in the Supplemental Notice, section 101 of Title 5 explicitly lists the fifteen entities considered “Executive departments” under section 301,¹⁸⁵ and EPA is not among them.¹⁸⁶ The statute instead designates EPA as an “independent establishment,” under section 104. Section 104 defines an “independent establishment” as “an establishment in the executive branch . . . which is not an Executive department, military department, Government corporation, or part thereof, or part of an independent establishment.”¹⁸⁷ Since EPA is an “independent establishment” rather than an “Executive department,” the agency cannot rely on section 301 as the source of its authority for the 2018 Proposal.¹⁸⁸

Response: See response to Comment 31-135.

Comment [48-376]: Commenter (12727) writes that EPA incorrectly asserts that EPA has gained the authorities of an “Executive department” through delegation and reorganization. In the

¹⁸² 5 U.S.C. § 301.

¹⁸³ *Id.*

¹⁸⁴ *Chrysler Corp. v. Brown*, 441 U.S. 281, 309-10 (1979).

¹⁸⁵ Section 101 lists 15 executive departments (which are the 15 cabinet-level departments): the Department of State, the Department of the Treasury, the Department of Defense, the Department of Justice, the Department of the Interior, the Department of Agriculture, the Department of Commerce, the Department of Labor, the Department of Health and Human Services, the Department of Housing and Urban Development, the Department of Transportation, the Department of Energy, the Department of Education, the Department of Veterans Affairs, and the Department of Homeland Security.

¹⁸⁶ 5 U.S.C. § 101; 85 Fed. Reg. at 15,397 (“EPA is not one of the 15 ‘Executive Departments’ listed at 5 U.S.C. 101.”).

¹⁸⁷ 5 U.S.C. § 104.

¹⁸⁸ See also William Funk, *Is the Environmental Appeals Board Unconstitutional or Unlawful?*, 49 *Envtl. L.* 737, 742-43 (2019) (stating that EPA is not an executive department under the Housekeeping Act so was not authorized to issue a proposal under section 301).

Supplemental Notice, EPA claims that Reorganization Plan No. 3, which established EPA—and contains no mention of the Housekeeping Act—implicitly granted EPA this status when it transferred programs and authorities from the Departments of Interior and Health, Education, and Welfare to the newly formed EPA.¹⁸⁹ Admitting that nothing in Reorganization Plan No. 3 explicitly grants this authority, EPA points to a 2008 OLC opinion, on the entirely unrelated topic of whether federal employees should be held responsible for lost or damaged federal property, which contends that section 2(a)(9) of the plan implicitly confers this authority alongside the explicit transfer of various functions.¹⁹⁰

Such a strained interpretation clearly contradicts the requirement for Congress to amend the statute, if it so wills, to recognize additional executive departments. Congress has demonstrated its capacity to grant newly created government entities the status of executive departments with housekeeping authorities when it so chooses. In 2002, Congress created the Department of Homeland Security (DHS) and, similar to EPA’s Reorganization Plan No. 3, laid out the functions transferred from existing departments to the new department. In section 101 of the Homeland Security Act (HSA), Congress specifically provided that the DHS was being “established . . . as an executive department of the United States within the meaning of title 5.”¹⁹¹ Congress has had decades to take equivalent action with regard to EPA, and Congress’s choice to not update the “Executive department” list cannot be conveniently ignored. To this day, EPA remains an “independent establishment” under the Housekeeping Act. It defies any reasonable interpretation for EPA to be simultaneously designated as an “executive department” and an “independent establishment,” when the latter is defined as an entity not listed among the former. To construe EPA as an “executive department” contradicts the plain language of the statute and congressional intent.

Response: The term “independent establishment” is not used in the Housekeeping Statute. Also see the response to Comment 31-135.

Comment [48-377]: Commenter (12727) notes that the first case EPA cites for support, *EPA v. General Electric Co.*,¹⁹² concerns the judicial reviewability of EPA’s refusal to comply with a third-party subpoena under the APA. The court found the refusal reviewable;¹⁹³ it did not find that EPA’s regulations, which claimed section 301 among other authorities, applied to the subpoena as issued. The court referenced EPA’s potential housekeeping authority only in dicta without any further discussion or analysis.¹⁹⁴

Response: See response to Comment 31-135.

Comment [48-378]: Commenter (12727) notes that in the second case EPA references for support, *Boron Oil Co. v. Downie*,¹⁹⁵ the court held that the lower courts lacked jurisdiction to

¹⁸⁹ See Reorganization Plan No. 3 of 1970, 84 Stat. 2086 (July 9, 1970).

¹⁹⁴ *Id.* at 595-97.

¹⁹⁵ 873 F.2d 67 (4th Cir. 1989); see also 85 Fed. Reg. at 15,397.

compel an EPA employee to appear and testify in a state court action to which the government is not a party as EPA was protected by sovereign immunity.¹⁹⁶ While finding the grant of sovereign immunity sufficient on its own merit, the court explained that the principle of federal supremacy supports the protection of sovereign immunity such that the state court could not compel testimony in violation of EPA's housekeeping regulations.¹⁹⁷ But the court provided no explication of how EPA could be construed as an "Executive department" under the Housekeeping Act with relevant authority to issue such regulations. Moreover, the EPA regulations there in question claim an assortment of authorities, not only the Housekeeping Act.¹⁹⁸

Response: See response to Comment 31-135.

Comment [48-379]: Commenter (12727) notes that the Supplemental Notice also broadly cites *Chrysler Corp. v. Brown*.¹⁹⁹ But that case provides no additional basis to apply section 301 authority to an "independent establishment," as the case concerns the DOL—a listed executive department under the Housekeeping Act. It also holds that the Housekeeping Act does not authorize issuance of substantive rules, as discussed *infra*.

Response: See response to Comment 31-135. The final rule is a rule of agency procedure and practice. The rule applies only to EPA and does not obligate or affect the rights of any outside parties. As the Supreme Court stated in *Chrysler Corp.*, whether a rule affects individual rights and obligations is an "important touchstone" for distinguishing substantive rules from other types of rules.²⁰⁰ This final rule does not regulate the rights and obligations of any party outside of the EPA let alone have legal force and effect on them. Therefore, any incidental impacts on voluntary behavior outside of the EPA do not render it a substantive rule. Nothing in this rule would prevent scientists from submitting their data and studies to EPA. Researchers may voluntarily take steps to ensure that their studies are given greater consideration by making their data and models publicly available for independent validation.

Comment [48-380]: Commenter (12727) notes that in the primary case EPA cites for its alleged authority under the Housekeeping Act to issue the proposal, *Chrysler Corp. v. Brown*, the Supreme Court makes explicit that the Housekeeping Act cannot authorize substantive rules such as the current proposal. *Chrysler Corp.* concerned a government contractor who asked the court to enjoin release of documents regarding petitioner's employment practices. The documents had been requested under the Freedom of Information Act (FOIA), and a division of the DOL had determined they should be released, consistent with FOIA and disclosure regulations from the DOL's Office of Federal Contract Compliance Programs (OFCCP). The court concluded that section 301 did not authorize the OFCCP regulations, explaining that section 301 is a "housekeeping statute," authorizing only rules of agency organization, procedure, or practice as opposed to "substantive rules."²⁰¹ It found "nothing in the legislative history of § 301 to indicate

¹⁹⁶ *Boron Oil Co.*, 873 F.2d at 70.

¹⁹⁹ 441 U.S. 281 (1979); see also 85 Fed. Reg. at 15,397.

²⁰⁰ *Chrysler Corp.*, 441 U.S. 281 at 302.

²⁰¹ *Chrysler Corp.*, 444 U.S. at 310.

it is a substantive grant of legislative power to promulgate rules authorizing the release of trade secrets or confidential business information.”²⁰² The case offers no support for a more expansive reading of what constitutes non-substantive rules of agency organization, procedure, or practice for even an executive department—which, as explained above, EPA is not.

Response: The final rule is a procedural rule of agency procedure and practice. It does not establish requirements for outside parties, nor does it affect the rights, interests, and obligations of outside parties. Even assuming there could be downstream practical effects on the voluntary behavior of outside parties and on outside parties’ interactions with EPA, such impacts do not render this procedural rule substantive. See *American Hosp. Ass’n v. Bowen*, 834 F.2d 1037, 1051 (D.C. Cir. 1987) (“[A]gency rules that impose ‘derivative,’ ‘incidental,’ or ‘mechanical’ burdens upon regulated individuals are considered procedural, rather than substantive.”)

Comment [48-381]: Commenter (12727) writes that Congress took explicit action in 1958 to amend section 301 to “correct” agencies from abusing the Housekeeping Act by attempting to use its authority as a substantive basis to withhold information from the public.²⁰³ The Supreme Court noted in *Chrysler Corp.* “that Congress had looked carefully at the statute in 1958; that the Special Subcommittee on Government Information had ‘unanimously agreed that [§ 301] originally was adopted in 1789 to provide for the day-to-day office housekeeping in the Government departments,’ and that attempts to construe it as something more was ‘misuse’ which ‘twisted’ the statute.”²⁰⁴ The courts have repeatedly checked subsequent agency attempts to “twist” the statute to a range of substantive purposes and found those efforts illegal, including halting government’s extralegal efforts to limit disclosure and inclusion of information in the scientific process.²⁰⁵ The Supplemental Notice now attempts to similarly and illegally twist the statute to withhold science from consideration in rulemakings that broadly affect the public interest.

²⁰² *Id.* (emphasis omitted); see also *United States ex rel. O’Keefe v. McDonnell Douglas Corp.*, 132 F.3d 1252, 1255 (8th Cir. 1998) (applying *Chrysler Corp.* and finding that the housekeeping statute did not provide authority for substantive regulations).

²⁰³ H.R. No. 1461, 85th Cong., 2d Sess. (1958), reprinted in 1958 U.S.C.C.A.N. 3352, 3353.

²⁰⁴ *U.S. ex rel. O’Keefe*, 132 F.3d at 1255 (quoting *Chrysler Corp.*, 441 U.S. at 310 n.41).

²⁰⁵ See *City & Cty. of San Francisco v. Azar*, 411 F. Supp. 3d 1001, 1023 (N.D. Cal. 2019) (vacating regulations from the Department of Health and Human Services and explaining that defendants “mistakenly rely on their ‘housekeeping authority’ to support their authority to promulgate the rule” but “[n]one of the statutes cited by defendants provide HHS with the authority to promulgate substantive rules” including the Housekeeping Act); *United States ex rel. O’Keefe*, 132 F.3d at 1255 (“In recent years, several agencies have unsuccessfully attempted to find statutory authority for substantive regulations in the Housekeeping Statute.”); *In re Bankers Trust Co.*, 61 F.3d 465, 470 (6th Cir. 1995) (holding regulation requiring subpoenaed party to refuse production of confidential information was not authorized by the Housekeeping Statute and “exceeded the congressional delegation of authority”), cert. dismissed, 517 U.S. 1205 (1996); *Exxon Shipping Co. v. United States Dep’t of Interior*, 34 F.3d 774, 776-78 (9th Cir. 1994) (holding that the Housekeeping Act did not authorize regulations allowing agency to withhold deposition testimony of federal employees); *In re Cincinnati Radiation Litig.*, 874 F. Supp. 796, 826-27 (S.D. Ohio 1995) (holding that the Housekeeping Act did not authorize a 1953 Defense Department directive on the use of human volunteers in experimental research); *McElyea v. Sterling Med. Inc.*, 129 F.R.D. 510, 514 (W.D. Tenn. 1990) (concluding that the Housekeeping Act did not give the Department of Navy authority to create general discovery privilege for persons under its jurisdiction).

Response: The purpose of the rule is to increase transparency of the science EPA uses to support its significant regulatory decisions and ISI. Nothing in the final rule will lead to the suppression of scientific data and models.

Comment [48-382]: Commenter (12727) writes that the proposal is a substantive rule and hence not authorized by the Housekeeping Act.

The 2018 proposal and Supplemental Notice meet the court-determined criteria for a substantive regulation, refuting EPA’s claim that it is proposing merely an “internal rule of agency procedure.”²⁰⁶ A “substantive rule” is not defined in the APA, but in distinguishing between “substantive rules” and “interpretive rules, general statements of policy, or rules of agency organization, procedure, or practice,” courts have described “substantive rules” as those “affecting individual rights and obligations,” a quality which helps identify which rules are “binding” or “have the force of law.”²⁰⁷ By contrast, courts have held that regulations issued pursuant to the authority under the Housekeeping Act “do not have the force and effect of law,”²⁰⁸ and are “directory, not mandatory in nature.”²⁰⁹ Courts have not been shy in finding executive departments’ regulations to be substantive rules exceeding authorities under the Housekeeping Act.²¹⁰

In *CropLife Am. v. EPA*,²¹¹ the D.C. Circuit Court of Appeals considered whether an EPA press release, which stated that the agency would not consider third party-controlled human exposure studies for purposes of pesticide registration subject to case-by-case consideration of individual studies, was a substantive rule. The court held that the press release bound both EPA and registrants during pesticide registrations and so was a binding “substantive rule.”²¹² In reaching its decision, the court considered two established case law formulations for determining whether an agency action constitutes a substantive regulation: the effects of the agency’s action;²¹³ and the agency’s expressed intentions regarding the action.²¹⁴ Consistent with *Chrysler Corp.*, the two analyses overlap in recognizing that a substantive action “binds private parties or the agency itself with the ‘force of law.’”²¹⁵ In *Croplife*, the court determined: “EPA’s stated rule is binding

²¹⁰ See supra note 98.

²¹¹ 329 F.3d 876 (D.C. Cir. 2003).

²¹² *Id.* at 883.

²¹³ See *Cnty. Nutrition Inst. v. Young*, 818 F.2d 943, 946 (D.C. Cir. 1987) (quoting *Am. Bus. Ass’n v. United States*, 627 F.2d 525, 529 (D.C. Cir. 1980)) (considering whether the agency action (1) “impose[s] any rights and obligations,” or (2) “genuinely leaves the agency and its decisionmakers free to exercise discretion”).

²¹⁴ See *Molycorp, Inc. v. EPA*, 197 F.3d 543, 545 (D.C. Cir. 1999) (stating that the court considers “(1) the Agency’s own characterization of the action; (2) whether the action was published in the *Federal Register* or the Code of Federal Regulations; and (3) whether the action has binding effects on private parties or on the agency”).

²¹⁵ *Gen. Elec. Co. v. EPA*, 290 F.3d 377, 382 (D.C. Cir. 2002); see also *Natural Resources Defense Council v. Wheeler*, 955 F.3d 68, 83 (D.C. Cir. 2020) (“A legislative rule is one that has legal effect or, alternately, one that an agency promulgates with the intent to exercise its delegated legislative power by speaking with the force of law

on petitioners, who are now barred from relying on third-party human studies (even in cases where such studies formerly were approved), and is binding on the agency because EPA has made it clear that it simply ‘will not consider’ human studies.”²¹⁶

Like the action at issue in *Croplife*, both the original proposal and the Supplemental Notice would bind EPA to not consider or to discount a scientific study it could have previously given full consideration, all else being equal, if the study fails to meet the new requirement that underlying data and models be publicly available (or available through tiered access). The only possible exception would be if an otherwise disqualified study met the proposal’s exemption criteria and the Administrator exercised his or her discretion to grant an exemption. Likewise, the proposed rule would bind the public, including organizations such as the Environmental Defense Fund (EDF), who can no longer receive the benefit of EPA’s full consideration of valid but non-complying studies that they submit to the agency as part of an administrative record for an agency action, which EPA would previously have been required to consider as part of the rulemaking process. Furthermore, EPA’s rule would require researchers interested in contributing to regulatory protections and ISI to alter their conduct or risk having their efforts deemed unusable. Ultimately, the rule would diminish the public’s statutorily protected interests in regulations informed by the best available science, an outcome that results from substantive choices about the scientific evidence it will consider.²¹⁷

Response: The purpose of the rule is to increase transparency of the science EPA uses to support its significant regulatory decisions and ISI. Nothing in the final rule will lead to the suppression of scientific data and models. This final rule does not regulate the rights and obligations of any party outside of the EPA let alone have legal force and effect on them. Therefore, any incidental impacts on voluntary behavior outside of the EPA do not render it a substantive rule.

Courts have held that an agency may bind itself to comply with a procedural rule. The *Accardi* doctrine holds that “government agencies are bound to follow their own rules, even self-imposed procedural rules that limit otherwise discretionary decisions.” *United States ex rel. Accardi v. Shaughnessy*, 347 U.S. 260, 267–68, 74 S.Ct. 499, 98 L.Ed. 681 (1954)). *Accardi* applies to “gratuitous” regulations that agencies did not need to promulgate because “‘[a] court’s duty to enforce an agency regulation [, while] most evident when compliance with the regulation is mandated by the Constitution or federal law,’ embraces as well agency regulations that are not so required.” *United Space Alliance, LLC v. Solis*, 824 F.Supp.2d 68, 82 (D.D.C. 2011) (citing *Lopez v. F.A.A.*, 318 F.3d 242, 247 (D.C.Cir.2003); quoting *United States v. Caceres*, 440 U.S. 741, 749, 99 S.Ct. 1465, 59 L.Ed.2d 733 (1979)).

Comment [48-383]: Commenter (12727) writes that when evaluating additional factors courts use to distinguish substantive rules, the proposal identifies itself even more definitively as a substantive rule than the EPA action reviewed in *Croplife*. First, both the 2018 proposal and the

Here, the 2018 Rule has independent legal effect beyond that compelled by *Mexichem* and reflects EPA’s intent to exercise its delegated legislative power.” (internal citation and quotation marks omitted)).

²¹⁶ *Croplife*, 329 F.3d at 881.

²¹⁷ EPA itself has recently argued as much. See Brief for Appellees at 19, *Union of Concerned Scientists v. Wheeler*, No. 19-1383 (1st Cir. filed Oct. 7, 2019) (describing EPA’s policy of disqualifying any researcher who has accepted funding from EPA from serving on a scientific advisory committee, because of concerns about the appearance of conflicts of interest, as a “substantive choice[] concerning [EPA’s] advisers”).

Supplemental Notice were published according to notice-and-comment procedures in the *Federal Register*, unlike the EPA action evaluated in *Croplife*. Courts have considered whether the agency used full public notice-and-comment procedures, which an agency need not use when producing an “interpretive” rule or rule of agency procedure, as an indicator of a substantive rule.²¹⁸ While courts consider an agency’s own characterization of its action, they disregard claims that conflict with the record such as EPA’s contention here that the 2018 proposal as supplemented “would not regulate the conduct or determine the rights of any entity outside the federal government.”²¹⁹ “The agency’s characterization of its own action is not controlling if it self-servingly disclaims any intention to create a rule with the “force of law,” but the record indicates otherwise.”²²⁰ And instead of a paragraph in a mere press release, EPA proposes to publish in the Code of Federal Regulations (CFR) criteria for barring studies from both regulatory and non-regulatory use—a hallmark of a substantive regulation.²²¹ EPA’s choice to put the rule through notice-and-comment rulemaking provides further evidence that EPA regards the rule as substantive.

Response: EPA voluntarily provided notice and comment on this procedural rule to notify the public of the internal steps the agency will take to increase transparency of the science used to support significant regulatory decisions and ISI. There are no provisions in the final rule that regulate outside conduct. Nor are there any provisions that bar the use of any studies. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. Many procedural rules are published in the CFR. Mere publication of those rules does not convert them into substantive rules.

Comment [48-408]: Commenter (12727) writes that argued in the inverse, the 2018 proposal and Supplemental Notice do not meet the requirements for a rule of agency organization, procedure, or practice, for purposes of the APA. Agency actions in this category are the opposite of substantive rules; they are those “that do not themselves alter the rights or interests of parties, although [they] may alter the manner in which the parties present themselves or their viewpoints to the agency.”²²² An agency action that “trenches on substantial private rights and interests” cannot be a rule of agency organization, procedure, or practice.²²³ A federal court recently vacated substantive regulations issued by the Department of Health and Human Services under their “mistaken[.]” claim of authority under the Housekeeping Act, finding that “[t]he challenged rule is not . . . a mere housekeeping rule. The expansive definitions in the rule depart from the

²¹⁸ See, e.g., *Long Island Care at Home, Ltd. v. Coke*, 551 U.S. 158, 172–73 (2007); see also 5 U.S.C. § 553(b)(3)(A); *MolyCorp*, 197 F.3d at 545.

²¹⁹ 85 Fed. Reg. at 15,398.

²²³ *Id.* at 708.

federal statutes, as explained above, changing the rights and responsibilities of health care providers.”²²⁴

By the same framework, the 2018 proposal and Supplemental Notice must be a substantive rule, exceeding the powers of the Housekeeping Act, because they affect private rights and interests. By restricting the scientific studies on which EPA may base final significant regulatory actions, EPA severely limits parties from relying on excluded studies in advocating for particular safeguards, or petitioning the agency to take a specific action, as the statute authorizes them to do. As noted in EDF’s prior comments, because the rule would substantively impact agency conclusions and regulations, it impacts private rights and interests. The proposal does not allow private individuals to submit for consideration (or renders such submittal a nullity) studies that they would have been permitted to prior to the proposal, thus impacting the substantive standards that EPA is able to justify setting—which has implications for the regulated community as well as for public health.²²⁵ EPA’s proposed action “encodes a substantive value judgment [and] puts a stamp of approval or disapproval on a given type of behavior” by requiring regulatory actions to be supported only by certain scientific information deemed acceptable by the proposal.²²⁶

Response: The final rule is a rule of agency procedure and practice. The rule applies only to EPA and does not obligate or affect the rights of any outside parties. Procedural rules cannot alter the rights or interests of parties but they “may alter the manner in which the parties present themselves or their viewpoints to the agency.” *James A. Hurson Assocs. v. Glickman*, 229 F.3d 277, 280 (D.C. Cir. 2000). Because the agency will consider rather than categorically exclude studies where the underlying data and models are not available for independent validation, researchers need not alter the way they conduct their studies for them to be considered by EPA. However, if those researchers want their studies to receive greater consideration, they can voluntarily take steps to ensure that the data and models are publicly available to the greatest extent possible, given any statutory limitations on data availability. EPA will evaluate studies determined to be pivotal science, using the criteria in § 30.5, which will allow all high-quality studies to be factored into the agency’s development of significant regulatory decisions and ISI.

Comment [48-433]: Commenter (12727) writes that EPA has even acknowledged that the “the bulk of the responsibility for instituting new methods for access to data and models” will “fall[] on outside parties”—including both researchers and the CDC—according to a memorandum prepared by committee staff to capture recent briefings on the rule before the House Committee

²²⁴ *City & Cty. of San Francisco v. Azar*, 411 F. Supp. 3d 1001, 1023 (N.D. Cal. 2019).

²²⁵ See, e.g., Comments of 88 Environmental, Farmworker, Environmental Justice, Public Health, and Animal Protection Organizations on Proposed Regulations on “Transparency” in Regulatory Science, Docket ID No. EPA-HQ-OA-2018-0259-6137, at 6-14 (Aug. 15, 2018) (“Earthjustice 2018 Comments”) (discussing the substantial impacts on public health that could result from the rule as originally proposed). The public health impacts would be even greater under the expanded scope of the Supplemental Notice.

²²⁶ *Am. Hosp. Ass’n v. Bowen*, 834 F.2d 1037, 1047 (D.C. Cir. 1987); see also *Pharm. Mfrs. Ass’n v. Finch*, 307 F. Supp. 858, 865 (D. Del. 1970) (finding that a regulation promulgating new criteria for clinical investigations that will meet the standards of evidence necessary to demonstrate the effectiveness of drug products, and excluding certain kinds of clinical investigations, was not merely a procedural rule, because it “did effect a material narrowing of the range of evidence which previously had been considered relevant in evaluating a drug’s efficacy,” “[b]ecause of the important clarification of acceptable testing standards effected by the . . . regulations,” and “because of the substantial impact of the[] regulations on the drug industry”).

on Science, Space, and Technology.²²⁷ For example, the memorandum records EPA’s opinion that researchers, “would be responsible for managing the logistics of making the data and models publicly available in a manner that complies with the rule, in consultation with EPA staff,” and the CDC would shoulder the burden of “hosting the data and models on its own servers, with CDC personnel working at the secure data enclave reviewing research proposals submitted by members of the public seeking to conduct their own analyses of study data and determining the level of access to grant on a case-by-case basis.”²²⁸ These substantial impacts on parties outside of EPA further confirm that the proposal is not an internal or procedural rule, but a substantive rule which cannot be issued under the Housekeeping Act.

Response: This procedural rule does not impose obligations or requirements on outside parties. Neither the CDC nor researchers are required to take any actions due to this rule. EPA discussed in the preamble of the 2020 SNPRM that it is investigating secured data access options with the pilot study using a CDC secure data enclave to host EPA datasets in a restricted use environment. Any decision whether to use CDC’s data enclave to host EPA data would be issued separately from this final rule.

As previously stated, nothing in this rule would prevent scientists from submitting their data and studies to EPA. Because the agency will consider rather than categorically exclude studies where the underlying data and models are not available for independent validation, researchers need not alter the way they conduct their studies. However, if those researchers want their studies to receive greater consideration, they can voluntarily take steps to ensure that the data and models are publicly available to the greatest extent possible, given any statutory limitations on data availability.

Comment [48-438]: Commenter (12727) writes that the Housekeeping Act provides no basis to violate other statutes, including landmark environmental laws and the IQA. As discussed above, the Housekeeping Act authorizes only procedural rules regarding “the custody, use, and preservation of [agency] records, papers, and property,”²²⁹ as opposed to “substantive rules.” Regulations issued under the Housekeeping Act “do not have the force and effect of law,”²³⁰ and have been “held to be directory, not mandatory in nature.”²³¹ While an agency is bound to adhere to all the laws it is required to administer, it is particularly egregious that EPA claims that a procedural housekeeping rule, which lacks legal force, would somehow supersede other binding

²²⁹ 5 U.S.C. § 301.

²³⁰ See *Einhorn*, 618 F.2d at 350 (reviewing regulations arising from the Internal Revenue Service’s Statement of Procedural Rules promulgated under 5 U.S.C. §§ 301, 552 and finding that “[t]heir purpose is to govern the internal affairs of the Internal Revenue Service. They do not have the force and effect of law.” (citations omitted)); see also James F. Ponsoldt, *Balancing Government Efficiency and the Protection of Individual Liberties: An Analysis of the Conflict Between Executive Branch “Housekeeping” Regulations and Criminal Defendants’ Rights to a Constitutionally Fair Trial*, 19 Harv. C.R.-C.L. L. Rev. 349, 370 (1984) (“The Housekeeping Statute only authorizes regulations consistent with law. In fact, regulations promulgated pursuant to the statute which relate to the internal operations of an agency have been held not to have the force of law even with respect to the rights of third parties.”).

²³¹ *Boulez*, 810 F.2d at 215.

statutory authorities and allow EPA to rewrite bedrock environmental statutes. The 2018 proposal and Supplemental Notice would require EPA to weigh the extra-statutory factor of data availability and disregard other high-quality data which EPA is required to review under the scientific standards of multiple environmental statutes.²³² The courts have barred previous unlawful efforts to amend binding statutory and regulatory requirements via the Housekeeping Act. Treasury Department rules derived under the Housekeeping Act were found explicitly unable to “override” other binding Treasury Department regulations promulgated pursuant to specific statutory delegation.²³³ Similar logic was at work in *Chrysler Corp.* Concluding that section 301 did not authorize regulations limiting the scope of the Trade Secrets Act, the Supreme Court found the “greatest significance” to be “the ‘housekeeping’ nature of § 301 itself.”²³⁴

As discussed above, EPA has styled the 2018 proposal and Supplemental Notice as a substantive rule that would bind the agency from considering scientific studies without publicly available datasets during rulemakings. However, even if the proposal were found to be validly issued under the Housekeeping Act, it could not in any way authorize violating environmental statutes or binding regulations implementing these statutes. Like the Trade Secrets Act, the major environmental statutes are binding authorities that cannot be limited by the regulations issued under the Housekeeping Act. Nor can the Housekeeping Act authorize rules that would supersede implementing regulations for environmental statutes which have been issued by specific statutory delegation in the same manner as the Treasury Department regulations discussed above.

Response: The final rule does not bind the agency from considering any particular studies. Nor does the rule authorize violations of the statutes and regulations EPA administers. The rule expressly states in § 30.3 that “[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”

Comment [54-248]: Commenter (11361) writes that this SNPRM demonstrates a disingenuous request for public input from the EPA.

The EPA is obligated through the APA to notify the public and invite public comment on proposed regulations.²³⁵ While fulfilling the procedural requirements of the APA through this SNPRM, the EPA downplays the public interest of this sweeping proposed regulation, repeatedly asserts that this proposed rule is an affair internal to the agency, and sets up a path for the agency to dismiss public input regarding the STRS rule.

²³² For a more detailed explanation of how the 2018 proposal would violate EPA’s statutory requirements under a range of environmental laws, see EDF 2018 Comments at 13-34 and Earthjustice 2018 Comments at 33-53.

²³³ *Flynn v. Comm’r*, 269 F.3d 1064, 1072 (D.C. Cir. 2001).

²³⁴ *Chrysler Corp.*, 441 U.S. at 311-12.

²³⁵ Administrative Procedure Act, 5 U.S.C. § 552.

In the first paragraph of the Executive Summary, the EPA appears to dissuade public comment by understating the interest of members of the general public in a proposed rule designed to significantly alter regulations protecting public health.

First, the EPA frames the proposed rule as internal to the agency, stating “This SNPRM does not regulate any entity outside the Federal Government. Rather, the proposed requirements would modify the EPA's internal procedures regarding the transparency of science underlying regulatory decisions.”²³⁶ The EPA then concedes that “any entity interested in EPA's regulations may be interested in this proposal,” providing an example of “entities that conduct research or another scientific activity that is likely to be relevant to EPA's regulatory activity.”²³⁷

The EPA claims to have authority to make extensive changes to how the agency uses science in its decision-making through the Federal Housekeeping Statute, and dwells on this point in the SNPRM for several paragraphs.²³⁸ Remarkably, the EPA suggests that this rule, which ignores established processes for evaluating scientific merit and would impact every regulation under the EPA's authority, is not a “substantive rule.”²³⁹ The EPA asserts that the proposed rule “exclusively pertains to the internal practices of the EPA”²⁴⁰ and fails to mention that the EPA relies extensively on studies conducted by other entities, and indeed, is mandated to consider outside research under both the CAA and CWA. The EPA does not address how the application of the proposed rule could impact its ability to faithfully execute its statutory responsibilities under these acts; it simply makes reference to its intention to be consistent with its other statutes.²⁴¹ As the EPA repeatedly asserts that this proposed rule deals with internal EPA processes, the EPA invites public comment about whether to pursue this proposed rule under only its housekeeping authority, or under its housekeeping authority along with its other statutory authorities, and conspicuously does not invite comment about whether or not invocation of the housekeeping authority is appropriate at all.²⁴² Let it be clear: a rule of this breadth, with impacts extending into all significant agency decisions and actions, should by no means be considered a basic agency procedure and housekeeping.

Response: Rather than undermining public input, EPA voluntarily provided two opportunities for public comment and also held a public hearing on the 2018 proposal. EPA has used the criteria found in EPA's *Framework for Human Health Risk Assessment to Inform Decision Making* (Ref. 69) to evaluate extramural research for use in regulatory decisions. EPA has made that policy choice transparent by providing public notice before implementation.

Comment [55-272]: Commenter (10974) writes that EPA does not have the authority to use the Federal Housekeeping Statute in 5 U.S.C. § 301 to promulgate this rule.

Lower courts have since addressed what differentiates a housekeeping policy from a substantive rule. A recent U.S. District Court decision analyzed what constitute “housekeeping” versus

²⁴² Id.

“substantive” rules, as the APA does not define what a “substantive” rule is.²⁴³ The court found that a “substantive” rule “announces new rights and imposes new duties – one that shapes the primary conduct of regulated entities.”²⁴⁴ Other courts have found that substantive rules “jeopardize or substantially affect the rights and interests of private parties”,²⁴⁵ and that substantive rules are “legislative-type”²⁴⁶ rules that are described as “affecting individual rights and obligations.”²⁴⁷

The crux of EPA’s purported authority to use the housekeeping rule in this case relies, at its core, on the definition of a “substantive” rule, for the following two reasons.

First, the 2018 NPRM and the SNPRM would unmistakably, and significantly, affect individuals whose private health information may become public, as well as corporate CBI submitted to the EPA as included in research findings. Entities and individuals conducting research would also be affected – if they did not want to release underlying data, the EPA could (and likely would) give less credence to their studies while creating regulations. In these ways, the rule would meet the definition of a substantive rule.

Second, if finalized, this rule would have sweeping implications on how EPA and non-EPA research is conducted. It is inaccurate to imply, as EPA does, that this rule would not impact the entire field of environmental health research and state policymaking – it would. Due to the likelihood of this far-reaching impact, which will go well-beyond the confines of the agency itself and its internal housekeeping policy, EPA is not authorized to use this housekeeping authority in this context.

Based on our legal interpretation of 5 U.S.C. § 301 and the context under which it was created, the MPCA and MDH affirm that EPA does not have the authority to promulgate this substantive rule based solely, or in part, on the agency’s housekeeping authority – nor any of the other underlying environmental rule authorities listed in the SNPRM, corrected or as otherwise listed in the 2018 NPRM.²⁴⁸

Response: Nothing in the final rule mandates or compels the release of private health information or CBI. EPA has been clear in § 30.5 that where the Agency is making data or models publicly available, “it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security.”

Because the agency will consider rather than categorically exclude studies where the underlying data and models are not available for independent validation, researchers need not alter the way they conduct their studies. However, if those researchers want their studies to receive greater

²⁴⁷ *Chrysler Corp. v. Brown*, 441 U.S. 281, 302 (1979)

²⁴⁸ The 2018 comments from a multi-state coalition of Attorneys General, which included Minnesota, describe why the statutory authorities cited by EPA in 2018 do not authorize EPA to promulgate this rule. The comment letter is available under the Docket for this rulemaking, Comment ID EPA-HQ-OA-2018-0259-6915.

consideration, they can voluntarily take steps to ensure that the data and models are publicly available to the greatest extent possible, given any statutory limitations on data availability.

Also see the response to Comment 31-135.

Comment [59-327]: Commenter (11243) writes that the failure of EPA to identify a colorable legal basis for this rulemaking is emblematic of the Trump administration's brazen disregard for the rule of law.

The original proposal laughably gestures at EPA's various authorizing statutes as legal authority. The ridicule this claim engendered appears to have spurred one of the most significant aspects of the supplemental proposal. Namely, the new claim that this rulemaking is authorized by the federal housekeeping statute. This argument has two critical flaws though. First, the federal housekeeping statute does not apply to the EPA, only executive departments. Second, even if the statute did apply to EPA, it would not supply the legal basis for something like this rulemaking.

Response: See the response to Comment 31-135.

Comment [59-328]: Commenter (11243) notes that EPA acknowledges that it is not an executive department but argues that it was nonetheless brought within the scope of the federal housekeeping statute through Reorganization Plan Number 3 of 1970, which created the agency. The essay appended to my oral presentation explains in greater detail why this argument should be rejected. For now, I will emphasize two points. One, Reorganization Plan Number 3 conspicuously makes no mention of the federal housekeeping statute. Instead EPA has left to infer the transfer of that authority to a vague catch-all provision. In essence, then the agency claims Congress implicitly intended for EPA to be considered a department, but just hasn't gotten around to officially declaring it.

Two, while Congress has updated the list of executive departments several times since 1970, it has never included the EPA. Most recently it did so with the DHS which, like EPA, was pieced together from several existing agencies.

Response: See the response to Comment 31-135.

Comment [59-330]: Commenter (11243) writes that one, the censored science rule is a far cry from the kind of modest and noncontroversial internal operating procedures that Congress envisioned with the federal housekeeping statute. To wit: the original censored science proposal is so controversial it attracted over six hundred thousand public comments. Two, even the Supreme Court case that EPA cites to support this argument that the rulemaking is covered by the federal housekeeping statute, *Chrysler Corp. versus Brown*, makes clear that the censored science rule exceeds the modest authority that the law provides. Among other things, the Court in *Chrysler Corp.* was troubled by how the rule at issue affected the relationship between the government and private sector entities.

Significantly, the operative function of the censored science rule is to affect the relationship between EPA and members of the public. Specifically, it would fundamentally alter how the

public participates in the development of new rules by limiting the kinds of views that they can share on a scientific basis per those rules. Today you will hear many reasons for why the EPA should abandon the censored science rule. As I have explained, the lack of a legal basis for the rule provides one more reason. Thank you for your attention.

Response: There is no provision of the final rule that would affect the relationship between EPA and private sector entities. No party outside of EPA is obligated to take any steps to comply with this internal agency procedure. Further, the rule will not affect the public's ability to participate in the development of new rules. The agency provides notice of all studies that it considers in regulatory decisions; a practice that was codified at § 30.4. During the comment period on a proposed rule, the public can comment on EPA's evaluation of the science and can also submit studies to EPA that it believes the agency should consider.

Comment [71-404]: Commenter (11354) writes that there is a lack of authority. The proposal has changed the authority EPA seems to rely on. And it's solely on housekeeping authority statute for executive departments, in combination with corrective environmental statutes listed in the original proposal.

This really is a backward rulemaking; proposing an action and then asking for help to determine authority. It is cited authority that doesn't authorize the rule. And -- in an event of a conflict, the proposal says that other statute or regulations may apply.

Response: See the response to Comment 31-135 and APA response to Comment 25-94.

Comment [73-409]: Commenter (11576) writes that the Agency's new standards for evaluating scientific studies are not internal "housekeeping" requirements.

As the Supreme Court has noted, the federal housekeeping statute was originally “enacted to help General Washington get his administration underway by spelling out the authority for executive officials to set up offices and file Government documents”—documents “pertaining to the day-to-day business of Government[.]”²⁴⁹ In its current form, which has been codified in Section 301 of Title 5, the statute provides that:

The head of an Executive department or military department may prescribe regulations for the government of ... [the] department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property. This section does not authorize withholding information from the public or limiting the availability of records to the public.²⁵⁰

²⁴⁹ *Chrysler Corp. v. Brown*, 441 U.S. 281, 309 n.39 (1979) (quoting H.R. Rep. No. 1461, 85th Cong., 2d Sess., at 1 (1958)). See also Don Lively, *Government Housekeeping Authority: Bureaucratic Privileges Without a Bureaucratic Privilege*, 16 Harv. C.R.-C.L. L. Rev. 495, 498 n. 15 (1981) (noting that the housekeeping statute can be traced back to 1789, when “Congress enacted several statutes authorizing the heads of the various executive departments ‘to have the custody and charge of all records, books and papers in the office’”) (quoting Act of July 27, 1789, ch. 4, 1 Stat. 28).

²⁵⁰ 5 U.S.C. § 301.

Both the terms of the housekeeping statute and its legislative history accordingly demonstrate that it is “simply a grant of authority to ... agenc[ies] to regulate ... [their] own affairs.”²⁵¹ In the words of the Supreme Court, Section 301 “authoriz[es] what the ... [APA] terms ‘rules of agency organization[,] procedure[,] or practice’ as opposed to ‘substantive rules.’”²⁵²

With its supplemental notice, the EPA has admitted that it is “not one of the 15 ‘Executive Departments’” Congress has identified in Title 5.²⁵³ The agency argues, however, that it has “been granted full section 301 or equivalent authority” under Reorganization Plan No. 3 of 1970—and that this authority is sufficient, maybe, to support the proposed rule.²⁵⁴ According to the EPA, the regulation “exclusively pertains to the internal practices” of the agency, as it merely “describes how EPA will handle studies when data and models underlying science that is pivotal to EPA’s significant regulatory decisions or influential scientific information are or are not publicly available in a manner sufficient for independent validation and analysis.”²⁵⁵ Because of this “internal” focus, the EPA contends, the proposed rule should be understood as an unremarkable exercise of the agency’s housekeeping power.²⁵⁶

The EPA’s half-hearted attempt to cast the proposed restrictions on science as nothing more than internal “housekeeping” measures that lack substantive significance cannot be sustained.²⁵⁷ As a result, even if the agency has been granted “section 301 or equivalent authority[,]” that authority would not provide a foundation for the proposed rule.²⁵⁸

Response: See response to Comment 31-135.

Comment [73-410]: Commenter (11576) writes that under the proposed regulation, the EPA would be required to consider a new (and sometimes dispositive) factor when deciding if it should rely on a particular scientific study: whether “the data and models underlying ... [the study] are publicly available[.]”²⁵⁹ As the EPA admits in its supplemental notice, this assessment of data availability would be separate from—and subsequent to—the agency’s evaluation of a study’s “quality[.]”²⁶⁰ It could accordingly result in the exclusion of “high-quality studies” from

²⁵¹ *Chrysler Corp.*, 441 U.S. at 309.

²⁵⁴ *Id.* at 15,397-98. See also *id.* at 15,397, 15,398, 15,399 (questioning whether the EPA’s asserted “housekeeping” authority can be used “independently” in adopting the proposed rule, or whether it must be used “in conjunction” with other asserted powers).

²⁵⁵ *Id.* at 15,398.

²⁵⁶ *Id.* at 15,397-98.

²⁵⁷ See *Columbia Broad. Sys. v. United States*, 316 U.S. 407, 416 (1942) (noting that “[t]he particular label placed upon ... [an action by an agency] is not necessarily conclusive, for it is the substance of what the ... [agency] has purported to do and has done which is decisive”).

²⁵⁸ Supplemental Notice, 85 Fed. Reg. at 15,397-98.

²⁵⁹ Supplemental Notice, 85 Fed. Reg. at 15,397-98. The fact that the EPA would be bound by the requirements of the proposed rule when it undertakes later rulemakings and analyses confirms the substantive nature of regulation. See, e.g., *Pac. Gas & Elec. Co. v. Fed. Power Comm’n*, 506 F.2d 33, 38 (D.C. Cir. 1974) (noting that “[a] properly adopted substantive rule establishes a standard of conduct which has the force of law” in later agency proceedings).

²⁶⁰ Supplemental Notice, 85 Fed. Reg. at 15,399.

the agency's scientific analyses and rulemakings.²⁶¹ In the words of the notice, if the proposed rule is finalized, the EPA:

would continue to use standard processes for identifying, evaluating, and reviewing available data, models, and studies. When the Agency has potentially identified multiple key studies or models of similar quality that could drive its subsequent decisions, the Agency will investigate the availability of the underlying data. If, for example, multiple high-quality studies exist but only two studies have data and models that are available for independent validation and reanalysis, EPA would only include those two studies as pivotal regulatory science and/or pivotal science in accordance with the 2018 proposed rulemaking. However, under the alternative approach in this supplemental proposal, EPA would consider using all available high-quality studies but give greater consideration to those two studies with data available for independent validation.²⁶²

As the supplemental notice makes clear, the proposed rule would alter the EPA's substantive standards for evaluating scientific research—undermining the agency's ability to protect public health and the environment in the process. The regulation accordingly can't be dismissed as a “housekeeping” measure that merely “govern[s] internal agency procedures.”²⁶³ Indeed, the rule is at odds with the scientific standards that Congress has itself imposed on the agency. As the D.C. Circuit recently emphasized, the “EPA operates pursuant to multiple statutory mandates requiring that its decisions rest on various formulations of ‘the best available science’”—among them, the CAA's requirement that “[a]ir quality criteria ... accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare,” and the TSCA's demand that the EPA's administrator “‘make decisions ... based on the weight of the scientific evidence[.]’”²⁶⁴ In summarizing its own mission, the EPA has therefor acknowledged that it is obligated to “ensure that ‘national efforts to reduce

²⁶³ *Id.* at 15,398. See, e.g., *Int'l Ry. Co. v. Davidson*, 257 U.S. 506, 514 (1922) (noting that the housekeeping statute “does not confer ... any legislative power”); *United States v. George*, 228 U.S. 14, 20 (1913) (concluding that the federal housekeeping statute “confer[red] administrative power only” and did not authorize federal agencies to establish requirements beyond those imposed by statute as, “certainly, under the guise of regulation legislation cannot be exercised”); *White v. Shalala*, 7 F.3d 296, 303 (2d Cir. 1993) (holding that legislative rules, which “create new law, rights, or duties in what amounts to a legislative act[.]” do not fall within the APA's exclusion for “‘interpretive rules, general statements of policy, or rules of agency organization, procedure, or practice’”) (quoting 5 U.S.C. § 553(b)(3)(A)); *Am. Hosp. Ass'n v. Bowen*, 834 F.2d 1037, 1047, 1051 (D.C. Cir. 1987) (noting that a rule is substantive when it “encodes a substantive value judgment or puts a stamp of approval or disapproval on a given type of behavior[.]” and concluding that the defendant agency's challenged measures would have been substantive if they had established “a new standard of review” or “a presumption of invalidity” for the agency to apply); *City & County of San Francisco v. Azar*, 411 F. Supp. 3d 1001, 1024 (N.D. Cal. 2019) (noting that rules that “add to the requirements of the underlying statutes” are “legislative[.]” and Section 301 does not provide authority for the adoption of legislative rules); *Pharm. Mfrs. Ass'n v. Finch*, 307 F. Supp. 858, 863-64 (D. Del. 1970) (holding that FDA regulations that “prescribe[d] in specific detail, for the first time, the kinds of clinical investigations ... necessary to establish the effectiveness of existing and future drug products and which require that such evidence be submitted as a condition to avoiding summary removal from the market” could not be defended “as ‘procedural and interpretative’”).

²⁶⁴ *Physicians for Social Responsibility*, 956 F.3d at 639, 647 (quoting 42 U.S.C. § 7408(a)(2) and 15 U.S.C. § 2625(i)).

environmental risks are based on the best available scientific information[.]”²⁶⁵ The proposed rule is an unlawful effort to amend these standards by requiring the EPA to disregard or devalue high-quality studies based on an extra-statutory evaluation of data availability.²⁶⁶ As explained in comments on the original proposal, moreover, the regulation also promises to cause substantial harm to members of the public, who depend on the EPA to adopt safeguards based on the best available science.²⁶⁷

In short, while the EPA has declared that it has “the authority to establish policies governing its reliance on science in the administration of its regulatory functions[.]” this authority actually lies in Congress.²⁶⁸ Because the proposed rule would require the EPA to make decisions based on a factor Congress omitted from the governing statutes, it is both arbitrary and unlawful.²⁶⁹

Response: The purpose of the rule is to increase transparency of the science EPA uses to support its significant regulatory decisions and ISI. Nothing in the final rule will lead to the suppression of scientific data and models. EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In the final rule, EPA does not rely on, interpret, or apply provisions of a particular statute or statutes that it administers. EPA will undertake such efforts in forthcoming substantive actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. The rule expressly states in § 30.3 that “[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”

²⁶⁵ Id. at 639 (quoting EPA, Our Mission and What We Do (Feb. 7, 2018), <https://www.epa.gov/aboutepa/our-mission-and-what-we-do>).

²⁶⁶ The proposed rule’s disinterest in the quality of the studies used by the EPA is further confirmed by the fact that the rule doesn’t care if anything’s actually been done with publicly available data. According to the supplemental notice, “[a]lthough the ability to independently validate pivotal regulatory science or pivotal science is a key component of this rulemaking,” nothing in the regulation “would require that EPA, a member of the public or [any] other entity must independently validate a study before it can be considered to be pivotal regulatory science or pivotal science.” Supplemental Notice, 85 Fed. Reg. at 15,403. The notice also “clarifies” that independent validation is not required under proposed 40 CFR 30.7[.] which describes the role of independent peer review.” Id. While Congress has required the EPA to identify and use the best available science, the proposed rule is focused—arbitrarily and unlawfully—on other concerns.

²⁶⁷ See, e.g., August 2018 Coalition Comments at 6-14 (summarizing the significant impacts on public health that could result from the rule as originally proposed); *Elec. Privacy Info. Ctr. v. U.S. Dep’t of Homeland Sec.*, 653 F.3d 1, 6 (D.C. Cir. 2011) (concluding that the challenged regulation was substantive in light of the “public concern” it had created regarding “issues of privacy, safety, and efficacy”).

²⁶⁸ Original Proposal, 83 Fed. Reg. at 18,769.

²⁶⁹ See, e.g., *Motor Vehicle Mfrs. Ass’n of the U.S., Inc. v. State Farm Mutual Auto. Insurance Co.*, 463 U.S. 29, 43 (1983) (noting that “an agency rule would be arbitrary and capricious if the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise”). See also, e.g., *Flynn v. Comm’r*, 269 F.3d 1064, 1072 (D.C. Cir. 2001) (noting that internal housekeeping rules cannot “displace or override” substantive requirements); *New York v. U.S. Dep’t of Health & Human Servs.*, 414 F. Supp. 3d 475, 516 (S.D.N.Y. 2019) (rejecting the defendant agency’s contention that a rule was “mere housekeeping” when it “relocate[d] the metes and bounds—the who, what, when, where, and how—of conscience protection under federal law”).

This final rule does not regulate the rights and obligations of any party outside of the EPA let alone have legal force and effect on them. Therefore, any incidental impacts on voluntary behavior outside of the EPA do not render it a substantive rule. See response to comment 25-94.

EPA has used the criteria found in EPA’s *Framework for Human Health Risk Assessment to Inform Decision Making* (Ref. 69) to evaluate outside research for use in regulatory decisions.

Comment [73-411]: Commenter (11576) writes that the EPA has itself confirmed the substantive nature of the proposed regulation by electing to pursue it through notice-and-comment rulemaking. As the Supreme Court has said, the only actions authorized under the federal housekeeping statute are “what the ... [APA] terms ‘rules of agency organization[,] procedure[,] or practice’ as opposed to ‘substantive rules.’”²⁷⁰ And under the APA, “rules of agency organization, procedure, or practice” are exempt from the requirements of notice-and-comment rulemaking.²⁷¹ If the proposed rule were actually an internal housekeeping measure, in other words, notice and comment wouldn’t have been required. The EPA was correct in concluding otherwise. Its efforts to reframe the proposal now as one that “exclusively pertains to the internal practices” of the agency cannot be taken seriously.²⁷²

During two recent briefings that were held at the request of the House Committee on Science, Space, and Technology, the EPA provided further confirmation that the proposed rule cannot be dismissed as an internal housekeeping measure.²⁷³ According to a memorandum prepared by the committee’s staff, the EPA indicated that “the bulk of the responsibility for instituting new methods for access to data and models” under the proposed rule will “fall[] on outside parties”—both researchers and the CDC.²⁷⁴ These responsibilities, moreover, promise to be burdensome. Researchers, for instance, “would be responsible for managing the logistics of making the data and models publicly available in a manner that complies with the rule, in consultation with EPA staff.”²⁷⁵ And the CDC would be tasked with “hosting the data and models on its own servers, with CDC personnel working at the secure data enclave reviewing research proposals submitted by members of the public seeking to conduct their own analyses of study data and determining the level of access to grant on a case-by-case basis.”²⁷⁶ In light of the significant burdens the rule would impose on other agencies and private parties, the proposal cannot be defended as a housekeeping measure that governs the internal operations of the EPA.

Response: See responses to Comments 31-135 and 48-433.

²⁷⁰ *Chrysler Corp.*, 441 U.S. at 310.

²⁷¹ 5 U.S.C. § 553(b)(A).

Comment [81-583]: Commenter (112715) writes that EPA lacks authority to promulgate the proposed rule, which conflicts with statutory requirements regarding EPA’s consideration of scientific information.

As explained in the 2018 Comments, EPA lacks statutory authority to promulgate the proposed rule. Nothing in the supplemental proposal alters that conclusion. EPA’s citation to the federal Housekeeping Statute, 5 U.S.C. § 301, either alone or in combination with other substantive statutes that EPA administers, does not in any way alleviate this problem. First, a rule that requires EPA to exclude or give less weight to scientific information based purely on the availability of underlying data for independent validation is inconsistent with EPA’s legal duty under numerous statutes it implements to use the best available science. Second, EPA may not rely on a general grant of authority, i.e., housekeeping, to promulgate regulations or develop policies that are otherwise inconsistent with more specific statutory directives. Third, 5 U.S.C. § 301 does not apply to EPA. Fourth, even assuming EPA has some inherent housekeeping authority apart from 5 U.S.C. § 301, the proposed rule does not constitute a “housekeeping” measure given its massive substantive impact.

Response: EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In the final rule, EPA does not rely on, interpret, or apply provisions of any particular environmental statute or statutes that it administers. EPA will undertake such efforts in forthcoming substantive actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. The rule expressly states in § 30.3 that “[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”

Also, see the response to Comment 31-135.

Comment [81-585]: Commenter (12715) writes that the Housekeeping Statute does not apply to EPA.

By its plain language, the federal Housekeeping Statute provides no authority to EPA. The statute states, in pertinent part, that “[t]he head of an Executive department or military department may prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property.” 5 U.S.C. § 301. Moreover, as EPA concedes, a separate statute, 5 U.S.C. § 101, provides an exclusive list of the executive departments that are covered by the Housekeeping Statute and EPA is not included in that list.

EPA instead argues that it “gained” the housekeeping authority of 5 U.S.C. § 301 through the Reorganization Plan No. 3 of 1970. That Plan created EPA by transferring certain functions from the Department of Health, Education and Welfare (“HEW”) to the newly established agency.²⁷⁷ HEW was later divided into what are now the Departments of Education and Health and Human Services. What EPA fails to note, however, is that Congress then amended 5 U.S.C. § 101 to add the Departments of Education and Health and Human Services, granting those agencies the

²⁷⁷ Under Reorganization Plan No. 3 certain functions of several other entities including, among others, the Departments of Interior and Agriculture, were also transferred to the newly created EPA.

housekeeping authority of 5 U.S.C. § 301, but did not also add EPA. Congress subsequently amended 5 U.S.C. § 101 several times to add other federal entities to the list but, again, it never added EPA. It is thus clear that Congress knew how to give housekeeping authority to executive entities when it wanted to, and the absence of EPA from 5 U.S.C. § 101 reflects congressional intent to not confer the authority of 5 U.S.C. § 301 on EPA.

The inapplicability of the Housekeeping Statute here is further confirmed by a 2001 opinion by the U.S. Department of Justice (DOJ) OLC that rejected a similar attempt by the Office of Government Ethics (OGE) to arrogate to itself the housekeeping authority in 5 U.S.C. § 301. Opinion of the OLC of the DOJ, 25 Op. O.L.C. 13 (2001). As OLC observed, Congress used both “executive department” and “agency” in title 5 (see, e.g., sections 302, 305), “and we presume that that difference was intentional.” *Id.* at 15. “The fact that Congress, in conferring particular powers, distinguished between the heads of executive departments in section 301 and the heads of agencies in section 302 counsels against assuming that Congress meant to confer the authority in section 301 on the heads of all executive agencies.” *Id.* at 15-16. EPA thus may not use 5 U.S.C. § 301 as authority for the proposed rule.

Nor can EPA rely on the 2008 OLC opinion addressing EPA’s authority to establish a policy for its employees’ use of government personal property and agency-issued cell phones. Opinion of the OLC of the DOJ, 32 Op. O.L.C. 1 (2008). First, and far from supporting EPA’s position, that opinion explicitly finds that “EPA is not an ‘Executive department’ within the meaning of section 301,” and that any housekeeping authority would come from EPA’s organic statute. *Id.* at 82. Second, unlike the proposed rule here, the EPA policy addressed by the 2008 opinion had no effect outside of EPA and was not inconsistent with specific statutory directives regarding the subject matter of the policy. Thus, like the DOL regulations the Supreme Court found defective in *Chrysler Corp. v. Brown*, 441 U.S. 281, 310-12 (1979), the proposed rule finds no support in 5 USC § 301.²⁷⁸

Response: In the preamble, EPA acknowledges that it is not listed as an “Executive Department” under 5 USC § 101. The 2008 OLC acknowledges the 2001 OLC opinion cited by the commenter. There, OLC finds authority for OGE’s *Touhy* regulations in the Federal Records Act and OGE’s organic statute, 5 U.S.C. app § 401. In its 2008 opinion, OLC described Reorganization Plan No. 3 as EPA’s organic statute and found that the Plan provided EPA with housekeeping authority:

The difficulty here, however, is that section 301 confers regulatory authority only on the “heads of Executive departments and military departments,” and not the heads of other executive agencies, such as EPA. 5 U.S.C. § 301; *see also* 5 U.S.C. § 101; *Authority of the Office of Government Ethics to Issue Touhy Regulations*, 25 Op. O.L.C. 13, 15 (2001) (recognizing that section 301 authority is limited to the listed departments). In considering whether the EPA Administrator may exercise housekeeping authority equivalent to that under section 301, we must consider whether such authority has been conferred under EPA’s organic statute.

²⁷⁸ The other cases cited by EPA in the SNPR also provide no support because they do not address the question presented here.

The Reorganization Plan establishing the EPA vests the Administrator with authority equivalent in many respects to that enjoyed by the head of an executive department. Reorganization Plan No. 3 of 1970, § 1(b), 84 Stat. 2086, 2086 (July 9, 1970) (codified at 5 U.S.C. app. 189 (2006)).² The Reorganization Plan, which names the Administrator the “head of the agency,” *id.*, transfers to the Administrator functions previously vested by law in the heads of other executive departments, including functions of the Secretary of the Interior and the Secretary of Health, Education, and Welfare. *Id.* § 2(a)(1)–(4). The Administrator’s authority is not limited to those designated functions but also includes “[s]o much of the functions of the transferor officers and agencies” that are “incidental to or necessary for . . . the performance of,” or “primarily related to,” such functions. *Id.* § 2(a)(9). This ancillary authority includes “authority, provided by law, to prescribe regulations relating primarily to the transferred functions.” *Id.* At the time of the Reorganization Plan, such ancillary authority included the housekeeping authority conferred by 5 U.S.C. § 301 on the heads of those departments to enable their subordinates to carry out efficiently the statutory functions transferred to the Administrator of EPA. *See* 5 U.S.C. § 301 (Supp. II 1966). To perform those transferred functions, the Reorganization Plan further provides that the Director of OMB shall transfer to EPA “personnel, property, records, and unexpended balances of appropriations . . . used, held, available, or to be made available in connection with the functions transferred to the Administrator or the Agency.” Reorganization Plan No. 3 of 1970, § 4(a).

Taken together, these provisions convey to the Administrator all of the house-keeping authority available to other department heads under section 301, including authority to adopt property management regulations. Congress has vested the Administrator with the authority to run EPA, to exercise its functions, and to issue regulations incidental to the performance of those functions. This grant includes the authority to assign responsibility to others within the agency and to issue regulations prescribing the standards by which those functions are to be performed. The effective and efficient management of the agency’s personnel and property is plainly “incidental to” and “necessary for” the performance of the functions that the Administrator is charged with performing. Indeed, the Reorganization Plan specifically recognizes this authority by providing the Administrator not only with transferred functions but with the personnel and equipment necessary for the effective performance of those functions.

32 Op. O.L.C. 79, 82-83 (2008).

Also see the response to Comment 31-135.

Comment [81-586]: Commenter (12715) writes that *the proposed rule is not a matter of “housekeeping,” but instead has broad, substantive effect.*

Even assuming EPA has some inherent authority apart from 5 U.S.C. § 301 to make rules that apply exclusively to internal EPA practices, the proposed rule is not authorized by any housekeeping authority because it would unquestionably have broad impacts outside of EPA. Indeed, the very fact that EPA is engaging in notice-and-comment rulemaking is an implicit

admission that the proposed rule is not a matter of housekeeping since housekeeping rules are exempt from APA requirements. “The APA exempts from [5 U.S.C. § 553’s] procedural requirements: (1) interpretative rules; (2) general statements of policy; and (3) rules of agency organization, procedure, or practice.” *Mendoza v. Perez*, 754 F.3d 1002, 1020-21 (D.C. Cir. 2014). Conversely, rules to which the notice and comment requirements do apply are considered “substantive rules.” *Id.*

More importantly, the nature of the proposal is not, on its face, a simple matter of housekeeping. Restricting the information that EPA staff can consider in setting standards and criteria to protect public health and the environment or requiring staff to arbitrarily put a thumb on the scale when weighing information in setting such standards, will directly impact the decisions that EPA makes regarding standard setting. Those standards apply not to EPA but to the regulated community, and many have nationwide applicability. In addition, many states’ environmental laws and regulations explicitly adopt EPA standards, or at the very least require an express justification for any deviation. *See* 2018 Comments at 18-19. Furthermore, some states lack resources to develop their own standards and federal standards therefore apply by default. *Id.* EPA’s proposed rule would thus have far-ranging impacts outside the agency and would directly affect the health of the nation’s residents and natural resources. Indeed, EPA explicitly acknowledges that the supplemental proposal will have an impact on third parties by, for example: (1) requesting comment on how to cause researchers outside of EPA to change their practices to increase access to data, 85 Fed. Reg. at 15,403; and (2) conceding that the development of ISI will have “a clear and substantial impact on important public policies or private sector decisions,” *id.* at 15,398.

We are also aware that EPA confirmed to Staff of the House Committee on Science, Space, and Technology that “the bulk of the responsibility for instituting new methods for access to data and models falls on outside parties. The researchers would be responsible for managing the logistics of making the data and models publicly available in a manner that complies with the rule, in consultation with EPA staff.”²⁷⁹ This concession flatly contradicts the SNPR’s assertion that the proposed rule “pertains exclusively to internal practices at EPA.” 85 Fed. Reg. at 15,398. Accordingly, EPA should set aside the pretense that the proposal is a matter of agency housekeeping and directly confront the conflict between the proposed rule and the substantive statutes that command EPA to use the best available science.

In sum, EPA has entirely failed to address the 2018 Comments regarding the lack of legal authority for the initial proposal. Whether EPA is arbitrarily barring consideration of scientific studies or information with nonpublic underlying data, or arbitrarily according such studies or information less weight, the proposed rule unquestionably has substantive impacts and conflicts with the statutory commands that EPA use the best available science; no citation to “housekeeping” authority can cure that fatal flaw.

²⁷⁹ Letter from Honorable Eddie Bernice Johnson to Democratic Members of the House Committee on Science, Space and Technology (May 6, 2020) [hereinafter Johnson Letter] <https://science.house.gov/chairwoman-johnson-letter-to-science-committee-democratic-caucus-on-epa-transparency-rule> [Link dead, alternative link provided <https://science.house.gov/imo/media/doc/Letter%20and%20Memo%20-%20EJB%20to%20SST%20Dem%20Caucus%20re%20Transparency%20Rule.pdf>]

Response: The final rule does not regulate any party outside of EPA but rather exclusively governs EPA's internal process for considering pivotal science. This rule does not require any researcher or other outside entity to provide data or models to EPA. Instead, it governs internal agency procedures for considering various studies using factors including data availability. Furthermore, the final rule gives greater consideration to studies where the data and models are available for independent validation rather than providing for a categorical exclusion, which could be considered by researchers who are developing science and deciding whether to make the underlying data and models available.

Comment [82-717]: Commenter (12464) writes that the Housekeeping Statute does not grant EPA authority to promulgate the proposal.

The Proposal is not authorized by the Housekeeping Statute, 5 U.S.C. § 301, because (i) Congress did not intend for the Housekeeping Statute to delegate rulemaking authority to independent agencies such as EPA; (ii) Reorganization Plan No. 3 does not grant EPA housekeeping or equivalent authority; and (iii) even if EPA has such housekeeping authority, the Proposal is a substantive rule that may not be promulgated under the Housekeeping Statute or equivalent authority.

Response: See response to Comment 31-135.

Comment [82-718]: Commenter (12464) writes that Congress did not Grant Independent Agencies, such as EPA, Rulemaking Authority under the Housekeeping Statute

The plain text of the Housekeeping Statute demonstrates that it applies only to Executive departments and military departments, and not to independent agencies such as EPA. The statute provides, in relevant part, that “[t]he head of an Executive department or military department may prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property.” 5 U.S.C. § 301. While the EPA is clearly not a military department, the agency also does not qualify as an “Executive department” within the meaning of the statute. An earlier provision in the same chapter of the United States Code provides an exclusive list of “the Executive departments.” 5 U.S.C. § 101. EPA is not on that list.²⁸⁰

It is a firmly established rule of statutory construction that definitions of terms included within the framework of a law usually dictate the meaning of those terms as used in the statute.²⁸¹ Importantly, the definition of “Executive departments” does not start with the words “include” or

²⁸⁰ The full list is: the Department of State; the Department of the Treasury; the Department of Defense; the Department of Justice; the Department of the Interior; the Department of Agriculture; the Department of Commerce; the Department of Labor; the Department of Health and Human Services; the Department of Housing and Urban Development; the Department of Transportation; the Department of Energy; the Department of Education; the Department of Veterans Affairs; and the Department of Homeland Security. 5 U.S.C. § 101.

²⁸¹ See, e.g., *Stenberg v. Carhart*, 530 U.S. 914, 942 (2000) (“When a statute includes an explicit definition, we must follow that definition, even if it varies from that term’s ordinary meaning.”); *Colautti v. Franklin*, 439 U.S. 379, 392 n. 10 (1979) (“As a rule, ‘[a] definition which declares what a term ‘means’ . . . excludes any meaning that is not stated.’”).

“such as,” which would indicate that the list of departments is non-exhaustive.²⁸² Rather, the definition provides that “the Executive departments are” and proceeds to list those departments. Under the ordinary use of the verb “are,” i.e., to be equal in meaning, the definitional list of Executive departments is exclusive.²⁸³ Moreover, according to the canon of negative implication,²⁸⁴ EPA’s omission from this long list of departments (which has been intermittently amended) indicates that EPA is not an “Executive department” for purposes of the Housekeeping Statute.²⁸⁵

Response: See response to Comment 31-135.

Comment [82-719]: Commenter (12464) writes that EPA is an “independent establishment,” defined as “an establishment in the executive branch (other than the United States Postal Service or the Postal Regulatory Commission) which is not an Executive department, military department, Government corporation, or part thereof.” 5 U.S.C. § 104.²⁸⁶ For decades, the United States Government Manual included EPA in the list of “independent establishments and government corporations” rather than in the list of “departments.”²⁸⁷ Since 2010, the manual has changed the terminology to “independent agencies and government corporations,” but EPA remains part of the same list.²⁸⁸ Independent establishments do not have rulemaking authority under the Housekeeping Statute.

²⁸² See, e.g., *United States v. Howard*, 742 F.3d 1334, 1348 (11th Cir. 2014) (“The items that follow each use of the word ‘includes’ in the statute are non-exhaustive examples of items that qualify.”); *United States v. Chapman*, 21 F. Supp. 3d 839, 847 (S.D. Tex. 2014) (“[T]he use of the word ‘includes’ indicates a nonexhaustive, incomplete list.”).

²⁸³ *Colautti*, 439 U.S. at 392 n.10 (noting that the definition at issue uses the word “means,” not “includes,” indicating that Congress intended the provision to be the exclusive definition throughout the statute); see also *Be* (verb), MERRIAM-WEBSTER, <https://www.merriam-webster.com/dictionary/be> (last visited May 14, 2020).

²⁸⁴ The canon of negative implication, otherwise known as “expressio unius est exclusio alterius,” means “expressing one item of [an] associated group or series excludes another left unmentioned.” *N.L.R.B. v. SW Gen., Inc.*, 137 S. Ct. 929, 940 (2017). The canon applies when the circumstances support a sensible inference that Congress intended the omitted term to be excluded. See *id.*

²⁸⁵ See, e.g., *Greenblatt v. Nat’l Pork Bd.*, No. CV ELH-15-00054, 2015 WL 6549578, at *8 (D. Md. Oct. 27, 2015) (“Title 5 U.S.C. § 101 provides an exhaustive list of ‘executive departments,’ which includes the [U.S. Department of Agriculture], but not the [National Pork Board].”).

²⁸⁶ See William Funk, *Is the Environmental Appeals Board Unconstitutional or Unlawful?*, 49 ENVTL. L. 737, 742–43 (2019) (“EPA would fall under the term “independent establishment,” defined in Section 104, which explicitly distinguishes such establishments from Executive departments.”); Christopher D. Ahlers, *Presidential Authority over EPA Rulemaking Under the Clean Air Act*, 44 ENVTL. L. 31, 53 (2014) (reviewing the history of the 1966 Reorganization Act, the Postal Reorganization Act, and the Reorganization Plan No. 3 and concluding that “it was the intention of Congress that EPA be an independent establishment that would not be managed as an executive department”).

²⁸⁷ See, e.g., Office of the *Federal Register*, National Archives and Records Administration, *The United States Government Manual 2009/2010*, at 6 (2009), <https://www.govinfo.gov/content/pkg/GOVMAN-2009-09-15/pdf/GOVMAN-2009-09-15.pdf>; Office of the *Federal Register*, National Archives and Records Service, *The United States Government Manual 1983/84*, at vi (1983), https://www.govinfo.gov/app/collection/govman/2010_United%20States%20Government%20Manual/1983-84%20Edition; see also 2 Fed. Proc., L. Ed. § 2:22 (including EPA in a list of “independent establishments”).

²⁸⁸ See, e.g., Office of the *Federal Register*, National Archives and Records Administration, *The United States Government Manual 2019 Edition*, at 171 (2019), <https://www.govinfo.gov/content/pkg/GOVMAN-2019-11-21/pdf/GOVMAN-2019-11-21.pdf>.

The legislative history of the Housekeeping Statute confirms that Congress intended to grant rulemaking authority only to those executive departments listed under 5 U.S.C. § 101. When Congress enacted the current version of the Housekeeping Statute in 1958,²⁸⁹ a staff memorandum submitted to the Special Subcommittee on Government Information of the House Committee on Government Operations noted:

The statute does not apply to independent agencies, although some of the regulatory agencies cited it as authority to withhold information in answers to subcommittee questions. After the subcommittee discussed the matter with regulatory agency officials, they admitted that title 5, United States Code, section 22, [now 5 U.S.C. § 301] applies only to the executive departments of the Federal Government.²⁹⁰

Response: See the response to Comment 31-135.

Comment [82-720]: Commenter (12464) notes that the staff memorandum recognized that such independent agencies were not listed in the definition of an executive department under what is now 5 U.S.C. § 101.²⁹¹ Indeed, not only did the DOJ support this interpretation of the statute,²⁹² but the Subcommittee also decried independent agencies' disregard of the definition when claiming such authority in the past; such claims were an "unhappy history" that pointed to the fact that "the 'housekeeping' statute [had] been twisted from the original authority of the department head."²⁹³ Moreover, during the Subcommittee hearing, independent executive agencies, some of which have been superseded by new agencies or departments, clearly acknowledged the inapplicability of the Housekeeping Statute to their operations.²⁹⁴

²⁸⁹ The Housekeeping Statute was originally enacted in 1789 to help "General Washington get his administration underway by spelling out the authority for executive officials to set up offices and file Government documents." H.R. Rep. No. 85-1461, 1958 U.S.C.C.A.N. 3352, 3352 (Mar. 6, 1958). In 1958, Congress amended the Housekeeping Statute to clarify the scope of the law and to prevent executive departments from improperly invoking the statute to withhold information from the public. See *id.* at 3353. The Housekeeping Statute was subsequently codified at 5 U.S.C. § 301 on September 6, 1966. See Pub. L. 89 554, Sept. 6, 1966, 80 Stat. 379.

²⁹⁰ Availability of Information from Federal Departments and Agencies: Part 11—Amendment of "Housekeeping Statute" [Revised Statutes 161 (5 U.S.C. 22)] Proposed by H. R. 2767, H. R. 2768, H.R. 2769, H. R. 3497, and H.R. 2810 Before the Special Subcomm. On Government Information of the H. Comm. On Government Operations 85th Cong. 2618 (1957) (Exhibit IV, Staff Memorandum of Subcommittee) (emphasis added) [hereinafter, "Part 11"].

²⁹¹ Availability of Information from Federal Departments and Agencies: Part 14—Second Hearing on Amendment of "Housekeeping Statute" [Revised Statutes 161 (5 U.S.C. 22)] Proposed by H. R. 2767, H. R. 2768, H. R. 2769, H. R. 3497, and H. R. 2810 Before the Special Subcomm. On Government Information of the H. Comm. On Government Operations 85th Cong. 3414 (1957) (Exhibit VII, Staff Memorandum of Subcommittee) [hereinafter, "Part 14"].

²⁹² Part 11, *supra* note 57, at 2928-29 ("Title 5 of the United States Code deals with the executive departments. Sections 1 through 117 of chapter 1, dealing with salaries of heads of departments, vacancies in office etc., are specifically made as applicable to the three departments just discussed, as they are to the other seven departments created between 1789 and 1849. By definition, the word "department" means one of the 10 executive departments enumerated in section 1 of title 5.") (Exhibit XVII, Department of Justice Memorandum).

²⁹³ Part 14, *supra* note 58, at 3414.

²⁹⁴ Part 11, *supra* note 57, at 2608 ("Section 161 authorizes the 'head of each department' to prescribe regulations for the Government of his department, the conduct of its officers, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property. It is clear from the provisions of the statute that would be amended by this bill (R. S. secs. 158 and 159; 5 U.S.C. 1 and 2) that the proposed amendment

The fact that Congress intended to exclude independent agencies, such as EPA, from the Housekeeping Statute is further evidenced by the fact that one proposed version of the bill used the word “agency” rather than “Executive department” in 5 U.S.C. § 301, but that version was explicitly rejected because the “term is often used in referring to the independent regulatory agencies, to which the section does not apply, [and] it could lead to confusion and uncertainty in the future application of the section.”²⁹⁵

Response: See response to Comment 31-135.

Comment [82-722]: Commenter (12464) notes that Congress has since amended the definition of an “Executive department” under 5 U.S.C. § 101 to add two of the former independent agencies that had recognized the inapplicability of the statute to their operations in 1958—the Housing and Home Finance Agency (now the Department of Housing and Urban Development) and Veterans Administration (now the Department of Veterans Affairs).²⁹⁶

Congress, by contrast, has not added EPA to the list. As these examples demonstrate, when Congress wanted to grant housekeeping authority to a former independent agency, it knew how to do so explicitly by amending Section 101. If an agency could assert housekeeping authority absent explicit congressional authorization, it would render Section 101 effectively meaningless. In sum, given that EPA is an independent establishment and acknowledges that it is “not one of the 15 ‘Executive Departments’ listed at 5 U.S.C. 101,” it cannot avail itself of the Housekeeping Statute.

Response: See the response to Comment 31-135.

Comment [82-784]: Commenter (12464) writes that Reorganization Plan No. 3 does not grant EPA housekeeping authority or equivalent authority.

Reorganization Plan No. 3, which established EPA in 1970, does not grant the agency housekeeping or equivalent authority.²⁹⁷ The Supplemental Notice asserts that although the agency “is not one of the ‘Executive Departments’ listed at 5 U.S.C. 101,” EPA gained full

would apply only to the executive departments and not to other agencies of the Government, including the independent regulatory Commissions and agencies such as the Federal Power Commission.”) (Response of Jerome K. Kuykendall, Chairman, Federal Power Commission); id. at 2612 (“By the terms of the statute itself, title 5, United States Code, section 22, applies only to executive departments enumerated in title 5 United States Code, Section 1. This Commission is not included in that list; it is not an executive department but an independent, bipartisan, quasi-judicial agency.”) (Memorandum of the Securities Exchange Commission to the Committee of Government Operations, House of Representatives, on H.R. 2810, 2767, 2768, 2769, and 3497, 85th Congress, 1st Session); id. at 2613 (The proposed legislation will not directly affect the Small Business Administration, because section 161 of the Revised Statutes applies only to the heads of the executive departments as defined in section 1 of title 5 of the United States Code.”) (Response of Wendell B. Barnes, Administrator, Small Business Administration).

²⁹⁵ Part 11, supra note 57, at 2610 (Statement of Owen Clarke, Chairman, Committee on Legislation).

²⁹⁶ Part 11, supra note 57, at 2609 & 2614; see also Pub. L. 100-527, § 13(b), Oct. 25, 1988, 102 Stat. 2643 (adding Department of Veterans Affairs); Pub. L. 89-174, § 6(b), Sept. 9, 1965, 79 Stat. 667 (adding Department of Housing and Urban Development).

²⁹⁷ Reorganization Plan No. 3 of 1970, 84 Stat. 2086 (July 9, 1970),

<https://www.govinfo.gov/content/pkg/STATUTE-84/pdf/STATUTE-84-Pg2086.pdf#page=1>.

housekeeping or equivalent authority because Section 2(a)(9) of the Reorganization Plan transferred so much of the functions of the transferor offices and agencies, including those of the Department of the Interior (DOI) and Department of Agriculture (USDA), “as is incidental to or necessary for the performance by or under the [EPA] Administrator of the functions transferred.” 85 Fed. Reg. at 15,397. According to a 2008 OLC opinion, at “the time of the Reorganization Plan, such ancillary authority included the housekeeping authority conferred by 5 U.S.C. § 301 on the heads of those Departments to enable their subordinates to carry out efficiently the statutory functions transferred to the Administrator of the EPA.”²⁹⁸ Thus, the Supplemental Notice claims that the housekeeping authorities were implicitly transferred to EPA as incidental powers.

This argument is unpersuasive. As discussed above, Congress has demonstrated that it knows how to update the list of “Executive departments” to include newly created departments.²⁹⁹ Moreover, the DHS, like EPA, was created through the transfer and consolidation of various existing programs and authorities spread across several federal agencies. Indeed, similar to Reorganization Plan No. 3, the HSA of 2002 lays out in minute detail those functions and authorities that were being transferred to the new department from the Departments of Agriculture, Energy, and Treasury.³⁰⁰ However, unlike the Reorganization Plan, the HSA specifically asserts that the DHS is an executive department within the meaning of the Housekeeping Statute:

“There is established a DHS, as an executive department of the United States within the meaning of title 5, United States Code.”³⁰¹ Thus, when Congress intends to grant housekeeping authority, it does so by amending Section 101 to include a newly created department. No such mandate exists in Reorganization Plan No. 3 for EPA.

Response: See the response to Comment 31-135.

Comment [82-785]: Commenter (12464) writes that this interpretation of Reorganization Plan No. 3 is confirmed by its legislative history. When describing EPA’s functions, Russell Train, Chairman of the Council on Environmental Quality, noted that “a reorganization plan cannot create any new legal authorities or functions;” thus, when EPA would come into being its functions could only be those of its constituent parts that were clearly transferred.³⁰² The DOI’s and USDA’s housekeeping authorities were not so transferred.

Response: See the response to Comment 31-135.

³⁰¹ Pub. L. 107-296, 116 Stat. 2135, 2142, § 101.

³⁰² Reorganization Plans Nos. 3 and 4 of 1970 Before the Subcomm On Executive Reorganization and Government Research of the S. Comm. On Government Operations 91st Cong. 48 (1970) (Statement of Russel E. Train, Chairman, Council on Environmental Quality).

Comment [82-803]: Commenter (12464) writes that although the Supplemental Notice cites certain court decisions in support of EPA’s claim of housekeeping authority, the decisions were not carefully reasoned and cannot overcome the plain language of the Housekeeping Statute. For example, in *Davis Enterprises v. U.S. Environmental Protection Agency*, the Third Circuit concluded—without any analysis—that “[t]he EPA’s authority to govern its internal affairs is derived from 5 U.S.C. § 301.”³⁰³ In another case, the U.S. Court of Appeals for the Second Circuit stated that “the Federal Housekeeping Statute, 5 U.S.C. 301, authorizes government agencies such as the EPA to adopt regulations regarding ‘the custody, use, and preservation of [agency] records, papers, and property.’”³⁰⁴ While other federal courts have blindly followed these holdings in enforcing EPA’s *Touhy* regulations,³⁰⁵ both the Second and Third Circuits’ holdings show that the courts believed that EPA’s housekeeping authority derived from 5 U.S.C. § 301 alone because the EPA was a “government agency” within the meaning of the statute—a mistake in application that Congress attempted to avoid by enumerating the executive departments in Section 101. Such holdings are the type of “drive-by” rulings that the Supreme Court has cautioned against and *deserve* little to no weight.³⁰⁶

Response: See the response to Comment 31-135.

Comment [82-807]: Commenter (12464) writes that the Transparency Rule is a substantive rule that may not be promulgated under Section 301’s rulemaking authority.

Even assuming that EPA has Housekeeping Statute authority, the Proposal is a substantive rule outside the scope of the authority granted under that law. The purpose of the Housekeeping Statute is to delegate to executive and military departments the authority to prescribe rules related to their internal organization and operation; this authority does not extend to “substantive” rulemakings affecting the rights of parties and the department’s implementation of its statutory duties.³⁰⁷

The Housekeeping Statute was originally enacted in 1789 to help “General Washington get his administration underway by spelling out the authority for executive officials to set up offices and file Government documents.”³⁰⁸ In the legislative history of the 1958 amendments, Congress further made clear that the laws prescribed under the statute were limited to “day-to-day business” and recordkeeping.³⁰⁹ Thus the Housekeeping Statute was never intended to be used as

an authority to promulgate substantive rules with external legal consequences. The rule only authorizes what the APA “terms ‘rules of agency organization procedure or practice.’”³¹⁰

Response: As the Supreme Court stated in *Chrysler Corp.*, whether a rule affects individual rights and obligations is an “important touchstone” for distinguishing substantive rules from other types of rules.³¹¹ This final rule does not regulate the rights and obligations of any party outside of the EPA let alone have legal force and effect on them. Therefore, any incidental impacts on voluntary behavior outside of the EPA do not render it a substantive rule.

Comment [82-833]: Commenter (12464) writes that although the APA does not define “substantive” rules, such rules may be recognized by negative inference from the statute’s definition of “interpretative rules” (commonly known as “interpretive rules”). Interpretive rules are “general statements of policy, or rules of agency organization, procedure, or practice.” 5 U.S.C. § 553(b)(A). The U.S. Supreme Court has therefore described a “substantive rule” as a “legislative-type rule” or as one “affecting individual rights and obligations.”³¹² In coming to this definition, the Court relied heavily on the Attorney General’s Manual on the APA because neither the House nor Senate Report for the APA attempted to expound on the distinction between substantive and interpretive rules.³¹³ In a footnote, the Attorney General’s Manual describes “substantive” rules as those rules “other than organizational or procedural,” “issued by an agency pursuant to statutory authority and which implement the statute,” and having “the force and effect of law.”³¹⁴

Consistent with this definition, courts have forbidden executive departments from using Section 301 to implement substantive regulations.³¹⁵ For example, last year, in *New York v. U.S. Department of Health and Human Services*, a district court found that the Department of Health and Human Services’ (HHS) “conscience rule,” recognizing the right of HHS funding recipients to abstain from participating in medical procedures on account of religious or moral objections, was a substantive rule impermissibly promulgated under the Housekeeping Statute.³¹⁶ In coming to this conclusion, the court explained that although the rule had “housekeeping features,” it was “largely substantive—and, indeed, in key respects transformative.”³¹⁷ Specifically, the court found that the rule was substantive as the “conscience rule” would “effectively supersede Title

Clark, U.S. Dep’t of the Attorney General, Attorney General’s Manual on the Administrative Procedure Act, at 30 n.3 (1947), <https://heinonline.org/HOL/P?h=hein.agopinions/atgmanp0001&i=30> [Requires subscription]. A reprinted version of the Attorney General’s Manual is also available at <https://archive.org/details/AttorneyGeneralsManualOnTheAdministrativeProcedureActOf1947>.

³¹⁵ *Chrysler Corp.*, 441 U.S. at 310 (“[T]here is nothing in the legislative history of § 301 to indicate it is a substantive grant of legislative power to promulgate rules authorizing the release of trade secrets or confidential business information.”); *Koopmann v. U.S. Dep’t of Transportation*, 335 F. Supp. 3d 556, 560-64 (S.D.N.Y. 2018) (holding that Department of Transportation regulations forbidding former agency employees from testifying was substantive regulation outside of the Housekeeping Statute’s rulemaking authority).

³¹⁶ *New York v. U.S. Dep’t of Health & Human Servs.*, 414 F. Supp. 3d 475, 512-16 (S.D.N.Y. 2019).

³¹⁷ See *id.* at 513.

VII in the health care field” by bypassing the undue hardship exception,³¹⁸ “newly restrict[] the ability of employers to inquire about employees’ conscience objections,”³¹⁹ newly define the term “health care entity” to apply to pharmacists and medical laboratories, and construe “the Weldon Amendment and the [Affordable Care Act], for the first time, to apply to health care plan sponsors and third-party administrators.”³²⁰ The court held that “contrary to HHS’s depiction of [the “conscience rule”] as mere housekeeping, the Rule relocates the metes and bounds—the who, what, when, where, and how—of conscience protection under federal law.”³²¹

Response: Commenter’s reliance on *New York v. U.S. Dep’t of Health & Human Servs.*, 414 F. Supp. 3d 475 (S.D.N.Y. 2019) (*New York*) is misplaced. The district court held that HHS could not rely on housekeeping statutes to promulgate its conscience rule provisions finding that the rule was “heavily substantive” because “[i]t shapes the rights and obligations of those subject to the Conscience Provisions.” *New York* at 527.

A rule that announces new rights and imposes new duties—one that shapes the primary conduct of regulated entities—is substantive. *See N.Y.C. Emps. Ret. Sys. v. SEC*, 45 F.3d 7, 12 (2d Cir. 1995) (citing *White v. Shalala*, 7 F.3d 296, 303 (2d Cir. 1993)); *see also Chrysler Corp.*, 441 U.S. at 302, 99 S. Ct. 1705 (substantive rules “affect[] individual rights and obligations” (internal citations omitted)); *Thomas v. New York*, 802 F.2d 1443, 1447 (D.C. Cir. 1986) (substantive rules “jeopardize or substantially affect the rights and interests of private parties” (internal citations and quotation marks omitted)). In some contexts, the distinction between substantive and procedural rules can be elusive—“one of degree” and not kind. *Elec. Privacy Info. Ctr. v. U.S. Dep’t of Homeland Sec.*, 653 F.3d 1, 5 (D.C. Cir. 2011). But not here. At the time the Rule was promulgated, the President stated that it conferred “new protections.” And that the Rule recognizes new substantive rights and imposes new substantive duties on regulated entities in the health care sector is apparent from each of the Rule’s (1) purpose, (2) definitions, and (3) assurance and certification requirements.

Id. at 522-23.

EPA’s final rule does not establish rights or impose obligations on any outside parties unlike HHS’s conscience rule which established rights and imposed duties on regulated entities in the health care industry.

Also see the response to Comment 31-135.

Comment [82-836]: Commenter (12464) writes that the Proposal is similarly substantive because it would establish a rule declaring that studies whose data and models are not “publicly available in a manner sufficient for independent validation” are deemed immaterial (or given less weight).

³¹⁸ See *id.* Under Title VII, which prohibits religious discrimination against employees, an employer may avoid liability by showing that accommodating the employee’s religious objection would work as an “undue hardship” on the employer and that the employer has offered the employee a “reasonable accommodation.” *Id.* at 536.

³¹⁹ See *id.* at 515.

³²⁰ See *id.*

³²¹ See *id.* at 516.

85 Fed. Reg. at 15,405. Such a rule would not only impact the ability of private parties to challenge the scientific bases for EPA’s regulatory actions going forward but would also plainly restrict the agency’s use of science in its determination of ISI and regulatory decisions.

Additionally, the Proposal is a substantive rule because it will impose significant burdens on researchers. As discussed above,³²² the burden of implementing the tiered-access proposal will largely fall on researchers and universities. In particular, researchers will be responsible for determining which data and models can be made publicly available and managing the logistics of making the data and models available in a manner that complies with the rule. As the Proposal would place the bulk of the responsibility and costs for managing public access to data and models on people outside of the agency, it clearly has a binding external impact, and is substantive in effect.

Response: The purpose of the rule is to increase transparency of the science EPA uses to support its significant regulatory decisions and ISI. Nothing in the final rule will lead to the suppression of scientific data and models. As described in § 30.5, EPA will identify those studies that are given lesser consideration and provide a short description of why lesser consideration was given. The public can provide comments on that decision and can also submit additional studies that it believes the agency should have considered. Nothing in this rule would prevent scientists from submitting their data and studies to EPA. Researchers may voluntarily take steps to ensure that their studies are given greater consideration by making their data and models publicly available for independent validation. Additionally, the Administrator’s exemption in § 30.9 can be used to allow greater consideration for pivotal science where the underlying data and models are not publicly available. Also see responses to Comments 34-144, 34-155, 40-193 and 48-379.

Comment [84-788]: Commenter (11390) writes that the proposed rule falls outside EPA’s rulemaking authority.

Despite EPA’s assertion that the amended Proposed Rule governs “internal agency procedures” and “does not regulate any entity outside the Federal government,” the Proposed Rule is, in fact, a substantive regulation. It will profoundly impact how EPA interacts with regulated parties by changing how the agency performs its core functions.

“It is axiomatic that an administrative agency’s power to promulgate legislative regulations is limited to the authority delegated by Congress.” *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208 (1988). EPA steps far beyond that authority in the SNPRM, proposing a regulation that would change the way the agency engages in virtually any decision-making or scientific process—outside of agency adjudications and enforcement activities—whether or not that process ultimately leads to the adoption of regulations. EPA has revised the Proposed Rule to cite the agency’s housekeeping authority as its basis to regulate. But EPA has no statutory authority to issue the Proposed Rule, either through the Housekeeping Statute or via other environmental statutes EPA has previously cited.

EPA now asserts “housekeeping” authority to issue the Proposed Rule, maintaining that these sweeping changes to agency practice and policy are nothing more than “procedural” rules or

³²² See Section V, *supra*.

“internal agency procedures” that “do[] not regulate any entity outside the Federal Government,” akin to how EPA manages its filing system. This is a serious mischaracterization of the Proposed Rule’s import and effect.

The so-called Housekeeping Statute, 5 U.S.C. § 301—which does not, on its face, even apply to EPA³²³—was “originally adopted in 1789 to provide for the day-to-day office housekeeping in the Government departments,” and courts at every level have consistently found that it does not authorize substantive rules. See, e.g., *Chrysler Corp. v. Brown*, 441 U.S. 281, 310 (1979); U.S. ex rel. *O’Keefe v. McDonnell Douglas Corp.*, 132 F. 3d 1252, 1255-56 (8th Cir. 1998); *City and County of San Francisco v. Azar*, 411 F. Supp. 3d 1001, 1023 (N.D. Cal. 2019). While the Housekeeping Statute might appropriately authorize “a regulation that governs...the filing of government documents pertaining to the day-to-day business of government,” it does not confer an “unrestricted grant of authority” allowing the agency to make broad policy changes that drastically alter the way it discharges its fundamental duties. See *Respect Inc. v. Committee on Status of Women*, 815 F. Supp. 1112, 1123 (N.D. Ill. 1993). Indeed, Housekeeping Statute authority is generally limited to actions that are exempt from the very notice and comment rulemaking procedures EPA has undertaken for the Proposed Rule (and that EPA has tacitly acknowledged³²⁴ are required by doing so). See *Chrysler Corp.*, 441 U.S. at 310 (the Housekeeping Statute “authoriz[es] what the Administrative Procedures Act terms ‘rules of agency organization procedure or practice’ as opposed to ‘substantive rules.’”); 5 U.S.C. § 553(b)(3)(A) (exempting rules of agency procedure, organization, and practice from notice and comment rulemaking).

EPA’s characterization of the Proposed Rule as merely “procedural” or “internal” is erroneous and misleading. In reality, the Proposed Rule would have the effect of amending substantive and well-settled standards for decision-making under a number of the environmental statutes EPA administers, including the CAA, the TSCA, the SDWA, and others. For example, CAA § 109 mandates that EPA set air quality standards based on “air quality criteria,” which must “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare.” 42 U.S.C. §§ 7409, 7408(a)(2). The TSCA requires EPA to use the “best available science” when evaluating the testing and regulation of chemicals. 15 U.S.C. § 2625(h). Decisions are to be made using the “weight of the scientific evidence,” and EPA is required to consider all information related to a chemical substance, including hazard and exposure information, “that is reasonably available to the Administrator.” 15 U.S.C. §§ 2625(i), (k). Similarly, the SDWA mandates use of the “best available public health information” when EPA determines whether to regulate a contaminant, and reliance on the “best available, peer-reviewed science and supporting studies” when making regulatory decisions. 42 U.S.C. §§ 300g-1(b)(1)(B)(ii), 300g-1(b)(3). While EPA claims that “in the event the procedures outlined in this proposed rulemaking conflict with the statute that EPA administers, or their

³²³ The SNPRM acknowledges that EPA is not among the “Executive department[s]” to which the statute’s terms apply. 85 Fed. Reg. 15397. While the SNPRM claims that the subsequent Reorganization Plan No. 3 conferred housekeeping authority upon EPA, that plan nowhere mentions the Housekeeping Statute or provides such authority

³²⁴ The SNPRM also characterizes the Proposed Rule as a “significant regulatory action” as defined in Executive Order 12866; that Executive Order excludes “[r]egulations or rules that are limited to agency organization, management, or personnel matters”—the very types of actions authorized by the Housekeeping Statute. In other words, the Proposed Rule cannot both be authorized the Housekeeping Statute and subject to the requirements of E.O. 12866.

implementing regulations, the statutes and regulations will control,” the Proposed Rule so directly conflicts with multiple statutory requirements as to render this assertion meaningless. In sum, the Proposed Rule cannot be implemented without upending statutory standards for the use of science.

Such fundamental change to agency policy is the very type of action courts have consistently characterized as substantive. See, e.g., *Mendoza v. Perez*, 754 F.3d 1002, 1021 (D.C. Cir. 2014) (a substantive regulation “supplements a statute, adopts a new position inconsistent with existing regulations, or otherwise effects a substantive change in existing law or policy.”); *Rocky Mountain Helicopters, Inc. v. F.A.A.*, 971 F.2d 544, 546 (10th Cir. 1992) (a rule that “changes existing law, policy, or practice” is substantive). “Misuse” of the Housekeeping Statute as purported authorization for these rules has repeatedly been rejected as an “attempt to twist this simple administrative statute into an authorization for the promulgation of substantive rules.” See *U.S. ex rel. O’Keefe*, 132 F. 3d at 1255; see also *Exxon Shipping Co. v. U.S. Dep’t of Interior*, 34 F. 3d 774, 776-78 (9th Cir. 1994); *In re Cincinnati Radiation Litigation*, 874 F. Supp. 796, 821 (S.D. Ohio 1995) (Housekeeping Statute did not authorize a Department of Defense directive mandating that the Department’s experimentation on human subjects could only be conducted where the subject provided full and voluntary consent).

EPA’s Proposed Rule would singlehandedly alter the way EPA discharges its core statutory responsibilities under the key environmental statutes it is tasked with administering, at significant cost to public health and safety. Far from a mere procedural dictate or internal standard, the Proposed Rule dramatically changes the nature of EPA’s activities—both regulatory and non-regulatory—in ways that are inconsistent with existing law and a major departure from past agency policy. The Housekeeping Statute does not authorize such game-changing rulemaking.

Response: EPA disagrees with the commenter that the final rule effects a “substantive change” to existing policy. As discussed in the preamble of the 2018 proposal and the 2020 supplemental proposal, the final rule compliments and implements, but does not change, existing agency policies and OMB guidance on information quality and data availability. The study evaluation factors listed in § 30.5 and taken from existing agency guidance, the *Framework for Human Health Risk Assessment to Inform Decision Making* (Ref. 69). These factors will be used to evaluate studies deemed pivotal to a regulatory action or ISI. Because the rule does not categorically exclude any studies from consideration, EPA can still rely on pivotal science where the underlying data and models are not publicly available for independent validation. Additionally, an Administrator’s exemption granted pursuant to § 30.9 would allow greater consideration of pivotal science lacking data and model availability.

In *FCC v. Fox Television Stations, Inc.*, 556 U.S. 502, 515 (2009), the Supreme Court explained that a more detailed justification is required when the “new policy rests upon factual findings that contradict those which underlay its prior policy,” or “its prior policy has engendered serious reliance interests.” (internal citations omitted). Assuming, arguendo, that the final rule does effect a substantive change in agency policy, EPA has provided a “detailed justification” for the change in the 2018 and 2020 proposals. Because this is a rule of internal agency procedure, outside parties could not have developed reliance interests in the prior policy.

Also see responses to Comments 31-135 and 73-410.

Comment [87-753]: Commenter (11400) writes that this rule is much broader and more substantive than a mere “housekeeping” measure.

EPA is taking comments on its authority to promulgate this rule under its housekeeping authority. In our view, this is not “administrative housekeeping”. This rule creates rules to exclude scientific studies and applies to complex and studies with large price tags. This is not an “internal” matter to EPA, but instead affects broad research parameters that impact the scientific and health communities, and the affected public.

Response: See responses to Comments 31-135, 32-144 and 48-379.

Comment [88-763]: Commenter (11401) writes that like criticisms of EPA’s attempts to hold itself to high scientific standards, criticisms about the use of the housekeeping authority are misplaced. The criticism extends from the fact that the Federal Housekeeping Statute should be internally focused, but that’s exactly what’s laudable about this proposed rule. EPA is aiming to regulate itself by holding itself to high standards in ensuring the best science is used. Some argue that it would limit EPA’s ability to regulate, but EPA should be limited to only regulate when backed by sound science. Regulated communities have to meet strict standards imposed by EPA. It is only right that EPA is held to high standards itself. However, statutory authority from substantive statutes should be used in conjunction with this housekeeping authority.

Response: Thank you for your comment in support of the rule. However, EPA is relying exclusively on its housekeeping authority to promulgate this rule. In the final rule, EPA does not rely on, interpret, or apply provisions of a particular statute or statutes that it administers. EPA will undertake such efforts in forthcoming substantive actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. The rule expressly states in § 30.3 that “[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”

Comment [89-802]: Commenter (11403) writes that the Federal Housekeeping authority cannot be applied to substantive rulemaking. The Federal Housekeeping authority is also of no help to EPA. Apparently recognizing that the previously listed environmental statutes do not provide EPA with the authority it seeks, the agency has invoked an even more tenuous argument—that it may impose these regulations pursuant to the Federal Housekeeping statute, 5 U.S.C. § 301. That provision provides, in full:

The head of an Executive department or military department may prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property. This section does not authorize withholding information from the public or limiting the availability of records to the public.

Arguing that this provision gives EPA the power to establish “internal practices,” EPA claims that because these regulations govern how EPA internally treats scientific studies, the Federal Housekeeping statute is an additional source of authority.³²⁵ Once again, the agency is far off the mark.³²⁶

In short, EPA is simply mistaken in suggesting that these rules are simply a matter of “internal practices” with no substantive effect.³²⁷ As we and many other commenters have detailed, the rules have enormous implications for the manner in which EPA regulates on behalf of public health and the environment, and is certain to lead to dramatic real-world effects as EPA refuses to rely on legitimate scientific studies to make regulatory decisions.

Indeed, the Supreme Court made this precise distinction in *Chrysler Corp. v. Brown*, noting that the Federal Housekeeping statute is “simply a grant of authority to the agency to regulate its own affairs,” and provides no power for an agency to take an action with substantive effects.³²⁸ Given the real world impacts of these rules, EPA has no power to promulgate them under the Federal Housekeeping statute.

The *single* precedent on which EPA relies, *United States v. Manafort*, does not suggest otherwise, for the internal Special Counsel regulations at issue there concerned such matters as assignment of cases; staffing and budget matters; and reporting and compliance matters.³²⁹ Given that the regulations actually had no substantive effect, the Court naturally found they were duly promulgated under the Federal Housekeeping statute. Here, by contrast, again, these rules will have demonstrable substantive effect in governing how EPA treats scientific studies.

Indeed, while claiming authority under the Federal Housekeeping statute, it is apparent that EPA itself recognizes it is enacting a substantive rule, because it has subjected the rules to notice and comment rulemaking. As the Court explained in *Manafort*, that process is reserved for substantive rules not subject to the Federal Housekeeping statute, and an agency proceeding under that statute simply takes action, without public involvement.³³⁰

Moreover, while, as explained, the rules in *Manafort* are completely unlike those at issue here, there is a long line of precedents expressly rejecting agency attempts to rely on the Federal Housekeeping statute to promulgate substantive rules.³³¹ As another court explained in similarly rejecting an agency’s reliance on the Federal Housekeeping statute, EPA’s argument here “is

³²⁵ 85 Fed. Reg. at 15,398.

³²⁶ As a threshold matter, EPA is not an Executive Department covered by the plain language of the statute. 5 U.S.C. § 101.

³²⁹ *United States v. Manafort*, 312 F. Supp. 3d 60, 74-60 (D.D.C. 2018).

³³⁰ *Id.* at 74-75 (explaining that in issuing the Special Counsel regulations “the agency did not subject the regulations to the rulemaking procedures required by the Administrative Procedure Act, such as seeking notice and comment from the public”).

³³¹ See, e.g., *In re Bankers Trust Co.*, 61 F.3d 465, 470 (6th Cir. 1995); *Exxon Shipping Co. v. United States Dep’t of Interior*, 34 F.3d 774, 776-78 (9th Cir. 1994); *In re Cincinnati Radiation Litig.*, 874 F. Supp. 796, 826-27 (S.D. Ohio 1995); *McElyea v. Sterling Med. Inc.*, 129 F.R.D. 510, 514 (W.D. Tenn. 1990).

simply one more attempt to twist this simple administrative statute into an authorization for the promulgation of substantive rules.”³³²

As the Supreme Court has emphasized, “an administrative agency’s power to promulgate legislative regulations is limited to the authority delegated by Congress.”³³³ Because these regulations are not permissible under any substantive grant of authority to EPA, and may not proceed under the Federal Housekeeping statute, EPA must abandon this effort to undermine the use of scientific studies in its decision-making.

Response: See responses to Comments 31-135, 32-144 and 48-383.

Comment [90-825]: Commenter (11404) writes that EPA lacks “housekeeping authority” and such authority would not justify the Proposed Rulemaking in any event.

Finally, EPA is incorrect in its assertion that it can use federal “housekeeping authority” codified in Title 5, section 301 of the United States Code as a justification for the Strengthening Transparency in Regulatory Science Proposed Rulemaking. First, EPA lacks federal housekeeping authority conferred on heads of Executive Departments. EPA is not an “Executive Department” within the meaning of the statute. See 5 USC § 101. Executive Departments, as defined, are Cabinet-level Departments of the federal government. EPA is not among those departments. EPA’s assertion that it “gained housekeeping authority through the Reorganization Plan No. 3 of 1970” (85 FR 15397) which established EPA (“Plan No. 3”) is legally and factually incorrect. Plan No. 3 makes no mention of such authority. Moreover, even if Plan No. 3 had addressed this issue, President Nixon lacked authority to expand the list of Executive Departments authorized by statute to exercise housekeeping authority. EPA’s reliance on the Second Circuit decision in *EPA v. General Electric Company*, 197 F3d 592 (1999) (“GE”) is misplaced. The court in GE did not analyze, much less decide, that EPA possesses housekeeping authority. Second, even if EPA had federal housekeeping authority, the Proposed Rulemaking extends far beyond the reach of housekeeping authority. The Supreme Court has made clear that housekeeping authority is only to be used to promulgate rules of agency procedure, organization, or practice—not substantive rules. See e.g., *Chrysler Corp. v. Brown*, 441 US 281 (1979) (describing the purpose of housekeeping authority as being “to provide for day-to-day housekeeping” and not to include “substantive rules.” *Id.*, at 283). EPA’s Proposed Rulemaking extends far beyond the modest, noncontroversial rulemaking for which housekeeping authority provides justification. The Strengthening Transparency in Regulatory Science proposal would fundamentally change how EPA uses science for regulatory purposes—both in its future rulemakings and retroactively. Thus, even if EPA possessed such authority, the Proposed Rulemaking cannot be justified by the limited authority intended to be conferred by housekeeping authority.

Response: See response to Comment 31-135.

Comment [92-850]: Commenter (11396) writes that in addition to the lack of a scientific justification, EPA’s legal authorization for the Proposed Rule, as supplemented by the SNPRM,

³³² *United States ex rel. O’Keefe v. McDonnell Douglas Corp.*, 132 F.3d 1252, 1255 (8th Cir. 1998).

³³³ *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208 (1988).

is also wholly lacking. The limited "housekeeping" authority under 5 U.S.C. 301 (assuming it applies, which it likely does not), authorizing some federal agencies to regulate their own internal affairs, may not serve as the legal foundation for a rule that could allow EPA to exclude the best available science from its policymaking. As explained above, excluding the best available science from EPA policymaking is patently at odds with the agency's duties under multiple federal statutes. EPA is proposing here to alter the substantive standards for evaluating scientific research. But the federal housekeeping statute in no way authorizes EPA to make such substantive and impactful changes. Nor may the agency rely on the authority of the federal statutes it administers, which provide no legal basis at all for this proposal.

Response: See responses to Comments 31-135, 32-144 and 73-410.

Comment [93-853]: Commenter (11395) writes that as EPA acknowledges in the SNPRM, the Supreme Court ruled in *Chrysler Corp. v. Brown*, [441 U.S. 281, 309 (1979)]. that the intended purpose of the Housekeeping Statute is "to govern internal departmental affairs" and, as such, authorizes "what the [APA] terms 'rules of agency organization, procedure or practice' as opposed to substantive rules." Because the proposed Strengthening Transparency rule would have far reaching substantive impacts on a wide range of EPA programs and activities, it is clearly inappropriate to invoke the Housekeeping Statute as authority applicable to this proposed rule.

Response: See response to Comment 31-135.

Comment [94-879]: Commenter (11408) writes that in the 2018 proposal, the EPA glibly asserted that authority for the rulemaking could be found in "the statutes its administers, including provisions providing general authority to promulgate regulations necessary to carry out the Agency's functions under these statutes and provisions specifically addressing the Agency's conducting of and reliance on scientific activity to inform those functions."³³⁴ (The 2018 proposal goes on to cite specific provisions in various authorizing statutes that provide general rulemaking authority or that create scientific research programs to support implementation of the particular statute.) Unsurprisingly, this position met almost immediately with broad condemnation and was singled out as one of the most flawed aspects of the 2018 proposal.³³⁵

The supplemental proposal now seeks to remedy this threshold weakness in the original proposal by offering a new alternative legal justification for the rulemaking. Specifically, the supplemental proposal employs a novel reading of an obscure law known as the Federal Housekeeping Statute to identify a legal basis for the rule.³³⁶ (The supplemental proposal also sought public comment on whether to rely on the Federal Housekeeping Statute as an

³³⁴ Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18769 (proposed Apr. 30, 2018) (to be codified at 40 C.F.R. pt. 30)

³³⁵ See, e.g., Letter from Legal Scholars to EPA, re: Comment on Proposed Rule—Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18768 (Apr. 30, 2018) ("Proposed Rule") (Aug. 14, 2018), available at <https://legal-planet.org/wp-content/uploads/2018/08/FINAL-EPA-HQ-OA-2018-0259-Comment-Letter.pdf>.

³³⁶ Strengthening Transparency in Regulatory Science, 85 Fed. Reg. 15396, 15397-98 (proposed Mar. 18, 2020) (to be codified at 40 C.F.R. pt. 30).

independent basis for the rule or to use that statute’s authority in conjunction with the specific provisions of its authorizing statutes that were cited in the 2018 proposal.)

This new attempt to find legal authority for the rule has two critical flaws. First, the Federal Housekeeping Statute doesn’t apply to the EPA – only “Executive departments,” a category that does not include the EPA. Second, even if the statute did apply to the EPA, the modest authorities it confers on covered federal agencies would not supply the legal basis for the kind of far-reaching requirements and limitations contemplated in the rulemaking. Because neither the 2018 proposal nor the supplemental proposal has identified a sound legal basis for this rulemaking, the rulemaking presents a clear case of an action that is “in excess of statutory . . . authority,”³³⁷ rendering it highly vulnerable to rejection on judicial review.

Response: See response to Comment 31-135.

Comment [94-880]: Commenter (11408) writes that the operative provision of the Federal Housekeeping Statute reads: “The head of an *Executive department* or military department may prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property.”³³⁸ A related law provides the definitive list of the “Executive departments” covered by the Federal Housekeeping Statute.³³⁹ Since its creation, the EPA has remained conspicuously absent from this list.

The supplemental proposal acknowledges this obvious shortcoming but asserts that the 1970 legislation that created the EPA, Reorganization Plan No. 3, still served to bring the agency within the scope of Federal Housekeeping Statute.³⁴⁰ Reorganization Plan No. 3 formally established the agency while laying out all the programs and authorities that were being transferred to it from already existing agencies, including the DOI and an agency then known as the Department of Health, Education, and Welfare.

Significantly, however, Reorganization Plan No. 3 never directly mentions the Federal Housekeeping Statute. To overcome this barrier, the supplemental proposal adopts the legal theory that the EPA’s Office of General Counsel (OGC) employed in a 2008 memorandum opinion concerning an unrelated regulation. That opinion contends that Section 2(a)(9) of the Plan implicitly confers this authority through a vague “catchall” provision. Specifically, this provision calls for the transfer of “So much of the functions of the transferor officers and agencies referred to in or affected by the foregoing provisions of this section as is incidental to or necessary for the performance by or under the Administrator of the functions transferred by those provisions or relates primarily to those functions.”

In essence, then, the supplemental proposal argues that, when Congress formally approved Reorganization Plan No. 3, it has also implicitly intended to regard the EPA as an Executive department – or at least imbue it with some of the trappings of an Executive department – but in

³³⁷ 5 U.S.C. §706(2)(C).

³³⁸ Federal Housekeeping Statute, 5 U.S.C. §301 (emphasis added).

³³⁹ 5 U.S.C. §101.

³⁴⁰ Reorganization Plan No. 3 of 1970, 84 Stat. 2086.

the nearly 50 year since has not gotten around to officially declaring it by updating the relevant statutory list. This argument is unpersuasive.

Since the enactment of the Federal Housekeeping Statute, Congress has amply demonstrated that it knows how to update the statutory “Executive departments” list, and it has done so on several occasions both before and after it approved Reorganization Plan No. 3. Indeed, Congress updated the list a little over a month after Reorganization Plan No. 3 to remove the Post Office Department from the list.³⁴¹ That seemingly would have provided an ideal opportunity for Congress to take the step of explicitly adding the newly created EPA.

Congress has had several opportunities in the nearly 50 years since the EPA was created to update the statutory “Executive departments” list, and it has conspicuously failed to do so. Most notably, Congress could have done so in 1979 when it updated the list to reflect the reorganization of the old Department of Health, Education, and Welfare – from which many of the EPA’s original functions and authorities had sprung – into the new Departments of Education and Health and Human Services, respectively. The fact that Congress has yet not updated the statutory “Executive departments” list to include the EPA despite ample opportunities to do so cannot be wished away by a memo from the agency’s OGC.

Of greater relevance, Congress has shown that it knows how to update the statutory “Executive departments” list to include new departments that are created through the transfer and consolidation of various existing programs and authorities spread across several federal agencies, as was the case with the EPA. Congress took precisely this step when it created the DHS. Like Reorganization Plan No. 3, the HSA of 2002, adopted in response to the September 11th terrorist attacks, lays out those functions and authorities that were being transferred to the new DHS from where they had previously existed at agencies like the Departments of Agriculture, Energy, and Treasury.³⁴² Significantly, in transferring these functions, the HSA also specifically provides in Section 101 that the DHS was being “established . . . as an executive department of the United States within the meaning of [the title of the U.S. code that contains the Federal Housekeeping Statute].”³⁴³

Another problem with the supplemental proposal’s argument is that the EPA has evolved as an agency in significant ways since its creation. This then raises intractable difficulties regarding the appropriate present-day application of the catchall provision contained in Reorganization Plan No. 3. Through various authorization and reauthorization acts, the present-day EPA is no longer the same agency that was established via Reorganization Plan No. 3, and it now carries out functions and authorities that were not contemplated at the time the Plan was drafted. Under the OGC’s theory adopted by the supplemental proposal, it stands to reason that these new functions and authorities would not benefit from the implicit transfer of the Federal Housekeeping Statute authorities. That result would put current EPA officials (and potentially reviewing judges) in the awkward position of policing the lines between those agency functions and authorities covered by the Federal Housekeeping Statute and those that are not. Such a bizarre result weighs further

³⁴¹ Postal Reorganization Act, Pub. L. 91–375 §6(c)(1).

³⁴² Homeland Security Act of 2002, Pub. L. 107-296.

³⁴³ Homeland Security Act of 2002 §101.

against accepting the theory that the catchall provision in Reorganization Plan No. 3 served as an implicit transfer of the authorities conferred by the Federal Housekeeping Statute.

To be sure, the EPA has for decades issued regulations under claimed authority from the Federal Housekeeping Statute and the appropriateness of the legal basis for these regulations appears to have gone unchallenged. But a legal wrong cannot be made right through simple repetition. If it did, then agencies would face strong incentives to break the law as much as they could before getting caught. It is also worth noting that these previous applications involved genuinely noncontroversial internal procedures for the agency – the kind of procedures that the Federal Housekeeping Statute was designed to authorize, as noted below. As such, it would be unreasonable to construe the lack of a challenge to the legal basis for these actions as a broad recognition or acceptance of the appropriateness of their legal basis. Instead, it is more likely that their noncontroversial nature was such that they failed to attract the kind of intensive legal scrutiny that would have exposed their inadequate legal basis to begin with.

Response: See response to Comment 31-135.

Comment [94-881]: Commenter (11408) writes that even if the supplemental proposal was correct in its assertion that the EPA is covered by the Federal Housekeeping Statute, it does not necessarily follow that the authorities it confers would supply the legal basis for this rulemaking. On the contrary, it is clear that the modest authorities that the Federal Housekeeping Statute affords to covered agencies are insufficient to support this rule, since its primary effect is external in nature because it seeks to alter how the general public interacts with the EPA for the purpose of affecting its regulatory decision-making or informing its policy-relevant scientific determinations.

To support its contention that the Federal Housekeeping Statute provides it with authority to issue the rule, the supplemental proposal curiously cites the Supreme Court case *Chrysler Corp. v. Brown*.³⁴⁴ The citation of this case is curious because the Court’s reasoning there cuts unmistakably against this argument. At issue in *Chrysler Corp.* was a DOL regulation that sought to compel the public disclosure of reports provided to the government by government contractors concerning their workforce composition, even though such disclosures would seemingly run afoul of the Trade Secrets Act. The Court struck down this regulation, finding that the modest reach of the Federal Housekeeping Statute was too limited to empower the DOL to displace the mandates imposed on it by Trade Secrets Act.

Crucially, in reaching its decision, the Court emphasized the essential “‘housekeeping’ nature” of the Federal Housekeeping Statute and characterized the law as “simply a grant of authority to the agency to regulate its *own affairs*.”³⁴⁵ The Court had little trouble contrasting this understanding of the statute’s modest reach with the DOL’s regulation. Indeed, the material impacts of this regulation unavoidably extended well beyond what might be considered routine internal agency operating procedures given that its function was to alter the application of the Trade Secrets Act, a law that Congress enacted to govern privacy issues that arise from the federal government’s interactions with private sector businesses. Accordingly, the Court concluded that Congress had

³⁴⁴ *Chrysler Corp. v. Brown*, 441 U.S. 281 (1979).

³⁴⁵ *Id.* at 309 (emphasis added).

not intended the Federal Housekeeping Statute to authorize something like the DOL's workforce composition disclosure regulation.

The logic employed by the Court in *Chrysler Corp.* is readily applicable to this rulemaking. As was the case there, this rulemaking cannot be reasonably understood as governing the EPA's internal operating procedures. That is because the provisions in this rulemaking are directly and inextricably tied to the implementation of the EPA's various authorizing statutes, as well as to its adherence to the APA. The rulemaking's impact on the APA is significant in this regard because the function of that law is to govern how the federal government interacts with members of the public in the development of new regulations. As such, this rulemaking is practically indistinguishable from the one at issue in *Chrysler Corp.*, which, as noted above, sought to alter the DOL's adherence to the Trade Secrets Act, a law that similarly seeks to manage certain kinds of interactions between the government and the general public. In relevant part, the APA directs agencies to "give interested persons an opportunity to participate in the rule making through submission of written data, views, or arguments." It further directs them to develop a final rule based on the "consideration of the relevant matter presented."³⁴⁶

The rulemaking would undeniably impact the EPA's compliance with these public participation requirements under the APA. In particular, its function is to fundamentally alter how members of the public are able to contribute to the development of the EPA's regulations and policy-relevant scientific determinations. Among other things, it would limit the kinds of "written, data, views, or arguments" that "interested persons" can submit to the EPA during the public comment process, while also drastically overhauling what the EPA can regard as "relevant matter presented" for its "consideration" in developing a final rule. As such, because this rulemaking goes well beyond routine internal housekeeping procedures, it plainly exceeds the authority that could be granted to the EPA by the Federal Housekeeping Statute.

That the rulemaking would have such a significant impact on how the public interacts with the EPA on matters important to the public can also be seen in the considerable controversy it has provoked since its inception. The 2018 proposal received nearly 600,000 public comments, nearly all of which were in opposition. At a recent House Science Committee hearing on the rulemaking, none of the committee members present and none of the non-agency invited witnesses offered support for the 2018 proposal.³⁴⁷ It is also noteworthy in this regard that Congress has rejected several bills in recent years that have sought to impose limitations on the EPA's consideration of science in developing new rules that are similar to those contained in this rulemaking.³⁴⁸ It would be hard to believe that the kind of modest and mundane authorities supplied by the Federal Housekeeping Statute could provide the legal basis for a rulemaking that has engendered such widespread opposition and controversy.

(2019), <https://science.house.gov/hearings/strengthening-transparency-or-silencing-science-the-future-of-science-in-epa-rulemaking> (last visited May 14, 2020).

³⁴⁸ See, e.g., Secret Science Reform Act of 2015, H.R. 1030, 114th Cong. (2015), available at <https://www.congress.gov/bill/114th-congress/house-bill/1030>.

Response: See responses to Comments 31-135, 40-193 and 48-408.

Comment [97-899]: Commenter (11479) writes that the supplemental notice offers a different source of authority for the proposed rule, changing from a range of statutes to the Federal Housekeeping Act. The Act reads that “The head of an Executive department or military department may prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property” (emphasis added).³⁴⁹ EPA is not an “executive department” of the federal government.³⁵⁰ Even if the Federal Housekeeping Act applied here, it is meant to cover procedural rules, which the APA defines as “rules of agency organization, procedure or practice,” not substantive rules, like this proposed rule, that would prevent an agency from fulfilling its statutory duties.

Response: See response to Comment 31-135.

Comment [98-942]: Commenter (11500) writes that for the reasons discussed in the Supplemental Notice, they support EPA’s proposal to rely on its internal Housekeeping authority as a basis for these proposed regulations. However, they also note EPA’s statement that “This internal agency procedure is intended to be consistent with the statutes that EPA administers and EPA plans to implement this procedural rulemaking in accordance with all applicable statutory and regulatory requirements.” As discussed in their Comments on the proposal, the CAA requires the maximum practicable scientific transparency in NAAQS proceedings. Accordingly, while EPA’s Housekeeping authority is one appropriate basis for this proposal, the agency should make it clear that other statutes such as the CAA not only permit but require the actions EPA has proposed. This is necessary to ensure that future administrations cannot repeal or modify the rule simply by changing the agency’s interpretation of the Housekeeping statute.

Response: Thank you for your comment in support of the final rule. EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this rule, EPA does not rely on, interpret, or apply provisions of a particular statute or statutes that it administers. EPA will undertake such efforts in forthcoming substantive actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule.

Comment [99-951]: Commenter (11480) writes that they have been a strong defender of EPA’s authority to issue public health protections. Decisions made by EPA under a variety of statutes, from the CAA to the EPCRA to the TSCA, have impacted our members. EPA decisions to reduce hazardous pollutants have reduced workplace exposures and protected the health of workers and their families. And EPA decisions have advanced manufacturing technologies in the United States to ensure that the processes and products are less polluting and more globally competitive. In some cases, their members have opposed EPA decisions due to concerns over job

³⁴⁹ 5 U.S. Code § 301. Pub. L. 89-554, Sept. 6, 1966, 80 Stat. 379. Online at <https://www.law.cornell.edu/uscode/text/5/301>, Accessed May 14, 2020.

³⁵⁰ 5 U.S. Code § 101. Online at <https://www.law.cornell.edu/uscode/text/5/101>, Accessed May 14, 2020.

security. Since EPA's creation they have evaluated regulatory decision-making by taking a hard look at the science used to justify regulatory proposals under a variety of statutes.

However, we question EPA's authority to issue this proposal. The cited authority –the federal housekeeping statute– was originally enacted for executive departments a century prior to the modern civil service. This supplemental proposal acknowledges that EPA is not an executive department, but it claims that the agency can use this authority anyway based on the Reorganization Plan No. 3 of 1970. The use of this supposed authority is dubious for this reason and because the implementation of this proposal would go beyond the internal organization or functioning of the agency by significantly impacting the implementation of statutes that the EPA is carrying out at the direction of the United States Congress.

Response: See the response to Comment 31-135.

Comment [113-994]: Commenter (11391) writes that EPA lacks legal authority to adopt the proposed rule.

In addition to being unsupported and unjustified, the Proposed Rule also lacks any statutory basis. Administrative agencies, such as EPA, have only the power conferred on them by Congress.³⁵¹ Agencies may, therefore, only adopt regulations where authorized to do so by Congressional statute.³⁵² In the 2020 SNPRM, EPA claims that the Proposed Rule is authorized under the Federal Housekeeping Statute³⁵³ but, as the Agency itself recognizes, that statute only authorizes the adoption of procedural rules governing agencies' internal affairs.³⁵⁴ The Proposed Rule goes beyond this, regulating the conduct of outside parties, and thus amounts to a substantive rule, which the courts have repeatedly held cannot be adopted under the Federal Housekeeping Statute.³⁵⁵ The courts have interpreted the Federal Housekeeping Statute as a "narrow" grant of authority to agencies to deal with internal "housekeeping" matters.³⁵⁶ In *Chrysler Corp. v. Brown*, the Supreme Court held that the Federal Housekeeping Statute "authoriz[es] what the APA terms rules of agency organization, procedure or practice as opposed to substantive rules."³⁵⁷ The court defined "substantive rules" as those that "affect[] individual rights and obligations."³⁵⁸ Building on that definition, in *American Hospital Association v. Bowen*, the U.S. Court of Appeals for the District of Columbia Circuit (D.C. Circuit) identified several key features of substantive rules.³⁵⁹ According to the court, substantive rules typically establish binding standards that create rights, impose obligations, or otherwise "significantly

³⁵¹ *Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 371 (1986) ("[A]n agency literally has no power to act . . . unless and until Congress confers power upon it").

³⁵² *Am. Library Ass'n v. FCC*, 406 F.3d 689, 691 (D.C. Cir. 2005) ("It is axiomatic that administrative agencies may issue regulations only pursuant to authority delegated to them by Congress").

impact” private interests, for example, by “put[ting] a stamp of [agency] approval or disapproval on a given type of behavior.”³⁶⁰

Contrary to EPA’s claim, the Proposed Rule is not merely an “internal rule of agency procedure,”³⁶¹ but rather a substantive rule, which binds parties outside the Agency. In this regard, we note that the Proposed Rule is similar to EPA’s 2001 directive banning agency consideration of third-party human studies (“2001 Directive”), which was held to be a substantive rule in *Croplife America v. EPA* (“Croplife”).³⁶² In that case, the D.C. Circuit reasoned that the 2001 Directive used “clear and unequivocal language,” stating that EPA “will not consider . . . any human studies in its regulatory decision-making.”³⁶³ Based on that language, the court concluded that the 2001 Directive bound both EPA and third parties, who were “concretely injured” because they could no longer rely on human studies that had previously been accepted by the Agency.³⁶⁴ Similarly, the Proposed Rule mandates that EPA “will only use,” or under the alternative proposal “will . . . give greater consideration to,” studies for which the underlying data are available. As such, the Proposed Rule will prevent or severely impede third parties from relying on other studies, previously accepted by EPA. Those parties are bound by the Proposed Rule, which “put[s] a stamp of . . . disapproval” on their reliance on certain studies, thus significantly affecting their interests.

Given the above, EPA’s characterization of the Proposed Rule as non-binding³⁶⁵ is plainly incorrect and does not undo its substantive effect. EPA points to dicta from *U.S. v. Manafort*³⁶⁶ to argue that its characterization of the Proposed Rule is determinative.³⁶⁷ However, as the D.C. Circuit held in *Croplife*, “an agency’s characterization of its own action is not controlling if it self-servingly disclaims any intention to create a binding rule with the force of law, but the record indicates otherwise.”³⁶⁸ Here, the record makes clear that the Proposed Rule “impose[s] requirements,” which are expressed in mandatory terms.³⁶⁹ The Proposed Rule thus leaves EPA and third parties with no choice in how to deal with scientific studies.³⁷⁰

³⁶⁰ Id. at 1045 & 1047 (“Substantive rules are ones which grant rights, impose obligations, or produce other significant effects on private interests.” As such, in determining whether a rule is substantive, the courts look at whether it “has a substantial impact on parties” and, “more broadly, whether . . . [it] encodes a substantive value judgement or puts a stamp of approval or disapproval on a given type of behavior”). See also id. at 1046 (A “substantive rule establishes a standard of conduct which has the force of law in subsequent proceedings”) (internal citations omitted)). Cf. *Chamber of Commerce of the U.S. v. U.S. Dep’t of Labor*, 174 F.3d 206, 212 (D.C. Cir. 1999) (“Substantive rules are ones which grant rights, impose obligations, or produce other significant effects on private interests . . . [W]hether a rule has the force of law often will bear upon its proper classification as substantive or procedural,” but “will not necessarily be controlling”).

³⁷⁰ While the 2020 Proposed Rule provides for the granting of exemptions, allowing use of non-public studies, that does not render it non-binding. See generally, *Croplife*, 328 F.3d at 881 (rejecting EPA’s argument that the 2001

By preventing the use of studies for which the underlying data are not available, the Proposed Rule reverses long-standing EPA policy, which further indicates that it is a substantive rule not authorized under the Federal Housekeeping Statute. Indeed, in *Alcaraz v. Block*, the U.S. Court of Appeals for the Ninth Circuit held that a key feature of substantive rules is that they “create[] new” or “change existing law or policy.”³⁷¹ EPA implies that it has not previously had a coherent, existing policy regarding the use of scientific studies,³⁷² but that is not the case. For at least the last two decades, EPA has consistently relied on studies for which the underlying data are not available, and repeatedly rejected claims that it cannot or should not do so.³⁷³ As far back as 1997, EPA concluded that it was “impractical and unnecessary” to exclude such studies from its review and that doing so “would make it extremely difficult, if not impossible, for EPA to regulate in complex technical areas at the forefront of science.”³⁷⁴ EPA reiterated that view in 2016 and affirmed that it would continue to rely on all relevant studies (i.e., regardless of the availability of the underlying data).³⁷⁵ The Proposed Rule effects a sudden and, as discussed in Part I above, unjustified reversal of that twenty-year policy.

Response: See responses to Comments 31-135, 32-144, 48-379, 48-380, 48-382 and 48-408.

Comment [114-1008]: Commenter (11392) notes that the EPA is proposing the option of using its housekeeping authority independently as authority for taking this action or in conjunction

Directive is not binding because it allows consideration of human test data if the agency is “legally required” to rely on such data).

³⁷¹ *Alcaraz v. Block*, 746 F.2d 593, 613 (9th Cir. 1984). See also Bowen, 834 F.2d at 1045 (substantive rules include those “which effect a change in existing law or policy”); *Croplife*, 329 F.3d at 885 (the fact that the 2001 Directive “effect[ed] a dramatic change in the agency’s established regulatory regime” indicates it is a substantive rule).

³⁷² See e.g., 2018 Notice, *supra* note 2, at footnote 3 (“Historically, EPA has not consistently observed the policies underlying this proposal”).

³⁷³ See e.g., National Ambient Air Quality Standards for Particulate Matter, 62 Fed. Reg. 28652, 28689-28694 (July 18, 1997) (EPA is “entitled to rely on . . . studies . . . regardless of the availability of the underlying health data”). EPA’s ability to rely on studies for which the underlying data are not publicly available has been affirmed by the courts. See e.g., *American Trucking Ass’n v. Env’tl. Prot. Agency*, 283 F.3d 355 (D.C. Cir. 2002); *Coal. of Battery Recyclers Ass’n v. Env’tl. Prot. Agency*, 604 F.3d 613 (D.C. Cir. 2010).

³⁷⁴ National Ambient Air Quality Standards for Particulate Matter, 62 Fed. Reg. 28652, 28689 & 28692 (July 18, 1997).

³⁷⁵ House of Representatives, Committee on Agriculture, Hearing to Consider the Impacts of the Environmental Protection Agency’s Actions on the Rural Economy, Responses to Submitted Questions 82 (Sept. 6, 2016) (EPA “does not believe that it is appropriate to refuse to consider published studies in the absence of underlying data. The EPA frequently relies on peer reviewed studies in the public literature without possessing underlying data ... If the EPA and other governmental agencies could not rely on published studies without conducting independent analyses of the raw data underlying them, then much relevant scientific information would become unavailable for use in setting standards to protect public health and the environment”). This view is also reflected in several EPA policy documents. See e.g., EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency 21 & 24 (2002), https://www.epa.gov/sites/production/files/2020-02/documents/epa-info-quality-guidelines_pdf_version.pdf [Original link dead, alternative link provided] (indicating that EPA frequently relies on information where “access to [the underlying] data and models cannot occur due to compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections”); EPA Science Policy Council, A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information 7 (2003), <https://www.epa.gov/sites/production/files/2015-01/documents/assess2.pdf> [Original link dead, alternative link provided] (noting that, while the accessibility of underlying data is one of several factors to be considered in assessing the quality of scientific information, EPA must also consider whether there are “confidentiality issues that may limit accessibility”).

with the environmental statutory provisions cited as authority in the 2018 proposed rulemaking (as clarified in this supplemental proposal). The Agency continues to consider whether it is appropriate to rely on its authority in the above-referenced environmental statutory provisions (potentially in conjunction with its housekeeping authority). The Agency will consider comments on this issue submitted in response to the 2018 proposal and in response to this SNPRM.

EPA does not possess the legal authority to promulgate this rule. As Members of Congress, we can affirm that Congress has never authorized the Agency to use any "housekeeping authority" in this manner. Furthermore, Congress explicitly rejected the legislative precursors to this rule in the failed Secret Science Reform Acts of 2014 and 2015 and HONEST Act of 2017. In its desperate search for a statutory basis, EPA is attempting to redefine the rule as a procedural matter rather than a change in policy. The federal housekeeping statute was never meant to be used this way, and EPA's verbal sleight-of-hand to justify its use only demonstrates the tenuous nature of the Agency's position.

First, the plain language of the Federal Housekeeping Statute at 5 U.S.C. 301 excludes EPA. The Agency is not one of the 15 Executive Departments listed at 5 U.S.C. 101, which are the Departments explicitly authorized to act pursuant to the Housekeeping Statute.³⁷⁶ The Agency asserts that it acquired housekeeping authority under the Reorganization Plan of 1970, as determined by the OLC in a 2008 memorandum opinion.³⁷⁷ That memorandum opinion was written in response to a narrow question, "whether the [EPA] may hold its employees liable for the negligent loss, damage, or destruction of government personal property or for the unauthorized personal use of agency-issued cell phones", which is in no rational conception related to the action proposed in the SNPRM. Whether the underlying assertion is correct or not, any housekeeping authority possessed by EPA must be narrow and limited in nature, consistent with the Agency's absence from 5 U.S.C. 101 and the language of the Housekeeping Statute itself. Congress established specific criteria for the housekeeping authority in 5 U.S.C. 301, namely that the authority extends to "the government of [the] department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, paper, and property."³⁷⁸ This is not catch-all language: it is meant to limit the authority to internal department affairs of a procedural nature, separate from the Agency policymaking process. In other words, the Federal Housekeeping Statute does not provide any authority to enact policies, but merely to manage internal affairs such as record-retention, employee behavior, and property management.

Despite these limitations, EPA is determined to invoke the housekeeping authority for the "Strengthening Transparency" rule because it lacks any other authority. The SNPRM characterizes the rulemaking as "a rule of agency procedure to establish an agency wide approach to handling studies when the data and models underlying EPA's significant regulatory decisions and influential scientific information are publicly available and when those data and

³⁷⁶ 5 U.S. Code 101, "Executive Departments," accessed here: <https://uscode.house.gov/view.xhtml?req=granuleid:USC-1999-title5-section101&num=0&edition=1999> [Original link dead, alternative link provided]

³⁷⁷ "Authority of the Environmental Protection Agency to Hold Employees Liable for Negligent Loss, Damage, or Destruction of Government Personal Property." 32 Op. O.L.C. 79 (2008).

³⁷⁸ 5 U.S. Code 301, "Departmental Regulations," accessed here: [https://uscode.house.gov/view.xhtml?req=\(title:5%20section:301%20edition:prelim\)](https://uscode.house.gov/view.xhtml?req=(title:5%20section:301%20edition:prelim)).

models are not publicly available." This characterization contains critical conceptual errors. Most importantly, the phrase "handling studies" is misleading. The rule does not concern how the Agency "handles" scientific studies procedurally; it concerns how the Agency considers and uses studies in its policymaking process. Additionally, the rule would not create a procedure for an agency wide approach to scientific studies; it would create a new policy to categorically change the way certain studies are considered in the regulatory process where no such distinction existed before. EPA seeks to portray a sweeping policy change that would impact every aspect of Agency regulatory activity as a modest procedural change, akin to a change in procedure for record retention or the management of Agency property. Congress never provided any such "housekeeping authority" for this purpose.

EPA's own prior characterizations of the rule undermine its newfound depiction as a mere internal agency procedure. In a press release announcing the proposed rule on April 24, 2018, then-Administrator Scott Pruitt declared "the era of secret science at EPA is coming to an end" because the rule would allow Americans to "assess the legitimacy of the science underpinning EPA decisions that may impact their lives."³⁷⁹ EPA stated that the proposed rule was "designed to increase transparency in the preparation, identification, and use of science in policymaking."³⁸⁰ The end of an era, the legitimacy of EPA's science, the use of science in policymaking: these are hardly matters of internal agency procedure. They are fundamental questions about the Agency's policy for the consideration of science in its regulatory process, and they must be governed by the statutory authorities that Congress has enacted for that purpose. EPA cannot claim the authority to implement this policy under the Federal Housekeeping Statute by pretending that the rule is not a sweeping change in policy.

Response: See responses to Comments 31-135, 32-144, 48-379, 48-381, 48-382 and 73-410.

Comment [115-1018]: Commenter (11393) writes that EPA lacks authority for the proposed rule and SNPRM.

AARST challenges the authority EPA claims to rely on for the proposal. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301. 85 Fed. Reg. at 15404. The preamble says EPA is taking comment on whether to use 5 U.S.C. § 301, which the SNPRM calls EPA's housekeeping authority, independently or in conjunction with statutory provisions cited in the proposed rule and corrected in the SNPRM's preamble. 85 Fed. Reg. at 15398. The fact that EPA is still considering and asking what authority it can rely on for the proposed rule, twenty-two months after the initial proposed rule, shows that EPA does not have such authority. Housekeeping does not allow any federal agency to ask the public whether it has the authority to change the goals of a given statute and thereby, through a rushed rulemaking comment period, adopt the proposed authority. The SNPRM's statements on authority continues EPA's pattern of making rules first and searching for a justification later (which it still has not provided for this rulemaking).

³⁷⁹ Environmental Protection Agency, "EPA Administrator Pruitt Proposes Rule To Strengthen Science Used In EPA Regulations," April 24, 2018, accessed here: <https://archive.epa.gov/epa/newsreleases/epa-administrator-pruitt-proposes-rule-strengthen-science-used-epa-regulations.html>.

³⁸⁰ Environmental Protection Agency, "Strengthening Transparency in Regulatory Science," Proposed Rule, *Federal Register* (83 FR 18768, April 30, 2018), accessed here: <https://www.govinfo.gov/content/pkg/FR-2018-04-30/pdf/2018-09078.pdf>.

First, none of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking. In most cases, EPA simply cites its general authority for rulemaking under the statutes. Still that general authority alone cannot provide a basis for the rule, especially when, as here, the rule would conflict with the requirements of each of the statutes. Courts have made clear that “EPA cannot rely on its gap-filling authority to supplement [a statute’s] provisions when Congress has not left the agency a gap to fill.” *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); see also *New York v. U.S. EPA*, 413 F.3d 3, 40-42 (D.C. Cir. 2005). EPA otherwise cites to statutes describing research programs established by the agency, with no relation to or authorization for the requirements the SNPRM seeks to create. AARST also disagrees with EPA’s reliance on 5 U.S.C. § 301 because 1) it is questionable whether § 301 applies to EPA as EPA is not one of the fifteen “Executive Departments” listed at 5 U.S.C. § 101, and 2) the proposed rule and SNPRM are not merely internal rules of agency procedure—they would significantly impact every aspect of EPA’s scientific and regulatory work, the individuals who contribute to that work, and the Tribes and communities who rely on it.

Response: See responses to Comments 31-135 and 73-410.

Comment [118-1021]: Commenter (11407) writes that EPA lacks authority for the proposed rule and SNPRM.

The SNPRM changes the authority EPA claims to rely on for the proposal, however either way, the proposal remains unlawful. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301. 85 Fed. Reg. at 15404. The preamble says EPA is taking comment on whether to use 5 U.S.C. § 301, which the SNPRM calls EPA's housekeeping authority, independently or in conjunction with statutory provisions cited in the proposed rule and corrected in the SNPRM's preamble. 85 Fed. Reg. at 15398. The fact that EPA is still considering and asking what authority it can rely on for the proposed rule, twenty-two months after the initial proposed rule, shows that EPA does not have such authority. The SNPRM's statements on authority continues EPA's pattern of making rules first and searching for a justification later (which it still has not provided for this rulemaking). As the NTAA explained in its 2018 comments: In order to protect human health and environment, EPA must have a solid foundation before it proposes rules and rulemaking as such portrays the agency's naiveté in seeking answers for questions about its own authority.

First, none of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking. In most cases, EPA simply cites its general authority for rulemaking under the statutes. Still that general authority alone cannot provide a basis for the rule, especially when, as here, the rule would conflict with the requirements of each of the statutes. Courts have made clear that "EPA cannot rely on its gap-filling authority to supplement [a statute's] provisions when Congress has not left the agency a gap to fill." *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); see also *New York v. U.S. EPA*, 413 F.3d 3, 40-42 (D.C. Cir. 2005). EPA otherwise cites to statutes describing research programs established by the agency, with no relation to or authorization for the requirements the SNPRM seeks to create. The Ute Mountain Ute Tribe also disagrees with EPA's reliance on 5 U.S.C. § 301 because 1) it is questionable whether § 301 applies to EPA as EPA is not one of the fifteen "Executive Departments" listed at 5 U.S.C. § 101, and 2) the proposed rule and SNPRM are not merely internal rules of agency procedure—

they would significantly impact every aspect of EPA's scientific and regulatory work, the individuals who contribute to that work, and the Tribes and communities who rely on it.

Response: See responses to Comments 31-135 and 73-410.

Comment [119-1034]: Commenter (11484) notes that EPA seeks comment on whether to use its housekeeping authority, either independently, or in conjunction with other environmental statutes, as the basis of this rule. It would be inappropriate to use housekeeping authority in this rulemaking. While it is stated in the SNPRM that “EPA is authorized to promulgate this regulation under its housekeeping authority,” legal precedent cited in the same document negates this argument. The SNPRM cites the U.S. Supreme Court case *Chrysler Corp v. Brown* to demonstrate that EPA’s housekeeping authority applies only to “‘rules of agency organization, procedure or practice’ as opposed to substantive rules.”

A plain language reading of the proposed rule makes clear that because it governs which scientific studies EPA must consider or ignore in issuing regulations, it will affect substantive rules. However, EPA argues in the SNPRM, incorrectly, that the proposed rule “exclusively pertains to the internal practices of the EPA.” If EPA’s role under the proposed rule were merely to acquire, consider, and file all relevant studies, the “internal practices” argument may be correct. However, the proposed rule would require the Agency to consider some studies but not others and would give the Administrator case-by-case discretion over such consideration, potentially completely altering the outcome of future rulemakings. Thus, the proposed rule has a direct impact on substantive rules and housekeeping authority does not apply. Unless the proposed rule is revised to exclude substantive rulemakings such as setting the NAAQS, the assertion of housekeeping authority fails on its face.

In conclusion, Puget Sound Clean Air Agency (PSCAA) opposes the proposed rule in its entirety due to the fundamental flaw that it would limit EPA’s access to the best available science by relying on arbitrary and nonscientific reasons to restrict studies from consideration, a flaw that the recent changes fail to correct. Further, the most recent version of the rule proposes to make inappropriate use of housekeeping authority, rendering it legally vulnerable. If enacted, this rule would result in federal regulations with a weaker evidence basis and erode the environmental and public health protections that our Agency is charged with carrying out.

I urge you to withdraw this flawed proposal that relies on dubious authority and contravenes EPA’s statutory mandate to issue regulations based on the best available science.

Response: See responses to Comments 31-135, 32-144, 34-155, 38-185, 48-381 and 73-410.

Comment [124-1053]: Commenter (11492) writes that the Federal Housekeeping Statute does not give authority for this Rule: According to legislative history, the Federal Housekeeping Statute³⁸¹ was never intended by Congress to authorize an agency to use for substantive regulations. EPA cannot now use § 301 of the Federal Housekeeping Statute to give itself

³⁸¹ 5 U.S.C. § 301

authority to create substantive regulations, because it expressly contradicts the purpose of the code it is invoking.

Response: See response to Comment 31-135.

Comment [125-1078]: Commenter (11495) writes that EPA is not an Executive Department subject to the Federal Housekeeping Statute.

The Housekeeping Statute permits “what the [APA] terms ‘rules of agency organization, procedure, or practice,’ as opposed to substantive rules.”³⁸² Specifically, the statute grants “the head of an executive department” the authority to govern internal departmental affairs.³⁸³ The statute allows for the promulgation of regulations “for the government” of the department, “the conduct of its employees, the distribution and performance of its business, and the custody, use and preservation of its records, papers, and property.”³⁸⁴ Congress amended the statute in 1958 to add a second sentence stating, “[t]his section does not authorize withholding information from the public or limiting the availability of records to the public.”³⁸⁵

The Housekeeping Statute, by its express terms, applies only to the heads of “executive department[s] or military department[s].”³⁸⁶ EPA is not one of the fifteen executive departments listed in 5 U.S.C. § 101, nor is it a military department.³⁸⁷ The EPA’s own OLC has agreed that 5 U.S.C. § 301 does not apply to the EPA, stating in one OLC opinion that “the difficulty here, however, is that section 301 confers regulatory authority only to ‘heads of Executive departments and military departments’ and not the heads of other executive agencies, such as EPA.”³⁸⁸ Congress used the term “executive department” in this statute, while in other provisions it uses the term “agency.”³⁸⁹ Such differences are typically presumed intentional by the Supreme Court, meaning that “executive department” and “agency” do not refer to the same things.³⁹⁰ Therefore, the executive departments listed in 5 U.S.C. § 101 are the only government entities to which the Housekeeping Statute directly applies.

³⁸² 85 Fed. Reg. 53 at 15,397 (quoting *Chrysler Corp. v. Brown*, 441 U.S. 281, 309 (1979)).

³⁸³ 5 U.S.C. § 301. The statute also applies to the head of military departments.

O.L.C. 79 (May 28, 2008), available at <https://www.justice.gov/sites/default/files/olc/opinions/attachments/2015/06/23/op-olc-v032-p0079.pdf>.

³⁸⁹ See 5 U.S.C. §§ 302, 305. See Authority of the Office of Government Ethics to Issue Touhy Regulations, 25 Op. O.L.C. 13, 15 (Jan. 18, 2001).

³⁹⁰ Authority of the Office of Government Ethics to Issue Touhy Regulations, 25 Op. O.L.C. at 15; see *Bates v. United States*, 522 U.S. 23, 29–30 (1997) (“[W]here Congress includes particular language in one section of a statute but omits it in another section of the same Act, it is generally presumed that Congress acts intentionally and purposely in the disparate inclusion or exclusion.”) (quoting *Russello v. United States*, 464 U.S. 16, 23 (1983)); see also *Duncan v. Walker*, 533 U.S. 167, 173 (2001).

There are other executive branch agencies that have been found to be excluded from the Housekeeping Statute. For example, the OGE may not issue regulations pursuant to 5 U.S.C. § 301 because OGE is not an executive department.³⁹¹ OGE may only issue regulations concerning the production of agency records pursuant to other authority,³⁹² and regulations concerning employee testimony on official matters can be issued pursuant to the implied authority conferred on it by its own organic statute, 5 U.S.C. § 401.³⁹³ Similarly, no OLC opinion has found that EPA may issue any regulation pursuant to the Housekeeping Statute.³⁹⁴ EPA even admits that the Housekeeping Statute does not apply directly to EPA, instead arguing that “EPA gained housekeeping authority through the Reorganization Plan No. 3 of 1970, 84 Stat. 2086 (July 9, 1970).”³⁹⁵

Response: See response to Comment 31-135.

Comment [125-1081]: Commenter (11495) writes that the Reorganization Plan No. 3 of 1970 does not explicitly grant Housekeeping Authority to EPA.

It is not apparent anywhere in Reorganization Plan No. 3 of 1970 (the “Plan”) that Congress or the President intended the Housekeeping Statute to apply to the newly created EPA. The Plan was prepared by President Richard Nixon and transmitted to the Congress on July 9, 1970 in accordance with Chapter 9 of Title 5 of the United States Code.³⁹⁶ One of the purposes of 5 U.S.C. § 901 is “to promote the better execution of the laws.”³⁹⁷ The President’s accompanying message to the Congress explained that the EPA was being created to rationally and systematically organize the government’s environmentally related activities, specifically related to air, water, and land.³⁹⁸ The President noted that research on pollutants and their impact on the total environment was “critical” for the measurement of the success or failure of the country’s pollution abatement efforts.³⁹⁹ One of the primary functions of EPA established under the Plan is “[t]he conduct of research on the adverse effects of pollution and on methods and equipment for controlling it, the gathering of information on pollution, and the use of this information in strengthening environmental protection programs and recommending policy changes.”⁴⁰⁰

Section 1 of the Plan establishes the EPA’s existence.⁴⁰¹ Section 2 of the Plan transfers to the EPA Administrator various functions of other agencies, such as the DOI’s jurisdiction over the

³⁹¹ Authority of the Office of Government Ethics to Issue *Touhy* Regulations, 25 Op. O.L.C. at 15.

³⁹² OGE may issue “*Touhy*” regulations concerning the production of agency records pursuant to 44 U.S.C. § 3102. A “*Touhy*” regulation refers to U.S. ex rel *Touhy v. Ragen*, 340 U.S. 462 (1951).

³⁹³ 25 Op. O.L.C. at 15.

³⁹⁴ But see Authority of EPA to Hold Employees Liable for Negligent Loss, Damage, or Destruction of Government Personal Property, 32 Op. O.L.C. 79 (concluding that although the housekeeping statute does not apply to EPA, the Administrator of the EPA does have housekeeping authority under EPA’s organic statute).

³⁹⁵ 85 Fed. Reg. at 15,397.

³⁹⁶ Reorganization Plan No. 3 of 1970, U.S. ENVIRO. PROTECTION AGENCY (July 9, 1970) available at <https://archive.epa.gov/epa/aboutepa/reorganization-plan-no-3-1970.html>.

³⁹⁷ 5 U.S.C. § 901(a)(1).

³⁹⁸ Reorganization Plan No. 3 of 1970.

³⁹⁹ *Id.*

⁴⁰⁰ *Id.*

⁴⁰¹ *Id.*

Federal Water Quality Administration and the Federal Water Pollution Control Act.⁴⁰² Sections 2(a)(2)–(8) transfer other various discrete functions to EPA, while retaining some environmentally related functions in the Department of Health, Education, and Welfare, the DOI, and the USDA.⁴⁰³ Section 2(a)(9) transfers “[s]o much of the functions of the transferor officers and agencies referred to in or affected by the foregoing provisions of this section as is incidental to or necessary for the performance by or under the Administrator of the functions transferred by those provisions or relates primarily to those functions.”⁴⁰⁴

Section 2(a)(9) is not a catch-all provision that would allow the EPA Administrator broad housekeeping authority, as EPA now appears to assert.⁴⁰⁵ By its express terms, Section 2(a)(9) only grants the EPA Administrator authority “incidental to or necessary for” carrying out the functions detailed in the “foregoing provisions of this section”—that is, Section 2(a)(1) through (8).⁴⁰⁶ This position is supported by the fact that Section 2(a)(9) specifies some functions that fall under the authority of Section 2 and some specific functions that should be “excluded,” including the functions of the Bureau of Reclamation under section 3(b)(1) of the Water Pollution Control Act.⁴⁰⁷ Section 2(b) of the Plan goes on to specify some functions that will be transferred under this authority, including the DOI’s Water Pollution Control Advisory Board, the boards provided for by the Federal Water Pollution Control Act, and the Department of Health, Education, and Welfare’s Air Quality Advisory Board.⁴⁰⁸ The specificity of the language used throughout Section 2 of the Plan, and particularly in Section 2(a)(9), demonstrates that the Plan was not intended to transfer every imaginable function from DOI and other agencies to the EPA.

Nowhere in the Plan is the Housekeeping Statute mentioned, nor is the transfer of housekeeping authority to EPA mentioned. As already stated, the Housekeeping Statute applies only to the heads of military departments and the heads of the 15 “executive departments” listed in 5 U.S.C. § 101. The Plan does not explicitly add EPA to this list of executive departments. EPA offers no support for its broad claim of housekeeping authority other than noting that the Administrator is the head of the EPA, and that the Plan transferred functions and authorities of “various agencies and executive departments” to EPA.⁴⁰⁹

However, the transfer of discrete functions, boards, and authorities to EPA does not equate to the transfer of sweeping housekeeping authority. Section 2(a)(9) only transfers those functions “incidental to or necessary for” the performance of the previously mentioned transferred functions. The authority to promulgate rules such as the Strengthening Transparency in Regulatory Science rule—which drastically alters the agency’s process for considering scientific

⁴⁰² Id.

studies in its decision-making process—does not follow from the grant of “incidental to” or “necessary” functions authorized under Section 2(a)(9) of the Plan.

Response: See response to Comment 31-135.

Comment [125-1084]: Commenter (11495) writes that these substantive rules are not authorized under the Housekeeping Statute. In *Chrysler Corp.*, this meant that the confidential information given to the government in the form of trade secrets could not be released under the authority of a § 301 regulation because to do so properly would require the agency to exercise substantive legislative power.⁴¹⁰ Similarly, here, the use of the notice and comment process and the nature of the Supplemental Notice—which limits the types of scientific information considered by EPA in all standard setting, and any preliminary scientific assessments, reports, and enforcements that use externally generated peer-reviewed science as a basis for reporting, action, or decision—indicate that the Strengthening Transparency rule is “substantive,” rather than merely “procedural” or “interpretive,” and therefore cannot be authorized by the Housekeeping Statute.⁴¹¹

The very cases and authorities that EPA cites in its Supplemental Notice, among others, are distinguishable from the Proposed Rule. For example, the EPA’s OLC opinion, “Authority of EPA to Hold Employees Liable for Negligent Loss, Damage, or Destruction of Government Personal Property,” concluded that the EPA Administrator could set rules for employee conduct on the job as well as outside of the workplace that might undermine the “efficient operation of the Department.”⁴¹² This scenario regarding liability for breaching personnel and property rules is clearly a matter of “internal departmental affairs.”⁴¹³ The management of employees and personal property is clearly “incidental to” and “necessary for” the effective performance of the agency.⁴¹⁴ The rule did not relate to the substantive work of the EPA, like the Supplemental Notice at issue here does.

Additionally, in *Boron Oil Co. v. Downie*, the Fourth Circuit held that an EPA regulation under 5 U.S.C. § 301 allowing employees to resist subpoenas to testify in state court was valid.⁴¹⁵ US ex rel. *Touhy v. Ragen*, a case oft-cited by courts interpreting § 301, the Supreme Court held that the DOJ could resist a subpoena for documents pursuant to an intra-agency rule promulgated under the authority of 5 U.S.C. § 22, the predecessor to the current Housekeeping Statute.⁴¹⁶ Clearly, the scenarios in *Boron Oil* and *Touhy* relating to an agency’s discretion to resist subpoenas are authorized under the housekeeping statute because they directly relate to “preservation of agency records and papers.” However, just because the DOJ may resist subpoenas with the help of § 301, does not make § 301 applicable to the EPA broadly or authorize the promulgation of the Supplemental Notice specifically.

⁴¹⁰ *Chrysler Corp.*, 441 U.S. at 310.

⁴¹¹ *Id.* at 301–03.

⁴¹² 32 Op. O.L.C. 79.

⁴¹³ *Id.*

⁴¹⁴ *Id.*; see also 5 U.S.C. § 301.

⁴¹⁵ *Boron Oil Co. v. Downie*, 873 F.2d 67, 69 (4th Cir. 1989); see also U.S. ex rel *Touhy v. Ragen*, 340 U.S. 462 (1951); *EPA v. General Elec. Co.*, 197 F.3d 592 (2d Cir. 1999).

⁴¹⁶ U.S. ex rel *Touhy v. Ragen*, 340 U.S. 462 (1951).

More recently, in *United States v. Manafort*, the District Court for the District of Columbia (D.C.) held that DOJ special counsel regulations were not “substantive rules” that created individual rights but were merely statements of internal departmental policy.⁴¹⁷ Citing *Chrysler Corp.*, the court agreed with the DOJ that the regulations were not intended to create any rights and were “matters of agency management or personnel.”⁴¹⁸ DOJ did not seek notice and comment for the special counsel regulations, and DOJ even used language in those regulations stating that they did not create “any rights, substantive or procedural, enforceable at law . . . by any person or entity, in any matter, civil, criminal, or administrative.”⁴¹⁹ This type of language has been found by courts to effectively disclaim the creation of any enforceable rights.⁴²⁰

Clearly, here, EPA has not followed the same steps as DOJ did in the promulgation of the special counsel regulations at issue in *United States v. Manafort*. EPA’s Supplemental Notice is distinguishable from DOJ’s special counsel regulations and other procedural rules because it is being promulgated under the notice and comment process, does not use language disclaiming the creation of any rights enforceable at law, and creates a new qualitative measure for the agency’s consideration and use of science in the agency’s fundamental functions. Accordingly, the Supplemental Notice is a substantive rule that falls outside the scope of the Housekeeping Statute.

Response: Throughout the rule’s preamble, EPA clearly states that rule does not impact the rights or obligations of outside parties. Additionally, the regulatory provisions include mandates applicable only to EPA. See responses to Comments 31-135, 32-144, 48-382 and 48-383.

Comment [125-1092]: Commenter (11495) writes that just as EPA cannot base the Supplemental Notice on the general rulemaking authority granted by environmental statutes, it also cannot justify its action on the authority, if any, granted under 5 U.S.C. § 301. First, as detailed above, the Housekeeping Statute likely does not apply to EPA. Further, even assuming that it does apply, the authority granted by the Housekeeping Statute is not broad enough to override EPA’s specific environmental statutory directives. Simply put, the EPA cannot use the guise of an internal procedural rule—which this rule clearly is not⁴²¹—to contravene explicit quality of information provisions in the substantive environmental statutes the agency is responsible for administering.

The Housekeeping Statute is “simply a grant of authority to the agency to regulate its own affairs.”⁴²² The statute does not provide a general, independent basis for deviating from a specific statutory mandate or limiting the scope of other provisions. Where the SDWA, for example, requires EPA to consider the “best available, peer-reviewed science,” EPA cannot use this rule to effectively alter the statutory text to require the best, *publicly available*, peer-reviewed science.⁴²³ Thus, even if the Proposed Rule were limited to regulation of internal agency

⁴¹⁷ *United States v. Manafort*, 312 F.Supp.3d 60, 75 (D.D.C. 2018).

⁴¹⁸ *Id.*; *Chrysler Corp.*, 441 U.S. at 302; Office of Special Counsel, 64 Fed. Reg. 37,038, 37,041 (July 9, 1999).

⁴¹⁹ *United States v. Manafort*, 312 F.Supp.3d at 75; 28 C.F.R. 600.10.

⁴²⁰ *United States v. Manafort*, 312 F.Supp.3d at 75.

⁴²¹ See *supra*, pgs. 9–13.

⁴²² *Chrysler Corp. v. Brown*, 441 U.S. 281, 308-12 (1979).

⁴²³ See 42 U.S.C. § 300g-1(b)(3)(A)(i).

procedures, which it is not, EPA cannot use such housekeeping as a pretext for modifying the statutory provisions requiring consideration of the best available science.

EPA must base its decisions on such criteria as the latest scientific knowledge, the best available, peer-reviewed science, and/or generally accepted scientific principles or laboratory tests. Neither the environmental statutes nor the federal Housekeeping Statute suggests that EPA, in deciding how it will handle scientific information, can reject or attribute lesser weight to scientific evidence that otherwise meets those criteria solely because the underlying data are not publicly available. EPA's Proposed Rule both lacks sufficient legal authority and unlawfully contradicts the environmental statutes that the Agency is tasked with implementing.

Response: See responses to Comments 31-135, 32-144, 34-155 and 73-410.

Comment [130-1135]: Commenter (11884) writes that in a nutshell, there is no reasonable way the Rule or any part of the Trio⁴²⁴ could be adopted pursuant to the EPA's so called "housekeeping" powers. Good or bad, the Trio marks a dramatic "sea change" for the world of environmental regulation. The term "housekeeping" connotes trivial changes that do not require a second thought. To quote administrative judge K. Bresler: "'housekeeping' refers to minor matters". K. Bresler, *Legal Housekeeping Clear Writing* (2014).

In *Chrysler Corp. v. Brown*, 441 U.S. 281, 310 (1979), the Supreme Court emphasized that nothing in the housekeeping statute permits an agency to "withhold information from the public or to limit the availability of records to the public." *Id.* (quoting the housekeeping statute's legislative history). With the Trio, EPA hopes to stifle good science. To use paraphrase the Court, EPA seeks to "twist" its housekeeping authority "into a claim of authority to withhold information". *Id.* n. 41 at 310; cf. *id.* (referencing "numerous" similar comments in the legislative history).

Response: See the responses to Comments 31-135, 32-144 and 48-381.

Comment [130-1136]: Commenter (11884) writes that even if the Trio⁴²⁵ were to be mischaracterized as a few "procedural" changes, they could not be considered as within the housekeeping statute because, when aggregated, they affect the public's substantive rights. The housekeeping law does not allow an agency to curtail "substantive rights". *Id.* at 310.

By the same token, myriad purely procedural changes could eviscerate substantive rights. Those procedural changes are invalid. For example, EPA could adopt a procedural rule that no party can make a submission unless it first deposits a million dollars in the EPA's bank account to cover any potential administrative costs. Or EPA could bar submission of documents by anyone who has a technical degree (e.g., a B.S. or M.D.) to avoid unduly influencing agency executives.

⁴²⁴ [Note: The term "Trio" collectively refers to the Rule, SNPRM, and the Rule to the extent modified by the SNPRM.]

⁴²⁵ [Note: The term "Trio" collectively refers to the Rule, SNPRM, and the Rule to the extent modified by the SNPRM.]

Both of these purely procedural rules would have a substantive effect that go far beyond a permissible housekeeping rule.

Response: See responses to Comments 31-135, 40-193, and 48-379.

Comment [133-1166]: Commenter (11894) writes that all courts considering the issue, starting with the Supreme Court, have held that the Housekeeping Statute cannot be used as a basis for a legislative rule. *Chrysler Corp. v. Brown*, 441 U.S. at 310; see also, e.g. *United States ex rel. O'Keefe v. McDonnell Douglas Corp.*, 132 F.3d 1252, 1255 (8th Cir. 1998) (applying Chrysler Corp. and finding that the Housekeeping Statute did not provide authority for substantive regulations); *Exxon Shipping Co. v. United States Dept. of Interior*, 34 F.3d 774, 776-78 (9th Cir. 1994) (Housekeeping Statute did not authorize regulations allowing that agency to withhold deposition testimony of federal employees).

EPA's proposals (both the original and supplemental proposals) have every indicia of a substantive, legislative rule: codification in the CFR, adoption through notice and comment proceedings, and mandatory language of command (e.g., "the agency will only use" in proposed section 30.5), See *Long Island Care at Home, Ltd. v. Coke*, 551 U.S. 158, 172-73 (2007) (adoption through notice and comment procedures); *American Mining Congress v. Mine Safety and Health Admin.*, 995 F. 2d 1106, 1112 (D.C. Cir. 1993) (codification in *Federal Register*); *General Electric Co. v. EPA*, 290 F. 3d 377, 383 (D.C. Cir. 2002) (binding language).

Rules that bind an agency itself are legislative rules. In *CropLife Am. v. EPA*, 329 F. 3d 876 (D.C. Cir. 2003), the D.C. Circuit held that an EPA press release which stated that the agency would not consider third party-controlled human exposure studies for purposes of pesticide registration was a legislative rule. Like the supplemental proposal, the press release in CropLife purported to establish exceptions to its binding language to accommodate situations in which use of a study might be legally compelled. 329 F. 3d at 881-82. The court held that the press release bound both EPA and registrants during pesticide registrations and so was a binding "substantive rule;" it "binds private parties or the agency itself with the 'force of law.'" 329 F. 3d at 883 (emphasis supplied).

The current "housekeeping" proposal, like the press release in *CropLife*, would set binding rules governing how EPA uses science in its decision processes. Its hollow assurances of later action to consider studies when legally compelled to do so does not alter its status as a legislative rule any more than the similar assurances in *CropLife*. Since the Housekeeping Statute provides no authority for issuing legislative rules, it cannot provide a basis for either the supplemental or initial proposal. Both would bind EPA, under the conditions set out by EPA, namely that underlying data and models be publicly available (with some proposed exemptions and a grant to the Administrator of discretion) to not consider a scientific study it could have previously considered. The proposed rules would also bind the public. Furthermore, EPA's rule would require researchers interested in contributing to regulatory protections and ISI to alter their conduct or risk having their efforts deemed unusable. Ultimately, the rule would diminish the public's statutorily protected interests in regulations informed by the best available science, an outcome that EPA itself has recently contended results from substantive choices about the scientific evidence it will consider.

The Housekeeping Statute's "antecedents go back to the beginning of the Republic, when statutes were enacted to give heads of early Government departments authority to govern internal department affairs." *Chrysler Corp. v. Brown*, 441 U.S. 281, 309 (1979). It authorizes what the APA "terms 'rules of agency organization, procedure, or practice' as opposed to substantive rules," *Id.* at 310, and enables "department heads to make regulations governing day-to-day operation of the department," *id.* n 41.⁴²⁶ A typical housekeeping rule would govern purely internal agency procedures and practices such as storage and transport of records. The bottom line is that the Housekeeping Statute authorizes only rules of agency organization, procedure, or practice -- not "legislative" or "substantive" rules. That is not what EPA is doing with this regulation. Courts have found nothing in the legislative history to support a different reading. No case law offers support for an alternative reading.

Congress took explicit action in 1958 to amend Section 301 to "correct" agencies from abusing the Housekeeping Statute by attempting to use its authority as a substantive basis to withhold information from the public. As the Supreme Court noted in *Chrysler Corp.*, Congress had looked carefully at the statute in 1958. The Special Subcommittee on Government Information had "unanimously agreed that [§ 301] originally was adopted in 1789 to provide for the day-to-day office housekeeping in the Government departments," and attempts to construe it as something more was "misuse," which "twisted" the statute. The courts have repeatedly checked subsequent agency attempts to "twist" the statute to a range of substantive purposes and found those efforts illegal. The supplemental proposal now attempts, similarly and illegally, to twist the statute to withhold science from consideration in rulemakings that broadly affect the public interest.

There is no merit to EPA's claim that this fits into the Housekeeping authority because it addresses how the agency "handles" information. Every EPA activity during the rulemaking process, as the agency receives, evaluates, and responds to information submitted to the record, and considers it in regulatory decisions, could be said to involve "handling" information in the sense EPA is using it. Under EPA's reasoning, those would all be "housekeeping" actions, and could be governed by housekeeping rules, rather than rules promulgated under the rulemaking provisions of the APA. EPA also argues that the proposal neither regulates nor affects "any entity outside the federal government."⁴²⁷ But EPA goes on to concede that the rule governs information that may have "a substantial impact" on important "private sector decisions" and a potential impact on the public or private sector impact of more than \$500 million. 85 FR at 5398.

⁴²⁶ Under the APA, "rules of agency organization, procedure, or practice." are exempt from notice and comment requirements. 5 USC 553(a)(2). Thus a corollary of EPA's proposal to use the Housekeeping Statute to issue this rule is that it could have issued the rule without even providing public notice or an opportunity to comment.

⁴²⁷ Under a strained reading, one might take the language of EPA's proposal as saying that while the data on which EPA relies for its own support of regulations will be restricted, that bar will not apply to studies submitted by the public. This would make little sense and we are confident it is not EPA's position. But how can a restriction on the comment rights of the public be termed an internal housekeeping matter?

And the regulation will, as also noted, impose substantive limits on the use of science in rulemaking under the eight environmental laws⁴²⁸ identified in the proposal.⁴²⁹

The proposal, if finalized, would make major changes in how EPA conducts rulemakings that affect major segments of the economy - compelling EPA to ignore information regardless of its relevance and probity, based only on the public availability of the underlying data, and nullifying procedural rights under the APA, which ensures “interested persons an opportunity to participate in [a] rule making through submission of written data, or arguments” and directs that the agency consider “relevant matter presented.” 5 USC § Section 553(c). To then claim that authority to do this is predicated on a law intended to make sure that federal agencies make their internal trains run on time would be laughable, if it were not tragic -- and part of the tragedy is that the proposed rule would effectively deprive commenters of the right to have their information given due consideration, and would deprive agency decision-makers of research and data -- of science - essential to good decision-making.

The COVID-19 crisis, underway at this very moment as we write and file comments, has put into stark relief what happens when science is minimized, excluded, or ignored. But the rule is not about procedural rights. The decision to preclude full consideration of relevant and reliable information in developing regulations affects important “private sector decisions” and the level of environmental protection provided to the public alike. Thus, it is sad to read EPA’s earnest assurances that the proposed rule “would not regulate the conduct or determine the rights of any entity outside the federal government,” an assertion that is palpably wrong. One might as well say that a restriction on the evidence that a prisoner can use to prove his or her innocence does not affect his rights.⁴³⁰ The only sense in which the rule will have no effect outside the federal government is the narrow, hyper-literal sense in which firing a gun has no non-auditory effects because it is the fired bullets that cause such effects.⁴³¹

Response: See responses to Comments 31-135, 31-144, 34-155, 40-193, 48-379, 48-382, 48-383.

Comment [133-1167]: Commenter (11894) notes that EPA’s supplemental proposal posits that the agency could use its housekeeping authority without “exercising substantive rulemaking authority delegated to it by a particular statute or statutes that it administers” to issue these rules.

⁴²⁸ EPA states that it is proposing a rule “specifically addressing the agency’s conducting of, and reliance on scientific activity” under the Clean Air Act; the Clean Water Act; the Safe Drinking Water Act; the Resource Conservation and Recovery Act; the Comprehensive Environmental Response, Compensation, and Liability Act; the Federal Insecticide, Fungicide, and Rodenticide Act; the Emergency Planning and Community Right-To-Know Act and the Toxic Substances Control Act. EPA is proposing to issue a rule that would govern the use of science under each of these statutes.

⁴²⁹ Under a strained reading, one might take the language of EPA’s proposal as saying that while the data on which EPA relies for its own support of regulations will be restricted, that bar will not apply to studies submitted by the public. This would make little sense and we are confident it is not EPA’s position. But how can a restriction on the comment rights of the public be termed an internal housekeeping matter?

⁴³⁰ Under a strained reading, one might take the language of EPA’s proposal as saying that while the data on which EPA relies for its own support of regulations will be restricted, that bar will not apply to studies submitted by the public. This would make little sense and we are confident it is not EPA’s position. But how can a restriction on the comment rights of the public be termed an internal housekeeping matter?

⁴³¹ We also do not believe such a rule can even be lawful under the APA, a subject the proposal nowhere addresses. The Housekeeping Statute provides no authority for rules that circumvent statutory requirements.

85 FR at 15398. That begs the question of where the authority for the rule comes from because, as already explained, the Housekeeping Statute provides no legal basis for the proposed rule. Moreover, the supplemental proposal completely ignores the question of how a regulation not issued under the rulemaking authority of a statute can govern agency regulatory actions under the statute. What is plain and beyond refute is that the Housekeeping Statute, even as EPA rationalizes it, provides no authority for anything more than purely internal actions, certainly not for measures that have profound impacts beyond the agency and into society, much less for rules that authorize or mandate EPA to disregard relevant and reliable information in formulating rules or in responding to public comments on those rules.

Response: See responses to Comments 31-135, 32-144, 48-381 and 73-410.

Comment [133-2208]: Commenter (11894) writes that EPA now claims authority to base its data restriction proposal not just on the provisions of specific EPA laws that we addressed in our opening comments, but also on the general federal Housekeeping Statute, 5 U.S.C. § 301. This provision, enacted by the first Congress, provides that the head of an executive department or military department may prescribe regulations for the government of his department, the conduct of his employees, the distribution and performance of its business, and the use and preservation of its records, papers, and property. As the Supreme Court has recognized, this language only authorizes rules that govern internal agency operations and cannot be used to justify a legislative rule. In an attempt to bring the proposed science restrictions within that purpose, EPA's proposal states that it does not regulate any entity outside the federal government. Rather, they claim that the proposed requirements would modify the EPA's internal procedures regarding the transparency of science underlying regulatory decisions and that this rule would not regulate the conduct or determine the rights of any entity outside the federal government. Their position is that it exclusively pertains to the internal practices of the EPA. 85 Fed. Reg. 15398.

EPA specifically states that its proposal does *not* interpret or rely on the specific regulatory provisions of the various EPA statutes, despite the flood of comments it received demonstrating that these were indisputably the governing statutory authorities. But in a backhanded acknowledgment of a possible problem, the proposal states that this internal agency procedure is intended to be consistent with the statutes that EPA administers and EPA plans to implement this procedural rulemaking in accordance with all applicable statutory and regulatory requirements. Nonetheless, it says that in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control. *Id*

Response: See the responses to Comments 31-135 and 73-410.

Comment [135-1217]: Commenter (11895) writes that EPA lacks authority for the proposed rule and SNPRM.

The SNPRM changes the authority EPA claims to rely on for the proposal, however either way, the proposal remains unlawful. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301.⁴³² The preamble says EPA is taking comments on whether to use 5 U.S.C. § 301, which the

⁴³² 85 Fed. Reg. at 15,404.

SNPRM calls EPA's housekeeping authority, independently or in conjunction with statutory provisions cited in the proposed rule and corrected in the SNPRM's preamble.⁴³³ None of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking.

Courts have made clear that "EPA cannot rely on its gap-filling authority to supplement [a statute's] provisions when Congress has not left the agency a gap to fill."⁴³⁴ EPA otherwise cites to statutes describing research programs established by the Agency, with no relation to or authorization for the requirements the SNPRM seeks to create. The Tribe also disagrees with EPA's reliance on 5 U.S.C. § 301 because 1) it is questionable whether § 301 applies to EPA as EPA is not one of the 15 "Executive Departments" listed at 5 U.S.C. § 101, and 2) the proposed rule and SNPRM are not merely internal rules of agency procedure—they would significantly impact every aspect of EPA's scientific and regulatory work, the individuals who contribute to that work, and the tribes and communities who rely on it.

Response: See the responses to Comments 31-135 and 73-410.

Comment [136-1289]: Commenter (11907) writes that EPA is using a 19th-century statute giving department heads (Administrators) the right to manage personnel and internal record keeping so that it can contain the science it uses when drafting regulations. This statute (5 USC 301/Departmental Regulations), which was passed in 1874, is referred to by the EPA as giving it "housekeeping" authority to make internal decisions regarding what data, information, and studies it wants to use. The law states:

"The head of an Executive department or military department may prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property. This section does not authorize withholding information from the public or limiting the availability of records to the public."⁴³⁵

Furthermore, upon investigation into subsequent codes and statutes relating to this law, it appears to be a precursor to laws relating to national security.⁴³⁶ This law may give EPA broad discretionary powers that could be used to eliminate the use of confidential PII based epidemiology studies regarding the effects of pollutants of human and environmental health.

EPA could claim that the information is not "transparent" and therefore cannot be reproduced or only "quasi-reproduced" in a scientific setting. Simultaneously, the EPA could determine that CBI based studies are "exempt" from the transparency rule for reasons of corporate or even national security, thereby completely providing protection and "non-transparency" to industry-based science. This appears to be precisely the intent of this supplementary rule.

⁴³³ Id. at 15,398.

⁴³⁴ *Nat. Res. Def Council v. E.P.A.*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); see also *New York v. US. E.P.A.*, 413 F.3d 3, 40-42 (D.C. Cir. 2005).

⁴³⁵ 5 U.S. Code § 301.Departmental Regulations; Legal Information Institute; Cornell Law School; <https://www.law.cornell.edu/uscode/text/5/301>

⁴³⁶ 5 U.S. Code § 301.Departmental Regulations; Legal Information Institute; Cornell Law School; <https://www.law.cornell.edu/uscode/text/5/301>

Pursuant to these concerns The Skokomish Tribe strongly objects to this supplementary rule to the Proposed Rule on Strengthening Transparency in Regulatory Science. We do not agree with the use of discretionary "housekeeping authority" under 5 USC 301 to make high level internal decisions regarding what constitutes science and to choose what data, information, or studies can, or cannot be used. The Tribe holds that policy and regulatory outcomes based on this rulemaking will have harmful human health effects within our tribal community and by extension will also have harmful effects on treaty protected habitat and ecosystems within our "usual and accustomed" (U&A) treaty protected hunting, fishing and gathering grounds. This rulemaking does not support "transparency" in science but quite the reverse. It supports secrecy in science. This is in direct opposition of EPA's mission, which is to "protect human and environmental health".

Response: See responses to Comments 31-135, 32-144, 38-185, 40-193 and 48-381.

Comment [138-1262]: Commenter (11922) writes that I.EPA has broad authority under the Federal Housekeeping Statute consistent with or in addition to the authorities in the environmental statutes it administers to adopt this internal agency procedural transparency rule.

EPA specifically seeks comment as to whether the Federal Housekeeping Statute (5 U.S.C. § 301) independently or in combination with substantive statutes it administers can serve as legal authority for this transparency proposal. As the preamble states, the Federal Housekeeping Statute is a general grant of authority to heads of executive departments to prescribe regulations governing their departments. NRECA agrees with EPA's conclusion that, although EPA is not an executive department, the statute nevertheless applies to the agency and, consistent with the case law cited, that the Housekeeping Statute alone can serve as ample authority to implement a procedural transparency rule. 85 Fed. Reg. at 15,397-98.

EPA has acknowledged that, in some instances, requirements in the substantive statutes and regulations it administers may supersede a transparency rule. 85 Fed. Reg. at 15,398. Nevertheless, certain provisions within EPA's regulatory mandate support the underlying goals of this Transparency Rule. Below are highlighted provisions within the substantive statutes EPA cites (including and beyond those specific provisions EPA cites in the Supplemental's preamble) that are useful references to bolster the Transparency Rule, both in terms of reliance on housekeeping authority and in substance.

CAA

- Section 103, 42 U.S.C. § 7403: This provision directs EPA to establish a national research and development program. As part of this program, the Administrator is authorized to "collect and make available . . . the results of and other information . . . pertaining to such research and other activities," to "develop effective and practical processes, methods, and prototype devices for the prevention or control of air pollution," and to "develop methods and techniques necessary to identify and assess the risks to human health from both routine and accidental exposures to individual air pollutants and combinations thereof," among other activities. 42 U.S.C. § 7403(b), (d). Implicit in this authority is that the Administrator should have access to all pertinent information, and the ability to evaluate how that information is collected and analyzed. These

requirements correspond directly to the proposed Transparency Rule's requirement to "describe and document any assumptions and methods used" and to "describe variability and uncertainty" with regard to EPA's use of data and models underlying pivotal science or regulatory science. See 85 Fed. Reg. at 15,406.

- Section 301(a), 42 U.S.C. § 7601(a): This provision authorizes the EPA Administrator to promulgate regulations "necessary to carry out his functions under this chapter," including regulations "establishing general applicable procedures and policies for regional officers and employees" designed to "assure fairness and uniformity in the criteria, procedures, and policies applied by the various regions" and "provide a mechanism for identifying and standardizing inconsistent or varying criteria, procedures, and policies . . ." This authority reinforces the general housekeeping authority upon which EPA proposes to rely by confirming that Congress authorized EPA to promulgate regulations governing its delegated functions.
- Section 307(d)(3), 42 U.S.C. § 7607(d)(3): This provision requires that, when proposing a rule pursuant to that subsection, EPA must summarize "the factual data on which the proposed rule is based," as well as "the methodology used in obtaining the data and in analyzing the data. . . . All data, information, and documents referred to in this paragraph on which the proposed rule relies shall be included in the docket on the date of publication of the proposed rule." As with Section 103, these requirements support the Transparency Rule's goals. See 85 Fed. Reg. at 15,406.

CWA

- Section 101(e), 33 U.S.C. § 1251(e): Part of Congress's purpose in enacting the Clean Water Act was to encourage "[p]ublic participation in the development, revision, and enforcement" of any regulation or program established by EPA or a State under the CWA. The Transparency Rule's goal of increasing the ability of the public to participate fully is thus directly responsive to this declaration of policy.
- Section 104, 33 U.S.C. § 1254: This provision requires EPA to establish national research programs for pollution "prevention, reduction, and elimination," and as part of that mandate to "collect and make available, through publications and other appropriate means, the results of and other information . . . pertaining to such research." Similar to EPA's authority under the CAA, this provision encourages transparency to allow EPA to carry out the functions Congress prescribed.
- Section 501, 33 U.S.C. § 1361: Similar to the housekeeping statute upon which EPA proposes to rely, this provision generally authorizes EPA to promulgate regulations to effectuate the goals and requirements of the Act, reinforcing that Congress has given EPA broad authority as to the research and data EPA uses in administering the CWA.

SDWA

- Section 1442, 42 U.S.C. § 300j-1: This section provides EPA authority to conduct research regarding water contamination, including "improved methods to identify and measure the health effects of contaminants in drinking water . . . and assessing the health-related hazards of drinking

water.” Similar to the CAA and CWA, EPA is also authorized to “collect and make available” information regarding this research.

- Section 1445(a)(1), 42 U.S.C. § 300j-4(a)(1): This provision requires regulated persons and grantees to “establish and maintain such records . . . and provide such information as the Administrator may reasonably require by regulation to assist the Administrator in establishing regulations[,] . . . in evaluating the health risks of unregulated contaminants, or in advising the public of such risks.” EPA thus has the ability to determine what information it requires to best implement the SDWA, consistent with the goals of the Transparency Rule.

- Section 1450(a)(1), 42 U.S.C. § 300j-9(a)(1): Similar to the housekeeping statute upon which EPA proposes to rely, this provision generally authorizes EPA to promulgate regulations to effectuate the goals and requirements of the SDWA, reinforcing that Congress has given EPA broad authority as to the research and data EPA uses in administering the SDWA.

RCRA

- Section 2002(a)(1), 42 U.S.C. § 6912(a)(1): This provision generally authorizes EPA to promulgate regulations to administer RCRA, similar to the housekeeping statute EPA cites as authority for the Transparency Rule, and the other general authority provisions described above.

- Section 7004, 42 U.S.C. § 6974(b): This provision requires EPA to provide for and encourage public participation in the development of regulations and programs under RCRA, reinforcing the goal of the Transparency Rule to facilitate such participation.

- Section 8001, 42 U.S.C. § 6981: Similar to other statutes EPA administers, this provision requires EPA to conduct research. For RCRA, such research includes “adverse health and welfare effects of the release into the environment of material present in solid wastes,” and this provision directs EPA to establish a management program to coordinate such research activities. EPA’s promulgation of the Transparency Rule is consistent with EPA’s authority to coordinate and manage the research it uses to administer RCRA.

CERCLA

- Section 115, 42 U.S.C. § 9615: Through this provision Congress authorizes the President to delegate duties or powers under CERCLA and to promulgate necessary regulations, again similar to other general grants of authority and the housekeeping statute.

- Section 311, 42 U.S.C. § 9660: The Secretary of Health and Human Services, consulting with the EPA Administrator, is directed to establish a research program that includes epidemiologic studies into the human health effects of hazardous substances and methods to assess human health risk. Implicit in this mandate is the ability of the Administrator to access all pertinent information, and the ability to evaluate how that information is collected and analyzed. As with the CAA, this provision of CERCLA corresponds to the proposed requirements of the Transparency Rule regarding research assumptions and methods.

FIFRA

- Section 20, 7 U.S.C. § 136r: This general research section of FIFRA directs EPA to undertake research to administer the statute, and to ensure that the research is not duplicative of research other Federal agencies are undertaking. To this end, having an accurate picture of the content, methods, and validity of existing research is critical, and aligns with the purpose of the Transparency Rule.
- Section 25, 7 U.S.C. § 136w: Congress authorized EPA to promulgate regulations to implement FIFRA, like other statutes. One nuance in the FIFRA general authorization is that these regulations “shall take into account the difference in concept and usage between various classes of pesticides, including public health pesticides, and differences in environmental risk and the appropriate data for evaluating such risk between agricultural, nonagricultural, and public health pesticides.” More specifically than other statutes, then, this mandate recognizes the importance of data in the ability to regulate with precision and accuracy, supporting EPA’s goals in proposing the Transparency Rule. Additionally, this section requires EPA to provide for peer review of the studies conducted under FIFRA, which the Transparency Rule would facilitate.

EPCRA

- Section 328, 42 U.S.C. § 11048: As a statute geared toward the provision of information, instead of the gathering of information and promulgation of specific standards, EPCRA contains less specific directives regarding research, but nevertheless contains in this section the same general grant of authority EPA has under the Federal Housekeeping Statute to promulgate regulations necessary to administer the program.

TSCA

- Section 2, 15 U.S.C. § 2601: Congress declared as policy of the United States to develop “adequate information . . . with respect to the effect of chemical substances and mixtures on health and the environment and that the development of such information should be the responsibility of those who manufacture and those who process such chemical substances and mixtures.” It makes eminent sense that EPA should be able to require the information manufacturers and processors develop to conform to standards that allow EPA to make use of that information in promulgating regulations, as EPA intends through the Transparency Rule.
- Section 4, 15 U.S.C. § 2603: Congress authorized EPA to require testing and development of information regarding substances the agency determines lack sufficient information. Requests for and agreements to provide such information must include “protocols and methodologies” to be submitted to EPA. TSCA therefore explicitly recognizes the importance of not just receiving the results of studies, but also information about how they are conducted, which the Transparency Rule is intended to enhance. See also *id.* § 2626 (authorizing EPA and HHS to conduct and contract with others to conduct projects to develop test methods to meet the requirements of section 2603).

- Section 10, 15 U.S.C. § 2609: Similar to other general research-and-development provisions, in this section TSCA directs EPA to conduct research necessary to administer TSCA. Additionally, this section directs EPA, in conjunction with other agencies, to develop a system to retrieve information useful to administer TSCA. Implicit in these requirements is the discretion to determine what information is necessary, consistent with the proposed Transparency Rule.
- Section 26(h), 15 U.S.C. § 2625(h): Congress has directed EPA, when promulgating TSCA regulations and requiring testing and other information gathering, to “use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science.” In doing so, EPA is also to consider “the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information;” “the degree of clarity and completeness” of documentation of data, assumptions, and methods; and “the extent of independent verification or peer review of the information” Congress thus clearly contemplated, and expected, rigorous standards for data gathering and validation. TSCA’s requirements confirm the ability of EPA to harness its general rulemaking authority to ensure consistency of data gathering throughout EPA’s regulatory mandate.

These statutory summaries demonstrate that Congress has both authorized and directed EPA to facilitate and conduct research throughout the range of statutes the agency administers. Both implicitly and explicitly, and in general and specific terms, these statutes reinforce the need for accurate and complete information, supporting EPA’s authority to promulgate the Transparency Rule, whether under the general Federal Housekeeping Statute or EPA’s more specific statutory mandates, or both.

Response: See responses to Comments 31-135 and 73-410.

Comment [144-1307]: Commenter (11915) notes that the proposal seeks comment on whether it is appropriate to rely on EPA’s authority found in a variety of environmental statutes to promulgate this rulemaking, or to also cite the Federal Housekeeping Statute independently or in conjunction with these statutes. We recommend that EPA rely on the housekeeping statute in conjunction with overarching environmental authorities. The proposal is clearly intended to institute internal agency practices for the use of data and models, and is thus appropriate for and consistent with the housekeeping statute’s authorization of agencies to “prescribe regulations for the government of his department, the distribution and performance of its business, and the...use...of its records, papers, and property.”⁴³⁷ This is particularly fitting if the agency chooses the modified approach that does not exclude use of non-public data and models but rather allows use of all information while providing greater consideration to publicly available materials

Response: Thank you for your comment in support of the final rule. The final rule addresses how EPA will consider the relevant scientific studies when promulgating significant regulatory decisions or developing ISI. EPA will give greater consideration to studies where the underlying

⁴³⁷ 5 U.S.C. 301

data and models are available for independent validation. See responses to Comments 31-135 and 73-410.

Comment [159-1405]: Commenter (12430) notes that in the NPRM, U.S. EPA attempted to justify the proposed rule on the basis of several substantive statutes. Presumably out of recognition that these statutes do not support the proposal, the agency is now attempting to frame the proposal as a mere “housekeeping” measure. It invokes the Federal Housekeeping Statute, 5 U.S.C. section 301, which states in relevant part:

The head of an Executive department or military department may prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property.

As a threshold matter, the Federal Housekeeping Statute does not apply to U.S. EPA for the reasons explained in the comment submitted on the SNPRM by California Attorney General Xavier Becerra and other attorneys general. Even if the Federal Housekeeping Statute applied to U.S. EPA, it would be cabined by substantive environmental statutes, which Congress enacted after the Federal Housekeeping Statute. Most significantly, by its terms, the Federal Housekeeping Statute only authorizes (other) agencies to adopt regulations for purely internal matters, such as record retention and employee conduct. It cannot redeem the SNPRM.

Response: See responses to Comments 31-135 and 73-410.

Comment [159-1407]: Commenter (12430) notes that U.S. EPA contends that the proposed regulation should qualify as a housekeeping measure because, allegedly, it “exclusively pertains to the internal practices of the EPA[,]” and would simply “establish an agency wide approach to handling studies[.]”⁴³⁸ To date, U.S. EPA has cited the Federal Housekeeping Statute as authority for regulations covering such topics as subpoenaed employees, subpoenas duces tecum, the handling of CBI, agency practices under the FOIA and the Privacy Act of 1974,⁴³⁹ and agency-sponsored research involving human subjects.⁴⁴⁰ Such regulations affect how U.S. EPA employees conduct internal procedural and administrative tasks. The SNPRM, by contrast, would govern the science that U.S. EPA would be permitted to consider when implementing a range of substantive environmental laws. The SNPRM would directly limit the public’s ability to provide effective comment on future agency proposals, as it would force U.S. EPA to summarily reject public comments referencing studies or models relying on non-publicly available data. As detailed throughout the remainder of this comment, the SNPRM would profoundly affect future U.S. EPA regulatory decisions and “influential scientific information”—which, per U.S. EPA’s proposed definition, is information that would have a “clear and substantial impact on important public policies or private sector decisions.”⁴⁴¹ The amount of attention the proposal has attracted—from the scientific community, elected officials, the media, and nonprofit

⁴³⁸ 85 Fed. Reg. at 15398.

⁴³⁹ 5 U.S.C. §§ 552, 552a. See, e.g., 40 C.F.R. §§ 2.100, 2.211, 2.404, 2.405, 16.6.

⁴⁴⁰ See 40 C.F.R. Part 26.

⁴⁴¹ See proposed section 30.2.

organizations—reflects the extent of its impacts.⁴⁴² In response to the NPRM, for example, U.S. EPA received nearly 600,000 comments and more than 9,000 unique substantive comments. Many of these were comments from scientific organizations, scientists, and public health officials explaining the dire impacts the NPRM would have on public health and the environment. A purely internal housekeeping measure would not have drawn such widespread stakeholder interest.

Response: See responses to Comments 31-135, 32-144, 40-193, and 48-381.

Comment [159-1408]: Commenter (12430) writes that even if the Federal Housekeeping Statute somehow applied (which it does not), it could not authorize the proposal set forth in SNRPM. The Federal Housekeeping Statute does not compel U.S. EPA to adopt the SNRPM or authorize it to issue regulations counter to the substantive statutes it administers. These statutes consistently require U.S. EPA to use the best available science; there is no reasonable way that the general Federal Housekeeping Statute could be read as impliedly repealing the more specific and later-enacted substantive statutes.⁴⁴³

Response: See responses to Comments 31-135 and 73-410.

Comment [162-1467]: Commenter (12435) writes that the 5 U.S.C. 301 “housekeeping authority” does not authorize EPA to internalize decisions with high consequence for policy, such as this one. The proposed rule has broad implications for and potential impacts on external stakeholders, including specific repercussions in Colorado. The Supreme Court has held that Section 301 is a “‘housekeeping statute,’ authorizing what the [APA] terms ‘rules of agency organization, procedure, or practice’ as opposed to ‘substantive rules.’” *Chrysler Corp. v. Brown*, 441 U.S. 281, 310 (1979). In *Chrysler*, the Court analyzed whether 5 U.S.C. 301 authorized the DOL to pass regulations limiting the scope of the Trade Secrets Act and found that it did not. Similarly, the proposed rule, with its supplemental, constitutes the type of “substantive rule” excluded in this opinion. For example, the proposed rule may dictate what kind of evidence may be used to support CWA standards, which are the heart of the substance of this federal law. See

⁴⁴² E.g., E.P.A. to Limit Science Used to Write Public Health Rules, N.Y. TIMES (Nov. 11, 2019); E.P.A. Updates Plan to Limit Science Used in Environmental Regulations, N.Y. TIMES (March 4, 2020); The E.P.A. Says It Wants Research Transparency. Scientists See an Attack on Science, N.Y. TIMES (March 26, 2018); E.P.A. Announces a New Rule. One Likely Effect: Less Science, N.Y. TIMES (April 24, 2018); The EPA’s Anti-Science ‘Transparency’ Rule Has a Long History, WIRED (Nov. 13, 2019); Ellie Kauffman and Gregory Wallace, EPA ices plan to limit how many health-related studies can be considered in forming regulations, CNN (October 17, 2018); Heidi Voigt, EPA Wants New Rules to Rely Solely on Public Data, WALL STREET JOURNAL (April 24, 2018) Eva Botkin-Kowacki, Is transparency always a good thing? EPA weighs controversial new rule, CHRISTIAN SCIENCE MONITOR (March 12, 2020); BRADY DENNIS, EPA pushes ahead with effort to restrict the science it uses to craft regulations, Washington Post (November 13, 2019); Steven Mufson; Chris Mooney, EPA excluded its own top science officials when it rewrote rules on using scientific studies, WASHINGTON POST (Oct. 3, 2018); Joel Achenbach, Scientists decry new EPA proposal as a way of suppressing solid science, WASHINGTON POST (May 8, 2018).

⁴⁴³ In case of apparent conflict, statutes must be interpreted harmoniously when possible; to the extent that statutes cannot be harmonized, the later-in-time statute prevails. E.g., *Morton v. Mancari*, 417 U.S. 535, 551 (1974); *Radzanower v. Touche Ross & Co.*, 426 U.S. 148, 155 (1976). The Federal Housekeeping Statute was enacted prior to the adoption or amendment of the cited provisions of the Clean Air Act (42 U.S.C. § 7408); the Safe Drinking Water Act (42 U.S.C. §§ 300g-1); the Clean Water Act (33 U.S.C. § 1314); the Toxic Substances Control Act (15 U.S.C. § 2625); and the Emergency Planning and Community Right-to-Know Act (42 U.S.C. § 11023).

40 CFR Part 131. Similarly, this rule would set parameters around the “best available science” required to substantiate CAA standards. The EPA is not justified in attempting to use federal housekeeping statutes to internalize decisions of this type with broad consequences in order to shelter them from scrutiny and opposition.

Response: See response to Comments 31-135 and 73-410.

Comment [166-1511]: Commenter (12454) writes that the final rule would constitute regulations “for the government” of EPA, “performance of [EPA’s] business”, and “use . . . of [EPA’s] records, papers, and property.”⁴⁴⁴ NACoal recommends that EPA consider the Federal Housekeeping Statute as additional support for the final rule. While EPA is not an “executive department” within the meaning of the Federal Housekeeping Statute, the DOJ concluded in a formal opinion that the EPA Administrator has the same “housekeeping” authority under EPA’s organic statute.⁴⁴⁵

Response: Thank you for your comment in support of the final rule. See the response to Comment 31-135.

Comment [172-1549]: Commenter (12465) writes that the authority for the rule under the provisions of the housekeeping rule is a novel interpretation of the Federal Housekeeping Statute and as such the Agency would be well served by carefully considering stakeholder input on the underlying authority and the applicability under consideration.

Response: Thank you for your comment. In drafting the final rule, EPA carefully considered all of comments received on 2018 and 2019 proposals.

Comment [175-1573]: Commenter (12471) writes that in establishing this procedural framework to increase transparency, the Transparency Rule can rely solely on 5 U.S.C. § 301, the “Federal Housekeeping Statute” for authority. That statute states, “The head of an Executive department or military department may prescribe regulations for the government of his department . . . [concerning] the custody, use, and preservation of its records, papers, and property.”⁴⁴⁶ Procedural regulations to “govern[]” EPA’s framework to increase the transparency of ISI and the “use” of studies in EPA’s possession would fall squarely within the Agency’s authority under

⁴⁴⁴ See 5 U.S.C. § 301.

⁴⁴⁵ Id. at n.11 (citing Dep’t. of Justice, Office of Legal Counsel, Authority of the Environmental Protection Agency to Hold Employees Liable for Negligent Loss, Damage, or Destruction of Government Personal Property, 32 OPINIONS OF THE OFFICE OF LEGAL COUNSEL 79, 81-83 (May 28, 2008)).

⁴⁴⁶ As EPA notes in the SNPRM, while EPA is not one of the 15 “Executive Departments” listed at 5 U.S.C. 101, it gained housekeeping authority through the Reorganization Plan No. 3 of 1970, 84 Stat. 2086 (July 9, 1970). The Office of Legal Counsel has opined that the Reorganization Plan “convey[s] to the [EPA] Administrator all of the housekeeping authority available to other department heads under section 301” and demonstrates that “Congress has vested the Administrator with the authority to run EPA, to exercise its functions, and to issue regulations incidental to the performance of those functions.” 85 Fed. Reg. 15396, 15397 (March 18, 2020) (citing Authority of EPA to Hold Employees Liable for Negligent Loss, Damage, or Destruction of Government Personal Property, 32 O.L.C. 79, 2008 WL 4422366 at *4 (May 28, 2008)).

the Federal Housekeeping Statute. For additional support, the Agency might consider referencing authorities granted to the Agency under individual environmental statutes.

[...]

The Federal Housekeeping Statute authorizes neither the broad disclosure⁴⁴⁷ or withholding of information by government agencies⁴⁴⁸. The Supreme Court has noted that given the Federal Housekeeping Statute's "long and relatively uncontroversial history, and the terms of the statute itself, it seems to be simply a grant of authority to the agency to regulate its own affairs."⁴⁴⁹ The Court further determined that "there is nothing in the legislative history of § 301 to indicate it is a substantive grant of legislative power."⁴⁵⁰

Rather, the Federal Housekeeping Statute authorizes "what the [APA] terms 'rules of agency organization, procedure or practice' as opposed to substantive rules."⁴⁵¹ A procedural framework to increase the transparency of ISI would be such a non-substantive and internal rule of agency organization, procedure or practice authorized by the Federal Housekeeping Statute.

Response: Thank you for your comment in support of the final rule. See the responses to Comments 31-135 and 73-410.

Comment [177-1594]: Commenter (12596) notes that the Supplemental Transparency Proposal relies exclusively on the Federal Housekeeping Statute, citing the DOJ opinion for "housekeeping" authority. EPA retains the option to promulgate a Final Transparency Rule using substantive authority under environmental statutes, as it proposed in the original Transparency Proposal, while citing the Federal Housekeeping Statute for supplemental support. That said, we believe that the procedural transparency assessment framework discussed herein is well-tailored for the Supplemental Transparency Proposal's exclusive reliance on the Federal Housekeeping Statute.

[...]

A Final Transparency Rule that establishes a procedural transparency assessment framework would fall well within this standard. It would, consistent with the Federal Housekeeping Statute, simply prescribe rules for the performance of EPA assessment of studies within the Agency's custody. Such a procedural approach would not rely on a substantive grant of legislative power. The Administrator may be influenced by transparency assessments resulting from the Final Transparency Rule when taking separate substantive action under the CAA. Yet the procedural

⁴⁴⁷ *Chrysler Corp. v. Brown*, 441 US 281, 310 (1979) ("... there is nothing in the legislative history of § 301 to indicate it is a substantive grant of legislative power to promulgate rules authorizing the release of trade secrets or confidential business information.").

⁴⁴⁸ 5 U.S.C § 301 ("This section does not authorize withholding information from the public or limiting the availability of records to the public.")

⁴⁴⁹ *Chrysler*, 441 US at 309

⁴⁵⁰ *Id.* at 310.

⁴⁵¹ *Id.*

framework used to develop that assessment would still remain well within the Federal Housekeeping Statute’s “surely ample legislative authority.”

Response: EPA agrees with the commenter that it has adequate authority to promulgate this rule. See the response to Comment 31-135. EPA has decided to rely solely on its housekeeping authority and not the substantive environmental statutes cited in the 2018 and 2020 proposals.

Comment [184-2206]: Commenter (12707) writes that the Federal Housekeeping Statute alone or in conjunction with existing bedrock environmental laws does not authorize EPA to limit science considered in rulemaking processes.

EPA’s supplemental proposal is a second failed attempt at justifying an effort to limit or otherwise constrain its own ability to use the best available public health studies and science from outside EPA. The effort in the initial proposal to ground so-called “transparency” in bedrock environmental laws was exposed as untenable. EPA’s addition of the Federal Housekeeping Statute to the mix and recitation of new sections of several environmental laws does not strengthen EPA’s case. Whether or not EPA has 301 housekeeping authority is irrelevant. The statute authorizes EPA to control its own internal documents or materials; the statute and its authorities are not applicable to the long-standing public health studies EPA has relied upon to protect public health through the notice and comment rulemaking process.

EPA’s justification that this action to constrain science or leave science up to the political whims of the administrator is about internal agency procedure doesn’t hold. This proposal is not about internal paperwork, but about whether or not EPA can fulfill its core mission consistent with bedrock environmental laws.

Response: See responses to Comments 31-135, 32-144 and 73-410.

Comment [186-1700]: Commenter (12716) writes that EPA’s assertion that it is authorized to promulgate this regulation under the Federal Housekeeping Statute is without merit. The statute provides that “[t]he head of an Executive department or military department may proscribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property.”⁴⁵² As noted by EPA in its notice, the purpose of the Section 301 was to “grant early Executive departments the authority ‘to govern internal departmental affairs.’”⁴⁵³ Even if we were to accept EPA’s argument that it was granted authority to use the Housekeeping Statute under the Reorganization Plan,⁴⁵⁴ it is not authorized to justify the promulgation of substantive regulations under the statute.⁴⁵⁵ A change in the way that the agency fulfills its obligations and

⁴⁵² 5 U.S.C. 301.

⁴⁵³ EPA, Supplemental Notice of Proposed Rulemaking, Strengthening Transparency in Regulatory Science, 85 FR 15396, 15397, citing *Chrysler Corp. v. Brown*, 441 U.S. 281, 309 (1979).

⁴⁵⁴ This assertion is not without debate.

⁴⁵⁵ Indeed, Section 301 “is addressed solely to internal agency administration.” *New York v. United States HHS*, 414 F. Supp. 3d 475, 520 (S.D.N.Y. 2019).

promulgates regulations under the CAA and CWA that will impact public health and the environment is substantive in nature. This is not what was intended by the Housekeeping Statute.

Response: See response to Comments 31-135 and 73-410.

Comment [186-1845]: Commenter (12716) writes that EPA’s assertion that it is authorized to promulgate this regulation under the Federal Housekeeping Statute is without merit. The statute provides that “[t]he head of an Executive department or military department may proscribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property.”⁴⁵⁶ As noted by EPA in its notice, the purpose of the Section 301 was to “grant early Executive departments the authority ‘to govern internal departmental affairs.’”⁴⁵⁷ Even if we were to accept EPA’s argument that it was granted authority to use the Housekeeping Statute under the Reorganization Plan,⁴⁵⁸ it is not authorized to justify the promulgation of substantive regulations under the statute.⁴⁵⁹ A change in the way that the agency fulfills its obligations and promulgates regulations under the CAA and CWA that will impact public health and the environment is substantive in nature. This is not what was intended by the Housekeeping Statute.

Response: See response to Comments 13-135 and 73-410.

Comment [187-1710]: Commenter (12720) writes, finally, and equally problematic in the Agency’s quest to find authority for the rulemaking, is the assertion that authority for the Proposal may be found under the Agency’s so-called “housekeeping authority.” EPA first floated this claim in its notice extending the comment period for the initial rulemaking, stating that “EPA is proposing this rule under authority of 5 U.S.C. § 301, in addition to the authorities listed in the April 30th document.” See 83 Fed. Reg. 24,255, 24,256 (May 25, 2018). This statute, by its own terms, does not apply to EPA. 5 U.S.C. § 301. In citing this authority, EPA implicitly admits that the statutory authorities invoked in the original Proposal are lacking and reveals that the rulemaking lacks a basis in any statute.

The Agency again cites the federal housekeeping authority as a supposed statutory basis for the rulemaking in the Supplemental Proposal. 85 Fed. Reg. 15,396, 15,397 (March 18, 2020). EPA states that Section 301 of Title 5 provides “[t]he head of an Executive department or military department” authority to “prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property.” *Id.* The Agency then quotes the Supreme Court’s description of section 301 as designed to “grant early Executive Departments the authority ‘to govern internal department affairs’” and “authorizes ‘what the [APA] terms ‘rules

⁴⁵⁶ 5 U.S.C. 301.

⁴⁵⁷ EPA, Supplemental Notice of Proposed Rulemaking, Strengthening Transparency in Regulatory Science, 85 FR 15396, 15397, citing *Chrysler Corp. v. Brown*, 441 U.S. 281, 309 (1979).

⁴⁵⁸ This assertion is not without debate.

⁴⁵⁹ Indeed, Section 301 “is addressed solely to internal agency administration.” *New York v. United States HHS*, 414 F. Supp. 3d 475, 520 (S.D.N.Y. 2019).

of agency organization, procedure or practice, as opposed to substantive rules.” 85 Fed. Reg. at 15,397 (citing *Chrysler Corp. v. Brown*, 441 U.S. 281, 308- 12 (1979)).⁴⁶⁰

The fatal problem with the Agency’s citation to this authority is that, under plain statutory language, EPA is “not one of the 15 ‘Executive Departments’ listed at 5 U.S.C. § 101, to which section 301 applies. Id. 5 U.S.C. § 101. As such, the Agency has invoked a statute as a source of authority that by its own terms does not apply to EPA. Congress has had ample opportunity since 1970 to add EPA to the list of “Executive Departments” defined in 5 U.S.C. section 101. Congress has not done so. This is dispositive and fatal to the rulemaking’s reliance on the Federal Housekeeping statute. See, e.g., *Chevron, U.S.A., Inc. v. Nat. Res. Def. Council, Inc.*, 467 U.S. 837, 842–43 (1984) (“First, always, is the question whether Congress has directly spoken to the precise question at issue. If the intent of Congress is clear, that is the end of the matter; for the court, [] as well as the agency, must give effect to the unambiguously expressed intent of Congress.”); *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208 (1988) (“It is axiomatic that an administrative agency’s power to promulgate legislative regulations is limited to the authority delegated by Congress.”)

Response: See response to Comment 31-135.

Comment [187-1711]: Commenter (12720) notes that the Agency acknowledges that 5 U.S.C. § 301 does not apply to EPA in the Supplemental Proposal. 85 Fed. Reg. at 15,397. However, the Supplemental Proposal then claims that EPA “gained housekeeping authority through the Reorganization Plan No. 3 of 1970.” Id. The agency suggests that *this* housekeeping authority is sufficient to authorize the instant rulemaking. Id. This suggestion is wrong.

The Supplemental Proposal starts its inapposite line of argument by noting that “[t]he Reorganization Plan created EPA, established the Administrator as ‘head of the agency’ and transferred functions and authorities of various agencies and Executive departments to EPA.” Id. at 15,397/3. The Supplemental Proposal does not argue, nor could it, that creation of EPA or establishment of the Administrator as its head authorizes the instant rulemaking. Id. Instead, the Supplemental Proposal appears to argue that the transfer of “functions and authorities of various agencies and Executive departments to EPA” somehow authorizes the current rulemaking. Id. This is wrong.

EPA first argues that “[s]ection 2(a)(1)–(8) of the Reorganization Plan transferred to EPA functions previously vested in several agencies and executive departments including the Departments of Interior and Agriculture.” Id. Notably, however, EPA does not and cannot identify any subsection(s) in section 2 that even pretend to authorize the instant rulemaking and its myriad of restrictions and exemptions and other provisions. Id. EPA ducks the issue and simply references section 2(a)(1)–(8). This is understandable. There is no congressional delegation, no legislative history, no factual evidence and no suggestion of

⁴⁶⁰ In fact, *Chrysler* lays out the legislative history of the statute, which was “enacted to help General Washington get his administration underway by spelling out the authority for executive officials to set up offices and file Government documents.” 441 U.S. 281, 309. It “was adopted in 1789 to provide for the day-to-day office housekeeping in the Government departments.” Id. at 310. Nowhere does EPA explain how this rulemaking relates to setting up offices and filing government documents, or other “day-to-day office housekeeping.” Id.

authorization for EPA to adopt the instant rulemaking via the transfer of the listed functions from the Secretary of the Interior, the Secretary of Health, Education and Welfare, the Council of Environmental Quality, the Atomic Energy Commission, the Federal Radiation Council or the Secretary of Agriculture to the EPA. See the section 2(a)(1)–(8), Reorganization Plan No. 3 of 1970, 84 Stat. 2086 (July 9, 1970) (“Reorganization Plan”). EPA’s struggle to find authority for the instant rulemaking in 2(a)(1)–(8) of the Reorganization Plan fails badly.

Next, EPA argues that “Section 2(a)(9) also transferred so much of the functions of the transferor officers and agencies ‘as is incidental to or necessary for the performance by or under the Administrator of the functions transferred.’” 85 Fed. Reg. at 15,297/3. Section 2(a)(9) transfers to EPA:

So much of the functions of the transferor officers and agencies referred to in or affected by the foregoing provisions of this section as is incidental to or necessary for the performance by or under the Administrator *of the functions transferred by those provisions or relates primarily to those functions*. The transfers to the Administrator made by this section shall be deemed to include the transfer of (1) authority, provided by law, to prescribe regulations relating primarily to the transferred functions,

Reorganization Plan, section 2(a)(9) (emphasis added). EPA’s inability to identify any specific transferred function that authorizes the instant rulemaking is fatal. 85 Fed. Reg. at 15,297/3. EPA’s tautological argument about section 2(a)(9) fails for the same reason as the argument about section 2(a)(1)–(8): the transferred functions in no way provided authority for the instant rulemaking. EPA is unable to identify any authority for the rulemaking in the actual text of the Reorganization Plan or its legislative history, or in the actual text of any of the transferred functions, their referenced statutes, or their legislative history. EPA’s own silence speaks volumes about this inability.

EPA’s argument, here, about section 2(a)(9) echoes the original Proposal’s reliance on the general authority to prescribe regulations in section 301 of the CAA. But as NRDC noted in its comments on the Proposal:

EPA cites 42 U.S.C. § 7601(a) of the CAA as one basis for the Proposal. But that section merely authorizes the Administrator to “prescribe such regulations as are necessary to carry out his functions under this chapter.” The courts have made clear that “EPA cannot rely on its gap-filling authority to supplement the CAA’s provisions when Congress has not left the agency a gap to fill.” *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); see also *American Petroleum Institute v. EPA*, 52 F.3d 1113, 1119 (D.C. Cir. 1995) (“the general grant of rulemaking power to EPA cannot trump specific portions of the CAA”); *NRDC v. Reilly*, 976 F.2d 36, 41 (D.C. Cir. 1992) (EPA cannot use its general rulemaking authority as justification for adding to a statutorily specified list); *Sierra Club v. EPA*, 719 F.2d 436, 453 (D.C. Cir. 1983) (same); *Gonzales v. Oregon*, 546 U.S. 243, 264–65 (2006) (“It would go . . . against the plain language of the text to treat a delegation for the ‘execution’ of [the Attorney General’s] functions as a further delegation to define other functions well beyond the statute’s specific grants of authority.”). Here, not only is there no statutory gap to fill, as explained further below, the Proposal is in direct conflict with other provisions of the Act. EPA cannot rely on 42 U.S.C. § 7601(a) to support this rule.

NRDC Comments on Proposal, at 36. Federal courts have held, repeatedly and resoundingly, that congressional grants of general authority to issue regulations to carry out functions of a statute provide *no additional authority* to “trump” portions of a law (*American Petroleum Institute*, 52 F.3d at 1119); to “define other functions well beyond the statute’s specific grants of authority,” (*Gonzales*, 546 U.S. at 264–65); or to “supplement” statutory provisions “when Congress has not left the agency a gap to fill.” NRDC, 749 F.3d at 1064. Yet, this is precisely what EPA is doing, here, by purporting to “prescribe regulations relating primarily to the transferred functions” under the Reorganization Plan. See section 2(a)(9), Reorganization Plan. Reliance on section 2(a)(9) for this authority is unlawful for the same reasons that courts have found it unlawful for EPA and other agencies to rely on congressional grants of general authority to issue regulations to carry out functions of a statute.

Response: See response to Comments 13-135 and 73-410.

Comment [187-1712]: Commenter (12720) writes that finding no support in the Reorganization Plan itself, EPA must resort to citing a 2008 DOJ OLC memo “opin[ing]” that the “Reorganization Plan ‘convey[s] to the [EPA] Administrator all of the housekeeping authority available to other department heads under section 301.’”⁴⁶¹

First, the OLC memo itself reiterates that 5 U.S.C. 301 does not apply to EPA. OLC memo, p.81. Accordingly, EPA’s reliance on 5 U.S.C. 301, or any interpretations made in the OLC memo, itself, as any authority for the instant rulemaking is completely inapposite, arbitrary, and capricious. See e.g., 85 Fed. Reg. at 15,404/3 (citing 5 U.S.C. 301 as statutory authority for proposed 40 C.F.R. part 30). This defect, by itself, is fatal to the lawfulness of the entire proposed rulemaking.

Second, the interpretations offered in the OLC memo supply no authority for the instant rulemaking, and obviously lack the force of law. See, e.g., *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208 (1988) (“It is axiomatic that an administrative agency’s power to promulgate legislative regulations is limited to the authority delegated by Congress.”) Congress has delegated no authority to EPA to adopt the instant rulemaking. Neither the OLC memo, nor EPA’s reliance on it, will receive any deference from a reviewing court.

Third, the OLC was not reviewing or analyzing any facts or activities remotely similar to the subject of the instant rulemaking when the OLC issued the memo on which EPA now relies. Rather, the OLC was addressing the inherently internal issue of “destruction of government personal property [and] the unauthorized personal use of agency-issued cell phones,” which bore no relation to an agency’s performance of its substantive, statutory and regulatory responsibilities. OLC Memo, 79.

Response: See response to Comment 31-135.

⁴⁶¹ 85 Fed. Reg. at 15,397/3, n.3 (citing “Authority of EPA to Hold Employees Liable for Negligent Loss, Damage, or Destruction of Government Personal Property, 32 U.S. Op. Off. Legal Counsel 79, 2008 WL 4422366 at *4 (May 28, 2008) (“‘OLC Memo’”).

Comment [187-1713]: Commenter (12720) writes that even in the narrow bureaucratic situation present there, while the OLC concluded that “[t]he Reorganization Plan establishing the EPA vests the Administrator with authority equivalent in many respects to that enjoyed by the head of an executive department” OLC memo at 82, neither the Reorganization Plan nor 5 U.S.C. 301 authorizes the instant rulemaking. Nowhere in the Supplemental Proposal can EPA identify any passage in the OLC memo that purports to authorize a rulemaking that impacts EPA’s performance of its substantive, statutory responsibilities as sweepingly as the instant rulemaking would. Instead, the OLC memo fully supports the opposite conclusion, that neither 5 U.S.C. 301 nor the EPA “Reorganization Plan” supports “substantive rules” like the instant rulemaking. Footnote 4 of the OLC memo states unambiguously that:

As a general matter, regulations that “directly affect the rights and obligations of private parties” or regulate the “citizenry at large” constitute “substantive rules” under the APA and usually must be promulgated in accordance with notice and comment procedures. Authority to Prescribe Regulations, 28 Op. O.L.C. at 107. In contrast, agency rules “govern[ing] only the conduct of government employees” are not substantive rules within the meaning of the APA and are specifically excluded from publication and notice and comment requirements. *Id.* The EPA policies at issue here pertain solely to the conduct of EPA employees and have no application to the “citizenry at large.” Those policies are therefore not “substantive rules” that must be published under the APA.

OLC memo, pg. 84, n. 4.

Faced with this fatal restriction, EPA attempts to claim that both the Proposal and the Supplemental Proposal “would not regulate the conduct or determine the rights of any entity outside the federal government” as it “exclusively pertains to the internal practices of the EPA.” 85 Fed. Reg. at 15,398. Ironically, EPA offers up this preposterous assertion in the sentence immediately following a sentence “describ[ing] how EPA will handle studies when data and models underlying science that is *pivotal to EPA’s significant regulatory decisions or influential scientific information* are or are not publicly available in a manner sufficient for independent validation and analysis.” *Id.* Even the Agency’s own description of the Proposal and Supplemental Proposal make clear that the rulemaking is intrinsically substantive in nature—“pivotal to EPA’s significant regulatory decisions or influential scientific information.” *Id.*

The EPA claim that this rulemaking addresses only internal practices at the Agency does not even pass the laugh test. As noted extensively in the now hundreds of pages of comments submitted by NRDC alone, the rulemaking would dramatically and “directly affect the rights and obligations of private parties” and regulate the “citizenry at large” by rewriting how science is considered, used, and ignored in the Agency’s substantive rulemakings. Further, the fact that EPA originally relied (without any basis), 83 Fed. Reg. at 18,769, and still relies, 85 Fed. Reg. at 15,397, on the agency’s eight substantive environmental statutes, proves this point. As noted above, these statutes themselves dictate EPA’s obligation to use the highest-quality scientific information to inform the agency’s work, in various different ways specific to each statute. Only once it was abundantly clear that the rulemaking lacks any authority in these

substantive environmental statutes, did the Agency offer a wildly different, opposing theory that pretends this rulemaking governs “only the conduct of government employees.”⁴⁶²

Courts have made abundantly clear what constitutes a substantive rule versus one of entirely internal effect under the housekeeping statute (were the housekeeping statute applicable here, which it is not). Courts have found, based on both “§ 301’s text and its “long and relatively uncontroversial” history, [t]hat § 301 “is indeed a ‘housekeeping statute,’ authorizing what the APA terms ‘rules of agency organization procedure or practice’ as opposed to ‘substantive rules.’” Subsequent courts have repeatedly rejected agency attempts [t]o “twist this simple administrative statute into an authorization for the promulgation of substantive rules.” *New York v. United States Dep’t of Health & Human Servs.*, 414 F. Supp. 3d 475, 521 (S.D.N.Y. 2019)(internal citations omitted).

Response: See response to Comments 31-135, 48-379, 48-383 and 73-410.

Comment [198-2217]: Commenter (13549) writes that the SNPRM changes the authority EPA claims to rely on for the proposal, however either way, the proposal remains unlawful. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301. 85 Fed. Reg. at 15404. The preamble says EPA is taking comment on whether to use 5 U.S.C. § 301, which the SNPRM calls EPA’s housekeeping authority, independently or in conjunction with statutory provisions cited in the proposed rule and corrected in the SNPRM’s preamble. 85 Fed. Reg. at 15398. The fact that EPA is still considering and asking what authority it can rely on for the proposed rule, twenty-two months after the initial proposed rule, shows that EPA does not have such authority. The SNPRM’s statements on authority continues EPA’s pattern of making rules first and searching for a justification later (which it still has not provided for this rulemaking). As the NTAA explained in its 2018 comments: In order to protect human health and environment, EPA must have a solid foundation before it proposes rules and rulemaking as such portrays the agency’s naiveté in seeking answers for questions about its own authority.

First, none of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking. In most cases, EPA simply cites its general authority for rulemaking under the statutes. Still that general authority alone cannot provide a basis for the rule, especially when, as here, the rule would conflict with the requirements of each of the statutes. Courts have made clear that “EPA cannot rely on its gap-filling authority to supplement [a statute’s] provisions when Congress has not left the agency a gap to fill.” *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); see also *New York v. U.S. EPA*, 413 F.3d 3, 40-42 (D.C. Cir. 2005). EPA otherwise cites to statutes describing research programs established by the agency, with no relation to or authorization for the requirements the SNPRM seeks to create. The Band also disagrees with EPA’s reliance on 5 U.S.C. § 301 because 1) it is questionable whether § 301 applies to EPA as EPA is not one of the fifteen “Executive Departments” listed at 5 U.S.C. § 101, and 2) the proposed rule and SNPRM are not merely internal rules of agency procedure—they would

⁴⁶² Even the Agency’s own past practice makes clear that the housekeeping authority is irrelevant here. The Agency has “used housekeeping statute authorities in 82 actions since 1994, but almost all of them deal with acquisitions and contracts. And all are focused on internal matters, not outward-facing public policy. EPA most recently cited it when revising Freedom of Information Act regulations last year.” Jean Chemnick, “Agency leans on 1870s ‘housekeeping’ law to block science,” E&E News, May 8, 2020. <https://www.eenews.net/stories/1063076197>

significantly impact every aspect of EPA's scientific and regulatory work, the individuals who contribute to that work, and the Tribes and communities who rely on it.

The Band appreciates the SNPRM's recognition that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control." 85 Fed. Reg. at 15398. This statement alone should lead EPA to withdraw the proposed rule and SNPRM; the requirements conflict with every statute EPA administers and would cause EPA to unlawfully exclude valid scientific research from its work.

By way of example, in CAA Section 108(a)(2), Congress requires EPA to issue air quality criteria for air pollutants to "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air." 42 U.S.C. § 7408(a)(2). The SNPRM does not claim that studies that have not publicly released all their underlying data, such as those linking air pollution to mortality and disease, do not accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air. If EPA were to exclude such studies from consideration when issuing air quality criteria, it would be in violation of the CAA.

Response: See responses to Comment 31-135, 32-144, and 73-410.

Comment [199-1935]: Commenter (12403) writes that the Federal Housekeeping Statute is not an appropriate legal authority for this action. The proposal is also inconsistent with provisions in the TSCA and would hamper implementation of CAA requirements.

Response: Implementation of the final rule should not impact compliance with CAA and TSCA requirements. As stated in § 30.3, if there is a conflict between this rule and any of the statutes that EPA administers, the rule would yield to those statutes.

Comment [200-1965]: Commenter (12412) writes that the SNPRM changes the authority EPA claims to rely on for the proposal, however either way, the proposal remains unlawful. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301. 85 Fed. Reg. at 15404. The preamble says EPA is taking comment on whether to use 5 U.S.C. § 301, which the SNPRM calls EPA's housekeeping authority, independently or in conjunction with statutory provisions cited in the proposed rule and corrected in the SNPRM's preamble. 85 Fed. Reg. at 15398. The fact that EPA is still considering and asking what authority it can rely on for the proposed rule, twenty-two months after the initial proposed rule, shows that EPA does not have such authority. The SNPRM's statements on authority continues EPA's pattern of making rules first and searching for a justification later (which it still has not provided for this rulemaking). As the NTAA explained in its 2018 comments: In order to protect human health and environment, EPA must have a solid foundation before it proposes rules and rulemaking as such portrays the agency's naiveté in seeking answers for questions about its own authority.

First, none of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking. In most cases, EPA simply cites its general authority for rulemaking under the statutes. Still that general authority alone cannot provide a basis for the rule, especially when, as here, the rule would conflict with the requirements of each of the statutes. Courts have made clear that “EPA cannot rely on its gap-filling authority to supplement [a statute’s] provisions when Congress has not left the agency a gap to fill.” *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); *see also New York v. U.S. EPA*, 413 F.3d 3, 40-42 (D.C. Cir. 2005). EPA otherwise cites to statutes describing research programs established by the agency, with no relation to or authorization for the requirements the SNPRM seeks to create. LTBB disagrees with EPA’s reliance on 5 U.S.C. § 301 because 1) it is questionable whether § 301 applies to EPA as EPA is not one of the fifteen “Executive Departments” listed at 5 U.S.C. § 101, and 2) the proposed rule and SNPRM are not merely internal rules of agency procedure—they would significantly impact every aspect of EPA’s scientific and regulatory work, the individuals who contribute to that work, and the Tribes and communities who rely on it.

LTBB appreciates the SNPRM’s recognition that “in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.” 85 Fed. Reg. at 15398. This statement alone should lead EPA to withdraw the proposed rule and SNPRM; the requirements conflict with every statute EPA administers and would cause EPA to unlawfully exclude valid scientific research from its work.

By way of example, in CAA Section 108(a)(2), Congress requires EPA to issue air quality criteria for air pollutants to “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air.” 42 U.S.C. § 7408(a)(2). The SNPRM does not claim that studies that have not publicly released all their underlying data, such as those linking air pollution to mortality and disease, do not accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutants in the ambient air. If EPA were to exclude such studies from consideration when issuing air quality criteria, it would be in violation of the CAA.

Response: See response to Comments 31-135, 32-144, 48-382, 73-410.

Comment [201-2219]: Commenter (12474) writes that the SNPRM changes the authority EPA claims to rely on for the proposal, however either way, the proposal remains unlawful. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301. 85 Fed. Reg. at 15404. The preamble says EPA is taking comment on whether to use 5 U.S.C. § 301, which the SNPRM calls EPA’s housekeeping authority, independently or in conjunction with statutory provisions cited in the proposed rule and corrected in the SNPRM’s preamble. 85 Fed. Reg. at 15398. The fact that EPA is still considering and asking what authority it can rely on for the proposed rule, twenty-two months after the initial proposed rule, shows that EPA does not have such authority. The SNPRM’s statements on authority continues EPA’s pattern of making rules first and searching for a justification later (which it still has not provided for this rulemaking). As the NTAA explained in its 2018 comments: In order to protect human health and environment, EPA must

have a solid foundation before it proposes rules and rulemaking as such portrays the agency's naiveté in seeking answers for questions about its own authority.

First, none of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking. In most cases, EPA simply cites its general authority for rulemaking under the statutes. Still that general authority alone cannot provide a basis for the rule, especially when, as here, the rule would conflict with the requirements of each of the statutes. Courts have made clear that "EPA cannot rely on its gap-filling authority to supplement [a statute's] provisions when Congress has not left the agency a gap to fill." *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); see also *New York v. U.S. EPA*, 413 F.3d 3, 40-42 (D.C. Cir. 2005). EPA otherwise cites to statutes describing research programs established by the agency, with no relation to or authorization for the requirements the SNPRM seeks to create.

The NTAA also disagrees with EPA's reliance on 5 U.S.C. § 301 as:

- 1) It is questionable whether § 301 applies to EPA as EPA is not one of the fifteen "Executive Departments" listed at 5 U.S.C. § 101, and
- 2) The proposed rule and SNPRM are not merely internal rules of agency procedure—they would significantly impact every aspect of EPA's scientific and regulatory work, the individuals who contribute to that work, and the Tribes and communities who rely on it.

The NTAA appreciates the SNPRM's recognition that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control." 85 Fed. Reg. at 15398. This statement alone should lead EPA to withdraw the proposed rule and SNPRM; the requirements conflict with every statute EPA administers and would cause EPA to unlawfully exclude valid scientific research from its work.

By way of example, in CAA Section 108(a)(2), Congress requires EPA to issue air quality criteria for air pollutants to "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air." 42 U.S.C. § 7408(a)(2). The SNPRM does not claim that studies that have not publicly released all their underlying data, such as those linking air pollution to mortality and disease, do not accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air. If EPA were to exclude such studies from consideration when issuing air quality criteria, it would be in violation of the CAA.

Response: See responses to Comments 31-135, 32-144, 38-185 and 73-410.

Comment [205-2035]: Commenter (13788) writes that as EPA admits in the SNPRM, the Agency "is not one of the 15 'Executive Departments' listed at 5 U.S.C. 101."⁴⁶³ Therefore, on its face the Federal Housekeeping Statute does not even apply to EPA. EPA claims authority

⁴⁶³ 85 Fed. Reg. at 15,397.

based on Reorganization Plan No. 3 of 1970, which transferred functions previously vested in other agencies to EPA, as well as functions “incidental to or necessary for the performance by or under the Administrator of the functions transferred.”⁴⁶⁴ However, EPA provides no reason to believe this rule is incidental or necessary for performance of the functions transferred.

Response: The purpose of the rule is to increase transparency of the science EPA uses to support its significant regulatory decisions and ISI. Transparency of the underlying data, models, and process upon which the EPA makes its decisions is integral to demonstrating accountability and our dedication to public health and the environment. Also see the response to Comment 31-135.

Comment [207-2071]: Commenter (14397) notes that in the SNPRM, the EPA seeks comments on whether to use its housekeeping authority independently or in conjunction with “appropriate environmental statutory provisions.” EPA proposes using the Federal Housekeeping Statute, found at 5 U.S.C. § 301 (see 85 Fed Reg at 15404), which states that “[t]he Head of an Executive department or military department may prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, paper, and property.” It appears that the EPA itself does not believe that it has this authority, otherwise why would they still be seeking comments on this aspect of the proposal two years after it was first proposed. And EPA should well doubt the use of this provision in this instance - since the EPA was not one of the fifteen “Executive Departments” listed under 5 U.S.C. § 301 it is doubtful whether this provision is applicable. Additionally, the proposed rule and the SNPRM both go well beyond internal housekeeping provisions - they would dramatically impact every aspect of the EPA’s regulatory responsibilities. Use of this provision would unnecessarily prevent the EPA from carrying out its mission under the CAA, as the EPA itself seems to recognize when it states “in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.” (see 85 Fed Reg at 15398).

To illustrate the above argument, the CAA (Section 108(a)(2)) requires the EPA to set pollutant levels that “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air.” 42 U.S.C. § 7408(a)(2). The EPA, in this SNPRM, does not attempt to argue that the studies under attack for not providing all underlying data don’t accurately reflect the latest scientific knowledge. Therefore, if the EPA elects to exclude this data, it would be in clear violation of the CAA.

Response: See the response to Comments 31-135 and 73-410.

1.3 Specific Environmental Statutes

1.3.1 Clean Air Act (CAA) (NPRM and SNPRM Comments).

Comment: Sections 1.3.1.1 and 1.3.1.2 of this Chapter present comments received on the NPRM

⁴⁶⁴ Reorganization Plan No. 3 Section 2(a)(9).

(Section 1.3.1.1) and SNPRM (Section 1.3.1.2) related to the EPA's legal authority for the rule under the CAA. The EPA provides the following general response to these comments:

Response: The EPA appreciates your comments. As discussed in Section I.C of the final rule preamble and in this RTC document in Section 1.2, EPA has decided it is most appropriate to rely on its authority to promulgate housekeeping regulations, rather than any of the substantive environmental statutes cited in the 2018 proposal or the 2020 supplemental proposal as legal authority for the rule. EPA intends to promulgate future science transparency rules under its substantive environmental statutes. Additionally, the final rule states in § 30.3 that “[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”

1.3.1.1 CAA (NPRM Comments)

Comment [37-36]: Commenter (0046) states that the proposal amends the air quality criteria, adopted under §108 (b) of the CAA, for particulate matter (PM) and lead. See proposed rule fn. 3 final sentence which states that the proposed rule would “preclude” “future regulatory actions” using the Lanphear study which is part of the criteria for the NAAQS for lead, and the Harvard Six Cities and American Cancer Society II study (Dockery and Pope) which are part of the criteria for the PM NAAQS. Air quality criteria cannot be amended without review by Clean Air Scientific Advisory Committee (CASAC). See CAA §109 (d)(2)(B). EPA consequently must submit its proposal to CASAC for its review, following all procedural requirements for public meeting and deliberations in doing so. CASAC must then submit its recommendations to the Administrator (see §109 (d)(2)(B) final clause), and the Administrator must consider these recommendations and provide a reasonable explanation for any actions that deviate significantly from those recommendations (CAA section 307 (d)(3)). EPA cannot proceed with this action until these requirements are satisfied.

Comment [657-4043] Commenter (0671) states that the impact of the proposed rule (and its obvious purpose) will be to hamstring the EPA by effectively preventing EPA from using human subject studies in rulemaking. No other federal agency has such a broad standard as the one envisioned here. The EPA knows that the IRB will not allow such studies' data to be made public, so to require public data from these studies will make them invisible to the rulemaking process. Therefore, by requiring public data the EPA will be violating the CAA's requirement to use the “best available science” by forcing it to ignore such science that happens to include PII.

The proposed regulation is a terrible idea that is contrary to the intent of the CAA and its amendments, imposes substantial administrative burdens on researchers and potentially the American people, and does not serve its stated purpose.

Comment [657-4198]: Commenter (0671) The EPA should not implement the proposed regulation. No part of the Agency should be responsible for implementing this proposed regulation because it runs counter to the text and intent of the CAA and amendments.

Comment [1535-4532]: Commenter (1550) states that, as a practicing scientist they recognize the difference between the need for supporting data, and requirements that are imposed solely to

obstruct or censor evidence that an administrator finds inconvenient or which contradicts his preconceived positions.

Consider, for example, air pollution. The CAA is a bedrock environmental law that protects us from dangerous air pollutants. It would be endangered under this proposed rule because it relies on a longitudinal epidemiologic study of subjects whose participation involved a promise that the data would be used statistically without disclosing individual medical records. If the proposed rule is approved, we could lose the use of such statistical evidence and be unable to formulate valid science-based standards.

The same principles apply to many other areas of environmental health research. Once again, there is a fundamental difference between disclosure necessary to validate data and disclosure rules created solely to obstruct or censor results one dislikes. Doing so would violate the principles and traditions of science and be counter to the mission of the EPA.

Comment [1544-4546]: Commenter (1559) notes that the CAA protects us from dangerous air pollutants. We must keep this law. This proposed rule compromises the CAA, and for that reason, this rule must not be approved. We need to maintain the CAA sweeping improvements to the air we breathe, and we need to strengthen it to include all air toxics that are endocrine disruptors, mutagens, and carcinogens. We need federal regulation of the halogens---chlorine, bromine, and fluorine. We need federal regulation of the petroleum products that go airborne such as petroleum-based fragrances, pesticides, insecticides, herbicides, and airborne plastic molecule--all of which come from petroleum bases which are endocrine disruptors, mutagens, and carcinogens. It is time to ban synthetic, petroleum-based fragrances as 30% of the population has some discomfort from them, and this particularly applies to petroleum-based fragrances in dryer sheets that make it very difficult to breathe in local neighbors. We need to ban all synthetic fragrances and require substitution with 100% pure essential plant or fish oils.

Comment [1642-4554]: Commenter (1657) states that the CAA only requires EPA to use the "best available science", it doesn't not require that the EPA use only publicly available data, nor does it specify that the science on which EPA rules are based must be from the United States. Indeed, after May 25, 2018 any self-imposed requirement that the EPA use only public data on human subjects will prevent EPA from using the best available science when that science comes European Union (EU) member countries.

While the EPA has no control over statutory requirements in other jurisdictions the EPA does have a statutory obligation to obey U.S. law, and it will likely not be able to obey the CAA under the proposed rule after May 25, 2018.

Comment [1959-109]: Commenter (1973) expresses that they believe that the proposed rule would deprive policy makers of the real-world epidemiologic evidence, based on real exposures of real people, that has been and will continue to be vital for future revisions of the NAAQS, drinking water standard, pesticide standards, and other health based standards based on a false understanding of transparency and replication in science. This is direct contradiction to requirements of the CAA, for example, to consider the best available science, and would create an approach to the use of scientific evidence on the adverse health effects of air pollution by

EPA that would be at odds with the World Health Organization (WHO), the Royal Society for Medicine, and other national review bodies. It would also put EPA in direct opposition to the standards for considering evidence of health effects of smoking, high cholesterol, etc. by the CDC, of the studies considered for issuing guidelines generated by the NIH, and of the Food and Drug Administration (FDA) reliance on non-publicly available studies to approve drugs for use by people.

Comment [2322-160]: Commenter (2337) notes that the EPA’s core mission, reflected in numerous environmental statutes, is to protect public health and the environment.⁴⁶⁵ These same statutes require that EPA, in fulfilling this mission, support and rely on the best available science. While the specific terms of each statute vary, their direction is similar: EPA is charged with conducting and supporting research into the impacts of pollutants on human health and the environment⁴⁶⁶, using available scientifically accepted data to determine when pollutants pose a danger to human health or the environment,⁴⁶⁷ and establishing standards with a sufficient margin of safety to protect public health.⁴⁶⁸ Indeed, this requirement that EPA use the latest or best available science is repeated in numerous environmental statutes. The CAA, for example, directs the Administrator to reflect “the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare ...” when updating air quality criteria.⁴⁶⁹ Notably, public availability or independent verification are not disqualifying

⁴⁶⁵ See, e.g., Clean Water Act § 102, 33 U.S.C. § 1252 (directing Administrator to develop comprehensive programs to protect surface and ground waters); Safe Drinking Water Act § 1412, 42 U.S.C. § 300g-1 (directing Administrator to develop national primary drinking water regulations to protect public health); Solid Waste Disposal Act § 1003, 42 U.S.C. § 6902 (purpose of act is to promote protection of public health and the environment by improving management of solid and hazardous wastes); Clean Air Act § 101(b), 42 U.S.C. § 7401(b) (purpose of act is to protect and improve air quality to promote public health and welfare); see also <https://www.epa.gov/aboutepa/our-mission-and-what-we-do> (“The mission of EPA is to protect human health and the environment”).

⁴⁶⁶ See, e.g., Clean Air Act § 103, 42 U.S.C. § 7403 (Administrator is charged conducting and supporting investigations and research concerning air pollutants, long- and short-term health effects of air pollutants, and long- and short term causes, effects and trends of damage to ecosystems from air pollutants); Comprehensive Environmental Response, Compensation and Liability Act § 311, 42 U.S.C. § 9660 (Administrator and Secretary of Health and Human Services charged with supporting and conducting studies, including concerning risks to human health from hazardous substances).

⁴⁶⁷ See, e.g., Clean Water Act § 304(a)(1), 33 U.S.C. § 1314(a)(1) (directing Administrator to develop and periodically update criteria for water quality that accurately reflects “the latest scientific knowledge”); Clean Air Act § 107(a)(2), 42 U.S.C. § 7408(a)(2) (in issuing and updating air quality criteria, Administrator is required to reflect “the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare ...”) (emphasis added); Safe Drinking Water Act § 1412 (b)(3)(A), 42 U.S.C. § 300g-1(b)(3)(A) (in establish maximum contaminant level goals and national drinking water standards, Administrator is required to use “best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and ... data collected by accepted methods or best available methods ...”); Toxic Substances Control Act, 15 U.S.C. § 2625(h), (i) (for decisions based on science, requiring EPA to operate in a manner consistent with the best available science and make decisions based on the weight of the scientific evidence).

⁴⁶⁸ See, e.g., Clean Air Act § 109, 42 U.S.C. § 7409 (directing Administrator to adopt and every five years thereafter to review, national primary air quality standards adequate to protect public health, with an adequate margin of safety); Safe Drinking Water Act § 1412 (b)(4)(A), 42 U.S.C. § 300g-1(b)(4)(A) (directing Administrator to set maximum contaminant level goals for drinking water “at the level at which no known or anticipated adverse effects on the health of persons occur and which allows an adequate margin of safety”).

⁴⁶⁹ § 108(a), 42 U.S.C. § 7408(a); see also § 112(e)(2)(A), 42 U.S.C. § 7412(e)(2)(A) (in establishing priorities for adopting standards for hazardous air pollutants, Administrator shall consider “the known or anticipated adverse effects of such pollutants on public health and the environment”); § 112(f)(1)(C), 42 U.S.C. § 7412(f)(1)(C)

requirements.

Comment [2480-4920]: Commenter (2495) states that the EPA must use all the available scientific information in order to meet the goals Congress identified in the CAA. This is the standard met by the ISA for Ozone and Related Photochemical Oxidants, to cite one example. The agency should also follow the advice of CASAC.

Comment [4816-4226]: Commenter (4827) states that, under the CAA, the EPA is required to establish and regularly update federal standards for hazardous air pollutants (HAP), including asthma-causing PM and ozone. These standards, the NAAQS, form the backbone of our nation's air quality protections. Although the NAAQS did not prevent my sister's asthma, they have and continue to bring about substantial improvement in our nation's air quality since their first formulation.

But EPA's proposed rule would have excluded peer-reviewed studies that form the scientific basis of the NAAQS. For example, peer-reviewed studies would be excluded because the underlying data and models cannot be disclosed even in partial form. In fact, the Standards would likely not have been issued had the proposed rule been in place when they were first enacted in the 1970s, because EPA would have tossed out the underlying studies, tying its hands from taking action on an imminent public health concern. Without a doubt, many more Southern Californians would have their lives altered, or even cut short, by dangerous levels of air pollution.

If adopted, the proposed rule will deprive EPA policymakers from real-world evidence and studies that are vital to EPA's review of the NAAQS into the future.⁴⁷⁰ Further, the proposal directly contravenes the comprehensive federal and state regulatory programs Congress envisioned when drafting the CAA of 1970.⁴⁷¹ It reduces our public health legislation to mere declarations, as EPA would be severely delayed, if not rendered entirely unable, to establish future Standards using the "best available science."

Comment [4827-2070]: Commenter (4838) asserts that the proposed rule violates several environmental statutes because it hinders EPA's ability to rely on best available science, or the most up-to-date information, as they require. The CAA, CWA, SDWA, TSCA, and EPCRA all require certain decisions or regulatory criteria be based on the most up-to-date science.⁴⁷² These criteria are described as "best available science," "latest scientific knowledge," and "best

(requiring Administrator to report to Congress on human health risk from hazardous pollutants, including "any available epidemiological or other health studies").

Schwartz, Air Pollution and Mortality in the Medicare Population, 376 *New England Journal of Medicine* 2,513 (2017), and Krewski, D., Burnett, R.T., Goldberg, M. Hoover, K., Siemiatycki, J., Jerrett, M., Abrahamowicz, M. and White, Health Effects Institute, Special Report, Investigator's Report: Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Morality (Health Effects Institute, 2000), <https://www.healtheffects.org/system/files/HEI-Reanalysis-2000.pdf>.

⁴⁷¹ Clean Air Act of 1970, 42 U.S.C.A. § 7401 (Congressional findings and declaration of purpose).

⁴⁷² See Toxic Substances Control Act, 15 U.S.C. § 2625(h), (k) (2018); Clean Water Act, 33 U.S.C. § 1314(a)(1) (2018); Clean Air Act, 42 U.S.C. § 7408(a)(2) (2018); Emergency Planning and Community Right-to-Know Act, 42 U.S.C. § 11023(d)(2) (2018).

available public health information.”⁴⁷³ The proposed rule would illegally limit EPA’s ability to rely on best available science in violation of these statutes.

Comment [4829-2023]: Commenter (4840) states that many of laws authorizing the activities of the EPA require the agency to use the best science in protecting the public’s health and environment. For example, the CAA mandates that air quality criteria “accurately reflect” the “latest scientific knowledge.” In the past, the EPA has considered all available studies in issuing these criteria without consideration of the availability of the underlying data. Promulgation of this proposed rule would be an arbitrary and capricious violation of the provisions of these laws.

Comment [4867-2034]: Commenter (4878) notes that the CAA authorizes EPA to establish NAAQS to protect public health and to regulate emissions of HAPs. EPA works with local governments to reduce air pollution and uses scientific studies that could be impacted by the proposed rule to revise its national air quality standards and NAAQS on a regular basis.⁴⁷⁴

Very little is currently known about air pollution and its impacts on the brain. Recent studies have linked particulate exposures to Parkinson’s disease including a large study done in Denmark. This study used several thousand people with and without a current diagnosis of Parkinson’s disease. Using extremely specific (within 5-50 meters of the front door) geo-coding to estimate participant’s exposure to contaminants, the study estimated that ambient air pollution from traffic increased risk of developing Parkinson’s disease by 9 percent.⁴⁷⁵ Researchers found an increased risk of Parkinson’s disease after exposure to PM in studies from Taiwan⁴⁷⁶ and South Korea,⁴⁷⁷ as well.

In addition to concerns stated in the previous section about the usefulness of data if enough information is redacted to protect privacy, these studies raise additional challenges because they were performed internationally. In the Danish study, participants are protected by EU law. Going forward, an EU study’s compliance with the proposed rule will need to be reconciled with the new General Data Protection Regulation,⁴⁷⁸ which is seen as more restrictive than the United

⁴⁷³ Toxic Substances Control Act, 15 U.S.C. § 2625(h), (k) (requiring that the Administrator, in decisions based on science, “use scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed in a manner consistent with the best available science” (emphasis added)); Clean Water Act, 33 U.S.C. § 1314(a)(1) (requiring that criteria for water quality “accurately reflect[] the latest scientific knowledge” (emphasis added)); Clean Air Act, 42 U.S.C. § 7408(a)(2) (requiring air quality criteria “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare” (emphasis added)); Emergency Planning and Community Right-to-Know Act, 42 U.S.C. § 11023(d)(2) (requiring that a determination to add a chemical to the Toxics Release Inventory “be based on generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies, available to the Administrator” (emphasis added)).

⁴⁷⁸ Council Directive 2016/679 2016 O.J. (L119) 1, 88 (EC).

States' Health Insurance Portability and Accountability Act (HIPAA) of 1996.⁴⁷⁹ The privacy directive raises many issues for science not discussed here, but it is clear that many studies that involve people located in the EU will have a difficult time both complying with the new directive and providing enough information to EPA to be considered.

Studies coming from other countries are vital to health determinations in the United States because people in other countries are exposed to chemicals at different rates than in the U.S. The ability to compare and contrast exposure to health outcome can be enlightening; average PM concentrations in South Korea and China are several times higher than in the United States,⁴⁸⁰ making relatively subtle effects stand out more easily. Studies done in other countries can also help researchers tease out whether an effect is dose or length of exposure dependent. The inability to review and use international research in determinations will virtually guarantee EPA is missing major findings and important data.

Comment [4870-2300]: Commenter (4881) states that, in dismissing the last-resort claim of data inaccessibility in the case of *American Trucking Associations, Inc. v. EPA*, the Court pointed out that the CAA imposes no obligation on the EPA to obtain and publicize the raw data underlying published studies on which the Agency relies. The Court distinguished EPA's reliance on a study's results from its reliance on the raw data underlying such results, noting that raw data often are unavailable due to proprietary interests of a study's scientific investigators or confidentiality agreements with study participants. The Court endorsed EPA's own claim submitted in that case:

"If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. [S]uch data are often the property of scientific investigators and are often not readily available because of . proprietary interests . or because of [confidentiality] arrangements [with study participants]."

Comment [4873-2109]: Commenter (4884) expresses that the CAA requires that NAAQS be set at levels protecting the public health without regard to cost. I believe our other federal environmental laws have the same legal requirement. Footnotes numbered one through five at pg. 18769 of the subject *Federal Register* frustrate the CAA legal mandate to set NAAQS at levels sufficient to protect public health. In sum, these citations call for the best available science as long as it is publicly available. This truncated scientific information now deemed "transparent" will further be vetted by advisory boards; some likely representing other vested interests. What policy recommendations these conflicted councils may make are then to be ruled upon and perhaps over-ruled by the EPA Administrator. The Administrator can discount the value of clean air to breathe without fear of contradiction.

It is the avowed intent of this proposal to make these changes only for future EPA regulations

adopted under the provisions of 40 CFR Part 30. Such limitations are meaningless under the provisions of the CAA. This law calls for the NAAQS to be reestablished every five years at the latest.⁴⁸¹

Comment [5154-393]: Commenter (5165) states that the National Association of Clean Air Agencies (NACAA) appreciates this opportunity to comment on the U.S. EPA’s proposed rule, “Strengthening Transparency in Regulatory Science,” 83 Fed. Reg. 18,768 (Apr. 30, 2018). NACAA is the national, non-partisan, non-profit association of 156 local and state air pollution control agencies in 41 states, D.C. and four territories. The air quality professionals in our member agencies have vast experience dedicated to improving air quality in the U.S. These comments are based upon that experience. The views expressed in these comments do not represent the positions of every state and local air pollution control agency in the country.

The commenter agrees with EPA that “the best available science must serve as the foundation of EPA’s regulatory actions.”⁴⁸² Indeed, reliance on best available science is a fundamental requirement of the CAA and other environmental statutes that EPA administers. For example, the CAA requires EPA to establish NAAQS at levels “requisite to protect the public health” with “an adequate margin of safety.”⁴⁸³ In meeting this obligation, EPA is required to develop air quality criteria that “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air, in varying quantities.”⁴⁸⁴ Science-based decision making is at the very core of our shared mission to protect public health and the environment from the harmful effects of air pollution

Comment [5865-327]: Commenter (6111) states that the EPA’s historic position is consistent with the Statutes. For example, one of EPA’s core duties under the CAA is to set and periodically review the NAAQS for six common air pollutants. In carrying out this responsibility, Congress commanded EPA to use “the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects [of air pollution] on public health or welfare.”⁴⁸⁵

Furthermore, because EPA is required under the Statutes to assess the public health benefits of its regulations, it must take into account all relevant science and cannot arbitrarily exclude certain studies demonstrating those benefits. Under the CAA, EPA must set the NAAQS at a

⁴⁸¹ To quote 42 U.S.C. Title 42, Chapter 85, Part A, Section 7409, Subsection (d)(1): (d) Review and revision of criteria and standards; independent scientific review committee; appointment; advisory functions (1) Not later than December 31, 1980, and at five-year intervals thereafter, the Administrator shall complete a thorough review of the criteria published under section 7408 of this title and the national ambient air quality standards promulgated under this section and shall make such revisions in such criteria and standards and promulgate such new standards as may be appropriate in accordance with section 7408 of this title and subsection (b) of this section. The Administrator may review and revise criteria or promulgate new standards earlier or more frequently than required under this paragraph.

⁴⁸² 83 Fed. Reg. at 18,769

⁴⁸³ 42 U.S.C. § 7409(b)(1).

⁴⁸⁴ Id. § 7408(a)(2) (emphasis added).

⁴⁸⁵ 42 U.S.C. § 7408(a)(2).

level “requisite to protect the public health.”⁴⁸⁶

Many of the fundamental public health studies on which EPA has based key rules and standards under the Statutes are studies for which the raw data were not or could not have been released. Attachment 1 to this letter contains a partial list of studies [note: included under a separate excerpt] that likely contain confidential data; these are all studies on which EPA has relied and cited as the basis for its actions under some of the Statutes. Until now, release of the underlying raw data was not an EPA criterion for determining the “best available” reports, studies, analyses, or models. Indeed, none of the Statutes invoked by EPA as support for the proposed rule limits EPA in this fashion; none of the Statutes requires EPA to make raw data publicly available.⁴⁸⁷

EPA’s proposed new approach, which conflicts with the agency’s obligations and curtails its authority, is irrational at best and detrimental to public health and safety at worst.

Comment [5971-4586]: Commenter (5981) notes that the CAA allows the EPA via Risk Management to improve the safety protocols followed by first responders and workers at facilities which use hazardous chemicals.

The EPA historically investigates such emergency incidences involving death or injury to study causes and create Risk Management. Because these incidences and subsequent studies cannot be reproduced ethically, first responders and workers at hazardous facilities would be at greater risk. This would also negatively affect the public living near these facilities.

Comment [6099-564]: Commenter (6109) notes that the EPA cites two provisions of the CAA as legal support for its proposal: § 103 - which details research and development programs and lists authorized activities, and § 301(a) - which gives EPA authority to “prescribe such regulations as are necessary to carry out its functions under this chapter.” In citing § 103, EPA fails to acknowledge that the list of authorized activities does not include arbitrarily rejecting best

⁴⁸⁶ 42 U.S.C. § 7409(b).

⁴⁸⁷ When litigants in the past argued that EPA could not rely on studies for which the raw data had not been publicly available, the D.C. Circuit soundly rejected their argument. As the court explained in one case: Claiming neither that they were unable to obtain the studies, nor that the studies were improperly published or peer reviewed, Petitioners instead urge us to impose a general requirement that EPA obtain and publicize the data underlying published studies on which the Agency relies. The Clean Air Act imposes no such obligation. . . More generally, we agree with EPA that requiring agencies to obtain and publicize the data underlying all studies on which they rely “would be impractical and unnecessary.” [...] As EPA persuasively stated in denying Petitioners’ original request for information: If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. . . . Such data are often the property of scientific investigators and are often not readily available because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants]. *Am. Trucking Associations, Inc. v. E.P.A.*, 283 F.3d 355, 372 (D.C. Cir. 2002) (quoting Particulate Matter NAAQS, 62 Fed. Reg. 38,652, 38,689 (July 18, 1997)). The court reiterated this holding six years later in a challenge to the 2008 lead NAAQS. *Coal. of Battery Recyclers Ass’n v. E.P.A.*, 604 F.3d 613, 622 (D.C. Cir. 2010). In that case, the litigants had sought access to the raw data underlying Bruce P. Lanphear, et al., Low-Level Environmental Lead Exposure and Children’s Intellectual Function: An International Pooled Analysis, 113 ENVTL. HEALTH PERSP. 894 (2005).

available science, and in referencing § 301(a) EPA does not cite judicial authority or agency precedent for using this provision to limit the evidence that can be used in rulemaking.

Comment [6099-565]: Commenter (6109) states that, interestingly, EPA does not cite § 307(d) of the CAA as a basis of legal authority for this proposed rule. Subsection (d) ("Rulemaking") refers specifically to data disclosure (§ 307(d)(3)(A)). This may be because, as EPA is aware, courts have already rejected claims that § 307 prohibits the use of nonpublic data in decision making. In *American Trucking Associations, Inc. v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002), the court said, "we agree with EPA that requiring agencies to obtain and publicize the data underlying all studies on which they rely "would be impractical and unnecessary." In doing so, the D.C. Circuit Court directly cited EPA's own argument: 'If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment... [S]uch data are often the property of scientific investigators and are often not readily available because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants].'

EPA is seeking to rescind its previous position on the use of nonpublic data without providing an explanation of how, in the absence of these data, EPA will continue to adequately develop or implement regulations that are protective of human health.

EPA also fails to acknowledge that the CAA contains provisions that contradict this proposed rule. Section 109 of the CAA requires EPA to base air quality standards on "air quality criteria," which, per (§108(a)(2)) must "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health and welfare." Section 108 does not include a provision for ignoring existing data. In addition, § 109 requires that NAAQS must allow "an adequate margin of safety" and "protect public health." If EPA chooses to ignore relevant science, how will the agency know if it is setting standards with an adequate margin of safety?

Comment [6104-612]: Commenter (6114) states that the EPA itself seems to question whether it has the authority to promulgate this rule. The FR notice asks commenters to provide information on what areas of the CAA they feel may demonstrate this type of authority. The EPA should have a solid foundation before it proposes rules and not have to seek answers for questions about its own authority.

Comment [6112-1491]: Commenter (6137) notes that the EPA cites two provisions of the CAA as authority for the Proposed Rule. As further detailed below, neither provision provides such authority.

First, EPA cites CAA § 103, 42 U.S.C. § 7403, as authority for the Proposed Rule. 83 Fed. Reg. at 18,769. However, this section provides no authority for such a rule. Instead, the section requires EPA to create a research and development program for prevention and control of air pollution and to conduct research on health effects, among other issues. Specifically:

- Section 7403(a) requires EPA to “establish a national research and development program for the prevention and control of air pollution,” which includes funding or conducting studies, establishing technical advisory committees, and related activities.
- Section 7403(b) provides a list of specific “[a]uthorized activities” that EPA may take in establishing the “research and development program” under subsection (a), including, for example, collecting and making available information pertaining to the program, cooperating with other agencies, and making grants and contracts for research. *Id.* § 7403(b)(6).
- Section 7403(c) requires EPA to “conduct a program of research, testing, and development of methods for sampling, measurement, monitoring, analysis, and modeling of air pollutants.”
- Section 7403(d) requires EPA to “conduct a research program on the short-term and long-term effects of air pollutants, including wood smoke, on human health.”
- Section 7403(e) requires EPA to conduct ecosystem research.
- Section 7403(f) requires EPA to oversee an “experimental and analytical research effort, with the experimental research to be carried out at the Liquefied Gaseous Fuels Spill Test Facility.”
- Section 7403(g) requires that, in carrying out purpose of subsection (a), EPA shall “conduct a basic engineering research and technology program to develop, evaluate, and demonstrate nonregulatory strategies and technologies for air pollution prevention.”
- Section 7403(h) authorizes certain research by the National Institute of Environmental Health Sciences (NIEHS).
- Section 7403(i) discusses coordination of research with “other Federal ecological and air pollution research efforts.”
- Section 7403(j) discusses acid rain research.
- Section 7403(k) discusses air pollution conferences.

Notably absent from this long list of explicit requirements and responsibilities is rulemaking authority, much less authority to exclude scientific studies from consideration by EPA in any “regulatory decisions” for any reason, including whether or not the underlying data is, or can be made publicly available. See 83 Fed. Reg. at 18,773-74 (proposed 40 C.F.R. §§ 30.2, 30.3, 30.5) (indicating application of Proposed Rule only to use of studies and data in “significant regulatory decisions”). Indeed, the authorized activities included in Section 7403(b) are quite specific, including actions such as collecting and disseminating information, making grants and contracts, and even “construct[ing] facilities, provid[ing] equipment, and employ[ing] staff as necessary to carry out this chapter.”

Congress knew how to authorize EPA rulemaking activities elsewhere in the CAA. That § 7403 does not include such authority, much less authority to restrict science in particular, shows a clear intent not to grant such authority. *Meghrig v. KFC W., Inc.*, 516 U.S. 479, 485 (1996). Rather, the purpose of § 7403 is plainly to promote research and to advance and increase the use

and consideration of data, not to restrict it.⁴⁸⁸

Equally problematic, EPA's proposed action serves none of the goals and meets none of the requirements of § 7403. The Proposed Rule is not a "research and development program" and does not include the requisite components of such a program necessary for EPA to act pursuant to its authority under this provision. EPA is not proposing any grants or research fellowships, see § 7403(b), or any air pollutant monitoring, analysis, modeling, and inventory research, see § 7403(c), or any "basic engineering research and technology program to develop, evaluate, and demonstrate nonregulatory strategies and technologies for air pollution prevention," see § 7403(g). Nor is EPA proposing to conduct any epidemiological studies on air pollution or to develop any methods or techniques for human health risk assessment, see § 7403(d).⁴⁸⁹

In addition, even if EPA could otherwise act pursuant to this provision, EPA may not develop health risk assessment methods and techniques applicable to air pollutants without including the following requisite statutory elements:

- The creation of an Interagency Task Force, id. § 7403(d)(2)(A);
- An evaluation of each of the listed HAP under § 7412(b)(1) "based on reasonably anticipated toxicity to humans and exposure factors" listed therein, and which "shall be reviewed by the Interagency Task Force," id. § 7403(d)(2)(B);
- Preparation of environmental health assessments for each of the HAP, with specific deadlines, that "shall be prepared in accordance with guidelines developed by the Administrator in consultation with the Interagency Task Force and the SAB," including a specific list of scientific elements that includes "available toxicological and epidemiological information," "a determination of gaps in available information," and "where appropriate, an identification of additional activities . . . needed to identify the types or levels of exposure which may present significant risk of adverse health effects in humans." Id. § 7403(d)(2)(C).

EPA's Proposal does not include any, much less each, of these required components for an exercise of § 7403 authority. Thus, even if EPA otherwise had authority to act pursuant to this provision, the Proposed Rule is inconsistent with and contravenes the very provision which EPA itself cites.

For each and all of these reasons, § 7403 does not give EPA authority to regulate science or to

⁴⁸⁸ See, e.g., § 7403(b), (c)(2), (d)(1)(A) ("collect and make available, through publications and other appropriate means . . . information . . . pertaining to [EPA's] research and other activities"; "collect and disseminate . . . basic data on chemical, physical, and biological effects of varying air quality . . ."; "establish[] a national network to monitor, collect, and compile data . . . of air emissions, deposition, air quality . . ."; "conduct studies, including epidemiological, clinical, and laboratory and field studies, as necessary to identify and evaluate exposure to and effects of air pollutants on human health").

⁴⁸⁹ Moreover, and as discussed in great detail *infra*, Section V [of their comments], for EPA to perform any of these tasks, it would have to meet the procedural requirements constraining its research and development authority. For example, 42 U.S.C. § 7403(d) sets specific directions that ensure that EPA may not conduct a research program on the effects of air pollution on its own pursuant to this provision, but rather, for such "environmental health effects research," EPA must consult with the Secretary of Health and Human Services, generally. Id. § 7403(d)(1). EPA failed to follow these requisite procedures.

exclude from EPA regulatory decisions the consideration of a subset of scientific studies.

Second, EPA cites section 301(a) of the CAA, 42 U.S.C. § 7601(a), as authority for the Proposed Rule. 83 Fed. Reg. at 18,769. This section of the CAA authorizes only “such regulations as are necessary to carry out [the Administrator’s] functions under [the CAA].” 42 U.S.C. § 7601(a)(1). As discussed below, this provision does not authorize the Proposed Rule.

It is beyond cavil that general rulemaking provisions do not “provide [EPA] Carte blanche authority to promulgate any rules, on any matter relating to the CAA, in any manner that the [EPA] wishes.” *North Carolina v. EPA* 531 F.3d 896, 922 (D.C. Cir. 2008), on reh’g in part, 550 F.3d 1176 (D.C. Cir. 2008) (citing *Citizens to Save Spencer County v. EPA*, 600 F.2d 844, 873 (D.C. Cir. 1979)). Rather, such regulations must be “necessary” to carry out another statutory duty. See, e.g., *id.* (“EPA cannot claim retiring excess Title IV allowances is ‘necessary’ for EPA to ensure SIPs [State Implementation Plans] comply with section 110(a)(2)(D)(i)(I).”); 42 U.S.C. § 7601(a). And “EPA cannot rely on its gap-filling authority to supplement the CAA’s provisions when Congress has not left the agency a gap to fill”—i.e., ‘when there is statutory language on point.’” *WildEarth Guardians v. EPA*, 830 F.3d 529, 539 (D.C. Cir. 2016) (citing *Nat. Res. Def. Council v. EPA*, 749 F.3d 1055, 1063–64 (D.C. Cir. 2014)); see also *Nat. Res. Def. Council v. EPA*, 749 F.3d 1055, 1063–64 (D.C. Cir. 2014) (“[W]e have consistently held that EPA’s authority to issue ancillary regulations is not open-ended, particularly when there is statutory language on point.” (citing *Am. Petroleum Inst. v. EPA*, 52 F.3d 1113, 1119 (D.C. Cir. 1995))).⁴⁹⁰

EPA has not argued, nor could it, that the Proposed Rule is “necessary” for fulfilling the agency’s rulemaking duties under the CAA. Rather, as discussed *infra*, Section IV.A of the commenters’ comment letter, EPA’s proposed exclusion of scientific data that is not publicly available is antithetical to the purposes of the CAA. Moreover, EPA itself has repeatedly determined, and the D.C. Circuit has affirmed, that disclosure of the data underlying studies on which the agency relies is not necessary to fulfill the Agency’s transparency and public comment obligations under the CAA, 42 U.S.C. § 7607(d).

For example, when EPA set the 1997 PM NAAQS, “[s]everal commenters questioned EPA’s ability to rely on studies demonstrating an association between PM and excess mortality without obtaining and disclosing the raw ‘data’ underlying these studies for public review and comment.” 62 Fed. Reg. 38,652, 38,689 (July 18, 1997); see also EPA, Responses to Comments on the 1996 Proposed Rule on the NAAQS for PM (July 1997), https://www3.epa.gov/ttn/naaqs/standards/pm/data/rtc_pm.pdf. EPA responded that “[i]t would be impractical and unnecessary for EPA to review underlying data for every study upon which it relies as support for every proposed rule or standard.” 62 Fed. at 38,689. EPA made clear that disclosing such data was not its general practice, in part because EPA was not relying on the underlying data but rather on the study results themselves. *Id.* EPA recognized that “[i]f EPA and

⁴⁹⁰ See also *Nat. Res. Def. Council v. Reilly*, 976 F.2d 36, 41 (D.C. Cir. 1992) (EPA cannot use its general rulemaking authority as justification for adding to a statutorily specified list); *Sierra Club v. EPA*, 719 F.2d 436, 453 (D.C. Cir. 1983) (same); see also *Gonzales v. Oregon*, 546 U.S. 243, 264–65 (2006) (“It would go . . . against the plain language of the text to treat a delegation for the ‘execution’ of [the Attorney General’s] functions as a further delegation to define other functions well beyond the statute’s specific grants of authority.”).

other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment.” Id. EPA explained:

[S]uch data are often the property of scientific investigators and are often not readily available because of the proprietary interests of the investigators or because of arrangements made to maintain confidentiality regarding personal health status and lifestyle information of individuals included in such data. Without provisions of confidentiality, the possibility of conducting such studies could be severely compromised. Id.

And when the 1997 PM NAAQS was challenged, the D.C. Circuit affirmed EPA’s consideration of relevant scientific epidemiological evidence without disclosure of all of the raw data. See *Am. Trucking Ass’n v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002) (The court “agree[d] with EPA that requiring agencies to obtain and publicize the data underlying all studies on which they rely ‘would be impractical and unnecessary.’” (quoting 62 Fed. Reg. at 38,689) (emphasis added)).

In *Coalition of Battery Recyclers Association v. EPA*, 604 F.3d 613, 623 (D.C. Cir. 2010), petitioners again challenged EPA’s failure to disclose underlying data for a study on the health effects of lead exposure, on which it relied to issue the 2008 Lead NAAQS. Specifically, the petitioners contended “the Lanphear study [on which EPA relied] contained such errors that EPA acted arbitrarily and capriciously in relying on results from the study without first obtaining and making public the underlying data for the study.” *Battery Recyclers*, 604 F.3d at 622-23. EPA reiterated in its briefing that it would be “impractical and unnecessary” to disclose such data. See EPA Respondent Brief (Doc. No. 1230237) at 47 (Feb. 16, 2010) (citation and quotation marks omitted; emphasis added), *Battery Recyclers*, 604 F.3d at 623. The D.C. Circuit again agreed with and upheld EPA’s determination that disclosure of underlying data is not necessary to consider the results of a health study to be relevant to a clean air rulemaking pursuant to 42 U.S.C. § 7607(d). The court applied its prior holding in *American Trucking*, that “[t]he CAA imposes no such obligation” and that “requiring agencies to obtain and publicize the data underlying all studies on which they rely would be impractical and unnecessary.” *Battery Recyclers*, 604 F.3d at 623 (quoting *American Trucking*, 283 F.3d at 372). Though petitioners “attempt[ed] to distinguish their request on the ground that in *American Trucking* the court was addressing requests for data underlying several studies, while they request only that EPA obtain and make public the data underlying the Lanphear study,” id. at 623, the court found that argument unpersuasive, again “noting that raw data often is unavailable due to proprietary interests of a study’s scientific investigators or confidentiality agreements with study participants.” Id. at 623 (citing *American Trucking*, 283 F.3d at 372).

EPA also cannot argue that excluding studies from the Agency’s consideration when the underlying data cannot be publicly disclosed is “necessary” for ensuring the Agency relies on the best available science. As an initial matter, nowhere in the Proposed Rule does EPA find that particular studies, much less all studies that rely in part on the collection of confidential raw data (such as people’s names and health records), are bad science, or even less reliable science. Nowhere does EPA show how health studies that rely in part on confidential personal information can never be relevant in any way to CAA rulemakings. Nor could it, as EPA has

found such studies relevant and has relied on such studies for decades, and they are commonly accepted and valued as important scientific information of health effects within the scientific community. See Section IV.A [of comment letter]. EPA cites no examples of situations where unsound, unlawful, or arbitrary decision-making resulted from an agency's reliance on studies that do not fit its newfound notions of "transparency" and "integrity." Rather, courts have repeatedly upheld actions that have relied on such studies, as cited above.

Moreover, EPA has not demonstrated that it is consistent with scientific principles to categorically exclude peer-reviewed scientific information from all consideration in a rulemaking, as EPA proposes to do. If EPA has any doubts or concerns regarding the merits of a particular study, it must address those doubts or concerns for that particular study in the context of a given rulemaking, where agency staff, internal scientific experts, scientific advisory committees, or commenters contend that study is relevant. EPA has provided no scientific justification for ignoring an entire class of health science simply because the underlying data has not been disclosed. Whether underlying data on which a study relies is made public or not simply has no bearing on whether a scientific study is good science, is accurate, is reliable, and is relevant to a scientific question (such as the health effects of air pollution). And to the extent EPA requires additional verification of a study, there are myriad ways it can do so without disclosing confidential data (for example, requesting an independent scientific body to conduct a confidential review). See Section IV.A, *infra*, of the commenters' comment letter.

Furthermore, there is no statutory gap with respect to what studies EPA should consider (nor does EPA attempt to identify any). As further discussed below, sections of the CAA that govern air standards and rulemakings specify the applicable standards and generally require consideration of all available science. EPA has been adopting rules under most of these provisions for decades without finding any need for restrictions of the sort EPA proposes here. The Agency provides no explanation, and none exists, for suddenly finding "gaps" in these provisions.

Finally, EPA fails to acknowledge that it has had a longstanding policy of considering health studies without requiring disclosure of all underlying raw data. Indeed, it tries to minimize its prior position in a footnote, stating that: "Historically, EPA has not consistently observed the policies underlying this proposal, and courts have at times upheld EPA's use [of] non-public data in support of its regulatory actions." 83 Fed. Reg. at 18,769, n.3. It ignores the fact that EPA itself has consistently considered and used health studies dependent on non-public information for clean air rulemakings. Further, the Agency's longstanding policy has been that "EPA does not generally undertake evaluations of raw, unanalyzed scientific data as part of its public health standard setting process." 62 Fed. Reg. at 38,689. Only in "extreme cases – for example where there are credible allegations of fraud, abuse or misconduct – would a review of raw data be warranted." *Id.* That EPA now finds this data so important that it must be publicly disclosed before the Agency will even consider a study represents a monumental shift in course.

EPA is not working on a blank slate. Therefore, it must do more than just explain the change. Rather, EPA must provide "a more detailed justification," *FCC v. Fox Television Stations, Inc.*, 556 U.S. 502, 515 (2009); see also *Motor Vehicles Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 41-42 (1983), because its new policy directly contradicts the Agency's prior

findings that such studies are relevant to clean air rulemakings and provide evidence of health effects that the Agency can and must consider. EPA has not provided any reasoned explanation for its departure, much less an explanation with the requisite detail to justify its about-face.

Comment [6112-1582]: Commenter (6137) states that Agency “regulations, in order to be valid, must be consistent with the statute under which they are promulgated.” *Decker v. Nw. Env'tl. Def. Ctr.*, 568 U.S. 597, 609 (2013) (quoting *United States v. Larionoff*, 431 U.S. 864, 873 (1977)). As discussed below, the Proposed Rule violates a number of provisions in the statutes upon which EPA relies as statutory authority. For this reason, too, the Proposed Rule is invalid.

The CAA’s specific rulemaking provisions do not allow EPA to create the restrictions on the consideration or use of health science that EPA proposes. Rather, these provisions govern each type of CAA rulemaking, and to the extent science can and must be considered under these provisions, EPA may not lawfully restrict the use of such science.⁴⁹¹ The Proposed Rule contravenes a number of CAA provisions and is thus unlawful.

First, sections 108 and 109 of the CAA do not allow EPA to restrict science as proposed and demonstrate that the Proposed Rule cannot lawfully be applied to any NAAQS rulemakings. These provisions specify that EPA’s air quality criteria (on which the NAAQS are based) must “accurately reflect the latest scientific knowledge.” 42 U.S.C. § 7408(a)(2); *id.* § 7409(b) (requiring those “criteria” be used to set NAAQS). This language unambiguously requires EPA to consider “all identifiable effects on public health,” not just some. *Id.* § 7408(a)(2). The criteria “shall include information” on defined factors, “to the extent practicable.” *Id.* This provision leaves no room for EPA to ignore or exclude studies because underlying data is not disclosed.

EPA cannot possibly ensure its air quality criteria “accurately reflect the latest scientific knowledge” if it refuses to even read certain studies based on an arbitrary public disclosure test. EPA’s past practice illustrates this: for decades, the Agency’s practice has been to review all available scientific studies, including those relying on non-public data. See, *e.g.*, *Battery Recyclers*, 604 F.3d at 616; see also EPA, ISA for PM (Final Report, Dec 2009) (2009), <https://cfpub.epa.gov/ncea/risk/recordisplay.cfm?deid=216546>; EPA, Air Quality Criteria for PM, Vols. II-III (1996), <https://cfpub.epa.gov/ncea/risk/recordisplay.cfm?deid=2832>. The legislative history of § 108 confirms that Congress’s intent was for EPA to “establish such national goals on the basis of the best information available,” not to sit idly by until industry representatives no longer dispute questions regarding health effects. S. Rep. No. 91-1196 (Sept. 17, 1970), CAA 70 Leg. Hist. 19, 110 (emphasis added).

In addition, the Proposed Rule would direct EPA to violate the statutory procedures that must be followed when the Agency sets NAAQS. This includes EPA’s appointment of an independent scientific review committee, including certain defined members, see 42 U.S.C. § 7409(d)(2)(A), and consideration of the recommendations of that committee when setting the NAAQS, *id.* § 7409(d)(2)(B) -(C); see also, *e.g.*, *Mississippi v. EPA*, 744 F.3d 1334, 1346 (D.C. Cir. 2013) (explaining NAAQS development process). That committee shall advise EPA regarding whether there are “areas in which additional knowledge is required.” 42 U.S.C. § 7409(d)(2)(C). In

⁴⁹¹ Commenters do not concede that the Proposed Rule would necessarily apply to every action under these provisions.

promulgating NAAQS in the past, EPA has recognized that the CAA requires it to consider scientific advice and recommendations from such experts, including those that rely on health studies where underlying data is not disclosed.⁴⁹² Directing the Agency to ignore scientific studies presented by CASAC, just because the underlying data is not public, contravenes these statutory requirements.

Second, section 7409 of the Act requires EPA to adopt NAAQS based on the criteria, at levels requisite to protect public health with an adequate margin of safety. “[T]he Act requires [a] . . . preventative and precautionary” approach to setting NAAQS, whereby EPA must protect public health from “not just known adverse effects, but those of scientific uncertainty or that research has not yet uncovered.” *Am. Lung Ass’n v. EPA*, 134 F.3d 388, 389 (D.C. Cir. 1998) (citation and quotation marks omitted). Congress “specifically directed” EPA “to protect against . . . effects whose medical significance is a matter of disagreement.” *Lead Indus. Ass’n v. EPA*, 647 F.2d 1130, 1154 (D.C. Cir. 1980); accord *Nat. Res. Def. Council, Inc. v. EPA*, 824 F.2d 1146, 1152 (D.C. Cir. 1987) (en banc) (discussing legislative history). EPA’s proposal would flout these precedents by refusing to consider scientific studies – even those published in peer reviewed journals by reputable scientists – based on an arbitrary data transparency policy.

To the extent the CAA allows EPA to weigh particular studies based on its expert judgment, this does not authorize EPA to categorically exclude an entire class of studies from being considered when performing a rulemaking to fulfill the Agency’s statutory directive to protect public health and welfare. 42 U.S.C. § 7409(b)(1) (requiring primary NAAQS to be standards “the attainment and maintenance of which in the judgment of the Administrator, based on such criteria and allowing an adequate margin of safety, are requisite to protect the public health”). EPA cannot rationally engage in its task of determining an appropriate level for the NAAQS if it entirely excludes relevant health studies from its consideration simply because underlying data has not been publicly released. Under the Proposed Rule, EPA would refuse to consider studies indicating that adverse health effects occur at a specific pollutant level—even where multiple studies reach the same results—where the studies fail to meet the agency’s arbitrary disclosure tests. This would contradict the statutory requirement to assure public health protection by ignoring some of the most important health science relevant to that question and is the epitome of irrational agency action.

Third, the Proposed Rule violates section 7412 of the CAA, which includes myriad provisions that require EPA to evaluate health risks and effects of HAP and to set emission standards to reduce these risks and effects, based on certain science-based legal tests applicable to particular § 7412 rulemakings. See, e.g., 42 U.S.C. § 7412(a), (b)(1)-(4), (f)(1)-(2). In no place does the

⁴⁹² See, e.g., EPA, Integrated Science Assessment (ISA) of Ozone and Related Photochemical Oxidants (Final Report, Feb 2013), EPA/600/R-10/076F (2013), <http://cfpub.epa.gov/ncea/isa/recordisplay.cfm?deid=247492>; EPA, Integrated Science Assessment (ISA) for Particulate Matter (Final Report, Dec 2009), EPA/600/R-08/139F (2009), <https://cfpub.epa.gov/ncea/risk/recordisplay.cfm?deid=216546>; see also EPA, Integrated Science Assessment (ISA) for Lead (Final Report, Jul 2013), <https://cfpub.epa.gov/ncea/isa/recordisplay.cfm?deid=255721>; EPA, CASAC Review of the EPA’s Integrated Science Assessment for Lead (Third External Review Draft – November 2012) (June 4, 2013), <https://cfpub.epa.gov/ncea/isa/recordisplay.cfm?deid=242655>; see also EPA, EPA Clean Air Scientific Advisory Committee (CASAC) (last updated Aug. 3, 2018), <https://yosemite.epa.gov/sab/sabproduct.nsf/WebProjectsbyTopicCASAC!OpenView> (NAAQS assessments and criteria document).

statute limit EPA's consideration of scientific studies on health effects or risks to those studies where underlying data is publicly disclosed, nor does it authorize EPA to so limit its consideration of such scientific information. Instead, § 7412 includes language repeatedly indicating the requirement, embodying Congressional intent, for EPA to consider all relevant scientific information regarding health risks and effects, actual or potential, of HAP.

For example, § 7412(f) requires EPA to investigate and report, among other things, on “the actual health effects with respect to persons living in the vicinity of sources,” and “any available epidemiological or other health studies” regarding the effects of HAP, as part of the residual risk requirements. *Id.* § 7412(f)(1)(C) (emphasis added); *id.* § 7412(f)(1) (also providing other requirements for EPA's investigation and report to Congress). EPA submitted that report to Congress in 1999.⁴⁹³ Section 7412(f) further provides that, in the absence of Congressional action on recommendations provided in EPA's Residual Risk Report to Congress, EPA “shall . . . promulgate standards for [each air toxics] category or subcategory if promulgation of such standards is required in order to provide an ample margin of safety to protect public health in accordance with this section (as in effect before November 15, 1990).” *Id.* § 7412(f)(2)(A). This provision also directs that:

Emission standards promulgated under this subsection shall provide an ample margin of safety to protect public health in accordance with this section (as in effect before November 15, 1990), unless the Administrator determines that a more stringent standard is necessary to prevent, taking into consideration costs, energy, safety, and other relevant factors, an adverse environmental effect. If standards promulgated pursuant to subsection (d) and applicable to a category or subcategory of sources emitting a pollutant (or pollutants) classified as a known, probable or possible human carcinogen do not reduce lifetime excess cancer risks to the individual most exposed to emissions from a source in the category or subcategory to less than one in one million, the Administrator shall promulgate standards under this subsection for such source category.

Id. § 7412(f)(2)(A). It would not be possible for EPA to fulfill its statutory directives under § 7412(f) to ensure that air toxics emissions standards “provide an ample margin of safety to protect public health,” and to assess and remove any unacceptable health risks, unless EPA considered all relevant scientific studies in assessing such health risks. *Id.* § 7412(f)(2).

Further, § 7412(f)(2) also explicitly refers to EPA's Benzene Rule, which interpreted the prior version of this provision and which itself relied on certain studies and guidelines for which underlying data was not disclosed. *Id.* § 7412(f)(2)(B) (citing 54 Fed. Reg. 38,044 (Sept. 14, 1989)).⁴⁹⁴ As EPA determined, and Congress, the D.C. Circuit, and EPA have affirmed through citation and reliance on that rule, § 7412(f) standards must be “based on the most current scientific knowledge,” and on risk assessment guidelines and methods developed by EPA

⁴⁹³ EPA, Residual Risk Report to Congress, EPA-453/R-99-001 (Mar. 1999), <https://www.epa.gov/fera/residual-risk-report-congress-1999>. 36

⁴⁹⁴ In that rule, among other studies, “the Agency compiled and presented a ‘Survey of Societal Risk’ in its July 1988 proposal (53 FR 28512-28513).” 54 Fed. Reg. at 38,046. The underlying data for that survey was not disclosed, yet the Agency both considered and relied on it. *Id.*

scientists and expert independent scientists. 54 Fed. Reg. at 38,062-63.⁴⁹⁵ EPA has repeatedly recognized this reliance on an expansive array of scientific support that includes information that relies on epidemiological and other health studies for which the underlying data is not published in later § 7412(f) rulemakings as well.

Indeed, EPA itself has interpreted its legal responsibility pursuant to this provision as “incorporating into our assessments the best available science with respect to dose-response information.”⁴⁹⁶ To achieve that, EPA has followed scientific recommendations by the Office of Air Quality Planning and Standards, and has prioritized certain sources of such dose-response information according, in part, to “level of peer review received.”⁴⁹⁷ These guidelines direct EPA to consult dose-response assessments such as a reference concentration (RfC, for inhalation), reference dose (RfD, for ingestion), and a unit risk estimate (URE, for cancer risk) and/or slope factor (SF, for cancer risk).⁴⁹⁸ EPA’s scientific method is to consult and rely on IRIS (an EPA

⁴⁹⁵ In that rule, EPA explained that risk assessments and § 7412(f) rules must be based on “the most current scientific knowledge and on sound scientific judgment”; EPA stated that it had based that rule on “an evaluation of the currently available information and on the regulatory mission of EPA to protect public health”; EPA also relied on the then-applicable Cancer Guidelines, and Guidelines for Exposure Assessment, explaining that “these guidelines were developed by scientists in EPA, and were extensively reviewed by the public and by expert scientists in industry, academia, environmental groups, and other governmental agencies.” 54 Fed. Reg. at 38,062-63.

⁴⁹⁶ See, e.g., EPA, Residual Risk Assessment for the Portland Cement Manufacturing Source Category in Support of the Sept. 2017 Risk and Technology Review Proposed Rule at 23 (July 2017), <https://www.regulations.gov/document?D=EPA-HQ-OAR-2016-0442-0153> (describing the Agency’s current policy and scientific methodology for this type of health risk assessment); see also e.g., EPA, Residual Risk Assessment for Pulp Mill Combustion Sources in Support of the October, 2017 Risk and Technology Review Final Rule at 6, 18-19 (July 2017), <https://www.regulations.gov/document?D=EPA-HQ-OAR-2014-0741-0266> (same). In citing these examples, Commenters do not contend that EPA’s approach is the most health-protective or that it fully incorporates the extent of current scientific knowledge, as they have repeatedly urged EPA to follow the more conservative and more scientifically up-to-date approach of the NAS Silver Book, as the Agency is well aware from submitted comments and from reviewing that report. See, e.g., NAS, Science & Decisions: Advancing Risk Assessment (2009), <https://www.nap.edu/catalog/12209/science-and-decisions-advancing-risk-assessment>; Nat. Res. Def. Council, Strengthening Toxic Chemical Risk Assessments to Protect Human Health (Feb. 2012), <https://www.nrdc.org/sites/default/files/strengthening-toxic-chemical-risk-assessments-report.pdf> (describing ways EPA needs to strengthen, not weaken, risk assessments based on NAS recommendations). However, refusing to look at IRIS or other health reference values that rely in any way on non-public data as EPA proposes would represent a significant backward step by EPA, away from current science, as well as an about-face from its well-developed scientific policy and current methods which are based on years of evaluation and have gone through extensive peer review by the Science Advisory Board. See, e.g., SAB, Risk and Technology Review (RTR) Risk Assessment Methodologies (May 2010) (supporting EPA’s approach and urging EPA to take a more protective scientific approach on certain issues).

⁴⁹⁷ EPA, Cement Kilns Risk Assessment, *supra* n.53, at 23 (citing EPA, 2014a. Table 1); EPA, Table 1: Prioritized Chronic Dose-Response Values for Screening Risk Assessments (June 18, 2018), <https://www.epa.gov/sites/production/files/2014-05/documents/table1.pdf>.

⁴⁹⁸ EPA, Cement Kilns Risk Assessment, *supra* n.53, at 23 (The RfC is defined as an “estimate (with uncertainty spanning perhaps an order of magnitude) of a continuous inhalation exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime.” The RfD is “an estimate (with uncertainty spanning perhaps an order of magnitude) of a daily oral exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime.” The URE is defined as “the upper-bound excess cancer risk estimated to result from continuous lifetime exposure to an agent at a concentration of 1 µg/m³ in air.” The SF is “an upper bound, approximating a 95 percent confidence limit, on the increased cancer risk from a lifetime exposure to an agent. This estimate, [is] usually expressed in units of proportion (of a population) affected per mg/kg/day . . .”).

database containing peer-reviewed scientific health assessment information) as a top priority source of such information, due in part to the high level of peer review. As EPA's guidelines explain: "IRIS is a critical resource for risk assessors because the database contains toxicity information that reflects a consensus among EPA program offices."⁴⁹⁹ EPA also prioritizes dose response information from the U.S. ATSDR, and the California EPA Office of Environmental Health Hazard Assessment.⁵⁰⁰ Each of these recognizes the value of relevant scientific information without regard to whether full underlying data can be or has been publicly disclosed.⁵⁰¹

Section 7412(a)(11) likewise illustrates the constraints the CAA imposes on limiting consideration of science when establishing cancer risk. This provision defines "carcinogenic effect" as having "the meaning provided by the Administrator under Guidelines for Carcinogenic Risk Assessment as of the date of enactment." 42 U.S.C. § 7412(a)(11). These Guidelines for Carcinogenic Risk Assessment ("Cancer Guidelines"), in turn, direct that EPA shall rely on "established scientific peer review processes," and state that "[t]he cancer guidelines incorporate basic principles and science policies based on evaluation of the currently available information."⁵⁰² The Cancer Guidelines also provide that EPA's Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens ("Supplemental Guidance") should be considered along with the Guidelines.⁵⁰³ Both the Cancer Guidelines and Supplemental Guidance cite as relevant and in some instances important some of the very types of scientific studies that EPA's Proposed Rule would categorically exclude: epidemiological studies which rely on private or confidential medical information, or assessments such as IRIS, California EPA's (Cal. EPA) assessments, and other health reference concentration information that rely on such studies.⁵⁰⁴ The Cancer Guidelines do not preclude the consideration of any "one

⁴⁹⁹ EPA, Air Toxics Risk Assessment Reference Library, Vol. 1 Tech. Res. Manual, EPA-453-K-04-001A at 3-9 (April 2004), https://www.epa.gov/sites/production/files/2013-08/documents/volume_1_reflibrary.pdf; id. at 12-25 ("Dose-response assessments that have achieved full intra-agency consensus are incorporated in the Integrated Risk Information System (IRIS), which is regularly updated and available on-line (www.epa.gov/iris).").

⁵⁰⁰ EPA, Cement Kilns Risk Assessment, *supra* n.53, at 24.

⁵⁰¹ As IRIS values show, IRIS considers relevant and often essential epidemiological evidence for which underlying private confidential or medical information is not released. See, e.g., EPA, EPA's Reanalysis of Key Issues Related to Dioxin Toxicity and Response to NAS Comments, Vol. 1, CAS No. 1746-01-06, EPA/600/R-10/038F, at 1-7 (Feb. 2012), https://cfpub.epa.gov/ncea/iris/iris_documents/documents/supdocs/dioxinv1sup.pdf (discussing the use of two human epidemiological studies "as co-critical studies" to derive the reference dose in the IRIS assessment, and the SAB's agreement with EPA that these represent best available science); EPA, Toxicological Review of Hexavalent Chromium (Aug. 1998),

https://cfpub.epa.gov/ncea/iris/iris_documents/documents/toxreviews/0144tr.pdf (relying on human epidemiologic studies); EPA, Toxicological Review of Formaldehyde-Inhalation Assessment (June 2010), http://ofmpub.epa.gov/eims/eimscomm.getfile?p_download_id=497038 (relying on epidemiologic studies).

⁵⁰² EPA, Guidelines for Carcinogen Risk Assessment (hereinafter "Cancer Guidelines") at 1-2 (Mar. 2005), https://www.epa.gov/sites/production/files/2013-09/documents/cancer_guidelines_final_3-25-05.pdf

⁵⁰³ EPA, Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens, EPA/630/R-03/003F (Mar. 2005), https://www3.epa.gov/airtoxics/childrens_supplement_final.pdf.

⁵⁰⁴ For example, the Supplemental Guidance states: "[The] critical data are either human epidemiological data on childhood exposures resulting in adult cancer or research studies with rodents involving early postnatal exposures. The major human data available are from radiation exposures . . . with very limited data available for humans exposed during childhood to chemicals." Suppl. Guidance at 13. The Cancer Guidelines and later EPA policy state that "[a]ll studies that are considered to be of acceptable quality, whether yielding positive or null results, or even suggesting protective carcinogenic effects, should be considered in assessing the totality of the human evidence.

kind of data” as relevant, but instead “cover the assessment of available data,” explaining that “[i]t is very important that all analyses consider the basic standards of quality, including objectivity, utility, and integrity.”⁵⁰⁵

Thus, EPA’s Proposal to ignore studies because underlying data is not disclosed is antithetical to the Guidelines upon which EPA relies when determining carcinogenic effects in § 7412(a)(11). The statute’s text and incorporation of EPA’s science guidelines on cancer risk are unambiguous and leave no gap to fill regarding what “carcinogenic” means. Thus, in regulating carcinogens EPA may not apply the Proposed Rule’s exclusion of any relevant health science regarding carcinogens and carcinogenic risk from air pollutants in rulemakings.

Consistent with the reliance on all relevant health science to determine carcinogenic effects, for cancer and other health risks under § 7412(f), EPA has an existing policy of what it describes as using the “the best available science with respect to dose-response information. The recommendations are based on the following sources, in order of priority”: (1) EPA IRIS values which have all gone through independent, external peer-review; (2) ATSDR values, which follow an approach similar to EPA’s IRIS program; and (3) Cal. EPA values for which “[t]he process for developing these assessments is similar to that used by EPA to develop IRIS values and incorporates significant external scientific peer review.”⁵⁰⁶ Likewise, for non-cancer health risks from air pollution, EPA’s guidelines do not exclude science that is relevant, even if underlying data is not disclosed.⁵⁰⁷ Notably, the vast majority of health reference values that EPA uses in § 7412(f) come from EPA’s IRIS program, which includes a scientific literature review of all available relevant studies, without excluding any due to a lack of disclosure of underlying data.⁵⁰⁸

Conclusions about the overall evidence for carcinogenicity from available studies in humans should be summarized along with a discussion of uncertainties and gaps in knowledge.” Cancer Guidelines, *supra* n.59, at 2-4 (emphasis added). They further provide that “[h]uman data may come from epidemiologic studies or case reports . . . The most common sources of human data for cancer risk assessment are epidemiologic investigations . . . Epidemiologic data are extremely valuable in risk assessment because they provide direct evidence on whether a substance is likely to produce cancer in humans, thereby avoiding issues such as: species-to-species inference, extrapolation to exposures relevant to people, effects of concomitant exposures due to lifestyles. Thus, epidemiologic studies typically evaluate agents under more relevant conditions. When human data of high quality and adequate statistical power are available, they are generally preferable over animal data and should be given greater weight in hazard characterization and dose-response assessment, although both can be used.” *Id.* at 2-3.

⁵⁰⁵ *Id.* at 1-5.

⁵⁰⁸ EPA, IRIS Process for Developing Human Health Assessments (last updated March 7, 2018), <https://www.epa.gov/iris/basic-information-about-integrated-risk-information-system#process>.

Fourth, the Proposed Rule is unlawful because EPA is considering costs and is relying on implementation costs as a basis for the Rule, in direct violation of § 7409, § 7412(f)(2), and other provisions of the CAA where cost is not a relevant or permissible factor in determining health and environmental impacts. See, *e.g.*, 83 Fed. Reg. at 18,768 (indicating that Proposed Rule would apply to “regulations for which the public is likely to bear the cost of compliance”); see also *id.* at 18,774 (proposed § 30.8) (requiring agency to implement the Proposed Rule “in a manner that minimizes costs”). Section 7412(f)(2) prohibits consideration of economic costs in assessing and determining whether the health risks that a major air toxics source causes are “unacceptable,” as it requires a determination of what is required to provide an “ample margin of safety to protect the public health.” *Nat. Res. Def. Council, Inc.*, 824 F.2d at 1164-65 (quotation marks omitted); Benzene Rule, 54 Fed. Reg. at 38,048-49 (citing Vinyl Chloride decision as prohibiting consideration of costs when determining a “safe” or “acceptable” emission level).⁵⁰⁹ Similarly, as EPA explained in the Cancer Guidelines: “Risk assessments may be used to support decisions, but in order to maintain their integrity as decision-making tools, they are not influenced by consideration of the social or economic consequences of regulatory action.” Cancer Guidelines, *supra* n.59, at 1-5 to 1-6. It is therefore both unlawful and arbitrary to use cost as a justification to ignore and exclude health science from residual risk air toxics assessments, and thus as part of the determination of whether risk is acceptable or unacceptable, pursuant to § 7412(f)(2).

Fifth, section 7412(n) directs EPA to “perform a study of the hazards to public health reasonably anticipated to occur as a result of emissions by electric utility steam generating units of pollutants listed under subsection (b) after imposition of the requirements of this chapter,” and to list such sources “after considering the results of [this] study.” 42 U.S.C. § 7412(n)(1). This provision includes no limitation on the data EPA can or must consider for this question, based on EPA’s own interpretation. Thus, previously, in fulfilling its duty pursuant to this provision, EPA considered a wide array of scientific studies as relevant, regardless whether underlying data was disclosed.⁵¹⁰ Excluding consideration of relevant scientific material addressing such hazards solely because underlying data is not available would arbitrarily lead to an incomplete assessment of relevant information and flout the statute’s preventative and health-protective

⁵⁰⁹ See also, *e.g.*, NESHAP Proposed Rule, Pulp Mills, 81 Fed. Reg. 97,046, 97,064 (Dec. 30, 2016) (citing Benzene Rule and vinyl chloride decision) (“If risks are unacceptable, the EPA must determine the emissions standards necessary to bring risks to an acceptable level without considering costs.”); NESHAP Proposed Rule, Friction Materials Mfg., 83 Fed. Reg. 19,499, 19,502 (May 3, 2018) (same); see also *Whitman v. Am. Trucking Ass’n*, 531 U.S. 457, 468-71 (2001) (EPA is prohibited from considering costs in adopting national ambient air quality standards under the Clean Air Act rules).

⁵¹⁰ See, *e.g.*, EPA, Supplemental Finding That It Is Appropriate and Necessary To Regulate Hazardous Air Pollutants From Coal- and Oil-Fired Electric Utility Steam Generating Units; Final Rule, 81 Fed. Reg. 24,420, 24,421-23, 24,438, nn.1, 10, 11 (Apr. 25, 2016) (citing peer-reviewed risk assessments on human health effects and additional peer review of the Mercury Risk Assessment as well as evaluation of the non-mercury HAP risk assessment and co-benefits from reductions in PM_{2.5} and SO₂ emissions in the MATS Regulatory Impact Analysis) (U.S. EPA. 2011. Revised Technical Support Document: National Scale Assessment of Mercury Risk to Populations with High Consumption of Self-caught Freshwater Fish in Support of the Appropriate and Necessary Finding for Coal- and Oil-Fired Electric Generating Units. Office of Air Quality Planning and Standards. November. EPA–452/R–11–009. Docket ID No. EPAHQ–OAR–2009–0234–19913; U.S. EPA. 2011. Supplement to Non-mercury Case Study Chronic Inhalation Risk Assessment for the Utility MACT Appropriate and Necessary Analysis. Office of Air Quality Planning and Standards. November. Docket ID No. EPA–HQ–OAR–2009–0234–19912; U.S. EPA. 2011. Regulatory Impact Analysis for the Final Mercury and Air Toxics Standards. EPA–452/R–11–011. Docket ID No. EPA–HQ–OAR–2009–0234–20131.).

intent. EPA may not apply the Proposed Rule under this provision, as EPA has already recognized – for example, in acting pursuant to § 7412(n)(1) to reach the determination that it is “appropriate and necessary” to regulate power plants due to their health hazards⁵¹¹ – but rather must consider the types of studies the Proposed Rule would ignore. EPA cannot depart from its decision to consider such studies relevant without meeting the *State Farm* and *Fox* tests, see *supra* at 23, which it unquestionably has not done here.

In addition, the listing and delisting provisions for HAP and source categories, and the requirements for the urban air toxics program, require EPA to assess particular and potential health effects and risks from HAP. See, *e.g.*, 42 U.S.C. § 7412(b)(2)-(3), (c)(9), (k). EPA’s Proposal to ignore relevant scientific information due to the lack of public disclosure violates these requirements.

Sixth, CAA § 7429 requires EPA to evaluate health risks and does not allow the exclusion of relevant scientific information. For example:

- § 7429(a)(3) – standards must include new unit siting requirements that, on a site-specific basis, minimize potential risks to public health or the environment;
- § 7429(e) requires permits to include site-specific provisions “if the Administrator or the State determines that emissions in the absence of such limitations or measures may reasonably be anticipated to endanger public health or the environment”;
- § 7429 (h)(3) requires residual risk review under § 112(f), and § 129(b)(1) requires the inclusion of any residual risk standards in the guidelines for existing units.

Seventh, the Proposed Rule is antithetical to the very purpose of the CAA, which is “to protect and enhance the quality of the Nation’s air resources so as to promote the public health and welfare and the productive capacity of its population.” 42 U.S.C. § 7401(b)(1). A “primary goal” is “pollution prevention.” *Id.* § 7401(c). Each of the above provisions must be read in a way that advances that goal; the Proposed Rule would do the contrary and is thus inconsistent with the statute and unlawful. EPA’s Proposal runs directly counter to these goals and objectives by arbitrarily excluding consideration of science that discloses health impacts of air pollution. The Proposal is not neutral. It only excludes health-based science (dose-response studies, epidemiological studies) where underlying data is not disclosed, generally because it cannot or should not be disclosed to protect individual participants’ privacy and confidentiality. EPA cannot exclude whole categories of scientific data untethered from a specific context or study, but rather must assess each health study on a case-by-case basis to determine whether or not it should be considered in a particular rulemaking, under EPA’s long-standing scientific guidelines and policies and its regular approach in CAA rulemakings. Instead, this Proposed Rule excludes health studies from consideration as a class, up front, before EPA is even in the rulemaking stage under its authority. And it does so not for scientific reasons, but simply due to industry preferences – most notably because industry cannot pick them apart by replicating decades of air pollution health effects, or by contacting individuals who shared private medical information to replicate the collection of data.

⁵¹¹ 81 Fed. Reg. at 24,422-23.

While the CAA provides for protection of “public health and welfare,” the Proposed Rule favors excluding science even if it is the most relevant and important evidence regarding how to protect public health. While the CAA aims for “pollution prevention” to protect public health, the Proposed Rule would prevent consideration of science relevant to these very goals. Therefore, EPA’s Proposed Rule is unlawful and arbitrary. Thus, EPA cannot lawfully satisfy § 7429 for similar reasons as described above, unless it evaluates relevant information on risks.

Eighth, a number of important CAA provisions require EPA to act based on a finding that air pollution is reasonably anticipated to endanger health or the environment. See, *e.g.*, 42 U.S.C. §§ 7415, 7422, 7521. The D.C. Circuit has ruled that such language “requires a precautionary, forward-looking scientific judgment about the risks of a particular air pollutant, consistent with the CAA’s ‘precautionary and preventative orientation.’” *Coal. for Responsible Regulation v. EPA*, 684 F.3d 102, 122 (D.C. Cir. 2012) (citation omitted). Such a precautionary approach does not require scientific certainty. “If a statute is ‘precautionary in nature’ and ‘designed to protect public health,’ and the relevant evidence is ‘difficult to come by, uncertain, or conflicting because it is on the frontiers of scientific knowledge,’ EPA need not provide ‘rigorous step-by-step proof of cause and effect’ to support an endangerment finding.” *Id.* at 121 (citation omitted). Thus, the court expressly rejected the notion that EPA can or should disregard uncertain or “difficult to come by” evidence under “endangerment” statutes. Indeed, the court rejected the notion that EPA could not rely on studies that synthesized the research of others:

It makes no difference that much of the scientific evidence in large part consisted of “syntheses” of individual studies and research. Even individual studies and research papers often synthesize past work in an area and then build upon it. This is how science works. EPA is not required to re-prove the existence of the atom every time it approaches a scientific question.

Id. at 120. Thus, in making endangerment determinations, there is no lawful or rational basis for EPA to automatically exclude reliance on any studies that synthesize and evaluate research by others.

The Courts have also rejected EPA’s attempts to avoid endangerment determinations based on considerations other than the specific endangerment criteria. In *Massachusetts v. EPA*, the Court held that the endangerment language in section 7521(a)(1) required EPA to assess whether motor vehicle emissions cause or contribute to air pollution which may reasonably be anticipated to endanger public health and welfare due to climate change, and to so determine exclusive of any other policy considerations. *Massachusetts v. EPA*, 549 U.S. 497, 532-34 (2007). Likewise, here, EPA cannot avoid its duty to make endangerment findings by arbitrarily rejecting scientific studies to serve vague and disingenuous policy interests such as allegedly fostering greater public trust and greater transparency in agency decisions.

The Proposed Rule also conflicts with specific language in § 7415 requiring an endangerment finding notification,

[w]henver the Administrator, upon receipt of reports, surveys or studies from any duly constituted international agency has reason to believe that any air pollutant or pollutants emitted in the United States cause or contribute to air pollution which may reasonably be

anticipated to endanger public health or welfare in a foreign country or whenever the Secretary of State requests him to do so with respect to such pollution which the Secretary of State alleges is of such a nature, the Administrator shall give formal notification thereof to the Governor of the State in which such emissions originate.

42 U.S.C. § 7415(a). This provision does not allow EPA to ignore any such “reports, surveys or studies,” if they show “reason to believe” that an air pollutant endangers public health. *Id.*

Similarly, § 7422 directs that EPA “shall review all available relevant information,” to determine whether to make an endangerment finding for certain radioactive pollutants (including source material, special nuclear material, and byproduct material), cadmium, arsenic and polycyclic organic matter. 42 U.S.C. § 7422(a) (emphasis added). This language expressly forecloses EPA’s refusal to consider available studies based on an arbitrary transparency screen. See also 42 U.S.C. § 7521(a)(1)-(a)(3)(B) (providing for EPA to promulgate revised standards for heavy duty trucks “[o]n the basis of information available to the Administrator concerning the effects of air pollutants emitted from heavy-duty vehicles or engines and from other sources of mobile source related pollutants on the public health and welfare, and taking costs into account”).

Finally, the CAA’s rulemaking provision for air standards and limitations does not allow EPA to ignore relevant scientific information, including information provided by Commenters, and likewise may not direct a court to ignore this data. Section 7607 of the CAA – which provides for judicial review of air rulemakings – prescribes more detailed rulemaking procedures than those provided by the APA for a designated list of air emission standards and rules. 42 U.S.C. § 7607(d)(1). These procedures protect the public’s right to notice and comment, in part, by requiring EPA to place into the docket and to consider and respond to all such comments. *Id.* § 7607(d)(4)(B)(i) (“Promptly upon receipt by the agency, all written comments and documentary information on the proposed rule received from any person for inclusion in the docket during the comment period shall be placed in the docket.”); *id.* § 7607(d)(5) (“In promulgating a rule to which this subsection applies (i) the Administrator shall allow any person to submit written comments, data, or documentary information; (ii) the Administrator shall give interested persons an opportunity for the oral presentation of data, views, or arguments, in addition to an opportunity to make written submissions . . .”); *id.* § 7607(d)(6)(B) (“The promulgated rule shall also be accompanied by a response to each of the significant comments, criticisms, and new data submitted in written or oral presentations during the comment period.”).

EPA’s Proposed Rule contravenes these requirements and is therefore unlawful because it allows EPA to decide, before even receiving comments, that it will not consider or respond through regulatory action to any comments that submit scientific material for which underlying information is not disclosed. Under § 7607(d), EPA may not lawfully decide to ignore an entire class of science; if submitted by commenters as relevant, EPA must consider and respond in the context of the statutory test that applies to its rulemaking. Failure to do so is unlawful and arbitrary. *Id.* § 7607(d)(9).⁵¹²

⁵¹² Ignoring an entire class of science is also unlawful under the APA – which applies to all EPA rulemaking – as the APA likewise requires notice and comment and requires EPA to respond to all submitted comments. See 5 U.S.C. § 553. EPA has also promulgated rules specific to certain statutes that likewise require notice and comment as well as

Relatedly, for certain rules where recommendations are provided from scientific experts, § 7607 requires additional material to be placed into the docket, without EPA discretion. *Id.* § 7607(d)(3) (requiring a “statement” that “shall also set forth or summarize and provide a reference to any pertinent findings, recommendations, and comments by the Scientific Review Committee established under section 7409(d) of this title and the NAS, and, if the proposal differs in any important respect from any of these recommendations, an explanation of the reasons for such differences.”). EPA’s Proposed Rule unlawfully violates this provision because it would direct EPA to refuse to consider or discuss such information if based on studies for which underlying data were not disclosed.

More generally, EPA may not attempt to restrict, before a rulemaking has even begun, the type of information it will consider in that rulemaking. Doing so impinges on the federal courts’ authority to determine what scientific evidence is relevant to application of CAA requirements in rulemakings. Pursuant to § 7607, the relevant court of appeals, and most frequently the D.C. Circuit, has jurisdiction to consider a petition for review of an EPA air rule. 42 U.S.C. § 7607(b). This grant of jurisdiction includes a grant allowing the court to decide what record material is relevant. *Id.*; see also *id.* § 7607(c). Notably, the court rules provide that the record on review of an agency order or regulation must include, *inter alia*, “the pleadings, evidence, and other parts of the proceedings before the agency.” D.C. Cir. R. 16 (“If necessary, the court may direct that a supplemental record be prepared and filed.”); see also Fed. R. App. P. 16. Similarly, the Federal Rules of Evidence require courts, not EPA or any other federal agency, to determine what evidence is “relevant” and “admissible.” See, *e.g.*, Fed. R. Evid. 401402 (allowing courts, and Congress by statute, but not federal agencies, to prescribe rules of evidence and determine admissibility of evidence and expert testimony).⁵¹³ Scientific information submitted by commenters undoubtedly qualifies as “evidence” that the court must consider, even if EPA refuses to do so.⁵¹⁴ EPA may not lawfully prevent submission of such evidence, or attempt to exclude it from a rulemaking record. *Id.*⁵¹⁵

Where EPA previously attempted to restrict or change the statutory test and authority granted to

consideration of and responses to those comments by EPA. See, *e.g.*, 40 C.F.R. § 25.3 (rulemaking under the CWA, SDWA, and RCRA require “public participation,” including “providing access to the decision-making process, seeking input from and conducting dialogue with the public, assimilating public viewpoints and preferences, and demonstrating that those viewpoints and preferences have been considered by the decision-making official”). Thus, for the same reason the Proposed Rule violates the CAA’s rulemaking provision, so too does it violate the APA and a number of other statutes that EPA is responsible for implementing.

⁵¹³ “Relevant evidence is admissible unless any of the following provides otherwise: The United States Constitution; a federal statute; these rules; or other rules prescribed by the Supreme Court.” Fed. R. Evid. 402. “A witness who is qualified as an expert by knowledge, skill, experience, training, or education may testify in the form of an opinion or otherwise if: (a) the expert’s scientific, technical, or other specialized knowledge will help the trier of fact to understand the evidence or to determine a fact in issue; (b) the testimony is based on sufficient facts or data; (c) the testimony is the product of reliable principles and methods; and (d) the expert has reliably applied the principles and methods to the facts of the case.” Fed. R. Evid. 702; See also, *Daubert v. Merrell Dow Pharm., Inc.*, 509 U.S. 579 (1993).

⁵¹⁴ Courts have repeatedly allowed the use of certain health studies as proof of harm from air pollution even though their underlying data are not publicly disclosed. See, *e.g.*, *Battery Recyclers*, 604 F.3d at 623.

⁵¹⁵ Not only does this apply to appeals of decisions under the Clean Air Act, but it also applies more generally to any agency rulemaking decision arising out of any statute under EPA’s authority that is appealed to an appellate court where the Federal Rules of Appellate Procedure and Federal Rules of Evidence apply.

courts to evaluate CAA cases, the D.C. Circuit rejected that as unlawful and outside of the bounds of EPA's authority. *Nat. Res. Def. Council v. EPA*, 749 F.3d 1055, 1062 (D.C. Cir. 2014) (vacating affirmative defense to civil penalties because it changed the standard set by statute for court's discretion in enforcement cases, and thus violated § 7604 and § 7413). For this reason, too, the Proposed Rule is invalid.

Comment [6112-1626]: Commenter (6137) contends that the EPA's Proposal is also deficient because it fails to follow particular procedural requirements under the CAA that are legally required for EPA to issue certain types of rules. Specifically, the CAA requires that the CASAC complete a review of air quality criteria and the NAAQS every five years. 42 U.S.C. § 7409(d)(2)(B). Because the Proposed Rule aims to "preclude [the Agency] from using [nonpublic] data in future regulatory actions," it would impact the CASAC's review of air quality criteria. 83 Fed. Reg. at 18,769, n.3. Accordingly, EPA was required to follow the path prescribed by the CAA – including submission of the proposed rule to CASAC for review, allowing CASAC to provide recommendations to the Administrator, and then requiring the Administrator to include a statement regarding the recommendations made by CASAC in the Proposed Rule. 42 U.S.C. §§ 7409(d)(2)(B), 7607(d)(3); see also 42 U.S.C. § 7607(b), (d). Yet, there can be no dispute that none of these steps were taken before issuance of the Proposed Rule.

Comment [6112-2470]: Commenter (6137) asserts that it would be irrational and impracticable to require EPA to seek out the underlying data for, and demand separate peer review of, all data and models the Agency uses for purposes of characterizing the quantitative relationship between dose or exposure and magnitude of a predicted health or environmental impact. For instance, in the last ozone NAAQS review, EPA reviewed more than 4,000 studies and references for the ISA, and cited more than 2,200 in the final ISA. See EPA, Health and Environmental Research Online, ISA Ozone (2013) (last updated July 2, 2018), https://hero.epa.gov/hero/index.cfm/project/page/project_id/1628. It is neither practicable nor necessary for EPA to demand production of underlying data from thousands or even hundreds of studies, and to require new peer reviews of each. EPA cannot construe the statute in a way that would render it impossible to complete the review and revision of the NAAQS that Congress mandated.

EPA further tries to justify the Proposed Rule as a way to ensure the Agency is not arbitrary and capricious in its conclusions. But as previously noted, the D.C. Circuit has twice rejected the notion that EPA must obtain and disclose data underlying the studies it relies on in NAAQS development.

Comment [6112-3473]: Commenter (6137) states that, to the extent EPA suggests the Rule may be applied retroactively, there is simply no basis for doing so. It is well-established that an agency cannot apply a rule retroactively absent clear congressional intention for such application. *E.g., Sierra Club v. Whitman*, 285 F.3d 63, 68 (D.C. Cir. 2002) (referring to "unusual ability to implement rules retroactively"); *Bowen v. Georgetown Univ. Hospital*, 488 U.S. 204, 208 (1988) ("Retroactivity is not favored in the law. Thus, congressional enactments and administrative rules will not be construed to have retroactive effect unless their language requires this result. By the same principle, a statutory grant of legislative rulemaking authority will not, as a general matter, be understood to encompass the power to promulgate retroactive

rules unless that power is conveyed by Congress in express terms.” (citations omitted)). EPA has not identified any such congressional intention in any of the statutes at issue, and thus retroactive application of the Rule would be unlawful.

Nor would the statutes upon which EPA relies support such an application. For example, as explained above, the CAA does not allow—and, as the D.C. Circuit has held, certainly does not require, *e.g.*, *American Trucking*, 283 F.3d at 372—applying the so-called transparency provisions of the Proposed Rule at all in rules subject to the procedural requirements of CAA § 307(d). Such rules include NAAQS. Further, far from suggesting that EPA could lawfully reopen long-settled NAAQS to apply a new and novel standard of review, the CAA requires EPA to review and revise air quality criteria and NAAQS at least every five years and to “promulgate such new standards as may be appropriate.” 42 U.S.C. § 7409(d)(1) (emphasis added). This carefully chosen language confirms that Congress did not intend for EPA to apply rules like the Proposed Rule to undo existing NAAQS, but instead intended for regular reviews of scientific information to result in new NAAQS.

Comment [6112-4453]: Commenter (6137) expresses that, in addition, in performing certain CAA and other rulemakings, EPA may not consider the economic implications of considering or excluding certain science at all. See Section IV.A of the commenters’ comment letter. Yet EPA’s failure to provide any lawful or rational justification for its costs/benefits statement for the Proposed Rule suggests that economic cost may have impermissibly played a role in its analysis. Had EPA focused on health rather than cost, EPA could not possibly find that the benefits of ignoring health science outweigh the costs for public health rulemakings.

Comment [6116-2627]: Commenter (6141) states that, most importantly, the CAA and other major federal environmental statutes provide EPA with broad authority to establish procedures, requirements, and criteria for adopting rules, regulations, and policies for how the Agency adopts new regulations, rules, and guidance. For example, section 301(a) of the CAA provides the EPA Administrator with broad authority to establish regulations “as are necessary to carry out ... the functions” under the CAA, while section 307(d) provides extensive authority on the manner in which EPA may conducting notice and comment rulemakings, including provisions for ensuring a robust rulemaking record and adequate opportunities for public participation.⁵¹⁶

Comment [6118-1681]: Commenter (6143) states that the EPA has issued its proposed rule on Strengthening Transparency in Regulatory Science pursuant to its authority under several environmental statutes that that it implements, including the CAA; CWA; SDWA; RCRA;

⁵¹⁶ As a general matter, CAA section 307(d) imposes more stringent transparency requirements for public notice and comment than those requirements imposed under section 553 of the APA. See CAA section 307(d)(3) (providing that notice of proposed rulemaking shall not only comply with the public notice requirements of APA section 553(b), but also be “accompanied by a statement of its basis and purpose” which shall include “the factual data on which the proposed rule is based,” “the methodology used in obtaining the data and in analyzing the data,” and “the major legal interpretations and policy considerations underlying the proposed rule”). See also, *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 519 (D.C. Cir. 1983) (stating that CAA § 307(d)(3) “requires a much more detailed notice of rulemaking” than does the APA); *Union Oil Co. of Cal. v. EPA*, 821 F.2d 678,681-82 (D.C. Cir. 1987) (noting that the CAA establishes “new procedural requirements for EPA rulemaking” that are “more stringent than those previously applicable under the Administrative Procedure Act,” including a requirement that “EPA . . . establish a detailed ‘rulemaking docket’ that . . . must provide the entire basis for the final rule”).

CERCLA; EPCRA; FIFRA; and TSCA.⁵¹⁷ This proposed action is fully consistent with the authorities and objectives laid out in those statutes. EPA must ensure that any final action it takes on this proposal continues to respect the balance reflected in those statutes between sound, transparent science, and legitimate privacy interests.

Comment [6119-1360]: Commenter (6144) states that the CAA has requirements to update pollution standards that provide for an “adequate margin of safety” to protect public health.⁵¹⁸ This determination can only be reliably made using the best available science. This proposal would, however, prevent EPA from using the best available information to set science-based pollution standards that would provide for an adequate margin of safety because the proposal excludes studies where the raw data and other underlying information cannot be made public for good reason. EPA should not cite the CAA as an appropriate source of statutory authority. Further, the CAA encourages a very close partnership with the NAS and other independent scientific institutions. When EPA is considering a proposal to reinterpret how it uses science in regulatory decisions, it should first and foremost consider comments from and engage with NAS and similar bodies, before moving forward in such a rushed manner. If EPA is arguing that it derives its authority from statutes like the CAA, it should only do so after consultation with independent scientific bodies and significant stakeholder engagement.

Comment [6128-2225]: Commenter (6153) notes that the CAA requires that EPA set NAAQS to protect the public health, and to do so with an adequate margin of safety.⁵¹⁹ NAAQS must be based on air quality criteria that “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air.”⁵²⁰ EPA must comprehensively consider the state of scientific knowledge,⁵²¹ and set standards to “protect individuals who are particularly sensitive to the effects of pollution.”⁵²² These susceptible groups include children; the elderly; and those with heart disease, lung disease, or asthma. Recently, Patricia Koman and colleagues have suggested that pregnant women should be considered an at-risk population due to physiological changes, noting, “Women with preexisting conditions, women experiencing poverty, and groups that suffer systematic discrimination may be particularly susceptible to cardiac effects of air pollutants during pregnancy.”⁵²³

Comment [6149-2755]: Commenter (6174) contends that there is no basis in existing bedrock environmental laws that authorizes EPA to limit science considered in rulemaking processes. EPA cites several key laws as a justification for this current proposal to limit or constrain the science it can consider. Nowhere in the cited statutes is there any basis for demanding access to raw data, nor does this relate sensibly to any definition of best available science. Rather it

undermines the use of best available science as called for in numerous environmental statutes including the CAA. Further, there is no basis in the statutes for politically appointed administrators to choose which science will be considered and which may not be.

The CAA, for example, has requirements to update pollution standards that provide for an adequate margin of safety for public health. This determination can only be reliably made using the best available science. However, this proposal would prevent EPA from using the best available information to set science-based pollution standards that would provide for an adequate margin of safety. EPA should not cite the CAA as an appropriate source of statutory authority.

In sum, there is no statutory authority for EPA to rely on to censor or constrain science. Indeed, quite the opposite. Further, such an effort would only serve to undermine EPA's essential role.

Comment [6152-637]: Commenter (6122) states that the proposed rule is not based on any valid statutory authority and is arbitrary and capricious.

EPA cites multiple statutory provisions in an attempt to support the proposed rule that it believes authorize this type of rulemaking, “including provisions providing general authority to promulgate regulations necessary to carry out the Agency’s functions under these statutes and provisions specifically addressing the Agency’s conducting of and reliance on scientific activity to inform those functions . . .”⁵²⁴ None of the specific statutory provisions provided by EPA provide specific authority for EPA to fundamentally rework the foundational processes it uses to assess and include/reject science. Indeed, if such authority existed, one would have expected EPA to have discovered this authority many decades earlier. Instead, EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, “Congress...does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes.”⁵²⁵ And if this is true, neither can the EPA alter the fundamental details of all of its regulatory schemes based on such vague provisions of law. We review each of the provisions listed by EPA, none of which discuss transparency, dose response, pivotal regulatory science, benefit-cost calculation, or changing “agency culture,” the stated goals of this rulemaking.

Section 103 of the CAA directs the EPA to “conduct, and promote the coordination and acceleration of, research, investigations, experiments, demonstrations, surveys and studies” on air pollution.⁵²⁶ Curtailing the use of science based on arbitrary notions of transparency does the opposite of what Section 103 requires.

Section 301(a) of the CAA gives the Administrator authority to “prescribe such regulations as are necessary to carry out his functions” relating to the CAA.⁵²⁷ This catch-all provision certainly provides the authority to prescribe regulations, but EPA has not provided a single rationale

⁵²⁴ Proposed rule at 18769.

⁵²⁵ *Whitman v. American Trucking Assns., Inc.*, 531 US 457 (2001).

⁵²⁶ 42 U.S.C. § 7403.

⁵²⁷ 42 U.S.C. § 7601(a).

explaining how the proposed rule is “necessary” to the carrying out functions under the CAA.

Comment [6155-632]: Commenter (6125) notes that Congress first established the legal standards that NAAQS must meet in the 1970 CAA. EPA must establish primary and secondary NAAQS for air pollutants, “emission of which ... cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare”. CAA section 108 (a)(1)(A). For each such pollutant, the law requires NAAQS not just to “protect the public health” but to do so “with an adequate margin of safety.” CAA § 109(b)(1) (emphasis added). In setting these standards, EPA cannot consider the costs of meeting them, see *Whitman v. American Trucking*, 531 U.S. 457, 464-71 (2001) (Scalia, J.) but must instead comprehensively consider the state of scientific knowledge. To make sure this happens, Congress required NAAQS to be based on “air quality criteria,” CAA § 109 (b), which must “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air.” CAA §108(a)(2) (emphasis added). The Supreme Court agrees that NAAQS must be based on “published air quality criteria that reflect the latest scientific knowledge.” *Whitman*, supra, at 457. Accord, *State of Mississippi v. EPA*, 744 F. 3d. 1344, 1346 (D.C. Cir. 2013).

Air quality criteria must include information on “variable factors...which of themselves or in combination with other factors may alter the effects on public health or welfare of such air pollutant”; the types of air pollutants which ... may interact with such pollutant to prove an adverse effect”; and “any known or anticipated adverse effects on welfare.” CAA section 108 (a)(2) (A)-(C). To make sure that EPA based its decisions on this latest useful science, in 1997 Congress also required EPA to appoint a scientific review committee – the CASAC -- to review the scientific information to be embodied in the air quality criteria and used to determine NAAQS. CAA § 109(d).

These statutory provisions originated in the 1970 Senate version of the CAA. The Senate Report on them stated that: “Margins of safety are essential to any health-related environmental standards if a reasonable degree of protection is to be provided against hazards which research has not yet identified” Library of Congress. Environmental Policy Division, (197480). A legislative history of the Clean Air Amendments of 1970, together with a section-by-section index. Washington: U.S. Govt. Print. Off. at p. 410 (emphasis added). The courts agree. See, e.g. *American Trucking Association v. EPA* (ATA III), 283 F.3d. at 369 (D.C. Cir. 2002).

EPA could not obey these statutory commands unless it considered (1) all knowledge that met the standards of quality observed by the scientific community to establish health effects of pollution; (2) knowledge that, though it might not meet these standards, was nevertheless “useful in indicating” these effects or pointing to “hazards which research has not yet identified;” and (3) all the knowledge regarding the factors which may result in these pollutants’ synergistic effects on public health and welfare.

Since the NAAQS provisions were enacted in 1970, EPA has conducted many NAAQS rulemakings. The agency does not establish per se, a priori rules regarding study inclusion or exclusion, but rather evaluates each of the individual studies — and there are thousands typically evaluated for each NAAQS review — on its merits based on reasoned criteria. While details of

the development and review of the criteria and standards have evolved, in practice, over the last four decades, EPA has endeavored to include all relevant peer reviewed scientific studies in the process, even searching out relevant newer literature to be sure that what is considered in a regulatory context is comprehensive.⁵²⁸ During this period, EPA has included tens of thousands of peer reviewed studies of health effects, exposure, and atmospheric interactions, and monitoring in reviews of criteria and standards.

A requirement that any study must be excluded from consideration unless the raw data and full methodologies are made available for each of them is both impractical and inconsistent with the legislative mandate and EPA's practice over the last 40 years. Reasoned criteria that EPA has typically applied include:

- Are the study populations, subjects, or animal models adequately selected, and are they sufficiently well-defined to allow for meaningful comparisons between study or exposure groups?
- Are the statistical analyses appropriate, properly performed, and properly interpreted?
- Are likely covariates adequately controlled or taken into account in the study design and statistical analysis?
- Are the air quality data, exposure, or dose metrics of adequate quality and sufficiently representative of information regarding ambient conditions?
- Are the health, ecological or welfare effect measurements meaningful, valid, and reliable?
- Do the analytical methods provide adequate sensitivity and precision to support conclusions?⁵²⁹

⁵²⁸ See, e.g. 28 EPA (2012). Provisional Assessment of Recent Studies on Health Effects of Particulate Matter Exposures. EPA/600R-12/056F. National Center for Environmental Assessment RTP Division. Office of Research and Development. Research Triangle Park, NC. December 2012.
<https://www3.epa.gov/ttn/naaqs/standards/pm/data/20121213psa.pdf>

⁵²⁹ Figure II, Illustration of processes for literature search and study selection used for development of ISAs, Integrated Science Assessment for Ozone, EPA 600/R-10/076F (February 2013). The ISA explains in detail "the initial step in this process is publication of a call for information in the *Federal Register* that invites the public to provide information relevant to the assessment, such as new or recent publications on health or welfare effects of the pollutant, or from atmospheric and exposure sciences fields. EPA maintains an ongoing literature search process for identification of relevant scientific studies published since the last review of the NAAQS. Search strategies are designed for pollutants and scientific disciplines and iteratively modified to optimize identification of pertinent publications. Papers are identified for inclusion in several additional ways: specialized searches on specific topics; independent review of tables of contents for journals in which relevant papers may be published; independent identification of relevant literature by expert scientists; review of citations in previous assessments and identification by the public and the Clean Air Scientific Advisory Committee (CASAC) during the external review process. Studies that have undergone scientific peer review and have been published or accepted for publication and reports that have undergone review are considered for inclusion in the ISA. Analyses conducted by EPA using publicly available data are also considered for inclusion in the ISA. All relevant epidemiologic, controlled human exposure, toxicological, and ecological and welfare effects studies published since the last review are considered, including those related to exposure-response relationships, mode(s) of action (MOA), and potentially at-risk populations and life stages. Studies on atmospheric chemistry, environmental fate and transport, dosimetry, toxicokinetics and exposure are also considered for inclusion in the document, as well as analyses of air quality and emissions data. References that were considered for inclusion in a specific ISA can be found using the HERO website (<http://hero.epa.gov>) ." Id. at 1-11.

Thus a science regulation that applies to the NAAQS is unlawful unless EPA can show that the new standard can be established and implemented consistent with the applicable statutory requirements, including those requiring the use of “scientific knowledge” and specifying how to use it. This proposal has neither acknowledged that such requirements exist nor explained how it can, under the regulation, produce scientific information and rulemaking records meeting them, and there is nothing in the record to demonstrate that it can. Thus, contrary to the implicit suggestion in the proposal that EPA is working with a blank slate when it puts a unique spin on science under the CAA, it is entering a field where Congress has provided expansive directives. Moreover, the agency and the congressionally mandated CASAC have long followed an inclusive approach to selecting and evaluating the relevant scientific literature, consistent with these directives.

Automatic disclosure of data underlying scientific studies, regardless of the obstacles, has never been a precondition to EPA consideration of those studies in setting NAAQS. In two cases cited in the proposal, plaintiffs challenged rules on the basis that there was no public access to underlying data. In each case, EPA declined to provide the data, and in each case, the court affirmed that denial, and endorsed EPA’s reasoning in doing so.⁵³⁰

Comment [6155-665]: Commenter (6125) states that even if the per se rule could satisfy the substantive requirements of the NAAQS—which it cannot—the proposal fails utterly to comply with procedural requirements for establishing NAAQS, and in particular, for amending the air quality criteria on which the NAAQS are based. The law requires EPA to set NAAQS (as well as virtually every other significant CAA rule) through a structured dialogue with the public. CAA § 307(d)(3). First, EPA must issue a proposal setting out the “factual data” relied on the “methodology used in obtaining the data and in analyzing the data,” and the major legal and policy considerations underlying the proposal. The public can then comment on every aspect of this proposal and can submit its own data. When EPA takes final action, it must respond, “to each of the significant comments, criticisms, or new data submitted.” *Ib.*

These provisions largely mirror the requirements of the APA though they are more elaborately stated. Other specific provisions, however, go well beyond APA requirements. Specifically, any change in criteria documents must by law be reviewed by CASAC. CAA §109(d). In addition, criteria documents must also be reviewed by EPA’s SAB under 42 USC 42 USC section §4365

⁵³⁰ Specifically, in *American Trucking Ass’n v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002) the court said: This brings us finally to Petitioners’ argument that EPA “denied the public essential procedural rights” by failing to obtain and make public the data underlying certain “key studies” relating to the “confounder” issue. Claiming neither that they were unable to obtain the studies, nor that the studies were improperly published or peer reviewed, Petitioners instead urge us to impose a general requirement that EPA obtain and publicize the data underlying published studies on which the Agency relies. The Clean Air Act imposes no such obligation; it merely directs EPA to include in any notice of proposed rulemaking “data, information, and documents ... on which the proposed rule relies.” 42 U.S.C. § 7607(d)(3) (emphasis added). Here, EPA explained that it “relied on the scientific studies cited in the rulemaking record, rather than on the raw data underlying” those studies. Particulate Matter NAAQS, 62 Fed. Reg. at 38,689. In addition, Agency counsel advised us at oral argument that on those few occasions when EPA requested underlying data from an investigator, the Agency included those data in the record, Tr. of Oral Arg. at 74-75. More generally, we agree with EPA that requiring agencies to obtain and publicize the data underlying all studies on which they rely “would be impractical and unnecessary.” Particulate Matter NAAQS, 62 Fed. Reg. at 38,689. ATA III at 372

(c)(1) (the Environmental Research Development Demonstration Authorization Act).

EPA's proposal would specifically and indisputably amend the air quality criteria, adopted pursuant to section 108 (b) of the CAA, for PM and lead. See proposed rule footnote 3 final sentence which states that the proposed rule would "preclude" using the Lanphear study⁵³¹ which is part of the criteria for the NAAQS for lead, and the Harvard Six Cities and American Cancer Society II studies which are part of the air quality criteria for the PM NAAQS, and presumably a number of informative studies that update and expand these original works by adding more recently collected health and air pollution information. For these reasons, the statement at proposal 18773 saying the rule "does not establish an environmental health or safety standard" is false.

The proposal furthermore affects the current review of the PM NAAQS by proposing to regulate -- in fact, dictate -- the type of science that can be used in that review, and removing studies which were part of the air quality criteria in the past reviews, which would again directly alter the air quality criteria. Air quality criteria cannot be amended without review by CASAC. See CAA §109 (d)(2)(B). EPA consequently must submit its proposal to CASAC for its review, following all procedural requirements for public meeting and deliberations in doing so. CASAC must then submit its recommendations to the Administrator (see §109 (d)(2)(B) final clause), and the Administrator must consider these recommendations and provide a reasonable explanation for any actions that deviate significantly from those recommendations (CAA §307(d)(3)).

EPA cannot proceed with this action until these requirements are satisfied. And EPA cannot short-circuit the role the law assigns CASAC by using this type of broad rulemaking, effectively dictating how science can be used in future rule makings, to restrict CASAC's authority.

The proposal would amend the substantive standards for decision-making for a host of actions covered by CAA section 307 (d), among them the NAAQS (§307 (d)(1)(A)), residual risk determinations for HAP (§307 (d)(1)(C)), standards for mobile source air toxics (§307 (d)(1)(K)), and residual risk standards for municipal solid waste combustors (§307(d)(1)(D)). Therefore, CAA §307 (d)(5)(ii) and (iv) require the Administrator to hold a public hearing on his proposal and to keep the record open for an additional thirty days, "to provide an opportunity for submission of rebuttal and supplementary information."

EPA should have submitted its proposal to the SAB pursuant to the requirements of 42 USC § 4365 (c)(1) (the Environmental Research Development Demonstration Authorization Act), which requires the Administrator to submit to the SAB any "proposed criteria document, standard, limitation, or regulation, together with relevant scientific and technical information in the possession of the Environmental Protection Agency (EPA) ... on which the proposed action is based" at the time it provides that proposal to another agency of the government for formal review. The SAB is then to review and comment on the proposal, which the Administrator is to consider, although the Administrator is not required to obtain Science Advisory Board approval for any final action. See H. Rep. No. 95-722 (95th Cong. 1st Sess. (1977) (Conference Report).

⁵³¹ Bruce P. Lanphear et. al, Lead-Contaminated House Dust and Urban Children's Blood Lead Levels, 86 Am J Public Health 1416 (1996). <https://ajph.aphapublications.org/doi/pdfplus/10.2105/AJPH.86.10.1416>

EPA and the SAB have adopted procedures to implement this statutory requirement, whereby EPA provides SAB with a description (including a pertinent summary of potential issues of scientific concern) of planned major actions not yet proposed and the SAB determines, in a public forum, which of these actions merits its consideration and comment. See Memorandum of December 27, 2012, “Identifying EPA Planned Actions for Science Advisory Board Consideration of the Underlying Science” from Michael Goo, Assistant Administrator for Policy, Glenn Paulsen, EPA Science Advisor, and Vanessa Vu, SAB Office Director, and Memorandum of November 12, 2013 from SAB Chair James Mihelic to Members of the Chartered SAB and Liaisons. EPA has failed to comply with its statutory obligations and the requirements of its internal procedures.

In short, in its evident zeal to advance purported “transparency,” EPA has thus ignored a variety of statutory and regulatory requirements which provide actual transparency to agency rulemakings, including the CAA’s scientific review process.

Comment [6155-2630]: Commenter (6125) states that it is clear from even a brief look that these provisions require EPA to consider all the best available science, without authorizing, or even mentioning any of the per se restrictions based on “transparency” that EPA has proposed to use as a universal overriding rule. For these reasons, EPA must justify its proposal as a proper exercise of its authority under each of the statutory provisions whose operation it would affect - provisions that the agency does not even cite. It is the job of the proposer, not the commenters, to survey these provisions and provide the needed justification.

In several of the listed statutes Congress has explicitly told EPA how to use science in decision-making. As an example, the commenter notes that CAA 108(a)(2) specifies that “air quality criteria for an air pollutant shall accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air.”

These provisions, and others, all use mandatory language directing EPA to use reliable and relevant scientific information -- and further specify how to do so. They all direct that decisions regarding protection of public health be based on the full range of relevant scientific information, in some cases specifying how to identify what information to use. None of them give EPA discretion to ignore such information for any of the reasons set forth in the proposal.

Comment [6161-1504]: Commenter (6131) notes that the EPA itself seems to question whether it has the authority to promulgate this rule. The FR notice asks commenters to provide information on what areas of the CAA they feel may demonstrate this type of authority. The EPA should have a solid foundation before it proposes rules and should not have to seek answers for questions about its own authority.

Comment [6163-1102]: Commenter (6133) notes that the EPA cites 42 U.S.C. § 7601(a) of the CAA as one basis for the Proposal. But that section merely authorizes the Administrator to “prescribe such regulations as are necessary to carry out his functions under this chapter.” The courts have made clear that “EPA cannot rely on its gap-filling authority to supplement the CAA’s provisions when Congress has not left the agency a gap to fill.” *NRDC v. EPA.*, 749 F.3d

1055, 1064 (D.C. Cir. 2014); see also *American Petroleum Institute v. EPA*, 52 F.3d 1113, 1119 (D.C. Cir. 1995) (“the general grant of rulemaking power to EPA cannot trump specific portions of the CAA”); *NRDC v. Reilly*, 976 F.2d 36, 41 (D.C. Cir. 1992) (EPA cannot use its general rulemaking authority as justification for adding to a statutorily specified list); *Sierra Club v. EPA*, 719 F.2d 436, 453 (D.C. Cir. 1983) (same); *Gonzales v. Oregon*, 546 U.S. 243, 264–65 (2006) (“It would go . . . against the plain language of the text to treat a delegation for the ‘execution’ of [the Attorney General’s] functions as a further delegation to define other functions well beyond the statute’s specific grants of authority.”). Here, not only is there no statutory gap to fill, as explained further below, the Proposal is in direct conflict with other provisions of the Act. EPA cannot rely on 42 U.S.C. § 7601(a) to support this rule.

EPA also cites 42 U.S.C. § 7403, which requires the Administrator to establish a national research and development program for air pollution, among other things. EPA does not state specifically which of the many subsections it believes authorizes this proposed rule. Thus, the citation fails to provide sufficient notice for the public to comment on the proposed rule.

Nothing in the Proposal establishes or even purports to establish the type of national research and development program for air pollution discussed in subsection (a). But that subsection is nonetheless revealing about congressional intent concerning “studies relating to the causes, effects (including health and welfare effects) extent, prevention, and control of air pollution.” 42 U.S.C. § 7403(a)(1). There is no indication that Congress intended to allow EPA to ignore or refuse to consider studies on the health and welfare effects of air pollution only if raw data or ‘regulatory science underlying EPA’s actions [were] publicly available in a manner sufficient for independent validation.’ See 83 Fed. Reg. at 18,773 (proposed §§ 30.1–30.3). Indeed, the absence of any such congressional conditions or criteria makes it all the more obvious that EPA invented and added those criteria and conditions as a matter of its own policy preferences, contrary to the Act. This EPA may not do.

Subsection (b) authorizes EPA to collect and make available information about such research, but nothing in that subsection allows EPA to restrict which types of data it considers in regulatory decisions. Nor does subsection (b) draw any distinction between dose-response data and other types of data. Again, the absence of any such congressional distinction makes it all the more obvious that EPA invented and added that distinction as a matter of its own policy preferences, contrary to the Act. This EPA may not do. None of the other subsections in 42 U.S.C. § 7403 address this issue either. There is no support in the CAA for the Proposal.

Comment [6163-1128]: Commenter (6133) notes that in CAA section 101(b), Congress directs EPA “to protect and enhance the quality of the Nation’s air resources so as to promote the public health and welfare and the productive capacity of its population.” 42 U.S.C. § 7401(b). The Proposal prevents EPA from doing so by blocking the agency from considering information that also is the best available, peer-reviewed, independent, credible science that could persuade or cause the agency to better protect the “public health and welfare and the productive capacity of [the Nation’s] population.” In this way, the Proposal thwarts the leading purpose of the CAA. CAA section 101 shows the Proposal is arbitrary and capricious and an abuse of EPA’s discretion.

CAA section 103(a)(1) directs EPA to “conduct, and promote the coordination and acceleration of, research, investigations, experiments, demonstrations, surveys, and studies relating to the causes, effects (including health and welfare effects), extent, prevention, and control of air pollution.” 42 U.S.C. § 7403(a)(1). There is nothing in these congressional directives restricting these tasks (“research, investigations, experiments, demonstrations, surveys, and studies”) to materials based only on data that are “publicly available in a manner sufficient for independent validation.” 83 Fed. Reg. at 18,773/2 (proposed § 30.1). Nor is there any authorization in these congressional directives to distinguish between “research, investigations, experiments, demonstrations, surveys, and studies” that involves “dose response data and models,” and science that does not, for imposing regulatory restrictions on what science EPA must consider. The absence of any such congressional restrictions, authorizations or distinctions makes it clear that EPA invented and added the Proposal’s limitations and conditions as a matter of its own policy preferences, contrary to the Act. This EPA may not do. CAA section 103(a)(1) shows that the Proposal is arbitrary and capricious and an abuse of EPA’s discretion.

CAA subsection 103(a)(4) directs EPA to “establish technical advisory committees composed of recognized experts in various aspects of air pollution to assist in the examination and evaluation of research progress and proposals and to avoid duplication of research.” 42 U.S.C. § 7403(a)(4). CAA section 103(a)(5) directs EPA to “conduct and promote coordination and acceleration of training for individuals relating to the causes, effects, extent, prevention, and control of air pollution.” Id. § 7403(a)(5). There is nothing in these congressional directives restricting these tasks to materials based only on data that are “publicly available in a manner sufficient for independent validation.” 83 Fed. Reg. at 18,773/2 (proposed § 30.1). Nor is there any authorization in these congressional directives to distinguish between research or science that involves “dose response data and models” on the one hand, and science that does not, on the other hand, for imposing regulatory restrictions on what science EPA must consider. The absence of any such congressional restrictions, authorizations, or distinctions makes it clear that EPA invented and added the Proposal’s limitations and conditions as a matter of its own policy preferences, contrary to the Act. This EPA may not do. CAA subsections 103(a)(4) & (5) show that the Proposal is arbitrary and capricious and an abuse of EPA’s discretion.

CAA section 103(b) is significantly titled “Authorized Activities of Administrator in Establishing Research and Development Program.” 42 U.S.C. § 7403(b) (emphasis added). It states that:

In carrying out the provisions of the preceding subsection the Administrator is authorized to—

- (1) collect and make available, through publications and other appropriate means, the results of and other information, including appropriate recommendations by him in connection therewith, pertaining to such research and other activities;
- (2) cooperate with other Federal departments and agencies, with air pollution control agencies, with other public and private agencies, institutions, and organizations, and with any industries involved, in the preparation and conduct of such research and other activities;

- (3) make grants to air pollution control agencies, to other public or nonprofit private agencies, institutions, and organizations, and to individuals, for purposes stated in subsection (a)(1) of this section;
- (4) contract with public or private agencies, institutions, and organizations, and with individuals, without regard to section 3324(a) and (b) of title 31 and section 6101 of title 41;
- (5) establish and maintain research fellowships, in the EPA and at public or nonprofit private educational institutions or research organizations;
- (6) collect and disseminate, in cooperation with other Federal departments and agencies, and with other public or private agencies, institutions, and organizations having related responsibilities, basic data on chemical, physical, and biological effects of varying air quality and other information pertaining to air pollution and the prevention and control thereof;
- (7) develop effective and practical processes, methods, and prototype devices for the prevention or control of air pollution; and
- (8) construct facilities, provide equipment, and employ staff as necessary to carry out this chapter.

Id. There is nothing in these congressional directives restricting these tasks, research or data to materials based only on data that are “publicly available in a manner sufficient for independent validation.” 83 Fed. Reg. at 18,773/2 (proposed § 30.1). Nor is there any authorization in these congressional directives to distinguish between research, science, data, or models that involves “dose response data and models” on the one hand, and science that does not, on the other hand, for imposing regulatory restrictions on what science EPA must consider. The absence of any such congressional restrictions, authorizations or distinctions makes it clear that EPA invented and added the Proposal’s limitations and conditions as a matter of its own policy preferences, contrary to the Act. This EPA may not do. CAA subsections 103(b) shows that the Proposal is arbitrary and capricious and an abuse of EPA’s discretion.

CAA section 103(d) addresses Environmental Health Effects Research:

- (1) The Administrator, in consultation with the Secretary of Health and Human Services (HHS), shall conduct a research program on the short-term and long-term effects of air pollutants, including wood smoke, on human health. In conducting such research program, the Administrator—
 - (A) shall conduct studies, including epidemiological, clinical, and laboratory and field studies, as necessary to identify and evaluate exposure to and effects of air pollutants on human health;
 - (B) may utilize, on a reimbursable basis, the facilities of existing Federal scientific

laboratories and research centers; and

(C) shall consult with other Federal agencies to ensure that similar research being conducted in other agencies is coordinated to avoid duplication.

42 U.S.C. § 7403(d).

There is nothing in these congressional directives restricting these tasks, research, studies, or data to materials based only on data that are “publicly available in a manner sufficient for independent validation.” 83 Fed. Reg. at 18,773/2 (proposed § 30.1). Nor is there any authorization in these congressional directives to distinguish between research, science, data, or models that involves “dose response data and models” on the one hand, and science that does not, on the other hand, for imposing regulatory restrictions on what science EPA must consider. The absence of any such congressional restrictions, authorizations, or distinctions makes it clear that EPA invented and added the Proposal’s limitations and conditions as a matter of its own policy preferences, contrary to the Act. This EPA may not do. CAA subsection 103(d) shows that the Proposal is arbitrary and capricious and an abuse of EPA’s discretion.

CAA subsection 103(d)(2) directs “[i]n conducting the research program under this subsection, the Administrator shall develop methods and techniques necessary to identify and assess the risks to human health from both routine and accidental exposures to individual air pollutants and combinations thereof.” 42 U.S.C. § 7403(d)(2). Subsection 103(d)(2) then says, “such research program shall include the following elements,” listing subsections (A)-(C). *Id.* Subsection 103(d)(2)(B) & (C) are especially relevant and revealing:

(B) An evaluation, within 12 months after November 15, 1990, of each of the HAP listed under section 7412(b) of this title, to decide, on the basis of available information, their relative priority for preparation of environmental health assessments pursuant to subparagraph (C). The evaluation shall be based on reasonably anticipated toxicity to humans and exposure factors such as frequency of occurrence as an air pollutant and volume of emissions in populated areas. Such evaluation shall be reviewed by the Interagency Task Force established pursuant to subparagraph (A).

(C) Preparation of environmental health assessments for each of the HAP referred to in subparagraph (B), beginning 6 months after the first meeting of the Interagency Task Force and to be completed within 96 months thereafter. No fewer than 24 assessments shall be completed and published annually. The assessments shall be prepared in accordance with guidelines developed by the Administrator in consultation with the Interagency Task Force and the SAB of the EPA. Each such assessment shall include—

(i) an examination, summary, and evaluation of available toxicological and epidemiological information for the pollutant to ascertain the levels of human exposure which pose a significant threat to human health and the associated acute, subacute, and chronic adverse health effects;

(ii) a determination of gaps in available information related to human health effects and

exposure levels; and

(iii) where appropriate, an identification of additional activities, including toxicological and inhalation testing, needed to identify the types or levels of exposure which may present significant risk of adverse health effects in humans."

42 U.S.C. § 7403(d)(2)(B) & (C) (emphases added).

There is nothing in these congressional directives restricting these tasks, research, studies, or data to materials based only on data that are "publicly available in a manner sufficient for independent validation." 83 Fed. Reg. at 18,773/2 (proposed § 30.1). Nor is there any authorization in these congressional directives to distinguish between research, science, data, or models that involves "dose response data and models" on the one hand, and science that does not, on the other hand, for imposing regulatory restrictions on what science EPA must consider. The absence of any such congressional restrictions, authorizations, or distinctions makes it clear that EPA invented and added the Proposal's limitations and conditions as a matter of its own policy preferences, contrary to the Act. This EPA may not do. CAA subsection 103(d)(2) shows that the Proposal is arbitrary and capricious and an abuse of EPA's discretion.

Equally damning for the Proposal, when Congress directs EPA to evaluate pollutants and their health effects, Congress uses broad and capacious terms:

- "on the basis of available information" (§ 103(d)(2)(B), 42 U.S.C. § 7403(d)(2)(B));
- "available toxicological and epidemiological information for the pollutant to ascertain the levels of human exposure which pose a significant threat to human health and the associated acute, subacute, and chronic adverse health effects" (§ 103(d)(2)(C)(i), 42 U.S.C. § 7403(d)(2)(C)(i)); and
- "available information related to human health effects and exposure levels" (§ 103(d)(2)(C)(ii), 42 U.S.C. § 7403(d)(2)(C)(ii)).

These instructions to EPA are prefaced with the mandatory language, "[s]uch research program shall include the following elements." (§ 103(d)(2), 42 U.S.C. § 7403(d)(2)). Congress went out of its way not to authorize EPA to ignore "available toxicological and epidemiological information" to ensure that the agency would be "ascertain[ing] the levels of human exposure which pose a significant threat to human health and the associated acute, subacute, and chronic adverse health effects." (§ 103(d)(2)(C)(i), 42 U.S.C. § 7403(d)(2)(C)(i)).

This shows clear congressional concern with all available science related to human health effects from air pollution—not some restricted, politicized subset of science where underlying, confidential data are "publicly available in a manner sufficient for independent validation." CAA subsection 103(d)(2) shows that the Proposal is arbitrary and capricious and an abuse of EPA's discretion.

When Congress directs EPA to conduct an ecosystem research program in subsection 103(e), Congress says that such program "shall include" "[e]valuation of risks to ecosystems exposed to air pollutants, including characterization of the causes and effects of chronic and episodic

exposures to air pollutants and determination of the reversibility of those effects.” 42 U.S.C. § 7403(e). Subsections (e)(3) -(e)(6) address other effects on water quality, crops, soils, and other elements of ecosystems.

There is nothing in these congressional directives restricting these tasks, research, studies, or data to materials based only on data that are “publicly available in a manner sufficient for independent validation.” 83 Fed. Reg. at 18,773/2 (proposed § 30.1). Nor is there any authorization in these congressional directives to distinguish between research, science, data, or models that involves “dose response data and models” on the one hand, and science that does not, on the other hand, for imposing regulatory restrictions on what science EPA must consider. The absence of any such congressional restrictions, authorizations, or distinctions makes it clear that EPA invented and added the Proposal’s limitations and conditions as a matter of its own policy preferences, contrary to the Act. This EPA may not do. CAA subsection 103(e) shows that the Proposal is arbitrary and capricious and an abuse of EPA’s discretion.

In section 108(a)(2) of the CAA, Congress required air quality criteria for air pollutants to “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air,” CAA § 108(a)(2), 42 U.S.C. § 7408(a)(2) (emphases added). In *American Trucking v. Whitman*, 531 U.S. at 457, the Supreme Court said that NAAQS must be based on “published air quality criteria that reflect the latest scientific knowledge.”

The Proposal violates these statutory requirements by prohibiting EPA from considering available science to discharge the agency’s statutory responsibility to “protect the public health,” with “an adequate margin of safety.” CAA § 109(b)(1), 42 U.S.C. § 7409(b)(1). The Proposal does this by subverting and supplanting the congressional criteria in CAA § 108(a)(2), 42 U.S.C. § 7408(a)(2) with a restrictive standard driven by whether raw data are “publicly available in a manner sufficient for independent validation,” 83 Fed. Reg. at 18,773/2 (proposed § 30.1).

With this unlawful maneuver, the Proposal prevents EPA from adopting air quality criteria that “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare.” CAA § 108(a)(2), 42 U.S.C. § 7408(a)(2) (emphases added). First, the Proposal thwarts the congressional directives for “accurate reflection” of the “latest scientific knowledge.” It does so by compelling or allowing EPA to ignore the “latest scientific knowledge,” and to fail to “accurately reflect” that science, if raw data are not “publicly available in a manner sufficient for independent validation.” 83 Fed. Reg. at 18,773/2 (proposed § 30.1).

Moreover, the Proposal thwarts the congressional directives for science that is “useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air.” CAA §108(a)(2), 42 U.S.C. § 7408(a)(2) (emphases added). It does so, again, by compelling or allowing EPA to ignore the “latest scientific knowledge,” and to fail to accurately reflect that science, if raw data are not “publicly available in a manner sufficient for independent validation.” 83 Fed. Reg. at 18,773/2 (proposed § 30.1).

Further, section 208 contains the mandatory term “shall”—which does not give the agency latitude. It does not matter if that “scientific knowledge” is “publicly available” in the way EPA contemplates in the Proposal, it must simply inform the effects of air pollution on public health or welfare. Further, *American Trucking* considered the requirements of this section and specifically concluded that “the CAA imposes no” “general requirement that EPA obtain and publicize the data underlying published studies on which the Agency relies.” 283 F.3d at 372.

In these statutory provisions, obviously there is no mention of the necessity, or even relevance, of raw data being “publicly available in a manner sufficient for independent validation” before EPA must consider studies based on that data. Equally plain, there is no authorization for EPA to fail to “accurately reflect” that science when issuing air quality criteria.

There is nothing in these congressional directives restricting EPA’s responsibilities, or the research, studies, or data it must consider, to materials based only on data that are “publicly available in a manner sufficient for independent validation.” 83 Fed. Reg. at 18,773/2 (proposed § 30.1). Nor is there any authorization in these congressional directives to distinguish between research, science, data, or models that involve “dose response data and models” on the one hand, and science that does not, on the other hand, for imposing regulatory restrictions on what science EPA must consider. The absence of any such congressional restrictions, authorizations, or distinctions makes it clear that EPA invented and added the Proposal’s limitations and conditions as a matter of its own policy preferences, contrary to the Act. This EPA may not do. CAA subsection 108(a) shows that the Proposal is arbitrary and capricious and an abuse of EPA’s discretion.

The Proposal also violates section 109 of the CAA and contravenes the Supreme Court decision in *American Trucking v. Whitman*. The Proposal’s conception of “pivotal regulatory science” turns on, among other things, “analyses that drive the magnitude of the benefit-cost calculation,” and “studies, models and analyses” that are “critical to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, risks and other impacts on which a final regulation is based.” 83 Fed. Reg. at 18,770/2; *id.* at 18,773/2 (proposed § 30.2 (dose response data and models)). CAA section 109(b)(1) requires EPA to promulgate or revise health-based NAAQS that are “requisite to protect the public health,” “allowing an adequate margin of safety.” 42 U.S.C. § 7409(b)(1).

As noted, in *American Trucking v. Whitman*, a unanimous Supreme Court said that NAAQS must be based on “published air quality criteria that reflect the latest scientific knowledge.” 531 U.S. at 457. Moreover, the Court held that CAA section “109(b), interpreted in its statutory and historical context and with appreciation for its importance to the CAA as a whole, unambiguously bars cost considerations from the NAAQS-setting process.” 531 U.S. at 471. The Court also squarely rejected arguments appealing to statutory language concerning “adverse public health, welfare, social, economic, or energy effects which may result from various strategies for attainment and maintenance” of NAAQS. The justices made clear such language and concerns have “no bearing upon whether cost considerations are to be taken into account in formulating the standards.” *Id.*

The Proposal violates CAA section 109(b)(1) and the governing Supreme Court interpretation in

American Trucking by purporting to allow the “magnitude of a benefit-cost calculation” and “quantified costs and benefits” to impact or govern (1) EPA’s consideration of peer-reviewed science relevant to reviewing, setting or revising health-based NAAQS; and (2) EPA’s review, revision or establishment of health-based NAAQS. This is unlawful.

CAA sections 109(b)(1), (2), & (c) require EPA to protect Americans’ “public health” with an adequate margin of safety, and America’s “welfare” from “any known or anticipated adverse effect.” 42 U.S.C. § 7409(b)(1), (2) & (c). The Proposal prevents EPA from doing so by blocking the agency from considering information that also is the best available, peer-reviewed, independent, credible science that could persuade or cause the agency to better protect Americans’ public health and welfare, based on the statutory criteria in section 109. In this way, the Proposal thwarts the central role and fundamental right to health-based air quality standards under the CAA. CAA section 109 shows the Proposal is arbitrary and capricious and an abuse of EPA’s discretion.

CAA section 111(a)(1) defines a standard of performance as:

a standard for emissions of air pollutants which reflects the degree of emission limitation achievable through the application of the best system of emission reduction which (taking into account the cost of achieving such reduction and any non-air quality health and environmental impact and energy requirements) the Administrator determines has been adequately demonstrated.” 42 U.S.C. 7411(a)(1).

There is nothing in these congressional directives restricting EPA’s establishment of “standards of performance,” or its determinations of “achievability” or “best system of emission reduction” or “adequate demonstration,” to information based only on data that are “publicly available in a manner sufficient for independent validation.” 83 Fed. Reg. at 18,773/2 (proposed § 30.1). Nor is there any authorization in these congressional directives to distinguish between research, science, data, or models involving “dose response data and models” on one hand, and science that does not, on the other hand, for imposing regulatory restrictions on what science EPA must consider.

EPA cannot fulfill the congressional directive to establish the “best system of emission reduction” if EPA is artificially and unlawfully restricting its consideration of data and information to those that are “publicly available in a manner sufficient for independent validation.” *Id.* Nor may EPA fulfill the “adequately demonstrated” directive if systems of emission reduction that have been adequately demonstrated require EPA to consider data, science, or information that are not “publicly available in a manner sufficient for independent validation.” *Id.*

CAA section 111(b)(1)(A) requires EPA to establish a list of stationary sources to be subject to section 111 standards of performance:

[The Administrator] shall include a category of sources in such list if in his judgment it causes, or contributes significantly to, air pollution which may reasonably be anticipated to endanger public health or welfare.

42 U.S.C. 7411(b)(1)(A) (emphasis added).

There is nothing in the Act restricting EPA's consideration of which categories of sources "may reasonably be anticipated to endanger public health or welfare" to information based only on data that are "publicly available in a manner sufficient for independent validation." 83 Fed. Reg. at 18,773/2 (proposed § 30.1). There is no indication of congressional intent that what "may reasonably be anticipated to endanger public health or welfare" may be modified or constrained by ignoring science and data concerning endangerment if that information is not "publicly available in a manner sufficient for independent validation."

The absence of any such congressional restrictions, authorizations, or distinctions concerning what EPA may consider makes it clear that EPA invented and added the Proposal's limitations and conditions as a matter of its own policy preferences, contrary to the Act. This EPA may not do. CAA subsections 111(a)(1) and 111(b)(1)(A) show that the Proposal is arbitrary and capricious and an abuse of EPA's discretion.

CAA section 112(b) provides a list of toxic air pollutants for which industrial sources must limit their emissions. The statute then directs the Administrator to periodically review that list of HAP and, where appropriate, revise this list by rule. In particular, the Administrator is directed to add pollutants which:

present, or may present, through inhalation or other routes of exposure, a threat of adverse human health effects (including, but not limited to, substances which are known to be, or may reasonably be anticipated to be, carcinogenic, mutagenic, teratogenic, neurotoxic, which cause reproductive dysfunction, or which are acutely or chronically toxic) or adverse environmental effects whether through ambient concentrations, bioaccumulation, deposition, or otherwise, but not including releases subject to regulation under subsection (r) as a result of emissions to the air. 42 U.S.C. § 7412(b)(2).

There is nothing in these congressional directives restricting EPA's establishment of this list nor of the pollutants that should be added to it based only on data that are "publicly available in a manner sufficient for independent validation." 83 Fed. Reg. at 18,773/2 (proposed § 30.1). Nor is there any authorization in these congressional directives to distinguish between research, science, data, or models involving "dose response data and models" on one hand, and science that does not, on the other hand, for imposing regulatory restrictions on what science EPA must consider.

EPA cannot fulfill the congressional directive to establish section 112(b)(2)'s pollutant list if the agency is artificially and unlawfully restricting its consideration of data and information to those that are "publicly available in a manner sufficient for independent validation." *Id.* Nor will EPA be able to fully analyze pollutants for inclusion on this list if determining inclusion would require EPA to consider data, science or information that are not "publicly available in a manner sufficient for independent validation." *Id.*

Similarly, Section 112(b)(3) lays out a petition process to add chemicals to the Section 112 list that similarly require the petitioner to submit to EPA proof that "the substance is an air pollutant and that emissions, ambient concentrations, bioaccumulation or deposition of the substance are

known to cause or may reasonably be anticipated to cause adverse effects to human health or adverse environmental effects.” 42 U.S.C. § 7412(b)(3)(B). Here, the straitjacket that the Proposal would place on this statutory language would similarly prevent the agency from carrying out its statutory directive.

Section 112(b)(3)(C) provides criteria for delisting pollutants from the list. This section would nonetheless be hamstrung if the agency were limited exclusively to data that are “publicly available in a manner sufficient for independent validation.” 83 Fed. Reg. at 18,773/2 (proposed § 30.1). Nor is there any authorization in the section’s congressional directives to distinguish between research, science, data, or models involving “dose response data and models” on one hand, and science that does not, on the other hand, for purposes of listing or delisting pollutants from section 112’s hazardous pollutant list.

Nearly every subsection of Section 112, including standards for major and area sources, reporting requirements, and accidental release provisions, touch on protecting “public health,” weighing “risks,” or assessing how “hazardous” a “substance” or “pollutant” may be. EPA cannot fulfill the congressional directives of any of these sections if the agency is artificially and unlawfully restricting its consideration of data and information to those that are “publicly available in a manner sufficient for independent validation.” *Id.* Nor will EPA be able to fully analyze risks to or impacts on human health and set section 112 standards accordingly if making such determinations would require EPA to consider data, science, or information that are not “publicly available in a manner sufficient for independent validation.” *Id.*

The absence of any such congressional restrictions, authorizations, or distinctions concerning what EPA may consider makes it clear that EPA invented and added the Proposal’s limitations and conditions as a matter of its own policy preferences, contrary to the Act. This EPA may not do. CAA section 112 makes exceedingly clear that the Proposal is arbitrary and capricious and an abuse of EPA’s discretion.

The sections listed above merely represent a sampling of some examples in Title 1 of the Act that exemplify the extent to which the Proposal is arbitrary, capricious, an abuse of EPA’s discretion, and a violation of clear congressional directives. The Act’s five other Titles are no different, and the list provided here is not exhaustive—the CAA is rife with examples of statutory language that the Proposal would distort with its adherence to data that are “publicly available in a manner sufficient for independent validation” 83 Fed. Reg. at 18,773/2 (proposed § 30.1) and research, science, data, or models involving “dose response data and models.”

Comment [6165-1550]: Commenter (6135) states that they agree with the findings of the U.S. Court of Appeals for the D.C. Circuit in *American Trucking Associations v Environmental Protection Agency* that the CAA imposes no obligation to obtain and make public the data underlying certain “key studies” and similarly reject arguments that a general requirement be imposed for EPA to obtain and publicize the data underlying published studies on which the agency relies. We also agree with the court’s finding that “requiring agencies to obtain and publicize the data underlying all studies on which they rely ‘would be impractical and

unnecessary."⁵³²

Comment [6168-4099]: Commenter (6178) raises the following concerns with the Transparency Rule proposed by the NPRM:

1. The Agency cites specific sections of statutes it administers as the basis of the Agency's authority to adopt the Transparency Rule; specifically CAA sections 103, 301(a), 42 U.S.C. 7403, 7601(a). The Agency rightly cites this act of Congress in an attempt to support the NPRM as such authority is necessary for the Agency to adopt regulations pursuant to the CAA.

2. However, Congress, in each section cited, never instructs the Agency to consider transparency to the public of supporting data and/or models of the scientific research when deciding to rely on such research as support for regulations passed pursuant to the CAA. Consequently, the Transparency Rule requires the EPA to rely on factors which Congress has not intended it to consider when promulgating regulations pursuant to the CAA, rendering the Transparency Rule arbitrary and capricious under the APA.

3. Further, not only does the Transparency Rule lack sufficient Congressional intent to avoid being deemed arbitrary and capricious, implementing the Rule would actually contradict Congressional instruction to conduct scientific research with a focus on 'promotion' and 'coordination' among itself and other institutions that produce scientific research material to the objectives of the CAA Congress requires the EPA to enforce. This provides additional cause for finding the Transparency Rule arbitrary and capricious under the APA.

Comment [6168-4102]: Commenter (6178) states that the CAA does not instruct the Agency to consider Transparency to the public when evaluating scientific data.

It is a basic principle of separation of powers enshrined in the American system of government that only Congress passes laws, and then only the executive branch enforces such laws. With respect to executive agencies like the EPA, this principle translates into limitations on such agencies: the agencies are inherently restricted by the specifics of the laws they enforce.

The EPA's NPRM violates this basic principle of separation of powers. This is evident when reviewing each of the Acts the Agency cited in the NPRM as each instruct the EPA to conduct scientific research with very specific goals in mind, none of which however concern transparency to the public of the underlying data and models supporting the conclusions of such research.

To illustrate this lack of Congressional intent, section 7403 of the CAA, one of two cited by the Agency to support the Transparency Rule as authorized by the CAA, Congress instructs the EPA administrator to "establish a national research and development program for the prevention and

⁵³² See *American Trucking Associations v EPA*, 283 F.3d 355, 372 (D.C. Circuit 2002). Subsequent legal challenges that EPA should be required to obtain and make public the underlying data from studies used as the basis of regulatory action have similarly been rejected even if it is requested for a single study as opposed to all studies on which the agencies relies. See 2010 U.S. Court of Appeals for the D.C. Circuit ruling in *Coalition of Battery Recyclers Association v Environmental Protection Agency*, 604 F.3d 613, 623 (D.C. Circuit 2010).

control of air pollution and as part of such program shall...conduct, and promote the coordination and acceleration of, research, investigations, experiments, demonstrations, surveys, and studies relating to the causes, effects (including health and welfare effects), extent, prevention, and control of air pollution; encourage [and] cooperate with... air pollution control agencies and other appropriate public or private agencies, institutions, and organizations, and individuals in the conduct of such activities; conduct investigations and research and make surveys concerning any specific problem of air pollution in cooperation with any air pollution control agency with a view to recommending a solution of such problem...; establish technical advisory committees composed of recognized experts in various aspects of air pollution to assist in the examination and evaluation of research progress and proposals and to avoid duplication of research; and conduct and promote coordination and acceleration of training for individuals relating to the causes, effects, extent, prevention, and control of air pollution.”⁵³³ [emphasis added]

The other section cited, CAA section 7601, states “the Administrator [of the EPA] is authorized to prescribe such regulations as are necessary to carry out his functions under this chapter.”⁵³⁴

Each of the emboldened phrases above highlights Congress’s instructions to the EPA on how to conduct scientific research when determining the appropriate regulations to adopt pursuant to the CAA. Nowhere in such instructions does Congress direct the Agency to consider whether the underlying data and/or models supporting the conclusions of such scientific research is transparent such that, in the words of the NPRM, “the data and models underlying the science [pivotal to its significant regulatory actions] is publicly available in a manner sufficient for validation and analysis.”⁵³⁵ Therefore, the Transparency Rule does not follow from the Congressional instruction found in the CAA.

Furthermore, Congress instructs the EPA in the CAA to focus on ‘promoting cooperation’ between it and other institutions, public and private, researching air pollution such that ‘acceleration’ of necessary research is achieved, resulting in required EPA regulations being enacted as soon as possible. Focusing on transparency as described in the NPRM would very likely delay promulgation of such regulations as coordination between critical research institutions that utilize nonpublic information (*i.e.* research participant’s personal data or proprietary research databases) would inevitably be hindered, if not entirely eliminated.⁵³⁶ Accordingly, not only would the Transparency Rule’s adoption lack basis in the Congressional instructions cited by the Agency, it would also contradict the basic Congressional instructions that the Agency Administrator is only ‘authorized to prescribe such regulations as are necessary to carry out his functions’.

Each of the other Acts’ sections cited by the Agency in support of the Transparency Rule contain substantially similar clauses, therefore the above analysis applies to each cited Act.

⁵³³ See 42 USC §7403, available at <http://uscode.house.gov>

⁵³⁴ See 42 USC §7601, available at <http://uscode.house.gov>

⁵³⁵ NPRM at 18769.

⁵³⁶ A discussion of the impact of the Transparency Rule on scientific research can be found here: <http://www.latimes.com/business/hiltzik/la-fi-hiltzik-epa-transparency-20180424-story.html>

Comment [6334-3168]: Commenter (6356) asserts that the regulation should not be applied retroactively. EPA proposes on page 18,771 that this regulation, if finalized, would apply prospectively. But it solicits comment regarding how the proposed rule should apply to future rulemakings which are based on the administrative record from previous reviews – particularly where the governing statute requires repeated review on a fixed date-certain cycle and dose-response data and models underlying pivotal regulatory science if those were developed prior to the effective date of this rule. Id. at 18,772/col. 1. The commenter submits that to the extent that future regulations rely on old data and/or dose-response relationships, then the proposed regulation should be transparent on both sets of information--the data and/or dose-response models must be available for review and independent validation in the context of the new rulemaking. However, the information could not form the basis for a challenge of a standard or pollutant limitation that EPA promulgated prior to adoption of this final agency action. In other words, prior regulations should not be affected by this rulemaking, even if EPA has not made their basis available for independent validation. But if that information forms the basis for a new standard or pollutant limitation, then the data and dose-response relationships that were the foundation of the historic requirements would be subject to this regulation if adopted. To the extent that these methods of analyses have evolved or been replaced, and particularly if they are distinguishable, it may change the outcome of future regulations, even if the old regulations adopted prior to this rulemaking continue to be implemented.

EPA should explain, in the context of this rulemaking, that many environmental statutes, including but not limited to the CAA, contain anti-backsliding provisions regarding the relaxation of standards. See, e.g., CSS Section 172(e), 42 U.S.C. §7502(e). Courts have interpreted this CAA provision to mean that while EPA can revoke a NAAQS for a criteria pollutant, the non-backsliding provisions of the Act prohibit the agency from revoking regulatory requirements that were required for implementation of a prior standard. See *South Coast Air Quality Management District v. EPA*, 882 F.3d 1138 (D.C. Cir. (2018), petition for rehearing pending; *South Coast Air Quality Management District v. EPA*, 472 F.3d 882 (2006), rev'd. 489 F.3d 1245 (D.C. Cir. 2007). Both decisions involved revocation of a standard and its replacement with a more stringent standard, so NEDA/CAP expresses no opinion of revision of standard to a less stringent standard, because we consider that unlikely to happen. It may be helpful for EPA to flag similar statutory provisions in its final action on this Notice.

Comment [6340-1454]: Commenter (6362) states that the provisions cited by EPA under the CAA, the CWA, the SDWA, the CERCLA, and the EPCRA in support of its authority to develop and implement its proposed rule all provide broad regulatory authority to promulgate regulations “as are necessary to carry out [the Administrator’s] functions” under the statute.

Comment [6343-2707]: Commenter (6365) expresses that they are committed to meeting their obligations to operate in a responsible manner to avoid adversely impacting the environment and public health and safety. Both lead itself and the production of lead are extensively regulated by the EPA, including under the CAA. As a result of this program and other actions taken by industry, “[t]he United States have made tremendous progress in reducing lead concentrations in the outdoor air,” with the national average concentrations dropping “more than 90 percent since 1980,” and “EPA expects that most of the areas previously designated as nonattainment will

have attained or are on track to attain by the end of 2016.”⁵³⁷

In order to ensure that the regulatory standards that the commenter’s members are subject to are supported by the best possible science, the ABR supports EPA’s objective of strengthening transparency in regulatory science by ensuring that the data and models underlying regulatory science is publicly available in a manner sufficient for validation and analysis. Furthermore, EPA should establish clear criteria for data and model availability so that stakeholders can effectively determine whether the data and models underlying each regulatory proposal are available for review.

Comment [6353-2326]: Commenter (6375) notes that the EPA solicits comment on whether alternative or additional regulatory or other policy vehicles are appropriate to establish and implement these policies, and whether further regulatory or other policy vehicles at the programmatic or statutory level would be appropriate as alternative or additional steps the agency may take to further the policies articulated in Section II of the NPRM’s preamble. (pg. 18771).

The regulatory language that EPA proposes provides general requirements that apply to the Agency’s use of science under the many statutes that it implements. The generality of the proposed regulations may be a function of the diverse purposes of those statutes. Specifically, some of these statutes focus on the introduction of new substances into the marketplace (*e.g.*, FIFRA and TSCA), while others primarily concern regulation of emissions or releases to (*e.g.*, CAA and CWA), or removal from (*e.g.*, CERCLA), the environment. The scientific analyses required for these different programs and the sources of the scientific information underlying those analyses differ. The Agency should consider supplementing the general language that it has proposed with statutory specific regulations. A statutory-specific rulemaking would provide greater certainty going forward.

Comment [6355-2849]: Commenter (6377) notes that CAA Section 108(a)(2) requires NAAQS to be based on air quality criteria that “shall accurately reflect the latest scientific knowledge” useful in identifying potential health and welfare effects, including, “to the extent practicable,” specific information on variable factors, pollutant interactions and welfare effects. These statutory provisions impose three distinct requirements for the scientific information contained in criteria documents (now known as ISA): (1) it must be accurate; (2) it must reflect the latest relevant information available; and (3) specific data must be provided where practicable.

In adopting these provisions in 1970, the Senate Committee expressly noted the absence of key scientific information relevant to NAAQS development and adopted an ambitious research program to fill the gaps, including research on: (1) the contribution of air pollution to the etiology of disease; (2) synergistic effects; (3) tissue accumulation; (4) functional impairment; (5) contributing factors such as age, occupation and smoking; and (6) improved predictive models.⁵³⁸ The Committee stated that “This effort should be directed toward the accelerated development of more comprehensive air quality criteria” (*id.*). Accordingly, as new information

⁵³⁷ https://www.epa.gov/sites/production/files/2016-09/documents/pb_naaqs_nfr_fact_sheet.pdf.

⁵³⁸ “A Legislative History of the Clean Air Act Amendments of 1970,” Vol 1 at p. 407 (1970 Senate Report).

is developed, Congress directed EPA to include it in more comprehensive versions of the ISA.

This requirement was strengthened in the 1977 CAA Amendments, which included the rulemaking provisions that now appear in Section 107(d) of the Act. Those provisions originated in the House bill, and in adopting them the House Committee found that “appropriately broad administrative discretion to promulgate regulations to protect health or the environment must be restrained by thorough and careful procedural safeguards that ensure an effective opportunity for public participation in the rulemaking process.”⁵³⁹ Two provisions were adopted to provide such assurance. With respect to proposed rules, Section 307(d)(3) provides:

All data, information, and documents . . . on which the proposed rule relies shall be included in the docket on the date of publication of the proposed rule.

Section 307(d)(6)(C) imposes a similar requirement on final rules:

The promulgated rule may not be based (in whole or in part) on any information or data which has not been placed in the docket as of the date of such promulgation.

As the 1977 House Committee noted, these provisions were necessary because Congress gave EPA broad discretion in developing NAAQS, rejecting the “substantial evidence” standard for judicial review in favor of the more lenient “arbitrary and capricious” standard, under which courts give substantial deference to agency findings of fact.⁵⁴⁰ In adopting this approach, Congress wanted to be sure that all of the scientific information on which the agency relies is available for public review at the proposal stage and for judicial review in the wake of a final standard. The House Committee went on to state that “Of course, the agency has at least as great an obligation to include any such documents that contradict its position as it does to include those that support it” (p. 321).

To recap, Section 108(a) of the Act requires NAAQS to be based on scientific information that is accurate and the latest relevant information available, including specific data where practicable. Section 307(d) requires all data and information on which proposed and final rules are based to be placed in the underlying dockets. These provisions amount to a statutory requirement for EPA to provide scientific transparency to the maximum extent practicable in developing ISA and proposed and final NAAQS rules.

Comment [6355-2851]: Commenter (6377) states that the substantial costs of the NAAQS program have been documented extensively. In enacting the CAA Amendments of 1970 and 1977, Congress prohibited EPA from considering costs in establishing NAAQS, but also adopted a series of provisions designed to ensure that the potential benefits of the program would be justified by the scientific data in NAAQS rulemaking dockets. EPA’s transparency proposal is a reasonable effort to implement those requirements while providing adequate protections for privacy, confidentiality, and other potential problem areas. Far from being inconsistent with the

⁵³⁹ H.R. Rep. No. 294, 95th Cong., 1st Sess. 319 (1977).

⁵⁴⁰ See, e.g., *American Trucking Assn’s, Inc. v. EPA*, 283 F.3d 355, 362 (D.C. Cir. 2002)(“ATA III”)(“Our task is the limited one of ascertaining that the choices made by the [EPA] Administrator were reasonable and supported by the record”).

applicable CAA provisions, EPA's transparency proposal is required by them and is long overdue. The Coalition urges EPA to implement the proposal expeditiously and apply it to all currently pending NAAQS reviews.

Comment [6424-1252]: Commenter (6446) notes that the proposed rule deviates from accepted practices that EPA routinely uses, and is required to use, to evaluate science it relies on for regulatory decisions. EPA has long recognized that proprietary CBI submitted to it cannot be shared with the public, yet it routinely relies on that information, including scientific studies and other scientific information, as the foundation for important regulatory decisions. EPA also adheres to specific Congressional directives regarding the science it should consider for regulatory action, including directives to consider whether the scientific information is reasonable, clear, complete and whether it has been peer reviewed. (See, *e.g.*, the TSCA at 15 U.S.C. § 2625, subds. (h) and (i), requiring EPA to consider several factors to evaluate science relating to toxic chemicals and requiring that decisions be based on "the weight of the scientific evidence," and the CAA at 42 U.S.C. § 7408, subd. (a)(2), requiring EPA to rely on "the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices.")

Comment [6870-4001]: Commenter (6892) states⁵⁴¹ that, in their view, the federal statutes not only fail to support the proposal but instead require consideration of all relevant scientific evidence. The provisions cited by the EPA proposal provide flimsy support – thus the plaintive cry for legal assistance from public commenters. More importantly, the proposal flies in the face of EPA's primary responsibility to base its decisions on consideration of all relevant scientific evidence.

It would be tedious to discuss the statutes in each of the different areas that EPA regulates, and not very useful, since the provisions cited by EPA in each area are similar. Air pollution is probably the most important area covered by the proposal in public health terms, so I will use that as an example.

The problem is not just that the CAA fails to provide clear authority for EPA's proposed exclusionary rule. There are also provisions in the Act that cut strongly against the proposal.

Like many recent EPA actions, the "transparency" proposal is an effort to elevate the concerns of regulated businesses at the expense of EPA's primary mission: protecting public health and safety. Transparency is a worthy goal, but it should not serve as an excuse to ignore inconvenient evidence or to compromise public safety.

Comment [6872-3439]: Commenter (6894) expresses that an unintended negative outcome, the community of scientists, which has increasingly grown to share the essential data used in research, would be thwarted by those who may be unable or unwilling to share their data, especially post-facto data that were part of the current publications already having gone through the peer review and publication process. The result would be a crippling, if not an elimination of the strong, crucial science that has been the backbone of existent, validated regulatory reviews

⁵⁴¹ Available at <https://legal-planet.org/2018/04/30/the-questionable-legal-basis-of-the-transparency-proposal/>

per the CAA mandate.

Comment [6873-1716]: Commenter (6895) notes that, in one example of the need for valid science-based standards, the PM-2.5 NAAQS set limits based on daily and annual exposure to PM-2.5 in ambient air. The regulation was supported by studies that were performed in many communities by many scientists and those scientists were able to calculate similar linkages between a concentration of PM2.5 and an acute or chronic health effect.

The Health Effects Institute (HEI) examined two of the sentinel studies that were pivotal to the development of the PM-2.5 NAAQS.⁵⁴² The Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality were selected for independent validation because the development of the NAAQS relied on their findings. A team of independent analysts started from the individual health and air quality data to see if the author's conclusions were supported. They corroborated the findings of the original studies.

Further, as noted above the re-validation of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality as well as the re-analysis of 40 studies all used to support the development of the PM-2.5 NAAQS shows clearly that the authors of these pivotal studies provided sufficient data so that the work could be replicated and validated. There is no need for revisiting these studies through the application of additional restrictions or requirements for public data availability nor from the release of personally identifying information.

In 1971 President Richard Nixon signed into law the ban on lead in paint in public housing, followed later by a ban in all paint sold in the United States. In 1973, the newly formed EPA reviewed blood lead levels among urban adults and children grouped by location and found blood lead levels which exceeded concentrations that were known to be associated with adverse health effects. The data was pooled and masked by sex, age, location, and potential exposure category. EPA's review led to the removal of lead from gasoline in 1995. All these actions directly resulted in lower ambient lead levels and the prevention of adverse neurological effects in children and adults from lead exposure. If this situation were to occur today, in accordance with this proposed rule EPA would be required to replicate these findings, making each individual's results available for further review by non-scientific individuals (lawyers and politicians), which would have further delayed the removal of lead from gasoline and jeopardized the health of millions of children living in urban areas across the United States. EPA requests comments on alternatives to redoing studies upon which current regulations are based. The Departments are strongly opposed to any retroactive application of the proposed rule. The pivotal studies used in many of the past regulatory actions including the promulgation of the PM-2.5 NAAQS provided sufficient data so that the work could be replicated and validated in a manner widely accepted by the scientific community in the lead in gasoline matter, an alternative would be to put lead back in gasoline. That would of course be unconscionable, however, EPA's reasoning could well lead to this type of result.

Comment [6891-2149]: Commenter (6921) states that numerous laws such as the CAA require

⁵⁴² Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality, Health Effects Institute, 2000.

the use of the best available science when implementing their provisions; the proposed rule would run afoul of such laws and hinder their proper implementation .

Comment [6894-3604]: Commenter (6915) states that the CAA requires that air quality criteria “accurately reflect *the latest scientific knowledge* useful in indicating the kind and extent of *all identifiable effects on public health or welfare*.” § 108(a)(2), 42 U.S.C. § 7408(a)(2) (emphases added).

Comment [6895-3068]: Commenter (6916) states that the EPA’s attempt to justify its action on the basis that courts previously have found it has the discretion to rely on non-public data in decision making, see 83 Fed. Reg. 18,769 n.3, simply does not explain why this proposed action – to cut off access to studies based on non-public data - is justified. The cases, upholding earlier Agency decisions not to release sensitive data underlying regulatory decisions, were decided based on a hard look at the statute, on grounds “that ‘the CAA imposes no such obligation’ and that ‘requiring agencies to obtain and publicize the data underlying all studies on which they rely would be impractical and unnecessary.’”⁵⁴³ Nor is EPA’s suggestion that various third-party independent organizations have called for “open science”⁵⁴⁴ at all persuasive, as discussed below. This issue has been debated – and transparency has improved, over many years – but even commentators in the initial rounds of the conversation, noted that there is no empirical evidence supporting the idea that there is a “bad science” problem.⁵⁴⁵

The commenter further states that the proposal is impractical and unnecessary because existing laws and guidelines provide for controlled release of underlying data to permit reanalysis where there are questions about study results.

Comment [6895-3151]: Commenter (6916) notes that, by statute, the public may not access raw underlying data - or protected intellectual property. To the extent that the Proposal would, if finalized, require the public release of such data, it is unlawful.

EPA’s CAA rulemaking history illustrates that the Proposal is not necessary: scientific results and methods can be questioned and validated without exposing protected underlying data to public scrutiny.⁵⁴⁶

⁵⁴³ *Coal. of Battery Recyclers v. EPA*, 604 F.3d 613, 623 (D.C. Cir. 2010) (quoting *Am. Trucking Ass’ns v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2001)). While the *American Trucking* case related to requests for data underlying several studies, the *Battery Recyclers* petitioners contended that their complaint (which was that the Agency had a duty to produce data underlying only one study), could be distinguished; the court disagreed, noting as well that the study results in question had been reconfirmed in a later analysis of the data, without requiring its release. *Id.* at 623-624.

PROB. 63, 72 n. 38 (2003) [hereinafter “‘Bad Science’ Fiction”] (citing Paul Locke, Legal Answer to a Scientific Question, at 60, *Env’tl. F.* (Nov/Dec 2000)).

⁵⁴⁶ See Earthjustice Comments at 8.

The Proposal seeks comment⁵⁴⁷ on whether its new public data release paradigm should be applied even to “dose response data and models...developed prior to the effective date.” To be clear (which the Proposal is not) this would have the potential effect, on CAA rulemakings, of prohibiting the use of the well-developed dose response information resulting from two landmark studies, the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality, that have been called “the poster children of good-science reforms.”⁵⁴⁸ We strongly oppose such an outcome, as it would remove from EPA’s rulemaking toolbox the “best available science” on the link between air quality and health. That is both unnecessary and unjustified.

The Proposal’s focus on public release of the underlying data used in studies – particularly “dose response data” and studies,⁵⁴⁹ evinces a clear lack of understanding of the way science is conducted and verified. While replicating the results of a study with the same data set certainly verifies it, as the National Research Council said in 2002, “[f]or large epidemiological studies, repeating a study is seldom either possible or desirable.”⁵⁵⁰ More effective, instead, is some combination of new studies testing the same question in different places, and/or an independent analysis with the same data.⁵⁵¹ Formal peer review, whether or not prior to publication, also validates the outcome of scientific studies,⁵⁵² as reflected in the OMB Guidelines presumption of objectivity and usefulness for scientific studies that have undergone formal peer review, described above.

An example of this is the series of studies, re-analyses, verifications, and extensions of work begun in 1974 on the prospective “respiratory health effects of respirable particles and sulfur oxides on a sample of adults and children in six U.S. cities.”⁵⁵³ This work, first undertaken by

⁵⁴⁷ 83 Fed. Reg. at 18,772 (seeking comment on whether the new framework should be applied to studies in the existing prior records for NAAQS, and to “dose response data and models if those data and models were developed prior to the effective date” for a final rule). See Earthjustice Comments, at 90 (discussing unlawful retroactive application of the Proposal).

⁵⁵¹ *Id.* At Ch. 2, p. 7-8; see also Douglas W. Dockery, Health Effects of Particulate Air Pollution, 19(4) ANN. EPIDEMIOL. 25 (Apr. 2009) [hereinafter “Dockery”] (“True replication requires not reanalyzing existing work but independent investigators producing independent data.”). Notably, the Harvard Six Cities and ACS studies hypotheses have been subject to all kinds of reanalysis at this point, including new studies with new data, similar studies in different areas by independent researchers using the same (but masked) data, as described herein.

⁵⁵² 2002 NRC Report at 7-8 (discussing that the soundness of a study is demonstrated through the “strength of the design, methods, and statistical results,” as well as its consistency with the data “other studies and scientific theories.”).

⁵⁵³ Dockery, *supra* n. 39 at 258. As the National Research Council noted: “the [original] data were encumbered by several types of confidentiality constraints. The investigators had assured the participants in the study that their identity and their relationship to any information obtained would be kept confidential. Special agreements were signed by each participant, the study director, and a witness. Assurances of confidentiality are typical in studies of this kind.” 2002 NRC Report at 10-11. In addition to the confidentiality agreements with individual study participants, the investigators had had to sign certain statements in order to obtain death certificates from the states. They had had to agree that they would (1) limit access to the records to only the members of the research staff, (2) destroy records upon the completion of the study, and (3) not release the records to other agencies, publish data so

researchers at the Harvard School of Public Health, became known as the Harvard Six Cities Study. The Six Cities Study, published in 1993, tracked 20,000 people in six U.S. cities for two years and found a definitive link between PM pollution and serious health effects, including death. The American Cancer Society Study, published in 1995, linked air pollution to cardiovascular disease, respiratory disease, and lung cancer. Since their publication the studies have been reanalyzed and extended and consistently validated.⁵⁵⁴ EPA has found that these additional studies provide “consistent and stronger evidence of an association with mortality at lower air quality distributions than had previously been observed.”⁵⁵⁵

Some of the early peer reviewed Harvard Six Cities work was relied on by EPA in setting the PM NAAQS in 1987.⁵⁵⁶ Industry challenged the 1987 24-hour PM standards in part by questioning that work.⁵⁵⁷ The court held that EPA must “take into account all the relevant studies revealed in the record,”⁵⁵⁸ and noted the precautionary nature of the CAA.

The Harvard researchers and others continued to explore the effects of ambient PM exposures on human health and mortality, in the six cities, and various other places around the country and the world.⁵⁵⁹ As those results came out, industry-sponsored researchers again challenged them, in

individuals could be identified, or contact family members of decedents. Furthermore, the investigators had had to sign non-disclosure agreements to obtain information from the National Death Index. Hence, although investigators were willing to share data sets, which is a common scientific practice, they believed that to open their thousands of boxes of original records would be unethical. *Id.*

professional meetings and journals, arguing that because they could not reproduce or use the (confidentially provided) human health data set, the results could not be relied on. They claimed to come up with different results using other data.

The HEI was brought in to manage an evaluation of the studies. HEI, funded by industry and EPA, is an independent arbiter, which chose a new team of scientists to reconstruct the Six Cities data set and verify the original results.⁵⁶⁰ Subsequently, over 100 other studies were peer-reviewed and published by 2004, building on, expanding, corroborating, and verifying the relationship between PM exposures and adverse respiratory health effects and even early death. These included follow up using “the sample of adults in the Harvard Six Cities Study,” that found an approximately two-year reduction in life expectancy for those living in the most polluted areas.⁵⁶¹

These results, and the methodologies underlying them, were then validated by the original Harvard Six Cities researchers, in collaboration with a team funded by the American Cancer Society, using new cohort data – a combined data sample of more than 500,000 adults.⁵⁶² The collaborative work was peer-reviewed and published.⁵⁶³ That work then became the focus of new debate over the 1997 PM NAAQS standard-setting, including new industry attacks based on industry’s asserted lack of access to the health data in which they were grounded – raising the same questions that are still underlying this 2018 Proposal – namely, arguing that EPA needed to make public the data underlying any study on which it relied. Again, however, HEI was brought in to validate the results, and the resulting work was published in 2000.⁵⁶⁴ The D.C. Circuit Court reviewing the 1997 standard determined in 2002 that releasing the data was neither required by the Act, nor was it practical or necessary.⁵⁶⁵

The HEI review validated the previous work, and “demonstrated the robustness of the PM-mortality risk estimates to many alternative model specifications....[and] also made a number of innovative methodological contributions that...substantially contributed to subsequent analyses.”⁵⁶⁶

Comment [6895-3185]: Commenter (6916) states that the EPA’s Proposal to limit the scientific basis for the Agency’s decision making is not authorized by the CAA.

EPA, like all federal agencies, is a creature of statute, and “may act only pursuant to authority delegated ... by Congress.”⁵⁶⁷ But the Proposal fails to state clearly under what authority EPA is

proposing these rules, providing only a list of statutes that require the Agency affirmatively to take scientific information into account, but not explaining why they would offer the Agency authority to disregard certain relevant studies.⁵⁶⁸ Indeed, EPA seems unsure of its authority, requesting comment on “additional or alternative sources of authority.”⁵⁶⁹

Nor does the EPA Administrator’s authority “to prescribe such regulations...as are necessary to carry out the Agency’s functions”⁵⁷⁰ present an opening to disregard relevant information, as EPA suggests. To the contrary, courts have held that the Administrator must take into account all relevant studies in the record.⁵⁷¹ Other CAA sections, not cited by the Agency, lay out and define some of the Administrator’s rulemaking “functions under the Act” as requiring for example, the use of “the latest scientific knowledge useful in indicating the kinds and extent of all identifiable effects on public health or welfare...”⁵⁷² So, the Proposal to permit him to disregard some studies is contrary not only to his general rulemaking authority, but to his specific authority to, inter alia, set NAAQS based on the “latest scientific knowledge.”⁵⁷³

The seminal CAA air quality standard-setting provisions have twice been held not to require the release of data underlying studies relied on by the Agency, as discussed above. Indeed, in both situations, the court has described such release as “unnecessary and unjustified.”⁵⁷⁴

The Proposal also is inconsistent with the overall precautionary nature of the CAA.⁵⁷⁵ Congress did not intend EPA to limit itself to considering only ‘sure things’ but asks the Administrator to protect the public against uncertain dangers due to exposure to air pollution. Primary NAAQS are to be set with an “adequate margin of safety,”⁵⁷⁶ meaning that “the Administrator need not regulate only the known dangers to health but may ‘err’ on the side of overprotection.”⁵⁷⁷ This precautionary approach is reflected also in the various technology-forcing sections of the Act, which Senator Muskie said “may [require] that people and industries will be asked to what seems to be impossible at the present time.”⁵⁷⁸ Under this scheme, the Administrator must consider all relevant studies placed in the record, and “may apply his expertise to draw conclusions from suspected, but not completely substantiated, relationships between facts, from theoretical projections from imperfect data, from probative preliminary data not yet certifiable as ‘fact’ and

⁵⁶⁸ See generally, Dan Farber, “The Questionable Legal Basis of the ‘Transparency’ Rulemaking,” (Apr. 30, 2018), <http://legal-planet.org/2018/04/30/the-questionable-legal-basis-of-the-transparency-proposal/>.

⁵⁶⁹ 83 Fed. Reg. at 18,769.

⁵⁷⁰ Id.

⁵⁷¹ See, e.g., *Am. Petroleum Inst. v. Costle*, 665 F.2 1176, 1187 (D.C. Cir. 1981) (in setting NAAQS based on an ‘adequate margin of safety’ to protect public health, the Administrator must consider all relevant studies revealed in the record, not only the studies favoring a particular position). The Agency’s Proposal does not define the word “relevant” to exclude studies based on confidential data, nor could it argue that human health findings are not relevant to an assessment of human health effects.

⁵⁷² 42 U.S.C. § 7408(a)(2), describing the criteria document that must form the basis for a NAAQS setting process under CAA section 109, 42 U.S.C. § 7409.

⁵⁷³ Id.

⁵⁷⁴ See commenters’ comment letter, *supra* at note 12.

⁵⁷⁵ *NRDC*, 902 F.2d at 968 (describing the “precautionary nature” of the CAA).

⁵⁷⁶ 42 U.S.C. § 7409(b)(1).

the like,”⁵⁷⁹ in order to protect public health as Congress intended. This context simply does not authorize the Administrator to decline to consider any studies – but particularly not those representing the best available science – because the underlying data is confidential.

Comment [6895-3204]: Commenter (6916) states that CAA section 307(d)(6)(B) requires that when finalizing a proposed rule, and after taking comment, an Agency must “respon[d] to each of the significant comments, criticism, and new data submitted in written or oral presentations during the comment period.”⁵⁸⁰ And, while both proposed and final rules under the CAA must be accompanied by a statement of basis that summarizes studies and data on which the Agency relies, in no way does that requirement authorize the public release of the raw data. Nor does the Act’s requirement that the record underlying rules include a “summary of ... the factual data on which the ... rule is based,”⁵⁸¹ require the public release of such data. Nor does the Act elsewhere require or allow data to be released to the public. Where “new data” is submitted by commenters, that must be responded to by the Agency and that response made part of the record, but the statute does not require public release of new data either.⁵⁸² Indeed, Agency proposals, including this one, describe measures by which commenters can submit so-called CBI – which the Agency can consider but protect from public release.⁵⁸³

Therefore, to the extent that the Proposal envisions authorizing EPA to ignore or disregard or not to consider some studies submitted during a rulemaking comment period, whether or not the data is publicly released, such agency action would be taken in direct violation of the CAA.⁵⁸⁴ Nor is there any basis elsewhere in the CAA for EPA to decide to exclude or prohibit the consideration of otherwise relevant matter because it is based on confidential information not available to the general public.

The Proposal does not meet CAA procedural requirements.⁵⁸⁵ As noted supra, the CAA requires, with any proposed rule, a summary of “the factual data on which the proposed rule is based; the methodology used in obtaining the data and in analyzing the data; and the major legal interpretations and policy considerations underlying the proposed rule.”⁵⁸⁶ But this Proposal is not accompanied by any record in support. Nor has the Agency even attempted to explain in the preamble why current statutes and guidelines do not adequately provide for the public to

⁵⁷⁹ *NRDC*, 902 F.2d at 968.

⁵⁸⁰ 42 U.S.C. § 7607(d)(6)(B).

⁵⁸⁴ See, e.g., *NRDC*, 902 F.2d at 971 (“the Administrator must take into account all the relevant studies revealed in the record and make an informed judgment based on available evidence”) (internal citations omitted) (emphasis added).

⁵⁸⁵ See Earthjustice Comments at 64.

⁵⁸⁶ 42 U.S.C. § 7607(d)(3) (subsection headers omitted). As originally published, the Proposal also violated the CAA’s requirement that proposed rules be subject to an opportunity for oral comment. The Agency has since corrected that flaw. EPA, News Release, “EPA Announces Extended Comment Period and Public Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations,” (May 24, 2018), <https://www.epa.gov/newsreleases/epaannounces-extended-comment-period-and-public-hearing-proposed-rule-strengthen>.

question scientific studies, seek validation, replication (or reproducibility)⁵⁸⁷ of study results, and to comment on methodologies, without “public” release of confidential data. It therefore does not satisfy the CAA’s requirements or provide the public with a meaningful opportunity to fully comment on the proposal.

Comment [6895-3227]: Commenter (6916) contends that the Proposal does not clearly identify the authority under which EPA has promulgated it. As discussed above, the CAA does not authorize the Proposal, which is clearly aimed at limiting the studies EPA can rely on and consider in CAA rulemaking. Certainly that is the case for the CAA sections listed by the Agency in the Proposal, including the general rulemaking authority under the Act which requires the evaluation of all material in the record. EPA’s suggestion that it has “general authority” to make rules to comply with its obligations is similarly unavailing here, as the general authority does not exist to make rules that are outside EPA’s statutory obligations, or in violation of them⁵⁸⁸ – and a rule that would enable EPA to disregard relevant studies in a CAA rulemaking record is clearly outside the Agency’s authority. Nowhere does the Act permit EPA to limit its own access to relevant science.

The Proposal’s terms are so vague as to fail to afford an opportunity for meaningful comment. Significant issues are presented in the Proposal only in the broadest terms, and with enough specificity “to permit interested parties to comment meaningfully.”⁵⁸⁹ As noted *supra*, we assume (as we must, given no other information from the Agency), that the Proposal is aimed at precluding EPA’s reliance on studies for which the data are not made public. That is the natural reading of the proposed regulatory language, which is the most choate information offered in the Proposal. But even that reading is not certain, given the very broad discretionary nature of the exemptions provided for in the rule text (see, *e.g.*, 83 Fed. Reg. 18,774, proposed 40 C.F.R. § 30.9, giving the Administrator the ability to grant an exemption to the data publication requirement if that is “impracticable,” which is undefined in the Proposal). As a result, it is unclear how this rule would apply to EPA decision making, and how it would be different than the Agency’s current protocol for considering studies relevant to specific rulemaking proposals.

As one example, EPA alludes to “transparency” multiple times, but without defining what that concept means, or explaining why it believes existing statutes, regulations, guidelines and protocols fail to meet it.⁵⁹⁰ While asserting an interest in “ensur[ing] that the data and models underlying science is [sic] publicly available in a manner sufficient for validation and analysis,”⁵⁹¹ there is no more specific statement explaining how that would be implemented or

⁵⁸⁷ The Proposal uses these terms seemingly interchangeably and certainly without defining what they mean. See, *e.g.*, 83 Fed. Reg. 18,768, *ibid.* (stating that the public disclosure must be “sufficient for independent validation);” *id.* at 18,770 (claiming a “replication crisis”); *id.* (mentioning a “standard for reproducibility” and “reproducible scientific assessments.”).

⁵⁸⁸ See *Am. Petroleum Inst.*, 52 F.3d at 1119 (“EPA cannot rely on its general authority to make rules necessary to carry out its functions when a specific statutory directive defines the relevant functions of EPA in [an] area”).

⁵⁸⁹ *Honeywell Int’l, Inc. v. EPA*, 372 F.3d 441, 445 (D.C. Cir. 2004).

⁵⁹⁰ In 83 Fed. Reg. at 18,768-18,774, EPA includes 13 preamble references to “transparency,” and one rule text reference, at proposed 40 C.F.R. § 30.7, without providing any indication of the intended meaning of that term. Also see generally, Dan Farber, “Pruitt’s Utterly Opaque Transparency Proposal,” (Apr. 26, 2018), available at: <https://legal-planet.org/2018/04/26/pruitts-utterly-opaque-transparency-proposal/>.

⁵⁹¹ 83 Fed. Reg. at 18,769.

why releasing confidential health and business information is necessary. Nor is the Agency's rationale completely clear in the Proposal. When commenters are left to guess, that is not lawfully sufficient notice of the subjects and issues involved.

Comment [6895-3296]: Commenter (6916) states that the EPA has failed to follow required and customary rulemaking process in issuing this Proposal. The rulemaking process set forth in the APA, and in more detail in the CAA, provide a Congressionally-directed framework to assure that the Agency's rulemaking decisions are not arbitrary – that they are made transparently and based on an adequate record that is subject to public scrutiny. Similarly, the Environmental Research, Development and Demonstration Authorization Act of 1976 (ERDDAA) requirement to submit CAA regulatory proposals to SAB review serves as a check to ensure that the scientific basis underlying the rule is robust.

As discussed above, however, EPA failed to submit the rule to its SAB, and additionally did not prepare a regulatory impacts analysis of the Proposal as required by Executive Order 12,866. Nor did the Administrator provide sufficient time for a meaningful OMB Office of Information and Regulatory Affairs (OIRA) review, having signed the rule on April 24, 2018 after having submitted the Proposal to OIRA on April 19, 2018 – despite the requirement to provide OIRA with at least 10 working days to decide whether to waive review.⁵⁹²

EPA's failure to subject the Proposal to these required analyses denies the public "transparency" – because information is withheld on which the affected public might base meaningful comments – as well as denying OMB the information it needs to complete its reviews.

EPA's Proposal claims to be "consistent with" Executive Order 13,777, which ordered a Regulatory Reform Task Force to identify regulations that "rely in whole or in part on data, information, or methods that are not publicly available or are insufficiently transparent to meet the standard for reproducibility," and 13,783, which required a focus on energy independence, but also the "achieve[ment of] environmental improvements for the American people."⁵⁹³ But the Executive Order 13,777 Task Force report does not identify any regulations that rely on insufficiently transparent data,⁵⁹⁴ nor is this Proposal - which would deny access to scientific studies - consistent with the goal of advancing environmental improvements for the American public.

Comment [6897-1893]: Commenter (6918) supports the Proposed Rule's underlying values, which originate from EPA's statutory authority and principles of good government.

⁵⁹² Exec. Order No. 12,866 § 6(b)(2)(A) requires that the Agency give OIRA ten working days to determine whether to waive review; id. at § 8 forbids an Agency from publishing "or otherwise issu[ing] to the public," a Proposal until either OIRA waives review or completes it. In this instance, OIRA did not complete its review until one day after the Administrator signed the Proposal, which was published only six days later on April 30, 2018, seven working days after the rule was submitted to OIRA. See also *supra* note 30 (press account).

⁵⁹³ Id. at 18,769, citing Exec. Orders Nos. 13,777, 82 Fed. Reg. (Mar. 1, 2017) & 13,783, 82 Fed. Reg. 16,093 (Mar. 31, 2017)).

⁵⁹⁴ EPA, Final Report on Review of Agency Actions that Potentially Burden the Safe, Efficient Development of Domestic Energy Resources Under Executive Order 13,783, (Oct. 25, 2017) ("noting that EPA has coordinated its review with other Administration initiatives, such as ... E.O. 13,777").

Transparency, validity, and public participation are especially important when EPA issues rules under the CAA. Section 307(d)(3) of the Act, which applies to certain important categories of EPA rules as well as to other rules to which the EPA Administrator decides to apply it, imposes even more stringent requirements than does the APA, 5 U.S.C. § 553, which specifies general requirements for notice-and-comment rulemaking. Specifically, CAA section 307(d)(3) requires:

In the case of any rule to which this subsection applies, notice of proposed rulemaking shall be published in the *Federal Register*, as provided under section 553(b) of Title 5, shall be accompanied by a statement of its basis and purpose and shall specify the period available for public comment The notice of proposed rulemaking shall also state the docket number, the location or locations of the docket, and the times it will be open to public inspection. The statement of basis and purpose shall include a summary of—

- (A) the factual data on which the proposed rule is based;
- (B) the methodology used in obtaining the data and in analyzing the data; and
- (C) the major legal interpretations and policy considerations underlying the proposed rule.

As the D.C. Circuit has explained, section 307(d) requires EPA to issue a proposed rule and to provide a detailed explanation of its reasoning at the proposed rule stage. See, e.g., *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 519 (D.C. Cir. 1983). CAA § 307(d)(3) “requires a much more detailed notice of rulemaking” than the APA. *Id.* at 518; see also *Union Oil Co. v. EPA*, 821 F.2d 678, 681-82 (D.C. Cir. 1987) (noting that Congress’s 1977 amendments to the CAA “provide new procedural requirements for EPA rulemaking” that are “more stringent than those previously applicable under the Administrative Procedure Act,” including a requirement that “EPA . . . establish a detailed ‘rulemaking docket’ that . . . must provide the entire basis for the final rule.”) (quoting 42 U.S.C. § 7607(d)(3) (1982)). The public process values that underlie notice-and-comment rulemaking, both under the CAA and under the APA, amply justify the notice requirement. If poor notice is given, “[t]he agency will not get the informed feedback it needs, the parties will feel unfairly treated, and there will be a meager record for [the courts] to review.” *Small Refiner Lead Phase-Down Task Force*, 705 F.2d at 550.

The Proposed Rule represents another instance of EPA seeking to build on its existing policies, principles, and statutory obligations. EPA recognizes that “[m]eaningful public participation requires much more than simply holding public meetings or hearings or collecting public comment.”⁵⁹⁵ And, consistent with EPA’s long history of seeking to increase transparency, promote public participation, and ensure validity of its rules, increasing access to underlying data and models will help satisfy EPA’s specific obligations under the CAA.

Comment [6901-4441]: Commenter (6922) provides that, in the CAA:

The Administrator shall issue air quality criteria for an air pollutant within 12 months after he has included such pollutant in a list under paragraph (1). Air quality criteria for an air pollutant shall accurately reflect the latest scientific knowledge useful in indicating

⁵⁹⁵ EPA, Public Participation Guide, <https://www.epa.gov/international-cooperation/public-participation-guide> (last visited Aug. 14, 2018).

the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air, in varying quantities.⁵⁹⁶

Comment [8750-1431]: Commenter (9227) asserts that, not only is there no authority for EPA's pan-statutory Proposal, but the Proposal would also violate explicit statutory commands. Though EPA admits that "[t]he best available science must serve as the foundation of EPA's regulatory actions,"⁵⁹⁷ proposed section 30.5 would prohibit EPA from considering high quality and critically important scientific studies—precisely that “best available science”—when undertaking regulatory actions. Specifically, section 30.5 would prevent EPA from considering any scientific study for which the underlying “dose response data and models” are not “publicly available in a manner sufficient for independent validation.”⁵⁹⁸ The commenter notes that in CAA, 42 U.S.C. § 7408(a), EPA shall establish air quality criteria that “shall accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air, in varying quantities.”). And, by excluding science that meets these statutory criteria from supporting regulations to protect public health and welfare, the Proposal would frustrate Congress's policy in these statutes and frustrate EPA from achieving its fundamental mission.⁵⁹⁹

Comment [8750-1432]: Commenter (9227) states that the EPA's statutory authorities generally require the agency to consider all available data when undertaking significant rulemakings. The EPA's statutory authorities mandate a variety of requirements for what scientific information EPA must consider in rulemaking. These statutes are discussed in detail, *infra* at Section I.B.3. To take one example that appears in numerous statutes, including TSCA, CAA, SDWA, and the ESA, Congress has often required agencies to act on the “best available science.” For an agency to comply with this obligation, the agency must at least consider all available scientific information. “Best” means “of the most excellent, effective, or desirable type or quality.”⁶⁰⁰ “Available” means “able to be used or obtained.”⁶⁰¹ And “science” means “the intellectual and practical activity encompassing the systematic study of the structure and behavior of the physical and natural world through observation and experiment.”⁶⁰² Assessing which science is “best” requires consideration of the overall quality of the science, and the public availability of underlying data is, at best, one of many aspects that should inform that assessment of overall quality.

An agency “cannot ignore available. . . information.”⁶⁰³ Numerous courts have indicated that a plaintiff or petitioner can establish a violation of the “best available science” requirement by

“point[ing] to any scientific evidence that the agency failed to consider.”⁶⁰⁴ “The best available data requirement. . . prohibits [an agency] from disregarding available scientific evidence that is in some way better than the evidence [it] relies on.”⁶⁰⁵ “An agency does. . . have an obligation to deal with newly acquired evidence in some reasonable fashion.”⁶⁰⁶ EPA’s proposal will result in EPA precluding itself from considering certain studies that are “available,” thus violating the requirement that EPA rely on the best available science.

In addition, the requirement that agencies use “best available” science or information often means that the agency must act even if the available science or information is imperfect.

“Even if the available scientific and commercial data were quite inconclusive, [the agency] may—indeed must—still rely on it” when the agency has a duty to act.⁶⁰⁷ “[W]here the information is not readily available, we cannot insist on perfection.”⁶⁰⁸ Just as the Courts have recognized that they cannot expect perfection, agencies cannot choose to ignore certain studies or sources of information based solely on whether the data is publicly available—especially where the validity of those studies has been established using techniques that do not rely on public availability of underlying data.

EPA cannot reasonably elevate the interest in public availability of all underlying information above all other factors in assessing the “best available science.” Textually, EPA’s approach is unlawful.

Comment [8750-1448]: Commenter (9227) notes that, as EPA acknowledges in footnote 3 of the Proposal, in at least two instances the D.C. Circuit Court of Appeals has recognized that studies for which underlying data is not publicly available may constitute “best available science.”⁶⁰⁹ The D.C. Circuit’s decisions in these cases further demonstrate that the public unavailability of a study’s underlying data does not render a study incapable of constituting “best available science” otherwise unworthy of EPA’s consideration.

In *American Trucking Associations v. EPA*, the petitioner challenged EPA’s reliance on scientific studies for which underlying data was not publicly available in deciding to strengthen the NAAQS for PM.⁶¹⁰ The Court held that the CAA did not require EPA to make public underlying data where EPA relied on the study itself and not the raw data underlying the study. The Court agreed with EPA’s position that requiring agencies to obtain and publicize the data underlying all studies on which they rely “would be impractical and unnecessary.”⁶¹¹ Importantly, the Court

⁶¹¹ *Id.* at 372 (quoting National Ambient Air Quality Standards for Particulate Matter, 62 Fed. Reg. 38,652, 38,689 (July 18, 1997)).

concluded that:

If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. . . . Such data are often the property of scientific investigators and are often not readily available because of. . . proprietary interests. . . or because of [confidentiality] arrangements [with study participants].⁶¹²

The court accordingly recognized that ignoring relevant scientific information simply because the underlying data is not available would violate EPA's obligations to consider "best available science." *Coalition of Battery Recyclers Association v. EPA* involved another challenge to EPA's reliance on a scientific study for which the underlying data was not publicly available.⁶¹³ In that case, EPA had relied upon the study in question to determine the "concentration-response relationship between blood lead levels and IQ changes."⁶¹⁴ The D.C. Circuit again upheld EPA's reliance on studies without making the underlying data publicly available and explained, "raw data often is unavailable due to proprietary interests of a study's scientific investigators or confidentiality agreements with study participants."⁶¹⁵ Likewise, in *City of Waukesha v. EPA* the D.C. Circuit concluded that agency peer review satisfies the requirement to use best, peer reviewed science and supporting studies.⁶¹⁶

Comment [8750-1453]: Commenter (9227) notes that, by prohibiting EPA from considering all valid and relevant studies when undertaking significant rulemakings, the proposed rule would prevent EPA from complying with an array of statutory provisions governing EPA's consideration of available science.

Under CAA section 108(a),⁶¹⁷ EPA must establish air quality criteria for each air pollutant that serves as the basis for setting the NAAQS. Such criteria "shall accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air, in varying quantities."⁶¹⁸ As explained above, the scientific community, EPA, and the courts have all concluded that lack of public availability of underlying data does not render the study invalid. And consideration of such studies can be essential for EPA to fulfill CAA section 108(a)'s directive that it consider "the latest scientific knowledge" in establishing air quality criteria, that it consider studies "useful" in indicating effects of pollutants on ambient air, and in providing an adequate margin of safety in the standard itself.⁶¹⁹ Thus, EPA's proposal to bar EPA from considering such studies would prevent EPA from complying with its statutory obligation under CAA section 108(a).

⁶¹⁷ 42 U.S.C. § 7408(a).

⁶¹⁸ 42 U.S.C. § 7408(a)(2).

⁶¹⁹ Id.

Section 108(a)(2) says nothing about excluding information—its evident purpose is to be inclusive as to information to be considered. EPA’s historic practice reflects this broad directive: each NAAQS review evaluates virtually all studies in the area, excluding none, but assigning appropriate weight based on study-by-study evaluation. Since the NAAQS provisions were enacted in 1970, EPA has conducted many NAAQS rulemakings. The agency does not establish per se, a priori rules regarding study inclusion or exclusion, but rather evaluates each of the individual studies—and there are thousands typically evaluated for each NAAQS review—on their merits based on reasoned criteria. While details of the development and review of the criteria and standards have evolved over time, in practice, EPA has endeavored to include all relevant scientific studies in the process, even providing provisional assessments of relevant literature that appears after the formal scientific review has been completed. Over the years, tens of thousands of peer-reviewed studies of health effects, exposure, and atmospheric interactions, and monitoring have been included in reviews of criteria and standards. A requirement that they must be excluded from consideration unless the raw data and full methodologies are made available for all of them is inconsistent with the legislative mandate and EPA’s practice over the last 40 years.

Thus, a science regulation that applies to the NAAQS is unlawful unless EPA can show that the new standard can be established and implemented consistent with the applicable statutory requirements. To do so, EPA must prove that public unavailability of data means that a study does not constitute “latest scientific knowledge useful” in indicating effects on human health or welfare.⁶²⁰ EPA’s Proposal neither acknowledges this requirement nor explains how the Proposal would not violate this statutory command.

For example, in past NAAQS reviews, EPA has considered the Harvard Six Cities study⁶²¹ and American Cancer Society studies⁶²², despite the fact that the data underlying these studies is not publicly available. These studies, however, are plainly “useful in indicating the kind and extent of all identifiable effects on public health or welfare.”⁶²³ These seminal studies have been part of the air quality criteria since the mid-1990s—they have thus been accepted as “useful” by separate panels of CASAC, and by EPA, in three separate NAAQS reviews. Their use has been upheld by the D.C. Circuit.⁶²⁴ Both studies have been reanalyzed and validated by highly competent third-party reviewers (the HEI) with access to the underlying data.⁶²⁵ The study results have been reproduced many times over.⁶²⁶ Extended follow-up analyses of the ACS and

⁶²⁶ See EPA, NCEA, *Integrated Science Assessment for Particulate Matter* (EPA/600/R-08/139F), 7-86 (2009).

Harvard Six Cities studies provide consistent and stronger evidence of an association with PM 2.5 and mortality at even lower air quality distributions than had previously been observed.⁶²⁷ This type of cumulative weight of evidence is highly probative in assessing both causality and in establishing the level of the NAAQS.⁶²⁸ The proposal says almost nothing about any of these other attributes that not only make these studies “useful,” but indeed make them particularly high quality and reliable. The primary ozone NAAQS provides further examples of the pernicious effects the proposal would have. Among the key controlled human exposure studies demonstrating that exposure to ozone causes adverse health effects in even healthy subjects at levels below the level of the then-current NAAQS are Adams (2006) and Schelegle (2009).⁶²⁹ These studies were sponsored by the American Petroleum Institute, which controls access to the underlying data. The American Petroleum Institute refused an EPA researcher access to the data of a related Adams study it sponsored (Adams (1998)).⁶³⁰ So not only would these evidently “useful” (under CAA section 108(a)(1)) studies be barred from consideration under the Proposal, but the Proposal creates a perverse incentive for industry to refuse access to study data. The published studies—peer reviewed—would obviously be providing information “useful” in indicating effects of air pollution, but the Proposal would not only bar their consideration but create an incentive for industry never to provide underlying data for any industry-sponsored study with a result not to industry’s liking.

The most recent premiere long-term cohort study for PM is Domenici (2017) which found even greater effects of fine particles at levels below EPA’s current standards.⁶³¹ This study used a Medicare database available to any research group that can guarantee confidentiality of personal data.⁶³² Yet the proposal could evidently bar consideration of this powerful study.⁶³³

NAAQS must be requisite to protect the public health, and to provide an “adequate margin of safety” in doing so.⁶³⁴ The proposal violates this central statutory requirement. NAAQS are

⁶³² See CMS, Limited Data Set (LDS) Files, https://www.cms.gov/Research-Statistics-Data-and-Systems/Files-for-Order/Data-Disclosures/Data-Agreements/DUA_-_NewLDS (last accessed Aug. 9, 2018) (noting data requires a signed data use agreement and data cannot be disclosed).

⁶³³ See 83 Fed. Reg. 18768, 18773, Proposed section 30.5 final sentence (“where data is controlled by third parties, EPA shall work with those parties to endeavor to make the data available in a manner that complies with this section”). There appears to be some interaction required before third party studies are considered to be publicly available.

⁶³⁴ CAA section 109(b); 42 U.S.C. § 7409(b).

required to provide this margin of safety “to build a buffer to protect against uncertain and unknown dangers to human health.”⁶³⁵ EPA’s Proposal would build a buffer against using the very studies necessary to guard against these dangers.⁶³⁶

Comment [8750-1770]: Commenter (9227) contends that the proposed rule fails to meet even the most basic procedural and substantive obligations. The APA requires that the “opportunity for comment must be a meaningful opportunity,” and “[t]hat means enough time with enough information to comment and for the agency to consider and respond to the comments.”

Prometheus Radio Project v. FCC, 652 F.3d 431, 450 (3d Cir. 2011) (internal citation and quotation marks omitted). See also *Am. Hosp. Ass’n v. Bowen*, 834 F.2d 1037, 1044-45 (D.C. Cir. 1987) (noting the “obvious importance of the [APA’s] policy goals of maximum participation and full information.”). For its part, the CAA “requires a much more detailed notice of proposed rulemaking than does the APA.” *Union Oil Co. of Cal. v. EPA*, 821 F.2d 678, 682 (D.C. Cir. 1987); see *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 550 (D.C. Cir. 1983) (“[T]he additional notice requirements in § 307(d)(3) suggest that Congress intended agency notice under the CAA to be more, not less, extensive than under the APA.”). Executive Order 13563 underscores these obligations requiring that to promote “open exchange of information and perspectives among State, local, and tribal officials, experts in relevant disciplines, affected stakeholders in the private sector, and the public as a whole,” agencies “shall endeavor to provide the public with an opportunity to participate in the regulatory process.”⁶³⁷

Moreover, notice has to be provided by the agency; it cannot be bootstrapped from the public comments.⁶³⁸ The reasons are evident: there is no requirement for parties to monitor all of the thousands or tens of thousands of submitted comments in order to guess the issues on which to comment.⁶³⁹ A contrary rule “would turn notice into an elaborate treasure hunt, in which interested parties, assisted by high-priced guides (called ‘lawyers’), must search the record for the buried treasure of a possibly relevant comment.”⁶⁴⁰

Drafting these comments has entailed a great deal of guesswork. The comments of EDF or any other commenter on a particular issue thus should not be taken to mean that EPA provided sufficient notice of that issue.

The proposed rule lacks essential elements needed to understand it, rendering the opportunity for comment meaningless. The Proposal contains vague and contradictory statements about its actual substance and effect, fails entirely to analyze and disclose its costs and benefits, and is littered

⁶³⁵ *State of Mississippi*, 744 F.3d at 1353.

⁶³⁶ See *American Farm Bureau v. EPA*, 559 F.3d 512, 525-26 (D.C. Cir. 2009) (remanding primary Particulate Matter NAAQS because inadequate consideration of certain epidemiologic studies resulted in a standard lacking an adequate margin of safety).

⁶⁴⁰ *Small Refiner Lead Phase Down*, 705 F.2d at 550.

with vague references to entire websites and executive branch departments. The cursory reasoning and wholly inadequate record offered in support of the proposed rule prevents stakeholders from engaging with the agency on its rationale for the proposed action and its costs and benefits or offering contrary evidence. Finally, EPA has not provided any basis whatsoever to warrant the gross inadequacies of the proposed rule and the process to consider it. With such a deeply deficient basis for action, the only legally viable course is to withdraw the Proposal.

Comment [8750-1777]: Commenter (9227) Section 307(d) applies to “such. . . actions as the Administrator may determine.”⁶⁴¹ EPA claims to take this action under “authority of the statutes it administers. . . including CAA sections 103, 301(a).”⁶⁴² By issuing this Proposal through notice and comment procedures, Administrator Pruitt appears to have determined that 307(d) procedures apply.

Even without that invocation, the proposed rule is subject to these procedural requirements because it materially impacts many of the actions delineated in 307(d)(1) to which the CAA rulemaking procedures explicitly apply. The Proposal applies to “significant regulatory actions,” which many of these actions are. The CAA requires science-based decision-making that the Proposal will materially affect. For example, by restricting the science EPA may rely on in regulatory actions, the Proposal materially impacts residual risk determinations for HAP (§ 307(d)(1)(C)), standards for mobile source air toxics (§ 307 (d)(1)(K)), and residual risk standards for municipal solid waste combustors (§ 307(d)(1)(D)).⁶⁴³

This proposed rule directly affects EPA’s setting and review of NAAQS,⁶⁴⁴ the promulgation or revision of which is subject to the CAA rulemaking requirements.⁶⁴⁵ Section 108(a) of the CAA requires the Administrator to set air quality criteria for air pollutants that “reflect the latest scientific knowledge.” This Proposal amends the science EPA can consider for air quality criteria. Under CAA section 109 EPA must use the air quality criteria to set primary and secondary NAAQS and periodically review them— which EPA is currently doing for PM.⁶⁴⁶ In the Proposal, EPA cites *Am. Trucking Ass’ns v. EPA*, 283 F.3d 355, 358 (D.C. Cir. 2002) as an example of an instance where EPA relied on a scientific study where the underlying data was not publicly available. EPA states that under the Proposal use of such science would be “preclude[d]”⁶⁴⁷ In *Am. Trucking Ass’ns* the Court upheld EPA’s use of key studies underlying the NAAQS for PM. Under the Proposal, EPA would not have been permitted to use those studies, and it is unclear how the Proposal will affect EPA’s reliance on these studies as it undertakes its review. This demonstrates how this Proposal would have an immediate impact on EPA NAAQS-setting under the CAA. EPA is thus subject to the CAA 307(d) procedural requirements for this Proposal.

Comment [8750-1778]: Commenter (9227) asserts that the EPA has failed to provide a properly

⁶⁴³ 83 Fed. Reg. at 18,773.

⁶⁴⁴ CAA Section 108(a).

⁶⁴⁵ CAA Section 307(d)(1)(A).

⁶⁴⁶ See Release of the Final Integrated Review Plan for the National Ambient Air Quality, 81 Fed. Reg. 87,933 (Dec. 6, 2016).

⁶⁴⁷ 83 Fed. Reg. at 18,769 n. 3.

developed record in support of the proposed rule. EPA has not identified sufficient supporting evidence in the Proposal or in its docket and has failed to provide adequate notice of the supporting evidence for the public to respond to meaningfully, as the APA, the CAA, and other substantive statutes require.

Rulemaking under the CAA is subject to the same general requirements of statutory conformity and reasoned decision-making derived from the APA and basic principles of administrative law. CAA rules cannot be “arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law,” “in excess of statutory jurisdiction, authority, or limitations, or short of statutory right,” or “without observance of procedure required by law.”

The commenter notes that the citations for support in the Proposal are vague and uninformative, and even where the particular citation can be identified and located, it is often not clear how EPA thinks the citation supports the Proposal. This does not meet the standards of the APA and CAA.

Additionally, EPA has failed to meet the docket requirements of the CAA. CAA section 307(d)(3) requires that publication of the proposed rule in the *Federal Register* include a summary of the factual data on which the proposed rule is based, the methodology used in obtaining the data and in analyzing the data, and the major legal interpretations and policy consideration underlying the proposed rule. It also requires the agency to place “[a]ll data, information, and documents. . . on which the proposed rule relies” in the rulemaking docket on the date of publication of the proposed rule.⁶⁴⁸ The undifferentiated citation of articles and policies, most of which contradict the Proposal or otherwise offer no support for it, fails abjectly to satisfy these requirements.⁶⁴⁹ Any document that becomes available after the proposed rule has been published and that is of central relevance to the rulemaking must also be placed in the docket as soon as possible after its availability.⁶⁵⁰ The agency must allow enough time for participants in the rulemaking to respond to those documents with comments.⁶⁵¹

As of the date of the publication of the Proposal, the docket at regulations.gov contained only the following 12 documents: (1) OIRA Review Start Document (Apr. 17, 2018); (2) OIRA Review

⁶⁴⁸ CAA Section 307(d)(3).

⁶⁴⁹ See *Kennecott v. EPA*, 684 F.2d 1007, 1018 (D.C. Cir. 1982) (“Section 307(d)(3) requires that notice of proposed . . . regulations be accompanied by a statement of their basis and purpose, including the factual data on which the proposed regulations are based, the methodology used in obtaining and analyzing the data, and the major legal interpretations and policy considerations underlying the proposed regulations. . . . Though EPA states in its preamble to the final regulations that its current eligibility test is based upon a closure policy adopted by EPA before 1977, and that it has used financial tests similar to the present closure test under the agency’s existing policy, no documents embodying those tests or demonstrating the methodology used before 1977 were ever placed in the docket. The only document in the docket purporting to explain that a closure test was ever employed by EPA was a memorandum in which EPA economist Hale sets forth his recollection that such a test had been used before 1977 to determine whether smelters would be permitted to rely upon dispersion techniques to meet the ambient standards. That memo, dated August 17, 1979, was placed in the docket on March 12, 1980, approximately eleven months after the close of the public comment period, and reveals neither the actual tests nor the methodology used by EPA. The failure of EPA to observe the procedures mandated by §§ 307(d)(3) and 307(d)(6) was thus arbitrary and capricious.”)

⁶⁵⁰ CAA Section 307(d)(4).

Conclusion Document (Apr. 23, 2018); (3) White House Memorandum on Scientific Integrity (Mar. 9, 2009); (4) Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies; Republication, 67 Fed. Reg. 8,452 (Feb. 22, 2002); (5) Exec. Order 13,777, Enforcing the Regulatory Reform Agenda, 82 Fed. Reg. 12,285 (Feb. 24, 2017); (6) EPA, Plan to Increase Access to Results of EPA-Funded Scientific Research (Nov. 29, 2016); (7) OMB Memorandum M-05-03 on Issuance of OMB's "Final Information Quality Bulletin for Peer Review" (Dec. 16, 2018); (8) EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the EPA (Oct. 2002); (9) Exec. Order 13,563, Improving Regulation and Regulatory Review, 76 Fed. Reg. 3,821 (Jan. 18, 2011); (10) Exec. Order 16,093, Promoting Energy Independence and Economic Growth, 82 Fed. Reg. 16,093 (Mar. 28, 2017); (11) OMB Memorandum M-13-13: Open Data Policy-Managing Information as an Asset (May 9, 2013); (12) Commission on Evidence-Based Policymaking, *The Promise of Evidence-Based Policymaking* (Sep. 2017).

This clearly is not enough to meet the CAA's requirements. Aside from the drafts of the proposed rule submitted to OIRA, each of these documents was a pre-existing memorandum, policy document, or executive order that contains no specific analysis—factual, legal, policy or otherwise—that pertains to the impacts of or at all justifies this proposed rule. While EPA in the proposed rule cites to some of these documents as purportedly being consistent with these prior policies, see, *e.g.*, 83 Fed. Reg. at 18,769-70, as the discusses elsewhere in their comment letter, these policies do not in fact provide any basis for the Proposal. The record that EPA provides clearly fails to support its proposed action. Some of the factual data, legal interpretations, and policy considerations that EPA has not sufficiently provided evidence for include: the number of scientific studies that would be precluded from consideration under the Proposal; whether there are fields of research where the Proposal would result in insufficient scientific information available for EPA to meet its statutory duties; how EPA will address the substantial privacy concerns implicated by the Proposal; how application of this Proposal will impact substantive agency actions; what the costs of implementing this Proposal are if EPA intends to not just exclude studies from consideration where too costly to provide access, etc.

EPA, for instance, includes Executive Order 13,563 in the docket to support its statement that "[t]he best available science must serve as the foundation of EPA's regulatory actions."⁶⁵² While Executive Order 13,563 makes that statement, it does not support EPA's Proposal, which as explained above, hinders EPA's use of the best available science. EPA provides no evidence or explanation in the docket or Proposal for why EPA believes this policy would further that goal. The executive order only states that agencies should make available to the public the scientific or technological findings or conclusions on which rules rely, as opposed to underlying raw data that EPA has targeted with this Proposal. Meanwhile, EPA blatantly violates the executive order's provisions requiring agencies to weigh costs and benefits; to write regulations that are easy to understand; and to provide the scientific and technical findings underlying the rule for the public to comment on.

Section 307(d)(3) of the CAA requires that "[a]ll data, information, and documents ... on which the proposed rule relies shall be included in the docket on the date of publication of the proposed

⁶⁵² 83 Fed. Reg. at 18,769 n. 1.

rule.” Many items that EPA cites to in the Proposal as providing a basis for the proposed rule do not appear in the docket. For example, EPA states: “The proposed rule takes into consideration the policies or recommendations of third party organizations who advocated for open science.”⁶⁵³ In a footnote, EPA provides: “These include policies and recommendations from: The Administrative Conference of the United States’ Science in the Administrative Process Project; National Academies’ reports on Improving Access to and Confidentiality of Research Data, Expanding Access to Research Data, and Access to Research Data in the 21st Century; the Health Effects Institute; Center for Open Science; members of the Risk Assessment Specialty Section of the Society of Toxicology, the Dose Response Section of the Society for Risk Analysis, and the International Society for Regulatory Toxicology and Pharmacology; and the Bipartisan Policy Center’s Science for Policy Project.”⁶⁵⁴ Many of these policies and recommendations did not appear in the docket on the date of publication of the Proposal and still do not appear in the docket—a clear violation of the CAA—nor are the specific documents or reports even identified or properly cited so that they may be tracked down. This is evidently prejudicial to commenters—it undermines commenters ability to submit meaningful feedback when the agency is hiding the ball in this manner.

These policies and recommendations are not easily identifiable on their own either, even after significant internet research. This is also true of footnote 16, where EPA lists a number of agencies to support its claim that the federal government is already implementing solutions to data disclosure.⁶⁵⁵ EPA cites, for example, the National Institute of Standards of Technology. NIST has numerous policy documents on protecting privacy concerns and keeping data secure as well as its own internal policies on releasing data. It is hard to see how any are relevant here, but without a particular cite the public is denied even a chance to respond to whatever EPA is trying to use as support—or must respond to everything that might be being referenced, creating a burdensome task. Throughout these comments, as we attempt to respond to EPA’s Proposal, we have been very practically limited by our inability, even after much research and consideration, to be fully certain we have identified the appropriate policies to respond to. This presents a situation that the CAA’s docket requirement was exactly formulated to prevent.

On May 25, 2018, EPA added a memorandum to the docket for this rulemaking.⁶⁵⁶ This memorandum contains hyperlinks apparently intended to accompany various citations in the footnotes of the Proposal. This document does not cure the former procedural defect, as the CAA requires information the proposed rule relies on to be placed in the docket on the day the proposed rule is published.⁶⁵⁷ Further, these hyperlinks still link ambiguously to various documents and agency websites without providing any information about what specifically EPA intends to cite or how the cited information is being used or considered by EPA. Additionally, simply adding such a document to the docket does not provide adequate notice to the public. Someone who had access only to the proposed rule and was not carefully monitoring the docket would have no indication or notice of this new document. Either EPA is failing to comply with

⁶⁵⁷ Section 307(d)(3).

the CAA's requirements by failing to include in the docket factual data, legal interpretations, and policy considerations that support the Proposal, or these supporting items do not exist, deeming this rulemaking completely arbitrary—in either case the Proposal fails to meet the standards of the APA and CAA. Under the CAA the rulemaking docket “must provide the entire basis for the final rule and the exclusive record for judicial review,” this docket clearly cannot support a final rule.⁶⁵⁸

Comment [8750-1804]: Commenter (9227) states that the CAA requires that the *Federal Register* notice be accompanied by a statement of basis and purpose that includes a summary of the factual data on which the proposed rule is based, the methodology used in obtaining the data and in analyzing the data; and the major legal interpretations and policy considerations underlying the proposed rule.⁶⁵⁹ As discussed above, all data, information, and documents on which the proposed rule relies must be included in the docket on the date of publication of the proposed rule.⁶⁶⁰

These core requirements are “designed (1) to ensure that agency regulations are tested via exposure to diverse public comment, (2) to ensure fairness to affected parties, and (3) to give affected parties an opportunity to develop evidence in the record to support their objections to the rule and thereby enhance the quality of judicial review.”⁶⁶¹ In addition, “a chance to comment ... [enables] the agency [to] maintain[] a flexible and open-minded attitude towards its own rules,”⁶⁶² and “avoid[s] the inherently arbitrary nature of unpublished ad hoc determinations.”⁶⁶³ The failure to include critical documents relevant to the proposed rule in the docket, as required by the CAA, itself constitutes a notice violation because “absence of those documents, or of comparable materials. . . makes impossible any meaningful comment on the merits of EPA's assertions.”⁶⁶⁴ By failing to provide a more developed docket, EPA is frustrating the terms and purposes of these statute's notice requirements. These procedures are in place to form a “specific” proposal that can serve as a “focus for comments,” *Small Refiner Lead Phase Down Task Force v. EPA*, 705 F.2d 506, 548-49 (D.C. Cir. 1983); see *Home Box Office, Inc. v. FCC*, 567 F.2d 9, 36 (D.C. Cir. 1977) (agency must “make its views known . . . in a concrete and focused form so as to make criticism or formulation of alternatives possible”). Because EPA has not provided supporting evidence, has not included key items it points to as major considerations underlying the Proposal, and has generally presented a vague and unspecified proposed rule and docket, EDF and the public are hindered in our ability to provide specific comment focused on the underpinnings of the Proposal, because we do not know and can only guess as to what they

are.⁶⁶⁵

Even the text of EPA’s proposed rule and the statement of basis and purpose fails to provide the requisite notice to allow meaningful comment. At the most fundamental level, it contains vague and contradictory statements about the actual effect of the Proposal. The Proposal generally appears to make its requirements mandatory—*i.e.*, failure to make information publicly available will preclude the agency from relying on the study at all. See 83 Fed. Reg. at 18,769 n. 3 (“EPA is proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions.”); *id.* at 18,771 (“the regulatory text would impose requirements”); see also *id.* at 18,769 (“EPA will ensure that the data and models underlying the science is publicly available...”)(emphasis added) and proposed section 30.5 (“When promulgating significant regulatory actions, the Agency shall ensure that does response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation”). In a few places, however, the Proposal makes it sound as if its aims are more aspirational. See *id.* at 18,770 (“Where available and appropriate, EPA will use peer-reviewed information, standardized test methods, consistent data evaluation procedures, and good laboratory practices to ensure transparent, understandable, and reproducible scientific assessments.”)(emphasis added); *id.* at 18,772 (“The proposed rule directs EPA to make all reasonable efforts to” make data publicly available, but “does not compel the Agency to make that information available where it concludes after all such reasonable efforts that doing so in way [sic] that complies with the law and appropriate protections is not possible.”)(emphasis added); see also *id.* at 18,768 (“EPA should ensure that the data underlying those are publicly available...”)(emphasis added). The difference between a requirement precluding use of science and making all best efforts to make data publicly available is enormous.

To the extent EPA intends to propose a rule that would preclude use of science, as it appears the Proposal would do, the proposed rule is further flawed because it contains no analysis of how that would affect regulations. How many studies does EPA typically rely on in promulgating regulations? What percentage of these would meet EPA’s new requirements? For those that do not, how many could not meet these requirements for patient privacy, CBI, or other reasons? How would EPA set standards if it must rely on many fewer studies? Would EPA be precautionary in the face of less evidence? Would EPA delay promulgating regulations in order to comply with this new mandate? How does this mandate interact with statutory deadlines or statutory requirements that EPA look at a wide range of science? None of these very basic questions are addressed in the proposed rule and without answering them, it is impossible for the public to assess the import and likely consequences of the Proposal. Even more basically, the agency gives no notice as to the Proposal’s impacts, its costs, its benefits, why it applies only to regulatory requirements but not to any regulatory actions (like licensing or permitting) that confer a benefit, substantive and procedural criteria for adjudicating waivers, or even the legal theory under which the Proposal issues—the plaintive solicitation for comment as to “additional or alternative sources” of authority, 83 Fed. Reg. at 18771, does not suffice.

⁶⁶⁵ “Without a readily accessible statement of the agency’s rationale, interested parties [could not] comment meaningfully during the rulemaking process.” *Ne. Md. Waste Disposal Auth. v. EPA*, 358 F.3d 936, 949 (D.C. Cir. 2004).

To the extent the Proposal is intended to solicit comment on how EPA may make reasonable efforts to make data publicly available it is also unlawfully vague. The proposed rule includes numerous footnotes referencing entire websites or even Departments of the Executive Branch. For example, the Proposal claims that “EPA believes that concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions commonly used across some parts of the Federal government.”⁶⁶⁶ To support this proposition, EPA remarkably cites (without any further elaboration or explanation in the proposal itself) to “examples from the U.S. Department of Health and Human Services, National Institute of Standards and Technology, U.S. Department of Education, and the U.S. Census Bureau.”⁶⁶⁷ See *Small Lead Refiner Phase Down*, 705 F. 2d at 548 (requirement that comments are to raise issues with “reasonable specificity” applies equally to the agency giving notice). For example, it is not possible to identify whether the sources referenced support EPA’s claim that there are approaches available to address the serious privacy issues raised by the Proposal— without providing the specific policies and recommendations, a public commenter has no way of knowing whether they are consistent or why EPA believes them to be consistent. It is impossible to respond in a meaningful way without significant guesswork.

Similarly, in footnote 10 of the proposal, where EPA lists a number of organizations whose “policies and recommendations” the Proposal allegedly took under consideration—no explanation is provided.⁶⁶⁸ In addition, in the proposed rule EPA fails to adequately define key terms like “validation”, “independence”, “reproducibility,” “replication,” and “uncertainty,” while also citing a “replication crisis” in science. It is important that these terms are defined clearly as these terms are not defined consistently across the scientific community nor governments—which has implications for the scope and purview of the proposed rule.

This amount of information is wholly insufficient to allow a public commenter to provide meaningful comments about these issues.

Comment [8750-1807]: Commenter (9227) states that the Proposal impacts EPA’s process for setting NAAQs in material ways by amending the scientific information that can be used as air quality criteria. Under the CAA air quality criteria cannot be amended without review by the Clean Air Science Advisory Committee (CASAC).⁶⁶⁹ Thus, EPA must submit this proposal to CASAC for review, consider their recommendations, and provide reasonable explanation for deviation from those recommendations.⁶⁷⁰

Comment [8750-1943]: Commenter (9227) contends that the EPA arbitrarily failed to consider

⁶⁶⁶ Proposed Rule, 83 Fed. Reg. at 18,770.

⁶⁶⁷ Id. at 18,770 n. 16.

⁶⁶⁸ 83 Fed. Reg. at 18,770. n. 10 (“These include policies and recommendations from: The Administrative Conference of the United States’ Science in the Administrative process Project; National Academies’ reports on Improving Access to and Confidentiality of Research Data, Expanding Access to Research Data, and Access to Research Data in the 21st Century; the Health Effects Institute; Center for Open Science; members of the Risk Assessment Specialty Section of the Society of Toxicology, the Dose Response Section of the Society for Risk Analysis, and the International Society for Regulatory Toxicology and Pharmacology; and the Bipartisan Policy Center’s Science for Policy Project.”)

⁶⁶⁹ CAA § 109(d)(2)(B).

⁶⁷⁰ CAA § 109(d)(2)(B); 307(d)(3).

the far-reaching implications this Proposal could have on inter-agency coordination and consultation given that other agencies normally rely on research potentially excluded by the Proposal and cites consultation provisions in the CAA.⁶⁷¹

Comment [8750-2635]: Commenter (9227) notes that the EPA cites CAA, § 301, 42 U.S.C. § 7601, as purportedly granting authority for the Proposal.⁶⁷² The authority granted by section 301(a), however, applies only to the CAA and, in any event, is not broad enough to encompass this Proposal. Section 301 provides that “[t]he Administrator is authorized to prescribe such regulations subject to section 307(d) as are *necessary* to carry out his [or her] functions under this Act.”⁶⁷³ The courts have consistently “decline[d] to read ... open-ended power into section 301,”⁶⁷⁴ and instead have required that regulations promulgated under section 301 be both necessary and appropriate.⁶⁷⁵ As discussed in more detail below, EPA’s Proposal here is not necessary, and instead directly conflicts with several other provisions of the CAA. It is axiomatic that a “general grant of authority cannot trump specific statutory provisions.”⁶⁷⁶

[9066-1932] Commenter (6188) contends that the Proposed Rule contradicts the requirements of Federal environmental law, including cited authority for the rulemaking. The Proposed Rule’s requirements are at odds with statutory mandates contained in the very same environmental laws it points to as providing a basis for the rule. They also directly controvert authority it cites as support for the rulemaking.

The requirements of the Proposed Rule conflict with EPA’s statutory obligations under federal environmental laws. CAA § 109 mandates that EPA set air quality standards based on “air quality criteria,” which must “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare.” 42 U.S.C. §§ 7409, 7408(a)(2).

Exclusion of relevant studies from consideration based not on the quality of the science but on

⁶⁷¹ See *Motor Vehicle Mfrs. Ass’n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (“Normally, an agency rule would be arbitrary and capricious if the agency has . . . entirely failed to consider an important aspect of the problem.”).

⁶⁷² 83 Fed. Reg. at 18769.

⁶⁷³ 42 U.S.C. § 7601(a)(1) (emphasis added).

⁶⁷⁴ *Nat. Res. Def. Council v. Reilly*, 976 F.2d 36, 41 (D.C. Cir. 1992).

⁶⁷⁵ E.g., *Alabama Power Co. v. Costle*, 636 F.2d 323, 403 (D.C. Cir. 1979) (finding an EPA rule unauthorized under section 301, and concluding that “[a]n extension of PSD permit requirements beyond the wording of the Act is therefore neither necessary nor appropriate to carry out EPA’s functions under the Act.”); *Nat. Res. Def. Council v. EPA*, 22 F.3d 1125, 1148 (D.C. Cir. 1994) (“[S]ection 301 does not provide the Administrator ‘carte blanche authority to promulgate any rules, on any matter relating to the Clean Air Act, in any manner that the Administrator wishes,’” and instead “allow[s] the promulgation of rules that are necessary and reasonable to effect the purposes of the Act.”) (quoting *Citizens to Save Spencer County v. EPA*, 600 F.2d 844, 873 (D.C. Cir. 1979)); *Nat. Res. Def. Council v. EPA*, 749 F.3d 1055, 1063 (D.C. Cir. 2014) (“[W]e have consistently held that EPA’s authority to issue ancillary regulations is not open-ended, particularly when there is statutory language on point.”); *North Carolina v. EPA*, 531 F.3d 896, 922 (D.C. Cir. 2008), on reh’g in part, 550 F.3d 1176 (D.C. Cir. 2008) (striking down a regulation promulgated under Section 301 because EPA could not demonstrate that it was “necessary” to fulfill the purposes of the Act).

⁶⁷⁶ *Nat. Res. Def. Council v. EPA*, 749 F.3d 1055, 1063-64 (D.C. Cir. 2014); *API v. EPA*, 52 F.3d 1113, 1119 (D.C. Cir. 1995) (same).

the public availability of underlying data directly contradicts mandates.⁶⁷⁷ EPA itself has defined “best available science” without reference to the public availability of data:

Use of best available science involves the use of supporting studies conducted in accordance with sound and objective scientific practices, including, when available, peer reviewed science and supporting studies and data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).⁶⁷⁸

Simply put, the “best available science” is science that follows standards accepted by the scientific community, not science that EPA arbitrarily selects based upon the public availability of data—a criterion irrelevant to scientists’ standards for determining whether research represents the best science.

Specifically, scientists have observed that the best quality science oftentimes relies upon data that is not publicly available due to significant privacy considerations.⁶⁷⁹ It is for that very reason that courts have recognized EPA’s need to rely upon studies based on publicly undisclosed underlying data when considering the best science. *American Trucking Ass’n*s, 283 F.3d at 372 (explaining that curtailing EPA’s ability to rely on published studies would exclude “plainly relevant scientific information” from regulatory decision-making processes); see also *Coalition of Battery Recyclers Ass’n*, 604 F.3d at 623 (finding that EPA is entitled to rely on published study results as “raw data is often unavailable due to proprietary interests of a study’s scientific investigators or confidentiality agreements with study participants”). Forcing EPA to ignore high quality science controverts EPA’s statutory obligations and will impair EPA’s ability to protect public health and the environment.

Comment [9066-1894]: Commenter (6188) states that the EPA purports to derive authority for the Proposed Rule from CAA § 103. That provision simply authorizes EPA to establish a national research and development program for the prevention and control of air pollution and, as part of that program, to conduct and promote the coordination of research and studies relating to the causes, effects, extent, prevention, and control of air pollution. 42 U.S.C. § 7403(a)(1). The section authorizes specific activities of the Administrator in establishing such a program, none of which includes limiting the scope of reviewable data, research, or studies when undertaking regulatory action. The section has no bearing on how or to what extent EPA utilizes research in regulatory decision-making processes.

Comment [9217-3559]: Commenter (9225) contends that the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA’s

⁶⁷⁷ Even EPA’s current mission statement explains that EPA works to ensure “[n]ational efforts to reduce environmental risks are based on the best available scientific information.” See EPA, About EPA, available at <https://www.epa.gov/aboutepa/our-mission-and-what-we-do>.

⁶⁷⁸ Environmental Protection Agency Office of Chemical Safety and Pollution Prevention, Guidance to Assist Interested Persons in Developing and Submitting Draft Risk Evaluations Under the Toxic Substances Control Act, EPA 740-R17-001 (June 2017).

⁶⁷⁹ See, e.g., International Society for Environmental Epidemiology, Comments of the International Society for Environmental Epidemiology on EPA’s proposed rule on Strengthening Transparency in Regulatory Science (EPA-HQ-OA-2018-0259-0001) (citing to multiple robust environmental studies based upon data that could not be disclosed because of federal and foreign laws and access agreements with Medicare).

authority. This includes, but is not limited to, the CAA; CWA; TSCA; LCSA; SDWA; FIFRA; and more.

Comment [9287-3739]: Commenter (8281-PH16) Because of the importance of having access to such scientific data in order to protect the public's health, we oppose the “Strengthening Transparency and Regulatory Science” proposed rule. Research and evidence are the foundation of EPA's policies and has been necessary for success of laws like the CAA and improving and in saving lives from the dangers of air pollution.

Congress intentionally directed EPA to consider peer reviewed research under the CAA and mandates regular reviews of the science to ensure that EPA is reviewing and considering the most up to date science. The commenter believes that the proposal would prevent EPA from using the best science to inform decision-making, and the result would be weaker standards at the expense of American's health. For example, the proposal would exclude several landmark air quality studies from the evidence base that EPA is permitted to consider, largely on the basis that these studies include confidential patient information that would make them less transparent under the constructs of the proposed rule.

Comment [9290-3812]: Commenter (8281-PH24) states that the EPA has administered successfully, the CWA, and the CAA, and these acts should be expanded based on scientific research. The EPA should not be working to undermine scientific research.

Comment [5167-4751]: Commenter (5178) provides that the CAA requires that EPA set NAAQS to protect the public health, and to do so with an adequate margin of safety.⁶⁸⁰ NAAQS must be based on air quality criteria that “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air.”⁶⁸¹ EPA must comprehensively consider the state of scientific knowledge,⁶⁸² and set standards to “protect individuals who are particularly sensitive to the effects of pollution.”⁶⁸³ These susceptible groups include children; the elderly; and those with heart disease, lung disease, or asthma. Recently, Patricia Koman and colleagues have suggested that pregnant women should be considered an at-risk population due to physiological changes, noting, “Women with preexisting conditions, women experiencing poverty, and groups that suffer systematic discrimination may be particularly susceptible to cardiac effects of air pollutants during pregnancy.”⁶⁸⁴

Two landmark prospective cohort studies have informed the NAAQS for fine particulate pollution (PM_{2.5}). The Harvard Six Cities Study followed 8,111 residents of six U.S. cities from recruitment in 1974-1977 through 1991 and collected air sampling data and health

Examining Joint Effects of Air Pollution Exposure and Social Determinants of Health in Defining “At-Risk” Populations Under the Clean Air Act: Susceptibility of Pregnant Women to Hypertensive Disorders of Pregnancy. *World Medical & Health Policy*, 10(1):7-54.

information.⁶⁸⁵ After adjusting for other health risk factors, the investigators found that mortality rates were associated with the level of air pollution, and that the association was particularly strong for fine particulate pollution.⁶⁸⁶ The American Cancer Society (ACS) study linked air pollution data from 151 U.S. metropolitan areas to data on risk factors and mortality in 552,138 adults residing in these areas who enrolled in 1982 and were followed through 1989.⁶⁸⁷ The authors found increased mortality to be associated with sulfate and fine particulate air pollution “at levels commonly found in U.S. cities.”⁶⁸⁸

Both studies were instrumental in setting the 1997 NAAQS, and some stakeholders called for the data to be made public. However, study participants had been assured confidentiality. Instead of making data public, investigators agreed to supply it to the HEI, which used a competitive process to select a team to reanalyze the data. In 2000, HEI reported that the re-analyses “assured the quality of the original data, replicated the original results, and tested those results against alternative risk models and analytic approaches without substantively altering the original findings of an association between indicators of PM air pollution and mortality.”⁶⁸⁹

Since publication of these two landmark studies, dozens of additional peer-reviewed studies, as well as follow-up research involving the Six Cities and ACS cohorts, have replicated and expanded upon their findings and provided insights into specific effects of particulate pollution on certain groups.^{690,691} In a look back at the evolution of research on the health effects of particulate pollution, lead Six Cities investigator Douglas W. Dockery commented:

True replication requires not reanalyzing existing work but independent investigators producing independent data. The HEI process made important contributions in evaluating, advancing, and applying new methods which led to significant additional analyses. But the HEI work reanalyzing an existing body of evidence was time-consuming and expensive. It would not be a good use of resources to require this approach for all studies contributing to the regulatory actions, or even to a few key studies.⁶⁹²

EPA’s 2011 policy assessment for review of the particulate NAAQS noted that in addition to epidemiologic studies, toxicological and controlled human exposure studies identify potential biological pathways for cardiovascular and respiratory effects associated with particulate

⁶⁹² Dockery DW. (2009). Health Effects of Particulate Air Pollution. *Annals of Epidemiology*, 19(4): 257-263.

exposures.⁶⁹³ The analysis also summarizes research on susceptible populations: “the currently available epidemiological and controlled human exposure evidence expands our understanding of previously identified susceptible populations (*i.e.*, children, older adults, and individuals with pre-existing heart and lung disease) and supports the identification of additional susceptible populations (*e.g.*, persons with lower socioeconomic status (SES), genetic differences).”⁶⁹⁴ It reports that evidence is accumulating on the effects of PM_{2.5} on low birthweight and infant mortality.⁶⁹⁵

Some of the most recent research adds to knowledge on susceptible populations. For example, Qian Di and colleagues analyzed 2000-2012 data on 61 million Medicare beneficiaries and zip-code level information on PM_{2.5} and ozone pollution.⁶⁹⁶ They found increased mortality risks — including higher risks for black beneficiaries and those eligible for Medicaid, who are disproportionately women with low incomes⁶⁹⁷ — at pollutant levels below the current limits.⁶⁹⁸

Mingyu Zhang and colleagues analyzed local air pollution data as well as data from the Boston Birth Cohort, which began recruiting pregnant women in 1998 and followed their children for several years after birth.⁶⁹⁹ They found that the children of women who were exposed to the highest PM_{2.5} levels during their third trimesters had a greater risk of elevated blood pressure at ages three to nine.⁷⁰⁰ Both of these studies involve data that can be obtained by investigators who apply to use it and are approved by the relevant IRB or Privacy Board,^{701,702} but their data sets are not publicly available. Such an approach recognizes recent advances in identifying individuals from data that do not appear to contain PII. For decades, public release of data collected on individuals has relied on anonymization to protect privacy, but researchers have demonstrated the potential of “reidentification” techniques, which combine seemingly innocuous data from multiple publicly available sources, to identify individuals.^{703, 704}

Failure to consider these studies and others like them in setting NAAQS because their data are not publicly available would conflict with responsibilities to advance children’s environmental

health and environmental justice, as well as the requirement that EPA set standards that protect susceptible subgroups.

Comment [6141-2554]: Commenter (6166) asserts that the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA's authority. This includes, but is not limited to, the CAA; CWA; TSCA; LCSEA; SDWA; FIFRA; and more. Substantively, the rule violates numerous public health and environmental provisions contained in these laws, as well as requirements to use the best available science or to consider all available information,

Comment [6857-2945]: Commenter (6879) notes that EPA rules and regulations have been critical to the protection of wildlife, natural habitats, and the ecosystem services they provide to communities and the economy. This includes protection of people from air pollution and climate disruption under the CAA.

These laws require EPA to use the "best available" science, or all "reasonably available" science and information. By excluding high-quality peer-reviewed and validly published science from the regulatory decision-making process, the proposed regulation directly contravenes the specific mandate of these statutes. And by deliberately excluding the best science available, the rule also contravenes the Congressional mandates for these statutes and undermines their public health and environmental protection purposes.

Comment [6873-1712]: Commenter (6895) states that by mandating this irrelevant requirement, the proposed rule will restrict the use of best available science in public health and environmental protection decision making, which contradicts EPA's own "Peer Review Handbook."⁷⁰⁵ For example, EPA is required to use the "latest scientific knowledge" in setting NAAQS and historically EPA follows that requirement in making risk management decisions based on the best available science. The Presidential/Congressional Commission on Risk Assessment and Risk Management was mandated by Congress in the CAA Amendments of 1990 "to make a full investigation of the policy implications and appropriate use of risk assessment and risk management in regulatory programs under various Federal laws to prevent cancer and other chronic human health effects which may result from exposure to hazardous substances".^{706,707} After years of work the Commission proposed a systematic, comprehensive framework that can address various contaminants, media, and sources of exposure, as well as public values, perceptions, and ethics, and that keeps the focus on the risk management goals. For this framework to be successful, the use of science cannot be restricted or limited. EPA should adhere to the well-reasoned process which the Commission on Risk Assessment and Risk

⁷⁰⁵ EPA's own guidance states that "EPA strives to ensure that the scientific and technical bases of its decisions meet two important criteria: (1) they are based upon the best current knowledge from science, engineering, and other domains of technical expertise; and (2) they are credible," EPA, Science and Technology Policy Council, Peer Review Handbook, 4th Edition, October 2015, at p. A-4. The proposed rule, by eliminating studies that may not be made public for privacy and other reasons to support proposed rules and regulations undermines these two key criteria.

⁷⁰⁷ The Presidential/Congressional Commission on Risk Assessment and Risk Management. (1997). Final Report. Volume 2. Risk Assessment and Risk Management in Regulatory Decision-Making.

Management developed.

Comment [7869-3372]: Commenter (8272) asserts that the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA's authority. This includes, but is not limited to, the CAA; CWA; TSCA; LCSA; SDWA; and the FIFRA. The rule violates numerous public health and environmental provisions contained in these laws, as well as requirements to use the best available science or to consider all available information.

Comment [6106-875]: Commenter (6116) notes that, on April 30, 2018, the EPA published a notice in the *Federal Register* of a proposed rule that would drastically reduce the types of scientific studies that can be used to inform EPA regulations protecting public health under the guise of improving transparency. The commenter notes that they are troubled by this proposal, as we believe it would vastly undermine the mission of the EPA, which is to protect human health and the environment. It is curious that this proposal champions "transparency" when it seems certain to serve the opposite purpose. The commenter opposes this proposal for several reasons, including, but not limited to the following:

- The EPA itself seems to question whether it has the authority to promulgate this rule. The FR notice asks commenters to provide information on what areas of the CAA they feel may demonstrate this type of authority. The EPA should have a solid foundation before it proposes rules and should not have to seek answers for questions about its own authority.

Comment [6116-1117]: Commenter (6141) states that Ground the New Regulatory Framework based on the Agency's Statutory Authority and Longstanding Values and Principles of Good Government.

The Proposal for scientific transparency is consistent with the objectives and requirements of existing federal environmental statutes and administrative policies. Most importantly, the CAA and other major federal environmental statutes provide EPA with broad authority to establish procedures, requirements, and criteria for adopting rules, regulations, and policies for how the Agency adopts new regulations, rules, and guidance. For example, section 301(a) of the CAA provides the EPA Administrator with broad authority to establish regulations "as are necessary to carry out ... the functions" under the CAA, while section 307(d) provides extensive authority on the manner in which EPA may conducting notice and comment rulemakings, including provisions for ensuring a robust rulemaking record and adequate opportunities for public participation.⁷⁰⁸ The other relevant federal environmental statutes also provide EPA broad

⁷⁰⁸ As a general matter, CAA section 307(d) imposes more stringent transparency requirements for public notice and comment than those requirements imposed under section 553 of the APA. See CAA section 307(d)(3) (providing that notice of proposed rulemaking shall not only comply with the public notice requirements of APA section 553(b), but also be "accompanied by a statement of its basis and purpose" which shall include "the factual data on which the proposed rule is based," "the methodology used in obtaining the data and in analyzing the data," and "the major legal interpretations and policy considerations underlying the proposed rule"). See also, *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 519 (D.C. Cir. 1983) (stating that CAA § 307(d)(3) "requires a much more detailed notice of rulemaking" than does the APA); *Union Oil Co. of Cal. v. EPA*, 821 F.2d 678,681-82 (D.C. Cir. 1987) (noting that the CAA establishes "new procedural requirements for EPA rulemaking" that are

authority for the establishment of procedures, requirements, and criteria for how it establishes implementing rules, regulations, and policies.⁷⁰⁹ Oglethorpe Power [the commenter] supports EPA's proposal to use this authority to establish new rules for ensuring the transparency and public availability of the underlying scientific data and other important supporting documentation used by EPA in its regulatory actions.

Comment [6163-1276]: Commenter (6133) notes that, in addition to addressing how and whether the agency will consider science, the Proposal also contains a seemingly unrelated provision regarding agency peer review. The Proposal, in § 30.7, reads:

What role does independent peer review in this section?

EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

Because transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results.

83 Fed. Reg. at 18,774.

There is no statutory authority for EPA to “conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” The federal statutes that EPA lists as putative authority for the Proposal provide no authority for proposed § 30.7. See 83 Fed. Reg. at 18,769/2 (citing CAA sections 103, 301(a), 42 U.S.C. 7403, 7601(a)). The claimed authorities that EPA lists do not mention peer review or even allude to the concept. *Id.* Neither the Proposal nor accompanying docket materials identify any provision of any federal statute that authorizes EPA to promulgate proposed § 30.7. Our own research revealed no provision of any federal statute that authorizes EPA to promulgate proposed § 30.7.

When Congress writes federal statutes, Congress knows how to create legal authority for peer review, who shall conduct that peer review, what role, if any, that EPA or other parties will play, and how that peer review may be conducted. None of the provision in the law authorize EPA's

“more stringent than those previously applicable under the Administrative Procedure Act,” including a requirement that “EPA . . . establish a detailed ‘rulemaking docket’ that . . . must provide the entire basis for the final rule”).

⁷⁰⁹ See e.g., Clean Water Act sections 104, 501, 33 U.S.C. 1254, 1361; Safe Drinking Water Act sections 1442, 1450(a)(1), 42 U.S.C. 300j–1, 300j–9(a)(1); Resource Conservation and Recovery Act sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; Comprehensive Environmental Response, Compensation, and Liability Act (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; Emergency Planning and Community Right-To-Know Act section 328, 42 U.S.C. 11048; Federal Insecticide, Fungicide, and Rodenticide Act sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; Toxic Substances Control Act, as amended, section 10, 15 U.S.C. 2609.

Proposal in § 30.7. Instead, the statutes require that EPA use peer-reviewed science, regardless of whether it would meet EPA's definition of the term in § 30.7. And in cases where the law requires EPA to conduct the review, the statutes often spell out specifically how that should happen.

The commenter cites statute provisions on Peer Review under the CAA (as well as other statutes):

§ 7511b. Federal ozone measures

(g) Ozone design value study The Administrator shall conduct a study of whether the methodology in use by the EPA as of November 15, 1990, for establishing a design value for ozone provides a reasonable indicator of the ozone air quality of ozone nonattainment areas. The Administrator shall obtain input from States, local subdivisions thereof, and others. The study shall be completed, and a report submitted to Congress not later than 3 years after November 15, 1990. The results of the study shall be subject to peer and public review before submitting it to Congress.

42 U.S.C. § 7511b (emphasis added).

§ 7412. HAP

(p) Mickey Leland National Urban Air Toxics Research Center (NUATRC) (3) Scientific Advisory Panel (SAP) The Board of Directors shall be advised by a SAP, the 13 members of which shall be appointed by the Board, and to include eminent members of the scientific and medical communities. The Panel membership may include scientists with relevant experience from the NIEHS, the CDC, the EPA, the National Cancer Institute (NCI), and others, and the Panel shall conduct peer review and evaluate research results. The Panel shall assist the Board in developing the research agenda, reviewing proposals and applications, and advise on the awarding of research grants.

42 U.S.C. § 7412 (emphasis added).

Under longstanding federal case law, when Congress authorizes an approach in one section of a statute using specific language but does not do the same in other sections of a statute, courts presume that Congress acted purposefully and did not mean to address or authorize that approach in those other statutory sections. See, e.g., *Dean v. United States*, 556 U.S. 568 (2009) (“It is generally presumed that Congress acts intentionally when including particular language in one section of a statute but not in another.” (citing *Russello v. United States*, 464 U.S. 16, 23 (1983))). Not only are there no implied grants of authority to an agency in other statutory sections, but the congressional decisions to authorize the approach elsewhere in the statute give even greater force to the conclusion that the agency has not been given authority where Congress did not use the same or similar authorizing language.

1.3.1.2 CAA (SNPRM Comments)

Comment [29-2180]: Commenter (11184) states that, by way of example, in CAA. Section 108(a)(2), Congress requires EPA to issue air quality criteria for air pollutants to "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air." 42 U.S.C. § 7408(a)(2). The SNPRM does not claim that studies that have not publicly released all their underlying data, such as those linking air pollution to mortality and disease, do not accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air. If EPA were to exclude such studies from consideration when issuing air quality criteria, it would be in violation of the CAA.

Comment [48-518]: Commenter 12727 states that the expanded proposal would irreconcilably conflict with EPA's obligation to regulate emissions of HAP under the CAA. Section 112 of the Act requires EPA to set emission standards for existing major sources of HAP that are typically no less stringent than "the average emission limitation achieved by the best performing 12 percent of the existing sources (for which the Administrator has emissions information)."⁷¹⁰ This provision does not allow EPA to ignore information that the agency possesses but that qualifies as CBI. Indeed, EPA has historically taken such CBI into account in calculating the minimum limitation.⁷¹¹ Now, however, EPA has proposed to define "data and models" to encompass "data on environmental releases" and to eliminate any such data that would underlie pivotal regulatory science driving the level of a standard, such as emission standards under section 112.⁷¹² EPA's proposed rule, as expanded, patently conflicts with the CAA's well established requirements and cannot be finalized.⁷¹³

Comment [48-2181]: Commenter (12727) Several environmental statutes require EPA to ground its decision-making in scientific evidence. The CAA, for example, mandates that "[a]ir quality criteria . . . accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare," 42 U.S.C. § 7408(a)(2), and the TSCA requires the Administrator to "make decisions . . . based on the weight of the scientific evidence," 15 U.S.C. § 2625(i)."

The originally proposed regulatory language (§§ 30.3, 30.5) violated these statutory commands by preventing EPA from relying on a study as "pivotal regulatory science . . . used to justify significant regulatory decisions" if dose-response data or models underlying the study were not publicly available, without regard to whether the study had been validated by other means. The Supplemental Notice exacerbates these violations by expanding the proposed regulation's scope (§§ 30.3, 30.5) to not just pivotal *regulatory* science used to justify significant *regulatory* decisions, but also "pivotal science supporting influential scientific

⁷¹⁰ 42 U.S.C. § 7412(d)(3)(A).

⁷¹¹ See, e.g., 67 Fed. Reg. 46,028, 46,044-45 (July 11, 2002); 63 Fed. Reg. 68,832, 68,843, tbl. 4 (Dec. 14, 1998).

⁷¹² See 85 Fed. Reg. at 15,401-02; 83 Fed. Reg. at 18,773 (proposed 40 C.F.R. § 30.2, defining "[p]ivotal regulatory science").

⁷¹³ For the reasons discussed above, see Section III.C, *supra*, EPA's promise to yield in its application of the proposed rule whenever clear statutory duties require it to consider otherwise off-limits information cannot cure the rule's fundamental defects. On the contrary, the proposal's incompatibility with a wide array of EPA's governing statutes provides further evidence that the proposal is arbitrary and unlawful.

information.”

Comment [38-40]: Commenter (12727) Just as EPA is required to consider all available science when making its regulatory decisions, governing environmental and public health statutes likewise require EPA to consider all available science when releasing ISI, which often forms the basis for the agency’s regulatory decisions. For example:

CAA section 108 instructs EPA to establish air quality criteria that “accurately reflect the latest scientific knowledge,”⁷¹⁴ which criteria, in turn, must inform NAAQS.⁷¹⁵

A rule that prohibits EPA from considering (or that downgrades) valid, high quality scientific studies when generating ISI such as the products identified above would contravene the above-noted statutory directives regarding EPA’s obligation to consider all available science.

Comment [53-2006]: Commenter (11360) Congress intentionally and wisely embedded peer-reviewed research in the foundation of the CAA, including requiring regular reviews of the science, explicitly recognizing that EPA needs the most current, peer-reviewed data to protect the public health. Limiting scientific evidence does not strengthen regulations or policies; rather, it is paramount that the full suite of relevant science, vetted through peer-review, inform the landscape of decision-making. Excluding relevant studies simply because they do not meet unnecessarily rigid transparency standards will adversely affect decision-making processes.

Comment [73-421]: Commenter (11576) notes that, as previously explained, the current rulemaking process has also violated the requirements of other statutes the EPA may or may not be relying on in attempting to issue the proposed rule.⁷¹⁶ Under the CAA, the EPA is directed to “give interested persons an opportunity for the oral presentation of data, views, or arguments, in addition to an opportunity to make written submissions[,]” and to “keep the record of such proceeding open for thirty days after completion of the proceeding to provide an opportunity for submission of rebuttal and supplementary information.”⁷¹⁷ The EPA’s refusal to satisfy these requirements cannot be allowed to stand.

Comment [81-2189]: Commenter (12715) asserts that the EPA is arbitrarily barring consideration of scientific studies or information with nonpublic underlying data or data that are not able to be independently validated, or arbitrarily ascribing less weight to such studies or information, neither approach constitutes “housekeeping,” and neither comports with statutory requirements that EPA use the best available science. To reiterate from the 2018 Comments, EPA’s obligation with respect to the use of scientific information is clear: it must base its decisions on such criteria as the latest scientific knowledge, the best available, peer-reviewed science, and/or generally accepted scientific principles or laboratory tests. To cite an example, in performing its duties, EPA must rely on: “the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices,” CAA of 1970, 42 U.S.C. § 7408(a)(2). EPA has repeatedly emphasized the importance of this

⁷¹⁴ 42 U.S.C. § 7408(a)(2).

⁷¹⁵ Id. § 7409(b).

⁷¹⁶ See August 2018 Coalition Comments at 63-67.

⁷¹⁷ 42 U.S.C. § 7607(d)(5) (cited in August 2018 Coalition Comments at 43, 64).

fundamental precept, including in its 2018-2022 strategic plan, which states that one of the agency's priorities is to "identify, assess, conduct, and apply the best available science to address current and future environmental hazards."⁷¹⁸

These statutory requirements apply to all aspects of EPA's decision-making, including its scientific evaluations, adoption of regulatory standards, and development of policies. They do not permit what EPA proposes here: to either exclude or give less weight to scientific studies or information based on criteria—availability of the underlying data and ability to independently validate underlying data—that are not determinative of whether the studies or information constitute the best available science. Agencies may not adopt or implement regulations that conflict with the statutes under which they are promulgated, and an agency's interpretation of those statutes must always at least be reasonable. See *Chevron, U.S.A., Inc. v. Nat. Res. Def. Council, Inc.*, 467 U.S. 837, 842-44 (1984). Furthermore, neither 5 U.S.C. § 301 nor any other purported housekeeping authority allows EPA to negate these statutes' fundamental, substantive, and common-sense commands. And even assuming EPA has some inherent housekeeping authority, it cannot rely on a general grant of rulemaking authority to promulgate regulations or develop policies that are otherwise inconsistent with more specific statutory directives. *Glob. Van Lines, Inc. v. Interstate Commerce Comm'n*, 714 F.2d 1290, 1293-97 (5th Cir. 1983).⁷¹⁹

Finally, EPA acknowledges that the statutes it administers would control in the event of a conflict between the proposed rule and those statutes, see 85 Fed. Reg. at 15,398, but that caveat cannot save the proposed rule. First, the core principle of the proposed rule is facially invalid, *i.e.*, there is no circumstance in which it would be acceptable for EPA to exclude or give less weight to relevant, probative scientific studies, models, or other information that have been validated through peer review, on the sole basis that the underlying data are not publicly available or are not able to be independently validated. EPA cannot save an invalid rule by including what amounts to a waiver procedure, because the "essence of waiver is the assumed validity of the general rule." *Alltel Corp. v. Fed. Commc'n Comm'n*, 838 F.2d 551, 561 (D.C. Cir. 1988). Second, the agency's essential duty in rulemaking is to exercise its subject matter expertise to enact rules that implement and further the purposes of the statutes Congress has assigned it to administer. *Chevron*, 467 U.S. at 842-44. This does not include proposing rules without first determining the source of legal authority but instead asking commenters to supply that information. Third, the agency must propose its rules with specificity and be clear as to the programs, regulations, and information to which they will apply. 5 U.S.C. § 553(b)(3); *Home Box Office, Inc.*, *supra*, 567 F.2d at 35-36.

Comment [82-2192]: Commenter (12464) Third, both alternatives are inconsistent with the statutes directing which data EPA must consider in certain contexts. As we explained in a previous comment letter, many statutes require EPA to consider science in its decision-making, without any reference to whether such science is based on studies with raw data that is publicly

⁷¹⁸ U.S. Env'tl. Prot. Agency, Working Together: FY 2018-2022 EPA Strategic Plan, (2018) at page 42, <https://www.epa.gov/sites/production/files/2019-09/documents/fy-2018-2022-epa-strategic-plan.pdf>.

⁷¹⁹ EPA's citation to Clean Water Act, CERCLA, and RCRA provisions granting authority to promulgate rules to carry out the agency's responsibilities under those statutes, 85 Fed. Reg. at 15,397, is also unavailing. Restricting consideration of the best science is neither necessary nor consistent with those statutes' goals of protecting human health and the environment.

available.⁷²⁰ For example, under the CAA, EPA must set and review the NAAQS for six common pollutants.⁷²¹ In setting these standards, the CAA instructs EPA to use “the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects [of air pollution] on public health or welfare.”⁷²² Thus, a conflict would arise between the statutory language and the reduced-weight alternative if EPA gave less weight to a study that was “the latest scientific knowledge” on a relevant question merely because the raw data from that study is not publicly available. The same conflict would exist with the proposed tiered-access system, if the “latest scientific knowledge” came from a study with raw data to which researchers have not or could not grant restricted access.

Comment [89-2193]: Commenter (11403) states that the EPA’s 2018 version of this rule cited a hodgepodge of statutory authority, none of it valid. EPA at least corrected the obvious typographical errors from the previous version. However, those edits still do not grant EPA the authority to restrict science from all regulatory decision-making processes within the agency. EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, “Congress . . . does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes.”⁷²³ EPA does not have the authority to alter the fundamental details of all of its regulatory schemes based on such vague provisions of law.

Section 103 of the CAA directs EPA to “conduct, and promote the coordination and acceleration of, research, investigations, experiments, demonstrations, surveys and studies” on air pollution.⁷²⁴ Curtailing the use of science based on arbitrary notions of transparency does the opposite of what Section 103 requires.

Section 301(a) of the CAA gives the Administrator authority to “prescribe such regulations as are necessary to carry out his functions” relating to the CAA.⁷²⁵ This catch-all provision certainly provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is “necessary” to the carrying out of functions under the CAA

In short, none of the statutory provisions cited by EPA provide authority for the proposed rule. The proposed rule fails at step one under *Chevron v. Natural Resources Defense Council* since it is unreasonable to believe that any statutory general grant of authority or any mention of EPA’s oversight of other science or research programs would enable EPA to conduct rulemaking in a way that is altogether inconsistent with the rule of law. None of the cited provisions provide the authority sought by EPA, and as such the proposed rule should be withdrawn.

⁷²⁰ ELPC Multi-Clinic Comments, *supra* note 2, at 13-17.

⁷²¹ 42 U.S.C. § 7409.

⁷²² *Id.* § 7408(a)(2). Other examples of statutes that require EPA to use scientific information include the Safe Drinking Water Act, which requires EPA to use “the best available, peer-reviewed science,” *id.* § 300g-1(b)(3)(A)(i), and the Toxic Substances Control Act, which requires EPA to make decisions “based on the weight of the scientific evidence,” 15 U.S.C. § 2625(h), (i); see also Clean Water Act, 33 U.S.C. § 1314(a)(1) (requiring EPA to set water quality criteria that “accurately reflect[] the latest scientific knowledge” on a variety of factors).

⁷²³ *Whitman v. American Trucking Ass’n, Inc.*, 531 U.S. 457 (2001).

⁷²⁴ 42 U.S.C. § 7403.

⁷²⁵ 42 U.S.C. § 7601(a).

Comment [93-2088]: Commenter (11395) states that while similar language does not specifically appear in the CAA, *American Trucking Assns. v. EPA* [283 F.3d 355 (D.C. Cir. 2002)] supported EPA's reliance on peer-reviewed scientific studies, without conducting an independent analysis of the raw data underlying those studies, in setting the 1997 ozone and fine PM ambient air quality standards as follows:

If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment ... [S]uch data are often the property of scientific investigators and are often not readily available because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants].

Comment [97-2149]: Commenter (11479) states that the proposed rule, as modified in the supplemental notice, would clearly interfere with the agency's use of the best available science. The commenter notes that the CAA has requirements to update pollution standards that provide for an "adequate margin of safety" to protect public health.⁷²⁶ This determination can only be reliably made using the best available science. This proposal would, however, prevent EPA from using the best available science to set pollution standards that would provide for an adequate margin of safety, because the proposal excludes studies where the raw data and other underlying information cannot be made public. Because of this, EPA should not cite the CAA as a source of statutory authority. Further, the CAA encourages a close partnership with the NAS and other independent scientific institutions. When EPA is considering a proposal to reinterpret how it uses science in regulatory decisions, it should first and foremost consider comments from and engage with NAS and similar bodies, which, for this rule, EPA did not.

In fact, virtually all of EPA's statutory mandates require the use of the best available scientific evidence. Congress did not state in any of these laws that the agency shall only consider scientific evidence derived from studies where the underlying unanalyzed data is publicly available, nor that the evidence considered should be solely at the Administrator's discretion.

Comment [115-1431]: Commenter (11393) appreciates the SNPRM's recognition that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control." 85 Fed. Reg. at 15398. This statement alone should lead EPA to withdraw the proposed rule and SNPRM; the requirements conflict with every statute EPA administers and would cause EPA to unlawfully exclude valid scientific research from its work.

By way of example, in CAA Section 108(a)(2), Congress requires EPA to issue air quality criteria for air pollutants to "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air." 42 U.S.C. § 7408(a)(2). The SNPRM does not claim that studies that have not publicly released all their underlying data, such as those linking air pollution to mortality and disease, do not accurately reflect the latest scientific

⁷²⁶ 42 USC 7409 (b)

knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air. If EPA were to exclude such studies from consideration when issuing air quality criteria, it would be in violation of the CAA.

Comment [118-1437]: Commenter (11407) states that they appreciate the SNPRM's recognition that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control." 85 Fed. Reg. at 15398. This statement alone should lead EPA to withdraw the proposed rule and SNPRM; the requirements conflict with every statute EPA administers and would cause EPA to unlawfully exclude valid scientific research from its work.

By way of example, in CAA Section 108(a)(2), Congress requires EPA to issue air quality criteria for air pollutants to "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air." 42 U.S.C. § 7408(a)(2). The SNPRM does not claim that studies that have not publicly released all their underlying data, such as those linking air pollution to mortality and disease, do not accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air.

If EPA were to exclude such studies from consideration when issuing air quality criteria, it would be in violation of the CAA.

Comment [125-1091]: Commenter (11495) notes that the EPA attempts to support the Supplemental Notice, in part, with the same environmental statutes that require it to consider the best available science. For example, in the Proposed Rule, EPA cites section 103 of the CAA, which provides that the Administrator shall "conduct . . . research . . . and studies relating to the causes, effects (including health and welfare effects), extent, prevention, and control of air pollution" and is authorized to "collect and make available . . . the results of and other information . . . pertaining to such research and other activities."⁷²⁷ EPA also cites CAA section 301(a), which provides that the Administrator is authorized to "prescribe such regulations as are necessary" to carry out EPA's functions under the Act.⁷²⁸ EPA points to similar provisions for all major environmental statutes, each of which contain the same requirement that regulations promulgated under the Administrator's general rulemaking authority must be necessary.⁷²⁹

Courts have consistently "decline[d] to read open-ended power" into general statutory grants of

⁷²⁷ 42 U.S.C. §§ 7403(a)(1), (b)(1); see also Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18,768, 18769 (April 30, 2018) (Proposed Rule).

⁷²⁸ 42 U.S.C. § 7601(a) (emphasis added).

⁷²⁹ See 83 Fed. Reg. at 18,769 (invoking, in addition to CAA sections 103 and 301, Clean Water Act sections 104 and 501; Safe Drinking Water Act sections 1442 and 1450(a)(1); Resource Conservation and Recovery Act sections 2002(a)(1) and 7009; Comprehensive Environmental Response, Compensation, and Liability Act sections 115 and 311; Emergency Planning and Community Right-to-Know Act section 320; Federal Insecticide, Fungicide, and Rodenticide Act sections 25(a)(1) and 136r(a); and Toxic Substances Control Act section 10); 85 Fed. Reg. at 15,397 (clarifying that EPA relies upon RCRA section 8001 instead of section 7009; CERCLA section 115 instead of section 116; and adding CWA section 501 as an additional source of authority).

rulemaking authority, such as CAA section 301(a).⁷³⁰ Rather, the authority imparted by such provisions is limited to actions that are necessary and appropriate for enforcing and carrying out the specific statutory mandates enacted by Congress.⁷³¹ In the case of the CAA, this means that any rule promulgated under the authority of section 301(a) must be connected back to the actual purpose and goals of the Act—to protect and enhance public health and welfare through air pollution prevention.⁷³² Although EPA relies on such grants of general rulemaking authority, it fails to articulate any connection between the Strengthening Transparency in Regulatory Science Rule and the purposes or goals of each individual substantive statute.

EPA fails to—and indeed cannot—demonstrate that the Strengthening Transparency in Regulatory Science rule is both necessary and appropriate for carrying out a particular statutory directive. As discussed in detail above, the rule is not only unnecessary to carry out EPA’s functions, but also in direct opposition to a number of specific statutory “quality of information” provisions. It is well established that agencies may not rely on general statutory grants of rulemaking authority to promulgate regulations that are inconsistent with more specific statutory

Comment [125-2202]: Commenter (11495) states that the EPA’s Supplemental Notice is at odds with provisions of multiple environmental statutes which require the Agency to consider certain high-quality scientific information. The commenter notes that the CWA and the CAA require that water and air quality criteria determinations be based on the “latest scientific knowledge.”⁷³³]

Each of these provisions directs EPA to incorporate a certain quality of scientific information into its rulemaking decisions made pursuant to the statute. In particular, these requirements are designed to ensure the scientific validity of the information upon which EPA bases its actions. Mandating a high-quality scientific basis for regulatory actions is necessary to guarantee the best possible protections for public health and welfare and to minimize partisan influence in scientific decision-making.

The Supplemental Notice, however, would impermissibly prohibit the agency from considering of relevant and high-quality scientific studies whenever the data underlying the study are not publicly available—in direct contravention of the statutory directives that mandate, for example, consideration of the “best available science.” None of the provisions requires, or even suggests, that EPA only consider information that is publicly available. It strains the plain meaning of words like “best,” “latest,” and even “appropriate” to suggest that they permit the unscientific requirement that all data be publicly available.

EPA “cannot ignore available . . . information.”⁷³⁴ Courts have held that “best available data” requirements “prohibit[] [an agency] from disregarding available scientific evidence that is in

⁷³⁰ See *Nat. Res. Def. Council v. Reilly*, 976 F.2d 36, 41 (D.C. Cir. 1992).

⁷³¹ *Global Van Lines, Inc. v. Interstate Commerce Comm’n*, 714 F.2d 1290, 1295 (5th Cir. 1983).

⁷³² See 42 U.S.C. § 7401(b)(1)–(4), (b)(c).

⁷³³ 33 U.S.C. § 1314(a)(1); 42 U.S.C. § 7408(a)(2) (emphasis added).

⁷³⁴ *San Luis & Delta-Mendota Water Auth. v. Jewell*, 747 F.3d 581, 602 (9th Cir. 2014) (quoting *Kern City. Farm Bureau v. Allen*, 450 F.3d 1072, 1080-81 (9th Cir. 2006) (quoting *Conner v. Burford*, 848 F.2d 1441, 1454 (9th Cir. 1988))).

some way better than the evidence [it] relies on.”⁷³⁵ Furthermore, a plaintiff may establish a violation of a “best available science” requirement by “point[ing] to any scientific evidence that the agency failed to consider.”⁷³⁶ The Supplemental Notice would undoubtedly preclude EPA from considering certain studies and scientific information that is “better” or the “best available,” simply because the study’s underlying data is not publicly available, thereby failing to satisfy Congressional directives and undermining the quality of regulatory decisions.

Likewise, EPA cannot avoid the statutory directives to consider high-quality scientific information simply by assigning a lesser weight to such information when the underlying data are not publicly available, as the Agency alternatively proposes. The Supplemental Notice’s alternative proposal is designed to have largely the same pernicious effects as flatly prohibiting consideration of studies lacking publicly available data. Just as with the primary proposal, EPA’s alternative proposal would limit the agency’s consideration of the best available science in making important regulatory decisions, and is, therefore, arbitrary, and capricious.

The effect of the Proposed Rule is inconsistent with EPA’s view that the Supplemental Notice is “intended to be consistent with the statutes that EPA administers and EPA plans to implement this procedural rulemaking in accordance with all applicable statutory and regulatory requirements.”⁷³⁷ EPA attempts to resolve this inconsistency by stating that “in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”⁷³⁸ However, as discussed below, EPA lacks the statutory authority to issue a rule this broad, even when it claims that it will avoid statutory conflicts.

Comment: Comment [151-1349]: Commenter (12405) notes that the CAA authorizes EPA to establish NAAQS to protect public health and to regulate emissions of HAP. EPA works with local governments to reduce air pollution and uses scientific studies that could be impacted by the proposed rule to revise its national air quality standards and NAAQS on a regular basis.ⁱ

In addition to concerns stated in the previous section about the usefulness of data if enough information is redacted to protect privacy, these studies raise additional challenges because they were performed internationally. In the Danish study, participants are protected by EU law. Going forward, an EU study’s compliance with the proposed rule will need to be reconciled with the new General Data Protection Regulation, which is seen as more restrictive than the United States’ *HIPAA* of 1996. The privacy directive raises many issues for science not discussed here, but it is clear that many studies involving people located in the EU will have a difficult time both complying with the new directive and providing enough information to EPA to be considered.

Studies coming from other countries are vital to health determinations in the United States because people in other countries are exposed to chemicals at different rates than in the U.S. The

⁷³⁵ *Kern City. Farm Bureau*, 450 F.3d at 1080 (citing *Southwest Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000)).

⁷³⁶ See *Safari Club Int’l v. Salazar* (In re Polar Bear Endangered Species Act Listing & Section 4(d) Rule Litig. - MDL No. 1993), 709 F.3d 1, 9 (D.C. Cir. 2013).

⁷³⁷ See 85 Fed. Reg. at 15,398.

⁷³⁸ See *Id.*

ability to compare and contrast exposure to health outcomes can be enlightening. For example, average PM concentrations in South Korea and China are several times higher than in the United States,⁷³⁹ making relatively subtle effects stand out more easily. Studies done in other countries can also help researchers more clearly understand whether an effect is dependent on dose or length of exposure. The inability to review and use international research in determinations will guarantee EPA is missing major findings and important data.

Comment [157-1390]: Commenter (12422) states that many of laws authorizing the activities of the EPA require the agency to use the best science in protecting the public’s health and environment. For example, the CAA mandates that air quality criteria “accurately reflect” the “latest scientific knowledge.” In the past, the EPA has considered all available studies in issuing these criteria without consideration of the availability of the underlying data. Promulgation of this proposed rule would be an arbitrary and capricious violation of the provisions of these laws.

Comment [159-2089]: Commenter (12430) notes that, in the SNPRM, U.S. EPA proposes to consider only (or, in the alternative, more heavily weight) studies and models with publicly available data. However, restricting agency consideration of scientific studies and models would run afoul of U.S. EPA’s obligations under many of its operating statutes to rely on the best available science.

For example:

The CAA requires, “Air quality criteria for an air pollutant shall accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air, in varying quantities.”

The CAA and other statutes require U.S. EPA to make decisions based on many of the kinds of science that the SNPRM would prevent U.S. EPA from considering. The SNPRM, if finalized, would violate these statutes, and would prevent U.S. EPA from discharging its duties under the related laws.

Comment [161-2094]: Commenter (12434) states that the Proposal directly conflicts with requirements under the core federal environmental laws, each of which requires that decisions be made using the “best available science” or some similar restriction. By requiring that publicly available data be prioritized over other scientific data, regardless of any other merits, the EPA is arbitrarily constrained and will be unable to comply with the statutory requirements to meet the “best available science.”

Similarly, the CAA requires that air quality criteria “shall accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare . . .” 42 U.S.C. 7408(a)(2). The Supreme Court ruled that NAAQS must be based on “published air quality criteria that reflect the latest scientific knowledge.” *American Trucking v. Whitman*, 531 U.S. 457, 457 (2001). Like the CWA, the CAA details the information that should

⁷³⁹ Katherine Ellen Foley, Every Country has Terrible Air Pollution, but these are the World’s Worst, Quartz Media, Sep. 28, 2016, <https://qz.com/794542/air-pollution-map-by-country-fine-particulate-matter/>

be considered when making regulatory decisions but does not limit this scientific information to only that which is publicly available. Again, the Proposal would eliminate key scientific information that informs the public health impacts of air pollution and allows the EPA to properly establish guidelines and restrictions.

The standards set under the CAA necessarily rely on public health data. Significant environmental justice impacts will result if confidential or only partially publicly available public health data is ignored. For example, in *Connecticut v. Pruitt*, in which Save the Sound (then known as Connecticut Fund for the Environment) was an intervenor, a district court judge required the EPA to hold a hearing to determine whether a Pennsylvania coal-fired power plant should install controls. *Connecticut v. Pruitt*, No. 3:17-cv-00796 (D. Ct. Feb. 7, 2018). Pollution from the facility contributed to Connecticut's greenhouse gas and ozone pollution, resulting in nonattainment of NAAQS, which are set based on public health studies. Consequently, the burning of coal will be limited to emergencies by 2023 and phased out by 2028. Similarly, it is these data sets that can inform our understanding of disparate impacts of the siting of polluting activities. NAAQS are used by EPA and state agencies when conducting cumulative impact modeling to determine the additional public health impacts of the siting of a new facility on a community that is already burdened with pollution. These standards cannot be appropriately set or the impacts of the siting of polluting activities properly examined if these studies are ignored, potentially aggravating the disparate impacts on communities. In order to conduct robust public health studies, it is common for members of the public to be assured that the data sets will remain partially or fully confidential so as to protect the sensitive health information of study participants, allowing for large data sets from which to draw conclusions.

Comment [162-1475]: Commenter (12435) states that the proposed framework under which the EPA Administrator would have discretion to exempt certain studies from these requirements lacks criteria tied to the actual scientific merit of the studies and/or the Acts that EPA administers. This is inconsistent with existing statutes, including the CAA 109(d), which specifies that an independent scientific review committee shall “advise the Administrator of areas in which additional knowledge is required to appraise the adequacy and basis of existing, new, or revised NAAQS” and “describe the research efforts necessary to provide the required information.” This independent scientific review should not be limited in the research efforts reviewed by the Administrator.

Comment [177-1595]: Commenter (12596) states that the Administrators have used this authority to make substantive decisions regarding consideration of scientific studies when setting NAAQS.⁷⁴⁰ In the same way, this discretion would allow an Administrator to consider transparency assessments arising from a procedural framework during NAAQS reviews.

In these circumstances, a procedural framework would not be interpretative of the CAA's substantive authority. It would not modify the use or criteria for consideration of scientific

⁷⁴⁰ See e.g. National Ambient Air Quality Standards for Ozone, 80 Fed. Reg. 65,292, 65,326 (explaining that then Adm'n. McCarthy's “determination to attach less weight to the epidemiologic-based risk estimates reflected her consideration of key uncertainties, including the heterogeneity in effect estimates between locations, the potential for exposure measurement errors, and uncertainty in the interpretation of the shape of concentration-response functions for O₃ concentrations in the lower portions of ambient distributions.”) (emphasis added)).

studies under the statute, nor would it implicate public rights to participate under the CAA's rulemaking processes. Indeed, the public would retain the opportunity to provide input on transparency assessments, and EPA's substantive determinations concerning them, through a CAA rulemaking's notice-and-comment process. Transparency assessments produced under a procedural framework would simply be a data point for the Administrator to consider within the confines of the CAA and its jurisprudence.

Furthermore, the Final Transparency Rule would not affect requirements in the CAA to predicate regulatory action on the best science available. The opposite is true. In the face of growing concerns about the replicability of scientific studies, the absence of a transparency assessment framework undermines the reasonableness of future CAA rulemakings, and validity of underlying claimed health benefits.

One survey of 1,500 scientists found that 52% agreed that there is a significant "crisis" of reproducibility.⁷⁴¹ These challenges could implicate the Administrator's ability to make a reasonable determination of adverse impacts under the CAA. Without a formal framework, assessments of scientific replicability, and therefore the transparency of pivotal regulatory science, could be arbitrary and capricious. The Final Transparency Rule would increase replicability and verification in the scientific process, thereby allowing the testing of critical methodological assumptions and mitigating biases in key studies that inform significant regulations. In other words, it would foster review of best science.

Comment [181-1623]: Commenter (12699) notes that a further scan through these statutes would find additional language that would suggest a need for accurate information. Looking at just the criteria pollutant language in the CAA, "[a]ir quality criteria for an air pollutant shall accurately reflect the latest scientific knowledge."⁷⁴² [Emphasis added]. The NAAQS shall be "based on such criteria and allowing an adequate margin of safety, are requisite to protect the public health."⁷⁴³ It is impossible to know if something is "requisite" (or "necessary") if that decision is based on inaccurate science. The science in a given situation very well may be accurate, but it is incumbent upon the EPA (and other agencies) to take necessary steps to ensure this accuracy.

Beyond the specific statutory sections, the need for accuracy should be simply inferred. After all, did Congress delegate regulatory power to the EPA so that it can develop regulations that are based on inaccurate information?

Comment [181-2207]: Commenter (12699) states that, to put it succinctly, the answer is yes. The EPA should rely on both the substantive environmental statutes and the housekeeping authority.

The EPA would not be implementing these statutes properly if it were using flawed science in the promulgation of its rules. To highlight one example, it is useful to reexamine the U.S.

⁷⁴¹ Baker, Monya, 1,500 Scientists Lift the Lid on Reproducibility: Survey Sheds Light on the 'Crisis' Rocking Research, NATURE, Jul. 28, 2016.

⁷⁴² § 108(a)(2) of the Clean Air Act; 42 U.S. Code § 7408(a)(2), <https://www.govinfo.gov/content/pkg/USCODE-2013-title42/html/USCODE-2013-title42-chap85-subchapI-partA-sec7408.htm> (last visited May 18, 2020).

⁷⁴³ § 109(b) of the Clean Air Act; 42 U.S. Code § 7409(b), <https://www.govinfo.gov/content/pkg/USCODE-2013-title42/html/USCODE-2013-title42-chap85-subchapI-partA-sec7409.htm> (last visited May 18, 2020).

Supreme Court case *Michigan v. EPA*.⁷⁴⁴ In discussing the “appropriate and necessary” language in 112(n)(1)(A) of the CAA,⁷⁴⁵ the U.S. Supreme Court argued “[o]ne would not say that it is even rational, never mind “appropriate,” to impose billions of dollars in economic costs in return for a few dollars in health or environmental benefits.”⁷⁴⁶

Similarly, it would not be rational for the EPA to use science for these very costly policies without even knowing whether the science is credible. Nor would it be rational for the agency to fail to take every possible step to ensure scientific accuracy, including making underlying information available to the public (especially since the EPA is well aware of the problems that pervade the science). Making the information available to the public is not some nice gesture to appease the public. It is a critical step to help the agency itself get necessary feedback to better assess the science.

Comment [184-2093]: Commenter (12707) notes that the supplemental proposal undermines the use of best available science as called for in numerous environmental statutes including the CAA.

The CAA, for example, has requirements to update pollution standards that provide for an adequate margin of safety for public health. This determination can only be reliably made using the best available science. However, this proposal would prevent EPA from using that information to set science-based pollution standards that would provide for an adequate margin of safety. EPA should not cite the CAA as an appropriate source of statutory authority. The added confusion of the supplemental proposal, including so-called tiered access or EPA’s ability to consider some research over what has long been considered “best available science” based upon the availability of data, does not legitimize the proposal.

In sum, there is no statutory authority, with or without the Housekeeping Statute, for EPA to rely on to censor or constrain science. Further, finalizing this effort will only serve to undermine EPA’s essential role and create confusion over which studies will be considered and how they will be valued to set standards that directly impact public health and the quality of our air and water. Many of these uncertainties are recognized in EPA’s own SAB’s April 28, 2020 letter.

Comment [187-1702]: Commenter (12720) provides that the EPA cites 42 U.S.C. § 7601(a) of the CAA as one basis for the Proposal. But that section merely authorizes the Administrator to “prescribe such regulations as are necessary to carry out his functions under this chapter.” The courts have made clear that “EPA cannot rely on its gap-filling authority to supplement the CAA’s provisions when Congress has not left the agency a gap to fill.” *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); see also *American Petroleum Institute v. EPA*, 52 F.3d 1113, 1119 (D.C. Cir. 1995) (“the general grant of rulemaking power to EPA cannot trump specific portions

⁷⁴⁴ *Michigan v. EPA*, 135 S. Ct. 2699 (2015), <https://www.law.cornell.edu/supremecourt/text/14-46> (last visited May 18, 2020).

⁷⁴⁵ § 112(n)(1)(A) of the Clean Air Act; 42 U.S. Code § 7412(n)(1)(A), <https://www.govinfo.gov/content/pkg/USCODE-2013-title42/html/USCODE-2013-title42-chap85-subchapI-partAsec7412.htm> (last visited May 18, 2020) [Link dead, alternative link provided <https://www.law.cornell.edu/uscode/text/42/7412>].

⁷⁴⁶ *Michigan v. EPA*, 135 S. Ct. 2699 (2015), <https://www.law.cornell.edu/supremecourt/text/14-46> (last visited May 18, 2020).

of the CAA”); *NRDC v. Reilly*, 976 F.2d 36, 41 (D.C. Cir. 1992) (EPA cannot use its general rulemaking authority as justification for adding to a statutorily specified list); *Sierra Club v. EPA*, 719 F.2d 436, 453 (D.C. Cir. 1983) (same); *Gonzales v. Oregon*, 546 U.S. 243, 264–65 (2006) (“It would go . . . against the plain language of the text to treat a delegation for the ‘execution’ of [the Attorney General’s] functions as a further delegation to define other functions well beyond the statute’s specific grants of authority.”). Here, not only is there no statutory gap to fill, as explained further below, the Proposal and Supplemental Proposal are in direct conflict with other provisions of the Act. EPA cannot rely on 42 U.S.C. § 7601(a) to support any final rule.

EPA also cites 42 U.S.C. § 7403, which requires the Administrator to establish a national research and development program for air pollution, among other things. EPA does not state specifically which of the many subsections it believes authorizes this proposed rule. Thus, the citation fails to provide sufficient notice for the public to comment on the rulemaking.

Nothing in the Proposal (or Supplemental Proposal) establishes or even purports to establish the type of national research and development program for air pollution discussed in subsection (a). But that subsection is nonetheless revealing about congressional intent concerning “studies relating to the causes, effects (including health and welfare effects) extent, prevention, and control of air pollution.” 42 U.S.C. § 7403(a)(1). There is no indication that Congress intended to allow EPA to ignore or refuse to consider studies on the health and welfare effects of air pollution only if raw data or ‘regulatory science underlying EPA’s actions [were] publicly available in a manner sufficient for independent validation.” *See* 83 Fed. Reg. at 18,773 (proposed §§ 30.1–30.3). Indeed, the absence of any such congressional conditions or criteria makes it all the more obvious that EPA invented and added those criteria and conditions as a matter of its own policy preferences, contrary to the Act. This EPA may not do.

Subsection (b) authorizes EPA to collect and make available information about such research, but nothing in that subsection allows EPA to *restrict* which types of data it considers in regulatory decisions. Nor does subsection (b) draw any distinction between dose-response data, “data and models underlying pivotal regulatory science and pivotal science,” and other types of data. Again, the absence of any such congressional distinction makes it all the more obvious that EPA invented and added that distinction as a matter of its own policy preferences, contrary to the Act. This EPA may not do. None of the other subsections in 42 U.S.C. § 7403 address this issue either. There is no support in the CAA for the Proposal or the Supplemental Proposal.

Comment [198-2211]: Commenter (13549) states that the SNPRM changes the authority EPA claims to rely on for the proposal, however either way, the proposal remains unlawful. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301. 85 Fed. Reg. at 15404. The preamble says EPA is taking comment on whether to use 5 U.S.C. § 301, which the SNPRM calls EPA’s housekeeping authority, independently or in conjunction with statutory provisions cited in the proposed rule and corrected in the SNPRM’s preamble. 85 Fed. Reg. at 15398. The fact that EPA is still considering and asking what authority it can rely on for the proposed rule, twenty-two months after the initial proposed rule, shows that EPA does not have such authority. The SNPRM’s statements on authority continues EPA’s pattern of making rules first and searching for a justification later (which it still has not provided for this rulemaking). As the NTAA

explained in its 2018 comments: In order to protect human health and environment, EPA must have a solid foundation before it proposes rules and rulemaking as such portrays the agency's naiveté in seeking answers for questions about its own authority.

First, none of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking. In most cases, EPA simply cites its general authority for rulemaking under the statutes. Still that general authority alone cannot provide a basis for the rule, especially when, as here, the rule would conflict with the requirements of each of the statutes. Courts have made clear that "EPA cannot rely on its gap-filling authority to supplement [a statute's] provisions when Congress has not left the agency a gap to fill." *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); see also *New York v. U.S. EPA*, 413 F.3d 3, 40-42 (D.C. Cir. 2005). EPA otherwise cites to statutes describing research programs established by the agency, with no relation to or authorization for the requirements the SNPRM seeks to create. The Band also disagrees with EPA's reliance on 5 U.S.C. § 301 because 1) it is questionable whether § 301 applies to EPA as EPA is not one of the fifteen "Executive Departments" listed at 5 U.S.C. § 101, and 2) the proposed rule and SNPRM are not merely internal rules of agency procedure—they would significantly impact every aspect of EPA's scientific and regulatory work, the individuals who contribute to that work, and the Tribes and communities who rely on it.

The Band appreciates the SNPRM's recognition that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control." 85 Fed. Reg. at 15398. This statement alone should lead EPA to withdraw the NPRM and SNPRM; the requirements conflict with every statute EPA administers and would cause EPA to unlawfully exclude valid scientific research from its work.

By way of example, in CAA Section 108(a)(2), Congress requires EPA to issue air quality criteria for air pollutants to "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air." 42 U.S.C. § 7408(a)(2). The SNPRM does not claim that studies that have not publicly released all their underlying data, such as those linking air pollution to mortality and disease, do not accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air. If EPA were to exclude such studies from consideration when issuing air quality criteria, it would be in violation of the CAA.

Comment [199-2213]: Commenter (12403) notes that the proposal would hamper implementation of CAA requirements.

Comment [200-2214]: Commenter (12412) notes that the SNPRM changes the authority EPA claims to rely on for the proposal, however either way, the proposal remains unlawful. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301. 85 Fed. Reg. at 15404. The preamble says EPA is taking comment on whether to use 5 U.S.C. § 301, which the SNPRM calls EPA's housekeeping authority, independently or in conjunction with statutory provisions cited in the proposed rule and corrected in the SNPRM's preamble. 85 Fed. Reg. at 15398. The fact that EPA

is still considering and asking what authority it can rely on for the proposed rule, twenty-two months after the initial proposed rule, shows that EPA does not have such authority. The SNPRM's statements on authority continues EPA's pattern of making rules first and searching for a justification later (which it still has not provided for this rulemaking). As the NTAA explained in its 2018 comments: In order to protect human health and environment, EPA must have a solid foundation before it proposes rules and rulemaking as such portrays the agency's naiveté in seeking answers for questions about its own authority.

First, none of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking. In most cases, EPA simply cites its general authority for rulemaking under the statutes. Still that general authority alone cannot provide a basis for the rule, especially when, as here, the rule would conflict with the requirements of each of the statutes. Courts have made clear that "EPA cannot rely on its gap-filling authority to supplement [a statute's] provisions when Congress has not left the agency a gap to fill." *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); *see also New York v. U.S. EPA*, 413 F.3d 3, 40-42 (D.C. Cir. 2005). EPA otherwise cites to statutes describing research programs established by the agency, with no relation to or authorization for the requirements the SNPRM seeks to create. The commenter disagrees with EPA's reliance on 5 U.S.C. § 301 because 1) it is questionable whether § 301 applies to EPA as EPA is not one of the fifteen "Executive Departments" listed at 5 U.S.C. § 101, and 2) the proposed rule and SNPRM are not merely internal rules of agency procedure—they would significantly impact every aspect of EPA's scientific and regulatory work, the individuals who contribute to that work, and the Tribes and communities who rely on it.

The commenter appreciates the SNPRM's recognition that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control." 85 Fed. Reg. at 15398. This statement alone should lead EPA to withdraw the proposed rule and SNPRM; the requirements conflict with every statute EPA administers and would cause EPA to unlawfully exclude valid scientific research from its work.

By way of example, in CAA Section 108(a)(2), Congress requires EPA to issue air quality criteria for air pollutants to "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air." 42 U.S.C. § 7408(a)(2). The SNPRM does not claim that studies that have not publicly released all their underlying data, such as those linking air pollution to mortality and disease, do not accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutants in the ambient air. If EPA were to exclude such studies from consideration when issuing air quality criteria, it would be in violation of the CAA.

Comment [201-2218]: Commenter (12474) notes that the SNPRM changes the authority EPA claims to rely on for the proposal, however either way, the proposal remains unlawful. The text of the SNPRM proposes to rely solely on 5 U.S.C. § 301. 85 Fed. Reg. at 15404. The preamble says EPA is taking comment on whether to use 5 U.S.C. § 301, which the SNPRM calls EPA's housekeeping authority, independently or in conjunction with statutory provisions cited in the

proposed rule and corrected in the SNPRM's preamble. 85 Fed. Reg. at 15398. The fact that EPA is still considering and asking what authority it can rely on for the proposed rule, twenty-two months after the initial proposed rule, shows that EPA does not have such authority. The SNPRM's statements on authority continues EPA's pattern of making rules first and searching for a justification later (which it still has not provided for this rulemaking). As the NTAA explained in its 2018 comments: In order to protect human health and environment, EPA must have a solid foundation before it proposes rules and rulemaking as such portrays the agency's naiveté in seeking answers for questions about its own authority.

First, none of the initial or corrected environmental statutes provide EPA authority for the proposed rulemaking. In most cases, EPA simply cites its general authority for rulemaking under the statutes. Still that general authority alone cannot provide a basis for the rule, especially when, as here, the rule would conflict with the requirements of each of the statutes. Courts have made clear that "EPA cannot rely on its gap-filling authority to supplement [a statute's] provisions when Congress has not left the agency a gap to fill." *NRDC v. EPA*, 749 F.3d 1055, 1064 (D.C. Cir. 2014); see also *New York v. U.S. EPA*, 413 F.3d 3, 40-42 (D.C. Cir. 2005). EPA otherwise cites to statutes describing research programs established by the agency, with no relation to or authorization for the requirements the SNPRM seeks to create.

The NTAA also disagrees with EPA's reliance on 5 U.S.C. § 301 as:

1) It is questionable whether § 301 applies to EPA as EPA is not one of the fifteen "Executive Departments" listed at 5 U.S.C. § 101, and

2) The proposed rule and SNPRM are not merely internal rules of agency procedure—they would significantly impact every aspect of EPA's scientific and regulatory work, the individuals who contribute to that work, and the Tribes and communities who rely on it.

The NTAA appreciates the SNPRM's recognition that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control." 85 Fed. Reg. at 15398. This statement alone should lead EPA to withdraw the proposed rule and SNPRM; the requirements conflict with every statute EPA administers and would cause EPA to unlawfully exclude valid scientific research from its work.

By way of example, in CAA Section 108(a)(2), Congress requires EPA to issue air quality criteria for air pollutants to "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air." 42 U.S.C. § 7408(a)(2). The SNPRM does not claim that studies that have not publicly released all their underlying data, such as those linking air pollution to mortality and disease, do not accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air. If EPA were to exclude such studies from consideration when issuing air quality criteria, it would be in violation of the CAA.

Comment [205-2036]: Commenter (13788) states that this rule is not procedural. If finalized, it will have substantial effects on EPA decisions that impact regulated entities. For example, under the CAA’s NAAQS program, EPA is required to issue air quality criteria for pollutants that “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air.”⁷⁴⁷ If EPA were to ignore or diminish the value of the latest scientific studies because they involve human health data that cannot be made publicly available, that would significantly impact the health-protectiveness of the resulting ambient air quality standards, which would have a substantial effect on both regulatory beneficiaries and regulated industries.

In addition to the *Chrysler* Court’s decision,⁷⁴⁸ the D.C. Circuit held in *Pickus v. United States Bd. Of Parole*, that rules of practice or procedure “should not be deemed to include any action which goes beyond formality and substantially affects the rights of those over whom the agency exercises authority,” and that “adherence to congressional purpose counsels a construction of this exemption [for procedural rules] that excludes from its operation action which is likely to have considerable impact on ultimate agency decisions.”⁷⁴⁹ By restricting EPA’s consideration of science in regulatory decision-making based only on the public availability of underlying data, this rule would have a clear and substantial effect on ultimate agency decisions, including decisions that affect the rights of regulated entities, and therefore it is not a procedural rule.

Nor is this a proposed “internal rule of agency procedure” that “exclusively pertains to the internal practices of the EPA.”⁷⁵⁰ According to details provided to staff of the House Committee on Science, Space, and Technology,⁷⁵¹ EPA’s proposed tiered access system would not be implemented internally at EPA, but rather the Agency expects that the bulk of the burden of implementing such a system would fall on the researchers who conduct (or conducted, as this relates to retroactive application of this new policy) the study. According to information shared with committee staff, EPA anticipates that researchers would be responsible for managing the logistics of making data and models publicly available in compliance with the rule, for judging the sensitivity of study data and models and what information can or cannot be made publicly available through tiered access, and what tier of access should be designated for different types of information.⁷⁵² It is unclear how EPA would ensure compliance with this rule, or whether after this rule is finalized, it will in effect ban all studies based on confidential human health data. However, what is clear is that this rule would have significant impacts beyond the Agency’s internal practices and procedures.

Comment [205-2051]: Commenter (13788) states that under the APA and CAA, Agency actions that are “arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law”

⁷⁵⁰ 85 Fed. Reg. at 15,398.

⁷⁵¹ Democratic Staff, Committee on Science, Space, and Technology, Summary of Staff-Level Briefings from the Environmental Protection Agency on the “Strengthening Transparency in Regulatory Science” Supplemental Proposed Rule (Apr. 30, 2020), <https://science.house.gov/imo/media/doc/Letter%20and%20Memo%20-%20EBJ%20to%20SST%20Dem%20Caucus%20re%20Transparency%20Rule.pdf>.

⁷⁵² *Id.*

are to be held unlawful and set aside. Agencies are required to “articulate a satisfactory explanation for [the] action including a ‘rational connection between the facts found and the choice made.’”⁷⁵³ Here, however, EPA is proposing to exclude or devalue scientific studies based on criteria that are unrelated to scientific value or merit, and that would eliminate the Agency’s ability to rely on research that may be the best available science.

The Agency’s newly claimed statutory authority under the housekeeping statute does not save this rule, and actually undermines any transparency justification for the rule. Many of the studies EPA relies on are done outside of the Agency, and therefore must be beyond the reach of the housekeeping statute. The Agency’s conflation of transparency in EPA’s processes with data availability in scientific research outside the Agency cannot be used to provide satisfactory justification for this rule.

EPA seems to believe that by wielding the terms “validation” and “reanalysis” it shows concern about the quality of studies relied on by the Agency. But EPA’s real intention in the SNPRM, as in the Proposal, is to limit the Agency’s access to public health science, not to ensure the quality of the studies the Agency relies on. That is made abundantly clear by the Agency’s statement that if “multiple high-quality studies exist but only two studies have data and models that are available for independent validation and reanalysis, EPA would only include those two studies as pivotal regulatory science and/or pivotal science.”⁷⁵⁴ By acknowledging that the highest quality studies will be ignored if confidential data and models are not made available for validation and reanalysis, EPA is admitting that this rule is not concerned with improving the quality of studies relied on by the Agency. The SNPRM is instead laser-focused on information availability, even if it comes at the expense of the quality of scientific work. The best studies may not rely on available underlying data—precisely because they are human health studies that requires the maintenance of the privacy of the study participants—and in those situations this rule would clearly prioritize data availability over quality.

Unlike the 2018 Proposal, the SNPRM does not include any acknowledgement that EPA must use the “best available science” for regulatory actions—but it must.⁷⁵⁵ This lack of concern for quality is evident throughout the SNPRM and is particularly alarming in an agency that relies heavily on science—as it must, given its statutory mandates. Additionally, the suggestion that the rule could apply to studies retroactively if the Administrator does not grant an exemption further illustrates the intention to undermine longstanding reliance on the human health studies that have done the most to advance air quality and public health. The SNPRM states that the “proposal would apply to reviews of data, models, and studies at the time a rule is developed or ISI is finalized, regardless of when the data and models were generated.”⁷⁵⁶ EPA has provided no reasoning to explain how retroactive application to past studies—including the Harvard Six Cities and American Cancer Society PM health studies and subsequent work that links exposures to air pollution with declines and damages to human health—is justified. It certainly has not provided any information to suggest that this rule would encourage the release of more data from those studies. This proposal’s focus is clearly on arbitrarily excluding or diminishing the value of

⁷⁵³ *State Farm*, 463 U.S. 29, 42-44 (1983).

⁷⁵⁴ 85 Fed. Reg. at 15399 (emphasis added).

⁷⁵⁶ 85 Fed. Reg. at 15,399.

quality scientific research rather than any real commitment to transparency.

Comment [205-2126]: Commenter (13788) claims that the rule conflicts with EPA's performance of its statutory duties, including under the CAA, by preventing the Agency from relying on the latest and best available science for its rulemakings.

Comment [205-2186]: Commenter (13788) states that not one of the other environmental statutes cited as potential authority by EPA actually authorizes this rule.⁷⁵⁷ At most, many of the provisions cited by EPA generally allow the agency to promulgate regulations in order to implement various statutes, with many requiring that the regulations be necessary.⁷⁵⁸ However, EPA has not shown how this rule would further the implementation of any statute, much less how the rule is necessary to fulfill any statutory responsibilities, and the fact that the Agency has not considered such a rule necessary until now suggests the opposite. Under the CAA, the most important scientific studies and models for use in evaluating the public health effects of air pollution are those that are based on actual human health data—much of which cannot be publicly available due to the confidentiality requirements imposed by other federal statutes and the agreements under which the data is provided to researchers. For CAA rulemaking then, any of the approaches EPA is proposing actively undermine the Agency's use of the best science in making decisions that promote and protect the public health and welfare—the fundamental purpose of the CAA.

If Congress had intended EPA to prioritize data transparency over the quality of scientific information in its regulatory decision-making, it could have written that requirement into the statutes. In the absence of such a requirement and as required by law, EPA should prioritize quality in accordance with the various “mandates requiring that its decisions rest on various formulations of the best available science.”⁷⁵⁹

Comment [205-2216]: Commenter (13788) asserts that, Nor the Federal Housekeeping Statute cannot be used to authorize rules that limit the scope of EPA's responsibilities under other statutes. The *Chrysler* Court was clear that “[section] 301 does not authorize regulations limiting the scope of [the Trade Secrets Act]” (the statute under consideration in that case), or of any other substantive statutory authority.⁷⁶⁰ Similarly, the Federal Housekeeping Statute cannot authorize regulations limiting the scope of environmental statutes. If finalized, this rule would limit EPA's ability to evaluate and use the best available science to support its regulatory decisions, thereby undermining its ability to fully implement its responsibilities as mandated

⁷⁵⁷ See Earthjustice, et al., Comments on “Transparency” in Regulatory Science, at 18-31 (Aug. 15, 2018), Doc. ID No. EPA-HQ-OA-2018-0259-6137.

⁷⁵⁸ See, e.g., Clean Air Act § 301(a), 42 U.S.C. § 7601(a) (“The Administrator is authorized to prescribe such regulations as are necessary to carry out his functions under this chapter.”); Clean Water Act § 501(a), 33 U.S.C. § 1361(a) (authorizing the Administrator to “prescribe such regulations as are necessary to carry out his functions under this chapter.”); Comprehensive Environmental Response, Compensation, and Liability Act § 115, 42 U.S.C. § 9615 (authorizing the President “to promulgate any regulations necessary to carry out the provisions of this subchapter.”); Emergency Planning and Community Right-To-Know Act § 328, 42 U.S.C. § 11048 (“The Administrator may prescribe such regulations as may be necessary to carry out this chapter.”).

⁷⁵⁹ *Physicians for Social Responsibility v. Wheeler*, No. 19-5104, 2020 U.S. App. LEXIS 12727 at *27 (D.C. Cir. Apr. 21, 2020).

⁷⁶⁰ Env'tl. Prot. Agency, Clean Air Act Overview (2017), <https://www.epa.gov/clean-air-act-overview> Council Directive 2016/679 2016 O.J. (L119) 1, 88 (EC).

under environmental statutes. It therefore cannot be a valid exercise of the authority granted by the Federal Housekeeping Statute.

Neither the Federal Housekeeping Statute nor the IQA provide authority or justification for a rule that would significantly impede and disrupt EPA's ability to fulfill its statutory mandates. For example, the air quality criteria EPA is required to issue when reviewing the NAAQS under the CAA takes the form of an ISA, in which the Agency evaluates the latest science on public health and environmental effects of criteria pollutants. The ISA document is considered a HISA, which is a subset of the ISI governed by the IQA guidance. Subjecting the ISA to the requirements of this rule and SNPRM would result in the exclusion of important, longstanding public health studies from consideration, because the human health data on which they are based, and which makes them of value, is not publicly available as contemplated by the proposed rule. Such a result would directly conflict with the CAA's mandate that the air quality criteria reflect the latest scientific knowledge. The Agency claims that "[i]n the event the procedures outlined in this part conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control." EPA fails, however, to explain how the Agency will define and identify such conflicts and ensure that staff do not follow the proposed rule. This is a significant question that EPA entirely fails to discuss.

1.3.2 Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) (NPRM and SNPRM Comments).

Comment: Sections 1.3.2.1 and 1.3.2.2 of this Chapter present comments received on the NPRM (Section 1.3.2.1) and SNPRM (Section 1.3.2.2) related to the EPA's legal authority for the rule under the FIFRA. The EPA provides the following general response to these comments:

Response: EPA appreciates your comments. As discussed in Section I.C of the final rule preamble and in this RTC document in Section 1.2, EPA has decided it is most appropriate to rely on its authority to promulgate housekeeping regulations, rather than any of the substantive environmental statutes cited in the 2018 proposal or the 2020 supplemental proposal as legal authority for the rule. EPA intends to promulgate future science transparency rules under its substantive environmental statutes. Additionally, the final rule states in § 30.3 that "[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control."

1.3.2.1 FIFRA (NPRM Comments)

Comment [6103-517]: Commenter (6113) asserts that the proposed regulation turns the statutory scheme of FIFRA upside down. Very limited amounts of pesticides on food products are allowed only if EPA determines the amount to be safe. Slip op. p. 7. See also slip op. at p. 9 (explaining how the EPA must meet FDA standards on this). The proposed regulation seeks to exclude much information that establishes the pesticide's harm whereas the statute requires the manufacturer to prove that the amount is safe.

Comment [6112-1556]: Commenter (6137) provides that EPA also cites to two specific provisions in the Federal Insecticide, Fungicide, Rodenticide Act ("FIFRA") as statutory support

for the Proposed Rule. Upon closer examination, these provisions do not provide the necessary authority for this Rule.

First, EPA points to Section 20(a), 7 U.S.C. § 136r(a), which provides:

(a) Research

The Administrator shall undertake research including research by grant or contract with other Federal agencies, universities, or others as may be necessary to carry out the purposes of this subchapter, and the Administrator shall conduct research into integrated pest management in coordination with the Secretary of Agriculture. The Administrator shall also take care to ensure that such research does not duplicate research being undertaken by any other Federal agency.

By its plain language, this provision authorizes research, not the use of scientific studies in regulating pesticides. Thus, EPA's reliance on this provision as support for this rule is misplaced.

Second, the Proposed Rule cites Section 25(a)(1), 7 U.S.C. § 136w, which authorizes the EPA Administrator "to prescribe regulations to carry out the provisions of this subchapter." However, this broad authority is expressly limited to regulating "in accordance with the procedure" prescribed in FIFRA itself. *Id.* Yet, as discussed more fully in Section V, EPA failed to comply with these requisite procedures. Accordingly, this provision provides no authority for EPA's issuance of this rule.

Comment [6112-1567]: Commenter (6137) contends that not only does FIFRA not provide authority for the Proposed Rule, but it likewise contains provisions directly at odds with the purpose and effect of the Rule.

Under FIFRA, EPA must register a pesticide (with rare exceptions) before it may be sold or used in the United States. 7 U.S.C. § 136a(a). To register or re-register a pesticide, EPA must determine that its use "will not generally cause unreasonable adverse effects on the environment." *Id.* § 136a(c)(5)(D); see *id.* § 136(bb) (definition of "unreasonable adverse effects"). FIFRA defines "unreasonable adverse effects" as "any unreasonable risk to man or the environment, taking into account the economic, social, and environmental costs and benefits of the use of any pesticide." *Id.* § 136(bb).

EPA requires a company seeking establishment or retention of a pesticide registration to submit data and information to enable EPA to make its unreasonable adverse effects determination. In addition to a standard set of data, EPA can issue data call-in notices requiring additional testing and information. Often, EPA requires the registrant to conduct particular laboratory tests to assess the pesticide's toxicity. As Nancy Beck noted during the drafting of the rule, pesticide regulations require manufacturers to submit to EPA "a huge amount of data," and that the studies come to EPA as CBI. See Maria Hegstad, "Absent ORD Chief, Trump's Toxics Pick Expands Reach Across EPA Science," *Inside EPA* (May 10, 2018), <https://insideepa.com/weekly-focus/absent-ord-chief-trumps-toxics-pick-expands-reach-across-epa-science>. The raw data

underlying the industry laboratory studies is rarely made available to the public, and the registrants would almost certainly oppose such disclosure on CBI grounds. Nor are such studies typically peer reviewed.

In addition, after a pesticide has been registered, the registrant must provide EPA all factual information regarding the pesticide's unreasonable adverse effects. 7 U.S.C. § 136d(a)(2). Such information comes in a variety of forms – from academic studies, poisoning incident reports, or studies conducted for other regulatory authorities at the state, federal, or international level. Often, the raw data are unavailable.

The Proposed Rule thus conflicts with FIFRA's pesticide registration requirements as it eliminates from consideration important studies used to show the unreasonable adverse effects of the pesticide toxins. As Beck herself acknowledged of an early version of the rule, the directive would “jeopardize our entire pesticide registration/re-registration process.” Maria Hegstad, “Absent ORD Chief, Trump's Toxics Pick Expands Reach Across EPA Science,” *Inside EPA* (May 10, 2018). Accordingly, the Proposed Rule cannot stand.

Comment [6112-1623]: Commenter (6137) states that EPA failed to follow the specific procedures required by the FIFRA when issuing the Proposed Rule. Specifically, section 25w of FIFRA requires, among other things, that EPA provide a copy of any proposed rule or regulation to the Secretary of Agriculture for review and comment 60 days before a proposed rule is published in the *Federal Register*. 7 U.S.C. § 136w(a)(2)(A). EPA must then provide the Secretary a copy of the rule EPA intends to publish as a final rule no later than 30 days before publication. *Id.* § 136w(a)(2)(B). EPA must also consult with its own SAP in an effort to receive comments from it regarding the impact the proposed rule will have on health and the environment. *Id.* § 136w(d).⁷⁶¹ Such consultation must occur under the same timelines sets forth for consulting with the Secretary of Agriculture. *Id.* § 136w(d)(1). Lastly, before a final rule can take effect, EPA is required to submit the rule to Congress and “the rule or regulation shall not become effective until the passage of 60 calendar days after the rule or regulation is so transmitted.” *Id.* § 136w(a)(4).

Thus, FIFRA sets forth a clear process in which EPA must consult with a number of entities, including both the USDA and a SAP when issuing rules impacting pesticides. See, e.g., *Nat'l Coal. Against the Misuse of Pesticides v. EPA*, 867 F.2d 636 (D.C. Cir. 1989) (noting that “FIFRA generally requires the Administrator [of EPA] to consult with the Secretary of Agriculture . . . and a seven member Scientific Advisory Panel (on environmental health questions) prior to making public any notice of intent to cancel,” in context of pesticide registration cancellation). Yet it is indisputable that EPA utterly failed to take these necessary steps. For this reason, too, EPA's Proposal cannot stand.

⁷⁶¹ Indeed, FIFRA sets forth a specific role for its Scientific Advisory Panel, yet EPA entirely ignored them in this process: [t]he Administrator shall also solicit from the advisory panel comments, evaluations, and recommendations for operating guidelines to improve the effectiveness and quality of scientific analyses made by personnel of the Environmental Protection Agency that lead to decisions by the Administrator in carrying out the provisions of this subchapter. The comments, evaluations, and recommendations of the advisory panel submitted under this subsection and the response of the Administrator shall be published in the *Federal Register* in the same manner as provided for publication of the comments of the Secretary of Agriculture under such sections. 7 U.S.C. § 136w(d)(1).

Comment [6118-1731]: Commenter (6143) asserts that EPA has issued its proposed rule on Strengthening Transparency in Regulatory Science pursuant to its authority under several environmental statutes that it implements, including the CAA; CWA; SDWA; RCLA; CERCLA; EPCRA; FIFRA; and TSCA.⁷⁶² This proposed action is fully consistent with the authorities and objectives laid out in those statutes. EPA must ensure that any final action it takes on this proposal continues to respect the balance reflected in those statutes between sound, transparent science, and legitimate privacy interests.

Comment [6152-651]: Commenter (6122) contends that EPA cites multiple statutory provisions in an attempt to support the proposed rule that it believes authorize this type of rulemaking, “including provisions providing general authority to promulgate regulations necessary to carry out the Agency’s functions under these statutes and provisions specifically addressing the Agency’s conducting of and reliance on scientific activity to inform those functions . . .”⁷⁶³ None of the specific statutory provisions provided by EPA provide specific authority for EPA to fundamentally rework the foundational processes it uses to assess and include/reject science. Indeed, if such authority existed, one would have expected EPA to have discovered this authority many decades earlier. Instead, EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, “Congress...does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes.”⁷⁶⁴ And if this is true, neither can the EPA alter the fundamental details of all of its regulatory schemes based on such vague provisions of law. We review each of the provisions listed by EPA, none of which discuss transparency, dose response, pivotal regulatory science, benefit-cost calculation, or changing “agency culture,” the stated goals of this rulemaking.

Section 25(a)(1) of the FIFRA authorizes the Administrator “to prescribe regulations to carry out the provisions of this subchapter.”⁷⁶⁵ This general authorization section of FIFRA differs from that of the other statutes listed because it actually does specify some considerations the Administrator must give when promulgating regulations. For example, it states, “Such regulations shall take into account the difference in concept and usage between various classes of pesticides, including public health pesticides, and differences in environmental risk and the appropriate data for evaluating such risk between agricultural, nonagricultural, and public health pesticides.” This provision clearly intends to provide detail and guidance on rulemaking. The fact that the section does not mention transparency indicates that it does not grant EPA authority to undertake the proposed rule.

Section 136r(a) of the FIFRA directs the Administrator to conduct research to carry out the purposes of the statute.⁷⁶⁶ The section states, “The Administrator shall also take care to ensure that such research does not duplicate research being undertaken by any other Federal agency.”

⁷⁶² 83 Fed. Reg. at 18,769

⁷⁶³ Proposed rule at 18769.

⁷⁶⁴ *Whitman v. American Trucking Assns., Inc.*, 531 US 457 (2001).

⁷⁶⁵ “Federal Insecticide, Fungicide, and Rodenticide Act,” 7 U.S.C. 136w.

⁷⁶⁶ “Federal Insecticide, Fungicide, and Rodenticide Act,” 7 U.S.C. 136r(a).

The section does not state that the EPA can ignore sound science if it does not meet its nebulous definition of transparency.

Comment [6155-664]: Commenter (6125) states that the proposal lists FIFRA sec. 25 as an authority for the rulemaking. 83 FR 18769. The agency, however, has failed to follow required procedures for issuing a valid regulation under FIFRA. FIFRA requires the agency to seek comments from the Secretary of Agriculture on all draft proposed regulations prior to signing the regulation for publication in the *Federal Register*; and, if the USDA provides comments, the agency must respond in writing to the comments as part of the proposed rulemaking package. See FIFRA sec. 25(a)(2); 7 U.S.C. 136w(a)(2). The statute contains a similar provision regarding consultation with the SAP --a body of independent expert scientific peer reviewers chartered under the Federal Advisory Committee Act (FACA) on all draft proposed regulations. See FIFRA sec. 25(d); 7 U.S.C. 136w(d). FIFRA further requires

EPA to publish a notice in the *Federal Register* simultaneously with the transmission of the proposed rule to USDA. FIFRA sec. 25(a)(2)(C); 7 U.S.C. 136w(a)(2)(C). In addition, the statute requires the agency to submit a copy of the proposed rule to the Agriculture Committees in the House and Senate. See FIFRA sec. 25(a)(3); 7 U.S.C. 136w(a)(3). The agency did not comply with any of these requirements. A very serious consequence of these procedural mistakes is to deprive the agency of a full understanding of how the proposed rulemaking might affect the regulation of pesticides and thereby affect agriculture, human health, and the environment. Had this proposal been referred to the SAP, EPN and other interested entities would have had the opportunity, according to SAP practices, for comment, a process which assures that the decision-makers obtain the widest possible input to these critically important decisions.

Comment [6155-2725]: Commenter (6125) notes that other provisions prescribe factors EPA must use in making decisions. FIFRA, 7 USC 136a-1(g)(1) requires that EPA “shall conduct a thorough examination of all data submitted under this section concerning an active ingredient ... and of all other available data found by the Administrator to be relevant.”

Like the express science provisions discussed above, both of these provisions are mandatory and prescribe specific factors EPA must assess. Neither offers any basis for failing to consider such factors or evidence regarding such factors because it is supported by science that is not “transparent.” When Congress wished to limit available science to information that is publicly available, it has done so. Its failure to impose such limits on the use of data or science in the provisions discussed above is thus purposeful. As noted, the proposal does not even mention any of these relevant statutory requirements governing the use of science or data or information, much less explain how any of them could authorize EPA to make a decision without using information that is relevant to decision-making, solely for lack of transparency and regardless of reliability or relevance. None of these statutes provide EPA with any authority to pick and choose what reliable and useful science to use or ignore specific studies based on transparency. While the proposal misleadingly pays lip service to using the best available science, it would expressly “preclude” the use of reliable and available science that is not, in its characterization, “transparent,” regardless of whether it is the best available science. The proposal does not even mention the governing statutory requirements, much less explain how its approach is consistent with them.

Comment [6163-1111]: Commenter (6133) provides that under the FIFRA, EPA cites 7 U.S.C. § 136r(a), which authorizes the Administrator to “undertake research.” That section does not allow the restriction of what types of research EPA may consider in rulemakings or otherwise. Nor does it draw any distinction between dose-response data and other types of data. The absence of any such congressional distinction or restriction makes it all the more obvious that EPA invented and added the distinction and restrictions in the Proposal as a matter of its own policy preferences, contrary to the Act. This EPA may not do.

EPA also cites 7 U.S.C. § 136w, which is the general rulemaking authority that allows the Administrator to carry out the provisions of FIFRA. As explained above, that general grant of authority cannot support the rule, especially when the rule conflicts with the Act. Moreover, the citation fails to provide sufficient notice for the public to comment on the Proposal. FIFRA does not authorize the proposed rule.

Comment [6163-1141]: Commenter (6133) states that FIFRA requires that all pesticides distributed or sold in the United States be registered by EPA. EPA cannot register pesticides that would cause “unreasonable adverse effects on the environment.” 7 U.S.C. § 136a. Likewise it may “by regulation” limit the distribution, sale or use of a pesticide to prevent “unreasonable adverse effects on the environment,” *id.* § 136a(a) and must cancel the registration of pesticides that cause such “unreasonable adverse effects.” *Id.* § 136d. The term “unreasonable adverse effects on the environment” is defined to include unreasonable risks to human health, and dietary risks that violate the standard for pesticide residues under the Federal Food, Drug and Cosmetic Act (FFDCA). *Id.* § 136(bb). Given that registration decisions often depend heavily on dose-response data and models, EPA must clarify whether the Proposal will apply to registration and registration review decisions. If so, the Proposal conflicts with FIFRA’s requirement that EPA determine whether pesticides proposed for registration would have unreasonable adverse effects on the environment. In light of that language, EPA cannot exclude relevant studies bearing on a pesticide’s effect on human health or the environment simply because the underlying data cannot be made public.

The potential applicability of the Proposal to exclude consideration of epidemiological studies of the health impacts of pesticides where the underlying data cannot be made public also highlights the logical inconsistency and arbitrary approach in the embodied proposed rule. On the one hand, the Proposal appears to be intended to prohibit consideration of such public health studies, but on the other hand seems to envision that industry-conducted studies and models claimed to include CBI would be allowed to be considered. This highlights the arbitrary and one-sided nature of the Proposal, and the clear underlying intent, which is to undermine public health protections for the benefit of industry.

Regardless of whether the Proposal applies to registration decisions, it conflicts with FIFRA in other ways. FIFRA directs EPA, when promulgating rules, to “take into account the difference in concept and usage between various classes of pesticides, including public health pesticides, and differences in environmental risk and the appropriate data for evaluating such risk between agricultural, nonagricultural, and public health pesticides.” *Id.* § 136w(a) (emphasis added); see also *id.* § 136w(c) (setting forth some examples of rules EPA may promulgate under FIFRA).

EPA may not exclude “appropriate data” in these regulatory decisions simply because those data cannot be made public. Thus, the Proposal conflicts with FIFRA.

Finally, EPA has violated FIFRA’s procedural requirements. FIFRA requires EPA to provide the SAP and the Secretary of Agriculture with a copy of the Proposal at least 60 days before publication in the *Federal Register*. Id. § 136w(a)(2), (d). Any notification to the Secretary must be published in the *Federal Register*. Id. § 136w(a)(2)(D). There is no evidence in the Proposal that EPA followed these procedural requirements. (EPA also must provide the Panel and the Secretary a copy of the final rule 30 days before publication in the *Federal Register*. Id. § 136w(a)(2), (d).) Similarly, EPA must furnish a copy of the proposed and final regulation to the Committee on Agriculture of the House of Representatives and the Committee on Agriculture, Nutrition, and Forestry of the Senate. Id. § 136w(a)(3). Again, there is no evidence this occurred.

Comment [6340-1461]: Commenter (6362) contends that EPA cites Section 25(a)(1) of the FIFRA, which does provide the Agency with broad authority to “prescribe regulations to carry out the provisions of this subchapter [FIFRA].” It should be noted, however, that the statutory language is a bit different from the other cited statutes and does not read as “as are necessary to carry out...”. In addition, FIFRA Section 136r(a) does not relate to rulemaking and instead provides the Agency broad authority to undertake research necessary to carry out the purposes of FIFRA. As such, EPA may mistakenly have included Section 136r(a) to support the proposal as cited on 83 Fed. Reg. 18769.

Comment [6352-3512]: Commenter (6374) supports EPA’s efforts to strengthen the integrity of its regulatory actions and recognizes the Agency’s need to be able to independently validate the data that support many of its decisions. Under the FIFRA and the FFDCA, the data submitted by pesticide applicants and registrants in support of product approvals are subject to rigorous and well-defined EPA regulatory requirements that confirm their quality, validity, and integrity. To ensure that EPA’s product approval decisions are based on reliable and verifiable science, the toxicological and exposure studies submitted by registrants in support of each pesticide registration must:

- meet stringent data quality standards;
- comply with EPA’s good laboratory practice quality criteria;
- use generally accepted methods, sufficient numbers of measurements (to achieve statistical reliability) and sufficient controls; and
- achieve reproducible results.

The commenter appreciates EPA’s statement that when dealing with science developed outside of the Agency, “it is the charge of the regulators to ensure that key findings are valid and credible, as required by OMB’s Guidelines.” 83 Fed. Reg. at 18770. We also appreciate EPA’s statement that it “must also ensure that its decision-making is marked by independence, objectivity, transparency, clarity, and reproducibility” relying upon regulatory science. Data submitted by registrants in support of pesticide products regulated under FIFRA and FFDCA are subject to a well-developed and effective process that meets EPA’s data quality goals. CropLife America (CLA) believes that all research EPA relies on to make pesticide regulatory decisions should be required to meet the same standards.

Notably, EPA already has full access to raw data underlying studies submitted by pesticide registrants under FIFRA and FFDCA. Consistent with the requirements of EPA’s Good Laboratory Practice Standards (40 C.F.R. Part 160), all raw data underlying a study that supports a pesticide product registration or tolerance action must be retained and made available to EPA for inspection and copying. 40 C.F.R. §§ 160.15(a); 160.190(a). It is equally important to ensure the quality of other scientific information used by EPA to prepare the risk assessments that form the foundation for its pesticide registration decisions. CLA has consistently suggested that EPA require all scientific information used in pesticide risk assessments, including studies from academic and other non-registrant sources, meet the same high data quality standards that the Agency applies to registrant data submissions under FIFRA and FFDCA.

Comment [6352-3516]: Commenter (6374) encourages the Agency to develop procedures to ensure that data from non-registrants that are used to make pesticide regulatory decisions meet the same data access and quality standards required of registrants. At the same time, the commenter understands that EPA’s April 30, 2018 proposal is specifically directed at those data underlying final regulations determined to be “significant regulatory actions” by the OMB, consistent with definitions, formal exclusions, and practices dating to 1993. As described below, this threshold provision appropriately excludes data submitted in support of individual pesticide product registration or tolerance decisions from the scope of the Agency’s proposal. In so doing, EPA also is ensuring that it complies with the statutory framework established by Congress to carefully balance the requirements of public notice and transparency (which are accomplished through several statutory provisions under FIFRA and FFDCA) with the need to incentivize pesticide product innovation through the protection of proprietary data rights (also accomplished through specific provisions of FIFRA and FFDCA).

Under these circumstances, the commenter asks EPA to expressly clarify that the proposed rule (and any final rule that EPA promulgates) does not include data submitted under FIFRA or FFDCA to support individual pesticide registration or tolerance decisions, consistent with its approach to other types of permits. By contrast, the scope would encompass more broadly applicable rulemakings under FIFRA or FFDCA that do meet the definition of “significant regulatory action.”

Comment [6352-3522]: Commenter (6374) provides that the scope of EPA’s newly proposed transparency regulations is set forth at proposed 40 C.F.R. § 30.3, which provides that:

([t]he provisions of this subpart apply to dose response data and models underlying pivotal regulatory science that are used to justify significant regulatory decisions. . . [T]he provisions of this subpart do not apply to any other type of agency action, including . . . permit proceedings.)

As separately described at proposed 40 C.F.R. § 30.2, the term “regulatory decisions” means “final regulations determined to be significant regulatory actions” by the OMB pursuant to Executive Order (EO) 12866.

Pesticides are among the most highly regulated products in the United States, and FIFRA requires the generation and submission of extensive amounts of human health and environmental data to allow EPA to make registration decisions. The amount and types of data required to

register a specific pesticide are functions of both the attributes of the compound and the uses the applicant seeks to register. Even after EPA's initial approval, each pesticide product remains subject to comprehensive EPA review and oversight, requiring substantial additional data on an ongoing basis to maintain each registration. FIFRA includes requirements for public notice and access to information (see, *e.g.*, FIFRA §§ 3(c)(2)(A), 3(c)(4), 10(d)).

Pesticide product registration actions are not, however, "significant regulatory actions" under EO 12866. Specifically, EO 12866 defines a "significant regulatory action" to mean any regulatory action that is likely to result in a rule meeting certain specified criteria (*i.e.*, any substantive action by an agency that promulgates or is expected to lead to the promulgation of a final rule or regulation). 58 Fed. Reg. 51735 (Oct. 4, 1993).

EPA's pesticide registration approvals under FIFRA do not involve the promulgation of any rule or regulation with broad application. Instead, EPA issues individual pesticide product registrations as specific licenses or permits, based on the Agency's evaluation of the data required for the specific license. Part 158 of EPA's regulations describes "the minimum data and information EPA typically requires to support an application for pesticide registration" The general types of data required include:

- Product chemistry data to evaluate the chemical characteristics of the product;
- Toxicology data to measure potential human health effects of exposure to the pesticide, including tests conducted on laboratory animals;
- Ecological effects data to measure the product's potential impact on exposed biological systems, including wildlife, aquatic organisms, and non-target plant effects data;
- Human exposure data to measure the amount of direct exposure to the product experienced by agricultural workers and others who use the product;
- Environmental fate data to evaluate the product's behavior and persistence in environmental media, including soil and groundwater; and
- Residue chemistry data to measure the amounts and chemical constituents of pesticide residues remaining on treated crops used for food or animal feed.

See, *e.g.*, 40 C.F.R. Part 158 Subparts D, F, G, K, N, and O. All pesticide data submissions must demonstrate compliance with EPA's good laboratory practice standards, as required by 40 C.F.R. § 160.12.

EPA's individual pesticide registration decisions, like other permit decisions, are not notice-and-comment rulemaking actions and, as such, have never been subject to EO 12866 review requirements.

For pesticides registered for use on food crops, EPA must also establish tolerances or tolerance exemptions as required by FFDCA. Unlike pesticide product registration decisions, these tolerance actions are issued by formal notice-and-comment regulation. FFDCA also includes requirements for public notice and access to information that are consistent with FIFRA (see, *e.g.*, FFDCA §§ 408(d)(3), 408(e)(2), 408(i).

By virtue of longstanding OMB policy, regulatory actions regarding specific pesticide tolerances, temporary tolerances, and tolerance exemptions (with the exception of actions that make an existing tolerance more stringent) are expressly exempt from EO 12866's definition of "regulatory action." OMB, Guidance for Implementing EO 12866 (Oct. 12, 1993), at App. C. Consistent with this guidance, EPA has exempted all tolerances and tolerance exemptions from EO 12866 for decades.⁷⁶⁷

The two categories of decisions above stand in contrast to more broadly applicable pesticide regulations determined by OMB to meet the definition of "significant regulatory action," and which therefore, like other non-exempt regulations, are subject to the requirements of EO 12866. See, e.g., "Revisions to EPA's Rule on Protections for Subjects in Human Research Involving Pesticides," 76 Fed. Reg. 5735 (Feb. 2, 2011) (stating that "[u]nder Executive Order 12866, this has been identified as a 'significant regulatory action'"); "Regulations Under FIFRA for Plant-Incorporated Protectants," 66 Fed. Reg. 37772 (July 19, 2001) (stating that "[p]ursuant to Executive Order 12866, OMB has determined that this proposed rule is a 'significant regulatory action' because this action might raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order").

For these threshold reasons, the commenter understands that pesticide product registration data would not be subject to EPA's proposed transparency requirements. As further described below, this exclusion is mandated by law.

Comment [6352-3525]: Commenter (6374) asserts that the exclusion of pesticide product registration and tolerance data from the scope of EPA's proposal is mandated by the overriding statutory requirements that EPA is charged with administering. Specifically, EPA's disclosure of data submitted in support of pesticide registration actions must comply fully with FIFRA's special protections, which recognize the need to protect the confidentiality of certain information that relates to trade secrets or commercial or financial information and includes:

- A prohibition against EPA's disclosure of any "information which in the Agency's judgment contains or relates to trade secrets or commercial or financial information obtained from a person and privileged and confidential";⁷⁶⁸
- A requirement that EPA provide advance written notice to an applicant or registrant if it proposes to disclose information claimed as confidential;⁷⁶⁹ and

⁷⁶⁷ See, e.g., Xanthan Gum - Modified, Tolerance Exemption, 61 Fed. Reg. 4621 (Feb. 7, 1996) (OMB "has exempted this proposed rule from the requirements of section 3 of Executive Order 12866"); Pesticide Tolerance for 2,4 - D, 61 Fed. Reg. 4623 (Feb. 7, 1996) (OMB "has exempted this proposed rule from the requirements of section 3 of Executive Order 12866"); Defensin Proteins Derived From Spinach in Citrus Plants, Temporary Exemption from the Requirement of a Tolerance, 80 Fed. Reg. 25943 (May 6, 2015) (OMB "has exempted these types of actions from review under Executive Order 12866"); Titanium Dioxide, Exemption from the Requirement for a Tolerance, 83 Fed. Reg. 8616 (Feb. 28, 2018) (OMB "has exempted these types of actions from review under Executive Order 12866"). By contrast, an action to lower an established tolerance would, consistent with OMB's longstanding policy, be subject to OMB's definition of "regulatory action," and any data relied upon by EPA to support such an action should therefore be required to meet EPA's newly proposed transparency requirements.

⁷⁶⁸ FIFRA § 10(b).

⁷⁶⁹ FIFRA § 10(c).

- A prohibition against EPA’s disclosure of any information that discloses: (i) “manufacturing or quality control processes,” (ii) “the details of any methods for testing, detecting or measuring the quantity of any deliberately added inert ingredient of a pesticide,” or (iii) “the identity or percentage quantity of any deliberately added inert ingredient of a pesticide.”⁷⁷⁰

Alongside these significant confidentiality protections, FIFRA also provides its own transparency mandate for pesticide registration data with two important features. First, it requires that EPA make available to the public information concerning the objectives, methodology, results, or significance of any test or experiment performed on or with a registered pesticide, and any information concerning the effects of such pesticide on any organism or the behavior of such pesticide in the environment. FIFRA § 10(d)(1).⁷⁷¹

Second, this broad disclosure mandate for pesticide registration data is subject to an essential limitation. Recognizing the proprietary nature of pesticide studies and the possibility that industry competitors might obtain and seek to improperly use copies of another submitter’s unpublished data to satisfy its own pesticide regulatory requirements in other jurisdictions, FIFRA expressly prohibits EPA from disclosing studies submitted by an applicant or registrant to any employee or agent of a foreign or multinational pesticide company. FIFRA § 10(g)(1). Underscoring the importance of this prohibition, FIFRA requires that EPA obtain an affirmation (which must be submitted subject to criminal penalties under 18 U.S.C. § 1001) from any person seeking access to pesticide registration data to ensure that such person will not deliver or offer the data to any such business or entity. FIFRA §§ 10(g)(1), (3). Specifically, before EPA will provide a member of the public with access to a pesticide submission, the requestor must affirm that he or she:

- is not a business or other entity engaged in the production, sale, or distribution of pesticides in countries other than the United States or in addition to the United States (nor an employee or agent of any such business or entity);
- does not seek access to the information for purposes of delivering it or offering it for sale to any such business or entity or to any of its employees or agents; and
- will not purposefully deliver the information (or negligently cause it to be delivered) to any such entity or to any of its employees or agents.

EPA has confirmed that it would be unlawful for a person to execute the required affirmation while having the intent to publish or otherwise deliver a FIFRA data submitter’s previously unpublished data submission to a foreign or multinational pesticide producer, explaining that “the information delivered likely could be used to satisfy a data requirement imposed by a foreign country as a condition of producing, distributing, selling, shipping, or using the product

⁷⁷⁰ FIFRA §§ 10(d)(1)(A) – (C). In addition, FIFRA establishes specific penalties for violations of these disclosure requirements. FIFRA § 10(f).

⁷⁷¹ In the case of publicly funded research, Congress has provided EPA with the express right to obtain and publish the data, and EPA is required to make such data available to the public when requested under FOIA. OMB Circular A-110 at Sec. C.36(d)(1) (implementing the Data Access Act, also known as the Shelby Amendment). While the disclosure of publicly funded research does not raise the types of data protection concerns associated with proprietary research, OMB’s standards provide disclosure exceptions for trade secrets, certain confidential information, legally protected information, and private personal information when appropriate. *Id.* at Sec. C.36(d)(2)(i)(A), (B).

in that country.” See, EPA, “Limitations on Disclosure of Information Under Pesticide Law” (available at: <https://www.epa.gov/foia/limitations-disclosure-information-under-pesticide-law>).

FFDCA § 408(i) extends the same protections as FIFRA’s to data submitted in support of EPA tolerance decisions.

The Agency’s April 30, 2018, proposed transparency requirements, like all regulations issued by EPA, must comply fully with FIFRA’s and FFDCA’s protections for pesticide data.⁷⁷² EPA has successfully administered these data disclosure and confidentiality requirements for many years, ensuring that high-quality, verifiable data are available to the Agency from applicants and registrants while balancing the important need to make pesticide data available for public review and at the same time preventing disclosure to industry competitors. Accordingly, EPA’s proposed transparency requirements should explicitly incorporate the protections specifically guaranteed to pesticide registration data under FIFRA and FFDCA.

Comment [6353-2329]: Commenter (6375) provides that EPA solicits comment on whether alternative or additional regulatory or other policy vehicles are appropriate to establish and implement these policies, and whether further regulatory or other policy vehicles at the programmatic or statutory level would be appropriate as alternative or additional steps the agency may take to further the policies articulated in Section II. (pg. 18,771).

The regulatory language that EPA proposes provides general requirements that apply to the Agency’s use of science under the many statutes that it implements. The generality of the proposed regulations may be a function of the diverse purposes of those statutes. Specifically, some of these statutes focus on the introduction of new substances into the marketplace (*e.g.*, FIFRA and TSCA). The scientific analyses required for these different programs and the sources of the scientific information underlying those analyses differ. The Agency should consider supplementing the general language that it has proposed with statutory specific regulations. A statutory-specific rulemaking would provide greater certainty going forward.

Comment [6424-2639]: Commenter (6446) contends that the proposed rule also deviates from accepted practices that EPA routinely uses, and is required to use, to evaluate science it relies on for regulatory decisions. EPA has long recognized that proprietary CBI submitted to it cannot be shared with the public, yet it routinely relies on that information, including scientific studies and other scientific information, as the foundation for important regulatory decisions. (See, *e.g.*, FIFRA at 7 U.S.C. 136h, subd. (b).) EPA also adheres to specific Congressional directives regarding the science it should consider for regulatory action, including directives to consider whether the scientific information is reasonable, clear, complete and whether it has been peer reviewed.

⁷⁷² See, *e.g.*, *Chevron, U.S.A., Inc. v. Nat. Res. Def. Council, Inc.*, 467 U.S. 837, 842–43 (1984) (holding that “[i]f the intent of Congress is clear, that is the end of the matter; . . . the agency [] must give effect to the unambiguously expressed intent of Congress”); *Fed. Election Comm’n v. Democratic Senatorial Campaign Comm.*, 454 U.S. 27, 32, (1981) (holding that courts “must reject administrative constructions of the statute . . . that are inconsistent with the statutory mandate or that frustrate the policy that Congress sought to implement”).

Comment [6894-3610]: Commenter (6915) provides that although Section 25 of the FIFRA directs that regulations “take into account . . . *the appropriate data* for evaluating [] risk,” 7 U.S.C. 136w (emphasis added), it would be arbitrary and capricious to define “appropriate” to exclude from consideration relevant and valid scientific studies, as EPA proposes to do in this rulemaking. Requirements to review the “latest” and “appropriate” scientific data are not carte blanche to impose new, unscientific limits on that data.

Comment [8750-1815]: Commenter (9227) notes that the Proposal lists FIFRA section 25 as an authority for the rulemaking.⁷⁷³ The agency, however, has already failed to follow several required procedures for issuing a valid regulation under this section of FIFRA. FIFRA section 25 requires the agency to seek comments from the Secretary of Agriculture on all draft proposed regulations 60 days prior to signing a proposed regulation for publication,⁷⁷⁴ and 30 days prior to publication for a final rule. If the Secretary of Agriculture provides comments, the Administrator must also respond in writing as part of the proposed rulemaking package.⁷⁷⁵ FIFRA additionally requires EPA to publish a notice in the *Federal Register* simultaneously with the transmission of the proposed rule to USDA.⁷⁷⁶ And the statute requires the agency to submit a copy of the proposed rule for comment to the SAP,⁷⁷⁷ as well as a copy to the Agriculture Committees in the House and Senate any time the agency is required to consult with the Secretary of Agriculture.⁷⁷⁸ This means that EPA here should have provided both committees and the SAP with a copy of the proposed regulation at least 60 days prior to publication of the Proposal in the *Federal Register*. The agency did not comply with any of these requirements and does not indicate that it will in any final rule. The Proposal is therefore unlawful.⁷⁷⁹

To be sure, in some instances the Administrator and Secretary may together agree to waive some of the consultation requirements among themselves,⁷⁸⁰ but there is no indication that Administrator Pruitt did that with this Proposal. And even if the Administrator and Secretary later agree to waive the consultation requirement section 25(a)(2)(A) and (B), that waiver would not alter EPA’s obligation to provide the SAP and the House and Senate Committees with a copy of the regulation. Nor would it change the fact that the Administrator illegally issued the Proposal without consulting the Secretary of Agriculture. A very serious consequence of these procedural mistakes is to deprive the agency of a full understanding of how the proposed rulemaking might affect the regulation of pesticides and thereby affect agriculture, human health, and the environment.⁷⁸¹ Therefore, the only lawful path forward here is for the Agency to withdraw the Proposal, consult with the entities required by FIFRA, and then subsequently re-notice the Proposal.

⁷⁷³ 83 Fed. Reg. 18769.

⁷⁷⁴ 7 U.S.C. 136w(a)(2)(A).

⁷⁷⁵ 7 U.S.C. 136w(a)(2)(B).

⁷⁷⁶ 7 U.S.C. 136w(a)(2)(D).

⁷⁷⁷ 7 U.S.C. 136w(d)(1).

⁷⁷⁸ 7 U.S.C. 136w(a)(3).

⁷⁷⁹ If finalized, the proposal will also have to be transmitted to the Secretary of the Senate and Clerk of the House of Representatives. See 7 U.S.C. 136w(a)(4). The rule does not become effective until 60 days after this rule or regulation is transmitted.

⁷⁸⁰ 7 U.S.C. 136w(a)(2)(C).

⁷⁸¹ See also, Section II.D.8.

Comment [8750-1964]: Commenter (9227) provides that EPA arbitrarily failed to consider the far-reaching implications this Proposal could have on inter-agency coordination and consultation given that other agencies normally rely on research potentially excluded by the Proposal.⁷⁸²

Consultation Provisions in FIFRA

136w(a)(2)(A)

Authority of the Administrator: Procedure: Proposed regulations

(A) Proposed Regulations:

At least 60 days prior to signing any proposed regulation for publication in the *Federal Register*, the Administrator shall provide the Secretary of Agriculture with a copy of such regulation. If the Secretary comments in writing to the Administrator regarding any such regulation within 30 days after receiving it, the Administrator shall publish in the *Federal Register* (with the proposed regulation) the comments of the Secretary and the response of the Administrator with regard to the Secretary's comments. If the Secretary does not comment in writing to the Administrator regarding the regulation within 30 days after receiving it, the Administrator may sign such regulation for publication in the *Federal Register* any time after such 30-day period notwithstanding the foregoing 60-day time requirement.

136w(a)(2)(B)

Authority of the Administrator: Final Regulations

At least 30 days prior to signing any regulation in final form for publication in the *Federal Register*, the Administrator shall provide the Secretary of Agriculture with a copy of such regulation. If the Secretary comments in writing to the Administrator regarding any such final regulation within 15 days after receiving it, the Administrator shall publish in the *Federal Register* (with the final regulation) the comments of the Secretary, if requested by the Secretary, and the response of the Administrator concerning the Secretary's comments. If the Secretary does not comment in writing to the Administrator regarding the regulation within 15 days after receiving it, the Administrator may sign such regulation for publication in the *Federal Register* at any time after such 15-day period notwithstanding the foregoing 30-day time requirement. In taking any final action under this subsection, the Administrator shall include among those factors to be taken into account the effect of the regulation on production and prices of

⁷⁸² See *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) ("Normally, an agency rule would be arbitrary and capricious if the agency has . . . entirely failed to consider an important aspect of the problem.").

agricultural commodities, retail food prices, and otherwise on the agricultural economy, and the Administrator shall publish in the *Federal Register* an analysis of such effect

136w(a)(3)

Authority of the Administrator: Procedure: Congressional Committees

At such time as the Administrator is required under paragraph (2) of this subsection to provide the Secretary of Agriculture with a copy of proposed regulations and a copy of the final form of regulations, the Administrator shall also furnish a copy of such regulations to the Committee on Agriculture of the House of Representatives and the Committee on Agriculture, Nutrition, and Forestry of the Senate.

136w(a)(4)

Authority of the Administrator

Simultaneously with the promulgation of any rule or regulation under this subchapter, the Administrator shall transmit a copy thereof to the Secretary of the Senate and the Clerk of the House of Representatives. The rule or regulation shall not become effective until the passage of 60 calendar days after the rule or regulation is so transmitted.

136w-3

Identification of Pests; cooperation with USDA

The Administrator, in coordination with the Secretary of Agriculture, shall identify those pests that must be brought under control. The Administrator shall also coordinate and cooperate with the Secretary of Agriculture's research and implementation programs to develop and improve the safe use and effectiveness of chemical, biological, and alternative methods to combat and control pests that reduce the quality and economical production and distribution of agricultural products to domestic and foreign consumers.

136(r)(a)

Research and Monitoring: Research

The Administrator shall undertake research including research by grant or contract with other Federal agencies, universities, or others as may be necessary to carry out the purposes of this subchapter, and the Administrator shall conduct research into integrated pest management in coordination with the Secretary of Agriculture. The Administrator shall also take care to ensure that such research does not duplicate research being undertaken by any other Federal agency.

136a-1(n)(2)-(3)

Reregistration of registered pesticides: Authorization of funds to develop public health data

(2) Consultation. In the case of a pesticide registered for use in public health programs for vector control or for other uses the Administrator determines to be human health protection uses, the Administrator shall, upon timely request by the registrant or any other interested person, or on the Administrator's own initiative may, consult with the Secretary [of HHS] prior to taking final action to suspend registration under section 3(c)(2)(B)(iv) or cancel a registration under section 4, 6(e), or 6(f). In consultation with the Secretary, the Administrator shall prescribe the form and content of requests under this section.

(3) Benefits to support family. The Administrator, after consulting with the Secretary, shall make a determination whether the potential benefits of continued use of the pesticide for public health or health protection purposes are of such significance as to warrant a commitment by the Secretary to conduct or to arrange for the conduct of the studies required by the Administrator to support continued registration under section or reregistration under section 4

7 USCS 136(II) (2)

Definitions: Minor Use

(2) the Administrator, in consultation with the Secretary of Agriculture, determines that, based on information provided by an applicant for registration or a registrant, the use does not provide sufficient economic incentive to support the initial registration or continuing registration of a pesticide for such use and--

136i(a)(1)

Use of restricted use pesticides; applicators

Requires the Administrator to consult with Governor of each state to conduct a program for the certification of use of specific pesticides.

136a(c)(1)(F)(ii)

Registration of Pesticides: Procedure for registration

The period of exclusive data use provided under clause (i) shall be extended 1 additional year for each 3 minor uses registered after the date of enactment of this clause [enacted Aug. 3, 1996] and within 7 years of the commencement of the exclusive use period, up to a total of 3 additional years for all minor uses registered by the Administrator if the Administrator, in consultation with the Secretary of Agriculture, determines that, based on information provided by an applicant for registration or a registrant, that--(I) there are insufficient efficacious alternative registered pesticides available for the use; (II) the alternatives to the minor use pesticide pose greater risks to the environment or human health; (III) the minor use pesticide plays or will play a significant part in managing pest resistance; or (IV) the minor use pesticide plays or will play a significant part in an integrated pest management program.

136t(b)

Delegation and Cooperation

(b) Cooperation. The Administrator shall cooperate with the USDA, any other Federal agency, and any appropriate agency of any State or any political subdivision thereof, in carrying out the provisions of this Act and in securing uniformity of regulations.

136o(e)

Imports and Exports

Secretary of the Treasury shall prescribe regulations for this section in consultation with the Administrator.

136p

Exemption of Federal and State Agencies

The Administrator may, at the Administrator's discretion, exempt any Federal or State agency from any provision of this Act if the Administrator determines that emergency conditions exist which require such exemption. The Administrator, in determining whether or not such emergency conditions exist, shall consult with the Secretary of Agriculture and the Governor of any State concerned if they request such determination.

136w-7

USDA Minor Use Program

(A) Grant authority. The Secretary, in consultation with the Administrator, shall establish a program to make grants for the development of data to support minor use pesticide registrations and re-registrations. The amount of any such grant shall not exceed 1/2 of the cost of the project for which the grant is made.

136i-1(a)(1)

Pesticide Recordkeeping

The Secretary of Agriculture, in consultation with the Administrator of the EPA, shall require certified applicators of restricted use pesticides

136i-2(c)

Collection of Pesticide Use Information Coordination.

The Secretary of Agriculture shall, as appropriate, coordinate with the Administrator of the EPA in the design of the surveys and make available to the Administrator the aggregate results of the surveys to assist the Administrator.

Comment [9078-3466]: Commenter (6194) asserts that given the complexity and potentially broad-reaching impact of the Proposal, the limited time allotted for review of the Proposal by the OMB's OIRA suggests that the process was intended to be pro forma as opposed to meaningful.⁷⁸³ Yet, despite this truncated review, the Proposal was changed significantly during

⁷⁸³ Pursuant to Executive Order 12,866, agencies must submit proposals for "significant regulatory actions" to OIRA before publication in the *Federal Register*. OIRA's review can take as long as 90 days; the average review time for the 41 rules that EPA sent to OIRA from the beginning of the current Administration to the submission of the Proposal was 52 days; a significant contrast to the 5-day review period for the Proposal. See Genna Reed, What Happened During the Hasty White House Review of EPA's Science Restriction Rule?, UNION OF CONCERNED

this period. To the extent that any of those changes were made by OIRA, it would have exceeded the office's authority under Executive Order 12,866, which charges OIRA with conducting cost benefit analyses, not changing the substantive content of agencies' regulations. To the extent the changes were made by EPA, it is unclear on what version of the proposal OIRA conducted a cost benefit analysis and whether the version of the Proposal released to the public was reviewed by OIRA. Furthermore, as reported by Greenwire, former EPA Administrator Pruitt signed the Proposal before OIRA even completed its review; raising further doubt about the opportunity for any meaningful review by the OMB.⁷⁸⁴ These concerns are addressed in greater detail by the Union of Concerned Scientists in a blog post from May 7, 2018.⁷⁸⁵

EPA is also supposed to provide OIRA, and the public, an "assessment" and the "underlying analysis" of the anticipated benefits and costs of the proposal. E.O. 12,866, § 6(a)(3)(B)-(C), (E)(i). Yet the Proposal contains no serious attempt at assessing either. With respect to benefits, the Proposal contains a single sentence, stating that it will improve "the scientific quality of the Agency's actions and facilitate expanded data sharing and exploration of key data sets." 83 Fed. Reg. at 18,772. This assertion is questionable at best and presented without any underlying analysis.⁷⁸⁶ Regarding costs, the Proposal does not attempt an independent assessment, indicating only that "[t]his action should be implemented in a cost-effective way" and referencing an analysis by the Mercatus Center. *Id.* However, a CBO analysis of a similar legislative proposal concluded that it could cost hundreds of millions of dollars a year; the Proposal does not address or distinguish this analysis.⁷⁸⁷ EPA did not provide OIRA, and has not provided the public, with sufficient information for an analysis of the Proposal's benefits and costs.

Similar questions exist as to whether EPA solicited sufficient, if any, interagency review of the Proposal. For example, the Proposal cites the rulemaking provision of the FIFRA as a source of authority; this provision requires EPA to seek comments from the Secretary of Agriculture and the FIFRA SAP on draft regulations. 7 U.S.C. § 136w. EPA did not seek such input prior to publication of the Proposal. Such interagency review would be particularly important with respect to other agencies whose work could be impacted by the Proposal (see discussion in Section V below).

EPA's own SAB, which Congress created in 1978 to provide scientific advice to EPA, 42 U.S.C. § 4365(a), challenged EPA's failure to solicit SAB's input on the Proposal—pointing out that it was not even aware of the Proposal until it was published in the *Federal Register* and discussed in news articles.⁷⁸⁸ Given that EPA should have provided the Proposal to another federal agency

⁷⁸⁷ Congressional Budget Office, Cost Estimate: H.R. 1030, Secret Science Reform Act of 2015, at 2 (Mar. 11, 2015), <https://www.cbo.gov/sites/default/files/114th-congress-2015-2016/costestimate/hr1030.pdf>.

⁷⁸⁸ Memorandum from Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science, to Members of the Chartered SAB and SAB Liaisons, regarding Preparations for Chartered Science Advisory Board (SAB) Discussions of Proposed Rule: Strengthening Transparency in Regulatory Science

to review, EPA was also required to make the Proposal available to the SAB, along with any relevant scientific and technical information on which the Proposal was based. 42 U.S.C. § 4365(c). A SAB Work Group concluded that the Proposal deals with a “myriad of scientific issues for which the Agency should seek expert advice from the SAB,” explaining that:

- “There are . . . sensitive situations where public access may infringe on legitimate confidentiality and privacy interests, and where exceptions from complete public access may be appropriate. In addition, there are considerations associated with the cost and effort that would be involved in making large and complex existing datasets available.”
- “[T]he precise design of the rule appears to have been developed without a public process for soliciting input from the scientific community. Nor does the preamble to the rule describe precisely how the proposal builds on previous efforts to promote transparency such as the Information Quality Act and EPA’s Information Quality Guidelines.”
- “The proposed rule does not include any assessment of the impact of data restrictions on existing or future regulatory programs. . . Furthermore, the rule could have the effect of removing legal, ethical, and peer-reviewed studies of health effects as sources to support the agency’s regulatory efforts.”⁷⁸⁹

Even when EPA is not required to seek SAB’s opinion,⁷⁹⁰ failing to utilize SAB’s expertise is inconsistent with the purpose of SAB, which is to “to provide independent advice and peer review to EPA’s Administrator on the scientific and technical aspects of environmental issues.”⁷⁹¹ The SAB’s expertise and input is similarly valuable to the public, and should be available well before the end of the public comment period so as to inform discussion.

Comment [9217-3563]: Commenter (9225) contends that equally problematic, the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA’s authority. This includes, but is not limited to, the CAA; CWA; TSCA; LCSA; SDWA; FIFRA; and more.

Comment [6857-2945]: Commenter (6879) provides that EPA rules and regulations have been critical to the protection of wildlife, natural habitats, and the ecosystem services they provide to communities and the economy. This includes protection of endangered and other wildlife from pesticides and other toxic substances under FIFRA.

RIN (2080-AA14) (May 12, 2018),

[https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/\\$File/WkGrp_memo_2080-AA14_final_05132018.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/$File/WkGrp_memo_2080-AA14_final_05132018.pdf) [hereinafter “SAB May 12, 2018 memorandum”].

⁷⁸⁹ SAB May 12, 2018 memorandum, *supra* note 13; see also Letter from Dr. Michael Honeycutt, Chair, Science Advisory Board, to Scott Pruitt, Administrator, EPA, regarding Science Advisory Board Consideration of EPA Proposed Rule: Strengthening Transparency in Regulatory Science (June 28, 2018) (urging EPA to “request, receive, and review scientific advice from the SAB before revising the proposed rule”), [https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebReportsLastMonthBOARD/4ECB44CA28936083852582B004ADE54/\\$File/EPA-SAB-18-003+Unsigned.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebReportsLastMonthBOARD/4ECB44CA28936083852582B004ADE54/$File/EPA-SAB-18-003+Unsigned.pdf).

⁷⁹⁰ When EPA provides any proposed criteria document, standard, limitation, or regulation to any other federal agency for formal review and comment, it must also make such proposal available to the SAB for its review. SAB in turn may provide advice and comments to EPA on the adequacy of the scientific and technical basis of a proposal. Such advice must be provided within a timeframe specified by EPA. 42 U.S.C. § 4365(c).

⁷⁹¹ SAB Charter ¶ 3.

These laws require EPA to use the “best available” science, or all “reasonably available” science and information. By excluding high-quality peer-reviewed and validly published science from the regulatory decision-making process, the proposed regulation directly contravenes the specific mandate of these statutes. And by deliberately excluding the best science available, the rule also contravenes the Congressional mandates for these statutes and undermines their public health and environmental protection purposes.

Comment [6163-1276]: Commenter (6133) states that in addition to addressing how and whether the agency will consider science, the Proposal also contains a seemingly unrelated provision regarding agency peer review. The Proposal, in § 30.7, reads:

What role does independent peer review in this section?

EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

Because transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA’s justification for the assumptions applied and the implications of those assumptions for the results. (83 Fed. Reg. at 18,774.)

There is no statutory authority for EPA to “conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” The federal statutes that EPA lists as putative authority for the Proposal provide no authority for proposed § 30.7. See FIFRA sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w. The claimed authorities that EPA lists do not mention peer review or even allude to the concept. *Id.* Neither the Proposal nor accompanying docket materials identify any provision of any federal statute that authorizes EPA to promulgate proposed § 30.7. Our own research revealed no provision of any federal statute that authorizes EPA to promulgate proposed § 30.7.

When Congress writes federal statutes, Congress knows how to create legal authority for peer review, who shall conduct that peer review, what role, if any, that EPA or other parties will play, and how that peer review may be conducted. None of the provision in the law authorize EPA’s Proposal in § 30.7. Instead, the statutes require that EPA use peer-reviewed science, regardless of whether it would meet EPA’s definition of the term in § 30.7. And in cases where the law requires EPA to conduct the review, the statutes often spell out specifically how that should happen.

The commenter provides provisions for peer review for several statutes. Only the section relevant to FIFRA is excerpted here.

§ 136w. Authority of Administrator

(e) *Peer review.* The Administrator shall, by written procedures, provide for peer review with respect to the design, protocols, and conduct of major scientific studies conducted under this subchapter by the EPA or by any other Federal agency, any State or political subdivision thereof, or any institution or individual under grant, contract, or cooperative agreement from or with the EPA. In such procedures, the Administrator shall also provide for peer review, using the advisory panel established under subsection (d) of this section or appropriate experts appointed by the Administrator from a current list of nominees maintained by such panel, with respect to the results of any such scientific studies relied upon by the Administrator with respect to actions the Administrator may take relating to the change in classification, suspension, or cancellation of a pesticide. Whenever the Administrator determines that circumstances do not permit the peer review of the results of any such scientific study prior to the Administrator's exercising authority under section 136d(c) of this title to immediately suspend the registration of any pesticide to prevent an imminent hazard, the Administrator shall promptly thereafter provide for the conduct of peer review as provided in this sentence. The evaluations and relevant documentation constituting the peer review that relate to the proposed scientific studies and the results of the completed scientific studies shall be included in the submission for comment forwarded by the Administrator to the advisory panel as provided in subsection (d). As used in this subsection, the term "peer review" shall mean an independent evaluation by scientific experts, either within or outside the EPA, in the appropriate disciplines. (7 U.S.C. § 136w (emphasis added)).

§ 136w-8. Pesticide registration service fees

(a) Definition of costs in this section, the term "costs", when used with respect to review and decision-making pertaining to an application for which registration service fees are paid under this section, means-- (1) costs to the extent that—

(A) officers and employees provide direct support for the review and decision-making for covered pesticide applications, associated tolerances, and corresponding risk and benefits information and analyses; (B) persons and organizations under contract with the Administrator engage in the review of the applications, and corresponding risk and benefits information and assessments; and (C) advisory committees and other accredited persons or organizations, on the request of the Administrator, engage in the peer review of risk or benefits information associated with covered pesticide applications; (2) costs of management of information, and the acquisition, maintenance, and repair of computer and telecommunication resources (including software), used to support review of pesticide applications, associated tolerances, and corresponding risk and benefits information and analyses; and (3) costs of collecting registration service fees under subsections (b) and (c) and reporting, auditing, and accounting under this section. (7 U.S.C. § 136w-8 (emphasis added)).

Under longstanding federal case law, when Congress authorizes an approach in one section of a statute using specific language but does not do the same in other sections of a statute, courts presume that Congress acted purposefully and did not mean to address or authorize that approach in those other statutory sections. See, e.g., *Dean v. United States*, 556 U.S. 568 (2009) ("It is

generally presumed that Congress acts intentionally when including particular language in one section of a statute but not in another.” (citing *Russello v. United States*, 464 U.S. 16, 23 (1983)). Not only are there no implied grants of authority to an agency in the other statutory sections, but the congressional decisions to authorize the approach elsewhere in the statute give even greater force to the conclusion that the agency has not been given authority where Congress did not use the same or similar authorizing language.

The EPA approach proposed in § 30.7 is even more unlawful than would be the case, independently, under this case law. Proposed § 30.7 says “EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” 83 Fed. Reg. at 18,774/2 (emphasis added). EPA proposes to bind itself (“shall”) to conduct a particular form of peer review on “all pivotal regulatory science” based on an unenforceable, non-binding OMB bulletin that has never been the subject of notice and comment rulemaking and that itself is not authorized by any federal law. To the contrary, treating the content of the unenforceable bulletin as a binding regulation would itself violate the federal statutes that EPA implements, because those statutes do not codify the bulletin, and EPA would be unlawfully codifying a mere policy preference. This EPA may not do.

This Proposal is unlawful, arbitrary, and capricious, and an abuse of EPA discretion. To reiterate, the Proposal identifies no statutory authority for EPA to conduct independent peer review for any, much less all, “pivotal regulatory science” consistent with the dense content (and exceptions) of the OMB bulletin. The Proposal identifies no statutory authority for EPA to bind itself, and future administrations, to conduct peer review only in this fashion, unless and until future notice-and-comment rulemaking is undertaken. The Proposal identifies no suggestion in statutory language or legislative history that Congress intended EPA to conduct binding peer review consistent with this OMB bulletin, notwithstanding that Congress has known about this bulletin since 2005. EPA has simply made up proposed § 30.7—with its link to the OMB bulletin, and the putative authority for the Proposal—out of whole cloth. This EPA may not do.

Comment [6112-1605]: Commenter (6137) asserts that not only does the Proposed Rule contravene the statutes upon which EPA relies as statutory authority, but its limitations on science likewise conflict with core provisions of other environmental statutes. For example, the Food Quality Protection Act (FQPA), which regulates pesticide residue in conjunction with FIFRA, sets safety standards based on the consideration of all available data. Limiting the data available to conduct studies necessary to evaluate the harmful effects of pesticides runs counter to this mandate.

Specifically, Congress overhauled our food safety laws when it unanimously passed the FQPA, amending both FFDCA⁷⁹² and FIFRA. The overhaul responded to a seminal 1993 NAS report

⁷⁹² Under the FFDCA, EPA must establish the maximum residue of a pesticide allowed on food, called a “tolerance,” in order for a pesticide to be permitted on food that is imported or sold in interstate commerce. 21 U.S.C. § 346a(b) & (c). EPA may “establish or leave in effect a tolerance for a pesticide chemical residue in or on a food only if the Administrator determines that the tolerance is safe.” *Id.* § 346a(b)(2)(A)(i). If it finds a pesticide residue would not be safe, EPA must revoke a tolerance. *Id.*

criticizing EPA for treating children like “little adults” by failing to address the unique susceptibility of children to pesticide exposures based on the foods they eat, their play, metabolism, and sensitive stages of their development. NAS, *Pesticides in the Diets of Infants and Children* (1993). The NAS recommended that EPA revamp and strengthen its pesticide regulations to account for children’s vulnerabilities, consumption patterns, and exposures. Because it would take time to fill gaps in knowledge, safeguards, and methodologies, the NAS recommended that additional protection be afforded in the form of “uncertainty” or “safety factors.” The NAS first described how EPA has regularly used uncertainty factors and then proposed an additional uncertainty factor for fetal developmental toxicity and where data are incomplete: “In the absence of data to the contrary, there should be a presumption of greater toxicity to infants and children. To validate this presumption, the sensitivity of mature and immature individuals should be studied systematically to expand the current limited data base on relative sensitivity.” *Id.*

The FQPA strengthened the food safety standard in several ways. First, under the FQPA, the EPA Administrator “may establish or leave in effect a tolerance for a pesticide chemical residue in or on food only if the Administrator determines that the tolerance is safe. The Administrator shall modify or revoke a tolerance if the Administrator determines it is not safe.” 21 U.S.C. § 346a(b)(2)(A)(i). In other words, the absence of sufficient information to find a pesticide safe means it cannot be allowed in or on our food.

Second, safe “means the Administrator has determined there is a reasonable certainty that no harm will result from aggregate exposure to the pesticide chemical residue, including all anticipated dietary exposures and all other exposures for which there is reliable information.” *Id.* § 346a(b)(2)(A)(ii). The FQPA, therefore, requires that EPA conduct an assessment based on aggregation of all exposures to a pesticide whether from eating foods, drinking water with residues of the pesticide, or uses of the pesticide in and around the home or other places where people can be exposed. 21 U.S.C. § 346a(b)(2)(A)(ii), (C)(i)(I) & (ii). The FQPA also requires EPA to assess and protect against unsafe risks posed by cumulative exposures to pesticides that share a “common mechanism of toxicity,” as is the case with pesticides in the organophosphate, carbamate, and pyrethroid families. See 21 U.S.C. § 346a(b)(2)(C)-(D).

Third, EPA must make specific safety determinations for infants and children. *Id.* § 346a(b)(2)(C)(ii)(I) & (II). It must consider available information concerning “the special susceptibility of infants and children,” including “neurological differences between infants and children and adults, and effects of in utero exposure to pesticide chemicals.” *Id.* § 346a(b)(2)(C)(i)(II). EPA must also base its tolerance decisions on available information about food “consumption patterns among infants and children.” *Id.* § 346a(b)(2)(C)(i)(I) & (III).

Fourth, EPA must account for children’s sensitivities, scientific uncertainty, and gaps in available data. The statute requires that “an additional tenfold margin of safety for the pesticide chemical residue and other sources of exposure shall be applied for infants and children to take into account potential pre -and post-natal toxicity and completeness of the data with respect to exposure and toxicity to infants and children.” *Id.* § 346a(b)(2)(C). EPA can depart from this requirement and use a different margin of safety “only if, on the basis of reliable data, such margin will be safe for infants and children.” *Id.*; see *Nw. Coal. for Alts. to Pesticides v. EPA*,

544 F.3d 1043, 1046 (9th Cir. 2008) (reversing EPA’s shrinkage of the safety factor in the absence of supporting data).

As an over-arching mandate, the FQPA directs EPA to make its tolerance determinations based on its assessment of the pesticide’s risk. 21 U.S.C. § 346a(b)(2)(C)(i). And throughout its mandates to assess the full effects of a pesticide, the FQPA directs EPA to base its risk assessment on “available information” about consumption patterns, special susceptibility of infants and children, and cumulative effects. *Id.* The FQPA also expressly directs EPA to consider the validity, completeness, and reliability of the available data from studies, the nature of the toxic effect, available information about the relationship between study results and human risk, and available information about aggregate and cumulative effects. *Id.* § 346a(b)(2)(C)(ii).

The Proposed Rule upends these mandates by requiring EPA to put on blinders and ignore a huge and important subset of the available data. It collides squarely with the congressional direction to consider all available data and information in order to protect our food and children in particular. It also conflicts with the congressional mandate to afford greater protection to children and our food when gaps in data prevent a full quantitative assessment and establishment of a dose-response. It thus undermines EPA’s ability to carry out its obligations under the FQPA.⁷⁹³

1.3.2.2 FIFRA (SNPRM Comments)

Comment [48-643]: Commenter (12727) contends that, as with the original proposal,⁷⁹⁴ the Supplemental Notice fails to comply with the pre-proposal review requirements set forth in the FIFRA. EPA continues to cite section 25 of FIFRA as a source of authority for this proposed action.⁷⁹⁵ Section 25, however, requires the agency to seek comments from the Secretary of Agriculture on all draft proposed regulations 60 days prior to signing a proposed rule.⁷⁹⁶ EPA is to publish this solicitation in the *Federal Register*,⁷⁹⁷ and respond to any written comments from the Secretary as part of the *Federal Register* proposal.⁷⁹⁸ FIFRA also requires that *any time* the EPA is required to consult with the Secretary of Agriculture, the agency must also submit a copy of the proposed rule for comment to the Agriculture Committees in the House and Senate at least 60 days prior to publication,⁷⁹⁹ and provide the SAP with an opportunity to provide comment on the health and environmental impacts of the proposed action.⁸⁰⁰

⁷⁹³ The FQPA also amended FIFRA’s “unreasonable adverse effects” definition to include “a human dietary risk from residues that result from a use of a pesticide in or on any food inconsistent with the [FQPA] standard.” 7 U.S.C. § 136(bb)(2). Accordingly, EPA can register or re-register a pesticide only if there is a reasonable certainty of no harm from aggregate and cumulative exposures to the pesticide under the FQPA standard. The FQPA’s science standards therefore extend to EPA’s FIFRA determinations. Accordingly, just as the Proposed Rule runs afoul of the FQPA’s standards, so too does it violate FIFRA’s mandates, as amended by the FQPA.

⁷⁹⁴ See EDF 2018 Comments at 133-34.

⁷⁹⁵ 85 Fed. Reg. at 15,397; 83 Fed. Reg. at 18,769.

⁷⁹⁶ 7 U.S.C. § 136w(a)(2)(A).

⁷⁹⁷ *Id.* § 136w(a)(2)(D).

⁷⁹⁸ *Id.* § 136w(a)(2)(A).

⁷⁹⁹ *Id.* § 136w(a)(3).

⁸⁰⁰ *Id.* § 136w(d)(1).

There is no indication that EPA has satisfied any of these statutory obligations. Pre-proposal review by the Secretary, however, would at least have raised the question of what potential impacts the proposal might have on FIFRA programs—an issue on which the Supplemental Notice is mute. Congress, by requiring these consultation steps, evidently viewed them as necessary and important. EPA’s disregard of these requirements is thus consequential, arbitrary, and unlawful.

Comment [73-2080]: Commenter (11576) contends that the current rulemaking process has also violated the requirements of other statutes the EPA may or may not be relying on in attempting to issue the proposed rule.⁸⁰¹ Under FIFRA, for instance, the EPA is required to provide the Secretary of Agriculture with a copy of any proposed rule for review and comment at least 60 days before a proposed rule is signed for publication in the *Federal Register*.⁸⁰² The EPA’s refusal to satisfy these requirements cannot be allowed to stand.

Comment [82-835]: Commenter (12464) asserts that the Supplemental Notice’s claim that the Proposal is not “substantive” rests on the assertion that the rule “would not regulate the conduct or determine the rights of any entity outside the federal government” and that “it exclusively pertains to the internal practices of EPA.” 85 Fed. Reg. at 15,398. Past court decisions, however, have found that EPA’s refusal to consider certain scientific studies in its regulatory decision-making processes carry the force and effect of law.

In *CropLife America v. U.S. EPA*, for example, pesticide manufacturers and trade associations sought judicial review of an EPA directive that provided that the agency, contrary to its established practice, would no longer consider or rely on third-party human studies in evaluating the safety of pesticides under FIFRA.⁸⁰³ Petitioners argued, and the D.C. Circuit agreed, that this directive was a substantive rule with the force of law, that the rule violated FIFRA’s requirement that EPA “consider all relevant reliable data,” and that the rule was arbitrary and capricious in violation of the APA.⁸⁰⁴

Specifically, in *CropLife*, the D.C. Circuit held that:

The disputed directive constitutes a binding regulation that is directly aimed at and enforceable against petitioners. It provides that “the Agency will not consider or rely on any [third-party] human studies in its regulatory decision making.” This clear and unequivocal language, which reflects an obvious change in established agency practice, creates a “binding norm” that is “finally determinative of the issues or rights to which it is addressed.”⁸⁰⁵

The Proposal would limit EPA’s consideration of scientific studies whose data and models are not sufficiently available to the public for reanalysis. It is therefore directly analogous to the

⁸⁰¹ See August 2018 Coalition Comments at 63-67.

⁸⁰² 7 U.S.C. § 136w(a)(2)(A) (cited in August 2018 Coalition Comments at 63-64).

⁸⁰³ *CropLife America, et al. v. EPA et al.*, 329 F.3d 876, 878 (D.C. Cir. 2003).

⁸⁰⁴ See *id.* at 879.

⁸⁰⁵ See *id.* at 881 (quoting *Chamber of Commerce v. U.S. Dep’t of Labor*, 174 F.3d 206, 212 (D.C. Cir. 1999) (quoting *Pacific Gas & Elec. Co. v. FPC*, 506 F.2d 33, 38 (D.C. Cir. 1974))).

directive at issue in *CropLife* regarding “best available science” requirements in that it creates a binding norm.

Moreover, in *CropLife*, the D.C. Circuit determined that the directive was a substantive rule with binding effect as it not only impacted private parties, but also the agency’s regulatory actions (as opposed to its internal practices). In particular, the court found that “there [was] little doubt” that the directive prohibiting EPA from considering third-party studies:

“binds private parties [and] the agency itself with the ‘force of law,’” and thus constitutes a regulation rather than a policy statement. The directive clearly establishes a substantive rule declaring that third-party human studies are now deemed immaterial in EPA regulatory decision-making under [the Federal Food, Drug and Cosmetic Act] and FIFRA.⁸⁰⁶

Comment [89-2187]: Commenter (11403) states that EPA’s 2018 version of this rule cited a hodgepodge of statutory authority, none of it valid. EPA at least corrected the obvious typographical errors from the previous version. However, those edits still do not grant EPA the authority to restrict science from all regulatory decision-making processes within the agency. EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, “Congress . . . does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes.”⁸⁰⁷ EPA does not have the authority to alter the fundamental details of all of its regulatory schemes based on such vague provisions of law.

The commenter provides several statutory examples, however only FIFRA material is excerpted here.

Section 25(a)(1) of the FIFRA authorizes the Administrator “to prescribe regulations to carry out the provisions of this subchapter.”⁸⁰⁸ This general authorization section of FIFRA differs from that of the other statutes listed because it actually does specify some considerations the Administrator must give when promulgating regulations. For example, it states, “Such regulations shall take into account the difference in concept and usage between various classes of pesticides, including public health pesticides, and differences in environmental risk and the appropriate data for evaluating such risk between agricultural, nonagricultural, and public health pesticides.”⁸⁰⁹ Unlike the other general grants of rulemaking authority, this provision clearly intends to offer detail and guidance on the nature of the rulemaking authority that the provision grants. As it does not mention restriction of scientific data, there is no indication that EPA has authority to undertake the proposed rule under this section.

⁸⁰⁶ See *id.* at 883 (internal citations omitted).

⁸⁰⁷ *Whitman v. American Trucking Ass’n, Inc.*, 531 U.S. 457 (2001).

⁸⁰⁸ “Federal Insecticide, Fungicide, and Rodenticide Act,” 7 U.S.C. § 136w.

⁸⁰⁹ *Id.*

Section 136r(a) of the FIFRA directs the Administrator to conduct research to carry out the purposes of the statute.⁸¹⁰ The section states, “The Administrator shall also take care to ensure that such research does not duplicate research being undertaken by any other Federal agency.” The section does not state that EPA can ignore sound science if the raw data is not publicly available.

In short, none of the statutory provisions cited by EPA provide authority for the proposed rule. The proposed rule fails at step one under *Chevron v. Natural Resources Defense Council* since it is unreasonable to believe that any statutory general grant of authority or any mention of EPA’s oversight of other science or research programs would enable EPA to conduct rulemaking in a way that is altogether inconsistent with the rule of law. None of the cited provisions provide the authority sought by EPA, and as such the proposed rule should be withdrawn.

Comment [133-1200]: Commenter (11894) states that this supplemental notice of proposed rulemaking, like the initial proposal, is procedurally deficient because it failed to comply with the rulemaking requirements in FIFRA §25. EPA states that its supplemental proposal pertains to regulatory actions taken under the authority of FIFRA and cites FIFRA as one authority for the overall rulemaking that its supplemental proposal modifies. Thus, both the initial and supplemental proposals are subject to the procedural requirements for rulemaking imposed by FIFRA §25. FIFRA §25 requires the agency to transmit a copy of proposed rules to the USDA and HHS and to the FIFRA SAP prior to publication of the proposal for public comment. The statute gives the SAP, USDA, and HHS 30 days within which to comment, and, if any does so, EPA must publish their comments and the agency’s responses in the *Federal Register* that announces the opportunity for public comment. FIFRA also requires that EPA provide a copy of the proposed rulemaking to the Senate and House Agriculture Committees prior to publication of the proposed rule.

The preamble of EPA’s supplemental proposal contains no information concerning the agency’s compliance with these essential procedural requirements for rulemaking under FIFRA; we can only conclude that EPA has flagrantly disregarded its legal responsibilities. In these congressionally imposed requirements, Congress has deemed the input of USDA, HHS, and the SAP essential to ensuring that, in issuing regulations affecting the operation of EPA’s regulatory programs affecting pesticides, EPA fully considers the impacts of all proposed rules on agriculture (USDA) and human health (HHS), and that the rules are grounded in sound science (SAP). Without such input, there is a high likelihood that the rules will produce unsound outcomes from essential scientific and public policy perspectives.

Comment [151-1345]: Commenter (12405) contends that all pesticides distributed or sold in the United States must first be registered by the EPA and reregistered every 15 years.⁸¹¹ To be registered, the FIFRA requires the applicant show that its proposed pesticide does not cause unreasonable risk to human health or the environment.⁸¹² The applicant typically provides studies that comply with the EPA’s testing guidelines along with its application materials. The

⁸¹⁰ “Federal Insecticide, Fungicide, and Rodenticide Act,” 7 U.S.C. § 136r(a).

⁸¹¹ Food Quality Protection Act of 1996, Pub. L. No. 104-170, 110 Stat. 1513, 1514-35 (1996)

⁸¹² Env’tl. Prot. Agency, FIFRA and Federal Facilities (2018), <https://www.epa.gov/enforcement/federal-insecticide-fungicide-and-rodenticide-act-fifra-and-federal-facilities>

EPA reviews the data provided and performs some of its own work, including human health and ecological risk assessments, on a chemical.⁸¹³ Additionally, under the FQPA which amended FIFRA, EPA must find a pesticide poses a “reasonable certainty of no harm” before it can be registered for use on food or feed.⁸¹⁴

For example, the herbicide paraquat is currently undergoing reregistration review. As part of that process, EPA is looking at studies relevant to the chemical’s health concerns, including the connection with Parkinson’s disease.⁸¹⁵ Over the past few decades, studies consistently show a correlation between exposure to pesticides and Parkinson’s disease, but that full breadth of data may not be reviewable by EPA under the current proposal. For example, a meta-review examined 40 studies and concluded, “epidemiologic studies suggest a relatively consistent association between exposure to pesticides and an increased risk of developing [Parkinson’s disease], despite differences in study design, case ascertainment and definition, control selection, and pesticide exposure assessment.” Many of these studies would be excluded from consideration under the proposed rule.

In addition, relevant studies have design characteristics that make them vulnerable to noncompliance and exclusion. Specifically, two studies of California’s Central Valley found years of exposure to a combination of herbicides paraquat and maneb increased the risk of Parkinson’s later in life. Another study found that Central Valley residents under age 60 who lived near fields where the pesticides paraquat and maneb were used between 1974 and 1999 had a Parkinson’s rate many times higher than other residents in the region.

Parkinson’s is rare enough such that in many communities, data that would need to be disclosed, such as behavioral factors (occupation, tobacco, or alcohol use, how long they have lived in the area), will render individuals easily identifiable. To protect patient privacy, scientists may not want to make even de-identified data public.⁸¹⁶ Without these and similarly designed studies, the EPA is likely to miss relevant information in its review.

Comment [165-1508]: Commenter (12453) states that EPA’s proposed framework is consistent with existing statutory transparency mandates for pesticide registration and tolerance data. FIFRA requires EPA to make available to the public information concerning the objectives, methodology, results, or significance of any test or experiment performed on or with a registered pesticide, and any information concerning the effects of such pesticide on any organism or the behavior of such pesticide in the environment -- subject to important restrictions necessary to protect the proprietary nature of pesticide studies. FIFRA §§ 10(d)(1), 10(g)(1).

The framework provided under FIFRA and the FFDCA is a successful example of balancing the importance of transparency with the need to ensure protection of data submitters’ proprietary rights. FIFRA and the FFDCA ensure the general public is provided secure access to pesticide

studies in a manner sufficient for independent validation, while at the same time protecting the proprietary nature of those studies by prohibiting, through the required affirmation, publication or any other type of delivery of the studies to foreign or multinational pesticide producers.

Comment [165-1510]: Commenter (12453) appreciates that there are circumstances in which there may be data that contain potentially relevant information that EPA should be able to consider, but that may not meet all the standards of transparency and quality that the majority of the data meet under FIFRA and the FFDCA, for instance. Two routine examples in the FIFRA and FFDCA context include (a) benefits data (often developed by agricultural experts) that must be submitted to, and evaluated by, EPA under FIFRA § 3 and §§ 6(b-e) and (b) information that must be submitted to and evaluated by EPA under FIFRA § 6(a)(2) adverse effects reporting requirements. In some circumstances, despite EPA's best efforts, it may not have the optimum degree of access. In such circumstances, EPA should have the option to assess both the degree of access to and the attributes of the data and, based on those two factors, to determine how much consideration to give to the particular data. In doing so, it should take into account the full set of data available to the Agency and ensure that the proper relative weight is given to specific items within that data set.

This approach is consistent, for instance, with the way in which EPA has addressed FIFRA's explicit provision authorizing EPA to consider data that appear in the "public literature." FIFRA § 3(c)(1)(F). In implementing this statutory provision, EPA has long taken into account the validity of the data and other considerations about the extent to which the Agency should rely on such data, consistent with Option 2. See, e.g., 40 CFR 152.94. In this statutory example, EPA may give more or less consideration to publications, depending on the degree of access and attributes of the data.

Comment [172-2092]: Commenter (12465) provides that while the supplemental proposal notes that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control," therein lies significant ambiguity as to the applicability and scope of regulation designed to underlie the basis of EPA regulatory science decisions. The details on how the Agency would navigate these potential regulatory conflicts should be considered and advanced concurrently with the current proposal to effect maximum stakeholder input. For example, EPA needs to fully understand the potential vulnerability this transparency rule would create for regulatory decisions made under the TSCA and the FIFRA that rely on CBI as well as the extent to which models relied on by both programs comply with the rule as proposed. It is possible that a significant number of EPA decisions under FIFRA and TSCA could be successfully challenged if this rule were finalized as proposed.

Comment [187-1708]: Commenter (12720) states that the FIFRA, EPA cites 7 U.S.C. § 136r(a), which authorizes the Administrator to "undertake research." That section does not allow the *restriction* of what types of research EPA may consider in rulemakings or otherwise. Nor does it draw any distinction between dose-response data, "data and models underlying pivotal regulatory science and pivotal science," or any other types of data. The absence of any such congressional distinction or restriction makes it all the more obvious that EPA invented and added the

distinction and restrictions in the Proposal and Supplemental Proposal as a matter of its own policy preferences, contrary to the Act. This EPA may not do.

EPA also cites 7 U.S.C. § 136w, which is the general rulemaking authority that allows the Administrator to carry out the provisions of FIFRA. As explained above, that general grant of authority cannot support the rule, especially when the rule conflicts with the Act. Moreover, the citation fails to provide sufficient notice for the public to comment on the Proposal or Supplemental Proposal. FIFRA does not authorize the proposed rule.

1.3.3 Safe Drinking Water Act (SDWA) (NPRM and SNPRM Comments).

Comment: Sections 1.3.3.1 and 1.3.3.2 of this Chapter present comments received on the NPRM (Section 1.3.3.1) and SNPRM (Section 1.3.3.2) related to the EPA's legal authority for the rule under the SDWA. The EPA provides the following general response to these comments:

Response: EPA appreciates your comments. As discussed in Section I.C. of the final rule preamble and in this RTC document in Section 1.2, EPA has decided it is most appropriate to rely on its authority to promulgate housekeeping regulations, rather than any of the substantive environmental statutes cited in the 2018 proposal or the 2020 supplemental proposal as legal authority for the rule. EPA intends to promulgate future science transparency rules under its substantive environmental statutes. Additionally, the final rule states in § 30.3 that "[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control."

1.3.3.1 SWDA (NPRM Comments)

Comment: [37-34]: Commenter (0046) writes that although unacknowledged in the proposal including its request for comments, SDWA's standard-setting section, §1412 (42 U.S.C. § 300g-1), addresses the use of science in decision-making under that authority:

§1412(b)(3)(A) Use of science in decision-making. — In carrying out this section, and, to the degree that an Agency action is based on science, the Administrator shall use—

(i) the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and (ii) data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).

So long as the data used is otherwise collected, assessed, and presented "in accordance with sound and objective scientific practices," Congress did not give the Administrator discretion to ignore the "best available, peer-reviewed science and supporting studies" based on any factor relating to the public availability or unavailability of data, as this proposal would seek to compel.

Comment [2772-2712]: Commenter (2787) writes that the proposed rule is inconsistent with EPA's statutory obligations to ground its actions on scientific evidence. The SDWA require that EPA use the "best available science."

Comment [4827-2071]: Commenter (4838) writes that the proposed rule violates several environmental statutes because it hinders EPA’s ability to rely on best available science, or the most up-to-date information, as they require. The CAA, CWA, SDWA, TSCA, and EPCRA all require certain decisions or regulatory criteria be based on the most up-to-date science.⁸¹⁷ These criteria are described as “best available science,” “latest scientific knowledge,” and “best available public health information.”⁸¹⁸ The proposed rule would illegally limit EPA’s ability to rely on best available science in violation of these statutes.

Comment [4837-3058]: Commenter (4848) notes that administrative procedure requires that EPA consider data submitted by the public in evaluating regulations.⁸¹⁹ Let’s be clear. Scientific studies submitted have always been of uneven quality.⁸²⁰ EPA has processes in place (including use of a scientific advisory board, testimony and written and oral public notice and comment) using both internal and external peer review to evaluate data. Depending on context, some studies are given greater weight than others. Some studies are disregarded entirely.

It is inappropriate, and likely unlawful under the APA⁸²¹ and the express language of numerous environmental statutes including the SDWA⁸²² and the TSCA,⁸²³ for EPA to categorically eliminate certain types of studies, and hence certain types of data, without considering context.⁸²⁴

⁸¹⁷ See Toxic Substances Control Act, 15 U.S.C. § 2625(h), (k) (2018); Clean Water Act, 33 U.S.C. § 1314(a)(1) (2018); Clean Air Act, 42 U.S.C. § 7408(a)(2) (2018); Emergency Planning and Community Right-to-Know Act, 42 U.S.C. § 11023(d)(2) (2018).

⁸¹⁸ Toxic Substances Control Act, 15 U.S.C. § 2625(h), (k) (requiring that the Administrator, in decisions based on science, “use scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed in a manner consistent with the best available science” (emphasis added)); Clean Water Act, 33 U.S.C. § 1314(a)(1) (requiring that criteria for water quality “accurately reflect[] the latest scientific knowledge” (emphasis added)); Clean Air Act, 42 U.S.C. § 7408(a)(2) (requiring air quality criteria “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare” (emphasis added)); Emergency Planning and Community Right-to-Know Act, 42 U.S.C. § 11023(d)(2) (requiring that a determination to add a chemical to the Toxics Release Inventory “be based on generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies, available to the Administrator” (emphasis added)).

U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006) (“best available science” requires agencies “seek out and consider all existing scientific evidence relevant to the decision” and “cannot ignore existing data.”); *Chlorine Chemistry Council v. EPA*, 206 F.3d 1286 (D.C. Cir. 2000) (“When EPA relies in any

Comment [5865-328]: Commenter (6111) notes that EPA’s historic position is consistent with the Statutes. The SDWA⁸²⁵

Furthermore, because EPA is required under the Statutes to assess the public health benefits of its regulations, it must take into account all relevant science and cannot arbitrarily exclude certain studies demonstrating those benefits. Under the SDWA, EPA must determine whether a contaminant “may have an adverse effect on the health of persons” before deciding to regulate it.⁸²⁶

Many of the fundamental public health studies on which EPA has based key rules and standards under the Statutes are studies for which the raw data were not or could not have been released. Attachment 1 to the commenters’ comment letter contains a partial list of studies [note: included under a separate excerpt] that likely contain confidential data; these are all studies on which EPA has relied and cited as the basis for its actions under some of the Statutes. Until now, release of the underlying raw data was not an EPA criterion for determining the “best available” reports, studies, analyses, or models. Indeed, none of the Statutes invoked by EPA as support for the proposed rule limits EPA in this fashion; none of the Statutes requires EPA to make raw data publicly available.⁸²⁷

EPA’s proposed new approach, which conflicts with the agency’s obligations and curtails its authority, is irrational at best and detrimental to public health and safety at worst.

Comment [6112-1552]: Commenter (6137) writes that despite EPA’s contrary contentions, the SDWA, 42 U.S.C. § 300f et seq., does not provide any authority for the adoption of a policy that would “preclude” EPA from considering all relevant scientific evidence in carrying out its duty to protect the quality of drinking water in the United States. See 83 Fed. Reg. at 18,769, n.3. In

way on scientific information to set SDWA standards, the agency is required to use ‘the best available, peer reviewed science and supporting studies conducted in accordance with sound and objective scientific practices . . .’).

⁸²⁵ 42 U.S.C. §§ 300g-1(b)(3)(A)(i), 300g-1(b)(1)(B)(ii)(II).

⁸²⁶ 42 U.S.C. § 300g-1(b)(1)(A)(i).

⁸²⁷ When litigants in the past argued that EPA could not rely on studies for which the raw data had not been publicly available, the D.C. Circuit soundly rejected their argument. As the court explained in one case: Claiming neither that they were unable to obtain the studies, nor that the studies were improperly published or peer reviewed, Petitioners instead urge us to impose a general requirement that EPA obtain and publicize the data underlying published studies on which the Agency relies. The Clean Air Act imposes no such obligation. . . More generally, we agree with EPA that requiring agencies to obtain and publicize the data underlying all studies on which they rely “would be impractical and unnecessary.” [...] As EPA persuasively stated in denying Petitioners’ original request for information: If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. . . . Such data are often the property of scientific investigators and are often not readily available because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants]. *Am. Trucking Associations, Inc. v. E.P.A.*, 283 F.3d 355, 372 (D.C. Cir. 2002) (quoting Particulate Matter NAAQS, 62 Fed. Reg. 38,652, 38,689 (July 18, 1997)). The court reiterated this holding six years later in a challenge to the 2008 lead NAAQS. *Coal. of Battery Recyclers Ass’n v. E.P.A.*, 604 F.3d 613, 622 (D.C. Cir. 2010). In that case, the litigants had sought access to the raw data underlying Bruce P. Lanphear, et al., Low-Level Environmental Lead Exposure and Children’s Intellectual Function: An International Pooled Analysis, 113 ENVTL. HEALTH PERSP. 894 (2005).

the Proposal, EPA points to two specific provisions of the SDWA as authorizing the rule, neither of which provides the necessary authority.

First, EPA points to 42 U.S.C. § 300j-1, but its reliance on this section is misplaced. Rather than authorizing the Administrator’s selective exclusion of science and research, this section simply describes the Agency’s responsibility to gather information—that is, “[to] conduct research, studies, and demonstrations relating to the causes, diagnosis, treatment, control, and prevention of physical and mental diseases and other impairments of man resulting directly or indirectly from contaminants in water, or to the provision of a dependably safe supply of drinking water.” 42 U.S.C. § 300j-1(a)(1). This section also directs EPA to study certain serious threats to drinking water, including “polychlorinated biphenyl contamination,” “disposal of waste (including residential waste),” “surface spills of contaminants,” “virus contamination,” “abandoned injection or extraction wells,” “intensive application of pesticides and fertilizers in underground water recharge areas,” “surface disposal of contaminants in underground water recharge areas,” and “the nature, extent, sources of and means of control of contamination by chemicals or other substances suspected of being carcinogenic.” *Id.* § 300j-1(a)(3)– (9). It therefore provides no legitimate basis for a rule that aims to limit the data that EPA can consider in executing the purposes of the SDWA.

Second, EPA cites the general grant of rulemaking authority in 42 U.S.C. § 300j-9(a)(1) as authorizing the Proposed Rule. However, this section likewise does not offer authorization. While this section empowers EPA “to prescribe such regulations as are necessary or appropriate to carry out [its] functions under this subchapter,” the Proposed Rule is neither necessary nor appropriate to effectuate the SDWA.

The SDWA requires EPA to protect the public by limiting contaminants in public water systems. Specifically, the Act directs EPA to establish a MCLG for each contaminant “at the level at which no known or anticipated adverse effects on the health of persons occur and which allows an adequate margin of safety.” 42 U.S.C. § 300g-1(b)(4)(A). EPA must then set an enforceable Maximum Contaminant Level (MCL) as close to this goal as is feasible. *Id.* § 300g-1(b)(4).

To accomplish these goals, in 1996, Congress amended the SDWA to ensure that EPA’s regulatory decisions were scientifically sound and adequately protective of public health. As amended, the SDWA directs EPA to base its determination about whether to regulate any particular contaminant “on the best available public health information.” *Id.* § 300g1(b)(1)(B)(ii)(II) (emphasis added). In addition, the amended SDWA expressly requires that, “to the degree that an Agency action is based on science, [EPA] shall use . . . the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices[] and . . . data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).” *Id.* § 300g1(b)(3)(A) (emphasis added). “Best available” means precisely what it says – the best of all that is available, not the best of some subset of what is available. The only qualifiers the SDWA places on what is “best available” are that the science be “peer-reviewed,” and that the “supporting studies” be “conducted in accordance with sound and objective scientific practices.” *Id.* Disclosure of confidential data underlying the studies plays no role in determining whether the science is the best available and is in no way required by the rule (but rather is expressly

rejected by the scientific community, see *infra*). Any rule proposing to disregard reliable scientific information relevant to the regulation of drinking water contaminants directly conflicts with the SDWA's sound science mandate.

Given that the Proposed Rule is manifestly contrary to the SDWA, which expressly requires use of the best science available, it is not authorized by the general rulemaking authority in § 300j-9(a)(1). *Mourning*, 411 U.S. at 369; *Ragsdale*, 535 U.S. at 86. EPA is thus left without an appropriate authorizing provision under the SDWA.

Comment [6112-1589]: Commenter (6137) writes that EPA's proposal to exclude reliable, accessible, and relevant science is antithetical to the requirements of the SDWA and thus is unlawful. The SDWA was established to protect the quality of the drinking water in the United States. To accomplish this, the SDWA requires EPA to limit contaminants in public water systems. As discussed *supra*, it does this by establishing a MCLG for each contaminant "at the level at which no known or anticipated adverse effects on the health of persons occur and which allows an adequate margin of safety." 42 U.S.C. § 300g-1(b)(4)(A). And in deciding whether to regulate any particular contaminant to protect public health, EPA must rely on "the best available public health information." *Id.* § 300g-1(b)(1)(B)(ii)(II) (emphasis added). And to the extent EPA relies on science, it must use "the best available, peer-reviewed science and supporting studies" available. *Id.* § 300g-1(b)(3)(A) (emphasis added). Thus, any decision to categorically ignore or otherwise fail to consider relevant scientific information when regulating drinking water would be unlawful under the SWDA.

Comment [6118-1726]: Commenter (6143) notes that EPA has issued its proposed rule on Strengthening Transparency in Regulatory Science pursuant to its authority under several environmental statutes that it implements, including the CAA; CWA; SDWA; RCRA; CERCLA; EPCRA; FIFRA; and TSCA.⁸²⁸ This proposed action is fully consistent with the authorities and objectives laid out in those statutes. EPA must ensure that any final action it takes on this proposal continues to respect the balance reflected in those statutes between sound, transparent science, and legitimate privacy interests.

Comment [6119-1359]: Commenter (6144) writes that the policy, as drafted, is in apparent violation of laws like the TSCA and the SDWA because of the statutory requirement to use the "best available science" and allow the agency to effectively ignore certain information regardless of the quality of that work, that would help implement these science-based laws. According to judicial precedent, "best available science" is defined as "all existing scientific evidence relevant to the decision" and a body of evidence that "cannot ignore existing data."⁸²⁹

Comment [6147-2575]: Commenter (6172) supports the Agency's proposal to promulgate a regulation to strengthen the transparency of science utilized by EPA to support regulatory policies in regulations promulgated under the SDWA.

SDWA regulations and National Primary Drinking Water Regulations (NPDWR) result in a significant economic burden on small and rural communities and often force local communities

⁸²⁸ 83 Fed. Reg. at 18,769

⁸²⁹ *Ecology Ctr., Inc. v. U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006)

to pay for federally mandated compliance that the communities do not believe is in their best interest for advancing public health policy. Under SDWA, this often results in a requirement to pay for treatment for nominal reductions of naturally occurring elements and compounds in drinking water supplies. Considering that rural and small communities are controlled and governed by people who are locally elected, all data, scientific studies and discretionary administrative decisions underlying federal actions that supersede local decisions should be made “publicly available in a manner sufficient for independent validation” and with clear explanation of discretionary decisions. NRWA fully supports a new regulation that requires use of peer-reviewed information, consistent data evaluation procedures, data transparency, and reproducible scientific assessments.

Comment [6147-2577]: Commenter (6172) notes that any regulations should improve the status quo and result in the following public disclosure of:

- A clear principle for implementing the discretion provided to the Administrator for selecting new contaminants for regulations under SDWA Section 1412. The lack of a clear principle or interpretation has allowed EPA to make a determination not to regulate perchlorate on October 10, 2008 and a subsequent affirmative EPA decision on February 11, 2011, that perchlorate meets the Section 1412 criteria for regulation as a contaminant. Such ambiguity in decision-making does not provide for regulatory certainty or persuasive reasoning for the local governments.

Comment [6147-2579]: Commenter (6172) references levels of regulated substances that are unsafe in drinking water as referenced in the SDWA (“unreasonable risk to health,” Section 1415 and “protective of public health,” Section 1412). For example, the EPA established a standard of 10 parts per billion (ppb) for arsenic in drinking water. The public naturally infers that any level above the standard is a health risk. However, when pressed by Congress to confirm this health risk, EPA failed to do so. In 2002, EPA did not find that arsenic concentrations above their standard necessarily present an “unreasonable risk to health.” In their reply to a Congressional inquiry, EPA stated that it is “determining what does not pose an unreasonable risk to health with respect to arsenic, rather than address the much more complex issue of what does constitute an unreasonable risk to health.”⁸³⁰ EPA should identify these public health levels for all NPDWR.

An explanation of why EPA selectively releases only certain peer-review studies to support NPDWR. In 2014, NRWA questioned the Agency about why it was not considering recent published studies that contradict the Agency’s current arsenic in drinking water risk assessment findings. The new studies specifically examined the low dose range data, the behavior of the risk function across the full exposure range and developed a new methodology to be able to examine the transition range between high risk and no risk. The first study (Lamm et al., RTP 2013)⁸³¹ demonstrates that the finding of a dose-relationship among the low dose villages is a consequence of the use of the external reference group that among the low-dose study villages

⁸³⁰ Exemptions & the Arsenic Rule, August 2002, Appendix G-2 Arsenic Guidance

⁸³¹ Steven H Lamm; Jun Lu; Shayhan A Robbins; Chao Zhou; Rusan Chen; Manning Feinleib, Bladder/lung cancer mortality in Blackfoot-disease (BFD)-endemic area villages with low (<150 µg/L) well water arsenic levels--an exploration of the dose-response Poisson analysis (Regulatory toxicology and pharmacology: RTP 2013;65(1):147-56)

there is no positive dose-response. The second study (Lamm et al., Tox 2014)⁸³² demonstrates that the data from the high-dose villages show a high cancer risk, but that risk disappears at 100 ug/L and below. The methodologies of the later papers are more refined and should be appreciated by the Agency. They demonstrate that extrapolation of the risk found at high doses to lower doses is inappropriate and significantly overpredicts the risk in the range of 10-100 ug/L.

Comment [6147-2582]: Commenter (6172) references all data used to craft SDWA policy including risk assessments. For example, a recent study (Mendez et al., J Expo Sci Environ Epidemiol 2017)⁸³³ analyzes the dose-response slope for certain public health endpoints for certain drinking water using data from the NCI and the U.S. Geological Survey. The conclusion of this study could influence the current Integrated Risk Information System (IRIS) Program that is developing an updated assessment of inorganic arsenic. However, the Mendez complete data set includes some data that is available to government agencies but not to the general public. Release of this data would allow for further assessment and demonstrate the repeatability of conclusions and comparisons to similar studies.

The SDWA mandates that the Agency consider a detailed risk and cost assessment, as well as best available peer-reviewed science, when developing the NPDWR. Crafting a regulation that strengthens the transparency of science utilized by EPA will result in improved federal public policy and SDWA implementation. NRWA wants to ensure that the understanding of the public health risks of particular concentrations of substances (especially naturally occurring elements) in public drinking water are properly understood and applied in making public policy.

Comment [6152-639]: Commenter (6122) writes that the proposed rule is not based on any valid statutory authority and is arbitrary and capricious.

EPA cites multiple statutory provisions in an attempt to support the proposed rule that it believes authorize this type of rulemaking, “including provisions providing general authority to promulgate regulations necessary to carry out the Agency’s functions under these statutes and provisions specifically addressing the Agency’s conducting of and reliance on scientific activity to inform those functions . . .”⁸³⁴ None of the specific statutory provisions provided by EPA provide specific authority for EPA to fundamentally rework the foundational processes it uses to assess and include/reject science. Indeed, if such authority existed, one would have expected EPA to have discovered this authority many decades earlier. Instead, EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, “Congress...does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes.” And if this is true, neither can the EPA alter the fundamental details of all of its regulatory schemes based on such vague provisions of law. We review each of the

⁸³² Steven H. Lamm; Shayhan Robbins; Rusan Chen; Jun Lu; Brian Goodrich, Manning Feinleib, Discontinuity in the cancer slope factor as it passes from high to low exposure levels – arsenic in the BFD-endemic area (Toxicology 326 (2014) 25–35)

⁸³³ William M. Mendez Jr.; Sorina Eftim; Jonathan Cohen; Isaac Warren; John Cowden; Janice S. Lee; Reeder Sams, Relationships between arsenic concentrations in drinking water and lung and bladder cancer incidence in U.S. counties (Journal of Exposure Science and Environmental Epidemiology (2016) 00, 1-9)

⁸³⁴ Proposed rule at 18769.

provisions listed by EPA, none of which discuss transparency, dose response, pivotal regulatory science, benefit-cost calculation, or changing “agency culture,” the stated goals of this rulemaking.

Section 1442 of the SDWA generally authorizes the Administrator to “conduct research, studies, and demonstrations relating to the causes, diagnosis, . . . resulting directly or indirectly from contaminants in water, or to the provision of a dependably safe supply of drinking water. . .”⁸³⁵ This section does not authorize EPA to exclude science based on a perceived lack of transparency or support any other aspect of the proposed rule.

Section 1450(a)(1) of the SDWA states, “The Administrator is authorized to prescribe such regulations as are necessary or appropriate to carry out his functions under this subchapter.”⁸³⁶ This catch-all provision provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is “necessary” to the carrying out functions under the SDWA.

Comment [6155-633]: Commenter (6125) notes that the SDWA mandates national drinking water regulations setting required purity levels for water from public water supply systems. 42 U.S.C. §300g-1. Before regulating, the Administrator must conclude that the contaminant at issue “may have” an adverse effect on the health of persons. *Id.* at (b)(1)(A)(i). In regulating, the Administrator must consider “the best available public health information.” *Id.* at (b)(1)(B)(ii)(II). The section adds that in setting regulations, the Administrator “shall use ...the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices” and in addition, “data collected by accepted methods or best available methods.” 42 USC section 300g-1 (3)(A). See *City of Waukesha v. EPA*, 320 F. 3d at 247 (D.C. Cir 2003) (agency peer review satisfies requirement to use best, peer-reviewed science and supporting studies); See *City of Portland v. EPA*, 507 F 3d 706, 716 (D.C. Cir 2002) (same).

Finally, to ensure that these requirements are met, and science is fully integrated into the regulatory decision, Congress specifically directed EPA to solicit the views of the SAB before proposing any drinking water regulations. 300-g (1) (e). Here again, EPA’s opaque “transparency” rule includes no showing that the proposal is consistent with or authorized by the language of the SDWA.

This proposal appears to be in conflict with the directions Congress gave for the use of and communication about scientific information in enacting P.L. 104-182, the 1996 Amendments to the SDWA. The previous law had mandated expedited schedules for EPA to promulgate regulatory standards for literally dozens of drinking water contaminants, notwithstanding “significant gaps in the scientific information available for many of these contaminants.” (Sen. Rpt. 104-169, at 28). “[T]o assure that future standards are based on better science,” the 1996 Amendments “add[ed] to the scientific foundation of future standards by imposing [new] requirements on EPA.” *Id.* The Report of the Senate Committee on Environment and Public Works is authoritative on these provisions, as the language adopted in the Committee bill (S.1316) on the use of science was adopted verbatim in P.L. 104-182. The most fundamental of

⁸³⁵ “Safe Drinking Water Act,” 42 U.S.C. § 300j-1.

⁸³⁶ “Safe Drinking Water Act,” 42 U.S.C. §300j-9(a)(1).

these added requirements – unacknowledged in the proposal – addresses the use of science in decision-making under SDWA’s standard-setting section, §1412 (42 U.S.C. § 300g–1):

§1412(b)(3)(A) Use of science in decision-making. — In carrying out this section, and, to the degree that an Agency action is based on science, the Administrator shall use—

(i) the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and

(ii) data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).

In imposing these requirements, Congress did not give the Administrator the discretion claimed in this proposal to invent novel, EPA-specific definitions of “sound and objective scientific practices,” or to ignore the “best available, peer-reviewed science and supporting studies” based on any factor relating to the public availability or unavailability of data. The report further emphasizes that these are requirements by specifying that the “Administrator has a duty to seek and rely upon the best available science and information to support.... [m]any of the most important activities including selecting contaminants for regulation, setting standards, designing analytical methods, and structuring waivers, variances and exemptions.” (S. Rep. 104-169, at 28) (emphasis added).

Particularly in light of this history, the requirements in this provision must be considered definitive as to the agency’s permitted approach to the use of science in covered decision-making. Thus, the declaration in the preamble to the proposal that “[w]here available and appropriate, EPA will use peer-reviewed information, standardized test methods, consistent data evaluation procedures, and good laboratory practices to ensure transparent, understandable, and reproducible scientific assessments” but is “precluded” from using such information where it is not feasible to make it available (83 FR at 18770 and n.3), cannot be reconciled with the scope of the permissible use of science under SDWA §1412(b)(3)(A) (i).

First, under SDWA, the peer-reviewed science used must qualitatively be the “best available”; no discretion is given to the Administrator to further limit the science used on the ambiguous grounds of “appropriate[ness],” much less the non-statutory basis of “transparency” put forward in the proposal. Most important, the core objective of the proposal – “to ensure that the regulatory science underlying its actions is publicly available in a manner sufficient for independent validation” (proposed § 30.1 “What is the purpose of this subpart?”) is one that the Administrator does not have authority to pursue under this SDWA provision.

Tellingly, the authority under SDWA cited for the proposal, SDWA §1442, simply authorizes research, technical assistance, information and research facilities, and training. That section cannot be read to authorize in any way the changes in the use of “regulatory science underlying [agency] actions” in this proposal, especially in the face of the terms and stated intentions of §1412(b)(3)(A)(i). (The other SDWA provision cited in the proposal as “authority”, §1450(a)(1), is simply a general rulemaking authority and cannot be used to bootstrap the lack of direct authority in SDWA for this proposal).

The principal cases interpreting this provision have defined and maintained the strict requirements of this authority. EPA observes the “best available science” requirement where it uses newer, peer-reviewed data rather than older data developed by an EPA scientist for the regulatory determination (re filtration avoidance, *City of Portland v. EPA*, 507 F.3d 706, 716 (D.C. Cir. 2007)), and where the agency explained and provided “substantial scientific support” for the model and data it used (*City of Waukesha v. EPA*, 320 F.3d 228, 250-51, 256-57 (D.C. Cir. 2003), but not where it rejected the evidence that was the “best available” at the time of the rulemaking (*Chlorine Chemistry Council v. EPA*, 206 F.3d 1286, 1290-91 (D.C. Cir. 2000)). *City of Waukesha v. EPA* furthermore indicates that agency peer review satisfies the requirement to use best, peer-reviewed science and supporting studies, as noted above. 320 F. 3d at 247.

Comment [6155-2631]: Commenter (6125) writes that it is clear from even a brief look that these provisions require EPA to consider all the best available science, without authorizing, or even mentioning any of the per se restrictions based on “transparency” that EPA has proposed to use as a universal overriding rule. For these reasons, EPA must justify its proposal as a proper exercise of its authority under each of the statutory provisions whose operation it would affect - provisions that the agency does not even cite. It is the job of the proposer, not the commenters, to survey these provisions and provide the needed justification.

The SDWA 1412(b)(3)(A) addresses EPA’s “use of science in decision-making” by providing that risk assessments “shall” use “the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices.”

This provision uses mandatory language directing EPA to use reliable and relevant scientific information -- and further specify how to do so. They all direct that decisions regarding protection of public health be based on the full range of relevant scientific information, in some cases specifying how to identify what information to use. None of them give EPA discretion to ignore such information for any of the reasons set forth in the proposal.

Comment [6163-1105]: Commenter (6133) notes that EPA cites 42 U.S.C. § 300j–1 of the SDWA as authority for the rule. Subsection (a) of that section allows EPA to conduct some types of research on drinking water contamination and requires it to conduct other studies. But it says nothing about which types of studies EPA may consider in rulemakings and does not distinguish between dose-response studies and other types of studies. The absence of any such congressional distinction or restriction makes it all the more obvious that EPA invented and added the distinction and restrictions in the Proposal as a matter of its own policy preferences, contrary to the Act. This EPA may not do. The remainder of the subsections have nothing to do with data or research. At any rate, EPA does not state specifically which of the subsections in 42 U.S.C. § 300j–1 it believes authorizes this proposed rule. Thus, the citation fails to provide sufficient notice for the public to comment on the proposed rule.

EPA also cites 42 U.S.C. § 300j–9(a)(1), but that says only that the “Administrator is authorized to prescribe such regulations as are necessary or appropriate to carry out his functions under this subchapter.” As explained above, that general grant of authority cannot support the rule, especially when the rule conflicts with the Act. The SDWA does not authorize the proposed rule.

Comment [6163-1136]: Commenter (6133) notes that the SDWA protects the nation’s public drinking water supplies. The Act generally applies to “each public water system in each State,” 42 U.S.C. § 300g, and requires EPA to set standards for drinking water contaminants that may have an adverse effect on human health and are known or anticipated to occur in such systems, *id.* § 300g-1(b)(1)(A).

For a given contaminant, the SDWA requires that EPA first establish a MCLG, which is “the level at which no known or anticipated adverse effects on the health of persons occur and which allows an adequate margin of safety.” *Id.* § 300g-1(b)(4)(A). EPA must then set a MCL “as close to the [MCLG] as is feasible.” *Id.* § 300g-1(b)(4)(B).

EPA also must, every five years, “publish a list of contaminants” that “are not subject to any proposed or promulgated national primary drinking water regulation, which are known or anticipated to occur in public water systems, and which may require regulation” *Id.* § 300g1(b)(1)(B)(i). The SDWA requires EPA to prioritize that list based on vulnerable subpopulations that are at risk and other factors. *Id.* § 300g-1(b)(1)(C). EPA must then decide whether to regulate at least five contaminants on the list based on the “best available public health information.” *Id.* § 300g-1(b)(1)(B)(ii).

In making these determinations, the SDWA requires EPA to use “the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices,” and “data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).” *Id.* § 300g1(b)(3)(A); see also *id.* § 300g-1(b)(12), (13) (similar); *id.* § 300j-19 (referring to best available science standard for risk assessment of algal toxins).

The Proposal would conflict with the SDWA by prohibiting EPA from using the “best available” science and “data collected by acceptable or best available methods” solely because that data could not be made public. Indeed, courts interpreting these requirements have already rejected this proposed limitation on dose-response studies, making clear that they can indeed be the “best available” science regardless of whether the underlying data are publicly available. In *City of Waukesha v. EPA*, the court approved EPA’s use of “studies of Hiroshima and Nagasaki atomic bomb survivors” in setting limits for radium and uranium in drinking water. 320 F.3d 228, 248, 252 (D.C. Cir. 2003). But of course, these and similar studies would likely be excluded under the Proposal because the underlying data are not available.⁸³⁷ The court also upheld the agency’s use of the LNT model used by EPA for both radium and uranium, *id.* at 249–50, 252, which is precisely the model that EPA now implies—without citing any evidence—is not scientifically justified.

Additionally, in carrying out its obligations to establish drinking water standards, the Act directs the agency to discuss “peer-reviewed studies known to the Administrator that support, are directly relevant to, or fail to support any estimate of public health effects and the methodology used to reconcile inconsistencies in the scientific data.” 42 U.S.C. § 300g-1(b)(3)(b)(v).

⁸³⁷ For a description of the studies, see Kotaro Ozasa, Epidemiological research on radiation-induced cancer in atomic bomb survivors, *Journal of Radiation Research*, Volume 57, Issue S1, 1 August 2016, Pages i112–i117, <https://academic.oup.com/jrr/article/57/S1/i112/2580473>.

Moreover, the agency must identify the “[q]uantifiable and non-quantifiable benefits for which there is a factual basis in the rulemaking record” in establishing a drinking water standard. Thus, under the express provisions of the SDWA, the agency cannot simply ignore peer-reviewed studies or other information in the record that the Proposed Rule would disallow from consideration, simply because the underlying data may be unavailable. *Id.* § 300g-1(b)(3)(c)(i). If Congress had intended for the data targeted by the Proposal to be excluded, it could have said so. Instead, Congress directed EPA to use “the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices,” and “data collected by accepted methods or best available methods.” 42 U.S.C. § 300g1(b)(3)(A). EPA cannot ignore these commands to achieve its political goal of rolling back public health protections.

Comment [6333-2425]: Commenter (6355) strongly agrees that “the best available science must serve as the foundation of EPA’s regulatory actions”.⁸³⁸ While the proposed rule does not define what is meant by ‘best available science’, and scientists and policy-makers may have different ideas on how the concept is defined and interpreted, the scientific community agrees that the ‘best available science’ is the product of a process that includes clearly stated objectives and rationale, appropriate study design and data collection methods, logical analysis and interpretation of data, and rigorous documentation and explanation of findings, all of which are evaluated by independent peer-review.⁸³⁹

The ‘best available science’ provides an indispensable foundation for policy and regulatory decisions; yet the proposed rule restricts the science that can be used for regulatory decision-making to those data that conform to a list of constraints (*i.e.*, independence, objectivity, transparency, clarity, and reproducibility). The ‘best available science’, as described above, is not bound by these criteria. Thus, the proposed rule would exclude relevant scientific evidence from the policy-making process. Ignoring relevant data would be in violation of those laws that mandate the use of ‘best available science’ (*e.g.*, SDWA).

Comment [6340-1455]: Commenter (6362) writes that the provisions cited by EPA under the CAA, the CWA, the SDWA, the CERCLA, and the EPCRA in support of its authority to develop and implement its proposed rule all provide broad regulatory authority to promulgate regulations “as are necessary to carry out [the Administrator’s] functions” under the statute.

Comment [6353-2321]: Commenter (6375) notes that EPA solicits comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation. (pg. 18,771). EPA’s statement concerning its legal authority could be enhanced by reference to statutory provisions that require it to rely on “accurate,” “useful,” or “best” data. For example, section 108(a)(2) requires that the Administrator issue air quality criteria that “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects

⁸³⁸ Environmental Protection Agency, 40 CFR Part 30, [EPA-HQ-OA-2018-0259; FRL-9977-40-ORD], RIN 2080-AA14, Strengthening Transparency in Regulatory Science, *Federal Register*, Vol. 83, No. 83, Monday, April 30, 2018, Proposed Rules, p18769.

⁸³⁹ P.J. Sullivan, J. M. Acheson, P. L. Angermeier, T. Faast, J. Flemma, C. M. Jones, E. E. Knudsen, T. J. Minello, D. H. Secor, R. Wunderlich, and B. A. Zanetell. 2006. “Defining and Implementing Best Available Science for Fisheries and Environmental Science, Policy, and Management”. *Fisheries* Vol. 31, No. 9, p460-465.

on public health and welfare . . .” 42 U.S.C. § 7408(a)(2). The SDWA requires the Administrator to assess risk using “the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices.” 42 U.S.C. § 300g1(b)(3)(A). Increasing the transparency of regulatory science and ensuring that it is reproducible helps in evaluating its accuracy and usefulness.⁸⁴⁰

Comment [6425-2355]: Commenter (6447) writes that the proposal is not authorized by statute and is contrary to Law.

EPA purports to rely on general statutory authority for the proposal, but no statutes authorize EPA to ignore science. On the contrary, as multiple U.S. Senators have noted, EPA's proposal would violate several statutes, including the TSCA, the SDWA, and the APA, which require the Agency to use the best available science, and all information presented to the agency during a rulemaking.⁸⁴¹ The current proposal would do the opposite, requiring EPA to ignore some of the best available science, and to ignore certain information submitted during rulemaking. In particular, the proposal would make it difficult or impossible to use most epidemiological studies, where the source data are almost always comprised of sensitive personal information. Epidemiological studies are fundamental to EPA policymaking, and a critical source of information about the effects of various risk factors on human health. The Agency does not the option of suppressing this information, and courts have held that EPA "cannot ignore existing data."⁸⁴²

In short, the proposed action would be illegal, and would not survive a legal challenge.

Comment [6884-3033]: Commenter (6905) notes that like EPA's mission statement, several of the federal statutes that provide authority for the agency's work call for use of the best science without regard for data transparency. For example, the SDWA calls on the Administrator to use “the best available, peer reviewed science and supporting studies conducted in accordance with sound and objective scientific practices.” SDWA specifically calls on the Administrator to make information on public health effects available including peer reviewed studies. But it qualifies the requirement with the phrase “to the extent practicable” and does not require that all the data underlying the studies be publicly available. It appears that the proposed rule could reject some of the best available science and may result in a finding that the rule contradicts the federal statutes.

Comment [6894-3605]: Commenter (6915) writes that the SDWA requires that findings which support a determination to regulate a contaminant “be based on *the best available public health information*,” and that, in developing the NPDWR, “to the degree that an Agency action is based on science, the Administrator shall use *the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices*.” §§

EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency. Pg. 21 (Oct. 2002, as amended June 24, 2004 & May 13, 2005) (EPA IQA Guidelines).

⁸⁴¹ Letter from Senator Thomas R. Carper (and others) to EPA Administrator Scott Pruitt (April 24, 2018) (“Senate letter”), attached hereto as Attachment B.

⁸⁴² Id.

1412(b)(1)(B)(ii)(II), 1412(b)(3)(A)(i), 42 U.S.C. §§ 300g-1(b)(1)(B)(ii)(II), 300g1(b)(3)(A)(i) (emphases added).

Comment [6901-4442]: Commenter (6922) notes that in the SDWA: “Use of science in decision-making. In carrying out this section, and, to the degree that an Agency action is based on science, the Administrator shall use:

- 1) The best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and
- 2) Data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).”⁸⁴³

Comment: [7876-4129]: Commenter (8279) objects to the proposal to limit the use of scientific evidence in rulemaking proceedings.

The proposed regulation will undercut the ability of EPA (including future EPA administrators) to protect the public pursuant to the SDWA and TSCA. The breadth of the proposed regulation is shown in part by reviewing the chemicals covered by the two acts. See, *e.g.*, The non-confidential list of 67951 TSCA chemicals, <https://www.epa.gov/tsca-inventory/how-access-tsca-inventory>, the list of hazardous waste, <https://www.epa.gov/hw/defining-hazardous-waste-listed-characteristic-and-mixed-radiological-wastes>, SDWA

Regulations, <https://www.epa.gov/ground-water-and-drinking-water/national-primary-drinking-water-regulations>, PDF copy of list, https://www.epa.gov/sites/production/files/2016-06/documents/npwdr_complete_table.pdf

Comment [8750-1433]: Commenter (9227) notes that EPA’s statutory authorities generally require the agency to consider all available data when undertaking significant rulemakings.

As just noted, EPA’s statutory authorities mandate a variety of requirements for what scientific information EPA must consider in rulemaking. These statutes are discussed in detail, at section I. B.3. of the commenter’s comment letter. To take one example that appears in numerous statutes, including TSCA, CAA, SDWA, and the ESA, Congress has often required agencies to act on the “best available science.” For an agency to comply with this obligation, the agency must at least consider all available scientific information. “Best” means “of the most excellent, effective, or desirable type or quality.”⁸⁴⁴ “Available” means “able to be used or obtained.”⁸⁴⁵ And “science” means “the intellectual and practical activity encompassing the systematic study of the structure and behavior of the physical and natural world through observation and experiment.”⁸⁴⁶ Assessing which science is “best” requires consideration of the overall quality of the science, and the public availability of underlying data is, at best, one of many aspects that should inform that assessment of overall quality.

⁸⁴³ 42 U.S.C. § 300g-1(b)(3)(A) (emphasis added).

⁸⁴⁴ Oxford American Dictionary 159 (3d ed. 2010).

⁸⁴⁵ Id. at 111.

⁸⁴⁶ Id. at 1564.

An agency “cannot ignore available. . . information.”⁸⁴⁷ Numerous courts have indicated that a plaintiff or petitioner can establish a violation of the “best available science” requirement by “point[ing] to any scientific evidence that the agency failed to consider.”⁸⁴⁸ “The best available data requirement. . . prohibits [an agency] from disregarding available scientific evidence that is in some way better than the evidence [it] relies on.”⁸⁴⁹ “An agency does. . . have an obligation to deal with newly acquired evidence in some reasonable fashion.”⁸⁵⁰ EPA’s proposal will result in EPA precluding itself from considering certain studies that are “available,” thus violating the requirement that EPA rely on the best available science.

In addition, the requirement that agencies use “best available” science or information often means that the agency must act even if the available science or information is imperfect.

“Even if the available scientific and commercial data were quite inconclusive, [the agency] may—indeed must—still rely on it” when the agency has a duty to act.⁸⁵¹ “[W]here the information is not readily available, we cannot insist on perfection.”⁸⁵² Just as the Courts have recognized that they cannot expect perfection, agencies cannot choose to ignore certain studies or sources of information based solely on whether the data is publicly available—especially where the validity of those studies has been established using techniques that do not rely on public availability of underlying data.

EPA cannot reasonably elevate the interest in public availability of all underlying information above all other factors in assessing the “best available science.” Textually, EPA’s approach is unlawful.

Comment [8750-1437]: Commenter (9227) writes that the proposed rule violates EPA’s statutory authorities.

Not only is there no authority for EPA’s pan-statutory Proposal, but the Proposal would also violate explicit statutory commands. Though EPA admits that “[t]he best available science must serve as the foundation of EPA’s regulatory actions,”⁸⁵³ proposed section 30.5 would prohibit EPA from considering high quality and critically important scientific studies—precisely that “best available science”—when undertaking regulatory actions. Specifically, section 30.5 would prevent EPA from considering any scientific study for which the underlying “dose response data and models” are not “publicly available in a manner sufficient for independent validation.”⁸⁵⁴

⁸⁵² *San Luis*, 747 F.3d at 602.

⁸⁵³ 83 Fed. Reg. at 18769.

⁸⁵⁴ 83 Fed. Reg. at 18773-74.

This is reflected “the best available public health information” in a SDWA rulemaking, 42 U.S.C. § 300g-1(b)(1)(B)(ii)(II). Accordingly, this proposed prohibition would contravene an array of statutes governing EPA’s consideration of science when promulgating rules, such as requirements to consider the “best available science” when setting environmental protection standards. See, e.g., SDWA, 42 U.S.C. § 300g-1(b)(3)(A) (EPA must use “[t]he best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices” and “[d]ata collected by accepted methods or best available methods”). And, by excluding science that meets these statutory criteria from supporting regulations to protect public health and welfare, the Proposal would frustrate Congress’s policy in these statutes and frustrate EPA from achieving its fundamental mission.⁸⁵⁵

Comment [8750-1465]: Commenter (9227) writes that EPA’s Proposal contravenes the SDWA.

The SDWA requires EPA to issue national drinking water regulations setting required purity levels for water from public water supply systems.⁸⁵⁶ Before regulating, the Administrator must conclude that the contaminant at issue “may have” an adverse effect on the health of persons.⁸⁵⁷ In regulating, the Administrator must consider “the best available public health information.”⁸⁵⁸ The section adds that in setting regulations, the Administrator “shall use ...the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices” and in addition “data collected by accepted methods or best available methods.”⁸⁵⁹ When Congress promulgated these statutory requirements in 1996, the Senate Committee on Environment and Public Works⁸⁶⁰ explained that the “Administrator has a duty to seek and rely upon the best available science and information to support.... [m]any of the most important activities including selecting contaminants for regulation, setting standards, designing analytical methods, and structuring waivers, variances and exemptions.”⁸⁶¹

By restricting EPA to considering only those scientific studies for which underlying data, models, and other information is publicly available, EPA’s proposal prevents EPA from complying with the SDWA directive that it consider the “best available” public health information and science when setting SDWA standards. Specifically, as explained above, the public will not necessarily have access to the underlying information used to produce the “best available, peer-reviewed science and supporting studies.”⁸⁶² Nowhere does the SDWA authorize EPA to ignore such studies based on the public unavailability of underlying information. Thus, regardless of the merits of the core objective of EPA’s proposal—“to ensure that the regulatory

⁸⁵⁵ See, e.g., *Shays v. FEC*, 528 F.3d 914, 919 (D.C. Cir. 2008) (“[W]e ‘must reject administrative constructions of [a] statute that frustrate the policy that Congress sought to implement.’”) (quoting *Cont’l Air Lines, Inc. v. Dep’t of Transp.*, 843 F.2d 1444, 1453 (D.C. Cir. 1988)).

⁸⁵⁶ 42 U.S.C. § 300g-1.

⁸⁵⁷ *Id.* at (b)(1)(A)(i).

⁸⁵⁸ *Id.* at (b)(1)(B)(ii)(II).

⁸⁵⁹ 42 U.S.C. § 300g-1(b)(3)(A). See *City of Waukesha v. EPA*, 320 F.3d at 247-48 (D.C. Cir. 2003) (holding that agency peer review satisfies requirement to use best, peer-reviewed science and supporting studies); *City of Portland v. EPA*, 507 F.3d 706, 716 (D.C. Cir. 2002) (same).

⁸⁶⁰ The Report of the Senate Committee on Environment and Public Works is authoritative on these provisions, as the language adopted in the Committee bill (S.1316) on the use of science was adopted verbatim in Pub. L. 104-182. See S. Rep. 104-169 at p. 121 and Pub. L. 104-182 at §103.

⁸⁶¹ S. Rep. 104-169 at 28 (emphasis added).

⁸⁶² 42 U.S.C. § 300g-1(b)(3)(A).

science underlying its actions is publicly available in a manner sufficient for independent validation” (proposed § 30.1 “What is the purpose of this subpart?”), EPA’s attempt to elevate this objective above the agency’s statutory obligation to consider the “best available” science when promulgating SDWA standards is unlawful.⁸⁶³

Comment [8750-1817]: Commenter (9227) writes that EPA’s proposal fails to meet the procedural requirements of the SDWA, 42 U.S.C. § 300f Et Seq.

EPA cites the SDWA as an authority for the Proposal but has failed to comply with the procedural requirements of the statute. The SDWA provides authority to promulgate regulations at 42 U.S.C. 300g-1(d). Though EPA does not cite this particular section, it is the only provision of the SDWA that provides EPA with rulemaking authority. The SDWA requires the Administrator to consult with the Secretary of HHS and the National Drinking Water Advisory Council (NDWAC) in proposing and promulgating regulations under this section. EPA has not met these requirements here, and as such cannot claim to be using SDWA authority to promulgate this rule.

Comment [8750-1965]: Commenter (9227) writes that EPA arbitrarily failed to consider the far-reaching implications this Proposal could have on inter-agency coordination and consultation given that other agencies normally rely on research potentially excluded by the Proposal.⁸⁶⁴

Consultation Provisions in the SDWA

300g-1 (b)(1)(D)

Standards: Listing of Contaminants for Consideration, Urgent Threats to Public Health

The Administrator may promulgate an interim NPDWR for a contaminant without making a determination for the contaminant under paragraph (4)(C), or completing the analysis under paragraph (3)(C), to address an urgent threat to public health as determined by the Administrator after consultation with and written response to any comments provided by the Secretary of HHS, acting through the director of the CDC or the director of the NIH.

300g-1(d)

Regulations:

Regulations; public hearings; administrative consultations. Regulations under this section shall be prescribed in accordance with section 553 of title 5, United States Code (relating to rulemaking), except that the Administrator shall provide opportunity for public hearing prior to

⁸⁶³ 83 Fed. Reg. at 18773.

⁸⁶⁴ See *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (“Normally, an agency rule would be arbitrary and capricious if the agency has . . . entirely failed to consider an important aspect of the problem.”).

promulgation of such regulations. In proposing and promulgating regulations under this section, the Administrator shall consult with the Secretary and the NDWAC.

300j-12(i)(2)

Funds: Indian Tribes: Use of Funds

(2) Use of funds. Funds reserved pursuant to paragraph (1) shall be used to address the most significant threats to public health associated with public water systems that serve Indian Tribes, as determined by the Administrator in consultation with the Director of the Indian Health Service and Indian Tribes.

300j-13(a)(5)

Source Water Quality Assessment

Demonstration project. The Administrator shall, as soon as practicable, conduct a demonstration project, in consultation with other Federal agencies, to demonstrate the most effective and protective means of assessing and protecting source waters serving large metropolitan areas and located on Federal lands.

300j-5(b)

NDWAC

(b) Functions. The Council shall advise, consult with, and make recommendations to, the Administrator on matters relating to activities, functions, and policies of the Agency under this title [42 USCS §§ 300f et seq.].

300j-3d

Water Supply Cost Savings

(a) Drinking water technology clearinghouse. The Administrator, in consultation with the Secretary of Agriculture, shall—

(1) develop a technology clearinghouse for information on the cost-effectiveness of innovative and alternative drinking water delivery systems, including wells and well systems; and

(2) disseminate such information to the public and to communities and not-for-profit organizations seeking Federal funding for drinking water delivery systems serving 500 or fewer persons.

300i-3(a)

Contaminant Prevention, Detection and Response

In general. The Administrator, in consultation with the CDC, after consultation with appropriate departments and agencies of the Federal Government and with State and local governments, shall review (or enter into contracts or cooperative agreements to provide for a review of) current and future methods to prevent, detect and respond to the intentional introduction of chemical, biological or radiological contaminants into community water systems and source water for community water systems, including each of the following:

300j19(b)(2)(A)

Algal Toxin Risk Assessment and Management

(b) Information coordination. In carrying out this section the Administrator shall--

(2) as appropriate, consult with--

(A) other Federal agencies that--

(i) examine or analyze cyanobacteria or algal toxins; or

(ii) address public health concerns related to harmful algal blooms.

Comment [9066-2646]: Commenter (6188) writes that the proposed rule contradicts the requirements of federal environmental law, including cited authority for the rulemaking.

The Proposed Rule's requirements are at odds with statutory mandates contained in the very same environmental laws it points to as providing a basis for the rule. They also directly controvert authority it cites as support for the rulemaking.

The requirements of the Proposed Rule conflict with EPA's statutory obligations under federal environmental laws. CAA § 109 mandates that EPA set air quality standards based on "air quality criteria," which must "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare." 42 U.S.C. §§ 7409, 7408(a)(2). The TSCA requires EPA to use the "best available science" when evaluating the testing and regulation of chemicals. 15 U.S.C. § 2625(h). Decisions are to be

made using the “weight of the scientific evidence,” and EPA is required to consider all information related to a chemical substance, including hazard and exposure information, “that is reasonably available to the Administrator.” 15 U.S.C. §§ 2625(i), (k). Similarly, the SDWA mandates use of the “best available public health information” when EPA determines whether to regulate a contaminant, and reliance on the “best available, peer-reviewed science and supporting studies” when making regulatory decisions. 42 U.S.C. §§ 300g-1(b)(1)(B)(ii), 300g-1(b)(3).

Exclusion of relevant studies from consideration based not on the quality of the science but on the public availability of underlying data directly contradicts these mandates.⁸⁶⁵ EPA itself has defined “best available science” without reference to the public availability of data:

Use of best available science involves the use of supporting studies conducted in accordance with sound and objective scientific practices, including, when available, peer reviewed science and supporting studies and data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).⁸⁶⁶

Simply put, the “best available science” is science that follows standards accepted by the scientific community, not science that EPA arbitrarily selects based upon the public availability of data—a criterion irrelevant to scientists’ standards for determining whether research represents the best science.

Specifically, scientists have observed that the best quality science oftentimes relies upon data that is not publicly available due to significant privacy considerations.⁸⁶⁷ It is for that very reason that courts have recognized EPA’s need to rely upon studies based on publicly undisclosed underlying data when considering the best science. *American Trucking Ass’n*, 283 F.3d at 372 (explaining that curtailing EPA’s ability to rely on published studies would exclude “plainly relevant scientific information” from regulatory decision-making processes); see also *Coalition of Battery Recyclers Ass’n*, 604 F.3d at 623 (finding that EPA is entitled to rely on published study results as “raw data is often unavailable due to proprietary interests of a study’s scientific investigators or confidentiality agreements with study participants”). Forcing EPA to ignore high quality science controverts EPA’s statutory obligations and will impair EPA’s ability to protect public health and the environment.

Comment [9078-3549]: Commenter (6194) writes that the proposal is inconsistent with EPA’s statutory obligations and conflicts with other applicable federal requirements.

⁸⁶⁵ Even EPA’s current mission statement explains that EPA works to ensure “[n]ational efforts to reduce environmental risks are based on the best available scientific information.” See EPA, About EPA, available at <https://www.epa.gov/aboutepa/our-mission-and-what-we-do>.

⁸⁶⁶ Environmental Protection Agency Office of Chemical Safety and Pollution Prevention, Guidance to Assist Interested Persons in Developing and Submitting Draft Risk Evaluations Under the Toxic Substances Control Act, EPA 740-R17-001 (June 2017).

⁸⁶⁷ See, e.g., International Society for Environmental Epidemiology, Comments of the International Society for Environmental Epidemiology on EPA’s proposed rule on Strengthening Transparency in Regulatory Science (EPA-HQ-OA-2018-0259-0001) (citing to multiple robust environmental studies based upon data that could not be disclosed because of federal and foreign laws and access agreements with Medicare).

The Proposal would prevent EPA from relying on the best available information in discharging its duties. EPA is charged with developing regulations that provide societal benefits by reducing harm to human health and the environment from the presence of chemicals in air, soil, drinking water, food, and consumer products. The Proposal implicates research that is central to making such determinations; creating an obstacle to the consideration of such science is contrary to both primary statutory directives and requirements to conduct cost benefit analyses. Likewise, EPA fails to address how it could implement a regulation that is inconsistent with federal requirements and standards governing the use of science across agencies.⁸⁶⁸

A. Statutory Requirements to Develop Health Based Standards and Conduct Cost-Benefit Analyses EPA acknowledges that it must use the “best available science” in all of its regulatory actions.⁸⁶⁹

This directive is embodied in multiple statutes implemented by EPA and is reflected in other environmental statutes, further illustrating Congress’ conceptualization of “best” available science. Broadly speaking, there are three basic types of statutory requirements that the EPA and other agencies consider scientific information. First, there are requirements that the agency consider the “best available science.” Second, there are requirements that the agency consider particular factors, including scientific factors. Third, there are requirements that the agency balance economic costs or technological feasibility against public health, environmental, or other benefits that must be scientifically assessed. The precise terminology regarding the required use of science may, as illustrated below, vary across statutes, but what these provisions have in common are requirements for EPA and other agencies to use scientific information that is “best,” not simply adequate, and “available.”

Table 1: Examples of Statutory Directives regarding Use of Science by EPA and other Agencies

- **SDWA** [42 U.S.C § 300g1(b)(3)(A)]: EPA must use “[t]he best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices,” and “[d]ata collected by accepted methods or best available methods (if the reliability of the method and the nature of the excision justifies use of the data).”
 - [42 U.S.C. § 300g1(b)(1)(b)(ii)]: EPA must use “best available public health information” in determining whether to regulate contaminants.

This statutory provisions link the concept of the “best available science” to the availability of underlying raw data, nor can such a limitation be read into the statutes. Where Congress wanted to direct EPA’s decision regarding what science to consider or how—it did so.⁸⁷⁰ When

⁸⁶⁸ Moreover, as discussed herein, the Proposal would flip the existing default by automatically excluding the best scientific research, rather than admitting science and then deciding if circumstances exist that warrant excluding a study. The status quo makes more sense than creating a blanket preclusion of valid studies and then allowing their use only by going through a timely and expensive exemption process.

⁸⁶⁹ EPA, Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18,768, 18,769 (Apr. 30, 2018) (citing Exec. Order No. 13,563, 76 Fed. Reg. 8,321 (Jan. 21, 2011)).

⁸⁷⁰ See, e.g., Toxic Substances Control Act, 15 U.S.C. § 2625(h) (directing EPA to consider, as applicable, the following factors: “(1) the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the

Congress wanted to link “best available science” to data being publicly available—it did so.⁸⁷¹ Thus, if Congress had wanted to put a blanket limitation on EPA’s consideration of science for which underlying data is not publicly available, it clearly knew how to do so—and it chose not to.

As EPA has previously explained, the agency would be unable to fulfill statutory mandates if it could not consider studies that follow federal laws and ethical standards regarding the privacy of patient and individual data:

If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. . . . [S]uch data are often the property of scientific investigators and are often not readily available because of the proprietary interests of the investigators or because of arrangements made to maintain confidentiality regarding personal health status and lifestyle information of individuals included in such data. Without provisions of confidentiality, the possibility of conducting such studies could be severely compromised.⁸⁷²

The Proposal would also cut EPA off from information needed to complete the cost-benefit analysis of regulations required under certain statutes and government-wide requirements.⁸⁷³

Not only would the Proposal impede EPA’s fulfillment of its statutory duties, but it would also be contrary to judicial precedent, which holds that “best available science” includes “all existing scientific evidence relevant to the [agency] decision [in question].” *Ecology Ctr., Inc. v. U.S.*

intended use of the information; (2) the extent to which the information is relevant for the Administrator's use in making a decision about a chemical substance or mixture; (3) the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented; (4) the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and (5) the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models”); see also Comprehensive Environmental Response, Compensation, and Liability Act, 42 U.S.C. § 9604(i)(10) and (13) (providing that the Agency for Toxic Substances and Disease Registry give EPA specified data and information for review biennially and requiring that “[a]ll studies and results of research conducted under this subsection (other than health assessments) shall be reported or adopted only after appropriate peer review”).

⁸⁷¹ See, e.g., Clean Water Act, 33 U.S.C. § 1321(a)(27) (defining “best available science” in the context of natural resource protection and restoration projects on the Gulf Coast as science that: “(A) maximizes the quality, objectivity, and integrity of information, including statistical information; (B) uses peer-reviewed and publicly available data; and (C) clearly documents and communicates risks and uncertainties in the scientific basis for such projects”).

⁸⁷² National Ambient Air Quality Standards for Particulate Matter, 62 Fed. Reg. 38,652, 38,689 (Jul. 18, 1997).

⁸⁷³ See, e.g., Exec. Order No. 13,783, 82 Fed. Reg. 16,093 (Mar. 31, 2017) (“It is also the policy of the United States that necessary and appropriate environmental regulations . . . are of greater benefit than cost, when permissible, . . . and are developed through transparent processes that employ the best available peer-reviewed science and economics.”); see also 42 U.S.C. § 7411(a)(1) (CAA provision requiring EPA to consider costs when establishing performance standards for new stationary sources of pollution); 42 U.S.C. § 7412(n)(1)(A) (CAA provision directing EPA to regulate power plants if such regulation is “appropriate and necessary,” which includes consideration of costs); 42 U.S.C. § 300g–1(b)(3)(C) (SDWA provision establishing requirements for health risk reduction and cost analysis under which quantifiable and non-quantifiable benefits of a proposed rule must be measured against its cost); 15 U.S.C. § 2605(c)(2)(A)(iv) (TSCA provision requiring EPA to consider “the reasonably ascertainable economic consequences” of a proposed rule).

Forest Serv., 451 F.3d 1183, 1194 n.4 (10th Cir. 2006) (quoting *Heartwood, Inc. v. U.S. Forest Serv.*, 380 F.3d 428, 436 (8th Cir. 2004)). While agencies need not produce new evidence,⁸⁷⁴ they must seek out information and “cannot ignore existing data.” *Id.* (emphasis added). Even if an agency is anticipating the arrival of better evidence, it must act on the basis of the evidence it currently has.⁸⁷⁵ Many of the fundamental public health studies on which EPA has based key rules and standards under the statutes are studies for which the raw data was not or could not have been released. Nonetheless these studies have been examined and validated,⁸⁷⁶ as will future studies. Arbitrarily cutting off consideration of a category of science is inconsistent with EPA’s statutory obligations.⁸⁷⁷

Comment [9217-3562]: Commenter (9225) writes that the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA’s authority. This includes, but is not limited to, the CAA; CWA; TSCA; LCSA; SDWA; FIFRA; and more.

Comment [7869-3372]: Commenter (8272) writes that the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA’s authority. This includes, but is not limited to, the CAA; CWA; TSCA; LCSA; SDWA; and the FIFRA. The rule violates numerous public health and environmental provisions contained in these laws, as well as requirements to use the best available science or to consider all available information.

Comment [6168-4099]: Commenter (6178) notes that the NPRM proposes to establish a new EPA regulation that will ‘ensure the data and models underlying the science pivotal to what the Agency deems ‘significant regulatory actions’ is publicly available in a manner sufficient for validation and analysis’, hereinafter referred to as the ‘Transparency Rule’ or ‘Rule’. Specifically, they wish to raise the following concerns with the Transparency Rule proposed by the NPRM:

1. The Agency cites specific sections of statutes it administers as the basis of the Agency’s authority to adopt the Transparency Rule; specifically SDWA sections 1442. The Agency rightly cites acts of Congress in an attempt to support the NPRM as such authority is necessary for the Agency to adopt regulations pursuant to the above listed Acts.

2. However, Congress, in each of the Acts’ sections cited, never instructs the Agency to consider transparency to the public of supporting data and/or models of the scientific research when deciding to rely on such research as support for regulations passed pursuant to any of the Acts. Consequently, the Transparency Rule requires the EPA to rely on factors which Congress

⁸⁷⁴ See *Friends of Blackwater v. Salazar*, 691 F.3d 428, 435 (D.C. Cir. 2012) (quoting *Sw. Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000)) (“[U]nder the ‘best ... data available’ standard, ‘the Secretary has no obligation to conduct independent studies.’”).

⁸⁷⁵ See, e.g., *San Luis & Delta-Mendota Water Auth. v. Jewell*, 747 F.3d 581, 630 (9th Cir. 2014) (“[T]he fact that science must advance further before the complicated ecosystem interactions in the Bay-Delta are fully understood does not necessarily mean that the Fish and Wildlife Service failed to rely on the best available science.”)

⁸⁷⁶ See the Harvard Letter, *supra* note 6.

⁸⁷⁷ The Proposal is also arbitrary in suggesting that science that cannot be used in setting regulations could still be used in individual permitting decisions.

has not intended it to consider when promulgating regulations pursuant to the Acts, rendering the Transparency Rule arbitrary and capricious under the APA.

3. Further, not only does the Transparency Rule lack sufficient Congressional intent to avoid being deemed arbitrary and capricious, implementing the Rule would actually contradict Congressional instruction to conduct scientific research with a focus on ‘promotion’ and ‘coordination’ among itself and other institutions that produce scientific research material to the objectives of the Acts Congress requires the EPA to enforce. This provides additional cause for finding the Transparency Rule arbitrary and capricious under the APA.

Comment [6141-2554]: Commenter (6166) writes that the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA’s authority. This includes, but is not limited to, the CAA; CWA; TSCA; LCSEA; SDWA; FIFRA; and more. Substantively, the rule violates numerous public health and environmental provisions contained in these laws, as well as requirements to use the best available science or to consider all available information.

Comment [8750-1661]: Commenter (9227) writes that EPA arbitrarily failed to consider the implications of this proposal on interagency coordination.

Additionally, EPA arbitrarily failed to consider the far-reaching implications this Proposal could have on inter-agency coordination and consultation given that other agencies normally rely on research potentially excluded by the Proposal.⁸⁷⁸ In the numerous environmental statutes that EPA cites, there are dozens of provisions that require EPA to coordinate or consult with other Federal entities—especially when implementing research programs and issuing information or guidelines.⁸⁷⁹ The Proposal would almost certainly frustrate and impair this coordination and consultation, either by forcing EPA to ignore the science provided by other agencies or by severely restricting the science that EPA itself would be able to share with other agencies in these statutorily required processes. The Proposal arbitrarily ignores these potential impacts.

In addition to the many examples of statutorily required consultation that are identified in Appendix B of the commenter’s comment letter, other federal agencies routinely incorporate and rely upon EPA science assessments in their own efforts to carry out their mandates to protect human health and safety. As with statutorily required consultations, the Proposal utterly fails to acknowledge or consider what impacts restricting EPA’s own use of dose-response studies would have on the work of these other agencies. Indeed, there is no evidence that these other

⁸⁷⁸ See *Motor Vehicle Mfrs. Ass’n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (“Normally, an agency rule would be arbitrary and capricious if the agency has . . . entirely failed to consider an important aspect of the problem.”).

⁸⁷⁹ See 42 U.S.C. §§ 7403, 7408(a), 7408(c), 7408(f), 7412 (Clean Air Act §§ 103, 108, 112); 33 U.S.C. §§ 1314, 1317(a)(7), 1345(d)(1) (Clean Water Act §§ 304, 307(a)(7), 404(d)(1)); 42 U.S.C. §§ 6907(a), 6911, 6912(a)(2)-(6), 6942(b), 6981(a) (Resource Conservation and Recovery Act §§ 1008(a), 2001, 2002(a)(2)-(6), 4002(b), 8001(a)); 7 U.S.C. §§ 136w-3, 136w(d), 136a-1(n)(2)-(3), 136(l)(2), 136t(b), 136i-2(c) (Federal Insecticide, Fungicide, and Rodenticide Act §§ 2, 4, 11, 22, 25, 28); 15 U.S.C. §§ 2608(d), 2604(f)(5), 2604(h)(2)(B)(ii) (Toxic Substances Control Act); 42 U.S.C. § 300g-1 (b)(1)(D), 300g-1(d), 300j-13(a)(5), 300j-3d, 300j-19(b)(2)(A) (Safe Water Drinking Act). See also Appendix B: Table of Consultation Requirements.

agencies were even permitted to comment on the Proposal as part of the usual process of interagency review.

Some selected examples of other federal agency programs that rely on EPA science include:

- FDA also regulates contaminants in bottled water under the FFDCA Section 410 of the Act requires that FDA regulations for bottled water be issued in coordination with the effective date of NPDWR issued under the SDWA and be no less protective of public health than those standards. If the Proposal impedes EPA's work to establish drinking water standards, this may affect FDA's own ability to justify protective bottled water standards.⁸⁸⁰

Comment [6428-1351]: Commenter (6450) writes that the proposed rule is not merely a disastrous policy choice, given its threats to public health and the integrity of EPA decision-making, but it is plainly unlawful. EPA clearly lacks the authority to issue the proposal. EPA cites to various provisions in federal law to justify its authority but, in virtually every case, the agency refers to sections that authorize or mandate EPA to undertake research, not to impose arbitrary limitations on the scientific data that informs public health decisions. EPA also cites to statutory provisions authorizing it to promulgate rules "necessary" to achieving the goals of relevant statutes but restricting the use of sound science is neither necessary nor consistent with the statutory goals of protecting clean air, clean water, and a safe environment. Indeed, the proposed rule directly contradicts the specific mandate of numerous federal laws, such as the SDWA and the TSCA, which require EPA to use the "best available" science or all "reasonably available" science and information in its decision-making.

Comment [6163-1276]: Commenter (6133) writes that the proposal's peer review provision lacks any statutory basis, is vague and contrary to existing requirements for peer review.

In addition to addressing how and whether the agency will consider science, the Proposal also contains a seemingly unrelated provision regarding agency peer review. The Proposal, in § 30.7, reads:

What role does independent peer review in this section?

EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

Because transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results.

⁸⁸⁰ FDA, Guidance for Industry: Bottled Water and Total Coliform and E. Coli; Small Entity Compliance Guide, <https://www.fda.gov/Food/GuidanceRegulation/GuidanceDocumentsRegulatoryInformation/ucm206215.htm> (last visited Aug. 14, 2018).

83 Fed. Reg. at 18,774.

There is no statutory authority for EPA to “conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” The federal statutes that EPA lists as putative authority for the Proposal provide no authority for proposed § 30.7. The SDWA sections 1442, 1450(a)(1), 42 U.S.C. 300j–1, 300j–9(a)(1). The claimed authorities that EPA lists do not mention peer review or even allude to the concept. *Id.* Neither the Proposal nor accompanying docket materials identify any provision of any federal statute that authorizes EPA to promulgate proposed § 30.7. Our own research revealed no provision of any federal statute that authorizes EPA to promulgate proposed § 30.7.

When Congress writes federal statutes, Congress knows how to create legal authority for peer review, who shall conduct that peer review, what role, if any, that EPA or other parties will play, and how that peer review may be conducted. None of the provision in the law authorize EPA’s Proposal in § 30.7. Instead, the statutes require that EPA use peer-reviewed science, regardless of whether it would meet EPA’s definition of the term in § 30.7. And in cases where the law requires EPA to conduct the review, the statutes often spell out specifically how that should happen.

Statute Provisions on Peer Review

SDWA

§ 300g-1. National drinking water regulations

(b) Standards

(3) Risk assessment, management, and communication

(A) Use of science in decision-making in carrying out this section, and, to the degree that an Agency action is based on science, the Administrator shall use--

(i) the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and(ii) data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).

(B) Public information

In carrying out this section, the Administrator shall ensure that the presentation of information on public health effects is comprehensive, informative, and understandable. The Administrator shall, in a document made available to the public in support of a regulation promulgated under this section, specify, to the extent practicable--

- (i) each population addressed by any estimate of public health effects;
- (ii) the expected risk or central estimate of risk for the specific populations;
- (iii) each appropriate upper-bound or lower-bound estimate of risk;
- (iv) each significant uncertainty identified in the process of the assessment of public health effects and studies that would assist in resolving the uncertainty; and
- (v) peer-reviewed studies known to the Administrator that support, are directly relevant to, or fail to support any estimate of public health effects and the methodology used to reconcile inconsistencies in the scientific data.

[...]

(12) Certain contaminants

(B) Sulfate

(i) Additional study Prior to promulgating a national primary drinking water regulation for sulfate, the Administrator and the Director of the CDC shall jointly conduct an additional study to establish a reliable dose-response relationship for the adverse human health effects that may result from exposure to sulfate in drinking water, including the health effects that may be experienced by groups within the general population (including infants and travelers) that are potentially at greater risk of adverse health effects as the result of such exposure. The study shall be conducted in consultation with interested States, shall be based on the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices, and shall be completed not later than 30 months after August 6, 1996.

42 U.S.C. § 300g-1 (emphasis added).

§ 300j-2. Grants for State programs

(d) New York City (NYC) watershed protection program

(1) In general The Administrator is authorized to provide financial assistance to the State of New York for demonstration projects implemented as part of the watershed program for the protection and enhancement of the quality of source waters of the NYC water supply system, including projects that demonstrate, assess, or provide for comprehensive monitoring and surveillance and projects necessary to comply with the criteria for avoiding filtration contained in 40 C.F.R. 141.71. Demonstration projects which shall be eligible for financial assistance shall be certified to the Administrator by the State of New York as satisfying the purposes of this subsection. In certifying projects to the Administrator, the State of New York shall give priority to monitoring projects that have undergone peer review.

42 U.S.C. § 300j-2 (emphasis added).

1.3.3.2 SWDA (SNPRM Comments)

Comment [23-84]: Commenter (10973) writes that additional review of alignment to statutory requirements is needed.

On 85 FR 15398, the proposal indicates that “this internal agency procedure is intended to be consistent with the statutes that EPA administers and EPA plans to implement this procedural rulemaking in accordance with all applicable statutory and regulatory requirements.” This statement is appreciated, and we encourage EPA to provide additional analysis to confirm alignment with these requirements.

As noted in our 2018 comments, the SDWA requires that regulatory decisions be based upon “(i) the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and (ii) data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).” (Sec. 1412 (b)(3)(A)). SDWA does not distinguish peer-reviewed science that has data and models that are publicly available from those where data and models may not be publicly available. Other environmental statutes have similar provisions which should also be carefully considered.

The current proposal in general is more flexible than the 2018 version in providing additional guidance on situations where “tiered access” can be established and/or EPA can waive the requirements for publicly available information, which will help to reduce potential conflicts between this Agency policy and statutory requirements. In finalizing this rule, a more formal assessment of potential conflicts between this policy and statutory language should be completed to assure that this policy does not hamper important regulatory decisions in SDWA or elsewhere. Additionally, by using EPA’s alternate approach for prioritizing publicly available data and models but not eliminating those that are not, potential conflicts can be reduced further.

Comment [48-2185]: Commenter (12727) notes that just as EPA is required to consider all available science when making its regulatory decisions, governing environmental and public health statutes likewise require EPA to consider all available science when releasing ISI, which often forms the basis for the agency’s regulatory decisions. For example the SDWA generally requires EPA to use “the best available, peer-reviewed science,”^{881 882}

A rule that prohibits EPA from considering (or that downgrades) valid, high quality scientific studies when generating ISI such as the products identified above would contravene the above-noted statutory directives regarding EPA’s obligation to consider all available science.

Comment [81-2187]: Commenter (12715) writes that the proposed rule conflicts with fundamental statutory requirements to use the best available science and citation to “housekeeping” authority cannot cure that defect.

⁸⁸¹ 42 U.S.C. § 300g-1(b)(3)(A)(i).

⁸⁸² 42 U.S.C. § 300g-1(b)(1)(B)(ii)(II).

Whether EPA is arbitrarily barring consideration of scientific studies or information with nonpublic underlying data or data that are not able to be independently validated, or arbitrarily ascribing less weight to such studies or information, neither approach constitutes “housekeeping,” and neither comports with statutory requirements that EPA use the best available science. To reiterate from the 2018 Comments, EPA’s obligation with respect to the use of scientific information is clear: it must base its decisions on such criteria as the latest scientific knowledge, the best available, peer-reviewed science, and/or generally accepted scientific principles or laboratory tests. To cite just a few examples, in performing its duties, EPA must rely on: “the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices,” SDWA of 1996, 42 U.S.C. § 300g-1(b)(3)(A)(i). EPA has repeatedly emphasized the importance of this fundamental precept, including in its 2018-2022 strategic plan, which states that one of the agency’s priorities is to “identify, assess, conduct, and apply the best available science to address current and future environmental hazards.”⁸⁸³

These statutory requirements apply to all aspects of EPA’s decision-making, including its scientific evaluations, adoption of regulatory standards, and development of policies. They do not permit what EPA proposes here: to either exclude or give less weight to scientific studies or information based on criteria—availability of the underlying data and ability to independently validate underlying data—that are not determinative of whether the studies or information constitute the best available science. Agencies may not adopt or implement regulations that conflict with the statutes under which they are promulgated, and an agency’s interpretation of those statutes must always at least be reasonable. See *Chevron, U.S.A., Inc. v. Nat. Res. Def. Council, Inc.*, 467 U.S. 837, 842-44 (1984). Furthermore, neither 5 U.S.C. § 301 nor any other purported housekeeping authority allows EPA to negate these statutes’ fundamental, substantive, and common-sense commands. And even assuming EPA has some inherent housekeeping authority, it cannot rely on a general grant of rulemaking authority to promulgate regulations or develop policies that are otherwise inconsistent with more specific statutory directives. *Glob. Van Lines, Inc. v. Interstate Commerce Comm’n*, 714 F.2d 1290, 1293-97 (5th Cir. 1983).⁸⁸⁴

Finally, EPA acknowledges that the statutes it administers would control in the event of a conflict between the proposed rule and those statutes, see 85 Fed. Reg. at 15,398, but that caveat cannot save the proposed rule. First, the core principle of the proposed rule is facially invalid, *i.e.*, there is no circumstance in which it would be acceptable for EPA to exclude or give less weight to relevant, probative scientific studies, models, or other information that have been validated through peer review, on the sole basis that the underlying data are not publicly available or are not able to be independently validated. EPA cannot save an invalid rule by including what amounts to a waiver procedure, because the “essence of waiver is the assumed validity of the general rule.” *Alltel Corp. v. Fed. Commc’n Comm’n*, 838 F.2d 551, 561 (D.C. Cir. 1988). Second, the agency’s essential duty in rulemaking is to exercise its subject matter

⁸⁸³ U.S. Env’tl. Prot. Agency, Working Together: FY 2018-2022 EPA Strategic Plan, (2018) at page 42, <https://www.epa.gov/sites/production/files/2019-09/documents/fy-2018-2022-epa-strategic-plan.pdf>.

⁸⁸⁴ EPA’s citation to Clean Water Act, CERCLA, and RCRA provisions granting authority to promulgate rules to carry out the agency’s responsibilities under those statutes, 85 Fed. Reg. at 15,397, is also unavailing. Restricting consideration of the best science is neither necessary nor consistent with those statutes’ goals of protecting human health and the environment.

expertise to enact rules that implement and further the purposes of the statutes Congress has assigned it to administer. *Chevron*, 467 U.S. at 842-44. This does not include proposing rules without first determining the source of legal authority but instead asking commenters to supply that information. Third, the agency must propose its rules with specificity and be clear as to the programs, regulations, and information to which they will apply. 5 U.S.C. § 553(b)(3); *Home Box Office, Inc.*, supra, 567 F.2d at 35-36.

Comment [82-2084]: Commenter (12464) writes that the cited provisions do not authorize EPA to promulgate the proposal.

“[I]t is ‘axiomatic’ that ‘administrative agencies may act only pursuant to authority delegated to them by Congress.’”⁸⁸⁵ None of the cited provisions, however, provide EPA with authority to ignore relevant scientific information. The Proposal, however, is not related to EPA research or research funding, and will actively hinder EPA’s ability to achieve the statutes’ underlying goals by limiting EPA’s ability to rely on the best available science.

EPA has long accepted that its decisions must be guided by the best available science. For example, in 2002, EPA issued Information Quality Guidelines in which it took the position that the standard set forth in the SDWA—to use “the best available, peer-reviewed science”—should apply to all of the agency’s risk assessments.⁸⁸⁶ EPA even reiterated its commitment to this standard in the Initial Proposal. 83 Fed. Reg. at 18,769. However, the Proposal would directly undermine this longstanding commitment to use the best available science. As we pointed out in a comment letter in response to the Initial Proposal, the Proposal would prevent EPA from relying on crucial studies that underlie a number of past, present, and future regulations.⁸⁸⁷ This radical departure from EPA’s standard practice cannot be justified by any of the statutes EPA identifies because it is contrary to the goals of those statutes.

Comment [89-2194]: Commenter (11403) writes that the proposed rule is not based on any valid statutory authority and is arbitrary and capricious.

a. The environmental statutory provisions cited by EPA do not authorize the proposed rule

EPA’s 2018 version of this rule cited a hodgepodge of statutory authority, none of it valid. EPA at least corrected the obvious typographical errors from the previous version. However, those edits still do not grant EPA the authority to restrict science from all regulatory decision-making processes within the agency. EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, “Congress . . . does not alter the fundamental details of a regulatory scheme in vague terms or

⁸⁸⁵ *Clean Air Council v. EPA*, 862 F.3d 1, 9 (D.C. Cir. 2017) (citation omitted).

⁸⁸⁶ EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency 21-23 (2005), <https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf>; see also Our Mission and What We Do, EPA, <https://www.epa.gov/aboutepa/our-mission-and-what-we-do> (last visited May 14, 2020) (identifying EPA’s mission to include ensuring that “[n]ational efforts to reduce environmental risks are based on the best available scientific information”).

⁸⁸⁷ ELPC Science Comments, supra note 2, at 6-12.

ancillary provisions—it does not, one might say, hide elephants in mouseholes.”⁸⁸⁸ EPA does not have the authority to alter the fundamental details of all of its regulatory schemes based on such vague provisions of law. Section 1442 of the SDWA generally authorizes the Administrator to “conduct research, studies, and demonstrations relating to the causes, diagnosis, . . . and other impairments of man resulting directly or indirectly from contaminants in water, or to the provision of dependably safe supply of drinking water . . .”⁸⁸⁹ This section does not authorize EPA to exclude science based on a perceived lack of transparency or support any other aspect of the proposed rule.

Section 1450(a)(1) of the SDWA states, “The Administrator is authorized to prescribe such regulations as are necessary or appropriate to carry out his functions under this subchapter.”⁸⁹⁰ This catch-all provision provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is “necessary” to carrying out the functions under the SDWA.

In short, none of the statutory provisions cited by EPA provide authority for the proposed rule. The proposed rule fails at step one under *Chevron v. Natural Resources Defense Council* since it is unreasonable to believe that any statutory general grant of authority or any mention of EPA’s oversight of other science or research programs would enable EPA to conduct rulemaking in a way that is altogether inconsistent with the rule of law. None of the cited provisions provide the authority sought by EPA, and as such the proposed rule should be withdrawn.

Comment [93-2087]: Commenter (11395) notes that the SDWA stipulates that, in risk assessment, management and communication actions that are based on science, “the Administrator shall use the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices” and defines “best available science,” as “science that is reliable and unbiased ... conducted in accordance with sound and objective science practices, including, when available, peer reviewed science and supporting studies and data collected by accepted methods or best available methods.” (40 CFR 300g-1) Again, a rule that precludes that use of high-quality peer reviewed studies in significant actions would contradict the SDWA language.

Comment [97-2150]: Commenter (11479) writes that the proposed rule, as modified in the supplemental notice, would clearly interfere with the agency’s use of the best available science. For example, the policy violates laws like the TSCA and the SDWA because of the statutory requirement to use the “best available science.” That requirement does not make exception for the agency to effectively ignore certain scientific information of high quality simply because the unanalyzed data cannot be made public for reasons of privacy, confidentiality, or intellectual property. According to judicial precedent, “best available science” is defined as “all existing scientific evidence relevant to the decision” and a body of evidence that “cannot ignore existing data.”⁸⁹¹

⁸⁸⁸ *Whitman v. American Trucking Ass’n, Inc.*, 531 U.S. 457 (2001).

⁸⁸⁹ “Safe Drinking Water Act,” 42 U.S.C. § 300j-1.

⁸⁹⁰ “Safe Drinking Water Act,” 42 U.S.C. § 300j-9(a)(1).

⁸⁹¹ *Ecology Ctr., Inc. v. U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006)

In fact, virtually all of EPA’s statutory mandates require the use of the best available scientific evidence. Congress did not state in any of these laws that the agency shall only consider scientific evidence derived from studies where the underlying unanalyzed data is publicly available, nor that the evidence considered should be solely at the Administrator’s discretion.

Comment [125-2200]: Commenter (11495) writes that EPA’s Supplemental Notice is at odds with provisions of multiple environmental statutes which require the Agency to consider certain high-quality scientific information. For example, the SDWA requires that the issuance of national drinking water regulations be based on the “best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices.”⁸⁹²

Each of these provisions directs EPA to incorporate a certain quality of scientific information into its rulemaking decisions made pursuant to the statute. In particular, these requirements are designed to ensure the scientific validity of the information upon which EPA bases its actions. Mandating a high-quality scientific basis for regulatory actions is necessary to guarantee the best possible protections for public health and welfare and to minimize partisan influence in scientific decision-making.

The Supplemental Notice, however, would impermissibly prohibit the agency from considering of relevant and high-quality scientific studies whenever the data underlying the study are not publicly available—in direct contravention of the statutory directives that mandate, for example, consideration of the “best available science.” None of the provisions requires, or even suggests, that EPA only consider information that is publicly available. It strains the plain meaning of words like “best,” “latest,” and even “appropriate” to suggest that they permit the unscientific requirement that all data be publicly available.

EPA “cannot ignore available . . . information.”⁸⁹³ Courts have held that “best available data” requirements “prohibit[] [an agency] from disregarding available scientific evidence that is in some way better than the evidence [it] relies on.”⁸⁹⁴ Furthermore, a plaintiff may establish a violation of a “best available science” requirement by “point[ing] to any scientific evidence that the agency failed to consider.”⁸⁹⁵ The Supplemental Notice would undoubtedly preclude EPA from considering certain studies and scientific information that is “better” or the “best available,” simply because the study’s underlying data is not publicly available, thereby failing to satisfy Congressional directives and undermining the quality of regulatory decisions.

Likewise, EPA cannot avoid the statutory directives to consider high-quality scientific information simply by assigning a lesser weight to such information when the underlying data are not publicly available, as the Agency alternatively proposes. The Supplemental Notice’s alternative proposal is designed to have largely the same pernicious effects as flatly prohibiting

⁸⁹² 42 U.S.C. § 300g-1(b)(3)(A)(i) (emphases added).

⁸⁹⁴ *Kern Cty. Farm Bureau*, 450 F.3d at 1080 (citing *Southwest Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000)).

⁸⁹⁵ See *Safari Club Int’l v. Salazar* (In re Polar Bear Endangered Species Act Listing & Section 4(d) Rule Litig. - MDL No. 1993), 709 F.3d 1, 9 (D.C. Cir. 2013).

consideration of studies lacking publicly available data. Just as with the primary proposal, EPA's alternative proposal would limit the agency's consideration of the best available science in making important regulatory decisions, and is, therefore, arbitrary, and capricious.

The effect of the Proposed Rule is inconsistent with EPA's view that the Supplemental Notice is "intended to be consistent with the statutes that EPA administers and EPA plans to implement this procedural rulemaking in accordance with all applicable statutory and regulatory requirements."⁸⁹⁶ EPA attempts to resolve this inconsistency by stating that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control."⁸⁹⁷ However, as discussed below, EPA lacks the statutory authority to issue a rule this broad, even when it claims that it will avoid statutory conflicts.

Comment [156-1380]: Commenter (12418) writes that making regulatory determinations based on whether a study has publicly available data and models instead of on the quality of the study conflicts with existing statutory mandates.

Giving more consideration to studies where "underlying data and models are available" does not fulfill EPA's requirement to protect public health from harmful substances in air, water, and other media using the best available science. The laws that EPA administers to protect the public from harmful substances in the environment provide guidance on how scientific evidence is incorporated into rulemaking. Under the statutory text of the SDWA, EPA must identify whether drinking water contaminants present a threat to public health using "the best available, peer-reviewed science"⁸⁹⁸ and the decision to regulate a contaminant must be based on the "best available public health information."⁸⁹⁹ In the context of developing MCL, this process involves an extensive literature review of the available evidence, identification of the highest quality studies for sensitive health effects, and selection of a critical study that will serve as the basis of regulatory values.

In the Supplemental Notice of Proposed Rulemaking (SNPR), EPA has failed to identify how relying more heavily on data and models that are publicly available fulfills these statutory mandates to use the best available science in decision making. EPA presents no evidence that studies in which the underlying data and models are publicly available are more valid or credible in a manner sufficient to justify greater consideration than studies where the underlying data are not available. Lacking in empirical support, the proposed rule conflicts with legal requirements for EPA's use of science in regulatory decision-making.

Comment [159-2090]: Commenter (12430) notes that in the SNPRM, U.S. EPA proposes to consider only (or, in the alternative, more heavily weight) studies and models with publicly available data. However, restricting agency consideration of scientific studies and models would

⁸⁹⁶ See 85 Fed. Reg. at 15,398.

⁸⁹⁷ See id

⁸⁹⁸ Safe Drinking Water Act. 42 USC § 300g-1(b)(3)(A)(i)

⁸⁹⁹ Safe Drinking Water Act. 42 USC § 300g1(b)(1)(B)(ii)(II)

run afoul of U.S. EPA's obligations under many of its operating statutes to rely on the best available science. For example:

- The SDWA requires that findings which support a determination to regulate a contaminant “be based on the best available public health information” and that, in developing the NPDWR, “to the degree that an Agency action is based on science, the Administrator shall use the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices.”⁹⁰⁰

Comment: [187-1704]: Commenter (12720) notes that EPA cites 42 U.S.C. § 300j–1 of the SDWA as authority for the rule. Subsection (a) of that section allows EPA to conduct some types of research on drinking water contamination and requires it to conduct other studies. But it says nothing about which types of studies EPA may consider in rulemakings and does not distinguish between dose-response studies and other types of studies. The absence of any such congressional distinction or restriction makes it all the more obvious that EPA invented and added the distinction and restrictions in the Proposal and Supplemental Proposal as a matter of its own policy preferences, contrary to the Act. This EPA may not do. The remainder of the subsections have nothing to do with data or research. At any rate, EPA does not state specifically which of the subsections in 42 U.S.C. § 300j–1 it believes authorizes this proposed rule. Thus, the citation fails to provide sufficient notice for the public to comment on the proposed rule.

EPA also cites 42 U.S.C. § 300j–9(a)(1), but that says only that the “Administrator is authorized to prescribe such regulations as are necessary or appropriate to carry out his functions under this subchapter.” As explained above, that general grant of authority cannot support the rule, especially when the rule conflicts with the Act. The SDWA does not authorize the proposed rule.

Comment [198-2210]: Commenter (13549) writes that as a baseline, whether working on “significant regulatory actions,” ISI, or anything requiring the consideration of science, EPA must base its decisions on the best available science. Anything less is nonsensical, arbitrary, and in violation of the environmental laws EPA is charged with implementing. The SNPRM does not maintain this baseline, but instead provides for ways EPA would exclude and lessen consideration of the best available science. Therefore, the SNPRM, along with the proposed rule, must be withdrawn. See, *e.g.*, 42 U.S.C. § 300g-1(b)(1)(B)(ii), (3)(A) (SDWA provisions requiring regulation of contaminants based on best available science); 15 U.S.C. § 2625(h) (TSCA provision requiring the use of best available science); see also 83 Fed. Reg. at 18,769 (“The best available science must serve as the foundation of EPA’s regulatory actions.”).

1.3.4 Toxic Substances and Control Act (TSCA) (NPRM and SNPRM Comments)

Comment: Sections 1.3.4.1 and 1.3.4.2 of this Chapter present comments received on the NPRM (Section 1.3.4.1) and SNPRM (Section 1.3.4.2) related to the EPA’s legal authority for the rule under the TSCA. The EPA provides the following general response to these comments:

⁹⁰⁰ 42 U.S.C. §§ 300g-1(b)(1)(B)(ii)(II), 300g-1(b)(3)(A)(i) (emphasis added).

Response: EPA appreciates your comments. As discussed in the Section I.C of the final rule preamble and in this RTC document in Section 1.2, EPA has decided it is most appropriate to rely on its authority to promulgate housekeeping regulations, rather than any of the substantive environmental statutes cited in the 2018 proposal or the 2020 supplemental proposal as legal authority for the rule. EPA intends to promulgate future science transparency rules under its substantive environmental statutes. Additionally, the final rule states in § 30.3 that “[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”

1.3.4.1 TSCA (NPRM Comments)

Comment [37-33]: Commenter (0046) writes that while TSCA Section 26 is not identified in the proposal, it includes provisions that raise questions about EPA’s authority for and potential application of the proposal. Section 26(h), “Scientific Standards”, states that “to the extent that the Administrator makes a decision based on science, the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science.” EPA must consider each of these factors “as applicable.” The availability of sufficient underlying data to “validate” or “reproduce” study results is not among the relevant factors that EPA must consider.

Similarly, section 26(i) addresses WEIGHT OF SCIENTIFIC EVIDENCE directing that:—The Administrator shall make decisions under sections 4, 5, and 6 based on the weight of the scientific evidence.” This requires the Administrator to evaluate the totality of available scientific evidence and make a judgment about its “weight” – not excluding evidence based solely on the availability of data sufficient for its validation.

These subsections indicate, at a minimum, that this proposal to require that “dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation...[w]hen promulgating significant regulatory actions” may not be consistent with the scientific standards and methodology for decision-making Congress prescribed for such actions under TSCA Section 26.

Comment: [996-3804]: Commenter (1011) believes that the proposed rule would create unnecessary difficulties for EPA and its ability to comply with statutes that rely upon the assessment of the best scientific data currently available. This includes the LSCA, which updates the TSCA and requires the Administrator to use “scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science.” EPA should reconsider this proposed rule to ensure that any new guidelines comply with applicable laws and encourage the use of all relevant scientific information, even if the underlying data cannot be made public.

Comment [2322-2720]: Commenter (2337) notes that EPA’s core mission, reflected in numerous environmental statutes, is to protect public health and the environment.⁹⁰¹ These same statutes

⁹⁰¹ See, e.g., Clean Water Act § 102, 33 U.S.C. § 1252 (directing Administrator to develop comprehensive programs to protect surface and ground waters); Safe Drinking Water Act § 1412, 42 U.S.C. § 300g-1 (directing Administrator

require that EPA, in fulfilling this mission, support and rely on the best available science. While the specific terms of each statute vary, their direction is similar: EPA is charged with conducting and supporting research into the impacts of pollutants on human health and the environment⁹⁰², using available scientifically accepted data to determine when pollutants pose a danger to human health or the environment,⁹⁰³ and establishing standards with a sufficient margin of safety to protect public health.⁹⁰⁴ Indeed, this requirement that EPA use the latest or best available science is repeated in numerous environmental statutes. The TSCA directs the Administrator, when making decisions based on science, to act “in a manner consistent with the best available science” and consider a number of factors, including the reasonableness of the methods used to develop the information, the completeness of the data, the extent of uncertainty, and independent verification or peer review.⁹⁰⁵ Notably, public availability or independent verification are not disqualifying requirements.

Comment [2533-4926]: Commenter (2548) writes that they have spent the past eighteen years of their career as a faculty member at highly ranked research universities (The University of North Carolina at Chapel Hill and Duke University) and have devoted the majority of this time to studying the potential health effects of exposures in the natural and built environments. They have served as President of the largest professional organization of biostatisticians in North America, as Chair of the Biometrics Section of the American Statistical Association, and as a standing member of numerous review groups at the NIH. They are currently a member of the National Academies' Committee on Applied and Theoretical Statistics and have recently chaired selection committees for two of the top prizes in statistical science worldwide.

to develop national primary drinking water regulations to protect public health); Solid Waste Disposal Act § 1003, 42 U.S.C. § 6902 (purpose of act is to promote protection of public health and the environment by improving management of solid and hazardous wastes); Clean Air Act § 101(b), 42 U.S.C. § 7401(b) (purpose of act is to protect and improve air quality to promote public health and welfare); see also <https://www.epa.gov/aboutepa/our-mission-and-what-we-do> (“The mission of EPA is to protect human health and the environment”).

⁹⁰² See, e.g., Clean Air Act § 103, 42 U.S.C. § 7403 (Administrator is charged conducting and supporting investigations and research concerning air pollutants, long- and short-term health effects of air pollutants, and long- and short term causes, effects and trends of damage to ecosystems from air pollutants); Comprehensive Environmental Response, Compensation and Liability Act § 311, 42 U.S.C. § 9660 (Administrator and Secretary of Health and Human Services charged with supporting and conducting studies, including concerning risks to human health from hazardous substances).

⁹⁰³ See, e.g., Clean Water Act § 304(a)(1), 33 U.S.C. § 1314(a)(1) (directing Administrator to develop and periodically update criteria for water quality that accurately reflects “the latest scientific knowledge”); Clean Air Act § 107(a)(2), 42 U.S.C. § 7408(a)(2) (in issuing and updating air quality criteria, Administrator is required to reflect “the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare ...”) (emphasis added); Safe Drinking Water Act § 1412 (b)(3)(A), 42 U.S.C. § 300g-1(b)(3)(A) (in establish maximum contaminant level goals and national drinking water standards, Administrator is required to use “best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and ... data collected by accepted methods or best available methods ...”); Toxic Substances Control Act, 15 U.S.C. § 2625(h), (i) (for decisions based on science, requiring EPA to operate in a manner consistent with the best available science and make decisions based on the weight of the scientific evidence).

⁹⁰⁴ See, e.g., Clean Air Act § 109, 42 U.S.C. § 7409 (directing Administrator to adopt and every five years thereafter to review, national primary air quality standards adequate to protect public health, with an adequate margin of safety); Safe Drinking Water Act § 1412 (b)(4)(A), 42 U.S.C. § 300g-1(b)(4)(A) (directing Administrator to set maximum contaminant level goals for drinking water “at the level at which no known or anticipated adverse effects on the health of persons occur and which allows an adequate margin of safety”).

⁹⁰⁵ 15 U.S.C. § 2625(h).

Their major concern regarding the proposed rule is that it violates the reformed TSCA, and indeed more importantly the best principles of science, in eliminating from consideration a class of studies that offer both large-scale population coverage and careful exposure assessment. These studies often provide our best information regarding potential health effects of environmental contaminants. In environmental health research, many research questions (*e.g.*, health effects of smoking, exposure to high levels of other air pollutants) cannot be evaluated in randomized controlled trials of humans for ethical reasons. In such cases, large observational cohort studies typically provide the best "real world" data on associations between environmental contaminant levels and health outcomes like heart attack, stroke, asthma, and premature death.

Comment [2772-2263]: Commenter (2787) writes that the proposed rule is inconsistent with EPA's statutory obligations to ground its actions on scientific evidence. The TSCA and the SDWA require that EPA use the "best available science."

Comment [2887-4671]: Commenter (2902) writes that many questions remain as to whether the proposed rule violates existing laws, such as the TSCA. The rule, as written, appears poorly designed and without the mission of the EPA in mind.

Comment [4582-4139]: Commenter (4593) writes that if EPA had adopted this data transparency limitation in past risk assessments, EPA would not have been able to take many of its historic actions to protect children, families, and the environment such as reducing or eliminating the exposure of children to lead in paint, gasoline and drinking water and promulgating protective air quality standards for PM and other air pollutants.

The proposed policy would affect assessments that will soon be carried out under TSCA Section 6. TSCA gives EPA the authority to regulate the manufacture, processing, distribution in commerce, use and disposal of chemicals. The problem formulation documents which set forth EPA's approach for assessing the first 10 chemicals under the amended TSCA are open for public comment now. How these chemicals are assessed will be the model for future assessments. The proposed policy would in fact make it impossible for EPA to consider the full array of well conducted and peer reviewed scientific studies of the health and environmental effects of pollution. It would bias the body of information in favor of industry supplied studies since they would have the means to provide the underlying data. Assessment of all relevant scientific information is essential in making sound judgments about protecting public health and the environment and is a legal requirement in all major environmental legislation.

TSCA also contains provisions to require chemical manufacturers to test the chemicals that they manufacture or process. To require industry to test chemicals under Section 4, EPA must make a set of legal findings.

It is the data inadequacy finding that we are interested in today for it is the nexus between TSCA and the proposed transparency policy. To make this finding, EPA conducts a thorough literature search and usually issues a rule to require studies that have not been published be submitted to the Agency. The bulk of the information considered, however, is typically studies published in peer-reviewed scientific journals. Despite being accepted by the scientific community, these studies do not meet the proposed transparency requirements of the proposed rule, since it

requires that all raw underlying data and the models used to analyze data supporting the study are available for public review. Thus, if the transparency rule were in effect, EPA would have to judge studies from peer reviewed journals as inadequate. Ignoring this large category of information would cost industry hundreds of millions of dollars to repeat perfectly good, scientifically acceptable studies, which the public would ultimately pay for through higher prices. And it would significantly delay or, in some cases, preclude assessment and regulation of risks to human health and the environment.

Comment [4827-2074]: Commenter (4838) writes that the proposed rule violates several environmental statutes because it hinders EPA's ability to rely on best available science, or the most up-to-date information, as they require. The CAA, CWA, SDWA, TSCA, and EPCRA all require certain decisions or regulatory criteria be based on the most up-to-date science.⁹⁰⁶ These criteria are described as "best available science," "latest scientific knowledge," and "best available public health information."⁹⁰⁷ The proposed rule would illegally limit EPA's ability to rely on best available science in violation of these statutes.

Comment [4837-3059]: Commenter (4848) notes that administrative procedure requires that EPA consider data submitted by the public in evaluating regulations.⁹⁰⁸ Scientific studies submitted have always been of uneven quality.⁹⁰⁹ EPA has processes in place (including use of a scientific advisory board, testimony and written and oral public notice and comment) using both internal and external peer review to evaluate data. Depending on context, some studies are given greater weight than others. Some studies are disregarded entirely.

⁹⁰⁶ See Toxic Substances Control Act, 15 U.S.C. § 2625(h), (k) (2018); Clean Water Act, 33 U.S.C. § 1314(a)(1) (2018); Clean Air Act, 42 U.S.C. § 7408(a)(2) (2018); Emergency Planning and Community Right-to-Know Act, 42 U.S.C. § 11023(d)(2) (2018).

⁹⁰⁷ Toxic Substances Control Act, 15 U.S.C. § 2625(h), (k) (requiring that the Administrator, in decisions based on science, "use scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed in a manner consistent with the best available science" (emphasis added)); Clean Water Act, 33 U.S.C. § 1314(a)(1) (requiring that criteria for water quality "accurately reflect[] the latest scientific knowledge" (emphasis added)); Clean Air Act, 42 U.S.C. § 7408(a)(2) (requiring air quality criteria "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare" (emphasis added)); Emergency Planning and Community Right-to-Know Act, 42 U.S.C. § 11023(d)(2) (requiring that a determination to add a chemical to the Toxics Release Inventory "be based on generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies, available to the Administrator" (emphasis added)).

See also Wendy E., Wagner, Administrative law, filter failure, and information capture, 59 Duke L.J. 1321 (2010). Compare Wendy E., Wagner, Barnes, and Lisa Peters, Rulemaking in the Shade: An Empirical Study of EPA's Air Toxic Emission Standards, 63 Admin. L.J. 99 (2011).

⁹⁰⁹ Thomas O. McGarity, Daubert and the Proper Role for the Courts in Health, Safety, and Environmental Regulation, 95 Am. J. Public Health S92 (2005).

It is inappropriate, and likely unlawful under the APA⁹¹⁰ and the express language of numerous environmental statutes including the SDWA⁹¹¹ and the TSCA,⁹¹² for EPA to categorically eliminate certain types of studies, and hence certain types of data, without considering context.⁹¹³

Comment [4867-2026]: Commenter (4878) notes that the TSCA is EPA's primary authority for regulating non-pesticide chemicals. Under TSCA, EPA can secure information on new and existing chemicals and regulate chemicals it determines pose an unreasonable risk to public health or the environment.⁹¹⁴ All studies used would be subject to the proposed rule.

In late 2016, the EPA moved to ban toxic chemical trichloroethylene (TCE) due to health risks, including a risk of Parkinson's disease,⁹¹⁵ though this action is still pending.⁹¹⁶ The original recommendation was based on hundreds of studies, many of which would not be considered under the proposed rule.

For example, one study sent questionnaires to 134 people who had formerly worked on a site with heavy and long-term exposure to TCE. Fourteen had signs of Parkinson's disease, and an additional thirteen showed mild features of the condition, far more than expected given the population.⁹¹⁷ Another asked twin pairs about exposure to solvents including TCE and showed a significant association between TCE exposure and Parkinson's disease risk.⁹¹⁸

In these relatively small studies, a distinctive characteristic — people who all worked together, and twins — respectively, combined with the most basic additional medical information could render the participants identifiable. Both of the TCE studies are highly cited and the findings

⁹¹⁸ Samuel M. Goldman, et al., Solvent Exposures and Parkinson's Disease Risk in Twins, *Annals of Neurology*, June 2012, at 776-784.

have been replicated. To exclude this evidence that TCE exposure is a risk factor for Parkinson's disease is illogical and does not serve the best health interests of the American public.

Furthermore, the proposed rule does not comply with the letter of TSCA. TSCA and other statutes administered by EPA requires the agency use the "best available science"⁹¹⁹ and none require the agency to access to raw data. TSCA additionally requires that EPA consider all information that is reasonably available to the administrator.⁹²⁰ As drafted, the proposed rule violates these statutes because it would force the agency to ignore some of the best information available.

Comment [5865-330]: Commenter (6111) writes that EPA's historic position is consistent with the Statutes. The TSCA requires that regulation of chemical substances be "consistent with the best available science" and that EPA make decisions "based on the weight of the scientific evidence."⁹²¹

Furthermore, because EPA is required under the Statutes to assess the public health benefits of its regulations, it must take into account all relevant science and cannot arbitrarily exclude certain studies demonstrating those benefits.

Many of the fundamental public health studies on which EPA has based key rules and standards under the Statutes are studies for which the raw data were not or could not have been released. Attachment 1 to this letter contains a partial list of studies [note: included under a separate excerpt] that likely contain confidential data; these are all studies on which EPA has relied and cited as the basis for its actions under some of the Statutes. Until now, release of the underlying raw data was not an EPA criterion for determining the "best available" reports, studies, analyses, or models. Indeed, none of the Statutes invoked by EPA as support for the proposed rule limits EPA in this fashion; none of the Statutes requires EPA to make raw data publicly available.⁹²²

⁹¹⁹ Frank R. Lautenberg Chemical Safety for the 21st Century Act Pub. L. No 114-182 (codified as amended at 15 USC §2625 (h)) available at: <http://uscode.house.gov/view.xhtml?path=/prelim@title15/chapter53&edition=prelim>

⁹²⁰ Id. at §2625 (k).

⁹²¹ 15 U.S.C. § 2625(h), (i).

⁹²² When litigants in the past argued that EPA could not rely on studies for which the raw data had not been publicly available, the D.C. Circuit soundly rejected their argument. As the court explained in one case: Claiming neither that they were unable to obtain the studies, nor that the studies were improperly published or peer reviewed, Petitioners instead urge us to impose a general requirement that EPA obtain and publicize the data underlying published studies on which the Agency relies. The Clean Air Act imposes no such obligation. . . More generally, we agree with EPA that requiring agencies to obtain and publicize the data underlying all studies on which they rely "would be impractical and unnecessary." [...] As EPA persuasively stated in denying Petitioners' original request for information: If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. . . . Such data are often the property of scientific investigators and are often not readily available because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants]. *Am. Trucking Associations, Inc. v. E.P.A.*, 283 F.3d 355, 372 (D.C. Cir. 2002) (quoting Particulate Matter NAAQS, 62 Fed. Reg. 38,652, 38,689 (July 18, 1997)). The court reiterated this holding six years later in a challenge to the 2008 lead NAAQS. *Coal. of Battery Recyclers Ass'n v. E.P.A.*, 604 F.3d 613, 622 (D.C. Cir. 2010). In that case, the litigants had sought access to the raw data underlying Bruce P. Lanphear, et al., Low-Level Environmental Lead

EPA's proposed new approach, which conflicts with the agency's obligations and curtails its authority, is irrational at best and detrimental to public health and safety at worst.

Comment [6093-532]: Commenter (6103) writes that the rule is counter to mandates in the reformed TSCA and other authorizing laws to use the best available science. Many of the statutes implemented by the EPA require the use of "best available science." This rule would actually undermine the use of best available science as called for in the statutes. As a result, the policy as drafted would be in violation of laws like the TSCA and the SDWA because the proposal would allow for the agency to ignore some of the best information that could help implement these laws.

Comment [6112-1557]: Commenter (6137) writes that EPA's reliance on the TSCA, 15 U.S.C. § 2609, as authority for the Proposed Rule, fares no better. Indeed, much like many of the other statutory provisions upon which EPA relies, this provision governs EPA's authority to conduct and support research and does not address EPA's authority to use scientific data or research in support of regulatory decisions.

Specifically, section 2609 grants EPA authority to "conduct such research, development, and monitoring as is necessary to carry out the purposes of this chapter. [EPA] may enter into contracts and may make grants for research, development, and monitoring under this subsection." 15 U.S.C. § 2609(a). Section 2609 grants EPA additional related authorities, including authority to:

- Create and operate information systems to store data relevant to chemical substances, id. § 2609(b);
- Develop "screening techniques for carcinogenic, mutagenic, teratogenic, and ecological effects of chemical[s]," id. § 2609(c);
- Establish a research program to develop chemical "monitoring techniques and instruments," id. § 2609(d);
- Conduct "basic research" on chemical screening and monitoring, id. § 2609(e), and train federal scientists on chemical screening and monitoring, id. § 2609(f); and
- Develop systems for information sharing among "Federal, state, and local authorities," id. § 2609(g).

Notably absent from the list of authorities under section 2609 is EPA's authority to determine what science it can consider when making regulatory decisions. Instead, the provision solely focuses on EPA's ability to conduct research or to fund research, independent of whether that research will or may be used by EPA to make regulatory decisions. Thus, section 2609 does not provide any basis for the authority claimed in the Proposed Rule.

Moreover, § 2625 of TSCA governs how EPA uses science when exercising its main regulatory powers under the statute and establishes detailed criteria that EPA must use when "the Administrator makes a decision based on science" when carrying out its regulatory powers. 15

Exposure and Children's Intellectual Function: An International Pooled Analysis, 113 ENVTL. HEALTH PERSP. 894 (2005).

U.S.C. § 2625(h). Thus, this provision, and not those cited by EPA, would theoretically govern a rule related to the use of science. See *Bennett v. Islamic Republic of Iran*, 618 F.3d 19, 25 (D.C. Cir. 2010) (“where Congress includes particular language in one section of a statute but omits it in another section of the same Act, it is generally presumed that Congress acts intentionally and purposefully in the disparate inclusion or exclusion.”) (quoting *Russello v. United States*, 464 U.S. 16, 23 (1983)). However, and as discussed more fully infra, Section IV.A, the Proposed Rule contravenes the requirements of § 2625 that EPA consider all “reasonably available information” when making regulatory decisions, and thus is not authorized by this provision either.

Comment [6112-1600]: Commenter (6137) writes that EPA’s proposed refusal to consider or use science relevant to decisions that will affect public health directly contravenes the newly enacted revisions to TSCA. Numerous provisions of TSCA make clear that EPA may not prohibit the consideration of non-public data in regulatory decision-making under TSCA. Indeed, when viewed as a whole, TSCA establishes a comprehensive scheme for how EPA is to evaluate and use science in making regulatory decisions that forecloses the Proposed Rule.

First, TSCA requires EPA to consider all “reasonably available information” when making any regulatory decisions under sections 2603, 2604, and 2605. 15 U.S.C. § 2625(k) (emphasis added) (EPA “shall take into consideration information relating to a chemical . . . that is reasonably available to [the Agency]”); also, id. § 2605(c)(2)(A).⁹²³ Thus, the statute mandates that if a study is reasonably available to EPA, EPA must consider it when making a significant regulatory decision under these provisions of the statute. Whether the data underlying a scientific study is publicly available has no bearing on whether the study itself is reasonably available to EPA. Because the Proposed Rule purports to apply to all significant regulatory decisions made by EPA under TSCA – including those made under these provisions – it is unlawful.

Second, when making any regulatory decision under sections 2603, 2604, and 2605, TSCA requires EPA to make an individualized evaluation of any information reasonably available to the Agency, and thus, prohibits the blanket ban erected in the Proposed Rule. Section 2625(h) establishes five statutory factors that EPA must consider when “mak[ing] a decision based on science.” 15 U.S.C. § 2625(h)(1)-(5). One of these statutory factors expressly addresses situations in which non-public scientific data is before the Agency and requires the Agency to “consider . . . the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models.” Id. § 2625(h)(5). In addition, EPA must consider whether the methodologies used to collect the data are “reasonable,” id. § 2625(h)(1), and the “degree of clarity and completeness” with which the methods used were documented, id. § 2625(h)(3). In sum, Section 2625(h) requires EPA to review each scientific study on a case-by-case basis to determine whether and how to use it. This case-by-case evaluation requires EPA to consider the public or non-public nature of the

⁹²³ “In proposing and promulgating a rule under subsection (a) with respect to a chemical substance or mixture, the Administrator shall consider and publish a statement based on reasonably available information with respect to—(i) the effects of the chemical substance or mixture on health and the magnitude of the exposure of human beings to the chemical substance or mixture; (ii) the effects of the chemical substance or mixture on the environment and the magnitude of the exposure of the environment to such substance or mixture; (iii) the benefits of the chemical substance or mixture for various uses; and (iv) the reasonably ascertainable economic consequences of the rule . . .” 15 U.S.C. § 2605(c)(2)(A) (emphasis added).

underlying data as one of many factors and prohibits EPA from implementing a blanket ban on the use of non-public data in significant regulatory decisions under TSCA.

Third, the Proposed Rule is at odds with the requirement that EPA act “consistent with the best available science.” Id. § 2625(h) (emphasis added). Although Congress did not define the term in TSCA, it is clear from other statutes that an agency cannot lawfully act consistent with the best available science when it categorically bars consideration of any science based on non-public data. For example, the ESA requires federal agencies to consider the “best scientific and commercial data available,” see 16 U.S.C. § 1536(a)(2), and courts have held that this provision requires an agency to consider “all relevant data . . . even when it is imperfect, weak, and not necessarily dispositive.” *League of Wilderness Defenders/Blue Mountains Biodiversity Project v. Connaughton*, 752 F.3d 755, 763-64 (9th Cir. 2014) (emphasis added); see also *Bldg. Indus. Ass'n of Superior Cal. v. Norton*, 247 F.3d 1241, 1246 (D.C. Cir. 2001) (an agency “must utilize the ‘best scientific . . . data available,’ not the best scientific data possible”) (emphasis in original). EPA itself acknowledged that this sort of restriction on science is contrary to the requirements of TSCA; when analyzing the same restrictions proposed in the HONEST Act, EPA recognized:

Provisions under the newly amended TSCA . . . would be significantly impacted by the HONEST Act. First, a number of provisions in section 26 could not be upheld under the HONEST Act. Section 26(h) requires the Agency to “use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with best available science.” . . . [T]he HONEST Act would not allow EPA to use the best available science. Section 26(i) requires the Agency to use the “weight of scientific evidence” in making decisions under TSCA, and EPA believes this would not be possible given that the provisions of the HONEST Act would prohibit the use of some data. Finally, section 26(k) requires the Agency to “take into consideration information relating to a chemical substance or mixture, including hazard and exposure information, under the conditions of use, that is reasonable available.” EPA would be in violation of the HONEST Act when upholding these provisions under TSCA, namely instead of using the best available science and all reasonable available data for chemical regulations, EPA would be restricted to selecting information based on availability. This approach would introduce research bias that would compromise the quality of the Agency’s work.

EPA, EPA Analysis of HONEST Act to CBO at 3-4 (2016), <https://www.scribd.com/document/344731162/EPA-analysis-of-Honest-Act-to-CBO> (emphasis added).

Indeed, where Congress has sought to qualify a best available science requirement by implementing a total bar on particular types of science, it has done so expressly. For example, in the Consumer Productive Safety Improvement Act of 2008, Congress directed a panel studying phthalates to use “the most recent, best-available, peer-reviewed, scientific studies.” 15 U.S.C. § 2057c(b)(2)(B) (emphasis added). The absence of any such prohibition in TSCA is further proof that the Proposed Rule is prohibited by the statute’s best-available-science requirement.

Fourth, the Proposed Rule is inconsistent with the TSCA requirement that EPA make regulatory decisions using a “weight of the scientific evidence” approach. Id. § 2625(i). As EPA has itself recognized, this approach requires the Agency to individually evaluate the strengths and weakness of any study reasonably available to the Agency. 40 C.F.R. § 702.33 (defining “weight of scientific evidence” as “comprehensively, objectively, transparently, and consistently, identify[ing] and evaluat[ing] each stream of evidence, including strengths, limitations, and relevance of each study and “integrat[ing] evidence as necessary and appropriate based upon strengths, limitations, and relevance” for purposes of risk evaluations under 15 U.S.C. § 2605 (emphasis added)). Thus, the Proposed Rule’s outright ban on consideration of scientific studies that rely on non-public data is prohibited by the weight of the scientific evidence approach required under TSCA.

In sum, these provisions – considered together and in light of other provisions of the statute – establish a comprehensive scheme for how EPA is to consider scientific data, and this scheme prohibits the Proposed Rule’s ban on the consideration of non-public data. Together, they require EPA to consider all reasonably available scientific information; evaluate each piece of information, including the methods by which it was acquired and analyzed; use each piece of information in a manner consistent with the best available science; and give each piece of information its due weight.

In addition, in deciding whether or not “there may be a reasonable basis to conclude that a chemical substance or mixture presents a significant risk of serious or widespread harm to human beings,” EPA must consider “any . . . information available to the Administrator.” 15 U.S.C. § 2603(f). And other provisions of TSCA expressly address certain types of non-public data and authorize EPA to consider it in making regulatory decisions. See 15 U.S.C. §§ 2604(b), 2613.

In light of the numerous provisions of TSCA addressing the consideration of scientific data, it is evident that if Congress had intended to allow EPA to bar the consideration of nonpublic data, it surely would have said so expressly. Given the comprehensiveness of these provisions providing otherwise, there is simply no room for a blanket ban on science that relies on non-public data. The Proposed Rule is therefore unlawful.

Comment [6112-1625]: Commenter (6137) writes that EPA failed to follow the procedural requirements under TSCA.

Pursuant to section 2609 of TSCA, prior to promulgating any rules, EPA must “consult[] and cooperate[] with the Secretary of Health and Human Services and with other heads of appropriate departments and agencies.” 15 U.S.C. § 2609(a); see also id. § 2609(b)(2)(A), (c), (d), (e), (g). Therefore, to the extent EPA relies on TSCA as authority for the Proposed Rule, it must consult and cooperate with the Secretary of HHS. Yet nowhere in the Proposed Rule does EPA indicate that it has done so. Failure to comply with this requirement would render any final rule unlawful. See 5 U.S.C. § 706(2)(D) (a reviewing court “shall . . . hold unlawful and set aside agency action . . . found to be . . . without observance of procedure required by law”).

Comment [6118-1732]: Commenter (6143) notes that EPA has issued its proposed rule on Strengthening Transparency in Regulatory Science pursuant to its authority under several

environmental statutes that that it implements, including the CAA; CWA; SDWA; RCRA; CERCLA; EPCRA; FIFRA; and TSCA.⁹²⁴ This proposed action is fully consistent with the authorities and objectives laid out in those statutes. EPA must ensure that any final action it takes on this proposal continues to respect the balance reflected in those statutes between sound, transparent science, and legitimate privacy interests.

Comment [6118-1733]: Commenter (6143) notes that in its proposal, the Agency recognizes that “[t]he best available science must serve as the foundation of EPA’s regulatory actions.”⁹²⁵ This is true not only as a matter of good governance, but as a statutory requirement. In particular, TSCA requires EPA to “use scientific information, technical procedures, measures, methods, protocols, methodologies, or models . . . in a manner consistent with the best available science” when making regulatory decisions that are based on science.⁹²⁶ Further, Congress directed EPA to consider the following five specific factors in doing so:

1. the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information;
2. the extent to which the information is relevant for the Administrator's use in making a decision about a chemical substance or mixture;
3. the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented;
4. the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and
5. the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models.⁹²⁷

Comment [6118-1734]: Commenter (6143) writes that EPA’s proposed action will help the Agency to carry out TSCA’s requirements regarding the use of the “best available science.” By ensuring greater transparency into the data, assumptions, and methodologies used in the studies on which EPA relies, this proposed rule will facilitate EPA’s analysis of the factors specified in TSCA §26(h)—particularly with respect to suitability, documentation, and consideration of uncertainty and variability.

The concern that some opponents of this proposed action have expressed—that it will inhibit or preclude use of certain studies that they believe to be relevant and useful, but for which data sufficient to permit independent verification are not publicly available—should be offset by recognizing that it is an explicit intent of the Agency to rely on the best available science. Science, studies, and conclusions from data that are not available for independent verification do not meet this requirement. They are not suitable for use as a basis for rulemaking insofar as they cannot be independently inspected and verified.

⁹²⁴ 83 Fed. Reg. at 18,769

⁹²⁵ Id.

⁹²⁶ TSCA §26(h).

⁹²⁷ Id.

As the Agency recognizes in its proposal, this greater transparency serves a dual function in EPA's efforts to implement its statutory duties. Greater transparency can help to "[strengthen] the integrity of EPA's regulatory actions and its obligation to ensure the Agency is not arbitrary in its conclusions."⁹²⁸ By supporting application of the "best available science" analysis, the proposed rule will help EPA reach regulatory decisions grounded in sound, quality science that will withstand judicial review—which, in the TSCA context, means decisions that are supported by "substantial evidence."⁹²⁹ At the same time, greater transparency will "enhanc[e] the public's ability to understand and meaningfully participate in the regulatory process."⁹³⁰ Public input is a fundamental part of the administrative process, and TSCA provides for public comment at multiple steps of the decision-making process under several of its provisions.⁹³¹ The proposed rule will improve the public's access to data necessary to make informed comments on the science underpinning EPA's actions.

Comment [6119-1358]: Commenter (6144) writes that the policy, as drafted, is in apparent violation of laws like the TSCA and the SDWA because of the statutory requirement to use the "best available science" and allow the agency to effectively ignore certain information regardless of the quality of that work, that would help implement these science-based laws. According to judicial precedent, "best available science" is defined as "all existing scientific evidence relevant to the decision" and a body of evidence that "cannot ignore existing data."⁹³² In addition to the "best available science" requirements, TSCA also requires EPA to take into consideration information "that is reasonably available to the Administrator."⁹³³ EPA's own regulations define that term as "information that EPA possesses or can reasonably generate, obtain, and synthesize . . . , whether or not that information is confidential business information, [sic] that is protected from public disclosure...."⁹³⁴ Not only would this proposed rule conflict with TSCA's mandate to consider the best available science, it would challenge the method by which EPA can review the weight of the scientific evidence which in rulemaking for TSCA is defined by a systematic review method.⁹³⁵ These reviews consider the entire body of scientific evidence, so the exclusion of certain studies based on whether the raw data and models are publicly available would render these reviews, as mandated, impossible.

Comment [6127-2244]: Commenter (6152) writes that the focus on reproducibility and limiting studies that contain personal health data would undermine worker health studies. Under the 2014 updates to the TSCA, EPA is required to assess worker exposures when the agency is evaluating the safety of chemicals. However, this proposal would essentially prohibit the use of epidemiology studies in that process because they are not considered reproducible in the same way as animal or toxicological tests.

⁹²⁸ 83 Fed. Reg. at 18,769.

⁹²⁹ TSCA §19(c).

⁹³⁰ 83 Fed. Reg. at 18,769.

⁹³² *Ecology Ctr., Inc. v. U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006)

⁹³³ 15 USC 2625(k)

⁹³⁴ 40 CFR 702.33

⁹³⁵ *Federal Register*. 2017. Procedures for Chemical Risk Evaluation Under the Amended Toxic Substances Control Act, Final Rule. National Archives and Records Administration. Vol. 82, No. 138. July 20. Online at <https://www.gpo.gov/fdsys/pkg/FR-2017-07-20/pdf/2017-14337.pdf>, accessed June 24, 2018.

Historically, epidemiology studies have been vital to identifying and protecting against harmful workplace exposures. An example from our union's history is the body of epidemiology research initiated through a labor and management partnership that identified the high incidence of bladder cancer among workers in the rubber industry. Subsequently those workers and employers worked together to reduce and eliminate the harmful chemical exposures causing occupational cancer.

Comment [6133-2162]: Commenter (6158) writes that the proposed rule likely violates federal laws that require the EPA to use the best scientific information available to it. EPA has a duty to use the best scientific information available under several laws. For example, the TSCA requires EPA to operate "in a manner consistent with the best available science" and make regulatory decisions based on the weight of the scientific evidence.⁹³⁶

Comment [6143-2594]: Commenter (6168) writes that EPA's focus on transparency in dose-response science is inconsistent with its recent turn to secrecy.

Some brief examples include:

- As Environmental Data and Governance Initiative (EDGI) has documented, EPA has made less accessible or removed extensive information about climate change that had been available on EPA's website.⁹³⁷
- EPA has failed to provide the information necessary for independent evaluation of its decisions under TSCA, *e.g.* EPA's recent decision to green light a new fragrance chemical despite a range of health concerns.⁹³⁸
- EPA has pushed to delay releasing reports documenting harms of chemicals, *e.g.* formaldehyde⁹³⁹ and Per- and Polyfluoroalkyl Substances (PFAS).⁹⁴⁰
- EPA has reduced opportunities for public participation by creating short comment periods and trying to circumvent public comment entirely.⁹⁴¹
- EPA's procedure for implementing TSCA is designed to limit the range of information included in regulatory decisions by limiting the sorts of uses/exposures that will be analyzed.⁹⁴²

⁹³⁶ 15 U.S.C. § 2625(h) and (i).

⁹³⁷ See for example the following reports produced by EDGI: Missing Environmental Protection Agency Endangerment Finding Web Resources (July 2017); Assessment of Removals and Changes in Access to Resources on the EPA's "Climate and Energy Resources for State, Local, and Tribal Government" Website (October 2017); Change in Access to the EPA's "A Student's Guide to Global Climate Change" Website (May 2017); Removal from the Greening EPA Website of a Climate Change Adaptation Web Resource, Links to Resources, and Mentions of EPA's Own Greening Performance Goals (Dec 2017)

⁹³⁸ The lack of transparency on this decisions is laid out in detail in EDF's three-part analysis: "EPA rams through its reckless review scheme for new chemicals under TSCA, your health be damned" (EDF, August 2018): Part 1, Part 2, Part 3

⁹³⁹ Sources: EPA blocks warnings on cancer-causing chemical (Politico, July 2018)

⁹⁴⁰ Suppressed Study: The EPA Underestimated Dangers of Widespread Chemicals (ProPublica, June 2018)

⁹⁴¹ Heinzerling, Lisa, The Legal Problems (So Far) of Trump's Deregulatory Binge (October 6, 2017). Harvard Law & Policy Review, Forthcoming.

⁹⁴² The Chemical Industry Scores a Big Win at the E.P.A. (New York Times, June 2018)

- EPA has drastically shifted influence away from the broader public and toward business interests, for example in private meetings and in appointments to SABs.

Especially under Scott Pruitt -- who was Administrator when this proposed rule was written and published -- EPA has been secretive, for example denying FOIA until required to release documents by courts. Pruitt's secrecy was famous: not telling reporters where he was speaking, not letting the press into events, hiding, and even changing his calendars, etc.⁹⁴³

The litany of ways the EPA under the current administration has been secretive and has sought to limit information and evidence of chemical harms suggests that the idea of "transparency" grows not out of commitment to openness and public participation. Rather, it is being used here strategically, in bad faith, to limit the evidence used in regulatory decision-making and to undermine moves toward protective regulations.

Comment [6152-652]: Commenter (6122) writes that the proposed rule is not based on any valid statutory authority and is arbitrary and capricious.

EPA cites multiple statutory provisions in an attempt to support the proposed rule that it believes authorize this type of rulemaking, "including provisions providing general authority to promulgate regulations necessary to carry out the Agency's functions under these statutes and provisions specifically addressing the Agency's conducting of and reliance on scientific activity to inform those functions . . ."⁹⁴⁴ None of the specific statutory provisions provided by EPA provide specific authority for EPA to fundamentally rework the foundational processes it uses to assess and include/reject science. Indeed, if such authority existed, one would have expected EPA to have discovered this authority many decades earlier. Instead, EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, "Congress...does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes."⁹⁴⁵ And if this is true, neither can the EPA alter the fundamental details of all of its regulatory schemes based on such vague provisions of law. We review each of the provisions listed by EPA, none of which discuss transparency, dose response, pivotal regulatory science, benefit-cost calculation, or changing "agency culture," the stated goals of this rulemaking.

Section 10 of the TSCA grants the Administrator authority on research, development, collection, dissemination, and utilization of data.⁹⁴⁶ There is no mention of any type of research or data that should be excluded in order to carry out the purposes of the statute.

⁹⁴³ For example, Anti-secrecy lawsuits soaring against Pruitt's EPA (Politico, February 2018); Pruitt rules EPA under a cloak of secrecy (EDF, September 2017)

⁹⁴⁴ Proposed rule at 18769.

⁹⁴⁵ *Whitman v. American Trucking Assns., Inc.*, 531 US 457 (2001).

⁹⁴⁶ "Toxic Substances Control Act," 15 U.S.C. 2609.

In short, none of the statutory provisions cited by EPA provide authority for the proposed rule. The proposal fails at step one under *Chevron v. Natural Resources Defense Council* and should be withdrawn as beyond the authority of the EPA.

Comment [6155-638]: Commenter (6125) notes that TSCA, in section 26(h), provides that in regulating “[t]he Administrator shall make decisions...based on the weight of the scientific evidence” and shall “take into consideration information...that is reasonably available to the Administrator.” *id* at (j). The law grants EPA broad authority to act against any “unreasonable risk of injury to health or the environment” created by the use of a chemical substance or mixture. Congress directed EPA to make this unreasonable risk determination without considering costs, though costs become relevant later at the stage of regulation. This directive to consider health impacts alone makes science of even more relevance to an unreasonable risk determination than it might be under a different statutory approach, such as cost benefit balancing.

Congress addressed in detail the types of science that EPA should use. Specifically, Congress directed that to the extent the Administrator based a regulatory decision on science, the agency use information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science, and [to] consider as applicable—

- (1) the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information;
- (2) the extent to which the information is relevant for the Administrator's use in making a decision about a chemical substance or mixture;
- (3) the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented;
- (4) the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and
- (5) the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models. 15 U.S.C. §2025 (h)

As noted above, Congress added that “[t]he Administrator shall make [regulatory] decisions...based on the weight of the scientific evidence,” *id* at (i), and shall “take into consideration information...that is reasonably available to the Administrator.” *id* at (j). Nowhere is the Administrator barred from considering studies for which underlying data may be unavailable. Quite the contrary. The Administrator is to evaluate studies based on a range of factors — including peer review, internal consistency of study methodology and how well uncertainties are characterized.

The proposed rule is inconsistent with and would lead to decisions that violate these provisions, since it substitutes an a priori requirement of data availability to the public in place of the statutory factors. The availability of sufficient underlying data for the public to ‘validate’ or

‘reproduce’ study results is not even among the factors the agency is to consider, much less a determinative factor nullifying all those enumerated. The proposal is likewise at odds with the requirement that decisions be based on the “weight of the scientific evidence” since it bars evidence from the weighting process. In sum, EPA has not identified a lawful basis for applying this rule to regulatory decisions under TSCA. The general regulatory and research authorities cited in the proposal do not provide such a basis.

Small wonder, then, that the proposal, having failed to identify any substantial legal basis for limiting science under the various affected programs “solicits public comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation.” 83 FR at 18771. But it is not the job of commenters to identify the legal sources of authority for the proposal, and the proposal fails to do so. That failure alone precludes adopting a final rule based on the proposal.

Comment [6155-2634]: Commenter (6125) writes that it is clear from even a brief look that these provisions require EPA to consider all the best available science, without authorizing, or even mentioning any of the per se restrictions based on “transparency” that EPA has proposed to use as a universal overriding rule. For these reasons, EPA must justify its proposal as a proper exercise of its authority under each of the statutory provisions whose operation it would affect - provisions that the agency does not even cite. It is the job of the proposer, not the commenters, to survey these provisions and provide the needed justification.

In several of the listed statutes Congress has explicitly told EPA how to use science in decision-making.

- TSCA 15 USC Section 2605 (h) provides that “the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science.”

These provisions all use mandatory language directing EPA to use reliable and relevant scientific information -- and further specify how to do so. They all direct that decisions regarding protection of public health be based on the full range of relevant scientific information, in some cases specifying how to identify what information to use. None of them give EPA discretion to ignore such information for any of the reasons set forth in the proposal.

Comment [6163-1112]: Commenter (6133) notes that EPA cites 15 U.S.C. § 2609 under the TSCA as support for this rule. But that section states only that the “Administrator shall, in consultation and cooperation with the Secretary of Health and Human Services and with other heads of appropriate departments and agencies, conduct such research, development, and monitoring as is necessary to carry out the purposes of this chapter.” It does not allow EPA to limit the type of data considered in regulatory decisions, nor does it draw a distinction between dose-response data and other types of data. TSCA does not support the proposed rule. The absence of any such congressional distinction or restriction makes it all the more obvious that EPA invented and added the distinction and restrictions in the Proposal as a matter of its own policy preferences, contrary to the Act. This EPA may not do.

Comment [6163-1142]: Commenter (6133) writes that under TSCA, EPA has broad authority to protect the public from harm from chemical substances and mixtures. TSCA authorizes EPA to issue regulations designed to gather information on, require testing of, and control exposure to chemical substances and mixtures. EPA must restrict or ban any chemical substance that presents an unreasonable risk of injury to human health or the environment. See, *e.g.*, 15 U.S.C. §§ 2603, 2604, 2605.

TSCA contains specific provisions regarding EPA's use and consideration of science in rulemakings. "In carrying out sections 2603, 2604, and 2605," EPA must "use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science." *Id.* § 2625(h). EPA must further consider the following:

- (1) the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information;
- (2) the extent to which the information is relevant for the Administrator's use in making a decision about a chemical substance or mixture;
- (3) the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented;
- (4) the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and
- (5) the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models.

Id. After consideration of these matters, EPA must make decisions "based on the weight of the scientific evidence." *Id.*

In short, EPA must examine the reliability of a study on a case-by-case basis by weighing several indicators of scientific validity. Noticeably absent from Congress's enumerated factors in § 2625(h) is whether the underlying data can be made available to the public. While § 2625(h)(4) provides that EPA should take into account "the extent of independent verification or peer review" of scientific information, this language indicates that peer review of a study could provide sufficient assurance of its reliability even without additional verification.

TSCA further directs EPA to make available to the public, among other things, "a list of the studies considered by the Administrator in carrying out each such risk evaluation, along with the results of those studies" and "each designation of a chemical substance . . . along with an identification of the information, analysis, and basis used to make the designations." *Id.* § 2625(i). Again, the statute, despite calling out specific information to be made publicly available, does not state that the underlying data for these studies must be made publicly available. Thus, the rule is flatly inconsistent with TSCA.

Finally, even if it were not already clear from the above provisions that EPA cannot bar consideration of studies as provided in the Proposal, TSCA also states that EPA "shall take into

consideration information relating to a chemical substance or mixture, including hazard and exposure information, under the conditions of use, that is reasonably available to the Administrator.” Id. § 2625(k). EPA has defined “reasonably available” to mean “information that EPA possesses or can reasonably generate, obtain and synthesize for use . . . for prioritization and risk evaluation. Information that meets such terms is reasonably available information whether or not the information is CBI that is protected from public disclosure under 15 U.S.C. 2613.” 40 C.F.R. § 702.3. Thus, if the studies covered by the rule are “reasonably available” to EPA, the agency must consider them, regardless of whether the raw data can be made public. EPA cannot create a double standard where studies withheld from the public as CBI must be considered but studies for which the underlying data cannot be made publicly available cannot be considered. The Proposal is unlawful under TSCA and cannot be promulgated.

Comment [6340-1462]: Commenter (6362) writes that EPA’s reference to section 10 under the TSCA also does not appear on-point. American Chemistry Council (ACC) believes EPA’s authority to implement this rule is derived from TSCA Section 26(h), which speaks directly to scientific information and standards to which the Agency must adhere in the administration of its work under TSCA Sections 4, 5, and 6.

Comment [6343-2705]: Commenter (6365) writes that they are committed to meeting their obligations to operate in a responsible manner to avoid adversely impacting the environment and public health and safety. Both lead itself and the production of lead are extensively regulated by the EPA, including under the TSCA, CAA, CWA, and RCRA. As a result of these programs and other actions taken by industry, “[t]he United States have made tremendous progress in reducing lead concentrations in the outdoor air,” with the national average concentrations dropping “more than 90 percent since 1980,” and “EPA expects that most of the areas previously designated as nonattainment will have attained or are on track to attain by the end of 2016.”⁹⁴⁷

In order to ensure that the regulatory standards that the ABR’s members are subject to are supported by the best possible science, the ABR supports EPA’s objective of strengthening transparency in regulatory science by ensuring that the data and models underlying regulatory science is publicly available in a manner sufficient for validation and analysis. Furthermore, EPA should establish clear criteria for data and model availability so that stakeholders can effectively determine whether the data and models underlying each regulatory proposal are available for review.

Comment [6353-2330]: Commenter (6375) notes that EPA solicits comment on whether alternative or additional regulatory or other policy vehicles are appropriate to establish and implement these policies, and whether further regulatory or other policy vehicles at the programmatic or statutory level would be appropriate as alternative or additional steps the agency may take to further the policies articulated in Section II. (pg. 18,771).

The regulatory language that EPA proposes provides general requirements that apply to the Agency’s use of science under the many statutes that it implements. The generality of the proposed regulations may be a function of the diverse purposes of those statutes. Specifically, some of these statutes focus on the introduction of new substances into the marketplace (*e.g.*,

⁹⁴⁷ h https://www.epa.gov/sites/production/files/2016-09/documents/pb_naaqs_nfr_fact_sheet.pdf

FIFRA and TSCA). The scientific analyses required for these different programs and the sources of the scientific information underlying those analyses differ. The Agency should consider supplementing the general language that it has proposed with statutory specific regulations. A statutory-specific rulemaking would provide greater certainty going forward.

Comment [6424-2640]: Commenter (6446) writes that the proposed rule also deviates from accepted practices that EPA routinely uses, and is required to use, to evaluate science it relies on for regulatory decisions. EPA has long recognized that proprietary CBI submitted to it cannot be shared with the public, yet it routinely relies on that information, including scientific studies and other scientific information, as the foundation for important regulatory decisions. (See, *e.g.*, CBI protection provisions in the TSCA at 15 U.S.C. § 2613, subd. (c). EPA also adheres to specific Congressional directives regarding the science it should consider for regulatory action, including directives to consider whether the scientific information is reasonable, clear, complete and whether it has been peer reviewed. (See, *e.g.*, the TSCA at 15 U.S.C. § 2625, subds. (h) and (i), requiring EPA to consider several factors to evaluate science relating to toxic chemicals and requiring that decisions be based on "the weight of the scientific evidence."

Comment [6425-2641]: Commenter (6447) writes that the proposal is not authorized by statute and is contrary to Law.

EPA purports to rely on general statutory authority for the proposal, but no statutes authorize EPA to ignore science. On the contrary, as multiple U.S. Senators have noted, EPA's proposal would violate several statutes, including the TSCA, the SDWA, and the APA, which require the Agency to use the best available science, and all information presented to the agency during a rulemaking.⁹⁴⁸ The current proposal would do the opposite, requiring EPA to ignore some of the best available science, and to ignore certain information submitted during rulemaking. In particular, the proposal would make it difficult or impossible to use most epidemiological studies, where the source data are almost always comprised of sensitive personal information. Epidemiological studies are fundamental to EPA policymaking, and a critical source of information about the effects of various risk factors on human health. The Agency does not the option of suppressing this information, and courts have held that EPA "cannot ignore existing data."⁹⁴⁹

In short, the proposed action would be illegal, and would not survive a legal challenge.

Comment [6833-3415]: Commenter (6855) writes that the requirements should apply specifically to risk evaluations performed under Section 6(b) of TSCA; to assessments (including certain retrospective assessments), models, criteria documents, and regulatory impact analyses that provide the basis for EPA's policies, procedures, guidance, and proposed and final regulatory decisions; and to individual party adjudications, enforcement activities, and permit proceedings.

Comment [6852-2770]: Commenter (6874) writes that a recent analysis tallied the costs to the U.S. economy of a set of endocrine-disrupting chemicals (EDCs) for which robust exposure,

⁹⁴⁸ Letter from Senator Thomas R. Carper (and others) to EPA Administrator Scott Pruitt (April 24, 2018) ("Senate letter"), attached hereto as Attachment B.

⁹⁴⁹ *Id.*

toxicity, and epidemiologic data exist. Teresa Attina and colleagues calculated that these EDCs cause annual losses of \$340 billion, or 2% of the 2010 U.S. GDP, with the majority of that due to IQ point loss and intellectual disability from in-utero exposure to polybrominated diphenyl ethers (PBDEs).⁹⁵⁰ The total also includes costs associated with 86,000 cases of endometriosis attributable to the phthalate DEHP and 37,000 cases of uterine fibroids attributable to DDT exposures;⁹⁵¹ uterine fibroids are both more common and more severe in African American women.⁹⁵² The authors note that although the LSCA's update of the TSCA gives EPA the authority to limit production of chemical hazards and protect vulnerable populations, it does not provide the kind of funding necessary to adequately assess the safety of the many chemicals that are in use despite a lack of sufficient safety data.⁹⁵³ Given this combination of insufficient federal funding for testing and the substantial potential benefits of regulations that reduce EDC exposure, as well as reformed TSCA's requirement to make decisions based on the "weight of the scientific evidence,"⁹⁵⁴ EPA should be using the best available science to guide regulation rather than restricting the pool of science that can inform its regulatory work.

Comment [6884-3029]: Commenter (6905) writes that states understand EPA's desire to be transparent with the public and we work hard to achieve this where possible. However, states are concerned that requiring all data used in scientific studies that underpin environmental and public health protection regulations be publicly available will lead to issues. For example, under the TSCA, EPA regularly relies on industry testing and data to make decisions on whether a chemical presents an unreasonable risk to human health or the environment. But some of this data is protected from public access under CBI claims.

Comment [6884-3032]: Commenter (6905) notes that like EPA's mission statement, several of the federal statutes that provide authority for the agency's work call for use of the best science without regard for data transparency. For example, TSCA as amended under the LSCA requires the EPA Administrator to use "scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science." The statute states that this best available science should be clear and complete, but it does not require it to be publicly available. It appears that the proposed rule could reject some of the best available science and may result in a finding that the rule contradicts the federal statutes.

Comment [6885-2986]: Commenter (6906) writes that in effect, EPA's proposal could be interpreted in a manner that is overly restrictive. EPA might also interpret this proposal in a manner that screens science studies using narrower criteria than congress indicated for risk evaluations under TSCA, where EPA is required to use the "best available science." The concept

⁹⁵⁴ 15 U.S.C, Chapter 53, Subchapter 1, §2625(i)

of “best available science” also applies to EPA decision-making generally and in other statutory programs, as explained in E.O. 13563.⁹⁵⁵ TSCA § 26(h) (as recently amended by the LSCA) requires that “in carrying out sections 4,5, and 6, to the extent that the Administrator makes a decision based on science, the Administrator shall use scientific information, technical procedures, measures, methods, protocols methodologies, or models, employed in a manner consistent with the best available science” (italics added). The phrase “best available science” incorporates evaluation of similar supporting studies, objectivity, consistency with intended use of information, relevance, variability, and independent verification. Under this standard, EPA is not only required to evaluate the clarity of data, but also assumptions, methods, protocols, methodologies and/or models.⁹⁵⁶ In effect, the standard requires the broader set of considerations used in the scientific community when evaluating studies. [...]

American Coatings Association [the commenter] (ACA) recognizes that proposed 40 CFR §30.5 (requiring disclosure of dose response data and models) and §30.7 (requiring peer review and comment to EPA) are designed to give the public enough information to evaluate whether EPA has used the “best available science.” The proposal and existing “best available science” standard are not necessarily mutually exclusive, but ACA suggest that EPA amend its proposal, so it more clearly incorporates consideration of factors that constitute “best available science.”

These changes would allow EPA to continue considering data from the EU and Canada during TSCA risk evaluations. Suggested changes also promote industry participation in TSCA risk evaluations.

Comment [6893-2964]: Commenter (6914) writes that they have been integrally involved with both the passage and the implementation of the original 1976 TSCA and the 2016 LSCA, which amended the 1976 TSCA law. The TSCA law requires EPA to rely on the “best available science” and specifies that the agency “cannot ignore existing data.” This proposal is contradictory in that it allows the agency to ignore some of the best available information that could help implement these laws. The proposal would limit exactly the kind of information

⁹⁵⁵ See E.O. 13563, 76 FR 3821 (Jan. 21, 2011). “Our regulatory system must protect public health, welfare, safety, and our environment while promoting economic growth, innovation, competitiveness, and job creation. It must be based on the best available science.”

⁹⁵⁶ Using the existing definition in the Safe Drinking Water Act and the explanation in TSCA Section 26(h), EPA codified a definition of “best available science” in its final Risk Evaluation Rule under TSCA: [S]cience that is reliable and unbiased. Use of best available science involves the use of supporting studies conducted in accordance with sound and objective science practices, including, when available, peer reviewed science and supporting studies and data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data). Additionally, EPA will consider as applicable: - The extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information; - The extent to which the information is relevant for the Administrator’s use in making a decision about a chemical substance or mixture; - The degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented; - The extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and - The extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies or models. (40 CFR 702.33)

Congress intended the agency to collect related to workplace chemical exposures and work-related disease.

Comment [6894-3607]: Commenter (6915) writes that the TSCA requires the Administrator, in decisions based on science, to “use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed *in a manner consistent with the best available science*,” and, in carrying out certain sections of the Act, to “take into consideration information relating to a chemical substance or mixture . . . that is *reasonably available* to [him or her].” § 26(h), (k), 15 U.S.C. § 2625(h), (k) (emphases added).

Comment [6901-4445]: Commenter (6922) notes that in the TSCA: “In carrying out sections 2603, 2604, and 2605 of this title, to the extent that the Administrator makes a decision based on science, the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science[.]”⁹⁵⁷

Comment [6903-1997]: Commenter (6924) writes that the rule is counter to mandates in the reformed TSCA to use the best available science and systematic reviews for chemical evaluations.

Reformed TSCA requires the use of the “best available science” for decision-making under the Act.⁹⁵⁸ In contrast, this proposed rule mandates EPA to ignore well-conducted, relevant studies simply because all the data are not publicly available and/ or may not conform to the rule’s invalid assumptions about GLP/Guideline and dose-response modeling; this is inconsistent with the TSCA statute and the Agency’s legal mandate.

Further, EPA’s rule delineating risk evaluation procedures under TSCA mandates the use of systematic review methods.⁹⁵⁹ Systematic reviews consider the entire body of scientific evidence and provide the most comprehensive, accurate and transparent evaluations of chemicals. In a systematic review, the quality and strength of all relevant individual studies is considered to reach an overall conclusion about the body of evidence, without requirements for data re-analysis or public access to data.⁹⁶⁰ This proposed rule would prevent EPA from completing systematic reviews as its regulation mandates for chemical evaluations because it would prohibit the Agency from considering studies where the data were not publicly available and downgrade studies based on criteria not related to actual study quality, such as GLP.

Comment [6912-3758]: Commenter (6933) writes that for all of these reasons, and many more beside (including the blatant inconsistency with requirements of the CAA, TSCA and other statutes to use best available science), they ask that you withdraw this proposal.

Comment [8750-1434]: Commenter (9227) writes that EPA’s statutory authorities generally require the agency to consider all available data when undertaking significant rulemakings.

As just noted, EPA’s statutory authorities mandate a variety of requirements for what scientific information EPA must consider in rulemaking. These statutes are discussed in detail, *infra* at Section I.B.3. To take one example that appears in numerous statutes, including TSCA, CAA, SDWA, and the ESA, Congress has often required agencies to act on the “best available science.” For an agency to comply with this obligation, the agency must at least consider all available scientific information. “Best” means “of the most excellent, effective, or desirable type or quality.”⁹⁶¹ “Available” means “able to be used or obtained.”⁹⁶² And “science” means “the intellectual and practical activity encompassing the systematic study of the structure and behavior of the physical and natural world through observation and experiment.”⁹⁶³ Assessing which science is “best” requires consideration of the overall quality of the science, and the public availability of underlying data is, at best, one of many aspects that should inform that assessment of overall quality.

An agency “cannot ignore available. . . information.”⁹⁶⁴ Numerous courts have indicated that a plaintiff or petitioner can establish a violation of the “best available science” requirement by “point[ing] to any scientific evidence that the agency failed to consider.”⁹⁶⁵ “The best available data requirement. . . prohibits [an agency] from disregarding available scientific evidence that is in some way better than the evidence [it] relies on.”⁹⁶⁶ “An agency does. . . have an obligation to deal with newly acquired evidence in some reasonable fashion.”⁹⁶⁷ EPA’s proposal will result in EPA precluding itself from considering certain studies that are “available,” thus violating the requirement that EPA rely on the best available science.

In addition, the requirement that agencies use “best available” science or information often means that the agency must act even if the available science or information is imperfect.

“Even if the available scientific and commercial data were quite inconclusive, [the agency] may—indeed must—still rely on it” when the agency has a duty to act.⁹⁶⁸ “[W]here the information is not readily available, we cannot insist on perfection.”⁹⁶⁹ Just as the Courts have recognized that they cannot expect perfection, agencies cannot choose to ignore certain studies or sources of information based solely on whether the data is publicly available—especially where

⁹⁶⁹ *San Luis*, 747 F.3d at 602.

the validity of those studies has been established using techniques that do not rely on public availability of underlying data.

EPA cannot reasonably elevate the interest in public availability of all underlying information above all other factors in assessing the “best available science.” Textually, EPA’s approach is unlawful.

Comment [8750-1438]: Commenter (9227) writes that the proposed rule violates EPA’s statutory authorities.

Not only is there no authority for EPA’s pan-statutory Proposal, but the Proposal would also violate explicit statutory commands. Though EPA admits that “[t]he best available science must serve as the foundation of EPA’s regulatory actions,”⁹⁷⁰ proposed section 30.5 would prohibit EPA from considering high quality and critically important scientific studies—precisely that “best available science”—when undertaking regulatory actions. Specifically, section 30.5 would prevent EPA from considering any scientific study for which the underlying “dose response data and models” are not “publicly available in a manner sufficient for independent validation.”⁹⁷¹ This would be true even if that scientific study constituted “information available to the Administrator” in a TSCA § 4(f) rulemaking. Accordingly, this proposed prohibition would contravene an array of statutes governing EPA’s consideration of science when promulgating rules, such as requirements to consider the “best available science” when setting environmental protection standards. See, e.g., TSCA, 15 U.S.C. § 2625(h) (“[T]he Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science.”). And, by excluding science that meets these statutory criteria from supporting regulations to protect public health and welfare, the Proposal would frustrate Congress’s policy in these statutes and frustrate EPA from achieving its fundamental mission.⁹⁷²

Comment [8750-1447]: Commenter (9227) notes that EPA has previously stated in several different forums that a scientific study can be valid even if the underlying dose response data and models are not publicly available. For example, EPA recently explained in its own Plan to Increase Access to Results of EPA-Funded Scientific Research that even though “some research data cannot be made fully available to the public but instead may need to be made available in more limited ways,” the lack of full public availability “does not affect the validity of the scientific conclusions from peer-reviewed research publications.”⁹⁷³ Under the plan, EPA must make publications resulting from EPA-funded research publicly accessible on NIH’s PubMed Central (PMC).⁹⁷⁴ The plan aims to “maximize access, by the general public and without charge, to digitally formatted data resulting from EPA funded research, while protecting confidentiality and personal privacy, recognizing proprietary interests, business confidential information and

⁹⁷⁴ *Id.* at 8.

intellectual property rights, and preserving the balance between the relative benefits and costs of long-term preservation and access.”⁹⁷⁵ The plan recognizes important exceptions for when “the research data cannot be released due to one or more constraints, such as requirements to protect confidentiality, personal privacy, proprietary interest, or property rights.”⁹⁷⁶ It specifically declares: “The validity of scientific conclusions drawn from research publications or their associated research data, or EPA’s ability to consider those conclusions and data in its actions, does not depend on compliance with this Plan.”⁹⁷⁷

Likewise, EPA’s Science Policy Council explains in A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information that EPA’s determination as to the quality and reliability of a particular scientific study does not depend on one single factor (*e.g.*, the public availability of underlying data), but instead turns on the agency’s consideration of five general factors.⁹⁷⁸ Congress implicitly endorsed this approach by including a directive for EPA to use these same five factors in evaluating science under the TSCA Amendments passed in 2016,⁹⁷⁹ and just last year this Administration included these same factors in a recent regulation implementing TSCA.⁹⁸⁰ The factors comprise: (1) soundness; (2) applicability and utility; (3) clarity and completeness; (4) uncertainty and variability; and (5) evaluation and review.⁹⁸¹ Of these, the only ones with any possible direct relevance to EPA’s proposed approach are the third and fifth factors, but neither supports the elevation of public availability of data above all other considerations or the exclusion of studies with non-public data. The third factor, “clarity and completeness” requires EPA to consider “[t]he degree of clarity and completeness with which the data, assumptions, methods, quality assurance, sponsoring organizations and analyses employed to generate the information are documented.” The fifth factor, “evaluation and review,” requires EPA to consider “[t]he extent of independent verification, validation and peer review of the information or of the procedures, measures, methods or models.” Even clear and complete “documentation” of the data used does not require that the data be made publicly available. Nor does factor five require either that a study’s findings must have been replicated using the same data, or that the data must be available to allow for such replication. Moreover, these are only portions of two of five key factors to consider.⁹⁸² As discussed at Section I. B.3. b) ii of the commenter’s comment letter, even this Administration, in the context of promulgating regulations under TSCA, has adopted a regulatory definition of “best available science”

⁹⁸¹ Note that TSCA and the regulations do not include the headers for the five factors (“soundness,” “applicability and utility,” etc.) included in the Science Policy Council guidance, but the description of each factor to be considered is largely identical.

⁹⁸² See EPA Science Policy Council, A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information.

expressly incorporating a multi-factor analysis, and that definition recognizes that public unavailability of data does not render a study incapable of being “best available science.”

Comment [8750-1464]: Commenter (9227) writes that EPA’s Proposal contravenes the TSCA.

i. TSCA expressly requires that EPA consider reasonably available information and EPA’s proposal would preclude EPA from considering some reasonably available information.

When Congress amended TSCA through passage of the LSCA, Congress provided a number of detailed instructions on how EPA should consider scientific information with respect to chemical substances; EPA’s proposal contradicts Congress’s carefully crafted scheme. In particular, Congress included a provision specifically requiring that EPA consider all “reasonably available information.”⁹⁸³ When making decisions about testing or the risk evaluation or regulation of new or existing chemicals, “the Administrator shall take into consideration information relating to a chemical substance or mixture, including hazard and exposure information, under the conditions of use, that is reasonably available to the Administrator.” 15 U.S.C. § 2625(k) (emphases added). But under EPA’s proposed rule, EPA would often be precluded from considering such reasonably available information if all the underlying data and models were not publicly available. See 83 Fed. Reg. at 18,769 n.3 (stating that proposal “would preclude [EPA] from using [non-public] data in future regulatory actions”). EPA’s proposal violates the plain language of TSCA § 26(k), as well as Congress’s clear purpose of ensuring that EPA consider all reasonably available information relating to a chemical when making a decision about the chemical.

Under its plain language, “available” means “able to be used or obtained; at someone’s disposal.”⁹⁸⁴ Congress chose this standard to ensure that EPA would make decisions based on all reasonably available information. S. Rep. No. 114-67 at 9 (June 18, 2015) (“The section ... requires EPA to consider reasonably available information about potential hazards and exposures of a chemical substance under the conditions of use when making decisions under TSCA.... The Committee intends that EPA systematically search for and identify relevant information that is available to inform safety assessments and determinations.”); Oversight of the EPA’s Progress in Implementing Inspector General and Government Accountability Office Recommendations: Hearing before the Subcomm. on Superfund, Waste Management, and Regulatory Oversight of the S. Comm. on Environment and Public Works, 114th Cong. at 63 (June 14, 2016) (“[F]or the EPA to properly evaluate and regulate toxic substances, it is essential that they have the most up-to-date chemical and toxicity data available.”). Congress also selected this standard to avoid paralysis by analysis—Congress wanted EPA to act on available information and not to postpone action waiting for new or perfect information to become available. See, e.g., 162 Cong. Rec. S3511, S3517 (daily ed. June 7, 2016) (referring to “information reasonably available to EPA” as “ensur[ing] that such considerations do not require additional information to be collected or developed”). “Congress recognized the need to use available studies, reports and recommendations for purposes of chemical assessments rather than creating them from whole cloth.” Id. at S3522. And Congress intended for EPA to consider studies even when they had not undergone all possible forms of vetting. “[I]n instances where there were other studies and

⁹⁸³ Pub. L. No. 114-182, § 17(k), 130 Stat. 448, 502 (June 22, 2016) (codified at 15 U.S.C. § 2625(k)).

⁹⁸⁴ Oxford American Dictionary 111 (3d ed. 2010).

reports unavailable at the time of the [NAS] recommendations, EPA should take advantage of those studies and reports in order to ensure that the science used for chemical assessments is the best available and most current science.” Id. at S3522. Congress intended for EPA to consider all reasonably available information, and EPA’s proposal would thwart that clear purpose.

Notably, this Administration has adopted two regulations under the amended TSCA defining reasonably available information. These regulations generally provide that:

Reasonably available information means information that EPA possesses or can reasonably generate, obtain, and synthesize for use in risk evaluations, considering the deadlines specified in TSCA [for action]. Information that meets the terms of the preceding sentence is reasonably available information whether or not the information is CBI, that is protected from public disclosure under TSCA section 14.

40 C.F.R. § 702.33; see also 40 C.F.R. § 702.3 (similar definition for prioritization decisions). This bears no resemblance to the limitations put forward in the Proposal. Indeed, EPA has defined “reasonably available information” to include information EPA withholds as CBI under TSCA § 14. 15 U.S.C. § 2613. If the proposed rule forecloses EPA from considering information that cannot be fully disclosed, as it appears to do, then EPA cannot comply with both these regulations and the proposed rule.

EPA’s proposal also violates other provisions of TSCA that expressly require EPA to act on “available information.” For example, in preparing risk evaluations for existing chemicals, EPA “shall integrate and assess available information on hazards and exposures for the conditions of use of the chemical substance, including information that is relevant to specific risks of injury to health or the environment and information on potentially exposed or susceptible subpopulations identified as relevant by the Administrator.”⁹⁸⁵ Under the proposed rule, EPA would not be able to integrate and assess available information where all underlying data has not been disclosed. Similarly, when developing regulations for existing chemicals, EPA “shall consider and publish a statement based on reasonably available information with respect to” a number of factors, including the effects of the chemical on health and the environment.⁹⁸⁶ But under the proposed rule, EPA cannot consider all reasonably available information when assessing those health and environmental effects.

Indeed, TSCA § 4(f) imposes a duty upon EPA to initiate regulation in response to any available information that meets certain substantive standards. However, if all the underlying information were not available, EPA’s proposed rule would then foreclose EPA from considering that information during the resulting rulemaking. Congress would not have created a scheme where EPA must act in response to certain information but then cannot consider that information in taking action. Specifically, under TSCA § 4(f):

Upon the receipt of—(1) any information required to be submitted under this Act, or (2) any other information available to the Administrator—which indicates to the Administrator that there may be a reasonable basis to conclude that a chemical substance or mixture presents a significant

⁹⁸⁵ 15 U.S.C. § 2605(b)(4)(F)(i) (emphasis added).

⁹⁸⁶ Id. § 2605(c)(2)(A) (emphasis added).

risk of serious or widespread harm to human beings, the Administrator shall, ... initiate applicable action under section 5, 6, or 7 to prevent or reduce to a sufficient extent such risk or publish in the *Federal Register* a finding, made without consideration of costs or other non-risk factors, that such risk is not unreasonable.⁹⁸⁷

Thus if “any ... information available” to EPA provides a reasonable basis to conclude that a chemical “presents a significant risk of serious or widespread harm to human beings,” then EPA must initiate action to regulate the chemical. But under EPA’s proposed rule, EPA would then be required to ignore the information triggering this duty when crafting the final regulation unless the source of the information fully disclosed all underlying data. That result clearly contradicts Congress’s intent, which was to create a duty for EPA to react to any available information meeting the substantive standard of TSCA § 4(f).

In sum, Congress repeatedly directed EPA to consider all reasonably available information when making decisions under TSCA. The proposed rule would illegally preclude EPA from considering available information. The two cannot be reconciled, and the rule is unlawful.

ii. TSCA requires an agency to act on the “best available science,” meaning that EPA must consider all available science and assess the quality of the science based on a variety of factors.

EPA’s proposed blanket prohibition against basing a rulemaking on science for which underlying data or models are not publicly available would be particularly hard to reconcile with the “best available science” standard as articulated in TSCA, which clearly contemplates a case-by-case analysis in which EPA weighs a variety of factors when identifying the best available science. The relevant provision of TSCA requires that:

(h) Scientific standards. In carrying out sections 4, 5, and 6, to the extent that the Administrator makes a decision based on science, the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science, and shall consider as applicable—

(1) the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information;

(2) the extent to which the information is relevant for the Administrator’s use in making a decision about a chemical substance or mixture; (3) the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented;

(4) the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and

⁹⁸⁷ 15 U.S.C. § 2603(f) (emphases added).

(5) the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models.⁹⁸⁸

Thus, Congress provided EPA with factors to guide its consideration of the “best available science,” and Congress did not make the public disclosure of all underlying data a requirement for material to be the “best available science.” Quite the opposite; Congress included aspects of disclosure and independent review as parts of factors to be considered when weighing scientific information. But these are just aspects of five different factors to be weighed “as applicable,” and Congress clearly contemplated that EPA would sometimes rely on science that does not meet the proposed rule’s requirement of full disclosure of all underlying data.

First, Congress directed EPA to consider these factors when weighing particular information; Congress specifically did not develop (or direct EPA to develop) bright-line criteria for eliminating information from consideration entirely. Thus, each factor includes the phrase “degree of” or “extent to which,” without identifying any threshold that would be disqualifying.⁹⁸⁹ This shows that Congress intended these factors to help EPA assess the weight information should be given based on its relative scientific reliability, not to create minimum thresholds of reliability below which information must be ignored by EPA altogether. For EPA to insert a screen on top of these factors—excluding information where the underlying data and models are not publicly available as required by the proposed rule—contradicts Congress’s unambiguous intent about how EPA should approach its assessment of the best available science.

Second, Congress made the “degree of clarity and completeness” with which the underlying data is documented to be part of one factor for EPA to consider in evaluating whether a particular study is the “best available science.”⁹⁹⁰ But EPA must also consider “the degree of clarity and completeness” with which “assumptions, methods, quality assurance, and analyses” are documented as well.⁹⁹¹ Thus, Congress contemplated that EPA would still rely on some studies that did not document completely all the underlying data, much less disclose all of that information.

Third, Congress made “the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models” another factor to be weighed when considering whether information is the “best available.”⁹⁹² Notably, Congress’s choice of the disjunctive “or” reflects that “peer review” can be an adequate alternative to “independent verification,” and Congress did not require that either “independent verification or peer review” be accomplished through public availability of data as required in the proposed rule. Moreover, Congress contemplated scenarios where EPA would give more weight to evidence even if the “information” had not undergone “independent verification or

⁹⁸⁸ 15 U.S.C. § 2625(h) (emphases added).

⁹⁸⁹ See, e.g. 15 U.S.C. § 2625(h)(1) (“the extent to which the scientific information...[are] consistent with the intended use of the information”) (emphasis added).

⁹⁹⁰ 15 U.S.C. § 2625(h)(3).

⁹⁹¹ *Id.*

⁹⁹² 15 U.S.C. § 2625(h)(5).

peer review” based on the extent to which the “procedures, measures, methods, protocols, methodologies, or models” had done so.

Fourth and most importantly, EPA cannot rationally elevate the interest in public disclosure of all underlying data above all the other factors that Congress expressly required EPA to consider in evaluating science. Congress required EPA to consider these five factors “as applicable” when weighing information, and Congress did not make full public availability of underlying data one of the factors, much less a decisive or absolute one.

This administration recently adopted a regulatory definition of “best available science” for purposes of TSCA which expressly incorporated consideration of these five factors and was otherwise inspired by use of the term in the SDWA.⁹⁹³ EPA defined the phrase:

Best available science means science that is reliable and unbiased. Use of best available science involves the use of supporting studies conducted in accordance with sound and objective science practices, including, when available, peer reviewed science and supporting studies and data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data). Additionally, EPA will consider as applicable:

[TSCA § 26(h)(1)(5) factors]⁹⁹⁴

According to EPA in selecting this definition, “the Agency is remaining consistent with the current approach already used Agency-wide, while also acknowledging the specific standards under TSCA.”⁹⁹⁵ Notably, this definition does not require public disclosure of all underlying data for science to be the “best available science,” yet many studies that meet this definition of “best available science” would be excluded under EPA’s proposed rule.

EPA’s Proposal cannot be reconciled with EPA’s existing definition of best available science, with decades of court and agency precedent, or with text of the statute. When a statute requires the agency to make a decision based on the “best available science,” it would be unlawful to follow EPA’s proposed rule.

iii. EPA’s proposed rule also contradicts TSCA’s requirement that decisions be made based on the weight of the scientific evidence.

TSCA § 26(i) requires EPA to make decisions regarding testing and regulating new and existing chemicals “based on the weight of the scientific evidence.”⁹⁹⁶ If EPA excludes certain information, as proposed, then EPA will not be able to weigh the evidence as a whole.

Indeed, this administration recently adopted a regulation defining “weight of scientific evidence” to mean “a systematic review method ... that uses a pre-established protocol to comprehensively, objectively, transparently, and consistently, identify and evaluate each stream of evidence,

⁹⁹³ See 82 Fed. Reg. 33,726, 33,731 (July 20, 2017), 42 U.S.C. § 300g-1(b)(3)(A).

⁹⁹⁴ 40 C.F.R. § 702.33.

⁹⁹⁵ 82 Fed. Reg. at 33,731.

⁹⁹⁶ 15 U.S.C. § 2625(i).

including strengths, limitations, and relevance of each study and to integrate evidence as necessary and appropriate based upon strengths, limitations, and relevance.”⁹⁹⁷ Systematic reviews consider the entire body of scientific evidence, but EPA’s proposed rule would prevent EPA from conducting true systematic review because it would prohibit the Agency from considering studies where the data were not publicly available and it would eliminate studies based on criteria other than their “strengths, limitations, and relevance.”⁹⁹⁸ If the proposed rule forecloses EPA from considering information that cannot be fully disclosed, as it appears to do, then EPA cannot comply with this regulation and the proposed rule.

In sum, EPA’s proposed rule is inconsistent with TSCA’s plain text. EPA should not adopt the proposed rule because it cannot be reconciled with the agency’s duties under TSCA.

iv. Section 10 of TSCA does not authorize this proposal.

Nothing in TSCA § 10 authorizes EPA to exclude scientific information during rulemakings on any basis. Section 10 authorizes EPA to research and develop information for purposes of carrying out TSCA.⁹⁹⁹ Section 10 also authorizes EPA to develop systems to collect and disseminate information about chemical substances.¹⁰⁰⁰ But TSCA § 10 is silent regarding rulemaking or EPA’s use of scientific information in rulemaking. It does not authorize EPA to exclude scientific information on any basis; if anything, TSCA § 10 reflects a congressional judgment that EPA should be prepared to use any and all “toxicological and other scientific information which could be useful to the Administrator in carrying out the purposes of this [Act].”¹⁰⁰¹

Comment [8750-1818]: Commenter (9227) writes that EPA unlawfully failed to consult with other agencies as required by TSCA.

When promulgating the Proposal, EPA unlawfully failed to consult with other entities as required by TSCA. For example, consider the sole statutory authority EPA cites under TSCA—§ 10. To the extent EPA acts under TSCA § 10, TSCA § 10 repeatedly directs EPA to consult, cooperate, and/or coordinate with the Secretary of HHS, and sometimes other agencies as well.¹⁰⁰² EPA has not identified any specific provision of TSCA § 10 that authorizes the proposed rule, and as noted above, no provision does. But if EPA acts under TSCA § 10, then EPA needs to comply with the requirements of whichever provision EPA considers relevant. Most of the provisions of TSCA § 10 expressly require that EPA consult, coordinate, or cooperate with, at least, the Secretary of HHS (section 10(a), 10(b)(2)(A), 10(b)(2)(B), 10(c), 10(d), 10(e), 10(g)). For example, the provision that mentions “research and development results” states that EPA shall act “in consultation with the Secretary of Health and Human

⁹⁹⁷ 40 C.F.R. § 702.33 (emphases added).

⁹⁹⁸ *Id.*

⁹⁹⁹ See 15 U.S.C. § 2609(a) (“The Administrator shall ... conduct such research, development, and monitoring as is necessary to carry out the purposes of this [Act].”); see also 15 U.S.C. § 2609(c), (d), (e).

¹⁰⁰⁰ See 15 U.S.C. § 2609(b), (c), (g).

¹⁰⁰¹ 15 U.S.C. § 2609(b)(2)(A).

¹⁰⁰² 15 U.S.C. § 2609(a), (b)(2)(A), (b)(2)(B), (c), (d), (e), (g).

Services and other heads of appropriate departments and agencies.”¹⁰⁰³ EPA does not appear to have complied with any of the procedural requirements of TSCA § 10.

Comment [8750-1819]: Commenter (9227) writes that EPA has failed to consult with the Science Advisory Committee on Chemicals (SACC).

As discussed above, this proposed rule has severe implications for the implementation of TSCA. The SACC’s purpose is “to provide independent advice and expert consultation, at the request of the Administrator, with respect to the scientific and technical aspects of issues relating to the implementation of this subchapter.”¹⁰⁰⁴ This rulemaking specifically involves “the scientific and technical aspects of issues relating to the implementation of [this Act],” yet there is no indication that the Administrator has consulted with the committee.¹⁰⁰⁵ Congress specifically created this Committee to consult on these types of issues, and thus EPA is abusing its discretion to not consult with this Committee about a proposal that will so radically affect the scientific and technical aspects of issues relating to the implementation of TSCA.

Comment [8750-2711]: Commenter (9227) writes that EPA arbitrarily failed to consider the far-reaching implications this Proposal could have on inter-agency coordination and consultation given that other agencies normally rely on research potentially excluded by the Proposal.¹⁰⁰⁶

Consultation provisions under the TSCA

2609(a)

Research, Development, collection, dissemination, and utilization of data

(a) Authority. The Administrator shall, in consultation and cooperation with the Secretary of HHS and with other heads of appropriate departments and agencies, conduct such research, development, and monitoring as is necessary to carry out the purposes of this Act. The Administrator may enter into contracts and may make grants for research, development, and monitoring under this subsection. Contracts may be entered into under this subsection without regard to sections 3648 and 3709 of the Revised Statutes

2609(b)(1), (2)

Research, development, collection, dissemination, and utilization of information: Information Systems

¹⁰⁰³ 15 U.S.C. § 2609(g).

¹⁰⁰⁴ 15 U.S.C. § 2625(o)(2).

¹⁰⁰⁵ 15 U.S.C. § 2625(o)(2).

¹⁰⁰⁶ Note: Footnote 361 on page 80 refers the reader to Appendix B, which lists the consultation provisions in the relevant statute.

Administrator shall Consult and cooperate with Secretary of HHS and other heads of appropriate departments and agencies, to establish an efficient system for retrieval of toxicological and other scientific information which could be useful

2609(c)

Research, development, collection, dissemination, and utilization of information: Screening Techniques

Administrator shall coordinate with Assistant Secretary for HHS to develop screening techniques

2609(d)

Research, development, collection, dissemination, and utilization of information: Monitoring

Administrator shall, in consultation and cooperation with the Secretary of HHS, establish and be responsible for research aimed at the development, in cooperation with local, State, and Federal agencies, of monitoring techniques and instruments which may be used in the detection of toxic chemical substances and mixtures and which are reliable, economical, and capable of being implemented under a wide variety of conditions

2609(e)

Research, development, collection, dissemination, and utilization of information: Basic Research

The Administrator shall, in consultation and cooperation with the Secretary of HHS, establish research programs to develop the fundamental scientific basis of the screening and monitoring techniques described in subsections (c) and (d), the bounds of the reliability of such techniques, and the opportunities for their improvement.

2609(g)

Research, development, collection, dissemination, and utilization of information: Exchange of research and development results

The Administrator shall, in consultation with the Secretary of HHS and other heads of appropriate departments and agencies, establish and coordinate a system for exchange among Federal, State, and local authorities of research and development results respecting toxic

chemical substances and mixtures, including a system to facilitate and promote the development of standard information format and analysis and consistent testing procedures.

2608(d)

Coordination

“Coordination. In administering this Act [15 USCS §§ 2601 et seq.], the Administrator shall consult and coordinate with the Secretary of Health and Human Services and the heads of any other appropriate Federal executive department or agency, any relevant independent regulatory agency, and any other appropriate instrumentality of the Federal Government for the purpose of achieving the maximum enforcement of this Act . . .”

2608(e)

Exposure Information

If the Administrator obtains information related to exposures or releases of a chemical substance or mixture that may be prevented or reduced under another Federal law, including a law not administered by the Administrator, the Administrator shall make such information available to the relevant Federal agency or office of the EPA.

2604(f)(5)

Manufacturing and Processing Notices: Protection Against Unreasonable Risks

Consult with Assistant Secretary of Labor prior to adopting any restriction of chemical substance for workplace exposures

2604(h)(2)(B)(ii)

Manufacturing and Processing Notices: Exemptions

Consult with AG of the Federal Trade Commission about exempting persons from information requirements.

Comment [9066-1929]: Commenter (6188) writes that the TSCA already expressly dictates the information that EPA must make publicly available, including a list of the studies EPA considers

in carrying out risk evaluations and the results of those studies. 15 U.S.C. § 2625(j). Nowhere does the statute require that the data underlying those studies be made publicly available or limit the use of data or studies in making evaluations or regulatory decisions. Once again, EPA has declined to cite the provision within the TSCA that deals most directly with data disclosure and has not explained how other provisions of the TSCA unrelated to data disclosure support a rule imposing additional data disclosure requirements.

Comment [9066-2647]: Commenter (6188) writes that the proposed rule contradicts the requirements of federal environmental law, including cited authority for the rulemaking.

The Proposed Rule’s requirements are at odds with statutory mandates contained in the very same environmental laws it points to as providing a basis for the rule. They also directly controvert authority it cites as support for the rulemaking.

The requirements of the Proposed Rule conflict with EPA’s statutory obligations under federal environmental laws. The TSCA requires EPA to use the “best available science” when evaluating the testing and regulation of chemicals. 15 U.S.C. § 2625(h). Decisions are to be made using the “weight of the scientific evidence,” and EPA is required to consider all information related to a chemical substance, including hazard and exposure information, “that is reasonably available to the Administrator.” 15 U.S.C. §§ 2625(i), (k). Exclusion of relevant studies from consideration based not on the quality of the science but on the public availability of underlying data directly contradicts these mandates.¹⁰⁰⁷ EPA itself has defined “best available science” without reference to the public availability of data:

Use of best available science involves the use of supporting studies conducted in accordance with sound and objective scientific practices, including, when available, peer reviewed science and supporting studies and data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).¹⁰⁰⁸

Simply put, the “best available science” is science that follows standards accepted by the scientific community, not science that EPA arbitrarily selects based upon the public availability of data—a criterion irrelevant to scientists’ standards for determining whether research represents the best science.

Specifically, scientists have observed that the best quality science oftentimes relies upon data that is not publicly available due to significant privacy considerations.¹⁰⁰⁹ It is for that very reason that courts have recognized EPA’s need to rely upon studies based on publicly

¹⁰⁰⁷ Even EPA’s current mission statement explains that EPA works to ensure “[n]ational efforts to reduce environmental risks are based on the best available scientific information.” See EPA, About EPA, available at <https://www.epa.gov/aboutepa/our-mission-and-what-we-do>.

¹⁰⁰⁸ Environmental Protection Agency Office of Chemical Safety and Pollution Prevention, Guidance to Assist Interested Persons in Developing and Submitting Draft Risk Evaluations Under the Toxic Substances Control Act, EPA 740-R17-001 (June 2017).

¹⁰⁰⁹ See, e.g., International Society for Environmental Epidemiology, Comments of the International Society for Environmental Epidemiology on EPA’s proposed rule on Strengthening Transparency in Regulatory Science (EPA-HQ-OA-2018-0259-0001) (citing to multiple robust environmental studies based upon data that could not be disclosed because of federal and foreign laws and access agreements with Medicare).

undisclosed underlying data when considering the best science. American Trucking Ass’n, 283 F.3d at 372 (explaining that curtailing EPA’s ability to rely on published studies would exclude “plainly relevant scientific information” from regulatory decision-making processes); see also Coalition of Battery Recyclers Ass’n, 604 F.3d at 623 (finding that EPA is entitled to rely on published study results as “raw data is often unavailable due to proprietary interests of a study’s scientific investigators or confidentiality agreements with study participants”). Forcing EPA to ignore high quality science controverts EPA’s statutory obligations and will impair EPA’s ability to protect public health and the environment.

Comment [9078-3551]: Commenter (6194) writes that the proposal is inconsistent with EPA’s statutory obligations and conflicts with other applicable federal requirements.

The Proposal would prevent EPA from relying on the best available information in discharging its duties. EPA is charged with developing regulations that provide societal benefits by reducing harm to human health and the environment from the presence of chemicals in air, soil, drinking water, food, and consumer products. The Proposal implicates research that is central to making such determinations; creating an obstacle to the consideration of such science is contrary to both primary statutory directives and requirements to conduct cost benefit analyses. Likewise, EPA fails to address how it could implement a regulation that is inconsistent with federal requirements and standards governing the use of science across agencies.¹⁰¹⁰

A. Statutory Requirements to Develop Health Based Standards and Conduct Cost-Benefit Analyses EPA acknowledges that it must use the “best available science” in all of its regulatory actions.¹⁰¹¹

This directive is embodied in multiple statutes implemented by EPA and is reflected in other environmental statutes, further illustrating Congress’ conceptualization of “best” available science. Broadly speaking, there are three basic types of statutory requirements that the EPA and other agencies consider scientific information. First, there are requirements that the agency consider the “best available science.” Second, there are requirements that the agency consider particular factors, including scientific factors. Third, there are requirements that the agency balance economic costs or technological feasibility against public health, environmental, or other benefits that must be scientifically assessed. The precise terminology regarding the required use of science may, as illustrated below, vary across statutes, but what these provisions have in common are requirements for EPA and other agencies to use scientific information that is “best,” not simply adequate, and “available.”

Table 1: Examples of Statutory Directives regarding Use of Science by EPA and other Agencies

¹⁰¹⁰ Moreover, as discussed herein, the Proposal would flip the existing default by automatically excluding the best scientific research, rather than admitting science and then deciding if circumstances exist that warrant excluding a study. The status quo makes more sense than creating a blanket preclusion of valid studies and then allowing their use only by going through a timely and expensive exemption process.

¹⁰¹¹ EPA, Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18,768, 18,769 (Apr. 30, 2018) (citing Exec. Order No. 13,563, 76 Fed. Reg. 8,321 (Jan. 21, 2011)).

- **TSCA** [15 U.S.C. § 2625(h)]: “In carrying out sections 2603, 2604, and 2605 of this title, to the extent that the Administrator makes a decision based on science, the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science”.

This statutory provision does not link the concept of the “best available science” to the availability of underlying raw data, nor can such a limitation be read into the statutes. Where Congress wanted to direct EPA’s decision regarding what science to consider or how—it did so.¹⁰¹² When Congress wanted to link “best available science” to data being publicly available—it did so.¹⁰¹³ Thus, if Congress had wanted to put a blanket limitation on EPA’s consideration of science for which underlying data is not publicly available, it clearly knew how to do so—and it chose not to.

As EPA has previously explained, the agency would be unable to fulfill statutory mandates if it could not consider studies that follow federal laws and ethical standards regarding the privacy of patient and individual data:

If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. . . . [S]uch data are often the property of scientific investigators and are often not readily available because of the proprietary interests of the investigators or because of arrangements made to maintain confidentiality regarding personal health status and lifestyle information of individuals included in such data. Without provisions of confidentiality, the possibility of conducting such studies could be severely compromised.¹⁰¹⁴

¹⁰¹² See, e.g., Toxic Substances Control Act, 15 U.S.C. § 2625(h) (directing EPA to consider, as applicable, the following factors: “(1) the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information; (2) the extent to which the information is relevant for the Administrator’s use in making a decision about a chemical substance or mixture; (3) the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented; (4) the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and (5) the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models”); see also Comprehensive Environmental Response, Compensation, and Liability Act, 42 U.S.C. § 9604(i)(10) and (13) (providing that the Agency for Toxic Substances and Disease Registry give EPA specified data and information for review biennially and requiring that “[a]ll studies and results of research conducted under this subsection (other than health assessments) shall be reported or adopted only after appropriate peer review”).

¹⁰¹³ See, e.g., Clean Water Act, 33 U.S.C. § 1321(a)(27) (defining “best available science” in the context of natural resource protection and restoration projects on the Gulf Coast as science that: “(A) maximizes the quality, objectivity, and integrity of information, including statistical information; (B) uses peer-reviewed and publicly available data; and (C) clearly documents and communicates risks and uncertainties in the scientific basis for such projects”).

¹⁰¹⁴ National Ambient Air Quality Standards for Particulate Matter, 62 Fed. Reg. 38,652, 38,689 (Jul. 18, 1997).

The Proposal would also cut EPA off from information needed to complete the cost-benefit analysis of regulations required under certain statutes and government-wide requirements.¹⁰¹⁵

Not only would the Proposal impede EPA's fulfillment of its statutory duties, but it would also be contrary to judicial precedent, which holds that "best available science" includes "all existing scientific evidence relevant to the [agency] decision [in question]." *Ecology Ctr., Inc. v. U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006) (quoting *Heartwood, Inc. v. U.S. Forest Serv.*, 380 F.3d 428, 436 (8th Cir. 2004)). While agencies need not produce new evidence,¹⁰¹⁶ they must seek out information and "cannot ignore existing data." *Id.* (emphasis added). Even if an agency is anticipating the arrival of better evidence, it must act on the basis of the evidence it currently has.¹⁰¹⁷ Many of the fundamental public health studies on which EPA has based key rules and standards under the statutes are studies for which the raw data was not or could not have been released. Nonetheless these studies have been examined and validated,¹⁰¹⁸ as will future studies. Arbitrarily cutting off consideration of a category of science is inconsistent with EPA's statutory obligations.¹⁰¹⁹

Comment [9217-3561]: Commenter (9225) writes that the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA's authority. This includes, but is not limited to, the CAA; CWA; TSCA; LCSEA; SDWA; FIFRA; and more.

Comment [9289-3793]: Commenter (PH20) writes that the rule is counter to the mandates in the reformed TSCA to use the best available science and systematic reviews for chemical evaluations.

Comment [9310-4993]: Commenter (PH84) writes that they played a key role in the reform of the TSCA which requires that EPA use the best available science in the review and management of toxic chemicals. As EPA begins to review the tens of thousands of chemicals already on the

¹⁰¹⁵ See, e.g., Exec. Order No. 13,783, 82. Fed. Reg. 16,093 (Mar. 31, 2017) ("It is also the policy of the United States that necessary and appropriate environmental regulations . . . are of greater benefit than cost, when permissible, . . . and are developed through transparent processes that employ the best available peer-reviewed science and economics."); see also 42 U.S.C. § 7411(a)(1) (CAA provision requiring EPA to consider costs when establishing performance standards for new stationary sources of pollution); 42 U.S.C. § 7412(n)(1)(A) (CAA provision directing EPA to regulate power plants if such regulation is "appropriate and necessary," which includes consideration of costs); 42 U.S.C. § 300g-1(b)(3)(C) (SDWA provision establishing requirements for health risk reduction and cost analysis under which quantifiable and non-quantifiable benefits of a proposed rule must be measured against its cost); 15 U.S.C. § 2605(c)(2)(A)(iv) (TSCA provision requiring EPA to consider "the reasonably ascertainable economic consequences" of a proposed rule).

¹⁰¹⁶ See *Friends of Blackwater v. Salazar*, 691 F.3d 428, 435 (D.C. Cir. 2012) (quoting *Sw. Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000)) ("[U]nder the 'best ... data available' standard, 'the Secretary has no obligation to conduct independent studies.'").

¹⁰¹⁷ See, e.g., *San Luis & Delta-Mendota Water Auth. v. Jewell*, 747 F.3d 581, 630 (9th Cir. 2014) ("[T]he fact that science must advance further before the complicated ecosystem interactions in the Bay-Delta are fully understood does not necessarily mean that the Fish and Wildlife Service failed to rely on the best available science.")

¹⁰¹⁸ See the Harvard Letter, *supra* note 6.

¹⁰¹⁹ The Proposal is also arbitrary in suggesting that science that cannot be used in setting regulations could still be used in individual permitting decisions.

market, they are concerned that they be able to take into consideration all information that is reasonably available.

Comment [9312-5004]: Commenter (PH46) writes that the rule is counter to mandates in the amended TSCA, to use the best available science and systematic reviews for chemical evaluations. Specifically, the proposed rule inappropriately codifies particular data analysis approach such as dose response modeling that should be made based on empirical considerations.

The rule is counter to the mandates in the amended TSCA to use the best available science and systematic reviews for chemical evaluations. In contrast, this proposed rule will have EPA ignore well-conducted, relevant studies simply because all the data are not publicly available and/or may not conform to the rule's invalid assumptions about good laboratory practices and guidelines, studies, and dose response modeling. This is inconsistent with modern science and the TSCA statutory mandates. Further, EPA's risk evaluation framework rules under TSCA mandate the use of systematic review methods. Well conducted systematic reviews consider the entire body of scientific evidence and the quality and strength of all relevant individual studies are considered to reach the overall conclusion.

Comment [6857-2945]: Commenter (6879) writes that EPA rules and regulations have been critical to the protection of wildlife, natural habitats, and the ecosystem services they provide to communities and the economy. This includes protection of endangered and other wildlife from pesticides and other toxic substances under the FIFRA and the TSCA.

These laws require EPA to use the "best available" science, or all "reasonably available" science and information. By excluding high-quality peer-reviewed and validly published science from the regulatory decision-making process, the proposed regulation directly contravenes the specific mandate of these statutes. And by deliberately excluding the best science available, the rule also contravenes the Congressional mandates for these statutes and undermines their public health and environmental protection purposes.

Comment [6163-1276]: Commenter (6133) writes that the proposal's peer review provision lacks any statutory basis, is vague and contrary to existing requirements for peer review.

In addition to addressing how and whether the agency will consider science, the Proposal also contains a seemingly unrelated provision regarding agency peer review. The Proposal, in § 30.7, reads:

What role does independent peer review in this section?

EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

Because transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and

weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results.

83 Fed. Reg. at 18,774.

There is no statutory authority for EPA to “conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” The federal statutes that EPA lists as putative authority for the Proposal provide no authority for proposed § 30.7. See TSCA, as amended, section 10, 15 U.S.C. 2609, and the APA). The claimed authorities that EPA lists do not mention peer review or even allude to the concept. *Id.* Neither the Proposal nor accompanying docket materials identify any provision of any federal statute that authorizes EPA to promulgate proposed § 30.7. Our own research revealed no provision of any federal statute that authorizes EPA to promulgate proposed § 30.7.

When Congress writes federal statutes, Congress knows how to create legal authority for peer review, who shall conduct that peer review, what role, if any, that EPA or other parties will play, and how that peer review may be conducted. None of the provision in the law authorize EPA's Proposal in § 30.7. Instead, the statutes require that EPA use peer-reviewed science, regardless of whether it would meet EPA's definition of the term in § 30.7. And in cases where the law requires EPA to conduct the review, the statutes often spell out specifically how that should happen.

Statute Provisions on Peer Review

TSCA

§ 2625. Administration

(h) Scientific standards In carrying out sections 2603, 2604, and 2605 of this title, to the extent that the Administrator makes a decision based on science, the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science, and shall consider as applicable-- (1) the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information; (2) the extent to which the information is relevant for the Administrator's use in making a decision about a chemical substance or mixture; (3) the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented; (4) the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and (5) the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models.

15 U.S.C. § 2625 (emphasis added).

§ 2617. Preemption

(b) New statutes, criminal penalties, or administrative actions creating prohibitions or other restrictions (1) In general Except as provided in subsections (c), (d), (e), (f), and (g), beginning on the date on which the Administrator defines the scope of a risk evaluation for a chemical substance under section 2605(b)(4)(D) of this title and ending on the date on which the deadline established pursuant to section 2605(b)(4)(G) of this title for completion of the risk evaluation expires, or on the date on which the Administrator publishes the risk evaluation under section 2605(b)(4)(C) of this title, whichever is earlier, no State or political subdivision of a State may establish a statute, criminal penalty, or administrative action prohibiting or otherwise restricting the manufacture, processing, distribution in commerce, or use of such chemical substance that is a high-priority substance designated under section 2605(b)(1)(B)(i) of this title.

(f) Waivers (2) Required exemptions Upon application of a State or political subdivision of a State, the Administrator shall exempt from subsection (b) a statute or administrative action of a State or political subdivision of a State that relates to the effects of exposure to a chemical substance under the conditions of use if the Administrator determines that-- (A)(i) compliance with the proposed requirement of the State or political subdivision of the State would not unduly burden interstate commerce in the manufacture, processing, distribution in commerce, or use of a chemical substance; (ii) compliance with the proposed requirement of the State or political subdivision of the State would not cause a violation of any applicable Federal law, rule, or order; and (iii) the State or political subdivision of the State has a concern about the chemical substance or use of the chemical substance based in peer-reviewed science; or (B) no later than the date that is 18 months after the date on which the Administrator has initiated the prioritization process for a chemical substance under the rule promulgated pursuant to section 2605(b)(1)(A) of this title, or the date on which the Administrator publishes the scope of the risk evaluation for a chemical substance under section 2605(b)(4)(D) of this title, whichever is sooner, the State or political subdivision of the State has enacted a statute or proposed or finalized an administrative action intended to prohibit or otherwise restrict the manufacture, processing, distribution in commerce, or use of the chemical substance.

15 U.S.C. § 2617 (emphasis added).

§ 2605. Prioritization, risk evaluation, and regulation of chemical substances and mixtures

(b) Risk evaluations (E) Metals and metal compounds In identifying priorities for risk evaluation and conducting risk evaluations of metals and metal compounds, the Administrator shall use the Framework for Metals Risk Assessment of the Office of the Science Advisor, Risk Assessment Forum, and dated March 2007, or a successor document that addresses metals risk assessment and is peer reviewed by the SAB.

15 U.S.C. § 2605 (emphasis added).

Under longstanding federal case law, when Congress authorizes an approach in one section of a statute using specific language but does not do the same in other sections of a statute, courts presume that Congress acted purposefully and did not mean to address or authorize that approach

in those other statutory sections. See, e.g., *Dean v. United States*, 556 U.S. 568 (2009) (“It is generally presumed that Congress acts intentionally when including particular language in one section of a statute but not in another.” (citing *Russello v. United States*, 464 U.S. 16, 23 (1983))). Not only are there no implied grants of authority to an agency in the other statutory sections, but the congressional decisions to authorize the approach elsewhere in the statute give even greater force to the conclusion that the agency has not been given authority where Congress did not use the same or similar authorizing language.

The EPA approach proposed in § 30.7 is even more unlawful than would be the case, independently, under this case law. Proposed § 30.7 says “EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” 83 Fed. Reg. at 18,774/2 (emphasis added). EPA proposes to bind itself (“shall”) to conduct a particular form of peer review on “all pivotal regulatory science” based on an unenforceable, non-binding OMB bulletin that has never been the subject of notice and comment rulemaking and that itself is not authorized by any federal law. To the contrary, treating the content of the unenforceable bulletin as a binding regulation would itself violate the federal statutes that EPA implements, because those statutes do not codify the bulletin, and EPA would be unlawfully codifying a mere policy preference. This EPA may not do.

This Proposal is unlawful, arbitrary, and capricious, and an abuse of EPA discretion. To reiterate, the Proposal identifies no statutory authority for EPA to conduct independent peer review for any, much less all, “pivotal regulatory science” consistent with the dense content (and exceptions) of the OMB bulletin. The Proposal identifies no statutory authority for EPA to bind itself, and future administrations, to conduct peer review only in this fashion, unless and until future notice-and-comment rulemaking is undertaken. The Proposal identifies no suggestion in statutory language or legislative history that Congress intended EPA to conduct binding peer review consistent with this OMB bulletin, notwithstanding that Congress has known about this bulletin since 2005. EPA has simply made up proposed § 30.7—with its the link to the OMB bulletin, and the putative authority for the Proposal—out of whole cloth. This EPA may not do.

1.3.4.2 TSCA (SNPRM Comments)

Comment [48-1959]: Commenter (12727) notes that several environmental statutes require EPA to ground its decision-making in scientific evidence. The TSCA requires the Administrator to “make decisions . . . based on the weight of the scientific evidence,” 15 U.S.C. § 2625(i).¹⁰²⁰

The originally proposed regulatory language (§§ 30.3, 30.5) violated these statutory commands by preventing EPA from relying on a study as “pivotal regulatory science . . . used to justify significant regulatory decisions” if dose-response data or models underlying the study were not publicly available, without regard to whether the study had been validated by other means.¹⁰²¹

¹⁰²⁰ Physicians for Soc. Responsibility, 2020 U.S. App. LEXIS 12727, at *3-4; see also id. at *26 (“EPA operates pursuant to multiple statutory mandates requiring that its decisions rest on various formulations of ‘the best available science.’ 15 U.S.C. § 2625(h).”).

¹⁰²¹ 83 Fed. Reg. at 18,773 (emphases omitted).

The SNPRM exacerbates these violations by expanding the proposed regulation's scope (§§ 30.3, 30.5) to not just pivotal *regulatory* science used to justify significant *regulatory* decisions, but also “pivotal science supporting influential scientific information.”¹⁰²²

Comment [48-2183]: Commenter (12727) writes that just as EPA is required to consider all available science when making its regulatory decisions, governing environmental and public health statutes likewise require EPA to consider all available science when releasing ISI, which often forms the basis for the agency's regulatory decisions.

For example:

- The TSCA directs that, in implementing the Act's testing requirements, manufacturing and processing notice requirements, and requirements for the prioritization, risk evaluation, and regulation of chemical substances and mixtures, EPA must make its decisions “based on the weight of the scientific evidence.”¹⁰²³ Likewise, in carrying out EPA's responsibilities under TSCA, “the Administrator shall use scientific information . . . employed in a manner consistent with the best available science.”¹⁰²⁴ Numerous other TSCA provisions emphasize EPA's obligation to consider all reasonably available scientific information when implementing TSCA's requirements.¹⁰²⁵

A rule that prohibits EPA from considering (or that downgrades) valid, high quality scientific studies when generating ISI such as the products identified above would contravene the above-noted statutory directives regarding EPA's obligation to consider all available science.

Comment [53-2007]: Commenter (11360) writes that Congress intentionally and wisely embedded peer-reviewed research in the foundation of the CAA, including requiring regular reviews of the science, explicitly recognizing that EPA needs the most current, peer-reviewed data to protect the public health. These expectations also are reflected in other public health laws that support the EPA's mission, including the TSCA. Limiting scientific evidence does not strengthen regulations or policies; rather, it is paramount that the full suite of relevant science, vetted through peer-review, inform the landscape of decision-making. Excluding relevant studies simply because they do not meet unnecessarily rigid transparency standards will adversely affect decision-making processes.

Comment [81-2191]: Commenter (12715) writes that the proposed rule conflicts with fundamental statutory requirements to use the best available science and citation to “housekeeping” authority cannot cure that defect.

Whether EPA is arbitrarily barring consideration of scientific studies or information with nonpublic underlying data or data that are not able to be independently validated, or arbitrarily ascribing less weight to such studies or information, neither approach constitutes “housekeeping,” and neither comports with statutory requirements that EPA use the best

¹⁰²² 85 Fed. Reg. at 15,405.

¹⁰²³ 15 U.S.C. § 2625(i).

¹⁰²⁴ *Id.* § 2625(h).

¹⁰²⁵ See EDF 2018 Comments [on NPRM] at 25-31.

available science. To reiterate from the 2018 Comments, EPA’s obligation with respect to the use of scientific information is clear: it must base its decisions on such criteria as the latest scientific knowledge, the best available, peer-reviewed science, and/or generally accepted scientific principles or laboratory tests. To cite just a few examples, in performing its duties, EPA must rely on the “best available science,” TSCA, 15 U.S.C. § 2625(h). EPA has repeatedly emphasized the importance of this fundamental precept, including in its 2018-2022 strategic plan, which states that one of the agency’s priorities is to “identify, assess, conduct, and apply the best available science to address current and future environmental hazards.”¹⁰²⁶

These statutory requirements apply to all aspects of EPA’s decision-making, including its scientific evaluations, adoption of regulatory standards, and development of policies. They do not permit what EPA proposes here: to either exclude or give less weight to scientific studies or information based on criteria—availability of the underlying data and ability to independently validate underlying data—that are not determinative of whether the studies or information constitute the best available science. Agencies may not adopt or implement regulations that conflict with the statutes under which they are promulgated, and an agency’s interpretation of those statutes must always at least be reasonable. See *Chevron, U.S.A., Inc. v. Nat. Res. Def. Council, Inc.*, 467 U.S. 837, 842-44 (1984). Furthermore, neither 5 U.S.C. § 301 nor any other purported housekeeping authority allows EPA to negate these statutes’ fundamental, substantive, and common-sense commands. And even assuming EPA has some inherent housekeeping authority, it cannot rely on a general grant of rulemaking authority to promulgate regulations or develop policies that are otherwise inconsistent with more specific statutory directives. *Glob. Van Lines, Inc. v. Interstate Commerce Comm’n*, 714 F.2d 1290, 1293-97 (5th Cir. 1983).¹⁰²⁷

Finally, EPA acknowledges that the statutes it administers would control in the event of a conflict between the proposed rule and those statutes, see 85 Fed. Reg. at 15,398, but that caveat cannot save the proposed rule. First, the core principle of the proposed rule is facially invalid, *i.e.*, there is no circumstance in which it would be acceptable for EPA to exclude or give less weight to relevant, probative scientific studies, models, or other information that have been validated through peer review, on the sole basis that the underlying data are not publicly available or are not able to be independently validated. EPA cannot save an invalid rule by including what amounts to a waiver procedure, because the “essence of waiver is the assumed validity of the general rule.” *Alltel Corp. v. Fed. Comm’n Comm’n*, 838 F.2d 551, 561 (D.C. Cir. 1988). Second, the agency’s essential duty in rulemaking is to exercise its subject matter expertise to enact rules that implement and further the purposes of the statutes Congress has assigned it to administer. *Chevron*, 467 U.S. at 842-44. This does not include proposing rules without first determining the source of legal authority but instead asking commenters to supply that information. Third, the agency must propose its rules with specificity and be clear as to the

¹⁰²⁶ U.S. Env’tl. Prot. Agency, Working Together: FY 2018-2022 EPA Strategic Plan, (2018) at page 42, <https://www.epa.gov/sites/production/files/2019-09/documents/fy-2018-2022-epa-strategic-plan.pdf>.

¹⁰²⁷ EPA’s citation to Clean Water Act, CERCLA, and RCRA provisions granting authority to promulgate rules to carry out the agency’s responsibilities under those statutes, 85 Fed. Reg. at 15,397, is also unavailing. Restricting consideration of the best science is neither necessary nor consistent with those statutes’ goals of protecting human health and the environment.

programs, regulations, and information to which they will apply. 5 U.S.C. § 553(b)(3); *Home Box Office, Inc.*, supra, 567 F.2d at 35-36.

Comment [89-2198]: Commenter (11403) writes that the proposed rule is not based on any valid statutory authority and is arbitrary and capricious.

a. The environmental statutory provisions cited by EPA do not authorize the proposed rule

EPA's 2018 version of this rule cited a hodgepodge of statutory authority, none of it valid. EPA at least corrected the obvious typographical errors from the previous version. However, those edits still do not grant EPA the authority to restrict science from all regulatory decision-making processes within the agency. EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, "Congress . . . does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes."¹⁰²⁸ EPA does not have the authority to alter the fundamental details of all of its regulatory schemes based on such vague provisions of law.

Section 10 of the TSCA grants the Administrator authority on research, development, collection, dissemination, and utilization of data.¹⁰²⁹ There is no mention of any type of research or data that warrants exclusion in order to carry out the purposes of the statute.

In short, the statutory provision cited by EPA does not provide authority for the proposed rule. The proposed rule fails at step one under *Chevron v. Natural Resources Defense Council* since it is unreasonable to believe that any statutory general grant of authority or any mention of EPA's oversight of other science or research programs would enable EPA to conduct rulemaking in a way that is altogether inconsistent with the rule of law. None of the cited provisions provide the authority sought by EPA, and as such the proposed rule should be withdrawn.

Comment [93-2086]: Commenter (11395) notes that TSCA specifies that "(h)azard information related to potential health and environmental hazards of the chemical substance will be reviewed in a manner consistent with best available science and weight of scientific evidence" (40 CFR 702.41(d)(2)). The TSCA definition of "best available science" goes on to list five criteria that should be considered, as applicable, one of which is "(t)he extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies or models." While this definition acknowledges the merit of independent verification, that criterion is only one of several listed and peer reviews is identified as another method of review of data quality. This is inconsistent with the SNPRM, which stipulates that studies for which data cannot be made available for reanalysis will not be considered or will be considered as less valid, even when the validity of those studies is supported by other avenues, including peer review.

Comment [97-2148]: Commenter (11479) writes that the proposed rule, as modified in the supplemental notice, would clearly interfere with the agency's use of the best available science.

¹⁰²⁸ *Whitman v. American Trucking Ass'ns, Inc.*, 531 U.S. 457 (2001).

¹⁰²⁹ "Toxic Substances Control Act," 15 U.S.C. § 2609.

For example, the policy violates laws like the TSCA and the SDWA because of the statutory requirement to use the “best available science.” That requirement does not make exception for the agency to effectively ignore certain scientific information of high quality simply because the unanalyzed data cannot be made public for reasons of privacy, confidentiality, or intellectual property. According to judicial precedent, “best available science” is defined as “all existing scientific evidence relevant to the decision” and a body of evidence that “cannot ignore existing data.”¹⁰³⁰ In addition to the “best available science” requirements, TSCA also requires EPA to take into consideration information “that is reasonably available to the Administrator.”¹⁰³¹ EPA’s own regulations define that term as “information that EPA possesses or can reasonably generate, obtain, and synthesize . . . , whether or not that information is confidential business information, [sic] that is protected from public disclosure...”¹⁰³² Not only would this proposed rule conflict with TSCA’s mandate to consider the best available science, it would challenge the method by which EPA can review the weight of the scientific evidence, which in rulemaking for TSCA is defined by a systematic review method.¹⁰³³ These reviews consider the entire body of scientific evidence, so the exclusion of certain studies based on whether the raw data and models are publicly available would render these reviews, as mandated, impossible.

In fact, virtually all of EPA’s statutory mandates require the use of the best available scientific evidence. Congress did not state in any of these laws that the agency shall only consider scientific evidence derived from studies where the underlying unanalyzed data is publicly available, nor that the evidence considered should be solely at the Administrator’s discretion.

Comment [101-2085]: Commenter (11482) writes that the proposed rule likely violates federal laws that require the EPA to use the best scientific information available to it. EPA has a duty to use the best scientific information available under several laws. For example, the TSCA requires EPA to operate “in a manner consistent with the best available science” and make regulatory decisions based on the weight of the scientific evidence.¹⁰³⁴ Numerous court cases have weighed in on the best available science standard in the context of numerous different federal laws. For example, courts have found that the agency must use the best science that is available to it at the time of the decision, not the best that might be available to it at some time in the future.¹⁰³⁵

Importantly, the critical actor under the best available science standard is the agency — the standard requires the use of the best science that is available to the agency, not necessarily available to the public. Excluding science that is available to the agency but not available to the public would thus be a violation of “best available science” provisions.

Under federal law, the agency must find a way to continue using the best available scientific data and models available to it, regardless of whether those data and models are publicly available.

July 20. Online at <https://www.gpo.gov/fdsys/pkg/FR-2017-07-20/pdf/2017-14337.pdf>, accessed June 24, 2018.

¹⁰³⁴ 15 U.S.C. § 2625(h) and (i).

¹⁰³⁵ *Chlorine Chemistry Council v. EPA*, 206 F.3d 1286 (D.C. Cir. 2000).

Excluding science whose raw data are not in the public domain runs counter to the “best available science” doctrine and is thus illegal.

Comment [125-2201]: Commenter (11495) writes that EPA’s SNPRM is at odds with provisions of multiple environmental statutes which require the Agency to consider certain high-quality scientific information. The TSCA requires the EPA Administrator to ensure that evaluation and regulation of toxic substances is “consistent with the best available science” and to use all scientific information that is “reasonably available” when making related decisions.¹⁰³⁶

Each of these provisions directs EPA to incorporate a certain quality of scientific information into its rulemaking decisions made pursuant to the statute. In particular, these requirements are designed to ensure the scientific validity of the information upon which EPA bases its actions. Mandating a high-quality scientific basis for regulatory actions is necessary to guarantee the best possible protections for public health and welfare and to minimize partisan influence in scientific decision-making.

The SNPRM, however, would impermissibly prohibit the agency from considering of relevant and high-quality scientific studies whenever the data underlying the study are not publicly available—in direct contravention of the statutory directives that mandate, for example, consideration of the “best available science.” None of the provisions requires, or even suggests, that EPA only consider information that is publicly available. It strains the plain meaning of words like “best,” “latest,” and even “appropriate” to suggest that they permit the unscientific requirement that all data be publicly available.

EPA “cannot ignore available . . . information.”¹⁰³⁷ Courts have held that “best available data” requirements “prohibit[] [an agency] from disregarding available scientific evidence that is in some way better than the evidence [it] relies on.”¹⁰³⁸ Furthermore, a plaintiff may establish a violation of a “best available science” requirement by “point[ing] to any scientific evidence that the agency failed to consider.”¹⁰³⁹ The SNPRM would undoubtedly preclude EPA from considering certain studies and scientific information that is “better” or the “best available,” simply because the study’s underlying data is not publicly available, thereby failing to satisfy Congressional directives and undermining the quality of regulatory decisions.

Likewise, EPA cannot avoid the statutory directives to consider high-quality scientific information simply by assigning a lesser weight to such information when the underlying data are not publicly available, as the Agency alternatively proposes. The SNPRM’s alternative proposal is designed to have largely the same pernicious effects as flatly prohibiting consideration of studies lacking publicly available data. Just as with the primary proposal, EPA’s

alternative proposal would limit the agency's consideration of the best available science in making important regulatory decisions, and is, therefore, arbitrary, and capricious.

The effect of the Proposed Rule is inconsistent with EPA's view that the SNPRM is "intended to be consistent with the statutes that EPA administers and EPA plans to implement this procedural rulemaking in accordance with all applicable statutory and regulatory requirements."¹⁰⁴⁰ EPA attempts to resolve this inconsistency by stating that "in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control."¹⁰⁴¹ However, as discussed below, EPA lacks the statutory authority to issue a rule this broad, even when it claims that it will avoid statutory conflicts.

Comment [133-1187]: Commenter (11894) notes that TSCA §5 requires EPA to review the likelihood that a new chemical will present an unreasonable risk to human health or the environment before it can be marketed. At present, much of the information that EPA reviews rests on CBI or otherwise would not meet the requirements of the proposal. To fill some of these gaps, EPA relies on models that likewise would often not meet those requirements.

Once again, EPA has failed to address how it can refuse to apply these new requirements to data and models used to support PMNs given express direction from Congress to the agency to consider data quality. Indeed, yet again, EPA has not addressed the issue of applicability to this program at all or addressed the impacts on the public health or the environment if it did. Nor, once again, has EPA explored the resources that would be needed to respond.

Comment [151-1348]: Commenter (12405) discusses Parkinson's disease research in TSCA determinations.

The *TSCA* is EPA's primary authority for regulating non-pesticide chemicals. Under TSCA, EPA can secure information on new and existing chemicals and regulate chemicals it determines pose an unreasonable risk to public health or the environment.¹⁰⁴² All studies used would be subject to the proposed rule.

In late 2016, the EPA moved to ban toxic chemical TCE due to health risks, including a risk of Parkinson's disease,¹⁰⁴³ though this action is still pending.¹⁰⁴⁴ The original recommendation was based on hundreds of studies, many of which would not be considered under the proposed rule.

In these relatively small studies, a distinctive characteristic — people who worked together and twins — respectively, combined with the most basic additional medical information could render

¹⁰⁴⁰ See 85 Fed. Reg. at 15,398.

the participants identifiable. Both TCE studies are highly cited, and scientists have replicated the findings. To exclude evidence that TCE exposure is a risk factor for Parkinson's disease is illogical and does not serve the best health interests of the American public.

Furthermore, the proposed rule does not comply with the letter of TSCA. TSCA and other statutes administered by EPA requires the Agency use the "best available science"¹⁰⁴⁵ and none require the Agency to access to raw data. TSCA additionally requires that EPA consider all information that is reasonably available to the administrator.¹⁰⁴⁶ As drafted, the proposed rule violates these statutes because it would force the Agency to ignore some of the best information available.

Comment [158-1398]: Commenter (12423) writes that EPA has already developed and employed the systematic review process to screen and prioritize studies used in TSCA risk assessments. Like this proposed rule, that process discounts or excludes studies for which underlying data are not publicly available. Consequently, whether intended or not, many studies providing tribally relevant data are likely to be excluded. Like in the current rule, reporting issues are conflated with study quality. The process is inconsistent with best practices in systematic review, is unscientific and arbitrary, and open to bias.

As the EPA tribal partnership group that works on TSCA related issues, the National Tribal Toxics Council (NTTC) would like to know how this rule would and could affect risk evaluations and use limits done under TSCA authority. Together with the systematic review process, this rule would multiply bias against studies with relevant tribal data and increase the likelihood that studies with relevant tribal information may not be considered. Much of tribal data is published in various reports and grey literature that is already discounted via systematic review. With generally fewer studies and data available that are relevant for tribes and the myriad unique exposures to begin with, how might excluding valid studies impact the agency's ability to estimate risk to tribes?

NTTC requested a briefing from EPA on these points on 04/20/2020 and the request was not met. We are left to assume that this rule will apply to TSCA risk evaluations and other TSCA activities and, if so, this rule will be extremely detrimental to ongoing efforts by the Office of Pollution Prevention and Toxics (OPPT) and the Office of Research and Development (ORD) to represent tribes in risk assessment, as per TSCA mandate to consider potentially exposed and susceptible subpopulations.

Conclusion 3: The rule will significantly impact EPA's capacity to carry out the TSCA protections for potentially exposed and susceptible subpopulations, as mandated by Congress in its 2016 bipartisan amendment.

Comment [160-1456]: Commenter (1431) remains concerned that in its desire to ensure that the data underlying its significant regulatory actions and ISI are publicly available, EPA may exclude information that is most relevant to its assessment of risks to human health and the

¹⁰⁴⁵ Frank R. Lautenberg Chemical Safety for the 21st Century Act Pub. L. No 114-182 (codified as amended at 15 USC §2625 (h)) available at: <https://uscode.house.gov/view.xhtml?path=/prelim@title15/chapter53&edition=prelim>

¹⁰⁴⁶ Id. at §2625 (k).

environment. In particular, excluding information that cannot be made publicly available would slow the development and implementation of alternative test methods and strategies to replace animal testing. Such approaches can provide information of equivalent or better scientific quality and relevance for risk assessment, and their development and implementation are mandated by the TSCA. This potential conflict between public accessibility and continued progress in regulatory science has been recognized by EPA's OPPT. In its Strategic Plan to Promote the Development and Implementation of Alternative Test Methods Within the TSCA Program, OPPT states that public access to the datasets used to build models that predict human outcomes may not be possible in some cases, because OPPT uses CBI to update and refine its models, and these activities are critical to its mission of evaluating chemicals under TSCA. Under the proposed rule and SNPRM, OPPT could be limited to using only publicly accessible information and open source models. As Robert DeWoskin, etioLogic LLC, notes in his comments on the proposed rule, in some cases, results from commercially available models can be used without the need to release proprietary code, and requiring commercial model developers to release this intellectual property would likely restrict their ability to continue developing and supporting their models.¹⁰⁴⁷ In addition, sponsors of new industrial chemicals and agrochemicals sometimes submit chemical and toxicological information derived from proprietary alternatives in lieu of certain animal tests. Under the proposed rule and SNPRM, EPA may be unable to consider this information, resulting in animal testing that would, in the case of industrial chemicals at least, be conducted in violation of TSCA provisions to use available nonanimal test methods and strategies. Finally, as numerous stakeholders have commented, the proposed rule could force EPA to exclude from its consideration epidemiologic studies that use confidential health data. Such studies are frequently the most relevant to protecting public health as they assess outcomes in humans following real world exposures. The exclusion of this information may lead EPA to increase its reliance on information from less relevant animal toxicity studies.

Comment [172-1551]: Commenter (12465) writes that while the supplemental proposal notes that “in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control,” therein lies significant ambiguity as to the applicability and scope of regulation designed to underlie the basis of EPA regulatory science decisions. The details on how the Agency would navigate these potential regulatory conflicts should be considered and advanced concurrently with the current proposal to effect maximum stakeholder input. For example, EPA needs to fully understand the potential vulnerability this transparency rule would create for regulatory decisions made under the TSCA and the FIFRA that rely on CBI as well as the extent to which models relied on by both programs comply with the rule as proposed. It is possible that a significant number of EPA decisions under FIFRA and TSCA could be successfully challenged if this rule were finalized as proposed.

Comment [187-1709]: Commenter (12720) notes that EPA cites 15 U.S.C. § 2609 under the TSCA as support for this rule. But that section states only that the “Administrator shall, in consultation and cooperation with the Secretary of Health and Human Services and with other heads of appropriate departments and agencies, conduct such research, development, and monitoring as is necessary to carry out the purposes of this chapter.” It does not allow EPA to *limit* the type of data considered in regulatory decisions, nor does it draw a distinction between

¹⁰⁴⁷ Robert DeWoskin, etioLogic LLC. EPA-HQ-OA-2018-0259-0562.

dose-response data and other types of data. TSCA does not support the proposed rule. The absence of any such congressional distinction or restriction makes it all the more obvious that EPA invented and added the distinction and restrictions in the Proposal and Supplemental Proposal as a matter of its own policy preferences, contrary to the Act. This EPA may not do.

Comment [198-2209]: Commenter (13549) writes that as a baseline, whether working on “significant regulatory actions,” ISI, or anything requiring the consideration of science, EPA must base its decisions on the best available science. Anything less is nonsensical, arbitrary, and in violation of the environmental laws EPA is charged with implementing. The SNPRM does not maintain this baseline, but instead provides for ways EPA would exclude and lessen consideration of the best available science. Therefore, the SNPRM, along with the proposed rule, must be withdrawn. See, *e.g.*, 15 U.S.C. § 2625(h) (TSCA provision requiring the use of best available science); see also 83 Fed. Reg. at 18,769 (“The best available science must serve as the foundation of EPA’s regulatory actions.”).

Comment [199-2212]: Commenter (12403) writes that the proposal is also inconsistent with provisions in the TSCA.

1.3.5 Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)/ Resource Conservation and Recovery Act (RCRA) (NPRM and SNPRM Comments).

Comment: Sections 1.3.5.1 and 1.3.5.2 of this Chapter present comments received on the NPRM (Section 1.3.5.1) and SNPRM (Section 1.3.5.2) related to the EPA’s legal authority for the rule under the CERCLA and RCRA. The EPA provides the following general response to these comments:

Response: EPA appreciates your comments. As discussed in Section I.C of the final rule preamble and in this RTC document in Section 1.2, EPA has decided it is most appropriate to rely on its authority to promulgate housekeeping regulations, rather than any of the substantive environmental statutes cited in the 2018 proposal or the 2020 supplemental proposal as legal authority for the rule. EPA intends to promulgate future science transparency rules under its substantive environmental statutes. Additionally, the final rule states in § 30.3 that “[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”

1.3.5.1 CERCLA/RCRA (NPRM Comments)

1.3.5.1.1 CERCLA

Comment [6112-1554]: Commenter (6137) provides that EPA also cites to provisions under the CERCLA as authority for its Proposed Rule. However, upon examination, these provisions likewise provide no legal support for the Proposal.

The first provision upon which EPA relies – Section 115 – is inapposite. It merely sets out goal dates for EPA to begin assessment and remediation of facilities on the NPL and is entirely

irrelevant to the issues of the Proposed Rule. See 42 U.S.C. § 9616. While the second provision upon which EPA relies – Section 311 – is at least relevant to the issues of the Proposed Rule, it nonetheless conflicts with the proposition that the Proposed Rule espouses. It requires the Department of HHS, in consultation with EPA, to establish and support a research program consisting of:

Basic research (including epidemiologic and ecologic studies) which may include each of the following:

- (i) Advanced techniques for the detection, assessment, and evaluation of the effects on human health of hazardous substances.
- (ii) Methods to assess the risks to human health presented by hazardous substances.
- (iii) Methods and technologies to detect hazardous substances in the environment and basic biological, chemical, and physical methods to reduce the amount and toxicity of hazardous substances.

42 U.S.C. § 9660(a)(1)(A); see also id. § 9660(c) (authorizing EPA to conduct research on the “detection, assessment, and evaluation of the effects on and risks to human health of hazardous substances and detection of hazardous substances in the environment”). These provisions say nothing about authorizing EPA to adopt rules at all, much less rules limiting reliance on studies that do not meet the criteria of the Proposed Rule. Section 311(a) merely provides for the Department of HHS to establish and support certain research programs. It does not give EPA any authority at all, much less authority to limit the type of studies that can be relied upon for purposes of implementing CERCLA’s operative provisions. Accordingly, CERCLA provides no support for EPA’s actions here.

Comment [6112-1591]: Commenter (6137) contends that under CERCLA, Congress created a hazardous substance research and classification regime based largely on studies that “determine relationships between exposure to toxic substances and illness”—the very dose response studies that the Proposed Rule would stifle. 42 U.S.C. § 9604(i)(1). The statute requires EPA and ATSDR to annually update a list of hazardous substances commonly found at facilities on the NPL that the agencies determine “pos[e] the most significant potential threat to human health due to their known or suspected toxicity to humans and the potential for human exposure to such substances . . .” Id. § 9604(i)(2)(A), (B). EPA must also develop guidelines for ATSDR’s toxicological profiles of each listed substance, which must include “available toxicological information and epidemiologic evaluations . . . to ascertain the levels of significant human exposure for the substance and the associated acute, subacute, and chronic health effects.” Id. § 9604(i)(3)(A). For any substance for which adequate information is unavailable, EPA and ATSDR must create a program of toxicological and epidemiological research to develop that information. Id. § 9604(i)(5).

Congress specified that CERCLA health assessments include:

preliminary assessments of the potential risk to human health posed by individual sites and facilities, based on such factors as the nature and extent of contamination, the existence of potential pathways of human exposure (including ground or surface water contamination, air emissions, and food chain contamination), the size and potential susceptibility of the community within the likely pathways of exposure, the comparison of expected human exposure levels to the short-term and long-term health effects associated with identified hazardous substances and any available recommended exposure or tolerance limits for such hazardous substances, and the comparison of existing morbidity and mortality data on diseases that may be associated with the observed levels of exposure.

42 U.S.C. § 9604(i)(6)(F). And when assessing alternate remedial actions under CERCLA, EPA must “at a minimum, take into account . . . the persistence, toxicity, mobility, and propensity to bioaccumulate of such hazardous substances and their constituents [and] short- and long-term potential for adverse health effects from human exposure.” Id. § 9621(b)(1).

EPA’s Proposed Rule would prevent the Agency from using the very types of health assessments that Congress mandates. It undermines both the letter and spirit of the statute and is therefore unlawful.

Comment [6118-1728]: Commenter (6143) asserts that EPA has issued its proposed rule on Strengthening Transparency in Regulatory Science pursuant to its authority under several environmental statutes that that it implements, including the CAA; CWA; SDWA; RCRA; CERCLA; EPCRA; FIFRA; and TSCA.¹⁰⁴⁸ This proposed action is fully consistent with the authorities and objectives laid out in those statutes. EPA must ensure that any final action it takes on this proposal continues to respect the balance reflected in those statutes between sound, transparent science, and legitimate privacy interests.

Comment [6152-642]: Commenter (6122) EPA cites multiple statutory provisions in an attempt to support the proposed rule that it believes authorize this type of rulemaking, “including provisions providing general authority to promulgate regulations necessary to carry out the Agency’s functions under these statutes and provisions specifically addressing the Agency’s conducting of and reliance on scientific activity to inform those functions . . .”¹⁰⁴⁹ None of the specific statutory provisions provided by EPA provide specific authority for EPA to fundamentally rework the foundational processes it uses to assess and include/reject science. Indeed, if such authority existed, one would have expected EPA to have discovered this authority many decades earlier. Instead, EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, “Congress...does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes.”¹⁰⁵⁰ And if this is true, neither can the EPA alter the fundamental details of all of its regulatory schemes based on such vague provisions of law. We review each of the provisions listed by EPA, none of which

¹⁰⁴⁸ 83 Fed. Reg. at 18,769

¹⁰⁴⁹ Proposed rule at 18769.

¹⁰⁵⁰ *Whitman v. American Trucking Assns., Inc.*, 531 US 457 (2001).

discuss transparency, dose response, pivotal regulatory science, benefit-cost calculation, or changing “agency culture,” the stated goals of this rulemaking.

Section 115 of the CERCLA and Executive Order 12580 authorize the president to delegate duties under CERCLA and designate EPA as the statute’s Administrator.¹⁰⁵¹ This delegation provision provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is “necessary” to the carrying out functions under CERCLA. EPA points to another section as a parallel citation, which addresses assessment, listing, and evaluation of facilities, and directs commencement of remedial investigations and feasibility studies and commencement of remedial actions.¹⁰⁵² This provision is irrelevant to the proposed rule, we will assume that the inconsistency is a mere typographical error and not intended to cite additional statutory authority.

Section 311 of the CERCLA directs the Administrator in the use and development of research and training tools.¹⁰⁵³ The section does not mention transparency or any of the other undefined terms that EPA uses like “dose response” and “benefit-cost calculation.”

Comment [6155-2632]: Commenter (6125) asserts that it is clear from even a brief look that these provisions require EPA to consider all the best available science, without authorizing, or even mentioning any of the per se restrictions based on “transparency” that EPA has proposed to use as a universal overriding rule. For these reasons, EPA must justify its proposal as a proper exercise of its authority under each of the statutory provisions whose operation it would affect - provisions that the agency does not even cite. It is the job of the proposer, not the commenters, to survey these provisions and provide the needed justification.

In several statutes Congress has explicitly told EPA how to use science in decision-making. The commenter notes that the provisions all use mandatory language directing EPA to use reliable and relevant scientific information -- and further specify how to do so. They all direct that decisions regarding protection of public health be based on the full range of relevant scientific information, in some cases specifying how to identify what information to use. None of them give EPA discretion to ignore such information for any of the reasons set forth in the proposal.

Comment [6155-2724]: Commenter (6125) asserts that other provisions prescribe factors EPA must use in making decisions. The CERCLA requires that EPA rules setting cleanup priorities “shall be based upon relative risk or danger to public health or welfare or the environment... taking into account to the extent possible” seven enumerated factors related to risk.

Like the express science provisions discussed above, both of these provisions are mandatory and prescribe specific factors EPA must assess. Neither offers any basis for failing to consider such factors or evidence regarding such factors because it is supported by science that is not “transparent.” When Congress wished to limit available science to information that is publicly available, it has done so. See CWA Section 311(a)(27), 33 USC 1321(a)(27) (for purposes of addressing oil and hazardous substance liability, “best available science” is defined as evidence

¹⁰⁵¹ “Comprehensive Environmental Response, Compensation, and Liability Act,” 42 U.S.C. 9515.

¹⁰⁵² “Comprehensive Environmental Response, Compensation, and Liability Act,” 42 U.S.C. 9516.

¹⁰⁵³ “Comprehensive Environmental Response, Compensation, and Liability Act,” 42 U.S.C. 9660.

that “uses peer reviewed and publicly available data”). Its failure to impose such limits on the use of data or science in the provisions discussed above is thus purposeful. As noted, the proposal does not even mention any of these relevant statutory requirements governing the use of science or data or information, much less explain how any of them could authorize EPA to make a decision without using information that is relevant to decision-making, solely for lack of transparency and regardless of reliability or relevance. None of these statutes provide EPA with any authority to pick and choose what reliable and useful science to use or ignore specific studies based on transparency. While the proposal misleadingly pays lip service to using the best available science, it would expressly “preclude” the use of reliable and available science that is not, in its characterization, “transparent,” regardless of whether it is the best available science. The proposal does not even mention the governing statutory requirements, much less explain how its approach is consistent with them.

Comment [6163-1107]: Commenter (6133) contends that under the CERCLA, EPA cites 42 U.S.C. § 9616 as authority, but that section merely provides a schedule for the assessment and remediation of Superfund sites. It is entirely unclear what this has to do with the subject matter of the Proposal. EPA does not state specifically which provision of 42 U.S.C. § 9616 it believes authorizes the Proposal, nor does the Proposal even explain the reference. Thus, the citation fails to provide sufficient notice for the public to comment on the proposed rule.

EPA also cites 42 U.S.C. § 9660, which has many subsections. This broad citation also fails to provide sufficient notice for the public to comment on the proposed rule. Subsections (a), (b), and (c) require the Secretary of Health and Human Services (HHS) and the Administrator of EPA to establish research programs on the effects of hazardous substances on human health. But nothing in those sections limits EPA’s consideration of studies in which the data can be made public or draws a line between dose-response data and other types of data. The absence of any such congressional distinction or restriction makes it all the more obvious that EPA invented and added the distinction and restrictions in the Proposal as a matter of its own policy preferences, contrary to the Act. This EPA may not do. CERCLA does not authorize the Proposal.

Comment [6163-1139]: Commenter (6133) provides that under CERCLA, EPA has power to clean up sites that are contaminated with hazardous substances, and to assure that responsible parties pay for such clean up. CERCLA requires EPA to issue regulations that identify hazardous substances that “present substantial danger to the public health or welfare or the environment,” and that specify the quantities of such substances that trigger the Act’s notification requirements. 42 U.S.C. § 9602(a). The Proposal contradicts this statutory mandate because it allows EPA to arbitrarily exclude some studies solely because the underlying data cannot be made public. Under the statute, EPA is required to use all relevant studies in determining whether a substance presents a substantial danger to people or the environment.

CERCLA also requires the President to promulgate and revise the National Contingency Plan for the removal of hazardous substances. *Id.* § 9605(a), (b). The President has delegated that authority to EPA. Exec. Order No. 12580, 52 Fed. Reg. 2923 (1987); Exec. Order No. 12777, 56 Fed. Reg. 54757. The Plan must include criteria for determining priorities “based upon relative risk or danger to public health or welfare or the environment,” taking into account enumerated factors. 42 U.S.C. § 9605(a)(8)(A). The Proposal conflicts with this section because it would

direct EPA to disregard relevant studies solely because the underlying data could not be made public, even if those studies shed light on the enumerated factors.

CERCLA's non-rulemaking provisions also show that Congress did not intend for studies to be excluded from consideration simply because the underlying data cannot be made public. For example, CERCLA authorizes the President to address hazardous substance releases that pose an "imminent and substantial danger to the public health or welfare," and to "undertake such investigations, monitoring, surveys, testing, and other information gathering" as necessary to determine "the extent of danger to the public health or welfare or to the environment." Id. § 9604(a), (b). This shows that Congress's purpose in enacting CERCLA was to address the serious public health and environmental threats of hazardous substance releases. That purpose would be undermined if EPA could refuse to consider relevant studies only because the underlying data cannot be made public. EPA also has co-responsibility with the ATSDR to establish a registry of diseases relating to toxic substance exposure, as well as to create a list of hazardous substances found at Superfund sites, prepare a toxicological profile of those substances, and determine whether adequate information on the health effects of those substances exists. Id. § 9604(i). The statute specifically lists the types of studies and data that should be considered in determining whether adequate information exists and assessing the need for further research. Id. § 9604(i)(5); see also id. § 9604(i)(13). The statute does not exclude studies whose underlying data cannot be made public. In short, the Proposal contradicts both the statutory language and the purpose of CERCLA.

Comment [6340-1457]: Commenter (6362) states that the provisions cited by EPA under the CAA, the CWA, the SDWA, the CERCLA, and the EPCRA in support of its authority to develop and implement its proposed rule all provide broad regulatory authority to promulgate regulations "as are necessary to carry out [the Administrator's] functions" under the statute. [...]

Comment [6343-2722]: Commenter (6465) provides that they further support EPA's objective of implementing this policy in a robust and consistent manner across its regulatory determinations. In particular, in order to robustly and consistently implement its scientific transparency standards, EPA should clarify that the science that is used in establishing remedial action performance standards for response actions under the of 1980 and for RCRA corrective actions is subject to EPA's proposed standards for ensuring transparency in regulatory science.

Clean-up obligations under CERCLA and corrective action obligations under RCRA are among the most critical environmental issues that impact industrial manufacturing companies. Between 1980 and 2015, private parties committed more than \$35 billion in cleanup costs, with several individual CERCLA matters having cleanup costs in excess of \$1 billion.¹⁰⁵⁴ Consequently, many CERCLA clean-ups constitute the magnitude of significant regulatory actions under Executive Order 12866 for a "significant regulatory action."

Comment [6353-2323]: Commenter (6375) states that EPA solicits comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation. (pg. 18,771). EPA's statement concerning its legal authority could be enhanced by reference to

¹⁰⁵⁴ <https://www.epa.gov/enforcement/superfund-enforcement-35-years-protecting-communities-and-environment> (Expired Link)

statutory provisions that require it to rely on “accurate,” “useful,” or “best” data. For example, section 108(a)(2) requires that the Administrator issue air quality criteria that “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health and welfare . . .” 42 U.S.C. § 7408(a)(2). Increasing the transparency of regulatory science and ensuring that it is reproducible helps in evaluating its accuracy and usefulness.

Furthermore, making data and methods underlying regulatory decisions publicly available is not new. Guidelines issued by both the OMB and EPA implementing the IQA, Treasury and General Government Appropriations Act for Fiscal Year 2001, § 515, P.L. No. 106-554, 114 Stat. 2763 (Dec. 21, 2001), emphasize the importance of reproducibility in assessing the quality and utility of data used in making regulatory decisions. It appears the OMB’s IQA guidelines recognize that the reproducibility of underlying science helps to ensure the integrity of agency decisions and explain that, “[m]aking the data and methods publicly available will assist in determining whether analytic results are reproducible.” 67 Fed. Reg. 8452, 8460 (Feb. 22, 2002) (OMB IQA Guidelines).

EPA’s IQA guideline¹⁰⁵⁵ states: “A higher degree of transparency about data and methods will facilitate the reproducibility of such information by qualified third parties, to an acceptable degree of imprecision. . . . It is important that analytic results for influential information have a higher degree of transparency regarding (1) the source of the data used, (2) the various assumptions employed, (3) the analytic methods applied, and (4) the statistical procedures employed.”

EPA should also consider replacing some of the citations it provides for its legal authority with others that might be more relevant. For example, the Agency may want to cite 42 U.S.C. § 6981, on research, instead of 42 U.S.C. § 6979, which concerns “Labor standards.” In addition, section 115 of CERCLA, 42 U.S.C. § 9615, which authorizes regulations, might be a more appropriate citation than section 116 of that Act, 42 U.S.C. § 9616, which specifies schedules for assessment and evaluation of facilities subject to the Act’s requirements.

Comment [6353-2328]: Commenter (6375) states that EPA solicits comment on whether alternative or additional regulatory or other policy vehicles are appropriate to establish and implement these policies, and whether further regulatory or other policy vehicles at the programmatic or statutory level would be appropriate as alternative or additional steps the agency may take to further the policies articulated in Section II. (pg. 18,771 of the NPRM FR notice).

The regulatory language that EPA proposes provides general requirements that apply to the Agency’s use of science under the many statutes that it implements. The generality of the proposed regulations may be a function of the diverse purposes of those statutes. Specifically, some of these statutes focus on removal from (*e.g.*, CERCLA), the environment. The scientific analyses required for these different programs and the sources of the scientific information

¹⁰⁵⁵ EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency. Pg. 21 (Oct. 2002, as amended June 24, 2004 & May 13, 2005) (EPA IQA Guidelines).

underlying those analyses differ. The Agency should consider supplementing the general language that it has proposed with statutory specific regulations. A statutory-specific rulemaking would provide greater certainty going forward.

Comment [6779-4123]: Commenter (6801) provides that the CERCLA, commonly known as Superfund, was enacted by Congress on December 11, 1980. This law created a tax on the chemical and petroleum industries and provided broad Federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. EPA, Superfund: CERCLA Overview, <https://www.epa.gov/superfund/superfund-cercla-overview> While the space allotted to this comment does not permit a thorough discussion of CERCLA's history, EPA discusses the many chemical spills that led to CERCLA and includes computerized graphics at this address: <https://www.epa.gov/superfund/superfund-history>

The EPA's numerous CERCLA regulations are in print in the CFR. Electronic versions can be found at <https://www.gpo.gov/fdsys/browse/collectionCfr.action?collectionCode=CFR> (official) or <https://www.ecfr.gov/cgi-bin/retrieveECFR?gp=1&SID=d5cf8817453753f37820f1e458cfd52a&ty=HTML&h=L&mc=true&n=pt40.30.307&r=PART> (unofficial, but more current).

The adoption or amendment of numerous EPA regulations require good scientific data including private medical data protected by privacy laws such as HIPAA, as well as data that is private and or difficult to reproduce for other reasons (for example, endangered wildlife surveys that may not be able to be repeated without impermissibly harming the wildlife or studies that require access to private land).

Examples of such good data and studies that led to CERCLA and/or the related regulations include: https://www.health.ny.gov/environmental/investigations/love_canal/lcreport.htm https://www.health.ny.gov/environmental/investigations/love_canal/docs/report_public_comment_final.pdf <https://archive.epa.gov/epa/aboutepa/love-canal-tragedy.html> <http://www.gendisasters.com/new-jersey/13273/logan-township-nj-chemical-explosion-dec-1977>

An example of a regulation that may not have been adopted if the proposed regulation was in effect, 40 CFR Part 355 Sub Part C Section 355.33 provides:

355.33 What release quantities of EHSs and CERCLA hazardous substances trigger the emergency release notification requirements of this subpart?

The release of a reportable quantity (RQ) of an EHS or CERCLA hazardous substance within any 24-hour period triggers the emergency release notification requirements. RQs for EHSs are listed in Appendices A and B of this part in the column labeled RQ. RQs for CERCLA hazardous substances are listed in Table 302.4 of 40 CFR 302.4 in the column labeled final RQ.

Obviously, any revision of the rule or of the RQs listed in Table 302.4 of 40 CFR 302.4 in the column labeled 'final RQ' would require a good scientific basis. That would include data protected by privacy laws such as HIPAA.

Unfortunately, virtually all EPA's CERCLA regulations suffer from the same defect.

Comment [8750-1968]: Commenter (9227) contends that EPA arbitrarily failed to consider the far-reaching implications this Proposal could have on inter-agency coordination and consultation given that other agencies normally rely on research potentially excluded by the Proposal.¹⁰⁵⁶

Consultation Provisions in the CERCLA

§311(a)(1)

Research, Development, and Demonstration

The Secretary of HHS...in consultation with the Administrator, shall establish and support a basic research and training program...consisting of the following:

(A) Basic research (including epidemiologic and ecologic studies) which may include each of the following:

(i) Advanced techniques for the detection, assessment, and evaluation of the effects on human health of hazardous substances.

(ii) Methods to assess the risks to human health presented by hazardous substances.

(iii) Methods and technologies to detect hazardous substances in the environment and basic biological, chemical, and physical methods to reduce the amount and toxicity of hazardous substances.

(B) Training, which may include each of the following:

(i) Short courses and continuing education for State and local health and environment agency personnel and other personnel engaged in the handling of hazardous substances, in the management of facilities at which hazardous substances are located, and in the evaluation of the hazards to human health presented by such facilities.

(ii) Graduate or advanced training in environmental and occupational health and safety and in the public health and engineering aspects of hazardous waste control.

¹⁰⁵⁶ See *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) ("Normally, an agency rule would be arbitrary and capricious if the agency has . . . entirely failed to consider an important aspect of the problem.")

(iii) Graduate training in the geosciences, including hydrogeology, geological engineering, geophysics, geochemistry, and related fields necessary to meet professional personnel needs in the public and private.

(a) sectors and to effectuate the purposes of this Act.

§311(a)(2)

Research, Development, and Demonstration

The Director of the NIEHS shall cooperate fully with the relevant Federal agencies referred to in subparagraph (A) of paragraph (5) in carrying out the purposes of this section.

§311(a)(5)

Research, Development, and Demonstration

To assist in the implementation of this subsection and to aid in the coordination of research and demonstration and training activities funded from the Fund under this section, the Secretary shall appoint an advisory council (hereinafter in this subsection referred to as the “Advisory Council”) which shall consist of representatives of the following:

- A. The relevant Federal agencies.
- B. The chemical industry.
- C. The toxic waste management industry.
- D. Institutions of higher education.
- E. State and local health and environmental agencies.
- F. The general public.

§311(a)(6)

Research, Development, and Demonstration

Within nine months after the date of the enactment of this subsection, the Secretary, acting through the Director of the NIEHS, shall issue a plan for the implementation of paragraph (1). The plan shall include priorities for actions under paragraph (1) and include research and training relevant to scientific and technological issues resulting from site specific hazardous substance response experience. The Secretary shall, to the maximum extent practicable, take appropriate steps to coordinate program activities under this plan with the activities of other Federal agencies in order to avoid duplication of effort. The plan shall be consistent with the need for the

development of new technologies for meeting the goals of response actions in accordance with the provisions of this Act. The Advisory Council shall be provided an opportunity to review and comment on the plan and priorities and assist appropriate coordination among the relevant Federal agencies referred to in subparagraph (A) of paragraph (5).

§311(c)

Research, Development, and Demonstration

HAZARDOUS SUBSTANCE RESEARCH.—The Administrator may conduct and support, through grants, cooperative agreements, and contracts, research with respect to the detection, assessment, and evaluation of the effects on and risks to human health of hazardous substances and detection of hazardous substances in the environment. The Administrator shall coordinate such research with the Secretary of HHS, acting through the advisory council established under this section, in order to avoid duplication of effort

§104(i)(4)

Response Authorities

The Administrator of the ATSDR shall provide consultations upon request on health issues relating to exposure to hazardous or toxic substances, on the basis of available information, to the Administrator of EPA

§104(i)(5)(A)

Response Authorities

For each hazardous substance listed pursuant to paragraph (2), the Administrator of ATSDR (in consultation with the Administrator of EPA and other agencies and programs of the Public Health Service shall assess whether adequate information on the health effects of such substance is available. For any such substance for which adequate information is not available (or under development), the Administrator of ATSDR, in cooperation with the Director of the National Toxicology Program (NTP), shall assure the initiation of a program of research designed to determine the health effects (and techniques for development of methods to determine such health effects) of such substance.

§104(i)(6)(C)

Response Authorities

In determining the priority in which to conduct health assessments under this subsection, the Administrator of ATSDR, in consultation with the Administrator of EPA, shall give priority to those facilities at which there is documented evidence of the release of hazardous substances, at which the potential risk to human health appears highest, and for which in the judgment of the Administrator of ATSDR existing health assessment data are inadequate to assess the potential risk to human health as provided in subparagraph (F). In determining the priorities for conducting health assessments

§107(c)

Abatement Action

Within one hundred and eighty days after enactment of this Act, the Administrator of the EPA shall, after consultation with the Attorney General, establish and publish guidelines for using the imminent hazard, enforcement, and emergency response authorities of this section and other existing statutes administered by the Administrator of the EPA to effectuate the responsibilities and powers created by this Act.

§120(e)(1)

Federal Facilities

Not later than 6 months after the inclusion of any facility on the NPL, the department, agency, or instrumentality which owns or operates such facility shall, in consultation with the Administrator and appropriate State authorities, commence a remedial investigation and feasibility study for such facility.

§120(e)(6)

Federal Facilities

Administrator, after consultation with other departments, may determine that remedial efforts should be done by another potentially responsible party and may enter into a settlement agreement with such party.

Comment [9066-1934]: Commenter (6188) asserts that the CERCLA § 311 requires EPA to carry out a research program to develop and demonstrate “alternative or innovative treatment technologies” for potential use in response actions. 42 U.S.C. § 9660(b). Information gathered as

part of that research program is already required to be made publicly available, with the express exception of trade secrets or personal proprietary information, two categories of data that the Proposed Rule does not protect on its face. Indeed, in requiring that all studies' supporting data be made publicly available, the Proposed Rule's language contradicts this statutory mandate. In sum, the authority EPA has cited for the rulemaking not only fails to confer upon EPA the power to promulgate the rule, but also is inconsistent with the rule's requirements.

Comment [9078-3554]: Commenter (6194) states that the Proposal would prevent EPA from relying on the best available information in discharging its duties. EPA is charged with developing regulations that provide societal benefits by reducing harm to human health and the environment from the presence of chemicals in air, soil, drinking water, food, and consumer products. The Proposal implicates research that is central to making such determinations; creating an obstacle to the consideration of such science is contrary to both primary statutory directives and requirements to conduct cost benefit analyses. Likewise, EPA fails to address how it could implement a regulation that is inconsistent with federal requirements and standards governing the use of science across agencies.¹⁰⁵⁷

This directive is embodied in multiple statutes implemented by EPA and is reflected in other environmental statutes, further illustrating Congress' conceptualization of "best" available science.¹⁰⁵⁸ Broadly speaking, there are three basic types of statutory requirements that the EPA and other agencies consider scientific information. First, there are requirements that the agency consider the "best available science." Second, there are requirements that the agency consider particular factors, including scientific factors. Third, there are requirements that the agency balance economic costs or technological feasibility against public health, environmental, or other benefits that must be scientifically assessed. The precise terminology regarding the required use of science may, as illustrated below, vary across statutes, but what these provisions have in common are requirements for EPA and other agencies to use scientific information that is "best," not simply adequate, and "available."

As EPA has previously explained, the agency would be unable to fulfill statutory mandates if it could not consider studies that follow federal laws and ethical standards regarding the privacy of patient and individual data:

(If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. . . . [S]uch data are often the property of scientific investigators and are often not readily available because of the proprietary interests of the investigators or because of arrangements made to maintain confidentiality regarding personal health status and lifestyle information of

¹⁰⁵⁷ Moreover, as discussed herein, the commenter provides that the Proposal would flip the existing default by automatically excluding the best scientific research, rather than admitting science and then deciding if circumstances exist that warrant excluding a study. The status quo makes more sense than creating a blanket preclusion of valid studies and then allowing their use only by going through a timely and expensive exemption process.

¹⁰⁵⁸ EPA, Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18,768, 18,769 (Apr. 30, 2018) (citing Exec. Order No. 13,563, 76 Fed. Reg. 8,321 (Jan. 21, 2011)).

individuals included in such data. Without provisions of confidentiality, the possibility of conducting such studies could be severely compromised.¹⁰⁵⁹)

Examples of EPA statutory mandates that could be impeded by the Proposal include (i) the development of standards to control emissions from burning hazardous waste fuels under the RCRA “as may be necessary to protect human health and the environment,” 42 U.S.C. § 6924(q)(1); and (ii) determinations of whether hazardous sites need to be placed on the CERCLA NPL. With respect to the latter, CERCLA provides that, if a health assessment indicates that a release or threatened release may pose a serious threat to human health, the ATSDR shall “notify the Administrator of EPA who shall promptly evaluate such release or threatened release in accordance with the hazard ranking system . . . to determine whether the site shall be placed on the National Priorities List.” 42 U.S.C. § 9604 (i)(6)(H). As referenced in footnote 41 of the commenter’s comment letter, health assessments provided by ATSDR to EPA on a scheduled basis are exempt from peer review as a prerequisite to submission.

The Proposal would also cut EPA off from information needed to complete the cost-benefit analysis of regulations required under certain statutes and government-wide requirements.¹⁰⁶⁰

Not only would the Proposal impede EPA’s fulfillment of its statutory duties, but it would also be contrary to judicial precedent, which holds that “best available science” includes “all existing scientific evidence relevant to the [agency] decision [in question].” *Ecology Ctr., Inc. v. U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006) (quoting *Heartwood, Inc. v. U.S. Forest Serv.*, 380 F.3d 428, 436 (8th Cir. 2004)). While agencies need not produce new evidence,¹⁰⁶¹ they must seek out information and “‘cannot ignore existing data.’” *Id.* (emphasis added). Even if an agency is anticipating the arrival of better evidence, it must act on the basis of the evidence it currently has.¹⁰⁶² Many of the fundamental public health studies on which EPA has based key rules and standards under the statutes are studies for which the raw data was not or could not have been released. Nonetheless these studies have been examined and validated,¹⁰⁶³ as will

¹⁰⁵⁹ National Ambient Air Quality Standards for Particulate Matter, 62 Fed. Reg. 38,652, 38,689 (Jul. 18, 1997).

¹⁰⁶⁰ See, e.g., Exec. Order No. 13,783, 82 Fed. Reg. 16,093 (Mar. 31, 2017) (“It is also the policy of the United States that necessary and appropriate environmental regulations . . . are of greater benefit than cost, when permissible, . . . and are developed through transparent processes that employ the best available peer-reviewed science and economics.”); see also 42 U.S.C. § 7411(a)(1) (CAA provision requiring EPA to consider costs when establishing performance standards for new stationary sources of pollution); 42 U.S.C. § 7412(n)(1)(A) (CAA provision directing EPA to regulate power plants if such regulation is “appropriate and necessary,” which includes consideration of costs); 42 U.S.C. § 300g–1(b)(3)(C) (SDWA provision establishing requirements for health risk reduction and cost analysis under which quantifiable and non-quantifiable benefits of a proposed rule must be measured against its cost); 15 U.S.C. § 2605(c)(2)(A)(iv) (TSCA provision requiring EPA to consider “the reasonably ascertainable economic consequences” of a proposed rule).

¹⁰⁶¹ See *Friends of Blackwater v. Salazar*, 691 F.3d 428, 435 (D.C. Cir. 2012) (quoting *Sw. Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000)) (“[U]nder the ‘best . . . data available’ standard, ‘the Secretary has no obligation to conduct independent studies.’”).

¹⁰⁶² See, e.g., *San Luis & Delta-Mendota Water Auth. v. Jewell*, 747 F.3d 581, 630 (9th Cir. 2014) (“[T]he fact that science must advance further before the complicated ecosystem interactions in the Bay–Delta are fully understood does not necessarily mean that the Fish and Wildlife Service failed to rely on the best available science.”)

¹⁰⁶³ See the Harvard Letter [their comment letter], *supra* note 6.

future studies. Arbitrarily cutting off consideration of a category of science is inconsistent with EPA's statutory obligations.¹⁰⁶⁴

Comment [6168-4099]: Commenter (6178) raises the following concerns with the Transparency Rule proposed by the NPRM:

1. The Agency cites specific sections of statutes it administers as the basis of the Agency's authority to adopt the Transparency Rule; specifically CERCLA (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660. The Agency rightly cites acts of Congress in an attempt to support the NPRM as such authority is necessary for the Agency to adopt regulations pursuant to the above listed Acts.
2. However, Congress, in each of the Acts' sections cited, never instructs the Agency to consider transparency to the public of supporting data and/or models of the scientific research when deciding to rely on such research as support for regulations passed pursuant to any of the Acts. Consequently, the Transparency Rule requires the EPA to rely on factors which Congress has not intended it to consider when promulgating regulations pursuant to the Acts, rendering the Transparency Rule arbitrary and capricious under the APA.
3. Further, not only does the Transparency Rule lack sufficient Congressional intent to avoid being deemed arbitrary and capricious, implementing the Rule would actually contradict Congressional instruction to conduct scientific research with a focus on 'promotion' and 'coordination' among itself and other institutions that produce scientific research material to the objectives of the Acts Congress requires the EPA to enforce. This provides additional cause for finding the Transparency Rule arbitrary and capricious under the APA.

Comment [6163-1276]: Commenter (6133) states that the Proposal contains a seemingly unrelated provision regarding agency peer review. The Proposal, in § 30.7, reads:

What role does independent peer review in this section?

EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

Because transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results.

83 Fed. Reg. at 18,774.

There is no statutory authority for EPA to "conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the

¹⁰⁶⁴ The Proposal is also arbitrary in suggesting that science that cannot be used in setting regulations could still be used in individual permitting decisions.

OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” The federal statutes that EPA lists as putative authority for the Proposal provide no authority for proposed § 30.7. See CERCLA (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660. The claimed authorities that EPA lists do not mention peer review or even allude to the concept. *Id.* Neither the Proposal nor accompanying docket materials identify any provision of any federal statute that authorizes EPA to promulgate proposed § 30.7. Our own research revealed no provision of any federal statute that authorizes EPA to promulgate proposed § 30.7.

When Congress writes federal statutes, Congress knows how to create legal authority for peer review, who shall conduct that peer review, what role, if any, that EPA or other parties will play, and how that peer review may be conducted. None of the provision in the law authorize EPA’s Proposal in § 30.7. Instead, the statutes require that EPA use peer-reviewed science, regardless of whether it would meet EPA’s definition of the term in § 30.7. And in cases where the law requires EPA to conduct the review, the statutes often spell out specifically how that should happen.

CERCLA

§ 9604. Response authorities

(i) ATSDR; establishment, functions, etc.

[...]

Any toxicological profile or revision thereof shall reflect the Administrator of ATSDR’s assessment of all relevant toxicological testing which has been peer reviewed. The profiles required to be prepared under this paragraph for those hazardous substances listed under subparagraph (A) of paragraph (2) shall be completed, at a rate of no fewer than 25 per year, within 4 years after October 17, 1986. A profile required on a substance listed pursuant to subparagraph (B) of paragraph (2) shall be completed within 3 years after addition to the list. The profiles prepared under this paragraph shall be of those substances highest on the list of priorities under paragraph (2) for which profiles have not previously been prepared. Profiles required under this paragraph shall be revised and republished as necessary, but no less often than once every 3 years. Such profiles shall be provided to the States and made available to other interested parties.

[...]

(7)(A) Whenever in the judgment of the Administrator of ATSDR it is appropriate on the basis of the results of a health assessment, the Administrator of ATSDR shall conduct a pilot study of health effects for selected groups of exposed individuals in order to determine the desirability of conducting full scale epidemiological or other health studies of the entire exposed population. (B) Whenever in the judgment of the Administrator of ATSDR it is appropriate on the basis of the results of such pilot study or other study or health assessment, the Administrator of ATSDR shall conduct such full scale epidemiological or other health studies as may be necessary to

determine the health effects on the population exposed to hazardous substances from a release or threatened release. If a significant excess of disease in a population is identified, the letter of transmittal of such study shall include an assessment of other risk factors, other than a release, that may, in the judgment of the peer review group, be associated with such disease, if such risk factors were not taken into account in the design or conduct of the study.

[...]

(13) All studies and results of research conducted under this subsection (other than health assessments) shall be reported or adopted only after appropriate peer review. Such peer review shall be completed, to the maximum extent practicable, within a period of 60 days. In the case of research conducted under the NTP, such peer review may be conducted by the Board of Scientific Counselors (BOSC). In the case of other research, such peer review shall be conducted by panels consisting of no less than three nor more than seven members, who shall be disinterested scientific experts selected for such purpose by the Administrator of ATSDR or the Administrator of EPA, as appropriate, on the basis of their reputation for scientific objectivity and the lack of institutional ties with any person involved in the conduct of the study or research under review. Support services for such panels shall be provided by the ATSDR, or by the EPA, as appropriate.

42 U.S.C. § 9604 (emphasis added).

Under longstanding federal case law, when Congress authorizes an approach in one section of a statute using specific language but does not do the same in other sections of a statute, courts presume that Congress acted purposefully and did not mean to address or authorize that approach in those other statutory sections. See, e.g., *Dean v. United States*, 556 U.S. 568 (2009) (“It is generally presumed that Congress acts intentionally when including particular language in one section of a statute but not in another.” (citing *Russello v. United States*, 464 U.S. 16, 23 (1983))). Not only are there no implied grants of authority to an agency in the other statutory sections, but the congressional decisions to authorize the approach elsewhere in the statute give even greater force to the conclusion that the agency has not been given authority where Congress did not use the same or similar authorizing language.

The EPA approach proposed in § 30.7 is even more unlawful than would be the case, independently, under this case law. Proposed § 30.7 says “EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” 83 Fed. Reg. at 18,774/2 (emphasis added). EPA proposes to bind itself (“shall”) to conduct a particular form of peer review on “all pivotal regulatory science” based on an unenforceable, non-binding OMB bulletin that has never been the subject of notice and comment rulemaking and that itself is not authorized by any federal law. To the contrary, treating the content of the unenforceable bulletin as a binding regulation would itself violate the federal statutes that EPA implements, because those statutes do not codify the bulletin, and EPA would be unlawfully codifying a mere policy preference. This EPA may not do.

This Proposal is unlawful, arbitrary, and capricious, and an abuse of EPA discretion. To reiterate, the Proposal identifies no statutory authority for EPA to conduct independent peer review for any, much less all, “pivotal regulatory science” consistent with the dense content (and exceptions) of the OMB bulletin. The Proposal identifies no statutory authority for EPA to bind itself, and future administrations, to conduct peer review only in this fashion, unless and until future notice-and-comment rulemaking is undertaken. The Proposal identifies no suggestion in statutory language or legislative history that Congress intended EPA to conduct binding peer review consistent with this OMB bulletin, notwithstanding that Congress has known about this bulletin since 2005. EPA has simply made up proposed § 30.7—with its link to the OMB bulletin, and the putative authority for the Proposal—out of whole cloth. This EPA may not do.

1.3.5.1.2 RCRA

Comment [5410-4087]: Commenter (5421) objects to the proposal to limit the use of scientific evidence in rulemaking proceedings.

EPA estimates that more than 35 million people, roughly 12 percent of the U.S. population, live within one mile of a RCRA Corrective Action site.¹⁰⁶⁵ The presence of hazardous constituents in contaminated soil, sediments, groundwater, surface water, and air at, or emanating from, RCRA Corrective Action sites can increase the risk of adverse health effects to exposed populations. This can be especially critical for minority and poor communities as well as sensitive sub-populations such as children, pregnant women, and the elderly who can be disproportionately affected. Dangers include acute health effects, such as poisoning and injuries from fire or explosions, and long-term effects, such as cancers, birth defects, and other chronic non-carcinogenic effects (*e.g.*, damage to kidney, liver, nervous and endocrine systems). By reducing exposures to contaminants listed in Table 1, as well as hundreds of others, RCRA Corrective Action cleanups protect the health of local residents, site workers, and others. Corrective Action sites can, and often do, contain more than one contaminant.” RCRA Corrective Action: Case Studies Report, April 2013, p. 1 (PDF copy attached to comment letter excerpt).

In addition to helping humans, RCRA helps both surrounding communities and the environment. *Id.* at 2.

EPA adopted regulations to administer its duties under RCRA, see *id.* at p. 24 (Appendix A). Under previous administrations, EPA used its regulations and powers flexibly to maximize its effectiveness. *Id.*

Unfortunately, EPA has much to do. See, *e.g.*, *id.* Even when construction of all RCRA facilities is completed, cleanup operations will continue. *Id.* at p. 25 (Appendix B).

A very scary problem with the EPA’s proposed “Anti-Environment” Regulation is that it will eviscerate EPA’s ability to regulate under RCRA to protect the millions of Americans living near RCRA sites. Good public policy requires both EPA and our elected officials to carefully consider, and if appropriate, to rely on the available data and studies. The proposed regulation is

¹⁰⁶⁵ Estimate calculated using EPA information on size and location of 3,747 facilities on the RCRA Corrective Action 2020 Universe, as well as 2000 Census population information for blocks and block groups.

nothing short of a brazen attempt to undercut the progress we Americans have made. Ignoring such good studies as proposed would endanger millions.

Comment [6112-1558]: Commenter 6137 contends that the RCRA, 42 U.S.C. § 6901 et seq., gives EPA the authority and responsibility to manage and control solid and hazardous waste, including the generation, transportation, treatment, storage, and disposal of the waste. EPA points to two provisions in RCRA for support of this Proposed Rule, neither of which authorizes this action.

The first provision of RCRA cited as authority for this rule, § 6912(a)(1), provides the Administrator with the general authority to “prescribe, in consultation with Federal, State, and regional authorities, such regulations as are necessary to carry out his functions under this chapter.” 42 U.S.C. § 6912(a)(1). RCRA defines the functions of EPA in the area covered by RCRA, and therefore, EPA cannot rely upon the general authority to make rules provided by the statute. *Am. Petroleum Inst.*, 52 F.3d at 1119 (“EPA cannot rely on its general authority to make rules necessary to carry out its functions when a specific statutory directive defines the relevant functions of EPA in a particular area.”). Moreover, limiting the consideration of reliable health science when promulgating regulations that have significant health and environmental impacts is in no way “necessary” for the Administrator to carry out his functions under RCRA, and thus, for this reason too, the general rulemaking provision does not authorize this rule. See *Mourning*, 411 U.S. at 369.

The second provision of RCRA upon which EPA relies, § 6979, is inapposite. This provision pertains to labor standards related to wages for laborers and mechanics. 42 U.S.C. § 6979. This provision has no relevance to the Proposed Rule whatsoever and certainly does not provide the authority for it. Thus, nothing that EPA cites to in RCRA provides the requisite authority for this Proposed Rule.

Comment [6112-1603]: Commenter (6137) asserts that not only do the provisions of RCRA upon which EPA relies not provide the requisite statutory authority, but other provisions of RCRA render the Proposed Rule unlawful. Specifically, section 8001 of RCRA provides that the Administrator shall conduct or otherwise assist in research, investigations, experiments, and other studies without limitation on what studies or data can be considered. 42 U.S.C. § 6981. The law mandates a broad and inclusionary role for science, requiring EPA to consider studies without limitation. The Proposed Rule’s elimination from consideration of entire categories of scientific data conflicts with the requirements of this section of RCRA, and thus cannot stand. See *Decker v. Nw. Env’tl. Def. Ctr.*, 568 U.S. 597 (2013).

Comment [6118-1729]: Commenter (6143) provides that EPA has issued its proposed rule on Strengthening Transparency in Regulatory Science pursuant to its authority under several environmental statutes that it implements, including the CAA; CWA; SDWA; RCRA; CERCLA; EPCRA; FIFRA; and TSCA.¹⁰⁶⁶ This proposed action is fully consistent with the authorities and objectives laid out in those statutes. EPA must ensure that any final action it takes

¹⁰⁶⁶ 83 Fed. Reg. at 18,769

on this proposal continues to respect the balance reflected in those statutes between sound, transparent science, and legitimate privacy interests.

Comment [6152-640]: Commenter (6122) states that EPA cites multiple statutory provisions in an attempt to support the proposed rule that it believes authorize this type of rulemaking, “including provisions providing general authority to promulgate regulations necessary to carry out the Agency’s functions under these statutes and provisions specifically addressing the Agency’s conducting of and reliance on scientific activity to inform those functions . . .”[30] None of the specific statutory provisions provided by EPA provide specific authority for EPA to fundamentally rework the foundational processes it uses to assess and include/reject science. Indeed, if such authority existed, one would have expected EPA to have discovered this authority many decades earlier. Instead, EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, “Congress...does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes.”[31] And if this is true, neither can the EPA alter the fundamental details of all of its regulatory schemes based on such vague provisions of law. We review each of the provisions listed by EPA, none of which discuss transparency, dose response, pivotal regulatory science, benefit-cost calculation, or changing “agency culture,” the stated goals of this rulemaking.

Section 2002(a)(1) of the RCRA authorizes the Administrator to “prescribe, in consultation with Federal, State, and regional authorities, such regulations as are necessary to carry out his functions under this chapter. . .”¹⁰⁶⁷ This catch-all provision provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is “necessary” to the carrying out functions under the RCRA.

Section 7009 of the RCRA states, “No grant for a project of construction under this chapter shall be made unless the Administrator finds that the application contains or is supported by reasonable assurance that all laborers and mechanics employed by contractors or subcontractors on projects of the type covered by sections 3141-3144, 3146, and 3147 of Title 40, will be paid wages at rates not less than those prevailing on similar work in the locality as determined by the Secretary of Labor in accordance with those sections; and the Secretary of Labor shall have with respect to the labor standards specified in this section the authority and functions set forth in Reorganization Plan Numbered 14 of 1950 (15 F.R. 3176) and section 3145 of Title 40.”¹⁰⁶⁸ It is almost impossible to imagine how the EPA determined that this section gives authority for the content of this rulemaking.

Comment [6163-1106]: Commenter (6133) contends that EPA claims that 42 U.S.C. § 6912(a)(1) of the RCRA provides authority for the rule. But 42 U.S.C. § 6912(a)(1) merely states that the Administrator is authorized to “prescribe, in consultation with Federal, State, and regional authorities, such regulations as are necessary to carry out his functions under this chapter.” As explained above, that general grant of authority cannot support the rule, especially when the rule conflicts with the Act. There is no support in RCRA for the Proposal.

¹⁰⁶⁷ “Resource Conservation and Recovery Act,” 42 U.S.C. 6912(a)(1).

¹⁰⁶⁸ “Resource Conservation and Recovery Act,” 42 U.S.C. 6979.

It appears that EPA's citation to 42 U.S.C. § 6979 is a mistake. That section deals with labor standards for construction and says nothing about research, data, or science. At any rate, EPA does not state specifically which provision of 42 U.S.C. § 6979 it believes authorizes the Proposal. Thus, the citation fails to provide sufficient notice for the public to comment on the proposed rule.

Comment [6163-1138]: Commenter (6133) notes that under the RCRA, EPA regulates the generation, transportation, treatment, storage, and disposal of hazardous waste. EPA must develop, and revise from time to time, "criteria for identifying the characteristics of hazardous waste" and "for listing hazardous waste" that should be subject to regulation, "taking into account toxicity, persistence, and degradability in nature, potential for accumulation in tissue, and other related factors such as flammability, corrosiveness, and other hazardous characteristics." 42 U.S.C. § 6921(a). EPA also must, in cooperation with ATSDR and the NTP, "identify or list those hazardous wastes" which must be subject to regulation because they contain "certain constituents (such as identified carcinogens, mutagens, or terat[o]gens) at levels in excess of levels which endanger human health." Id. § 6921(b)(1). Likewise, EPA must promulgate regulations establishing standards applicable to generators and transporters of hazardous waste, and owners and operators of hazardous waste treatment, storage, and disposal facilities, "as may be necessary to protect human health and the environment." Id. §§ 6922(a), 6923(a), 6924(a); see also id. § 6924(b), (d), (g).

The Proposal conflicts with RCRA's statutory mandate. RCRA requires EPA to evaluate and regulate hazardous waste based on whether it will endanger human health and the environment, while the Proposal allows EPA to disregard relevant science simply because the underlying data cannot be made public. Under RCRA, EPA cannot ignore studies for that reason. Thus, the Proposal violates RCRA.

Comment [6340-1460]: Commenter (6362) contends that the citation to the RCRA speaks to Labor Standards in the issuance of grants and does not appear applicable to this rulemaking authority.

Comment [6343-2710]: Commenter (6365) asserts that they are committed to meeting their obligations to operate in a responsible manner to avoid adversely impacting the environment and public health and safety. Both lead itself and the production of lead are extensively regulated by the EPA, including under the TSCA, CAA, CWA, and RCRA. As a result of these programs and other actions taken by industry, "[t]he United States have made tremendous progress in reducing lead concentrations in the outdoor air," with the national average concentrations dropping "more than 90 percent since 1980," and "EPA expects that most of the areas previously designated as nonattainment will have attained or are on track to attain by the end of 2016."¹⁰⁶⁹

In order to ensure that the regulatory standards that the ABR's members are subject to are supported by the best possible science, the ABR supports EPA's objective of Strengthening Transparency in Regulatory Science by ensuring that the data and models underlying regulatory science is publicly available in a manner sufficient for validation and analysis. Furthermore, EPA should establish clear criteria for data and model availability so that stakeholders can effectively

¹⁰⁶⁹ https://www.epa.gov/sites/production/files/2016-09/documents/pb_naaqs_nfr_fact_sheet.pdf

determine whether the data and models underlying each regulatory proposal are available for review.

Comment [6343-2721]: Commenter (6365) supports EPA’s objective of implementing this policy in a robust and consistent manner across its regulatory determinations. In particular, in order to robustly and consistently implement its scientific transparency standards, EPA should clarify that the science that is used in establishing remedial action performance standards for response actions under the CERCLA of 1980 and for RCRA corrective actions is subject to EPA’s proposed standards for ensuring transparency in regulatory science.

Clean-up obligations under CERCLA and corrective action obligations under RCRA are among the most critical environmental issues that impact industrial manufacturing companies. Between 1980 and 2015, private parties committed more than \$35 billion in cleanup costs, with several individual CERCLA matters having cleanup costs in excess of \$1 billion.¹⁰⁷⁰ Consequently, many CERCLA clean-ups constitute the magnitude of significant regulatory actions under Executive Order 12866 for a “significant regulatory action.”

Comment [8750-1969]: Commenter (9227) asserts that EPA arbitrarily failed to consider the far-reaching implications this Proposal could have on inter-agency coordination and consultation given that other agencies normally rely on research potentially excluded by the Proposal.¹⁰⁷¹

Consultation Provisions in the RCRA

§2002(a)(1)

Authorities of Administrator

In carrying out this Act, the Administrator is authorized to— (1) prescribe, in consultation with Federal, State, and regional authorities, such regulations as are necessary to carry out his functions under this Act.

§1008(a)

Solid Waste Management Information and Guidelines

Administrator shall consult with Federal agencies, among others, to develop and publish guidelines for solid waste management.

¹⁰⁷⁰ <https://www.epa.gov/enforcement/superfund-enforcement-35-years-protecting-communities-and-environment>. (Expired Link)

¹⁰⁷¹ See *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (“Normally, an agency rule would be arbitrary and capricious if the agency has . . . entirely failed to consider an important aspect of the problem.”).

§2001

Office of Solid Waste and Interagency Coordinating Committee

Establishing an Interagency Coordinating Committee for RCRA between EPA, Department of Energy (DOE), Department of Commerce, and all other Federal agencies. Includes coordinating research and projects.

§2002(a)(2)- (6)

Authorities of Administrator

(2) consult with or exchange information with other Federal agencies undertaking research, development, demonstration projects, studies, or investigations relating to solid waste; ...

(5) utilize the information, facilities, personnel and other resources of Federal agencies, including the National Bureau of Standards 1 and the National Bureau of the Census, on a reimbursable basis, to perform research and analyses and conduct studies and investigations related to resource recovery and conservation and to otherwise carry out the Administrator's functions under this Act; and

(6) to delegate to the Secretary of Transportation the performance of any inspection or enforcement function under this Act relating to the transportation of hazardous waste where such delegation would avoid unnecessary duplication of activity and would carry out the objectives of this Act and of the Hazardous Materials Transportation Act.

§4002(b)

Federal Guidelines for Plans

Not later than 18 months after enactment, Administrator shall consult with appropriate agencies to promulgate guidelines for the development and implementation of State plans. Such guidelines should be reviewed and revised at least every three years.

§8001(a)

Research, Demonstrations, Training, and Other Activities

The Administrator, alone or after consultation with the [DOE], or [FERC], shall conduct, and encourage, cooperate with, and render financial and other assistance to appropriate public (whether Federal, State, interstate, or local) authorities, agencies, and institutions, private agencies and institutions, and individuals in the conduct of, and promote the coordination of, research, investigations, experiments, training, demonstrations, surveys, public education programs, and studies relating to—

(1) any adverse health and welfare effects of the release into the environment of material present in solid waste, and methods to eliminate such effects...

§8001(b)(2) (D)

Research, Demonstrations, Training, and Other Activities

any activities undertaken under provisions of sections 8002 and 8003 as related to energy; as related to energy or synthetic fuels recovery from waste; or as related to energy conservation shall be accomplished through coordination and consultation with the [DOE]

Comment [9078-3553]: Commenter (6194) contends that the Proposal would prevent EPA from relying on the best available information in discharging its duties. EPA is charged with developing regulations that provide societal benefits by reducing harm to human health and the environment from the presence of chemicals in air, soil, drinking water, food, and consumer products. The Proposal implicates research that is central to making such determinations; creating an obstacle to the consideration of such science is contrary to both primary statutory directives and requirements to conduct cost benefit analyses. Likewise, EPA fails to address how it could implement a regulation that is inconsistent with federal requirements and standards governing the use of science across agencies.¹⁰⁷²

This directive is embodied in multiple statutes implemented by EPA and is reflected in other environmental statutes, further illustrating Congress' conceptualization of "best" available science.¹⁰⁷³ Broadly speaking, there are three basic types of statutory requirements that the EPA and other agencies consider scientific information. First, there are requirements that the agency consider the "best available science." Second, there are requirements that the agency consider particular factors, including scientific factors. Third, there are requirements that the agency balance economic costs or technological feasibility against public health, environmental, or other benefits that must be scientifically assessed. The precise terminology regarding the required use of science may, as illustrated below, vary across statutes, but what these provisions have in

¹⁰⁷² Moreover, as discussed herein, the Proposal would flip the existing default by automatically excluding the best scientific research, rather than admitting science and then deciding if circumstances exist that warrant excluding a study. The status quo makes more sense than creating a blanket preclusion of valid studies and then allowing their use only by going through a timely and expensive exemption process.

¹⁰⁷³ EPA, Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18,768, 18,769 (Apr. 30, 2018) (citing Exec. Order No. 13,563, 76 Fed. Reg. 8,321 (Jan. 21, 2011)).

common are requirements for EPA and other agencies to use scientific information that is “best,” not simply adequate, and “available.”

The Proposal would also cut EPA off from information needed to complete the cost-benefit analysis of regulations required under certain statutes and government-wide requirements.¹⁰⁷⁴

Not only would the Proposal impede EPA’s fulfillment of its statutory duties, but it would also be contrary to judicial precedent, which holds that “best available science” includes “all existing scientific evidence relevant to the [agency] decision [in question].” *Ecology Ctr., Inc. v. U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006) (quoting *Heartwood, Inc. v. U.S. Forest Serv.*, 380 F.3d 428, 436 (8th Cir. 2004)). While agencies need not produce new evidence,¹⁰⁷⁵ they must seek out information and “cannot ignore existing data.” *Id.* (emphasis added). Even if an agency is anticipating the arrival of better evidence, it must act on the basis of the evidence it currently has.¹⁰⁷⁶ Many of the fundamental public health studies on which EPA has based key rules and standards under the statutes are studies for which the raw data was not or could not have been released. Nonetheless these studies have been examined and validated,¹⁰⁷⁷ as will future studies. Arbitrarily cutting off consideration of a category of science is inconsistent with EPA’s statutory obligations.¹⁰⁷⁸

Comment [6168-4099]: Commenter (6178) raises the following concerns with the Transparency Rule proposed by the NPRM:

1. The Agency cites specific sections of statutes it administers as the basis of the Agency’s authority to adopt the Transparency Rule; specifically RCRA sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979. The Agency rightly cites acts of Congress in an attempt to support the NPRM as such authority is necessary for the Agency to adopt regulations pursuant to RCRA.

2. However, Congress, in each of the Acts’ sections cited, never instructs the Agency to consider transparency to the public of supporting data and/or models of the scientific research when deciding to rely on such research as support for regulations passed pursuant to any of the Acts.

¹⁰⁷⁴ See, e.g., Exec. Order No. 13,783, 82. Fed. Reg. 16,093 (Mar. 31, 2017) (“It is also the policy of the United States that necessary and appropriate environmental regulations . . . are of greater benefit than cost, when permissible, . . . and are developed through transparent processes that employ the best available peer-reviewed science and economics.”); see also 42 U.S.C. § 7411(a)(1) (CAA provision requiring EPA to consider costs when establishing performance standards for new stationary sources of pollution); 42 U.S.C. § 7412(n)(1)(A) (CAA provision directing EPA to regulate power plants if such regulation is “appropriate and necessary,” which includes consideration of costs); 42 U.S.C. § 300g–1(b)(3)(C) (SDWA provision establishing requirements for health risk reduction and cost analysis under which quantifiable and non-quantifiable benefits of a proposed rule must be measured against its cost); 15 U.S.C. § 2605(c)(2)(A)(iv) (TSCA provision requiring EPA to consider “the reasonably ascertainable economic consequences” of a proposed rule).

¹⁰⁷⁵ See *Friends of Blackwater v. Salazar*, 691 F.3d 428, 435 (D.C. Cir. 2012) (quoting *Sw. Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000)) (“[U]nder the ‘best . . . data available’ standard, ‘the Secretary has no obligation to conduct independent studies.’”).

¹⁰⁷⁶ See, e.g., *San Luis & Delta-Mendota Water Auth. v. Jewell*, 747 F.3d 581, 630 (9th Cir. 2014) (“[T]he fact that science must advance further before the complicated ecosystem interactions in the Bay–Delta are fully understood does not necessarily mean that the Fish and Wildlife Service failed to rely on the best available science.”)

¹⁰⁷⁷ See the Harvard Letter [their comment letter], *supra* note 6.

¹⁰⁷⁸ The Proposal is also arbitrary in suggesting that science that cannot be used in setting regulations could still be used in individual permitting decisions.

Consequently, the Transparency Rule requires the EPA to rely on factors which Congress has not intended it to consider when promulgating regulations pursuant to the Acts, rendering the Transparency Rule arbitrary and capricious under the APA.

3. Further, not only does the Transparency Rule lack sufficient Congressional intent to avoid being deemed arbitrary and capricious, implementing the Rule would actually contradict Congressional instruction to conduct scientific research with a focus on ‘promotion’ and ‘coordination’ among itself and other institutions that produce scientific research material to the objectives of the Acts Congress requires the EPA to enforce. This provides additional cause for finding the Transparency Rule arbitrary and capricious under the APA.

[6163-1276]: Commenter (6133) states that in addition to addressing how and whether the agency will consider science, the Proposal also contains a seemingly unrelated provision regarding agency peer review. The Proposal, in § 30.7, reads:

What role does independent peer review in this section?

EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

Because transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA’s justification for the assumptions applied and the implications of those assumptions for the results.

83 Fed. Reg. at 18,774.

There is no statutory authority for EPA to “conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” The federal statutes that EPA lists as putative authority for the Proposal provide no authority for proposed § 30.7. See RCRA sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; CERCLA (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660. The claimed authorities that EPA lists do not mention peer review or even allude to the concept. *Id.* Neither the Proposal nor accompanying docket materials identify any provision of any federal statute that authorizes EPA to promulgate proposed § 30.7. Our own research revealed no provision of any federal statute that authorizes EPA to promulgate proposed § 30.7.

When Congress writes federal statutes, Congress knows how to create legal authority for peer review, who shall conduct that peer review, what role, if any, that EPA or other parties will play, and how that peer review may be conducted. None of the provision in the law authorize EPA’s Proposal in § 30.7. Instead, the statutes require that EPA use peer-reviewed science, regardless of whether it would meet EPA’s definition of the term in § 30.7. And in cases where the law requires EPA to conduct the review, the statutes often spell out specifically how that should

happen. The commenter lists several statutes. Only comments related to RCRA are excerpted here.

RCRA

§ 6939a. Exposure information and health assessments

(b) Health assessments

(2) Whenever in the judgment of the Administrator, or the State (in the case of a State with an authorized program), a landfill or a surface impoundment poses a substantial potential risk to human health, due to the existence of releases of hazardous constituents, the magnitude of contamination with hazardous constituents which may be the result of a release, or the magnitude of the population exposed to such release or contamination, the Administrator or the State (with the concurrence of the Administrator) may request the Administrator of the ATSDR to conduct a health assessment in connection with such facility and take other appropriate action with respect to such risks as authorized by section 9604(b) and (i) of this title. If funds are provided in connection with such request the Administrator of such Agency shall conduct such health assessment.

[...]

(e) Periodic reports The Administrator of such Agency shall issue periodic reports which include the results of all the assessments carried out under this section. Such assessments or other activities shall be reported after appropriate peer review.

42 U.S.C. § 6939a (emphasis added).

1.3.5.2 CERCLA/RCRA (SNPRM Comments)

Comment [48-442]: Commenter (12727) notes that the Supplemental Notice adds a reference to the CWA, and amends its references to the CERCLA and RCRA,¹⁰⁷⁹ but these additions provide no additional support or authorization for the proposal.

The references to CWA and CERCLA cite to the general authorities of the EPA Administrator to issue regulations to fulfill the respective requirements of the statutes. These authorities cannot authorize the proposal's efforts to violate those statutes or act beyond the scope of their requirements.¹⁰⁸⁰ Similarly, the cited provision of RCRA contains the Administrator's general authorities to promote research and training, offering no basis for the proposal's requirements or

¹⁰⁷⁹ 85 Fed. Reg. at 15,397.

¹⁰⁸⁰ See *Chrysler Corp.*, 441 U.S. at 302 ("The legislative power of the United States is vested in the Congress, and the exercise of quasi-legislative authority by governmental departments and agencies must be rooted in a grant of such power by the Congress and subject to limitations which that body imposes."). For discussion of how the 2018 proposal exceeds the authorities of these statutes and violates the requirements of these statutes, see Earthjustice 2018 Comments at 26-27, 48 (CERCLA), and id. at 24-25, 45-47 (CWA).

reconciliation of where it may conflict with RCRA’s obligations—even requirements in the very same subsection it presumes to cite for authority.¹⁰⁸¹

Comment [73-413]: Commenter (11576) contends Section 8001 of the RCRA does not allow the EPA to issue the proposed rule.¹⁰⁸² Instead, the provision provides the agency with the authority:

- To conduct, and assist others in conducting, “research, investigations, experiments, training, demonstrations, surveys, public education programs, and studies” relating to solid-waste management;¹⁰⁸³
- To establish a management program or system to coordinate activities relating to solid-waste research, and to facilitate and accelerate the development of new technology;¹⁰⁸⁴
- To make grants to, and enter into contracts with, public agencies and authorities or private persons relating to solid-waste research;¹⁰⁸⁵ and
- To detail EPA personnel to agencies eligible for assistance under Section 8001.¹⁰⁸⁶

Notably absent from the provision is any grant of authority for the EPA to fundamentally change its approach to reviewing scientific research by selectively disregarding or devaluing certain studies. The EPA has also failed to provide a citation to any particular paragraph or subsection of the provision, making it difficult to even understand what language the EPA believes does give it such authority. While Section 8001 does provide the EPA with authority to coordinate research activities, this is plainly intended to increase scientific knowledge in pertinent areas and ensure efficiency—not to exclude scientific information from consideration or to provide substantive limits on the science that can be used by the agency at the expense of public health. The proposed rule is thus at odds with Section 8001, which accordingly provides no support for the agency’s action.

Comment [73-414]: Commenter (11576) asserts that there is also no plausible reading of CERCLA Section 115 that would provide the EPA with the authority to limit the science it relies on.¹⁰⁸⁷ Section 115 provides that “[t]he President is authorized to delegate and assign any duties or powers imposed upon or assigned to ... [the President] and to promulgate any regulations necessary to carry out the provisions of this subchapter.”¹⁰⁸⁸ This section accordingly allows the EPA—to whom the President has delegated implementation of CERCLA—to “promulgate any regulations necessary to carry out” the statute.¹⁰⁸⁹ The EPA has not shown that the proposed rule is in any way necessary to carry out CERCLA. Nor could it. In other words, the EPA has not identified any problems in implementing CERCLA that have resulted from relying on all available scientific knowledge.

¹⁰⁸¹ See Earthjustice 2018 Comments at 53.

¹⁰⁸² See 42 U.S.C. § 6981.

¹⁰⁸³ Id. § 6981(a).

¹⁰⁸⁴ Id. § 6981(b).

¹⁰⁸⁵ Id. § 6981(c)(1).

¹⁰⁸⁶ Id. § 6981(c)(4).

¹⁰⁸⁷ See 42 U.S.C. § 9615.

¹⁰⁸⁸ Id.

¹⁰⁸⁹ Id. (emphasis added).

Indeed, courts have rejected the view that such general rulemaking provisions authorize the promulgation of any regulation that is “‘reasonably related to the purposes of the enabling legislation[.]’” noting that “[a]n agency’s general rulemaking authority does not mean that the specific rule the agency promulgates is a valid exercise of that authority.”¹⁰⁹⁰ A regulation promulgated under such a provision “cannot stand if it is arbitrary, capricious, or manifestly contrary to the statute.”¹⁰⁹¹ The agency may not use such a provision “to contravene Congress’ will[.]”¹⁰⁹²

As explained elsewhere in these and previous comments, the proposed rule’s restrictions on the use of scientific studies where underlying data is not available will prevent the EPA from considering sound science in its rulemakings and analyses. This is manifestly at odds with CERCLA’s focus on protecting human health and the environment. Thus, the EPA cannot rely on Section 115 of CERCLA to support the proposal.

Comment [82-837]: Commenter (198105) asserts that none of the other statutory provisions identified by the Supplemental Notice authorize EPA to promulgate the Proposal. The Supplemental Notice asserts that RCRA Section 8001, 42 U.S.C. § 6981, CERCLA Section 115, 42 U.S.C. § 9615, and CWA Section 501, 33 U.S.C. § 1361, empower EPA to promulgate the Proposal. 85 Fed. Reg. at 15,397. However, there are two major problems with these assertions of statutory authority. First, the Supplemental Notice does not provide any explanation for how these provisions purportedly authorize the Proposal. Second, an examination of the cited provisions demonstrates that they provide no support for the Proposal; indeed, the Proposal would actively hinder, rather than promote, the statutory purposes of RCRA, CERCLA, and the CWA.

Comment [82-838]: Commenter (198105) asserts that the Supplemental Notice makes no effort at all to tie the Proposal to the statutory schemes of RCRA, CERCLA, or the CWA. Instead, it merely asserts that the cited provisions authorize the Proposal without any explanation of how the Proposal relates to the language or purposes of the three statutes. Additionally, both the Initial Proposal and the Supplemental Notice refer to a range of different provisions from different statutes. 83 Fed. Reg. at 18,769; 85 Fed. Reg. at 15,397. EPA must explain how distinct provisions in multiple statutes can authorize the agency to promulgate precisely the same rule for its review of science under all of these schemes, as well as how the Proposal would comply with each statutory scheme.¹⁰⁹³

Comment [82-851]: Commenter (198105) provides that “[I]t is ‘axiomatic’ that ‘administrative agencies may act only pursuant to authority delegated to them by Congress.’”¹⁰⁹⁴ None of the cited provisions, however, provide EPA with authority to ignore relevant scientific information. RCRA Section 8001 relates only to research and research funding, and the cited provisions of

¹⁰⁹⁰ *Colo. River Indian Tribes v. Nat’l Indian Gaming Comm’n*, 466 F.3d 134, 139 (D.C. Cir. 2006).

¹⁰⁹¹ *Ragsdale v. Wolverine World Wide, Inc.*, 535 U.S. 81, 86 (2002) (internal quotations omitted).

¹⁰⁹² *Id.* at 92.

¹⁰⁹³ 5 U.S.C. § 553(b)(2) (requiring that notice of proposed rulemaking include “reference to the legal authority under which the rule is proposed”); see also *Iowa League of Cities v. EPA*, 711 F.3d 844, 877 (8th Cir. 2013) (noting that an agency regulation will only survive *ultra vires* allegations if a court can “reasonably conclude that the grants of authority in the statutory provisions cited by the government contemplate the issuance” of the regulation).

¹⁰⁹⁴ *Clean Air Council v. EPA*, 862 F.3d 1, 9 (D.C. Cir. 2017) (citation omitted).

CERCLA and the CWA only authorize rulemakings that are necessary to achieve the statutes' broader purposes. The Proposal, however, is not related to EPA research or research funding, and will actively hinder EPA's ability to achieve the statutes' underlying goals by limiting EPA's ability to rely on the best available science.

EPA has long accepted that its decisions must be guided by the best available science. EPA even reiterated its commitment to this standard in the Initial Proposal. 83 Fed. Reg. at 18,769. However, the Proposal would directly undermine this longstanding commitment to use the best available science. As we pointed out in a comment letter in response to the Initial Proposal, the Proposal would prevent EPA from relying on crucial studies that underlie a number of past, present, and future regulations.¹⁰⁹⁵ This radical departure from EPA's standard practice cannot be justified by any of the statutes EPA identifies because it is contrary to the goals of those statutes.

Comment [82-852]: Commenter (198105) asserts that RCRA Section 8001, 42 U.S.C. § 6981, only empowers EPA to assist and conduct research; it says nothing about EPA's use of data in its regulatory capacity and certainly does not authorize EPA to limit its ability to rely on certain scientific data. In relevant part, RCRA Section 8001 grants EPA the authority to "conduct, and encourage, cooperate with, and render financial and other assistance" to institutions and individuals conducting research. 42 U.S.C. § 6981(a). The section also confers on EPA the authority to "establish a management program or system to insure the coordination of all such authorities," 42 U.S.C. § 6981(b), and to "make grants to or enter into contracts (including contracts for construction) with, public agencies and authorities or private persons" for the development of research. 42 U.S.C. § 6981(c).

None of these provisions empower EPA to issue a broad rulemaking whose primary effect will be to limit the agency's ability to rely on the best available science. Nothing in the statutory text purports to confer this power. On the contrary, the powers to "conduct," "encourage," "cooperate with," and assist in research efforts have nothing to do with the power to ignore research when acting in a regulatory capacity. The Supplemental Notice makes no attempt to connect the Proposal to the language of this provision or RCRA's statutory purposes.

Comment [82-855]: Commenter (195105) contends that section 115 of CERCLA, 42 U.S.C. § 9615, only authorizes the President, and by extension EPA, to promulgate regulations that are "necessary to carry out the provisions of this subchapter." 42 U.S.C. § 9615 (emphasis added). Section 115 does not authorize EPA to promulgate the Proposal for two related reasons.

First, the Supplemental Notice does not offer any reason why the Proposal is necessary to achieve CERCLA's purposes. Provisions in other environmental statutes with language identical to that in Section 115 have been interpreted to limit the Administrator's discretion in promulgating regulations.¹⁰⁹⁶ Similarly, the language of Section 115 of CERCLA is clear on its

¹⁰⁹⁵ ELPSC Science Comments, *supra* note 2, at 6-12

¹⁰⁹⁶ See, e.g., *Citizens to Save Spencer City, v. EPA*, 600 F.2d 844, 873 (D.C. Cir. 1979) (holding that section 301 of the Clean Air Act "does not provide the Administrator with Carte blanche authority to promulgate any rules, on any matter relating to the Clean Air Act, in any manner that the Administrator wishes"); see also *In re Permanent Surface Min. Regulation Litig.*, 653 F.2d 514, 523 (D.C. Cir. 1981) (quoting *Citizens to Save Spencer County to*

face: the provision only authorizes regulations that are necessary to achieve the statutory purposes of CERCLA. EPA, however, offers no justification for why the Proposal is necessary to achieve CERCLA's goals; indeed, it makes no effort to tie the Proposal to CERCLA's legislative purposes at all.

Second, Section 115 does not authorize EPA to promulgate the Proposal because it would hinder, rather than advance, CERCLA's underlying purposes. The discretion afforded to EPA under CERCLA only extends to actions that further the statute's goals, which include the "timely cleanup of hazardous waste sites" and ensuring that polluters are held financially responsible for cleanup efforts.¹⁰⁹⁷ In *Eagle-Picher Industries, Inc. v. U.S. EPA*, for example, the D.C. Circuit Court of Appeals upheld EPA's use of a particular model to determine priority sites only because the model was "reasonable and consistent with congressional intent."¹⁰⁹⁸

Allowing EPA to limit its use of scientific data, however, would hinder rather than further CERCLA's purposes by precluding EPA from relying on studies merely because their underlying data and models cannot be made available to the public for privacy or confidentiality reasons. Indeed, courts have recognized that valid scientific data is crucial in promulgating regulations under CERCLA.¹⁰⁹⁹ In *City of Stoughton, Wisconsin v. U.S. EPA*, for example, the D.C. Circuit Court of Appeals underscored that EPA must rely on valid data as a basis for administrative action under CERCLA.¹¹⁰⁰

The Proposal, if finalized, would also undermine specific actions that EPA has considered taking under CERCLA. For example, at the time of the Initial Proposal in 2018, EPA was planning to designate two chemicals—perfluorooctanoic acid (PFOA) and perfluorooctanoic sulfonate (PFOS)—as hazardous chemicals under CERCLA.¹¹⁰¹ Then-Administrator Pruitt had announced that EPA viewed these contaminants as public health risks and intended to develop MCL for them.¹¹⁰² However, this determination was based on epidemiological studies generated, *e.g.*, by the C8 Health Project,¹¹⁰³ all of which included confidential human health data.¹¹⁰⁴ The Proposal

reach the same conclusion under the Surface Mining Control and Reclamation Act); *Nat. Res. Def. Council v. EPA*, 749 F.3d 1055, 1063 (D.C. Cir. 2014) ("[W]e have consistently held that EPA's authority to issue ancillary regulations is not open-ended, particularly when there is statutory language on point.").

¹⁰⁹⁷ *Burlington Northern and Santa Fe Ry. Co. v. U.S.*, 556 U.S. 599, 602 (2009).

¹¹⁰⁴ See Philippe Grandjean, Delayed Discovery, Dissemination, and Decisions on Intervention in Environmental Health: A Case Study on Immunotoxicity of Perfluorinated Alkylate Substances, 17:62 ENVTL. HEALTH 1 (2018), <https://ehjournal.biomedcentral.com/articles/10.1186/s12940-018-0405-y>.

would severely weaken EPA's effort to promulgate MCL for PFOA and PFOS because it would limit the agency's ability to rely on studies whose underlying health data cannot be made publicly available.

Comment [89-2195]: Commenter (11403) states that EPA's 2018 version of this rule cited a hodgepodge of statutory authority, none of it valid. EPA at least corrected the obvious typographical errors from the previous version. However, those edits still do not grant EPA the authority to restrict science from all regulatory decision-making processes within the agency. EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, "Congress . . . does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes."¹¹⁰⁵ EPA does not have the authority to alter the fundamental details of all of its regulatory schemes based on such vague provisions of law.

Section 2002(a)(1) of the RCRA authorizes the Administrator to "prescribe, in consultation with Federal, State, and regional authorities, such regulations as are necessary to carry out his functions under this chapter. . . ."¹¹⁰⁶ This catch-all provision provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is "necessary" to carrying out functions under the RCRA.

Section 8001 of the RCRA provides EPA with authority to conduct and assist with research relating to the handling of waste management and recovery.¹¹⁰⁷ The section includes a provision stating, "the Administrator shall establish a management program or system to insure the coordination of all such activities and to facilitate the process of development of sound new technology (or other discoveries) from the research phase, through development, and into the demonstration phase."¹¹⁰⁸ Not only does section 8001 not provide EPA with authority to promulgate this regulation, the requirement to facilitate the development of new science contradicts the proposed rule's restrictions on science. Limiting scientific research only serves to hinder development of new science, not facilitate it.

Section 115 of the CERCLA and Executive Order 12580 authorize the President to delegate duties under CERCLA and designate EPA as the statute's administrator.¹¹⁰⁹ This delegation provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is necessary to carrying out the functions under CERCLA.

Section 311 of the CERCLA directs the Administrator in the use and development of research and training tools.¹¹¹⁰ The section does not mention transparency of data or give any other indication that it authorizes EPA to promulgate the proposed rule.

Comment [133-1189]: Commenter (11894) states that EPA, for many years, has issued recommendations on the soil and groundwater purity levels to be attained in CERCLA cleanups. These rest on detailed and constantly updated literature reviews. In themselves, they have no direct legal effect, and they are very rarely absolutely legally binding. However, they undeniably shape regulatory decisions. Once again, EPA has not given any indication whether or not the issuance of these standards would be “agency action” exempt from the new requirements. Nor - once again - has EPA evaluated in any way the impact on the program or the resources needed to mitigate that impact.

Comment [159-1410]: Commenter (12430) contends that the SNPRM cites to one additional RCRA statute – 42 U.S.C. section 6981 (“Section 6981”). Section 6981 consists of three subdivisions, the most relevant of which mandates that “[t]he Administrator shall establish a management program or system to insure the coordination of all such activities and to *facilitate* and *accelerate* the process of development of *sound* new technology (or other discoveries) from the research phase, through development, and into the demonstration phase.”¹¹¹¹ The SNPRM—which would often screen out the best available science and which has alarmed leading scientific bodies—would not “facilitate” or “accelerate” the advancement of “sound” science, for the reasons discussed throughout this comment.

Comment [159-1411]: Commenter (12430) notes that the SNPRM cites to an additional CERCLA provision – 42 U.S.C. section 9615 – that consists of a single statement of delegation: “The President is authorized to delegate and assign any duties or powers imposed upon or assigned to him and to promulgate any regulations necessary to carry out the provisions of this subchapter.” The SNPRM does not identify any “duties or powers imposed upon or assigned to” the president under RCRA that would authorize U.S. EPA to depart from accepted practices in the scientific community and to exclude and/or deprioritize the best available scientific studies for arbitrary reasons.

Comment [187-1705]: Commenter (12720) contends that EPA also claims that 42 U.S.C. § 6912(a)(1) of the RCRA provides authority for the rule. But 42 U.S.C. § 6912(a)(1) merely states that the Administrator is authorized to “prescribe, in consultation with Federal, State, and regional authorities, such regulations as are necessary to carry out his functions under this chapter.” As explained above, that general grant of authority cannot support the rule, especially when the rule conflicts with the Act. There is no support in RCRA for the Proposal or the Supplemental Proposal.

In the Supplemental Proposal, EPA states that its citation to 42 U.S.C. § 6979 is a mistake and should be corrected to Section 8001, 42 U.S.C. § 6981. Just as the previous incorrect citation failed to support the Proposal, this new citation fails to support the Proposal or Supplemental Proposal. As explained above, a general grant of authority cannot support the instant rulemaking, especially when the proposed text conflicts with the Act. Section 8001 outlines general authority under the statute to fund or conduct research, and to implement management programs. It does not remotely authorize the proposed rulemaking’s various provisions, definitions, requirements, or exemptions. The RCRA does not authorize the proposed rule.

¹¹¹¹ Emphasis added by commenter

Comment [187-1706]: Commenter (12720) provides that EPA states in the Supplemental Proposal that it finds authority under the CERCLA section 42 U.S.C. § 9615. The entirety of this section reads that “[t]he President is authorized to delegate and assign any duties or powers imposed upon or assigned to him and to promulgate any regulations necessary to carry out the provisions of this subchapter.” As explained above, that general grant of authority cannot support the rule, especially when the rule conflicts with the Act. The CERCLA does not authorize the proposed rule.

EPA also cites 42 U.S.C. § 9660, which has many subsections. This broad citation also fails to provide sufficient notice for the public to comment on the proposed rule. Subsections (a), (b), and (c) require the Secretary of HHS and the Administrator of EPA to establish research programs on the effects of hazardous substances on human health. But nothing in those sections limits EPA’s consideration of studies in which the data can be made public or draws a line between dose-response data and other types of data. The absence of any such congressional distinction or restriction makes it all the more obvious that EPA invented and added the distinction and restrictions in the Proposal and Supplemental Proposal as a matter of its own policy preferences, contrary to the Act. This EPA may not do. CERCLA does not authorize the rulemaking.

1.3.6 Emergency Planning and Community Right-to-Know Act (EPCRA) (NPRM and SNPRM Comments).

Comment: Sections 1.3.6.1 and 1.3.6.2 of this Chapter present comments received on the NPRM (Section 1.3.6.1) and SNPRM (Section 1.3.6.2) related to the EPA’s legal authority for the rule under EPCRA. The EPA provides the following general response to these comments:

Response: The EPA appreciates your comments. As discussed in Section I.C of the final rule preamble and in this RTC document in Section 1.2, EPA has decided it is most appropriate to rely on its authority to promulgate housekeeping regulations, rather than any of the substantive environmental statutes cited in the 2018 proposal or the 2020 supplemental proposal as legal authority for the rule. EPA intends to promulgate future science transparency rules under its substantive environmental statutes. Additionally, the final rule states in § 30.3 that “[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”

None of the statutory provisions cited by the commenter prohibits EPA from conducting additional peer review of studies the agency evaluates as support for significant regulatory decisions and ISI. That said, the final rule provides that if EPA determines that studies have already undergone adequate peer review, EPA will not conduct de novo independent peer review. Adequate peer review is peer review that is consistent with both OMB’s and EPA’s peer review guidance. The intent of the rule is to encourage EPA to go beyond current OMB/EPA guidance by recognizing that peer review that actually examined the underlying data will lead to even more confidence in the results of a peer reviewed study and that pivotal science that has had this deeper peer review will be given greater consideration in study quality evaluation.

1.3.6.1 EPCRA (NPRM Comments)

Comment [4827-2073]: Commenter (4838) writes that the proposed rule violates several environmental statutes because it hinders EPA’s ability to rely on best available science, or the most up-to-date information, as they require. The CAA, CWA, TSCA, and EPCRA all require certain decisions or regulatory criteria be based on the most up-to-date science.¹¹¹² These criteria are described as “best available science,” “latest scientific knowledge,” and “best available public health information.”¹¹¹³ The proposed rule would illegally limit EPA’s ability to rely on best available science in violation of these statutes.

Comment [6112-1555]: Commenter (6137) writes that EPA likewise relies upon a provision in the EPCRA that in no way authorizes this Proposed Rule. Specifically, Section 328 of EPCRA – upon which EPA relies – merely authorizes EPA to “prescribe such regulations as may be necessary to carry out” the statute. 42 U.S.C. § 11048. But this provision does not “empower[] [EPA] to establish regulations which run far afield from the substance of the Act.” *Kaw Valley, Inc. v. EPA* 844 F. Supp. 705, 708 (D. Kan. 1994) (citing *Central Forwarding, Inc. v. Interstate Commerce Comm’n*, 698 F.2d 1266, 1277 (5th Cir. 1983)). Given that the Proposed Rule is contrary to the purposes of EPCRA, see *infra*, Section IV.A, this general rulemaking provision cannot be considered “necessary,” and thus does not do the work that EPA ascribes to it. See *Mourning*, 411 U.S. at 369; *Ragsdale*, 535 U.S. at 86.

Comment [6112-1593]: Commenter (6137) writes that the Proposed Rule also violates EPCRA. EPCRA requires EPA to make determinations about whether to list new chemicals in the statute’s Toxic Release Inventory (TRI) program “based on generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies, available to [EPA].” 42 U.S.C. § 11023(d)(2). Specifically, Congress instructs EPA to add a chemical to the TRI list when:

(A) The chemical is known to cause or can reasonably be anticipated to cause significant adverse acute human health effects at concentration levels that are reasonably likely to exist beyond facility site boundaries as a result of continuous, or frequently recurring, releases.

(B) The chemical is known to cause or can reasonably be anticipated to cause in humans—

(i) cancer or teratogenic effects, or

¹¹¹² See Toxic Substances Control Act, 15 U.S.C. § 2625(h), (k) (2018); Clean Water Act, 33 U.S.C. § 1314(a)(1) (2018); Clean Air Act, 42 U.S.C. § 7408(a)(2) (2018); Emergency Planning and Community Right-to-Know Act, 42 U.S.C. § 11023(d)(2) (2018).

¹¹¹³ Toxic Substances Control Act, 15 U.S.C. § 2625(h), (k) (requiring that the Administrator, in decisions based on science, “use scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed in a manner consistent with the best available science” (emphasis added)); Clean Water Act, 33 U.S.C. § 1314(a)(1) (requiring that criteria for water quality “accurately reflect[] the latest scientific knowledge” (emphasis added)); Clean Air Act, 42 U.S.C. § 7408(a)(2) (requiring air quality criteria “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare” (emphasis added)); Emergency Planning and Community Right-to-Know Act, 42 U.S.C. § 11023(d)(2) (requiring that a determination to add a chemical to the Toxics Release Inventory “be based on generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies, available to the Administrator” (emphasis added)).

(ii) serious or irreversible—

(I) reproductive dysfunctions,

(II) neurological disorders,

(III) heritable genetic mutations, or

(IV) other chronic health effects.

(C) The chemical is known to cause or can reasonably be anticipated to cause, because of—

(i) its toxicity,

(ii) its toxicity and persistence in the environment, or

(iii) its toxicity and tendency to bioaccumulate in the environment, a significant adverse effect on the environment of sufficient seriousness, in the judgment of the Administrator, to warrant reporting under this section.

Id. EPA thus has a mandate from Congress to consider the types of toxicological studies that EPA's Proposed Rule would prevent the Agency from considering. For this reason, the Proposed Rule cannot withstand scrutiny.

Comment [6118-1730]: Commenter (6143) notes that EPA has issued its proposed rule on Strengthening Transparency in Regulatory Science pursuant to its authority under several environmental statutes that it implements, including the CAA; CWA; SDWA; RCRA; CERCLA; EPCRA; FIFRA; and TSCA.¹¹¹⁴ This proposed action is fully consistent with the authorities and objectives laid out in those statutes. EPA must ensure that any final action it takes on this proposal continues to respect the balance reflected in those statutes between sound, transparent science, and legitimate privacy interests.

Comment [6152-650]: Commenter (6122) writes that the proposed rule is not based on any valid statutory authority and is arbitrary and capricious.

EPA cites multiple statutory provisions in an attempt to support the proposed rule that it believes authorize this type of rulemaking, “including provisions providing general authority to promulgate regulations necessary to carry out the Agency’s functions under these statutes and provisions specifically addressing the Agency’s conducting of and reliance on scientific activity to inform those functions . . .”¹¹¹⁵ None of the specific statutory provisions provided by EPA provide specific authority for EPA to fundamentally rework the foundational processes it uses to assess and include/reject science. Indeed, if such authority existed, one would have expected EPA to have discovered this authority many decades earlier. Instead, EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However,

¹¹¹⁴ 83 Fed. Reg. at 18,769

¹¹¹⁵ Proposed rule at 18769.

as the Supreme Court has stated, “Congress...does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes.”¹¹¹⁶ And if this is true, neither can the EPA alter the fundamental details of all of its regulatory schemes based on such vague provisions of law. We review each of the provisions listed by EPA, none of which discuss transparency, dose response, pivotal regulatory science, benefit-cost calculation, or changing “agency culture,” the stated goals of this rulemaking.

Section 328 of the EPCRA states, “The Administrator may prescribe such regulations as may be necessary to carry out this chapter.”¹¹¹⁷ This catch-all provision provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is “necessary” to the carrying out functions under the EPCRA.

Comment [6163-1109]: Commenter (6133) notes that the only authority EPA cites under the EPCRA is 42 U.S.C. § 11048, which states that the “Administrator may prescribe such regulations as may be necessary to carry out this chapter.” The citation fails to provide sufficient notice for the public to comment on the Proposal. EPA does not identify any statutory authority for why the proposed rule is necessary to carry out the chapter. As explained above, that general grant of authority cannot support the rule, especially when the rule conflicts with the Act. EPCRA does not authorize the proposed rule.

Comment [6163-1140]: Commenter (6133) notes that EPCRA establishes requirements for state and local emergency planning and reporting on hazardous chemicals. It requires EPA to publish a list of extremely hazardous substances and set, by regulation, a threshold planning quantity for each substance on the list. 42 U.S.C. § 11002(a). “Any revisions to the list shall take into account the toxicity, reactivity, volatility, dispersibility, combustibility, or flammability of a substance.” Id. § 11002(a)(4). Notably, in defining the criteria that EPA must consider for the list, EPCRA affirmatively directs EPA to consider the toxicity of the substance, among other things, and says nothing about excluding relevant studies for the reasons stated in the Proposal.

EPCRA also contains reporting requirements for owners or operators who manufacture, process, or use hazardous chemicals. Id. § 11023. EPA “may by rule add or delete a chemical from the list” of covered chemicals if there is sufficient evidence that the “chemical is known to cause or can reasonably be anticipated to cause significant adverse acute human health effects” or if the “chemical is known to cause or can reasonably be anticipated to cause in humans . . . cancer or teratogenic effects, or...serious or irreversible . . . reproductive dysfunctions[,] neurological disorders[,] heritable genetic mutations[,] other chronic health effects.” Id. § 11023(d). A chemical can also be added if it “is known to cause or can reasonably be anticipated to cause . . . a significant adverse effect on the environment of sufficient seriousness” due to its toxicity. Id. Of critical importance here, this determination “shall be based on generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies, available to the Administrator.” Id.

¹¹¹⁶ *Whitman v. American Trucking Assns., Inc.*, 531 US 457 (2001).

¹¹¹⁷ “Emergency Planning and Community Right-To-Know Act,” 42 U.S.C. 11048.

The Proposal directly conflicts with EPCRA’s requirement to use “generally accepted scientific principles or laboratory tests,” or “appropriately designed and conducted epidemiological or other population studies.” See *id.* § 11023(d). As explained throughout these comments, there is no reason the underlying data must be public for these tests and studies to be “generally accepted” or “appropriately designed and conducted.” Thus, the Proposal is—on its face—contrary to EPCRA’s mandate that EPA use these tests and studies when making determinations under the statute.

Comment [6340-1458]: Commenter (6362) writes that the provisions cited by EPA under the CAA, the CWA, SDWA, CERCLA, and EPCRA in support of its authority to develop and implement its proposed rule all provide broad regulatory authority to promulgate regulations “as are necessary to carry out [the Administrator’s] functions” under the statute. [...]

Comment [6894-3608]: Commenter (6915) writes that the EPCRA requires that a determination to add a chemical to the TRI “be based on *generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies, available to the Administrator.*” § 313(d)(2), 42 U.S.C. § 11023(d)(2) (emphasis added).

Comment [6340-1457]: Commenter (6362) writes that the provisions cited by EPA under the CAA, the CWA, the SDWA, the CERCLA, and the EPCRA in support of its authority to develop and implement its proposed rule all provide broad regulatory authority to promulgate regulations “as are necessary to carry out [the Administrator’s] functions” under the statute. [...]

Comment [6155-2632]: Commenter (6125) writes that it is clear from even a brief look that these provisions require EPA to consider all the best available science, without authorizing, or even mentioning any of the per se restrictions based on “transparency” that EPA has proposed to use as a universal overriding rule. For these reasons, EPA must justify its proposal as a proper exercise of its authority under each of the statutory provisions whose operation it would affect - provisions that the agency does not even cite. It is the job of the proposer, not the commenters, to survey these provisions and provide the needed justification.

In several of the listed statutes Congress has explicitly told EPA how to use science in decision-making. For example, for EPCRA: EPCRA, 42 USC 11023(d)(2)(C) mandates that a determination whether to add a substance to list of “extremely hazardous substances” “shall be based on generally accepted scientific principles or laboratory tests or appropriately designed and conducted epidemiological or population studies available to the Administrator.”

These provisions all use mandatory language directing EPA to use reliable and relevant scientific information - and further specify how to do so. They all direct that decisions regarding protection of public health be based on the full range of relevant scientific information, in some cases specifying how to identify what information to use. None of them give EPA discretion to ignore such information for any of the reasons set forth in the proposal.

Comment [6163-1276]: Commenter (6133) writes that the Proposal’s peer review provision lacks any statutory basis, is vague and contrary to existing requirements for peer review.

In addition to addressing how and whether the agency will consider science, the Proposal also contains a seemingly unrelated provision regarding agency peer review. The Proposal, in § 30.7, reads:

What role does independent peer review in this section?

EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

Because transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results.

83 Fed. Reg. at 18,774.

There is no statutory authority for EPA to “conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” The federal statutes that EPA lists as putative authority for the Proposal provide no authority for proposed § 30.7. See 83 Fed. Reg. at 18,769/2 (citing CAA sections 103, 301(a), 42 U.S.C. 7403, 7601(a); CWA sections 104, 501, 33 U.S.C. 1254, 1361; SDWA sections 1442, 1450(a)(1), 42 U.S.C. 300j–1, 300j–9(a)(1); RCRA sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; CERCLA (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; EPCRA section 328, 42 U.S.C. 11048; FIFRA sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; and TSCA, as amended, section 10, 15 U.S.C. 2609, and the APA). The claimed authorities that EPA lists do not mention peer review or even allude to the concept. *Id.* Neither the Proposal nor accompanying docket materials identify any provision of any federal statute that authorizes EPA to promulgate proposed § 30.7. Our own research revealed no provision of any federal statute that authorizes EPA to promulgate proposed § 30.7.

When Congress writes federal statutes, Congress knows how to create legal authority for peer review, who shall conduct that peer review, what role, if any, that EPA or other parties will play, and how that peer review may be conducted. None of the provision in the law authorize EPA's Proposal in § 30.7. Instead, the statutes require that EPA use peer-reviewed science, regardless of whether it would meet EPA's definition of the term in § 30.7. And in cases where the law requires EPA to conduct the review, the statutes often spell out specifically how that should happen. EPCRA does not mention peer review.

The EPA approach proposed in § 30.7 is even more unlawful than would be the case, independently, under this case law. Proposed § 30.7 says “EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and

the exemptions described therein.” 83 Fed. Reg. at 18,774/2 (emphasis added). EPA proposes to bind itself (“shall”) to conduct a particular form of peer review on “all pivotal regulatory science” based on an unenforceable, non-binding OMB bulletin that has never been the subject of notice and comment rulemaking and that itself is not authorized by any federal law. To the contrary, treating the content of the unenforceable bulletin as a binding regulation would itself violate the federal statutes that EPA implements, because those statutes do not codify the bulletin, and EPA would be unlawfully codifying a mere policy preference. This EPA may not do.

This Proposal is unlawful, arbitrary, and capricious, and an abuse of EPA discretion. To reiterate, the Proposal identifies no statutory authority for EPA to conduct independent peer review for any, much less all, “pivotal regulatory science” consistent with the dense content (and exceptions) of the OMB bulletin. The Proposal identifies no statutory authority for EPA to bind itself, and future administrations, to conduct peer review only in this fashion, unless and until future notice-and-comment rulemaking is undertaken. The Proposal identifies no suggestion in statutory language or legislative history that Congress intended EPA to conduct binding peer review consistent with this OMB bulletin, notwithstanding that Congress has known about this bulletin since 2005. EPA has simply made up proposed § 30.7—with its the link to the OMB bulletin, and the putative authority for the Proposal—out of whole cloth. This EPA may not do.

1.3.6.2 EPCRA (SNPRM Comments)

Comment [81-2190]: Commenter (12715) writes that the proposed rule conflicts with fundamental statutory requirements to use the best available science and citation to “housekeeping” authority cannot cure that defect.

Whether EPA is arbitrarily barring consideration of scientific studies or information with nonpublic underlying data or data that are not able to be independently validated, or arbitrarily ascribing less weight to such studies or information, neither approach constitutes “housekeeping,” and neither comports with statutory requirements that EPA use the best available science. To reiterate from the 2018 Comments, EPA’s obligation with respect to the use of scientific information is clear: it must base its decisions on such criteria as the latest scientific knowledge, the best available, peer-reviewed science, and/or generally accepted scientific principles or laboratory tests. To cite just a few examples, in performing its duties, EPA must rely on: “the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices,” SDWA of 1996, 42 U.S.C. § 300g-1(b)(3)(A)(i); the “best available science,” TSCA, 15 U.S.C. § 2625(h); “the latest scientific knowledge,” CWA of 1977, 33 U.S.C. § 1314(a)(1), and CAA of 1970, 42 U.S.C. § 7408(a)(2); and “generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies,” EPCRA, 42 U.S.C. § 11023(d)(2). EPA has repeatedly emphasized the importance of this fundamental precept, including in its 2018-2022 strategic plan, which states that one of the agency’s priorities is to “identify, assess,

conduct, and apply the best available science to address current and future environmental hazards.”¹¹¹⁸

These statutory requirements apply to all aspects of EPA’s decision-making, including its scientific evaluations, adoption of regulatory standards, and development of policies. They do not permit what EPA proposes here: to either exclude or give less weight to scientific studies or information based on criteria—availability of the underlying data and ability to independently validate underlying data—that are not determinative of whether the studies or information constitute the best available science. Agencies may not adopt or implement regulations that conflict with the statutes under which they are promulgated, and an agency’s interpretation of those statutes must always at least be reasonable. See *Chevron, U.S.A., Inc. v. Nat. Res. Def. Council, Inc.*, 467 U.S. 837, 842-44 (1984). Furthermore, neither 5 U.S.C. § 301 nor any other purported housekeeping authority allows EPA to negate these statutes’ fundamental, substantive, and common-sense commands. And even assuming EPA has some inherent housekeeping authority, it cannot rely on a general grant of rulemaking authority to promulgate regulations or develop policies that are otherwise inconsistent with more specific statutory directives. *Glob. Van Lines, Inc. v. Interstate Commerce Comm’n*, 714 F.2d 1290, 1293-97 (5th Cir. 1983).¹¹¹⁹

Finally, EPA acknowledges that the statutes it administers would control in the event of a conflict between the proposed rule and those statutes, see 85 Fed. Reg. at 15,398, but that caveat cannot save the proposed rule. First, the core principle of the proposed rule is facially invalid, i.e., there is no circumstance in which it would be acceptable for EPA to exclude or give less weight to relevant, probative scientific studies, models, or other information that have been validated through peer review, on the sole basis that the underlying data are not publicly available or are not able to be independently validated. EPA cannot save an invalid rule by including what amounts to a waiver procedure, because the “essence of waiver is the assumed validity of the general rule.” *Alltel Corp. v. Fed. Commc’n Comm’n*, 838 F.2d 551, 561 (D.C. Cir. 1988). Second, the agency’s essential duty in rulemaking is to exercise its subject matter expertise to enact rules that implement and further the purposes of the statutes Congress has assigned it to administer. *Chevron*, 467 U.S. at 842-44. This does not include proposing rules without first determining the source of legal authority but instead asking commenters to supply that information. Third, the agency must propose its rules with specificity and be clear as to the programs, regulations, and information to which they will apply. 5 U.S.C. § 553(b)(3); *Home Box Office, Inc.*, supra, 567 F.2d at 35-36.

Comment [89-2196]: Commenter (11403) writes that the proposed rule is not based on any valid statutory authority and is arbitrary and capricious.

a. The environmental statutory provisions cited by EPA do not authorize the proposed rule

¹¹¹⁸ U.S. Env’tl. Prot. Agency, Working Together: FY 2018-2022 EPA Strategic Plan, (2018) at page 42, <https://www.epa.gov/sites/production/files/2019-09/documents/fy-2018-2022-epa-strategic-plan.pdf>.

¹¹¹⁹ EPA’s citation to CWA, CERCLA, and RCRA provisions granting authority to promulgate rules to carry out the agency’s responsibilities under those statutes, 85 Fed. Reg. at 15,397, is also unavailing. Restricting consideration of the best science is neither necessary nor consistent with those statutes’ goals of protecting human health and the environment.

EPA’s 2018 version of this rule cited a hodgepodge of statutory authority, none of it valid. EPA at least corrected the obvious typographical errors from the previous version. However those edits still do not grant EPA the authority to restrict science from all regulatory decision-making processes within the agency. EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, “Congress . . . does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes.”¹¹²⁰ EPA does not have the authority to alter the fundamental details of all of its regulatory schemes based on such vague provisions of law.

Section 328 of the EPCRA states “[t]he Administrator may prescribe such regulations as may be necessary to carry out this chapter.”¹¹²¹ This catch-all provision provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is “necessary” to carrying out functions under the EPCRA.

In short, none of the statutory provisions cited by EPA provide authority for the proposed rule. The proposed rule fails at step one under *Chevron v. Natural Resources Defense Council* since it is unreasonable to believe that any statutory general grant of authority or any mention of EPA’s oversight of other science or research programs would enable EPA to conduct rulemaking in a way that is altogether inconsistent with the rule of law. None of the cited provisions provide the authority sought by EPA, and as such the proposed rule should be withdrawn.

Comment [125-2204]: Commenter (11495) writes that EPA’s Supplemental Notice is at odds with provisions of multiple environmental statutes which require the Agency to consider certain high-quality scientific information. For example, the SDWA requires that the issuance of national drinking water regulations be based on the “best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices.”¹¹²² TSCA requires the EPA Administrator to ensure that evaluation and regulation of toxic substances is “consistent with the best available science” and to use all scientific information that is “reasonably available” when making related decisions.¹¹²³ The CWA and the CAA require that water and air quality criteria determinations be based on the “latest scientific knowledge.”¹¹²⁴ Lastly, EPCRA requires that some actions “be based on generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies.”¹¹²⁵

Each of these provisions directs EPA to incorporate a certain quality of scientific information into its rulemaking decisions made pursuant to the statute. In particular, these requirements are designed to ensure the scientific validity of the information upon which EPA bases its actions. Mandating a high-quality scientific basis for regulatory actions is necessary to guarantee

¹¹²⁰ *Whitman v. American Trucking Ass’n, Inc.*, 531 U.S. 457 (2001).

¹¹²¹ “Emergency Planning and Community Right-To-Know Act,” 42 U.S.C. § 11048.

¹¹²² 42 U.S.C. § 300g-1(b)(3)(A)(i) (emphases added).

¹¹²³ 15 U.S.C. § 2625(h), (k) (emphases added).

¹¹²⁴ 33 U.S.C. § 1314(a)(1); 42 U.S.C. § 7408(a)(2) (emphasis added).

¹¹²⁵ *Id.* § 11023(d)(2) (emphases added).

the best possible protections for public health and welfare and to minimize partisan influence in scientific decision-making.

The Supplemental Notice, however, would impermissibly prohibit the agency from considering of relevant and high-quality scientific studies whenever the data underlying the study are not publicly available—in direct contravention of the statutory directives that mandate, for example, consideration of the “best available science.” None of the provisions requires, or even suggests, that EPA only consider information that is publicly available. It strains the plain meaning of words like “best,” “latest,” and even “appropriate” to suggest that they permit the unscientific requirement that all data be publicly available.

EPA “cannot ignore available . . . information.”¹¹²⁶ Courts have held that “best available data” requirements “prohibit[] [an agency] from disregarding available scientific evidence that is in some way better than the evidence [it] relies on.”¹¹²⁷ Furthermore, a plaintiff may establish a violation of a “best available science” requirement by “point[ing] to any scientific evidence that the agency failed to consider.”¹¹²⁸ The Supplemental Notice would undoubtedly preclude EPA from considering certain studies and scientific information that is “better” or the “best available,” simply because the study’s underlying data is not publicly available, thereby failing to satisfy Congressional directives and undermining the quality of regulatory decisions.

Likewise, EPA cannot avoid the statutory directives to consider high-quality scientific information simply by assigning a lesser weight to such information when the underlying data are not publicly available, as the Agency alternatively proposes. The Supplemental Notice’s alternative proposal is designed to have largely the same pernicious effects as flatly prohibiting consideration of studies lacking publicly available data. Just as with the primary proposal, EPA’s alternative proposal would limit the agency’s consideration of the best available science in making important regulatory decisions, and is, therefore, arbitrary, and capricious.

The effect of the Proposed Rule is inconsistent with EPA’s view that the Supplemental Notice is “intended to be consistent with the statutes that EPA administers and EPA plans to implement this procedural rulemaking in accordance with all applicable statutory and regulatory requirements.”¹¹²⁹ EPA attempts to resolve this inconsistency by stating that “in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”¹¹³⁰ However, as discussed below, EPA lacks the statutory authority to issue a rule this broad, even when it claims that it will avoid statutory conflicts.

Comment [187-1707]: Commenter (12720) writes that the only authority EPA cites under the EPCRA is 42 U.S.C. § 11048, which states that the “Administrator may prescribe such regulations as may be necessary to carry out this chapter.” The citation fails to provide sufficient notice for the public to comment on the Proposal or Supplemental Proposal. EPA does not identify any statutory authority for why the proposed rule is necessary to carry out the chapter. As explained above, that general grant of authority cannot support the rule, especially when the rule conflicts with the Act. EPCRA does not authorize the proposed rule.

1.3.7 Clean Water Act (CWA) (NPRM and SNPRM comments).

Comment: Sections 1.3.7.1 and 1.3.7.2 of this Chapter present comments received on the NPRM (Section 1.3.7.1) and SNPRM (Section 1.3.7.2) related to the EPA’s legal authority for the rule under the CWA. The EPA provides the following general response to these comments:

Response: EPA appreciates your comments. As discussed in Section I.C of the final rule preamble and in this RTC document in Section 1.2, EPA has decided it is most appropriate to rely on its authority to promulgate housekeeping regulations, rather than any of the substantive environmental statutes cited in the 2018 proposal or the 2020 supplemental proposal as legal authority for the rule. EPA intends to promulgate future science transparency rules under its substantive environmental statutes. Additionally, the final rule states in § 30.3 that “[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”

1.3.7.1 CWA (NPRM Comments)

Comment [4827-2072]: Commenter (4838) writes that the proposed rule violates several environmental statutes because it hinders EPA’s ability to rely on best available science, or the most up-to-date information, as they require. The CAA, CWA, SDWA, TSCA, And EPCRA all require certain decisions or regulatory criteria be based on the most up-to-date science.¹¹³¹ These criteria are described as “best available science,” “latest scientific knowledge,” and “best available public health information.”¹¹³² The proposed rule would illegally limit EPA’s ability to rely on best available science in violation of these statutes.

¹¹³¹ See Toxic Substances Control Act, 15 U.S.C. § 2625(h), (k) (2018); Clean Water Act, 33 U.S.C. § 1314(a)(1) (2018); Clean Air Act, 42 U.S.C. § 7408(a)(2) (2018); Emergency Planning and Community Right-to-Know Act, 42 U.S.C. § 11023(d)(2) (2018).

¹¹³² Toxic Substances Control Act, 15 U.S.C. § 2625(h), (k) (requiring that the Administrator, in decisions based on science, “use scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed in a manner consistent with the best available science” (emphasis added)); Clean Water Act, 33 U.S.C. § 1314(a)(1) (requiring that criteria for water quality “accurately reflect[] the latest scientific knowledge” (emphasis added)); Clean Air Act, 42 U.S.C. § 7408(a)(2) (requiring air quality criteria “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare” (emphasis added)); Emergency Planning and Community Right-to-Know Act, 42 U.S.C. § 11023(d)(2) (requiring that a determination to add a chemical to the Toxics Release Inventory “be based on generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies, available to the Administrator” (emphasis added)).

Comment [6112-1551]: Commenter (6137) notes that EPA cites sections 104 and 501 of the CWA, 33 U.S.C. §§ 1254, 1361, as statutory authority for its Proposed Rule. Upon examination, these sections do not provide the authority EPA suggests.

Section 104, 33 U.S.C. § 1254, entitled “Research, investigations, training, and information,” addresses the Administrator’s authority as it relates to the establishment of national programs, cooperation, investigations, water quality surveillance system, and reports. It requires the Administrator to, among other things: “conduct and promote the coordination and acceleration of, research, investigations, experiments, training, demonstrations, surveys, and studies relating to the causes, effects, extent, prevention, reduction, and elimination of pollution”; and to “initiate and promote the coordination and acceleration of research designed to develop the most effective practicable tools and techniques for measuring the social and economic costs and benefits of activities which are subject to regulation under this chapter.” 33 U.S.C. § 1254(a)(1), (6).

Toward that end, the provision authorizes the Administrator to: “collect and make available, through publications and other appropriate means, the results of and other information, including appropriate recommendations by him in connection therewith, pertaining to such research and other activities referred to in” 1254(a)(1); and “cooperate with other Federal departments and agencies, State water pollution control agencies, interstate agencies, other public and private agencies, institutions, organizations, industries involved, and individuals, in the preparation and conduct of such research and other activities referred to in” 1254(a)(1). *Id.* § 1254(b)(1), (2). It also requires the Administrator to “conduct research on, and survey the results of other scientific studies on, the harmful effects on the health or welfare of persons caused by pollutants.” *Id.* § 1254(c). And it requires the Administrator to conduct and update a variety of studies, including, but not limited to, studies on oil pollution controls, *id.* § 1254(i), effects and control of pesticides in water, *id.* § 1254(l), waste oil disposal, *id.* § 1254(m), effects of pollution on estuaries and estuarine zones, *id.* § 1254(n), pollution from agriculture, *id.* § 1254(p), and effects and methods of controlling thermal discharges, *id.* § 1254(t).

Thus, section 1254 discusses research and studies in great detail, but it does so by setting forth requirements for cooperation and promotion of research. This section does not grant EPA any rulemaking authority at all, nor does it say anything about the Administrator’s ability to screen or otherwise define the parameters for research that EPA can rely on for regulatory purposes. Instead, it describes the different areas for research and study and requires the Administrator to conduct research and studies in these areas.

The second CWA provision upon which EPA relies fares no better. EPA cites to section 501, 33 U.S.C. § 1361, as additional statutory authority for this rule. This is the provision generally authorizing the Administrator to “prescribe such regulations as are necessary to carry out his functions under this chapter.” 33 U.S.C. § 1361(a) (emphasis added). Such authority only exists if the regulation is, in fact, “necessary to carry out” the provisions under the CWA. *Mourning v. Family Publ’n Serv., Inc.*, 411 U.S. 356, 369 (1973) (“[w]here the empowering provision of a statute states simply that the agency may ‘make . . . such rules and regulations as may be necessary to carry out the provisions of [an] Act,’ . . . the validity of a regulation promulgated thereunder will be sustained [only] so long as it is ‘reasonably related to the purposes of the enabling legislation.’” (citation omitted)). The Proposed Rule is decidedly not necessary at all.

As with the CAA discussed supra, the CWA regulatory authority enables the Agency to carry out its functions and fill any statutory gaps. The Proposed Rule is not needed to fill any “gaps” in the CWA, as Congress has already provided – in great detail – the Administrator’s regulatory authority as it relates to research, emphasizing the need for the use and promotion of inclusive research. See § 1254. Moreover, a rule “devised pursuant to Congress’ directive to issue regulations ‘necessary to carry out’ [an] Act . . . cannot stand if it is ‘arbitrary, capricious, or manifestly contrary to the statute.’” *Ragsdale v. Wolverine World Wide, Inc.*, 535 U.S. 81, 86 (2002) (citations omitted); see also *Am. Petroleum Inst.*, 52 F.3d at 1119 (“EPA cannot rely on its general authority to make rules necessary to carry out its functions when a specific statutory directive defines the relevant functions of EPA in a particular area.”). As discussed in Section IV.A of the commenter’s comment letter, not only is the regulation unnecessary to carry out EPA’s functions under the CWA or to fill any gaps, but it is arbitrary and antithetical to the objectives of the CWA. Thus, the Proposed Rule is not authorized under this general rulemaking provision.

Comment [6112-1588]: Commenter (6137) argues that the Proposed Rule violates the CWA in two ways: first, it runs afoul of its requirement to use all relevant science and the best technology available; and second, it undermines its mandate to protect public health. For each of these reasons, the rule cannot stand.

First, pursuant to Section 1251 of the CWA, the primary objective of the CWA is “to restore and maintain the chemical, physical, and biological integrity of the Nation’s waters.” 33 U.S.C. § 1251(a). Toward that end, a fundamental policy underlying the CWA is “to support and aid research relating to the prevention, reduction, and elimination of pollution.” *Id.* § 1251(b). The CWA thus promotes the use of good science. The Proposed Rule handicaps EPA from accomplishing these broad goals and objectives by limiting the available science and research.

For example, section 1313(c) of the CWA governs the establishment and modification of water quality standards. Pursuant to this provision, these standards “shall be such as to protect the public health or welfare, enhance the quality of water and serve the purposes of” the CWA. *Id.* § 1313(c)(2)(A). In setting these standards, EPA must “tak[e] into consideration their use and value for public water supplies, propagation of fish and wildlife, recreational purposes, and agricultural, industrial, and other purposes, and also taking into consideration their use and value for navigation.” *Id.* If EPA limits the type of science acceptable for these purposes, it is not fulfilling this obligation of the CWA as it is not using all means to accomplish this requirement.

Similarly, section 1313(d) requires states to establish “the total maximum daily load” for certain identified pollutants, and it must do so “at a level necessary to implement the applicable water quality standards with seasonal variations and a margin of safety which takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality.” *Id.* § 1313(d)(1)(C). As with Section 1313(c), if EPA is required to do this without all available science, it is not fulfilling its obligations under this provision.

Not only do the limitations on science undermine the Agency’s ability to most effectively fulfill the obligations of the CWA, but they likewise contradict provisions in the Act that require use of the best technology available. For example, section 1311(p)(1) requires that any modified

requirements of effluent limitations in certain permits apply “the best available technology economically achievable.” Failure to do so will render the effluent limitations invalid. See, *e.g.*, *Nat. Res. Def. Council v. EPA*, 808 F.3d 556, 564 (2d Cir. 2015). Several other provisions likewise require the use of the best technology to carry out the purpose of the Act. See, *e.g.*, 33 U.S.C. § 1314(b)(1) (regulations establishing or revising effluent limitations must apply “the best practicable control technology currently available” to identify “the degree of effluent reduction attainable”); *id.* § 1314(b)(2)(A) (regulations establishing or revising effluent limitations must apply “the best control measures and practices achievable” to identify “the degree of effluent reduction attainable . . . including treatment techniques, process and procedure innovations, operating methods, and other alternatives for classes and categories of point sources”); *id.* § 1314(b)(4)(A) (regulations establishing or revising effluent limitations must apply “the best conventional pollutant control technology” to identify “the degree of effluent reduction attainable . . . for classes and categories of point sources”).

Second, the CWA also contains several additional provisions that demonstrate its overarching goal of protecting the public health. For example, one of the provisions in section 1254 – one of the two sections cited by EPA as authorizing this Proposed Rule – addresses the “collection and dissemination of scientific knowledge on the effects and control of pesticides in water.” 33 U.S.C. § 1254(l). Pursuant to this provision, the Administrator is charged with developing and issuing to the States for the purpose of carrying out the CWA “the latest scientific knowledge available in indicating the kind and extent of effects on health and welfare which may be expected from the presence of pesticides in the water in varying quantities,” and updating that information “whenever necessary to reflect developing scientific knowledge.” *Id.* There are no qualifications or other limiting factors in the type of scientific knowledge that must be considered. Rather, the provision contemplates inclusiveness to most effectively accomplish the CWA’s objectives.

Several other provisions likewise address science and research as they relate to the public health goals of the CWA. For example, section 1254a requires the Administrator to “conduct research on the harmful effects on the health and welfare of persons caused by pollutants in water.” A provision addressing protection of the Great Lakes states, in part, that “[t]he Administrator may not carry out a project under this paragraph for remediation of contaminated sediments located in an area of concern— (i) if an evaluation of remedial alternatives for the area of concern has not been conducted, including a review of the short-term and long-term effects of the alternatives on human health and the environment.” See 33 U.S.C. § 1268(c)(11)(D). Section 1311(g)(2), which addresses requirements for modifications to effluent limitations, requires that such modifications not result in “the discharge of pollutants in quantities which may reasonably be anticipated to pose an unacceptable risk to human health or the environment.” And section 1314(a)(9) provides that the Administrator “shall publish new or revised water quality criteria for pathogens and pathogen indicators (including a revised list of testing methods, as appropriate), based on the results of the studies conducted under section 1254(v),” for the purpose of protecting human health in coastal recreation waters, and that at least once every five years, the Administrator must review and if necessary revise the water quality criteria. And EPA has long recognized that the National Pollutant Discharge Elimination System (NPDES) (§ 402 permit) and fill discharges (§ 404 permit) programs require protection of public health. See, *e.g.*, 33 U.S.C. §§ 1342, 1344 (authorizing EPA to prohibit, withdraw, or veto a discharge that “will have an unacceptable

adverse effect on municipal water supplies, shellfish beds and fishery areas . . . wildlife, or recreational areas”) and implementing regulations, including Section 404(b)(1) Guidelines (40 C.F.R. Part 230).¹¹³³

Taken together, these provisions demonstrate that the overall focus of the CWA is to promote and protect the public health and water quality in the most comprehensive way possible. Thus, any measure that could limit science or research supporting these objectives is antithetical to the Act. For these reasons, EPA’s reliance on the CWA to support its restrictions on science is entirely misplaced.

Comment [6118-1727]: Commenter (6143) notes that EPA has issued its proposed rule on Strengthening Transparency in Regulatory Science pursuant to its authority under several environmental statutes that it implements, including the CAA; CWA; SDWA; RCRA; CERCLA; EPCRA; FIFRA; and TSCA.¹¹³⁴ This proposed action is fully consistent with the authorities and objectives laid out in those statutes. EPA must ensure that any final action it takes on this proposal continues to respect the balance reflected in those statutes between sound, transparent science, and legitimate privacy interests.

Comment [6155-590]: Commenter (6125) writes that when Congress wished to limit available science to information that is publicly available, it has done so. See CWA Section 311(a)(27), 33 USC 1321(a)(27) (for purposes of addressing oil and hazardous substance liability, “best available science” is defined as evidence that “uses peer reviewed and publicly available data”). Its failure to impose such limits on the use of data or science in the provisions discussed above is thus purposeful. As noted, the proposal does not even mention any of these relevant statutory requirements governing the use of science or data or information, much less explain how any of them could authorize EPA to make a decision without using information that is relevant to decision-making, solely for lack of transparency and regardless of reliability or relevance. None of these statutes provide EPA with any authority to pick and choose what reliable and useful science to use or ignore specific studies based on transparency. While the proposal misleadingly pays lip service to using the best available science, it would expressly “preclude” the use of reliable and available science that is not, in its characterization, “transparent,” regardless of whether it is the best available science. The proposal does not even mention the governing statutory requirements, much less explain how its approach is consistent with them.

Comment [6155-2633]: Commenter (6125) argues that it is clear from even a brief look that these provisions require EPA to consider all the best available science, without authorizing, or even mentioning any of the per se restrictions based on “transparency” that EPA has proposed to use as a universal overriding rule. For these reasons, EPA must justify its proposal as a proper exercise of its authority under each of the statutory provisions whose operation it would affect -

¹¹³³ See, e.g., 40 C.F.R. Part 122 (requiring permits to implement water quality standards and protect public health); 40 C.F.R. § 230.10(c)(1), § 230.11 (prohibiting discharge of dredged or fill material which will cause or contribute to significant degradation of the waters of the United States, which includes: “[s]ignificantly adverse effects of the discharge of pollutants on human health or welfare, including but not limited to effects on municipal water supplies, plankton, fish, shellfish, wildlife, and special aquatic sites.”); see also § 230.50 (municipal and private water supplies).

¹¹³⁴ 83 Fed. Reg. at 18,769

provisions that the agency does not even cite. It is the job of the proposer, not the commenters, to survey these provisions and provide the needed justification.

In several of the listed statutes Congress has explicitly told EPA how to use science in decision-making. Specifically, for the CWA:

- CWA, 33 USC 1314(a)(1) mandates that the Administrator “shall develop and publish ... criteria for water quality accurately reflecting the latest scientific knowledge” “on the kind and extent of all identifiable effects on health or welfare” in setting water quality standards;

These provisions all use mandatory language directing EPA to use reliable and relevant scientific information -- and further specify how to do so. They all direct that decisions regarding protection of public health be based on the full range of relevant scientific information, in some cases specifying how to identify what information to use. None of them give EPA discretion to ignore such information for any of the reasons set forth in the proposal.

Comment [6163-1104]: Commenter (6133) notes that EPA cites sections 104, 33 U.S.C. § 1254, and 501, 33 U.S.C. § 1361, of the CWA as putative authority for the Proposal. Nothing in these sections authorize the Proposal’s limitations on scientific evidence.

With respect to section 104, the Proposal tellingly fails to specify which of its 22 subsections supposedly supports the restrictions EPA has proposed. This deficiency reflects a lack of authority for the Proposal in section 104. And even if EPA thinks that it can cobble together language in section 104 to support the Proposal, the agency’s complete failure to identify in the Proposal how section 104 authorizes this rulemaking means that EPA did not provide sufficient notice for the public to comment on the Proposal.

None of the subsections in section 104 states or suggests that, in promulgating regulations under the CWA, EPA may limit its consideration of “regulatory science underlying its actions” only to studies or analyses “are publicly available in a manner sufficient for independent validation.” See 83 Fed. Reg. at 18,773 (proposed § 30.5). To the contrary, several subsections indicate that Congress intended EPA to consider available scientific evidence in order to carry out the Act.

First, subsection (b) authorizes EPA to collect and publicize results and information related to studies about water pollution but does not say anything about limiting consideration of science simply because data cannot be made public, either as part of rulemakings or otherwise. Nor does it draw any distinction between dose-response data and other types of data.

Second, subsection (c) directs EPA to “conduct research on, and survey the results of other scientific studies on, the harmful effects on the health or welfare of persons caused by pollutants.” It provides no authority whatsoever for limiting consideration of studies, models or data, dose-response or otherwise, during rulemakings; indeed, by directing EPA to “survey the results of other scientific studies,” rather than the publicly-available dose-response data underlying those results, this subsection contradicts the Proposal’s limitations and conditions.

Third, subsection (l)(1) indicates that EPA should be inclusive with respect to considering evidence, as it directs EPA to “develop and issue to the States for the purpose of carrying out this Act the latest scientific knowledge available in indicating the kind and extent of effects on health and welfare which may be expected from the presence of pesticides in the water in varying quantities. He shall revise and add to such information whenever necessary to reflect developing scientific knowledge.”

Fourth, subsection (n) directs EPA to cooperate with various entities to “conduct and promote, encourage contributions to, continuing comprehensive studies of the effects of pollution, including sedimentation, in the estuaries and estuarine zones of the United States on fish and wildlife, on sport and commercial fishing, on recreation, on water supply and water power, and on other beneficial purposes.” Importantly, subsection (n)(2) reveals Congress’s intention that EPA will consider information broadly, by instructing the agency to “assemble, coordinate, and organize all existing pertinent information on the Nation’s estuaries and estuarine zones . . .”

EPA also cites 33 U.S.C. § 1361 as a basis for the Proposal, but it does not provide the agency with the authority it desires. Subsection (a) merely states that the “Administrator is authorized to prescribe such regulations as are necessary to carry out his functions under this chapter.” As explained above, that general grant of authority cannot support the rule, especially when the rule conflicts with the Act. Moreover, EPA casually invokes this provision, but does not make any effort to justify the proposed restrictions as necessary to any particular CWA statutory function, so it has not made the case that this provision provides authority to adopt the Proposal’s limits.

Finally, the Act contains other indications that Congress intended EPA’s consideration of science to be inclusive. In particular, section 304(a)(1) of the Act states:

The Administrator, after consultation with appropriate Federal and State agencies and other interested persons, shall develop and publish, within one year after the date of enactment of this title (and from time to time thereafter revise) criteria for water quality accurately reflecting the latest scientific knowledge (A) on the kind and extent of all identifiable effects on health and welfare including, but not limited to, plankton, fish, shellfish, wildlife, plant life, shorelines, beaches, esthetics, and recreation which may be expected from the presence of pollutants in any body of water, including ground water; (B) on the concentration and dispersal of pollutants, or their byproducts, through biological, physical, and chemical processes; and (C) on the effects of pollutants on biological community diversity, productivity, and stability, including information on the factors affecting rates of eutrophication and rates of organic and inorganic sedimentation for varying types of receiving waters.

Although water quality criteria EPA develops are not issued as regulations, such that the Proposal as written would likely not apply to them, the salient point—illustrated by the italicized language above—is that Congress refused to limit EPA’s consideration of available evidence in discharging one of its core functions aimed at protecting the nation’s waters. EPA provides no reason in the Proposal why the regulations the Proposal targets should be any different.

Accordingly, the CWA does not authorize the Proposal.

Comment [6163-1135]: Commenter (6133) argues that the Proposal, if adopted, would imperil the effective implementation of the CWA. Several provisions of the Act direct EPA to consider a range of data in promulgating regulations to effectuate its goals, and the development of these regulations would be hamstrung by the Proposal's restrictions on considering valid scientific evidence. As discussed in these comments, identifying, and excluding valid scientific evidence is time- and resource-intensive and has not been demonstrated to improve the quality of the science EPA considers or its science-based decisions. Accordingly, applying the proposed limitations to the myriad of regulatory decisions the agency is supposed to make would be a recipe for complete paralysis on multiple fronts under the CWA. Some examples of the water regulations that could be adversely affected by the far-reaching the Proposal follow.

Under sections 301 and 304, EPA must develop effluent limitation guidelines, setting out nationally applicable pollution discharge standards for various industries. These Effluent Guidelines Plan (ELG) "identify, in terms of amounts of constituents and chemical, physical, and biological characteristics of pollutants, the degree of effluent reduction attainable through the application of [particular levels of pollution control stringency] for classes and categories of point sources" 33 U.S.C. § 1314(b)(1)(A). EPA is to specify the factors used to determine the controls to be used, including "the age of equipment and facilities involved, the process employed, the engineering aspects of the application of various types of control techniques, process changes, the cost of achieving such effluent reduction, non-water quality environmental impact (including energy requirements), and such other factors as the Administrator deems appropriate" *Id.* § 1314(b)(1)(B). Making these judgments and formulating the proper control levels that industrial dischargers must meet will obviously depend on data collected about the processes used in a given industry, control technology performance, cost, and energy use, among other things.

Under section 303, the Act charges EPA with issuing initial water quality standards for states that fail to submit their own, and with developing such standards if EPA determines submitted standards are not consistent with the Act. *Id.* § 1313(b). Congress required these standards to take account of a wide range of evidence, and the Proposal would therefore curtail EPA's actions pursuant to the Act. Specifically, standards:

shall be such as to protect the public health or welfare, enhance the quality of water and serve the purposes of this chapter. Such standards shall be established taking into consideration their use and value for public water supplies, propagation of fish and wildlife, recreational purposes, and agricultural, industrial, and other purposes, and also taking into consideration their use and value for navigation.

Id. § 1313(c)(2)(A).

In addition, section 303's water quality standards process illustrates a hypocritical element of the Proposal. When states develop water quality standards, they must submit to EPA "[g]eneral information which will aid the Agency in determining the adequacy of the scientific basis of the standards," 40 C.F.R. § 131.6(f), and EPA's review of such a submission considers "[w]hether the State standards . . . are based upon appropriate technical and scientific data and analyses," *id.* § 131.5(a)(4), such that states can consider a wide range of information in establishing standards

and EPA's review of the states' standards looks simply to whether the information on which they are based is "appropriate." By contrast, if EPA were obliged to develop standards for a state (either because of a failure to submit or an inadequate submission), the Proposal would require EPA to consider a much more limited universe of information.

Pursuant to section 307 of the Act, EPA may issue category-wide effluent standards for listed toxic pollutants that go beyond the minimum level of control the Act mandates. These more stringent standards "shall take into account the toxicity of the pollutant, its persistence, degradability, the usual or potential presence of the affected organisms in any waters, the importance of the affected organisms, the nature and extent of the effect of the toxic pollutant on such organisms, and the extent to which effective control is being or may be achieved under other regulatory authority." Further, "[a]ny effluent standard promulgated under this section shall be at that level which the Administrator determines provides an ample margin of safety." 33 U.S.C. § 1317(a)(4). Obviously, it takes a substantial effort for EPA to assess these various factors and determine what level of pollution is acceptable, with an "ample margin of safety," and to do so for numerous categories of dischargers (multiplied by numerous different toxic pollutants). If EPA adopts the Proposal, it would make each element of this analysis that much more cumbersome and difficult, and thus make it harder for EPA to effectively protect the public from toxic pollution.

Section 311 includes a further example of the kinds of regulatory analyses into which the Proposal would inject confusion and administrative burden. That section charges EPA with issuing "regulations designating as hazardous substances, other than oil as defined in this section, such elements and compounds which, when discharged in any quantity into . . . [various water resources] present an imminent and substantial danger to the public health or welfare, including, but not limited to, fish, shellfish, wildlife, shorelines, and beaches." 33 U.S.C. § 1321(b)(2)(A). Indeed, answering these kinds of questions seems particularly likely to be undermined by the Proposal, as data relevant to determining the conditions under which hazardous substances may be an "imminent and substantial danger" could well come from prior accidental releases that could fail the Proposal's "reproducibility" trigger.

The foregoing examples are merely illustrative. The CWA imposes numerous regulatory duties on EPA, and the Proposal threatens to make carrying out those obligations harder. The Act's foundational purpose— "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters," 33 U.S.C. § 1251(a)—would thus be ill-served by finalizing the Proposal.

Comment [6340-1456]: Commenter (6362) writes that the provisions cited by EPA under the CAA, the CWA, the SDWA, the CERCLA, and the EPCRA in support of its authority to develop and implement its proposed rule all provide broad regulatory authority to promulgate regulations "as are necessary to carry out [the Administrator's] functions" under the statute.

Comment [6343-2709]: Commenter (6365) writes that their members are committed to meeting their obligations to operate in a responsible manner to avoid adversely impacting the environment and public health and safety. Both lead itself and the production of lead are extensively regulated by the EPA, including under the TSCA, CAA, CWA, and RCRA. As a

result of these programs and other actions taken by industry, “[t]he United States have made tremendous progress in reducing lead concentrations in the outdoor air,” with the national average concentrations dropping “more than 90 percent since 1980,” and “EPA expects that most of the areas previously designated as nonattainment will have attained or are on track to attain by the end of 2016.”¹¹³⁵

In order to ensure that the regulatory standards that their members are subject to are supported by the best possible science, the commenter supports EPA’s objective of strengthening transparency in regulatory science by ensuring that the data and models underlying regulatory science is publicly available in a manner sufficient for validation and analysis. Furthermore, EPA should establish clear criteria for data and model availability so that stakeholders can effectively determine whether the data and models underlying each regulatory proposal are available for review.

Comment [6353-2322]: Commenter (6375) notes that EPA solicits comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation. (pg. 18,771). EPA’s statement concerning its legal authority could be enhanced by reference to statutory provisions that require it to rely on “accurate,” “useful,” or “best” data. For example, section 108(a)(2) requires that the Administrator issue air quality criteria that “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health and welfare . . .” 42 U.S.C. § 7408(a)(2). Similarly, section 304 of the CWA requires water quality criteria that “accurately reflect [] the latest scientific knowledge . . .” 33 U.S.C. § 1314(a)(1). Increasing the transparency of regulatory science and ensuring that it is reproducible helps in evaluating its accuracy and usefulness.

Furthermore, making data and methods underlying regulatory decisions publicly available is not new. Guidelines issued by both the OMB and EPA implementing the IQA, Treasury and General Government Appropriations Act for Fiscal Year 2001, § 515, P.L. No. 106-554, 114 Stat. 2763 (Dec. 21, 2001), emphasize the importance of reproducibility in assessing the quality and utility of data used in making regulatory decisions. It appears the OMB’s IQA guidelines recognize that the reproducibility of underlying science helps to ensure the integrity of agency decisions and explain that, “[m]aking the data and methods publicly available will assist in determining whether analytic results are reproducible.” 67 Fed. Reg. 8452, 8460 (Feb. 22, 2002) (OMB IQA Guidelines).

EPA’s IQA guideline¹¹³⁶ states: “A higher degree of transparency about data and methods will facilitate the reproducibility of such information by qualified third parties, to an acceptable degree of imprecision. . . It is important that analytic results for influential information have a higher degree of transparency regarding (1) the source of the data used, (2) the various assumptions employed, (3) the analytic methods applied, and (4) the statistical procedures employed.”

¹¹³⁵ https://www.epa.gov/sites/production/files/2016-09/documents/pb_naaqs_nfr_fact_sheet.pdf

¹¹³⁶ EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency. Pg. 21 (Oct. 2002, as amended June 24, 2004 & May 13, 2005) (EPA IQA Guidelines).

Comment [6353-2327]: Commenter (6375) notes that EPA solicits comment on whether alternative or additional regulatory or other policy vehicles are appropriate to establish and implement these policies, and whether further regulatory or other policy vehicles at the programmatic or statutory level would be appropriate as alternative or additional steps the agency may take to further the policies articulated in Section II. (pg. 18,771).

The regulatory language that EPA proposes provides general requirements that apply to the Agency's use of science under the many statutes that it implements. The generality of the proposed regulations may be a function of the diverse purposes of those statutes. Specifically, some of these statutes primarily concern regulation of emissions or releases to (e.g., CAA and CWA). The scientific analyses required for these different programs and the sources of the scientific information underlying those analyses differ. The Agency should consider supplementing the general language that it has proposed with statutory specific regulations. A statutory-specific rulemaking would provide greater certainty going forward.

Comment [6873-1717]: Commenter (6895) writes that EPA's proposed rule would eliminate the use of best and vetted science to other areas of rulemaking beyond just CAA issues. For example, the proposed rule could negatively impact the development of Water Quality Standards (WQS) for the protection of human health and aquatic life, which forms the basis of New York's State Pollutant Discharge Elimination Systems (SPDES) program. This proposed rule could delay the development and permit implementation of WQS for all pollutants for which standards do not already exist, especially priority Contaminants of Emerging Concern (CEC) in New York State, as the best available peer-reviewed research would be excluded from consideration by EPA. As noted above, the proposed rule includes language regarding "dose response data and models, point of departure and reference value", which are toxicological principles and variables used specifically in the derivation of WQS.

Furthermore, the proposed rule could impede EPA research and guidance to the states pertaining to Water Treatment Chemical (INTC) use, as the formulations are typically confidential and proprietary. In recent years, EPA has focused on WTC use at potable water plants, and the discharge of untreated potentially WTC-laden effluents from these facilities. New York is similarly addressing this concern through our SPDES Whole Effluent Toxicity (WET) program in the absence of applicable WQS and/or analytical methods with sufficient levels of detection for the protection of aquatic life.

Comment [6894-3591]: Commenter (6915) writes that the proposed rule would violate the very federal laws EPA is required to uphold. To cite just a few examples, in performing its duties, EPA must rely on "the latest scientific knowledge," 33 U.S.C. § 1314(a)(1) (CWA). Indeed, no federal environmental law so much as suggests that, in setting standards, EPA can ignore the "latest" or "best" or "appropriately designed and conducted" scientific studies whenever any portion of the underlying data is not public—which is often the case for important privacy reasons.

Comment [6894-3606]: Commenter (6915) notes that the CWA requires that water quality criteria "accurately reflect [] *the latest scientific knowledge*." § 304(a)(1), 33 U.S.C. § 1314(a)(1) (emphasis added).

Comment [6894-3609]: Commenter (6915) writes that even statutory provisions that EPA chose to cite as authority for the proposed action prohibit the Agency from promulgating the proposed rule. For example, CWA § 104(l) explicitly requires that “[t]he Administrator shall . . . develop and issue . . . *the latest scientific knowledge available* in indicating the kind and extent of effects on health and welfare which may be expected from the presence of pesticides in water.”³³ U.S.C. § 1254(l) (emphasis added). It strains credulity to believe that a directive to issue the “latest scientific knowledge available” somehow imposes a requirement that the Administrator only issue knowledge based on publicly available data, and EPA has not supplied any substantive argument that it does.

Comment [6901-4443]: Commenter (6922) notes in the CWA: “The Administrator, after consultation with appropriate Federal and State agencies and other interested persons, shall develop and publish . . . criteria for water quality reflecting the latest scientific knowledge (A) on the kind and extent of all identifiable effects on health and welfare including, but not limited to, plankton, fish, shellfish, wildlife, plant life, shorelines, beaches, esthetics, and recreation which may be expected from the presence of pollutants in any body of water, including ground water; (B) on the concentration and dispersal of pollutants, or their byproducts, through biological, physical, and chemical processes; and (C) on the effects of pollutants on biological community diversity, productivity, and stability, including information on the factors affecting rates of eutrophication and rates of organic and inorganic sedimentation for varying types of receiving waters.”¹¹³⁷

Comment [8750-1945]: Commenter (9227) writes that EPA arbitrarily failed to consider the far-reaching implications this Proposal could have on inter-agency coordination and consultation given that other agencies normally rely on research potentially excluded by the Proposal.¹¹³⁸ The commenter provides the following consultation provisions in the CWA:

Consultation Provisions in CWA

§304(c)

Information and Guidelines

Consult with appropriate Federal and State agencies to issue information on pollution-reducing procedures and operating methods to implement standards of performance under §306.

§304(d)(1)-(2)

¹¹³⁷ 33 U.S.C. § 1314(a)(1) (emphasis added).

¹¹³⁸ See *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (“Normally, an agency rule would be arbitrary and capricious if the agency has . . . entirely failed to consider an important aspect of the problem.”)

Information and Guidelines

Consult with appropriate Federal and State agencies to publish the amount of reduction attainable through secondary treatment and information on alternative waste treatment management techniques.

§304(e)

Information and Guidelines

Consult with appropriate Federal and State agencies to publish supplemental regulations to control plant site runoff, leaks/spillage, sludge/waste disposal, and drainage

§304(f)

Information and Guidelines

Consult with Federal and State agencies to issue guidelines for evaluating nonpoint sources and methods to control pollution from those sources.

§307(a)(7)

Toxic Pretreatment Effluent Standards

Consult with Federal departments and agencies prior to publishing regulations pursuant to this section

§404(d)(1)

Disposal of Sewage Sludge

Administrator must consult with Federal agencies on regulations providing guidelines for the disposal of sludge and the utilization of sludge for various purposes.

§118(a)

Lake Tahoe Study

Coordinate with Secretary of Agriculture and other Federal agencies regarding adequacy and need for extending Federal oversight of Lake Tahoe

§311(d)(2)(M)

Oil and Hazardous Substance Liability

Consultation with FWS and NOAA for a fish and wildlife response plan

§312(e)

Marine Sanitation Devices

“Before the standards and regulations under this section are promulgated, the Administrator and the Secretary of the department in which the Coast Guard is operating shall consult with the Secretary of State; the Secretary of Health, Education, and Welfare; the Secretary of Defense; the Secretary of the Treasury; the Secretary of Commerce; other interested Federal agencies....”

Comment [9066-1933]: Commenter (9066) writes that the Proposed Rule also conflicts with provisions of federal environmental laws that EPA specifically cites as its authority for promulgating the rule. For example, the Proposed Rule cites CWA § 104, which authorizes EPA to establish national programs for the prevention, reduction, and elimination of pollution and to conduct and promote the coordination and acceleration of research and studies in connection with establishing those programs. 33 U.S.C. § 1254(a)(1). The activities authorized by this section do not include placing limitations on the use of scientific research for regulatory decision-making. Instead, this section requires EPA to undertake continuing comprehensive studies of the effects of pollution on estuaries and estuarine zones, considering “all pertinent information”—a mandate at odds with the Proposed Rule’s push to exclude relevant peer-reviewed research from the regulatory process.

Comment [9078-3550]: Commenter (6194) writes that the Proposal would prevent EPA from relying on the best available information in discharging its duties. EPA is charged with developing regulations that provide societal benefits by reducing harm to human health and the environment from the presence of chemicals in air, soil, drinking water, food, and consumer products. The Proposal implicates research that is central to making such determinations; creating an obstacle to the consideration of such science is contrary to both primary statutory directives and requirements to conduct cost benefit analyses. Likewise, EPA fails to address how

it could implement a regulation that is inconsistent with federal requirements and standards governing the use of science across agencies.¹¹³⁹

The commenter notes that in developing statutory requirements to develop health based standards and conduct cost-benefit analyses EPA acknowledges that it must use the “best available science” in all of its regulatory actions.¹¹⁴⁰ This directive is embodied in multiple statutes implemented by EPA and is reflected in other environmental statutes, further illustrating Congress’ conceptualization of “best” available science. Broadly speaking, there are three basic types of statutory requirements that the EPA and other agencies consider scientific information. First, there are requirements that the agency consider the “best available science.” Second, there are requirements that the agency consider particular factors, including scientific factors. Third, there are requirements that the agency balance economic costs or technological feasibility against public health, environmental, or other benefits that must be scientifically assessed. The precise terminology regarding the required use of science may, as illustrated below, vary across statutes, but what these provisions have in common are requirements for EPA and other agencies to use scientific information that is “best,” not simply adequate, and “available.”

CWA Example of Statutory Directives regarding Use of Science by EPA and other Agencies

- CWA [33 U.S.C. § 1321(a)(27)]: Some provisions dealing with oil and hazardous substances on the Gulf Coast require “best available science.”

CWA statutory provisions do not link the concept of the “best available science” to the availability of underlying raw data, nor can such a limitation be read into the statutes. Where Congress wanted to direct EPA’s decision regarding what science to consider or how—it did so.¹¹⁴¹ When Congress wanted to link “best available science” to data being publicly available—it did so.¹¹⁴² Thus, if Congress had wanted to put a blanket limitation on EPA’s consideration of

¹¹³⁹ Moreover, as discussed herein, the Proposal would flip the existing default by automatically excluding the best scientific research, rather than admitting science and then deciding if circumstances exist that warrant excluding a study. The status quo makes more sense than creating a blanket preclusion of valid studies and then allowing their use only by going through a timely and expensive exemption process.

¹¹⁴⁰ EPA, Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18,768, 18,769 (Apr. 30, 2018) (citing Exec. Order No. 13,563, 76 Fed. Reg. 8,321 (Jan. 21, 2011)).

¹¹⁴¹ See, e.g., Toxic Substances Control Act, 15 U.S.C. § 2625(h) (directing EPA to consider, as applicable, the following factors: “(1) the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information; (2) the extent to which the information is relevant for the Administrator’s use in making a decision about a chemical substance or mixture; (3) the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented; (4) the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and (5) the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models”); see also Comprehensive Environmental Response, Compensation, and Liability Act, 42 U.S.C. § 9604(i)(10) and (13) (providing that the Agency for Toxic Substances and Disease Registry give EPA specified data and information for review biennially and requiring that “[a]ll studies and results of research conducted under this subsection (other than health assessments) shall be reported or adopted only after appropriate peer review”).

¹¹⁴² See, e.g., Clean Water Act, 33 U.S.C. § 1321(a)(27) (defining “best available science” in the context of natural resource protection and restoration projects on the Gulf Coast as science that: “(A) maximizes the quality,

science for which underlying data is not publicly available, it clearly knew how to do so—and it chose not to.

As EPA has previously explained, the agency would be unable to fulfill statutory mandates if it could not consider studies that follow federal laws and ethical standards regarding the privacy of patient and individual data:

If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. . . . [S]uch data are often the property of scientific investigators and are often not readily available because of the proprietary interests of the investigators or because of arrangements made to maintain confidentiality regarding personal health status and lifestyle information of individuals included in such data. Without provisions of confidentiality, the possibility of conducting such studies could be severely compromised.¹¹⁴³)

The Proposal would also cut EPA off from information needed to complete the cost-benefit analysis of regulations required under certain statutes and government-wide requirements.¹¹⁴⁴

Not only would the Proposal impede EPA’s fulfillment of its statutory duties, it would also be contrary to judicial precedent, which holds that “best available science” includes “all existing scientific evidence relevant to the [agency] decision [in question].” *Ecology Ctr., Inc. v. U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006) (quoting *Heartwood, Inc. v. U.S. Forest Serv.*, 380 F.3d 428, 436 (8th Cir. 2004)). While agencies need not produce new evidence,¹¹⁴⁵ they must seek out information and “cannot ignore existing data.” *Id.* (emphasis added). Even if an agency is anticipating the arrival of better evidence, it must act on the basis of the evidence it currently has.¹¹⁴⁶ Many of the fundamental public health studies on which EPA has based key rules and standards under the statutes are studies for which the raw data was not or could not

objectivity, and integrity of information, including statistical information; (B) uses peer-reviewed and publicly available data; and (C) clearly documents and communicates risks and uncertainties in the scientific basis for such projects”)

¹¹⁴³ National Ambient Air Quality Standards for Particulate Matter, 62 Fed. Reg. 38,652, 38,689 (Jul. 18, 1997).

¹¹⁴⁴ See, e.g., Exec. Order No. 13,783, 82 Fed. Reg. 16,093 (Mar. 31, 2017) (“It is also the policy of the United States that necessary and appropriate environmental regulations . . . are of greater benefit than cost, when permissible, . . . and are developed through transparent processes that employ the best available peer-reviewed science and economics.”); see also 42 U.S.C. § 7411(a)(1) (CAA provision requiring EPA to consider costs when establishing performance standards for new stationary sources of pollution); 42 U.S.C. § 7412(n)(1)(A) (CAA provision directing EPA to regulate power plants if such regulation is “appropriate and necessary,” which includes consideration of costs); 42 U.S.C. § 300g–1(b)(3)(C) (SDWA provision establishing requirements for health risk reduction and cost analysis under which quantifiable and non-quantifiable benefits of a proposed rule must be measured against its cost); 15 U.S.C. § 2605(c)(2)(A)(iv) (TSCA provision requiring EPA to consider “the reasonably ascertainable economic consequences” of a proposed rule).

¹¹⁴⁵ See *Friends of Blackwater v. Salazar*, 691 F.3d 428, 435 (D.C. Cir. 2012) (quoting *Sw. Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000)) (“[U]nder the ‘best . . . data available’ standard, ‘the Secretary has no obligation to conduct independent studies.’”).

¹¹⁴⁶ See, e.g., *San Luis & Delta-Mendota Water Auth. v. Jewell*, 747 F.3d 581, 630 (9th Cir. 2014) (“[T]he fact that science must advance further before the complicated ecosystem interactions in the Bay–Delta are fully understood does not necessarily mean that the Fish and Wildlife Service failed to rely on the best available science.”)

have been released. Nonetheless these studies have been examined and validated,¹¹⁴⁷ as will future studies. Arbitrarily cutting off consideration of a category of science is inconsistent with EPA's statutory obligations.¹¹⁴⁸

Comment [9217-3560]: Commenter (9225) writes that the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA's authority. This includes, but is not limited to, the CAA; CWA; TSCA; LCSA; SDWA; FIFRA; and more.

Comment [9283-3584]: Commenter (8281-PH6) writes that the proposed rule is inconsistent with the Agency's statutory obligation to use the best available science as required in the TSCA, SDWA, and CWA.

Comment [9290-3814]: Commenter (8281-PH24) writes that the EPA has administered successfully, the CWA, and the CAA, and these acts should be expanded based on scientific research. The EPA should not be working to undermine scientific research. Instead, this EPA should be working to provide running water to the 630,000 American families who do not have running water in their homes.

Comment [9316-5014]: Commenter (8281-PH85) supports the application of this rule to EPA's environmental impact analyses, particularly Total Maximum Daily Loads (TMDL), and the NPDES permits under the CWA.

These legally binding permits include ethylene limits for wastewater treatment facilities for pollutants such as lead, mercury, or phosphorus. Slight alterations in these permit limits can cost a single wastewater facility tens of millions of dollars, the cost of which is passed on to individual local rate bearers. These permit limits are supposed to be derived in a manner similar to dose-response relationships as mentioned in the rule where, for example, a lower level of the pollutant in the discharge will result in a measurable increase in receiving water quality working with health. However, we have dealt with instances throughout the country where environmental agencies have based regulations on publicly unavailable data, outdated science or faulty science, even in the face of data or studies which indicate stringent permit limits imposed by these agencies are not anticipated to result in any quantifiable environmental or human health benefit despite the cost. We hope that this rule would remedy these shortcomings.

We also strongly support the use of independent expert peer reviews as an additional level of review for fiscal regulatory science. Our firm has been involved in independent peer reviews of various CWA-related EPA regulations which have concluded that the technical basis for EPA's regulations and permit limits were scientifically indefensible. Had no peer reviews occurred, these regulations would have imposed hundreds of millions of dollars of wastewater treatment costs to rate bearers with no anticipated benefit. As a science-based Agency applying science-based statutes it is critical to both receiving water quality and rate payers throughout the country

¹¹⁴⁷ See the Harvard Letter, *supra* note 6.

¹¹⁴⁸ The Proposal is also arbitrary in suggesting that science that cannot be used in setting regulations could still be used in individual permitting decisions.

that these permits, and regulations are based on sound science and not speculation. In this regard, we support application of EPA's proposed rule to CWA regulations.

Comment [6141-2554]: Commenter (6166) writes that the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA's authority. This includes, but is not limited to, the CAA; CWA; TSCA; LCSA; SDWA; FIFRA; and more. Substantively, the rule violates numerous public health and environmental provisions contained in these laws, as well as requirements to use the best available science or to consider all available information.

Comment [6168-4099]: Commenter (6168) raises the following concerns with the Transparency Rule proposed by the NPRM:

1. The Agency cites specific sections of statutes it administers as the basis of the Agency's authority to adopt the Transparency Rule; including CWA sections 104, 501, 33 U.S.C. 1254, 1361. The Agency rightly cites acts of Congress in an attempt to support the NPRM as such authority is necessary for the Agency to adopt regulations pursuant to the above listed Acts.
2. However, Congress, in each of the Acts' sections cited, never instructs the Agency to consider transparency to the public of supporting data and/or models of the scientific research when deciding to rely on such research as support for regulations passed pursuant to any of the Acts. Consequently, the Transparency Rule requires the EPA to rely on factors which Congress has not intended it to consider when promulgating regulations pursuant to the Acts, rendering the Transparency Rule arbitrary and capricious under the APA.
3. Further, not only does the Transparency Rule lack sufficient Congressional intent to avoid being deemed arbitrary and capricious, implementing the Rule would actually contradict Congressional instruction to conduct scientific research with a focus on 'promotion' and 'coordination' among itself and other institutions that produce scientific research material to the objectives of the Acts Congress requires the EPA to enforce. This provides additional cause for finding the Transparency Rule arbitrary and capricious under the APA.

Comment [7869-3372]: Commenter (8272) writes that the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA's authority. This includes, but is not limited to, the CAA; CWA; TSCA; LCSA; SDWA; and the FIFRA. The rule violates numerous public health and environmental provisions contained in these laws, as well as requirements to use the best available science or to consider all available information.

Comment [6163-1276]: Commenter (6133) writes that the Proposal's peer review provision lacks any statutory basis, is vague and contrary to existing requirements for peer review.

In addition to addressing how and whether the agency will consider science, the Proposal also contains a seemingly unrelated provision regarding agency peer review. The Proposal, in § 30.7, reads:

What role does independent peer review in this section?

EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

Because transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results.

83 Fed. Reg. at 18,774.

There is no statutory authority for EPA to “conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” The federal statutes that EPA lists as putative authority for the Proposal provide no authority for proposed § 30.7. See CWA sections 104, 501, 33 U.S.C. 1254, 1361. The claimed authorities that EPA lists do not mention peer review or even allude to the concept. *Id.* Neither the Proposal nor accompanying docket materials identify any provision of any federal statute that authorizes EPA to promulgate proposed § 30.7. Our own research revealed no provision of any federal statute that authorizes EPA to promulgate proposed § 30.7.

When Congress writes federal statutes, Congress knows how to create legal authority for peer review, who shall conduct that peer review, what role, if any, that EPA or other parties will play, and how that peer review may be conducted. None of the provision in the law authorize EPA's Proposal in § 30.7. Instead, the statutes require that EPA use peer-reviewed science, regardless of whether it would meet EPA's definition of the term in § 30.7. And in cases where the law requires EPA to conduct the review, the statutes often spell out specifically how that should happen. For example, for the CWA:

CWA

§ 1321. Oil and hazardous substance liability

(a) Definitions (27) the term “best available science” means science that--(A) maximizes the quality, objectivity, and integrity of information, including statistical information; (B) uses peer-reviewed and publicly available data; and (C) clearly documents and communicates risks and uncertainties in the scientific basis for such projects;

33 U.S.C. § 1321 (emphasis added).

Under longstanding federal case law, when Congress authorizes an approach in one section of a statute using specific language but does not do the same in other sections of a statute, courts presume that Congress acted purposefully and did not mean to address or authorize that approach

in those other statutory sections. See, e.g., *Dean v. United States*, 556 U.S. 568 (2009) (“It is generally presumed that Congress acts intentionally when including particular language in one section of a statute but not in another.” (citing *Russello v. United States*, 464 U.S. 16, 23 (1983))). Not only are there no implied grants of authority to an agency in the other statutory sections, but the congressional decisions to authorize the approach elsewhere in the statute give even greater force to the conclusion that the agency has not been given authority where Congress did not use the same or similar authorizing language.

The EPA approach proposed in § 30.7 is even more unlawful than would be the case, independently, under this case law. Proposed § 30.7 says “EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” 83 Fed. Reg. at 18,774/2 (emphasis added). EPA proposes to bind itself (“shall”) to conduct a particular form of peer review on “all pivotal regulatory science” based on an unenforceable, non-binding OMB bulletin that has never been the subject of notice and comment rulemaking and that itself is not authorized by any federal law. To the contrary, treating the content of the unenforceable bulletin as a binding regulation would itself violate the federal statutes that EPA implements, because those statutes do not codify the bulletin, and EPA would be unlawfully codifying a mere policy preference. This EPA may not do.

This Proposal is unlawful, arbitrary, and capricious, and an abuse of EPA discretion. To reiterate, the Proposal identifies no statutory authority for EPA to conduct independent peer review for any, much less all, “pivotal regulatory science” consistent with the dense content (and exceptions) of the OMB bulletin. The Proposal identifies no statutory authority for EPA to bind itself, and future administrations, to conduct peer review only in this fashion, unless and until future notice-and-comment rulemaking is undertaken. The Proposal identifies no suggestion in statutory language or legislative history that Congress intended EPA to conduct binding peer review consistent with this OMB bulletin, notwithstanding that Congress has known about this bulletin since 2005. EPA has simply made up proposed § 30.7—with its the link to the OMB bulletin, and the putative authority for the Proposal—out of whole cloth. This EPA may not do.

[6857-2945] Commenter (6879) notes that EPA rules and regulations have been critical to the protection of wildlife, natural habitats, and the ecosystem services they provide to communities and the economy. This includes protection of wetlands under the CWA. These laws require EPA to use the “best available” science, or all “reasonably available” science and information. By excluding high-quality peer-reviewed and validly published science from the regulatory decision-making process, the proposed regulation directly contravenes the specific mandate of these statutes. And by deliberately excluding the best science available, the rule also contravenes the Congressional mandates for these statutes and undermines their public health and environmental protection purposes.

1.3.7.2 CWA (SNPRM Comments)

Comment [48-1947]: Commenter (12727) notes that the Supplemental Notice adds a reference to the CWA, and amends its references to the CERCLA and RCRA,¹¹⁴⁹ but these additions provide no additional support or authorization for the proposal.

The references to CWA and CERCLA cite to the general authorities of the EPA Administrator to issue regulations to fulfill the respective requirements of the statutes. These authorities cannot authorize the proposal's efforts to violate those statutes or act beyond the scope of their requirements.¹¹⁵⁰ Similarly, the cited provision of RCRA contains the Administrator's general authorities to promote research and training, offering no basis for the proposal's requirements or reconciliation of where it may conflict with RCRA's obligations—even requirements in the very same subsection it presumes to cite for authority.¹¹⁵¹

[48-2184] Commenter (12727) notes that just as EPA is required to consider all available science when making its regulatory decisions, governing environmental and public health statutes likewise require EPA to consider all available science when releasing ISI, which often forms the basis for the agency's regulatory decisions. For example, for the CWA:

- The CWA instructs that EPA's water quality criteria must "accurately reflect[] the latest scientific knowledge" on a variety of factors.¹¹⁵²

A rule that prohibits EPA from considering (or that downgrades) valid, high quality scientific studies when generating ISI such as the products identified above would contravene the above-noted statutory directives regarding EPA's obligation to consider all available science.

Comment [73-415]: Commenter (11576) writes that in its supplemental notice, the EPA also points to Section 501 of the CWA, a provision that was first referenced in the agency's original proposal.¹¹⁵³ Like Section 115 of CERCLA, Section 501 grants general rulemaking authority, authorizing the administrator "to prescribe such regulations as are necessary to carry out" the agency's functions under the CWA.¹¹⁵⁴

For the reasons explained above, and as previously noted, Section 501's general grant of rulemaking authority does not provide support for the proposed rule.¹¹⁵⁵ Once again, the EPA has failed to explain why the regulation would be "necessary" for implementing the CWA. It plainly is not, as it would rather undermine the EPA's ability to protect public health and the environment by limiting the scientific studies the agency could consider when setting critical

¹¹⁴⁹ 85 Fed. Reg. at 15,397.

¹¹⁵⁰ See *Chrysler Corp.*, 441 U.S. at 302 ("The legislative power of the United States is vested in the Congress, and the exercise of quasi-legislative authority by governmental departments and agencies must be rooted in a grant of such power by the Congress and subject to limitations which that body imposes."). For discussion of how the 2018 proposal exceeds the authorities of these statutes and violates the requirements of these statutes, see Earthjustice 2018 Comments at 26-27, 48 (CERCLA), and *id.* at 24-25, 45-47 (CWA).

¹¹⁵¹ See Earthjustice 2018 Comments at 53.

¹¹⁵² 33 U.S.C. § 1314(a)(1).

¹¹⁵³ Supplemental Notice, 85 Fed. Reg. at 15,397; Original Proposal, 83 Fed. Reg. at 18,769.

¹¹⁵⁴ 33 U.S.C. § 1361(a). While the EPA has failed to identify the specific language in Section 501 that it means to rely on, none of the statute's other provisions appear to have any possible relevance to the proposed rule. See *id.* § 1361(b)-(f).

¹¹⁵⁵ August 2018 Coalition Comments at 24-25.

limits for toxic pollutants. And the agency has failed to provide any evidence that its current process for reviewing scientific evidence has been failing it. Limiting the science the EPA can rely on would compromise, not help, the agency's ability to "restore and maintain the chemical, physical, and biological integrity of the Nation's waters"—the very purpose of the CWA.¹¹⁵⁶ If the proposed rule is finalized, the EPA will undermine its ability to consider what may be the best or only scientific evidence available. The language of Section 501 does not provide authority for rules that are arbitrary and contrary to the statute—and it accordingly offers no support for the proposed rule.¹¹⁵⁷

Comment [81-2188]: Commenter (12715) writes that whether EPA is arbitrarily barring consideration of scientific studies or information with nonpublic underlying data or data that are not able to be independently validated, or arbitrarily ascribing less weight to such studies or information, neither approach constitutes "housekeeping," and neither comports with statutory requirements that EPA use the best available science. To reiterate from the 2018 Comments, EPA's obligation with respect to the use of scientific information is clear: it must base its decisions on such criteria as the latest scientific knowledge, the best available, peer-reviewed science, and/or generally accepted scientific principles or laboratory tests. To cite just a few examples, in performing its duties, EPA must rely on: "the latest scientific knowledge," CWA of 1977, 33 U.S.C. § 1314(a)(1). EPA has repeatedly emphasized the importance of this fundamental precept, including in its 2018-2022 strategic plan, which states that one of the agency's priorities is to "identify, assess, conduct, and apply the best available science to address current and future environmental hazards."¹¹⁵⁸

These statutory requirements apply to all aspects of EPA's decision-making, including its scientific evaluations, adoption of regulatory standards, and development of policies. They do not permit what EPA proposes here: to either exclude or give less weight to scientific studies or information based on criteria—availability of the underlying data and ability to independently validate underlying data—that are not determinative of whether the studies or information constitute the best available science. Agencies may not adopt or implement regulations that conflict with the statutes under which they are promulgated, and an agency's interpretation of those statutes must always at least be reasonable. See *Chevron, U.S.A., Inc. v. Nat. Res. Def. Council, Inc.*, 467 U.S. 837, 842-44 (1984). Furthermore, neither 5 U.S.C. § 301 nor any other purported housekeeping authority allows EPA to negate these statutes' fundamental, substantive, and common-sense commands. And even assuming EPA has some inherent housekeeping authority, it cannot rely on a general grant of rulemaking authority to promulgate regulations or develop policies that are otherwise inconsistent with more specific statutory directives. *Glob. Van Lines, Inc. v. Interstate Commerce Comm'n*, 714 F.2d 1290, 1293-97 (5th Cir. 1983).¹¹⁵⁹

¹¹⁵⁶ 33 U.S.C. § 1251(a).

¹¹⁵⁷ See *Colorado River Indian Tribes*, 466 F.3d at 139; *Ragsdale*, 535 U.S. at 86.

¹¹⁵⁸ U.S. Envtl. Prot. Agency, Working Together: FY 2018-2022 EPA Strategic Plan, (2018) at page 42, <https://www.epa.gov/sites/production/files/2019-09/documents/fy-2018-2022-epa-strategic-plan.pdf>.

¹¹⁵⁹ EPA's citation to Clean Water Act, CERCLA, and RCRA provisions granting authority to promulgate rules to carry out the agency's responsibilities under those statutes, 85 Fed. Reg. at 15,397, is also unavailing. Restricting consideration of the best science is neither necessary nor consistent with those statutes' goals of protecting human health and the environment.

Finally, EPA acknowledges that the statutes it administers would control in the event of a conflict between the proposed rule and those statutes, see 85 Fed. Reg. at 15,398, but that caveat cannot save the proposed rule. First, the core principle of the proposed rule is facially invalid, *i.e.*, there is no circumstance in which it would be acceptable for EPA to exclude or give less weight to relevant, probative scientific studies, models, or other information that have been validated through peer review, on the sole basis that the underlying data are not publicly available or are not able to be independently validated. EPA cannot save an invalid rule by including what amounts to a waiver procedure, because the “essence of waiver is the assumed validity of the general rule.” *Alltel Corp. v. Fed. Commc’n Comm’n*, 838 F.2d 551, 561 (D.C. Cir. 1988). Second, the agency’s essential duty in rulemaking is to exercise its subject matter expertise to enact rules that implement and further the purposes of the statutes Congress has assigned it to administer. *Chevron*, 467 U.S. at 842-44. This does not include proposing rules without first determining the source of legal authority but instead asking commenters to supply that information. Third, the agency must propose its rules with specificity and be clear as to the programs, regulations, and information to which they will apply. 5 U.S.C. § 553(b)(3); *Home Box Office, Inc.*, *supra*, 567 F.2d at 35-36.

Comment [82-856]: Commenter (12464) notes that section 501 of the CWA, 33 U.S.C. § 1361, does not authorize the Proposal for the same reasons. First, like Section 115 of CERCLA, Section 501(a) of the CWA only authorizes the EPA administrator to promulgate regulations “as are necessary to carry out his functions under this chapter.” 33 U.S.C. § 1361(a). The EPA Administrator’s discretion to promulgate regulations is limited by the goal of the CWA to “restore and maintain the chemical, physical, and biological integrity of the Nation’s waters.”¹¹⁶⁰ EPA, however, makes no effort to explain why the Proposal is necessary to further the CWA’s goals. On the contrary, the Proposal will limit the agency’s ability to rely on the best available science in promulgating regulations under the CWA.

Second, the Proposal is contrary to the broader statutory scheme of the CWA. Like many other environmental statutes, the CWA embraces science and seeks to incorporate the best available science into EPA’s decision-making. For example, in developing water quality criteria under the CWA, EPA must “accurately reflect[] the latest scientific knowledge.” 33 U.S.C. § 1314(a)(1). The Proposal, by arbitrarily blocking EPA from considering relevant scientific studies, is inconsistent with this mandate.

Comment [82-2081]: Commenter (12464) writes that none of the other statutory provisions identified by the Supplemental Notice authorize EPA to promulgate the Proposal. The Supplemental Notice asserts that RCRA Section 8001, 42 U.S.C. § 6981, CERCLA Section 115, 42 U.S.C. § 9615, and CWA Section 501, 33 U.S.C. § 1361, empower EPA to promulgate the Proposal. 85 Fed. Reg. at 15,397. However, there are two major problems with these assertions of statutory authority. First, the Supplemental Notice does not provide any explanation for how

¹¹⁶⁰ 33 U.S.C. § 1251(a); see, e.g., *American Frozen Food Institute v. Train*, 539 F.2d 107, 129 (D.C. Cir. 1976) (Under Section 501(a), “the Administrator has no more important function than carrying out the fundamental purposes of the Act.”); *E. I. du Pont de Nemours & Co. v. Train*, 430 U.S. 112, 131-32 (1977) (Section 501 gives EPA the authority “to achieve with reasonable effectiveness the purpose for which [Congress] has acted.”); see also *Am. Petroleum Inst. v. EPA*, 540 F.2d 1023, 1029 (10th Cir. 1976) (Section 501 is directed towards “the attainment of the congressional intent to protect and preserve water purity”).

these provisions purportedly authorize the Proposal. Second, an examination of the cited provisions demonstrates that they provide no support for the Proposal; indeed, the Proposal would actively hinder, rather than promote, the statutory purposes of RCRA, CERCLA, and the CWA.

Comment [82-2082]: Commenter (12464) argues that the Supplemental Notice makes no effort at all to tie the Proposal to the statutory schemes of RCRA, CERCLA, or the CWA. Instead, it merely asserts that the cited provisions authorize the Proposal without any explanation of how the Proposal relates to the language or purposes of the three statutes. Additionally, both the Initial Proposal and the Supplemental Notice refer to a range of different provisions from different statutes. 83 Fed. Reg. at 18,769; 85 Fed. Reg. at 15,397. EPA must explain how distinct provisions in multiple statutes can authorize the agency to promulgate precisely the same rule for its review of science under all of these schemes, as well as how the Proposal would comply with each statutory scheme.¹¹⁶¹

Comment [82-2083]: Commenter (12464) writes, “[I]t is ‘axiomatic’ that ‘administrative agencies may act only pursuant to authority delegated to them by Congress.’”¹¹⁶² None of the cited provisions, however, provide EPA with authority to ignore relevant scientific information. The CWA only authorizes rulemakings that are necessary to achieve the statutes’ broader purposes. The Proposal, however, is not related to EPA research or research funding, and will actively hinder EPA’s ability to achieve the statutes’ underlying goals by limiting EPA’s ability to rely on the best available science.

EPA has long accepted that its decisions must be guided by the best available science. For example, in 2002, EPA issued Information Quality Guidelines in which it took the position that the standard set forth in the SDWA—to use “the best available, peer-reviewed science”—should apply to all of the agency’s risk assessments.¹¹⁶³ EPA even reiterated its commitment to this standard in the Initial Proposal. 83 Fed. Reg. at 18,769. However, the Proposal would directly undermine this longstanding commitment to use the best available science. As we pointed out in a comment letter in response to the Initial Proposal, the Proposal would prevent EPA from relying on crucial studies that underlie a number of past, present, and future regulations.¹¹⁶⁴ This radical departure from EPA’s standard practice cannot be justified by any of the statutes EPA identifies because it is contrary to the goals of those statutes.

¹¹⁶¹ 5 U.S.C. § 553(b)(2) (requiring that notice of proposed rulemaking include “reference to the legal authority under which the rule is proposed”); see also *Iowa League of Cities v. EPA*, 711 F.3d 844, 877 (8th Cir. 2013) (noting that an agency regulation will only survive ultra vires allegations if a court can “reasonably conclude that the grants of authority in the statutory provisions cited by the government contemplate the issuance” of the regulation).

¹¹⁶² *Clean Air Council v. EPA*, 862 F.3d 1, 9 (D.C. Cir. 2017) (citation omitted).

¹¹⁶³ EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency 21-23 (2005), <https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf>; see also Our Mission and What We Do, EPA, <https://www.epa.gov/aboutepa/our-mission-and-what-we-do> (last visited May 14, 2020) (identifying EPA’s mission to include ensuring that “[n]ational efforts to reduce environmental risks are based on the best available scientific information”).

¹¹⁶⁴ ELPC Science Comments, *supra* note 2, at 6-12

Comment [89-2199]: Commenter (11403) writes that EPA’s 2018 version of this rule cited a hodgepodge of statutory authority, none of it valid. EPA at least corrected the obvious typographical errors from the previous version. However, those edits still do not grant EPA the authority to restrict science from all regulatory decision-making processes within the agency. EPA is attempting to use general grants of authority to create a completely novel approach to assessing science. However, as the Supreme Court has stated, “Congress . . . does not alter the fundamental details of a regulatory scheme in vague terms or ancillary provisions—it does not, one might say, hide elephants in mouseholes.”¹¹⁶⁵ EPA does not have the authority to alter the fundamental details of all of its regulatory schemes based on such vague provisions of law.

As an example, the commenter states that Section 501 of the CWA states, “The Administrator is authorized to prescribe such regulations as are necessary to carry out his functions under this chapter.”¹¹⁶⁶ This catch-all provision provides the authority to prescribe regulations, but EPA has not provided a single rationale explaining how the proposed rule is “necessary” to carrying out functions under the CWA.

In short, the commenter notes that none of the statutory provisions cited by EPA provide authority for the proposed rule. The proposed rule fails at step one under *Chevron v. Natural Resources Defense Council* since it is unreasonable to believe that any statutory general grant of authority or any mention of EPA’s oversight of other science or research programs would enable EPA to conduct rulemaking in a way that is altogether inconsistent with the rule of law. None of the cited provisions provide the authority sought by EPA, and as such the proposed rule should be withdrawn.

Comment [125-2203]: Commenter (11495) notes that EPA’s Supplemental Notice is at odds with provisions of multiple environmental statutes which require the Agency to consider certain high-quality scientific information. The CWA and the CAA require that water and air quality criteria determinations be based on the “latest scientific knowledge.”¹¹⁶⁷

Each of these provisions directs EPA to incorporate a certain quality of scientific information into its rulemaking decisions made pursuant to the statute. In particular, these requirements are designed to ensure the scientific validity of the information upon which EPA bases its actions. Mandating a high-quality scientific basis for regulatory actions is necessary to guarantee the best possible protections for public health and welfare and to minimize partisan influence in scientific decision-making.

The Supplemental Notice, however, would impermissibly prohibit the agency from considering of relevant and high-quality scientific studies whenever the data underlying the study are not publicly available—in direct contravention of the statutory directives that mandate, for example, consideration of the “best available science.” None of the provisions requires, or even suggests, that EPA only consider information that is publicly available. It strains the plain meaning of

¹¹⁶⁵ *Whitman v. American Trucking Ass’n, Inc.*, 531 U.S. 457 (2001).

¹¹⁶⁶ “Clean Water Act,” 33 U.S.C. § 1361.

¹¹⁶⁷ 33 U.S.C. § 1314(a)(1); 42 U.S.C. § 7408(a)(2) (emphasis added).

words like “best,” “latest,” and even “appropriate” to suggest that they permit the unscientific requirement that all data be publicly available.

EPA “cannot ignore available . . . information.”¹¹⁶⁸ Courts have held that “best available data” requirements “prohibit[] [an agency] from disregarding available scientific evidence that is in some way better than the evidence [it] relies on.”¹¹⁶⁹ Furthermore, a plaintiff may establish a violation of a “best available science” requirement by “point[ing] to any scientific evidence that the agency failed to consider.”¹¹⁷⁰ The Supplemental Notice would undoubtedly preclude EPA from considering certain studies and scientific information that is “better” or the “best available,” simply because the study’s underlying data is not publicly available, thereby failing to satisfy Congressional directives and undermining the quality of regulatory decisions.

Likewise, EPA cannot avoid the statutory directives to consider high-quality scientific information simply by assigning a lesser weight to such information when the underlying data are not publicly available, as the Agency alternatively proposes. The Supplemental Notice’s alternative proposal is designed to have largely the same pernicious effects as flatly prohibiting consideration of studies lacking publicly available data. Just as with the primary proposal, EPA’s alternative proposal would limit the agency’s consideration of the best available science in making important regulatory decisions, and is, therefore, arbitrary, and capricious.

The effect of the Proposed Rule is inconsistent with EPA’s view that the Supplemental Notice is “intended to be consistent with the statutes that EPA administers and EPA plans to implement this procedural rulemaking in accordance with all applicable statutory and regulatory requirements.”¹¹⁷¹ EPA attempts to resolve this inconsistency by stating that “in the event the procedures outlined in the proposed rulemaking conflict with the statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”¹¹⁷² However, as discussed below, EPA lacks the statutory authority to issue a rule this broad, even when it claims that it will avoid statutory conflicts.

Comment [133-1194]: Commenter (11894) writes that the CWA requires states, or, if they default, EPA, to establish “total maximum daily [pollution] loads” for individual water bodies to specify the pollution levels that they can tolerate. About 65,000 such TMDL have been established, mostly by states, but some by EPA. TMDL rest on extensive bodies of scientific information and modeling in several different technical fields. Once again, EPA has completely failed to even specify whether or not its new requirements would apply to this program.

The question whether these new requirements would apply to TMDL raises a fundamental issue that goes far beyond the TMDL program itself. Perhaps the new requirements would not apply to

¹¹⁶⁸ *San Luis & Delta-Mendota Water Auth. v. Jewell*, 747 F.3d 581, 602 (9th Cir. 2014) (quoting *Kern County. Farm Bureau v. Allen*, 450 F.3d 1072, 1080-81 (9th Cir. 2006) (quoting *Conner v. Burford*, 848 F.2d 1441, 1454 (9th Cir. 1988)).

¹¹⁶⁹ *Kern County. Farm Bureau*, 450 F.3d at 1080 (citing *Southwest Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000)).

¹¹⁷⁰ See *Safari Club Int’l v. Salazar* (In re Polar Bear Endangered Species Act Listing & Section 4(d) Rule Litig. - MDL No. 1993), 709 F.3d 1, 9 (D.C. Cir. 2013).

¹¹⁷¹ See 85 Fed. Reg. at 15,398.

¹¹⁷² See *id*

EPA-issued TMDL because of the specific regulatory language exempting EPA actions. But would they apply to the extensive technical guidance that EPA issues to states on how to write TMDL? And if they did, how could EPA exempt its own requirements from the same standards?

These questions are relevant, not just to the TMDL program, but to the entire structure of “cooperative federalism” under several EPA statutes. They would apply, for example, in almost exactly the same form, to permit decisions under the CWA or to permit and state implementation plan decisions under the CAA. Typically, under each of these statutes, EPA issues extensive technical guidance to state programs even though they retain the power to make regulatory decisions. Yet EPA’s proposal does not mention this issue in any way. Nor does it discuss the impact of these new requirements on the TMDL program or how the agency might address them.

Comment [133-1238]: Commenter (11894) notes that the CWA requires each state to develop TMDL for every waterbody the state identifies as having uses impaired because of pollution. The objective of the TMDL is to determine the pollutant loading capacity of the waterbody and to allocate that load among the pollutant sources so that the appropriate control actions can be taken to achieve the state’s water quality standards. States are responsible for developing TMDL and submitting them to EPA for approval. Even if a third party develops the TMDL with a proprietary model, the state is responsible for submitting that TMDL to EPA. If EPA disapproves a state TMDL, EPA must develop a replacement TMDL. TMDL are developed using a range of techniques from simple mass balance calculations to complex fate and transport mathematical models. To date, over 65,000 TMDL have been developed and approved for use in regulating point sources of pollution and controlling pollutant discharges from nonpoint sources. If the final science transparency rule applies retroactively to ISI, every one of the TMDL will have to be re-examined. If the model underlying a TMDL fails to meet the new tests of transparency and reproducibility, the enforceability of the state’s point source permit limits and nonpoint source controls based on that TMDL will be undermined. If the science transparency rule applies only prospectively to new TMDL, EPA will need to disapprove any new TMDL based on a proprietary model since such a model would not meet the new transparency and reproducibility requirements. Whether the science transparency rule applies retroactively or prospectively, EPA will incur significant costs and time replacing TMDL. Despite this major impact, the supplemental notice provides no estimation of the costs and benefits.

Comment [159-1414]: Commenter (12430) notes that the SNPRM cites to one additional CWA provision – 33 U.S.C. section 1361. The most arguably relevant subdivision simply states that “[t]he Administrator is authorized to prescribe such regulations as are necessary to carry out his functions under this chapter.” It does not address the use of science, and the SNPRM fails to explain how the proposed regulation would be “necessary to carry out” the CWA, particularly when another section of the Act requires that water quality criteria “accurately reflect[] the *latest scientific knowledge*.”¹¹⁷³

Comment [159-2091]: Commenter (12430) writes that in the SNPRM, U.S. EPA proposes to consider only (or, in the alternative, more heavily weight) studies and models with publicly available data. However, restricting agency consideration of scientific studies and models would run afoul of U.S. EPA’s obligations under many of its operating statutes to rely on the best

¹¹⁷³ 33 U.S.C. § 1314(a)(1) (emphasis added).

available science. For example, The CWA requires that water quality criteria “accurately reflect[] the latest scientific knowledge.”¹¹⁷⁴

Comment [161-1464]: Commenter (12434) writes that the Proposal directly conflicts with requirements under the core federal environmental laws, each of which requires that decisions be made using the “best available science” or some similar restriction. By requiring that publicly available data be prioritized over other scientific data, regardless of any other merits, the EPA is arbitrarily constrained and will be unable to comply with the statutory requirements to meet the “best available science.”

The CWA, for example, requires that the EPA develop water quality criteria “accurately reflecting the latest scientific knowledge.” 33 U.S.C. § 1314(a)(1). In fact, throughout the CWA, the Agency is required to look at a broad range of scientific information when promulgating the numerous regulatory decisions, it entails. When reviewing states’ water quality standards, the EPA must review any submitted “general information which will aid the Agency in determining the adequacy of the scientific basis of the standards.” 40 C.F.R. § 131.6(f). The CWA does not limit the review of this information and other scientific information by whether the data set is publicly available anywhere in the statute. In fact, given that many of these regulatory decisions directly consider “public health or welfare,” such as is the case for water quality standards, 33 U.S.C. § 1313(c)(2)(A), it is possible that the relevant scientific studies include data sets that are not fully publicly available because of public health data involved. The Proposal does not provide any such justification, beyond a stated intent of transparency, as to why a robust, and even peer-reviewed, scientific study that reflects the “latest scientific knowledge” could be insufficient or even ignored when making such critical decisions such as the establishment of water quality standards.

Public health data, most vulnerable to the Proposal’s exclusions, are used for the development of water quality standards, which are critical for protecting the health of communities in the Long Island Sound region. For example, NYC has developed a Long-Term Control Plan in order to reduce combined sewer overflow events. The success of the Long-Term Control Plan is matched against New York State’s water quality standards. If the latest scientific knowledge is not used when establishing these water quality standards because of confidential public health data sets, then NYC might work towards an inadequate standard that is not properly protective of public health, a serious consideration when speaking of the frequent overflow of raw sewage into local waterways during storm events.

Comment [187-1703]: Commenter (12720) notes that EPA cites sections 104, 33 U.S.C. § 1254, and 501, 33 U.S.C. § 1361, of the CWA as putative authority for the Proposal. Nothing in these sections authorize the Proposal’s limitations on scientific evidence.

With respect to section 104, the Proposal tellingly fails to specify which of its 22 subsections supposedly supports the restrictions EPA has proposed. This deficiency reflects a lack of authority for the Proposal in section 104. And even if EPA thinks that it can cobble together language in section 104 to support the Proposal, the agency’s complete failure to identify in the

¹¹⁷⁴ 33 U.S.C. § 1314(a)(1).

Proposal how section 104 authorizes this rulemaking means that EPA did not provide sufficient notice for the public to comment on the Proposal.

None of the subsections in section 104 states or suggests that, in promulgating regulations under the CWA, EPA may limit its consideration of “regulatory science underlying its actions” to studies or analyses that “are publicly available in a manner sufficient for independent validation.” *See* 83 Fed. Reg. at 18,773 (proposed § 30.5) (and modified at 85 Fed. Reg. at 15,402). To the contrary, several subsections indicate that Congress intended EPA to consider available scientific evidence in order to carry out the Act.

First, subsection (b) authorizes EPA to collect and publicize results and information related to studies about water pollution but does not say anything about *limiting* consideration of science simply because data cannot be made public, either as part of rulemakings or otherwise. Nor does it draw any distinction between dose-response data and other types of data.

Second, subsection (c) directs EPA to “conduct research on, and survey the results of other scientific studies on, the harmful effects on the health or welfare of persons caused by pollutants.” It provides no authority whatsoever for *limiting* consideration of studies, models or data, dose-response or otherwise, during rulemakings; indeed, by directing EPA to “survey the *results of other scientific studies*,” rather than the publicly-available dose-response data underlying those results, this subsection contradicts the Proposal’s (and Supplemental Proposal’s) limitations and conditions.

Third, subsection (l)(1) indicates that EPA should be inclusive with respect to considering evidence, as it directs EPA to “develop and issue to the States for the purpose of carrying out this Act the *latest scientific knowledge available* in indicating the kind and extent of effects on health and welfare which may be expected from the presence of pesticides in the water in varying quantities. He shall revise and add to such information whenever necessary to reflect developing scientific knowledge.”

Fourth, subsection (n) directs EPA to cooperate with various entities to “conduct and promote, encourage contributions to, continuing comprehensive studies of the effects of pollution, including sedimentation, in the estuaries and estuarine zones of the United States on fish and wildlife, on sport and commercial fishing, on recreation, on water supply and water power, and on other beneficial purposes.” Importantly, subsection (n)(2) reveals Congress’s intention that EPA will consider information broadly, by instructing the agency to “assemble, coordinate, and organize *all existing pertinent information* on the Nation’s estuaries and estuarine zones. . .”

EPA also cites 33 U.S.C. § 1361 as a basis for the Proposal, but it does not provide the agency with the authority it desires. Subsection (a) merely states that the “Administrator is authorized to prescribe such regulations as are necessary to carry out his functions under this chapter.” As explained above, that general grant of authority cannot support the rule, especially when the rule conflicts with the Act. Moreover, EPA casually invokes this provision, but does not make any effort to justify the proposed restrictions as necessary to any particular CWA statutory function, so it has not made the case that this provision provides authority to adopt the Proposal’s limits.

The Act contains other indications that Congress intended EPA's consideration of science to be inclusive. In particular, section 304(a)(1) of the Act states:

The Administrator, after consultation with appropriate Federal and State agencies and other interested persons, shall develop and publish, within one year after the date of enactment of this title (and from time to time thereafter revise) criteria for water quality *accurately reflecting the latest scientific knowledge* (A) on the kind and extent of all identifiable effects on health and welfare including, but not limited to, plankton, fish, shellfish, wildlife, plant life, shorelines, beaches, esthetics, and recreation which may be expected from the presence of pollutants in any body of water, including ground water; (B) on the concentration and dispersal of pollutants, or their byproducts, through biological, physical, and chemical processes; and (C) on the effects of pollutants on biological community diversity, productivity, and stability, including information on the factors affecting rates of eutrophication and rates of organic and inorganic sedimentation for varying types of receiving waters.

As the italicized language above reveals, Congress refused to limit EPA's consideration of available evidence in discharging one of its core functions aimed at protecting the nation's waters. EPA provides no reason in the Proposal why the any other action under the CWA the Proposal targets should be any different.

1.3.8 National Environmental Policy Act (NEPA) (SNPRM Comments)

Comment [Comment 20-1294]: Commenter (10753) cited comments as stating that NEPA requires preparation of an Environmental Impact Statement (EIS) before EPA adopts the Rule and/or the SNPRM. This is especially true because the SNPRM expressly extends the Rule's coverage to rules and models that may not have been otherwise covered. EPA states:

This SNPRM proposes that the scope of the rulemaking apply to ISI as well as significant regulatory decisions. This notice proposes definitions and clarifies that the proposed rulemaking applies to data and models underlying both pivotal science and pivotal regulatory science. In this SNPRM, EPA is also proposing a modified approach to the public availability provisions for data and models that would underly significant regulatory decisions and an alternate approach. Finally, EPA is taking comment on whether to use its housekeeping authority independently or in conjunction with appropriate environmental statutory provisions as authority for taking this action.

<https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-9322>

Put another way, by expanding the Rule's reach, the SNPRM requires an EIS more (and a more thorough EIS) than does the Rule by itself.

Response: NEPA does not apply to this rulemaking because the rule is not a "major Federal action significantly affecting the quality of the human environment." NEPA section 102(2)(c); 42 USC § 4332(2)(c). The rule is one of internal agency procedure that describes the consideration the agency will give to studies based on data availability and the factors EPA uses

to evaluate studies that may be used for regulatory purposes and ISI and, as such, will not affect the quality of the human environment.

Comment [Comment 89-814]: Commenter (11403) states that section 7(a)(2) of the ESA requires that “each federal agency shall, in consultation with and with the assistance of the Secretary, insure that any action authorized, funded, or carried out by such agency is not likely to jeopardize the continued existence of any endangered or threatened species or result in the destruction or adverse modification of habitat of such species which is determined by the Secretary . . . to be critical.”¹¹⁷⁵ Under the Services’ joint regulations implementing the ESA, EPA is required to review its actions “at the earliest possible time” to determine whether the action may affect listed species or critical habitat.¹¹⁷⁶ EPA must initiate consultation under Section 7 whenever its action “may affect” a listed species or critical habitat.¹¹⁷⁷ The phrase “may affect” has been interpreted broadly to mean that “any possible effect, whether beneficial, benign, adverse, or of an undetermined character, triggers the formal consultation requirement.”¹¹⁷⁸ Because this proposed rule would prevent EPA from utilizing the best available science, EPA would be unable to sufficiently determine if one of its decisions, regulations, or policies would harm a threatened or endangered species or its critical habitat. EPA must at a minimum engage in a programmatic consultation with the services to determine if this action is likely to adversely affect endangered species.

While some of EPA’s actions are exempt from the NEPA, this proposed rule is clearly not exempt. By EPA’s own tortured logic, this proposal encompasses virtually every aspect of EPA’s statutory mandate, and most of these still fall under the ambit of NEPA. Accordingly, the EPA must prepare an EIS for the proposed rule because the net effect of the changes to the existing regulations will mean more environmental harm due to delayed decisions, under-regulation of harmful pollutants, and the rejection of the best available science. By every definition, this will have a massive impact on the human environment and therefore requires review under NEPA.

NEPA requires every federal agency to prepare an EIS for all “major Federal actions significantly affecting the quality of the human environment.”¹¹⁷⁹ EPA may forego a NEPA analysis only if a categorical exclusion applies, and EPA has not indicated that it believes a categorical exclusion applies. If EPA does indeed believe that one applies, EPA must provide the public with notice and the opportunity for the public to provide comment. If EPA does not believe that a categorical exclusion applies, EPA must at the very least elect to first complete an Environmental Assessment (EA) to determine if an EIS is needed or complete a full EIS. It is highly likely, if not a certainty, that this proposal will have negative environmental impacts. A “reasonable person” reviewing this proposal could only conclude that the proposal is designed to weaken and hamstring EPA’s ability to properly regulate harmful pollutants, resulting in significant harm to human health and environmental quality. Therefore, a finding of no

¹¹⁷⁵ 16 U.S.C. § 1536 (a)(2) (emphasis added).

¹¹⁷⁶ 50 C.F.R. § 402.14(a).

¹¹⁷⁷ *Id.*

¹¹⁷⁸ *Western Watersheds Project v. Kraayenbrink*, 632 F.3d 472, 496 (9th Cir. 2011) (brackets omitted) (quoting 51 Fed. Reg. at 19,949). The threshold for triggering ESA consultation is “relatively low.” *Lockyer v. U.S. Dep’t of Agric.*, 575 F.3d 999, 1018 (9th Cir. 2009).

¹¹⁷⁹ 40 C.F.R. Part 1500.

significant impact from an EA would be highly suspect and would almost certainly be arbitrary and capricious. EPA must prepare a complete EIS on this proposed rule and provide a reasonable period to provide public comment consistent with the requirements of NEPA.

Response: An ESA section 7(a)(2) consultation is not required for this rule because it does not affect listed species or critical habitat. Further, contrary to the commenter's assertion, the rule does not prevent EPA from using the best available science. The rule is one of internal agency procedure that describes the consideration the agency will give to studies based on data availability and the factors EPA uses to evaluate studies that may be used for regulatory purposes and ISI.

See response to Comment 20-1294 regarding NEPA applicability.

1.3.9 Other Environmental Statutes (NPRM Comments)

Comment [37-32]: Commenter (0046) writes that EPA must also submit its proposal to the Science Advisory Board pursuant to the requirements of 42 U.S.C. §4365 (c)(1) (the Environmental Research Development Demonstration Authorization Act), which requires the Administrator to submit to the SAB any "proposed criteria document, standard, limitation, or regulation, together with relevant scientific and technical information in the possession of the (EPA) ... on which the proposed action is based" at the time it provides that proposal to another agency of the government for formal review. The SAB is then to review and comment on the proposal, which the Administrator is to consider, although the Administrator is not required to obtain SAB approval for any final action. See H. Rep. No. 95-722 (95th Cong. 1st Sess. (1977) (Conference Report).

Response: EPA sought SAB review of aspects of the proposed rule and received the SAB's comments on April 24, 2020. See [https://yosemite.epa.gov/sab/sabproduct.nsf/2DB3986BB8390B308525855800630FCB/\\$File/EP-A-SAB-20-005.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/2DB3986BB8390B308525855800630FCB/$File/EP-A-SAB-20-005.pdf).

Comment [993-4238]: Commenter (1008) states that they are in favor of all federal agencies promoting public access to research results, including to the data supporting research conclusions that inform regulatory decisions. Commenter further appreciates the previous Administration's memorandums and orders that require federal agencies to make their data publicly accessible (e.g. Increasing Access to the Results of Federally Funded Scientific Research" - OSTP Memo Feb 22, 2013, "Open Data Policy-Managing Information as an Asset" - OMB Memo M-13-13). However, no agency (including the EPA), in its push towards research transparency and public access to research data, should compromise or disregard its Congressional mandated mission.

Response: EPA intends to implement this rule consistent with its mission to protect human health and the environment. Implementation of the final rule will not result in EPA compromising or disregarding its mission.

Comment [1320-4331]: Commenter (1335) notes that there may be articles in the EPA legislation, such as those cited in the proposed Rule, which exhort the EPA to use the best

science available to reach regulatory conclusions, but the overarching intent and thrust of the Environmental Protection Act is to actually protect the environment. It would be extremely unwise to weaken the ability of the EPA to protect the environment to the best of its ability, to protect Americans from pollution and climate change (whatever the cause). In fact, any effort to thwart that central intent of the Act by the Agency must be in its core illegal.

Response: The Agency has no knowledge of the Environmental Protection Act referenced by the commenter. The final rule does not rely on or interpret the substantive environmental statutes that EPA cited in the 2018 and 2020 proposals. EPA's implementation of this rule will not weaken the Agency's ability to protect human health and the environment. The EPA is issuing this final rule to help strengthen the transparency of the dose-response data underlying certain EPA actions. As EPA states in the preamble, "codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the public's access to the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety."

Comment [1412-4472]: Commenter (1427) writes that the proposal asserts existing statutes and regulations governing the application of science in regulatory processes burden EPA, constrain its ability in the fulfillment of its mission where it must forthrightly (transparently) interface with the public. EPAs proposed remedies include weakening its duty to comply with legal, i.e., statutory and regulatory, and ethical obligations; defining new sciences unique to EPA administration; and assigning new authorities to non-scientist administrators to referee determinations that science applied to EPA regulations is valid and credible. Such remedies should be rejected.

Response: EPA disagrees with the commenter's assertion that the statutes and implementing regulations constrain EPA in the manner described by the commenter. EPA states clearly in § 30.3, that where there are conflicts between this rule and the substantive provisions of the statutes and regulations the Agency administers, this rule will yield. EPA is relying on its housekeeping authority to promulgate this purely procedural rule. It is well within the authority of the Administrator to develop procedures that govern the internal affairs of the Agency. See the response to Comment 31-135. The rule includes reasonable factors for the Administrator to consider when deciding whether to exempt a study from the rule requirements.

Comment [2322-157]: Commenter (2337) urges EPA not to finalize the Proposed Rule. The Proposed Rule is inconsistent with EPA's statutory mandate under various environmental laws to use the best available scientific data to protect public health and welfare and the environment.

Response: EPA disagrees that the final rule is inconsistent with its statutory mandates. EPA intends to continue relying on the high-quality studies to support its significant regulatory decisions and influential scientific information. See response to Comments 1320-4331 and 1412-4472.

Comment [2322-159]: Commenter (2337) expresses that the Proposed Rule requires that underlying data supporting scientific studies concerning the environmental or health impacts of

pollutants be made publicly available for independent validation in order for EPA to use such data in making regulatory decisions. The Proposed Rule further provides that EPA will conduct independent peer review on all data it uses to justify its regulatory decisions. While commenter supports EPA's goal of basing its rulemaking on the strongest scientific evidence possible and fostering transparency, they are concerned that the Proposed Rule unduly limits the scientific data EPA can consider and conflicts with EPA's statutory obligations.

Response: The final rule does not prevent the agency from considering any particular studies. Nor does the rule authorize violations of the statutes and regulations. EPA will not categorically exclude any studies from consideration when promulgating significant regulatory decisions or developing influential scientific information. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying dose-response data are available for independent validation. That means that the agency will consider all relevant studies when taking covered actions.

The final rule does not require EPA to conduct independent peer review of all the studies it uses to justify regulatory decisions. Section 30.6 provides, in pertinent part, that the "EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review." If adequate peer review has occurred under those guidelines, additional peer review may not be warranted.

Comment [2322-161]: Commenter (2337) writes that this repeated statutory requirement that EPA use the "latest," "best available," and "peer-reviewed" science conflicts with EPA's proposal to use only publicly available scientific data. None of the environmental statutes restrict reliable scientific evidence to studies where all underlying data has been made publicly available. Indeed, there are many reasons why data cannot, or cannot easily, be made public, including privacy and individual confidentiality concerns, particularly when related to personal health information. All high quality scientific research, regardless of the public availability of its raw data, should equally be used by EPA in establishing regulatory standards. Were EPA to reject otherwise reliable epidemiological or similar health evidence because underlying data could not be made available without violating privacy or confidentiality, EPA would not be using "the latest scientific knowledge" or "the best available peer reviewed science" in violation of its statutory obligations. Further, EPA would be ignoring data that would ensure its ability to meet its obligations to establish standards protective of public health, with "an adequate margin of safety."

Response: The final rule does not restrict EPA to using only publicly available scientific data. Additionally, the final rule does not categorically exclude any relevant studies from consideration. EPA will evaluate and weight studies determined to be pivotal science, using the criteria in § 30.5, which will allow all high-quality studies to be factored into the agency's development of significant regulatory decisions and influential scientific information. Also see the response to Comments 1320-4331, 1412-4472 and 2322-159.

Comment [2322-205]: Commenter (2337) contends that the Proposed Rule's provisions allowing data to be made public in controlled processes (section 30.5) and EPA to grant exemptions to the rule's requirements (section 30.9) do not resolve the rule's inconsistencies with environmental statutes. Where all underlying data cannot be made publicly available, the Proposed Rule requires the Administrator to make a case-by-case determination whether to exempt the data from disclosure requirements. This exemption will not ensure that EPA considers the latest or best available data, lacks consistent standards, and in any event will likely be difficult and time consuming to administer.

Response: EPA states clearly in § 30.3, that where there are conflicts between this rule and the substantive provisions of the statutes and regulations the Agency administers, this rule will yield. The final rule does not categorically exclude any relevant studies from consideration. See response to Comments 2322-159 and 2322-161.

EPA disagrees that the exemption provision lacks consistent standards. The final rule includes reasonable factors for the Administrator to consider when deciding whether to exempt a study from the rule requirements. The additional procedures required by this rule only apply to pivotal science, which is a subset of the total number of studies that the EPA would evaluate. Given the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA disagrees that implementation will be difficult or time-consuming.

Comment [2412-206]: Commenter (2427) writes that EPA's proposed rule that claims to strengthen transparency in science supporting regulations, would in fact prevent the Agency using the best available science – and therefore would keep EPA from complying with environmental laws.¹¹⁸⁰

Response: See response to Comments 2322-159 and 2322-161.

Comment [2772-2255]: Commenter (2787) argues that the proposed rule suffers from significant procedural flaws including lack of supporting evidence, insufficient detail in the proposal itself, and conflicts with EPA's statutory obligations.

Response: EPA disagrees that the final rule suffers from significant procedural flaws. See responses to comments in RTC section 1.5.

Comment [3117-104]: Commenter (3132) asserts that the proposal is void *ab initio* because the EPA has violated the National Environmental Policy Act. This is because the EPA is preparing the proposed rule without first preparing the necessary Environmental Impact Statement. See *generally*, NE_PA. With a few strictly limited exceptions, NEPA's Environmental Assessment and EIS requirements apply to EPA action. 40 CFR §6:204. Obviously, none of the exceptions

¹¹⁸⁰ Bob Sussman, "EPA's Flawed 'Secret Science' Plan Puts Good Science at Risk," BLOOMBERG BNA (May 21, 2018), available at: <https://www.bna.com/practitioner-insights-epas-n57982092715/>.

apply here and any rational Environmental Assessment would find an EIS necessary. See generally CFR §§6:200-210.

Response: NEPA does not apply to this rulemaking because the rule is not a “major Federal action significantly affecting the quality of the human environment.” NEPA section 102(2)(c); 42 USC § 4332(2)(c). The rule is one of internal agency procedure that describes the consideration the agency will give to studies based on data availability and the factors EPA uses to evaluate studies that may be used for significant regulatory actions and influential scientific information and, as such, will not affect the quality of the human environment.

Comment [3118-3141]: Commenter (3133) suggests that the proposal is void *ab initio* because the EPA has violated the NEPA. This is because the EPA is preparing the proposed rule without first preparing the necessary Environmental Impact Statement. NEPA. With a few strictly limited exceptions, NEPA's Environmental Assessment and EIS requirements apply to EPA actions. 40 CFR §6:204. Obviously, none of the exceptions apply to the proposal and any rational EA would find an EIS necessary. See generally 40 CFR §§6:200-210.

Response: See response to Comment 3117-104.

Comment [4831-2080]: Commenter (4842) states that there is no basis in existing bedrock environmental laws that authorizes EPA to limit science considered in rulemaking processes. EPA cites several foundational environmental laws as a justification for this proposal. Nowhere in the cited statutes is there any basis for demanding access to raw data, nor does this relate sensibly to any definition of best available science. Rather, this proposal undermines the use of best available science called for in environmental statutes including the Clean Air Act. Further, there is no basis for politically appointed administrators to choose which science will be considered and which may not be.

Response: The final rule does not rely on or interpret the substantive environmental statutes that EPA cited in the 2018 and 2020 proposals. Also see response to Comments 1412-4472 and 2322-205.

Comment [4832-283]: Commenter (4843) contends that this mandate directly undermines the agency's mission to protect health and human safety by purposefully creating more bureaucratic red tape to potentially prevent peer-reviewed scientific studies from having an effect on policy, without limiting the exposure of study participants. It works to undermine the scientific community as a whole by limiting the scope, type, character, and data from having any effect on policy unless researchers follow an arbitrarily limited state mandated and controlled scientific study format.

It is up to the agency to hire qualified people to read and interpret the most up to date science, to judge its value, and make recommendations based off the broader research as a whole to define and quantify potential hazards in the environment. This is a part of the EPA's core mandate and any decision that hinders it will directly increase the risk to everyone that the agency is sworn to protect. The mandate of the agency supersedes the current political climate.

Response: EPA disagrees that the final rule will undermine the Agency's mission. See the response to Comments 1320-4331 and 2322-205.

Comment [4868-4076]: Commenter (4879) suggests that given that there is no non-frivolous argument that any categorical NEPA exclusion could apply (see commenter's attached joint comment dated May 24, 2018), an EIS that fully discloses the environmental impact of the proposal is required by NEPA.

Response: See response to Comment 3117-104.

Comment [4873-2103]: Commenter (4884) asserts that EPA governance is not meant to be a profitable enterprise. It is meant to serve the public interests in good health and environmental quality. The Clean Air, Pure Waters, Toxic Substances Control, Resource Recovery, and Hazardous Waste laws all direct EPA to use the best science to achieve these ends without regard to cost. Why should EPA consider clean air cost free? Dirty air imposes poor health that the public must suffer and pay for. Dirty air soils clothes and buildings. Acidic deposition dissolves infrastructure, kills biota, and diminishes visibility. These impairments are costs to the public and the planet that cradles our lives and lively hood.

Response: Nothing in the final rule requires EPA to consider costs in a manner inconsistent with statutory requirements.

Comment [5153-4079]: Commenter (5164) writes that their letter adds to the abundant evidence that the NEPA requires the preparation of a proper EIS before the regulation can be adopted.

Response: See response to Comment 3117-104.

Comment [5170-382]: Commenter (5181) notes that the Administration is currently engaged in a multi-year effort to streamline NEPA and recommends that the proposed rule not undermine that initiative either by excluding information that does not meet the requirements or by requiring more time for the required transparency standards to be met.

Response: Nothing in the final rule is related to the Administration's efforts to streamline NEPA. This is a rule of internal agency procedure that applies only to EPA.

Comment [5410-4088]: Commenter (5421) states that EPA's success and the success of the existing regulations in handling RCRA problems with current scientific studies (studies that EPA would be compelled to ignore under the proposed regulation) provides further evidence that NEPA requires EPA to prepare a thorough EIS before it adopts the proposed regulation. Adopting the regulation without an EIS would violate NEPA.

Response: EPA disagrees that NEPA applies to this rulemaking. See response to Comments 3117-104, 2322-159 and 2322-161.

Comment [5865-695]: Commenter (6111) contends that the proposed rule would prohibit the continued and future use of these studies by EPA thereby obstructing EPA's statutory duty to

consider the “best,” “reasonably” available information in its decision-making processes. The resulting information vacuum would occur for no other reason than that the underlying human subject data is private and cannot be publicly disseminated.¹¹⁸¹

Response: See response to Comments 1320-4331, 2322-157, 2322-159, 2322-161, 2322-205 and 5410-4088.

Comment [5985-4090]: Commenter (5995) suggests that even assuming arguendo that a non-frivolous scientific argument in favor of the proposed regulation could be made, the NEPA requires the preparation of a proper EIS before the proposed regulation can be adopted.

As the agency necessarily concedes, EPA has responsibility to prepare its own NEPA documents for compliance . <https://www.epa.gov/nepa> Significantly, EPA regulations also expressly recognize that NEPA compliance is necessary if [t]he proposed action is known or expected to cause significant public controversy about a potential environmental impact of the proposed action. 40 C.F.R. Sect. 6.204(b)(8), https://www.ecfr.gov/cgi-bin/text-idx?SID=e62b352cfd49343307deaef7f6cdc0db&mc=true&node=se40.1.6_1204&rgn=div8 (stating that, in such circumstances, a categorical NEPA exclusion is not applicable). In the present case, EPA must prepare a thorough EIS before it adopts the proposed regulation.

Response: EPA disagrees that NEPA applies to this rulemaking. See response to Comment 3117-104.

Comment [6093-543]: Commenter (6103) writes that commenters with legal expertise may note that there is no basis in the cited statutes for demanding access to raw data.

Response: Nothing in the final rule requires EPA to demand access to raw data. The rule does not require EPA to obtain dose-response data from researchers nor does it require researchers to submit dose-response data to the Agency. EPA has explained that the Agency will give greater consideration to studies where the underlying dose-response data are available for independent validation. Also note that the Agency is not relying on any of the environmental statutes cited in the proposal as legal authority for the final rule.

Comment [6097-3146]: Commenter (6107) writes that by purporting to limit EPA's consideration of important data, the proposed rule would cripple EPA efforts to comply with NEPA.

Response: EPA disagrees that NEPA applies to this rulemaking. Also see response to Comments 2322-159 and 3117-104.

Comment [6099-563]: Commenter (6109) notes that EPA states "the best available science must serve as the foundation of EPA's regulatory actions," citing Executive Order No. 13563. EPA could have also cited multiple laws that already mandate EPA's use of "best available science," including the TSCA and SDWA. According to the U.S. 10th Circuit Court of Appeals decision in

¹¹⁸¹ Note that some of the Statutes require EPA to use the “best” available information and others have a lower standard. For example, the Toxic Substances Control Act compels EPA to take “reasonably” available information into account. 15 U.S.C. § 2625(k).

Ecology Ctr., Inc. v. U.S. Forest Service., (451 F.3d 1183, 1194 (10thCir. 2006)), "best available science" means that agencies "should seek out and consider all existing scientific evidence relevant to the decision" and "cannot ignore existing data." EPA is proposing precisely the opposite and providing for itself a mechanism by which the agency could ignore existing data and turn a blind eye to existing scientific evidence.

Response: See response to Comments 2322-159 and 2322-161.

Comment [6102-480]: Commenter (6112) writes that the objectives are consistent with EPA's authority under numerous statutes that emphasize the need for sound science and public participation in regulatory decisions.

Response: EPA appreciates your comment in support of the final rule.

Comment [6103-516]: Commenter (6113) states that by forcing EPA to ignore such private (and appropriately non-public) data, the proposed anti-environment rule is fiendishly calculated to block the EPA staff from considering the best data available. This scheme has at least three devastating flaws.

First, the proposed rule will nonsensically bar EPA from considering the best scientific data available disabling EPA rulemaking. This rule would violate the agency's common sense and statutory duty to consider the sound scientific data.

Response: See response to Comments 2322-159 and 2322-161.

Comment [6105-520]: Commenter (6115) writes that the objectives are consistent with EPA's authority under numerous statutes that emphasize the need for sound science and public participation in regulatory decisions.

Response: EPA appreciates your comment in support of the rulemaking.

Comment [6107-4015]: Commenter (6117) provides that the EPA has already embarked on a well-thought-out plan to require and promote research transparency, as described in the EPA's 2016 *Plan to Increase Access to Results of EPA-Funded Scientific Research* ("Plan"). Although the preamble to the proposed regulation cites and "applies concepts and lessons learned" from the *Plan*, there are some concerning differences.

First, the *Plan* indicates that it does not apply to "scientific research data collected before its implementation."¹¹⁸² In contrast, the preamble and the proposed regulation suggest that the regulation may apply retrospectively:

...EPA seeks comments on how the prospective or retrospective application of the provisions for dose response data and models or pivotal regulatory science could

¹¹⁸² Environmental Protection Agency, *Plan to Increase Access to Results of EPA-Funded Scientific Research*, Version 1.1 (Nov. 29, 2016), p. 5. Available at <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransparencyplan.pdf>. (Last accessed July 31, 2018).

inadvertently introduce bias regarding the timeliness and quality of the scientific information available.¹¹⁸³

The commenter does not recommend any retroactive application of this regulation. It is well established that agency rules cannot be applied retroactively unless Congress expressly granted the agency that power.¹¹⁸⁴ There is no specific grant of power to apply this proposed regulation retroactively. Moreover, the two bills upon which this proposed regulation is modeled, the Honest and Open New EPA Science Treatment (HONEST) Act of 2017 (H.R. 1430 – 115th Congress, 2017-2018), and the Secret Science Reform Act of 2015 (H.R.1030 – 114th Congress 2015-2016), were not enacted.

Response: This rule does not change any existing EPA regulations. It only applies prospectively to significant regulatory actions and influential scientific information, based on dose-response data, that are developed after the effective date of the rule. However, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

Comment [6112-1605]: Commenter (6137) states that not only does the Proposed Rule contravene the statutes upon which EPA relies as statutory authority, but its limitations on science likewise conflict with core provisions of other environmental statutes. For example, the Food Quality Protection Act (“FQPA”), which regulates pesticide residue in conjunction with FIFRA, sets safety standards based on the consideration of all available data. Limiting the data available to conduct studies necessary to evaluate the harmful effects of pesticides runs counter to this mandate.

Specifically, the commenter notes that Congress overhauled our food safety laws when it unanimously passed the FQPA, amending both the Federal Food, Drug, and Cosmetics Act (“FFDCA”)¹¹⁸⁵ and FIFRA. The overhaul responded to a seminal 1993 National Academy of Sciences (“NAS”) report criticizing EPA for treating children like “little adults” by failing to address the unique susceptibility of children to pesticide exposures based on the foods they eat, their play, metabolism, and sensitive stages of their development. NAS, *Pesticides in the Diets of Infants and Children* (1993). The NAS recommended that EPA revamp and strengthen its pesticide regulations to account for children’s vulnerabilities, consumption patterns, and exposures. Because it would take time to fill gaps in knowledge, safeguards and methodologies, the NAS recommended that additional protection be afforded in the form of “uncertainty” or “safety factors.” The NAS first described how EPA has regularly used uncertainty factors and then proposed an additional uncertainty factor for fetal developmental toxicity and where data are incomplete: “In the absence of data to the contrary, there should be a presumption of greater toxicity to infants and children. To validate this presumption, the sensitivity of mature and

¹¹⁸³ Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18768, 18772 (Apr. 30, 2018).

¹¹⁸⁴ *Bowen v. Georgetown University Hospital*, 488 U.S. 204, 208 (1988).

¹¹⁸⁵ Under the FFDCA, EPA must establish the maximum residue of a pesticide allowed on food, called a “tolerance,” in order for a pesticide to be permitted on food that is imported or sold in interstate commerce. 21 U.S.C. § 346a(b) & (c). EPA may “establish or leave in effect a tolerance for a pesticide chemical residue in or on a food only if the Administrator determines that the tolerance is safe.” *Id.* § 346a(b)(2)(A)(i). If it finds a pesticide residue would not be safe, EPA must revoke a tolerance. *Id.*

immature individuals should be studied systematically to expand the current limited data base on relative sensitivity.” Id.

The FQPA strengthened the food safety standard in several ways. First, under the FQPA, the EPA Administrator “may establish or leave in effect a tolerance for a pesticide chemical residue in or on food only if the Administrator determines that the tolerance is safe. The Administrator shall modify or revoke a tolerance if the Administrator determines it is not safe.” 21 U.S.C. § 346a(b)(2)(A)(i). In other words, the absence of sufficient information to find a pesticide safe means it cannot be allowed in or on our food.

Second, safe “means the Administrator has determined there is a reasonable certainty that no harm will result from aggregate exposure to the pesticide chemical residue, including all anticipated dietary exposures and all other exposures for which there is reliable information.” Id. § 346a(b)(2)(A)(ii). The FQPA, therefore, requires that EPA conduct an assessment based on aggregation of all exposures to a pesticide whether from eating foods, drinking water with residues of the pesticide, or uses of the pesticide in and around the home or other places where people can be exposed. 21 U.S.C. § 346a(b)(2)(A)(ii), (C)(i)(I) & (ii). The FQPA also requires EPA to assess and protect against unsafe risks posed by cumulative exposures to pesticides that share a “common mechanism of toxicity,” as is the case with pesticides in the organophosphate, carbamate, and pyrethroid families. See 21 U.S.C. § 346a(b)(2)(C)-(D).

Third, EPA must make specific safety determinations for infants and children. Id. § 346a(b)(2)(C)(ii)(I) & (II). It must consider available information concerning “the special susceptibility of infants and children,” including “neurological differences between infants and children and adults, and effects of in utero exposure to pesticide chemicals.” Id. § 346a(b)(2)(C)(i)(II). EPA must also base its tolerance decisions on available information about food “consumption patterns among infants and children.” Id. § 346a(b)(2)(C)(i)(I) & (III).

Fourth, EPA must account for children’s sensitivities, scientific uncertainty, and gaps in available data. The statute requires that “an additional tenfold margin of safety for the pesticide chemical residue and other sources of exposure shall be applied for infants and children to take into account potential pre -and post-natal toxicity and completeness of the data with respect to exposure and toxicity to infants and children.” Id. § 346a(b)(2)(C). EPA can depart from this requirement and use a different margin of safety “only if, on the basis of reliable data, such margin will be safe for infants and children.” Id.; see *Nw. Coal. for Alts. to Pesticides v. EPA*, 544 F.3d 1043, 1046 (9th Cir. 2008) (reversing EPA’s shrinkage of the safety factor in the absence of supporting data).

As an over-arching mandate, the FQPA directs EPA to make its tolerance determinations based on its assessment of the pesticide’s risk. 21 U.S.C. § 346a(b)(2)(C)(i). And throughout its mandates to assess the full effects of a pesticide, the FQPA directs EPA to base its risk assessment on “available information” about consumption patterns, special susceptibility of infants and children, and cumulative effects. Id. The FQPA also expressly directs EPA to consider the validity, completeness, and reliability of the available data from studies, the nature of the toxic effect, available information about the relationship between study results and human risk, and available information about aggregate and cumulative effects. Id. § 346a(b)(2)(C)(ii).

The Proposed Rule upends these mandates by requiring EPA to put on blinders and ignore a huge and important subset of the available data. It collides squarely with the congressional direction to consider all available data and information in order to protect our food and children in particular. It also conflicts with the congressional mandate to afford greater protection to children and our food when gaps in data prevent a full quantitative assessment and establishment of a dose-response. It thus undermines EPA's ability to carry out its obligations under the FQPA.¹¹⁸⁶

Response: EPA disagrees that the final rule will undermine EPA's ability to comply with the FQPA. See response to Comments 1320-4331, 1412-4472, and 2322-159.

Comment [6112-4017]: Commenter (6137) notes that EPA also requested "comment on how the prospective or retrospective application of the provisions for dose response data and models or pivotal regulatory science could inadvertently introduce bias regarding the timeliness and quality of the scientific information available." 83 Fed. Reg. at 18,772. Like much of the rest of the Proposal, it is unclear what exactly EPA is asking or suggesting. Certainly, to the extent EPA uses the Proposed Rule to exclude important, valid scientific information, it will bias the quality of the scientific information available.

To the extent EPA suggests the Rule may be applied retroactively, there is simply no basis for doing so. It is well-established that an agency cannot apply a rule retroactively absent clear congressional intention for such application. E.g., *Sierra Club v. Whitman*, 285 F.3d 63, 68 (D.C. Cir. 2002) (referring to "unusual ability to implement rules retroactively"); *Bowen v. Georgetown Univ. Hospital*, 488 U.S. 204, 208 (1988) ("Retroactivity is not favored in the law. Thus, congressional enactments and administrative rules will not be construed to have retroactive effect unless their language requires this result. By the same principle, a statutory grant of legislative rulemaking authority will not, as a general matter, be understood to encompass the power to promulgate retroactive rules unless that power is conveyed by Congress in express terms." (citations omitted)). EPA has not identified any such congressional intention in any of the statutes at issue, and thus retroactive application of the Rule would be unlawful.

Nor would the statutes upon which EPA relies support such an application. For example, as explained above, the Clean Air Act does not allow—and, as the D.C. Circuit has held, certainly does not require, e.g., *American Trucking*, 283 F.3d at 372—applying the so-called transparency provisions of the Proposed Rule at all in rules subject to the procedural requirements of Clean Air Act § 307(d). Such rules include NAAQS. Further, far from suggesting that EPA could lawfully reopen long-settled NAAQS to apply a new and novel standard of review, the Clean Air Act requires EPA to review and revise air quality criteria and NAAQS at least every five years and to "promulgate such new standards as may be appropriate." 42 U.S.C. § 7409(d)(1) (emphasis added). This carefully chosen language confirms that Congress did not intend for EPA

¹¹⁸⁶ The FQPA also amended FIFRA's "unreasonable adverse effects" definition to include "a human dietary risk from residues that result from a use of a pesticide in or on any food inconsistent with the [FQPA] standard." 7 U.S.C. § 136(bb)(2). Accordingly, EPA can register or re-register a pesticide only if there is a reasonable certainty of no harm from aggregate and cumulative exposures to the pesticide under the FQPA standard. The FQPA's science standards therefore extend to EPA's FIFRA determinations. Accordingly, just as the Proposed Rule runs afoul of the FQPA's standards, so too does it violate FIFRA's mandates, as amended by the FQPA.

to apply rules like the Proposed Rule to undo existing NAAQS, but instead intended for regular reviews of scientific information to result in new NAAQS.

Even if EPA had statutory authority to apply the Proposed Rule retroactively, it could not do so rationally. See *Sierra Club*, 285 F.3d at 68 (if EPA had authority to implement a rule retroactively, “retroactivity must be ‘reasonable,’”). Indeed, retroactive application of the Proposed Rule would undo well-settled rules in a tremendously unfair and irrational way, and would lead to widespread confusion about countless environmental and public health policies and protections.

Response: See response to Comment 6107-4015.

Comment [6127-2240]: Commenter (6152) states that the proposal is also neither required nor authorized under any statute that authorizes the EPA. Commenter strongly urges EPA to withdraw this proposed rule.

Response: EPA disagrees that it lacks authority to promulgate this rule. See the response to comment 31-135.

Comment [6133-2173]: Commenter (6158) suggests that importantly, the critical actor under the best available science standard is the agency — the standard requires the use of the best science that is available to the agency, not necessarily available to the public. Excluding science that is available to the agency but not available to the public would thus be a violation of “best available science” provisions.

Under federal law, the agency must find a way to continue using the best available scientific data and models available to it, regardless of whether those data and models are publicly available. Excluding science whose raw data are not in the public domain runs counter to the “best available science” doctrine and is thus illegal.

Response: See response to Comments 2322-159 and 2322-161.

Comment [6152-654]: Commenter (6122) asserts that the proposed rule violates the Endangered Species Act (ESA) and the NEPA.

Section 7(a)(2) of the ESA requires that “each federal agency shall, in consultation with and with the assistance of the Secretary, insure that any action authorized, funded, or carried out by such agency is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of habitat of such species which is determined by the Secretary . . . to be critical.”¹¹⁸⁷ Under the Services’ joint regulations implementing the ESA, the EPA is required to review its actions “at the earliest possible time” to determine whether the action may affect listed species or critical habitat.¹¹⁸⁸ The EPA must initiate consultation under Section 7 whenever its action “may affect” a listed species or critical

¹¹⁸⁷ 16 U.S.C. § 1536(a)(2) (emphasis added).

¹¹⁸⁸ 50 C.F.R. § 402.14(a). [51] 50 C.F.R. § 402.14(a).

habitat.¹¹⁸⁹ The phrase “may affect” has been interpreted broadly to mean that “any possible effect, whether beneficial, benign, adverse, or of an undetermined character, triggers the formal consultation requirement.”¹¹⁹⁰ Because this proposed rule would prevent the EPA from utilizing the best available science, as discussed above, the EPA would be unable to sufficiently determine if one of its decisions, regulations, or policies would harm a threatened or endangered species, or their critical habitat. EPA must at a minimum engage in a programmatic consultation with the Services to determine if this action is likely to adversely affect endangered species.

While some of the EPA’s actions are exempt from the National Environmental Policy Act (NEPA), this proposed rule is clearly not. By EPA’s own tortured logic, this proposal encompasses virtually every aspect of EPA’s statutory mandate, and most of these still fall under the ambit of NEPA. Accordingly, the EPA must prepare an Environmental Impact Statement (“EIS”) for the proposed rule because the net effect of the changes to the existing regulations will mean more environmental harm due to delayed decisions, under-regulation of harmful pollutants, and the rejection of the best-available science. By every definition, this will have a massive impact on the human environment.

NEPA requires every federal agency to prepare an EIS for all “major Federal actions significantly affecting the quality of the human environment” and the Council for Environmental Quality’s general NEPA regulations,¹¹⁹¹ which guide the EPA dictate whether or not an EIS must be prepared. The EPA may forego a NEPA analysis only if a categorical exclusion applies — the EPA has not indicated one way or another if it believes a categorical exclusion applies and if it does so, has not provided the public with notice of that belief or the opportunity to comment. If a categorical exclusion does not apply, the EPA must complete an Environmental Assessment (EA) or an EIS. To determine whether an EIS is required, the EPA may elect to prepare an EA first. If they do so, they must provide a period of notice and comment on the EA. It is highly likely, if not a certainty, that this proposal will have negative environmental impacts on the environment. A “reasonable person” reviewing this proposal could only conclude that the proposal is designed to weaken and hamstring the EPA’s ability to properly regulate harmful pollutants, resulting in significant harm to human health and environmental quality, and that an EA/FONSI would be completely arbitrary and capricious. Accordingly, the EPA must prepare a complete EIS on this proposed rule and provide a reasonable period to provide public comment.

Response: An ESA section 7(a)(2) consultation is not required for this rule because it does not affect listed species or critical habitat. Further, contrary to the commenter’s assertion, the rule does not prevent EPA from using the best available science. The rule is one of internal agency procedure that describes the consideration the agency will give to studies based on data availability and the factors EPA uses to evaluate studies that may be used for regulatory purposes and influential scientific information.

¹¹⁸⁹ 50 C.F.R. § 402.14(a).

¹¹⁹⁰ *Western Watersheds Project v. Kraayenbrink*, 632 F.3d 472, 496 (9th Cir. 2011) (brackets omitted) (quoting 51 Fed. Reg. at 19,949). The threshold for triggering ESA consultation “is relatively low.” *Lockyer v. U.S. Dep’t of Agric.*, 575 F.3d 999, 1018 (9th Cir. 2009).

¹¹⁹¹ 40 C.F.R. Part 1500.

EPA disagrees that this rulemaking is subject to NEPA. See response to Comment 3117-104.

Comment [6152-3730]: Commenter (6122) notes that EPA's proposal represents the most significant rejections of science in the agency's nearly 50-year history. If finalized, the rule would allow political appointees to reject the best-available science for virtually any reason and delay taking critical, life-saving actions in order to benefit special interests and corporate polluters. Simply put, EPA is proposing to formally adopt the mindset of flat-earthers and climate deniers, adopting the worst tactics of the tobacco industry, all in an effort to reward the Trump administration's political benefactors. If finalized, this proposal will kill Americans, more people will go to hospitals because of pollution-induced illness, it will degrade our environment, and it will cause wildlife to go extinct. This profoundly senseless proposal must be withdrawn in its entirety.

The scientific process has always provided transparency through the peer review process and other measures designed to ensure the accuracy of scientific studies. In contrast, the proposed rule will prevent EPA from relying on the best available science because, as the EPA is well aware, underlying data are sometimes unavailable and not essential to peer review. This does not diminish the credibility, veracity, or importance of a particular study or paper. Deliberately ignoring science in order to tip the scales in favor of regulatory inaction violates every law that the EPA is charged with administering. The EPA's proposed rule adds insult to injury by allowing the Administrator to cherry pick which studies to consider based entirely on his or her whims, including studies that are favorable to industry — or even authored by industry — where underlying data will inevitably be withheld on CBI grounds, while disallowing the public health studies that have long been the bedrock of EPA decision-making.

EPA may only act within the constraints of the authority delegated to it from Congress. There is no statutory authority that supports the proposed rule. For example, with regard to regulations under the CAA, the proposed rule refers to Sections 103 and 301(a). However, neither of these sections contains any language even remotely supporting this proposal — which is presumably why the proposed rule does not cite any specific statutory language. Agencies are not free to take actions unmoored from their statutory mandates. Rather, as the Courts have explained, "EPA is a federal agency — a creature of statute. It has no constitutional or common law existence or authority, but only those authorities conferred upon it by Congress."¹¹⁹² Here, since EPA's mandates under the CAA and all the other cited statutes plainly require that the agency consider the best available science, even where underlying data may not be publicly available, it could not be clearer that EPA may not proceed with its proposed regulation.

Response: EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, EPA does not rely on, interpret or apply provisions of a particular statute or statutes that it administers. EPA will undertake such efforts in forthcoming substantive actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. Also see response to Comments 31-135, 2322-159, 2322-161, 2322-205, 1320-4331, 1412-4472

¹¹⁹² Michigan vs. EPA, 268 F.3d 1075, 1081 (D.C. Cir. 2001).

Comment [6155-865]: Commenter (6125) writes that the policy justification for the proposal is inadequate. The proposal would apparently change the workings of all of the EPA's cited regulatory statutes, making key parts of regulatory decisions under each of them in advance. Accordingly, it must be justified as an exercise of regulatory authority under each such statute.

It is the agency's job, not EPN or any other commenter's, to provide that justification. However, to show how far short the proposal falls, the next section of EPN's comments explores in detail the deficiencies in the justification of this proposal under the cited statutes, and then examines in more detail three of the agency's most important regulatory mandates - the ambient air quality standards provisions of the CAA, the drinking water standards provisions of the SDWA, and the general chemical regulatory provisions of the TSCA.

Response: EPA disagrees that the final rule lacks justification. EPA described in the preamble of both the 2018 and 2020 proposals that the purpose of the rule is to increase the transparency of the science underlying significant regulatory actions and influential scientific information. The final rule would not result in the Agency making key parts of regulatory decisions in advance of a rulemaking. The studies considered by the Agency will be included in the rulemaking docket pursuant to § 30.4. For pivotal science, the weight assigned to the studies under § 30.5 and the rationale for the weighting will also be included in the docket. This will allow the public to comment on how the Agency evaluated the studies underlying the significant regulatory action before a rule is promulgated.

Comment [6155-2475]: Commenter (6125) contends that there is neither a legal basis nor a need for this rule. It would require that EPA violate explicit statutory provisions and would undermine environmental protection and critical health protections the public has come to rely on. It unlawfully shifts the basis for deciding what science to use in rulemaking away from the statutory goals of scientific reliability and environmental protection to so-called transparency, a term not used in the relevant EPA statutory provisions.

Response: See response to Comments 31-135, 1320-4331, and 1412-4472

Comment [6163-1118]: Commenter (6133) writes that the Proposal conflicts with the statutes that EPA administers.

The Proposal unlawfully restricts EPA's consideration and use of "dose response data and models that underlie" what the Proposal calls "pivotal regulatory science." 83 Fed. Reg. at 18,770/2. The Proposal goes on to state:

Pivotal regulatory science' is the studies, models, and analyses that drive the magnitude of the benefit-cost calculation, the level of a standard, or point-of-departure from which a reference value is calculated. In other words, they are critical to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, risks and other impacts on which a final regulation is based.

Id. By restricting EPA's implementation of its federal organic statutes and the Administrative Procedures Act in this fashion, and by defining "pivotal regulatory science" in this manner, the

Proposal violates federal laws. The Proposal does so by requiring EPA to implement federal laws based on the Proposal's criteria and conception of "pivotal regulatory science," rather than on the congressional criteria and requirements in federal statutes that contradict, disallow, or fail to include those criteria and concepts in the Proposal.

Response: See response to Comments 1320-4331, 1412-4472 and 2322-159.

Comment [6163-1143]: Commenter (6133) writes that the Food Quality Protection Act (also known as the Food, Drug, and Cosmetics Act or FFDCA) governs pesticide tolerances. Section 408 of the FFDCA requires EPA to set tolerances, which are maximum residue limits, for pesticide residues on foods. In setting tolerances, EPA must find that the tolerance is "safe." 21 U.S.C. § 346a. Safe is defined as meaning that there is a "reasonable certainty that no harm will result from aggregate exposure to the pesticide residue." Id. § 346a(b)(2)(a)(ii). To make this finding, EPA considers, among other things: the toxicity of the pesticide and its break-down products, aggregate exposure to the pesticide in foods and from other sources of exposure, and any special risks posed to infants and children. Id. § 346a(b). For threshold effects, EPA is required to add an additional tenfold margin of safety to protect infants and children, unless the administrator finds based on reliable data that a different safety factor will ensure the pesticide is safe. Id. § 346a(b)(2)(C)(ii). The statute contains specific provisions regarding the type and availability of data that must be considered. Id. § 346a(b)(2)(D), (E), (F).

The Proposal does not cite to the FFDCA, and apparently EPA never considered whether the Proposal is consistent with the law. It is not. First, the Act defines "safe" to mean that "there is a reasonable certainty that no harm will result from aggregate exposure to the pesticide chemical residue, including all anticipated dietary exposures and all other exposures for which there is reliable information." Id. § 346a(b)(2)(A)(ii). As part of this determination, EPA must "ensure that there is a reasonable certainty that no harm will result to infants and children from aggregate exposure." Id. § 346a(b)(2)(C). EPA cannot do this if it excludes relevant studies solely because the underlying data cannot be made public.

The FFDCA specifically speaks to how threshold and non-threshold effects shall be considered. Id. § 346a(b)(2)(B). The Proposal cannot override the specific Congressional mandates in the FFDCA for how to conduct a tolerance assessment. In determining whether there is a reasonable certainty of no harm to infants and children, EPA must consider "available information" on consumption patterns among infants and children, special susceptibility of infants and children (including for example neurological and in utero effects), cumulative effects on infants and children. Id. § 346a(b)(2)(C). Likewise, the Act specifies numerous scientific factors that must be considered in evaluating safety, including considering "available data" on these factors. Id. § 346a(b)(2)(D). The Proposal plainly contradicts these mandates. Obviously, published, peer-reviewed literature is "available" and must be considered. As with studies considered under other statutes, EPA fails to explain the arbitrariness of excluding published peer-reviewed studies while allowing industry studies considered CBI to be considered.

Finally, the FFDCA contains certain procedural requirements for "establishing general procedures and requirements to implement this section." Id. § 346a(e). Yet EPA failed to cite the FFDCA—either its substantive or procedural requirements—at all in its Proposal.

Response: EPA disagrees that the final rule will undermine EPA's ability to comply with the FQPA. See response to Comments 1320-4331, 1412-4472, and 2322-159.

Comment [6163-1146]: Commenter (6133) provides the following:

The Atomic Energy Act (AEA), 42 U.S.C. § 2011 et seq., is not a typical environmental law, as the original act established the Atomic Energy Commission (AEC) just after World War II to promote the "utilization of atomic energy for peaceful purposes to the maximum extent consistent with the common defense and security and with the health and safety of the public." The concern found in the final clause of its original organic act, "the health and safety of the public," has at no point disappeared in subsequent iterations of the act and this Proposal runs contrary to its clearly stated intent.

The AEC was abolished in the 1970s, and since that then, most of the functions of the AEA are carried out by the Nuclear Regulatory Commission and the U.S. Department of Energy. However, when EPA was formed in the early 1970s, it assumed the AEC's authority to issue generally applicable environmental radiation standards to protect the health and safety of the public. Other federal and state organizations must follow these standards when developing requirements for their areas of radiation protection. EPA also implements the Federal Radiation Council's authority under the AEA, developing guidance for federal and state agencies containing recommendations for their use in developing radiation protection requirements and working with states that have radiation protection programs.

There are several specific statutory requirements that EPA executes under the AEA, which states that "the purpose of this [Act is] to effectuate the policies set forth above by providing for – (d) a program to encourage widespread participation in the development and utilization of atomic energy for peaceful purposes to the maximum extent consistent with the common defense and security and with the health and safety of the public." 42 U.S.C. § 2013(d) (emphasis added).

The following regulations are health-based standards, and as we discuss supra section III.G., EPA bases its regulatory limits and nonregulatory guidelines for population exposures to low-level ionizing radiation on the linear no-threshold (LNT) dose-response model, which uses the premise that any radiation dose carries some risk, and that risk increases directly with dose. The viability of each of these longstanding health-based protections will be undercut by promulgation of a final rule that resembles this draft for the reasons discussed supra section III.G., and in direct conflict with the AEA's requirement that the utilization of atomic energy for peaceful purposes be "to the maximum extent consistent with the common defense and security and with the health and safety of the public."

Environmental Radiation Protection Standards for Nuclear Power Operations (40 C.F.R. Part 190); these standards limit radiation releases and doses to the public from the normal operation (non-emergency) of nuclear power plants and other uranium fuel cycle facilities.

Environmental Radiation Protection Standards for Management and Disposal of Spent Fuel, High Level and Transuranic Wastes (40 C.F.R. Part 191); this regulation sets environmental standards for the disposal of highly radioactive spent nuclear fuel and certain kinds of highly toxic and radioactive wastes produced from the nuclear weapons program that must ultimately be disposed of in a deep geologic repository.

Health and Environmental Protection Standards for Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings (40 C.F.R. Part 192); this regulation sets standards for the protection of the public health, safety, and the environment from radiological and non-radiological hazards associated with uranium and thorium ore processing, and disposal of associated wastes. In May of 2015, EPA proposed revisions to 40 C.F.R. 192 that would establish groundwater restoration and monitoring requirements at in-situ recovery facilities, and then in January 2017, EPA re-proposed those revisions. We await final agency action on the matter.

Criteria for the Certification and Recertification of the Waste Isolation Pilot Plant's Compliance with the 40 C.F.R. Part 191 Disposal Regulations (40 C.F.R. 194); these criteria apply to the certification and recertification of compliance with the radioactive waste disposal standards at the Waste Isolation Pilot Plant (WIPP) in New Mexico, the world's only deep geologic repository, which is operated by the U.S. Department of Energy (DOE) for permanent disposal of transuranic waste from the nation's nuclear defense program.

Public Health and Environmental Radiation Protection Standards for Yucca Mountain, Nevada (40 C.F.R. Part 197); these regulations, last promulgated in 2008 (after a Federal Appeals Court found an earlier version unlawful, see, e.g., *Nuclear Energy Inst., Inc. v. EPA*, 373 F.3d 1251 (D.C. Cir. 2004)), establish public health and environmental standards for storage and disposal of spent nuclear fuel at the proposed repository at Yucca Mountain, Nevada. The U.S. Nuclear Regulatory Commission would implement these regulations at Yucca Mountain if a repository were to be established there.

As discussed above, the Clean Air Act requires EPA to regulate airborne emissions of hazardous air pollutants (HAPs) from a specific list of industrial sources called "source categories." Standards known as the "National Emission Standards for Hazardous Air Pollutants" (NESHAPs) dictate specific regulatory limits for source categories that emit radionuclides. In 40 C.F.R. Part 61: the *National Emission Standards For Hazardous Air Pollutants*, EPA sets health based standards in a number of settings, such as Subpart B: *Radon Emissions from Underground Uranium Mines*; Subpart H: *Emissions of Radionuclides Other than Radon from Department of Energy Facilities*; Subpart I: *Radionuclide Emissions from Federal Facilities Other than Nuclear Regulatory Commission Licensees and Not Covered by Subpart H*; Subpart K: *Radionuclide Emissions from Elemental Phosphorus Plants*; Q: *Radon Emissions from Department of Energy Facilities*; R: *Radon Emissions from Phosphogypsum Stacks*; Subpart T: *Radon Emissions from the Disposal of Uranium Mill Tailings*; and Subpart W: *Radon Emissions from Operating Mill Tailings*.

And last, under the Safe Drinking Water Act (SDWA), discussed above, EPA sets health-based standards on the levels of certain radionuclides in drinking water. After much litigation, in 2000 EPA revised an outdated set of standards that had been in place since the late 1970s and set new monitoring provisions for community water systems (CWS). The current standards are: Combined radium 226/228 of 5 pCi/L; a gross alpha standard for all alphas of 15 pCi/L (not including radon and uranium); a combined standard of 4 mrem/year for beta emitters; and a the MCL for uranium at 30 µg/L.

In short, the Proposal could seriously damage EPA's ability to administer the AEA and protect the public from radiation. Yet the Proposal fails to cite the statute at all.

Response: EPA disagrees that the final rule will damage the Agency's ability to administer the AEA or any other environmental statutes. See response to Comments 1320-4331, 1412-4472, and 2322-159.

Comment [6163-3475]: Commenter (6133) contends that the Proposal's retroactivity provisions are arbitrary and capricious.

In the Proposal, EPA states that the proposed regulation "is intended to apply prospectively." 83 Fed. Reg. at 18,771. However, a few pages later, the agency "solicits comments on how the prospective or retrospective application of the provisions for dose response data and models or pivotal regulatory science could inadvertently introduce bias regarding the timeliness and quality of the scientific information available." Also, the Proposal states that "for regulatory programs . . . in which future significant regulatory actions may be based on the administrative record from previous reviews . . . , EPA seeks comment on the manner in which this proposed rule should apply to that previous record." Id. at 18,772.

In short, despite its assertion that the rulemaking is "intended" to apply prospectively, the Proposal contemplates prohibiting EPA—or will prohibit EPA—from relying on studies generated prior to rulemakings that fail to meet the Proposal's ill-defined criteria for "publicly available data." This approach is arbitrary and capricious, runs counter to the specific language of many statutes the agency is tasked with administering, and would destroy the agency's ability to promulgate health-based standards to protect the American public using the best available science.

The Proposal ignores an entire body of case law that has considered and roundly rejected both retroactivity in rulemakings and limiting data that underlies rulemakings to "publicly available data." In so doing, the Proposal is arbitrary and capricious, and should be rejected. The Supreme Court strongly disfavors retroactive application of rules. The Court has stated that:

Retroactivity is not favored in the law. Thus, congressional enactments and administrative rules will not be construed to have retroactive effect unless their language requires this result. [] By the same principle, a statutory grant of legislative rulemaking authority will not, as a general matter, be understood to encompass the power to promulgate retroactive rules unless that power is conveyed by Congress in express terms.

[] Even where some substantial justification for retroactive rulemaking is presented, courts should be reluctant to find such authority absent an express statutory grant.

Bowen v. Georgetown Univ. Hosp., 488 U.S. 204, 208–09 (1988) (internal citations omitted). Notably, the Proposal does not identify a single provision in a single statute that EPA administers, or any other federal law, that requires or even authorizes any final rule based on the Proposal to have retroactive effect. See generally 83 Fed. Reg. at 18,768–74. There has been no power conveyed by Congress in express terms to promulgate retroactive rules related to any element of the Proposal; it is unsurprising that the Proposal does not and cannot identify any express or even implied grant of authority. See *Bowen*, 488 U.S. at 208–09.

The Proposal claims prospective application, while nonetheless noting that in some circumstances EPA may desire to apply the rule retroactively. 83 Fed. Reg. at 18,771. This, too, is unlawful and fails to meet the high burden in the Supreme Court’s *Bowen* decision and its progeny concerning retroactive application of agency rules. The suggestion in the Proposal, for example, that EPA may invoke the Proposal’s approach to review all prior health and scientific studies underlying the NAAQS is illegitimate, arbitrary and capricious, and contrary to caselaw.¹¹⁹³ *Bowen* and its progeny do not permit agency rules to have retroactive effect to disallow health studies and regulatory science generated prior to, or relied upon by EPA prior to, adoption of any final rule based on the Proposal. This caselaw does not entertain any such exception and accepting any such exception for these circumstances would circumvent the holdings and reasoning of this case law.

Response: See response to Comments 1412-4472, 2322-159, 2322-161 and 6107-4015.

Comment [6340-1647]: Commenter (6362) writes that implementation of the rule should be statute-specific.

EPA requested comment on the effect this proposed rule may have on individual EPA programs. Each of the federal environmental statutes referenced by EPA as a source for its authority to propose this rule, was enacted and designed to achieve a specific environmental goal and purpose (e.g., TSCA regulates new and existing chemicals, CAA controls air pollution on a national level, and SDWA regulates public drinking water supplies across the nation). Each statute confers its unique authority upon the agency, requiring agency review according to different scientific standards; each has its own regulations designed to effectuate the specific corresponding program’s mission; and, in many cases, each statute relies on different and variable scientific disciplines. As such, ACC believes that this rule, while applicable to all the statutes identified, should be implemented by regulations specific to the objectives and scientific disciplines of each statute. ACC believes that just as the FOIA, which is overseen by the US DOJ, is implemented by each agency with specific and separate regulations relevant to the requirements of each statute, this policy rule should be implemented by each EPA program

¹¹⁹³ See 83 Fed. Reg. at 18,772/1 (“For regulatory programs, like the National Ambient Air Quality Standards program, in which future significant regulatory actions may be based on the administrative record from previous reviews—particularly where the governing statute requires repeated review on a fixed, date-certain cycle—EPA seeks comment on the manner in which this proposed rule should apply to that previous record.”)

office charged with implementing a given statute in a manner consistent with the authorities granted and requirements unique to that statute.¹¹⁹⁴

Response: EPA appreciates your comment. In this rule, EPA does not rely on, interpret or apply provisions of a particular statute or statutes that it administers. EPA will undertake such efforts in forthcoming substantive actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule.

Comment [6894-3611]: Commenter (6915) writes that because the proposed rule would run afoul of these provisions and potentially others,¹¹⁹⁵ EPA's citation to general rulemaking authorities such as CAA § 301(a), 42 U.S.C. § 7601(a), and CWA § 501, 33 U.S.C. § 1361, is unavailing. Such general provisions of rulemaking authority cannot override more specific statutory directives. *Global Van Lines*, 714 F.2d at 1293-97. Nor can EPA's reliance on 5 U.S.C. § 301 in the notice extending the comment period save its ultra vires proposal. 83 Fed. Reg. at 24,256. Known as the "housekeeping statute," 5 U.S.C. § 301 is "simply a grant of authority to the agency to regulate its own affairs," not a general, independent basis for deviating from a specific statutory directive or limiting the scope of other statutes. See *Chrysler Corp. v. Brown*, 441 U.S. 281, 308-12 (1979).

Thus, as a general matter, EPA's obligation is clear: it must base its decisions on such criteria as the latest scientific knowledge, the best available, peer-reviewed science, and/or generally accepted scientific principles or laboratory tests. No statute suggests that EPA, in setting standards, can reject scientific evidence that meets those criteria solely because the underlying data are not public or because the evidence is based on models that otherwise follow long-accepted scientific guidelines. In short, EPA lacks sufficient legal authority to either adopt or implement the proposed rule, and its proposed action conflicts with the statutes it must follow.

Response: See response to Comment 31-135 on EPA's authority to promulgate this rule. Also see response to Comments 1412-4472, 2322-159 and 2322-161.

Comment [6894-3624]: Commenter (6915) writes that the proposal provides no analysis of its environmental impacts and fails to explain how EPA has addressed the requirements of the NEPA, 42 U.S.C. § 4321 et seq.

Response: EPA disagrees that this rulemaking is subject to NEPA. See response to Comment 3117-104.

Comment [6906-3976]: Commenter (6927) agrees that this proposed rule is consistent with the Administrative Procedures Act (APA) as well as programmatic statutes that EPA administers to disclose to the public the bases for agency rules and to rationally execute and adequately explain agency actions.

¹¹⁹⁴ See, for example, the discussion of CWA criteria earlier in these comments under section VII. B., which is a good example of why it is important that EPA consider each statute it regulates when applying this proposed rule.

¹¹⁹⁵ For example, CAA § 184(d), 42 U.S.C. § 7511c(d), "require[s] that the best available air quality monitoring and modeling techniques be used" in setting the criteria for determining ozone contributions in nonattainment areas.

Response: EPA appreciates your comment in support of the rulemaking.

Comment [7775-4127]: Commenter (8178) objects to the proposal to limit the use of scientific evidence in rulemaking proceedings.

In general, before approving the proposed regulation, NEPA requires EPA to prepare a thorough EIS for the project. In a discussion entitled: What is included in an EIS?, EPA outlines the EIS requirements. <https://www.epa.gov/nepa/national-environmental-policy-act-review-process#EIS> The requirements include: Alternatives: Consideration of a reasonable range of alternatives that can accomplish the purpose and need of the proposed action.

Although the documents that EPA presented in support of the proposed regulation fall far short of what NEPA requires in many ways, the most obvious deficit may be the EPA's failure to meaningfully discuss reasonable alternatives to the proposed action. In the present case, as a consequence of Anti-Environment regulation's extraordinary breadth, NEPA requires EPA to prepare an EIS which reviews and discusses the many reasonable (and often patently superior) alternatives to the proposed regulatory action.

While courts sometimes differ on the necessary scope of alternatives, it is clear that even a minimal EIS should discuss several alternatives. The proposed regulation lists 8 different statutes (i.e., CAA, CWA, SDWA, RCRA, CERCLA, EPCRTKA, FIFRA, and TSCA) it will impact. See proposed regulation *Federal Register*, Vol. 83, No. 83 pg. 18769. Clearly, a reasonable discussion of alternatives would compare the proposed actions impacts with an alternative that impacts only 1 statute. Another alternative would apply to two of the listed statutes. Put simply each permutation of these statutes less than 8 statutes ought to be fully discussed in the EIS as a reasonable alternative. The EPA only has itself to blame for the complexity of the requisite EIS because it alone proposed a regulation that would affect 8 important statutes in one regulation.

Response: EPA disagrees that this rulemaking is subject to NEPA. See response to Comment 3117-104.

Comment [7876-4130]: Commenter (8279) argues that in addition to being bad for the environment, SDWA and TSCA lists mark the starting points for the required EIS that EPA must prepare, as required by NEPA, before the regulation is approved.

Response: EPA disagrees that this rulemaking is subject to NEPA. See response to Comment 3117-104.

Comment [8750-1427]: Commenter notes that the Proposal acknowledges that “[t]he best available science must serve as the foundation of EPA’s regulatory actions.”¹¹⁹⁶ But it then requires EPA to systematically ignore the best available science when it regulates to protect human health and welfare. This is counter to EPA’s statutory mandates to use “best available

¹¹⁹⁶ 83 Fed. Reg. at 18,769.

science,” and the proposal is a transparent attempt not to strengthen science, but rather to censor science that is inconvenient to the current Administration’s political goals.

Since EPA was established nearly half a century ago, the Agency and its leadership— under Administrations of both parties—have recognized the central role that rigorous science plays in fulfilling the Agency’s mission of protecting human health and the environment.¹¹⁹⁷ EPA’s obligation to consider the best available science is not only a policy commitment that flows from the Agency’s mission; it is a legal obligation enshrined in many of the fundamental public health and environmental statutes that EPA is charged with administering. The agency has established an array of mechanisms over the last five decades—including “rigorous review” by its scientific advisory boards “that goes beyond the typical journal peer review procedures”¹¹⁹⁸—to ensure that the Agency’s decisions are grounded in the best available science.

Response: See response to Comments 2322-159, 1320-4331 and 1412-4472.

Comment [8750-1435]: Commenter (9227) writes that EPA’s statutory authorities generally require the agency to consider all available data when undertaking significant rulemakings.

As just noted, EPA’s statutory authorities mandate a variety of requirements for what scientific information EPA must consider in rulemaking. These statutes are discussed in detail, *infra* at Section I.B.3. To take one example that appears in numerous statutes, including TSCA, CAA, SDWA, and the Endangered Species Act, Congress has often required agencies to act on the “best available science.” For an agency to comply with this obligation, the agency must at least consider all available scientific information. “Best” means “of the most excellent, effective, or desirable type or quality.”¹¹⁹⁹ “Available” means “able to be used or obtained.”¹²⁰⁰ And “science” means “the intellectual and practical activity encompassing the systematic study of the structure and behavior of the physical and natural world through observation and experiment.”¹²⁰¹ Assessing which science is “best” requires consideration of the overall quality of the science, and the public availability of underlying data is, at best, one of many aspects that should inform that assessment of overall quality.

¹¹⁹⁷ Brady Dennis, Outgoing EPA chief: Science is ‘fundamental to absolutely everything we do’, Washington Post (Dec. 21, 2016) (quoting former EPA Administrator Gina McCarthy as saying, “Science is everything. Almost every action we take is bounded by what the science tells us. It’s based on a factual record of where the world is today and what is our obligation under our mission. Science needs to be protected. Any effort to undermine that science in a way that would give undue influence to folks that aren’t scientists is a really big problem.”), https://www.washingtonpost.com/news/energy-environment/wp/2016/12/21/outgoing-epa-chief-science-is-everything-it-is-fundamental-to-absolutely-everything-we-do/?utm_term=.6f1e45472169; Christine Todd Whitman, No room for science in Trump Administration, CNN (May 15, 2017), <https://www.cnn.com/2017/05/15/opinions/noscience-in-trump-administration-whitman/index.html> (describing Administrator Pruitt’s actions as a “trend away from science as the backbone of the EPA and other key federal agencies”).

¹¹⁹⁸ Memorandum by Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science 4 (May 12, 2018) (observing that the Proposal “fails to mention that EPA has mechanisms for vetting science through several expert panels,” including the SAB and others).

¹¹⁹⁹ Oxford American Dictionary 159 (3d ed. 2010).

¹²⁰⁰ *Id.* at 111.

¹²⁰¹ *Id.* at 1564.

An agency “cannot ignore available. . . information.”¹²⁰² Numerous courts have indicated that a plaintiff or petitioner can establish a violation of the “best available science” requirement by “point[ing] to any scientific evidence that the agency failed to consider.”¹²⁰³ “The best available data requirement. . . prohibits [an agency] from disregarding available scientific evidence that is in some way better than the evidence [it] relies on.”¹²⁰⁴ “An agency does. . . have an obligation to deal with newly acquired evidence in some reasonable fashion.”¹²⁰⁵ EPA’s proposal will result in EPA precluding itself from considering certain studies that are “available,” thus violating the requirement that EPA rely on the best available science.

In addition, the requirement that agencies use “best available” science or information often means that the agency must act even if the available science or information is imperfect.

“Even if the available scientific and commercial data were quite inconclusive, [the agency] may—indeed must—still rely on it” when the agency has a duty to act.¹²⁰⁶ “[W]here the information is not readily available, we cannot insist on perfection.”¹²⁰⁷ Just as the Courts have recognized that they cannot expect perfection, agencies cannot choose to ignore certain studies or sources of information based solely on whether the data is publicly available—especially where the validity of those studies has been established using techniques that do not rely on public availability of underlying data.

EPA cannot reasonably elevate the interest in public availability of all underlying information above all other factors in assessing the “best available science.” Textually, EPA’s approach is unlawful.

Response: See response to Comments 1412-4472, 2322-159 and 2322-161.

Comment [8750-1450]: Commenter (9227) suggests that even the Proposal appears to concede that studies for which data is not publicly available could constitute the “best available science” that EPA is statutorily required to consider. The proposed exemption provision in section 30.9 makes it clear that EPA does not consider a study to be invalid or unsuitable for EPA’s consideration based only on the public unavailability of underlying data or models. Specifically section 30.9 would give the Administrator discretion to authorize consideration of a scientific study where “[i]t is not feasible to ensure that all dose response data and models underlying pivotal regulatory science is publicly available.” Of course, EPA could not have intended for proposed section 30.9 to provide the Administrator with discretion to take a study that is not

¹²⁰⁵ *Catawba County v. EPA*, 571 F.3d 20, 45 (D.C. Cir. 2009) (quoting *American Iron & Steel Institute v. EPA*, 115 F.3d 979, 1007 (D.C. Cir. 1991)).

¹²⁰⁶ *Southwest Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000) (quoting *City of Las Vegas v. Lujan*, 891 F.2d 927, 933 (D.C. Cir. 1989)).

¹²⁰⁷ *San Luis*, 747 F.3d at 602.

“best available science” into consideration when promulgating a rulemaking. If the Administrator has discretion to allow consideration of a study for which it is infeasible to make the study’s underlying data and models publicly available, then it obviously is not necessary for such underlying data and models to be publicly available for a scientific study to constitute “best available science.” Yet, unless the Administrator elects to exercise his discretion under proposed section 30.9 and find that it is “infeasible” to make a study’s underlying data and models publicly available, proposed section 30.5 broadly prohibits EPA from relying on the study in support of “significant regulatory actions.”

Moreover, while proposed section 30.5’s prohibition would apply to “pivotal regulatory science” used for “significant regulatory actions,” the proposed rule says nothing to prohibit EPA’s reliance on these studies for other agency purposes, such as in permitting, enforcement, or regulatory actions that do not qualify as “significant.” Thus, EPA clearly does not believe that a study cannot be “best available science” based solely on the fact that underlying data and models are not publicly available.

In sum, if finalized, EPA’s proposed rule would restrict EPA’s ability to consider “best available science” when undertaking significant rulemakings, contrary to the numerous statutory directives discussed in detail below.

Response: The Administrator’s exemption provision in §30.7 is needed because there are conditions under which compliance with the requirements of the final rule might be impracticable, such as the age of the study. EPA finalized the exemption provision with reasonable factors for the Administrator to consider when granting an exemption. In addition, the final rule requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

Also see responses to Comments 2322-161, 2322-159 and 2322-161.

Comment [8750-1812]: Commenter (9227) asserts that EPA failed to submit the proposal to the SAB or to consult with the scientific and technical community.

There is no indication that EPA consulted with the scientific and technical community— or even its own Science Advisory Board—before proposing to require that the underlying data and models be made publicly available for all pivotal regulatory science regardless of ethical, feasibility, or confidentiality constraints. As detailed in a June 28, 2018 letter from the chair of the SAB, the SAB learned of the rule only through a press event, *Federal Register* notice, and news articles.¹²⁰⁸ The letter further explained that the proposed rule “was not identified as a major action in either of the Spring 2017 or Fall 2017 semi-annual Regulatory Agendas,” and that SAB members “had no information regarding the timeline for finalizing the rule”¹²⁰⁹ The letter also points out that “the precise design of the proposed rule appears to have been

¹²⁰⁸ Letter from Dr. Michael Honeycutt, Chair, Science Advisory Board, to Scott Pruitt, EPA Administrator (June 28, 2018),

[https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebReportsLastMonthBOARD/4ECB44CA28936083852582BB004ADE54/\\$File/EPA-SAB-18-003+Unsigned.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebReportsLastMonthBOARD/4ECB44CA28936083852582BB004ADE54/$File/EPA-SAB-18-003+Unsigned.pdf).

¹²⁰⁹ Id.

developed without a public process for soliciting input specifically from the scientific community,” even though the proposed rule raises important scientific questions.¹²¹⁰

Not surprisingly, the SAB concluded in its May 31, 2018 meeting that the Proposal merits SAB review because it “deals with issues of scientific practice and proposes constraints to the use of scientific studies in particular contexts.”¹²¹¹ Moreover, the SAB chair’s June 28 letter raises a number of questions that echo the concerns we have detailed in our comments, including the feasibility of providing access to data and methods for already-completed studies; “legitimate confidentiality and privacy interests” that would counsel against providing “complete public access”; the costs and effort associated with implementing the Proposal; the relationship between the Proposal and previous EPA efforts to encourage transparency; and the need to consider “the multiple existing methods to assess the validity of prior epidemiologic studies” that “do not provide public access to data and analytic methods.”¹²¹²

EPA’s failure to consult with the SAB is contrary to statute and to EPA’s well established practice. EPA must submit its Proposal to the SAB pursuant to the requirements of 42 U.S.C. § 4365(c)(1) (the Environmental Research Development Demonstration Authorization Act or “ERDAA”), which requires the Administrator to submit to the SAB any proposed criteria document, standard, limitation, or regulation, together with relevant scientific and technical information in the possession of the (EPA) on which the proposed action is based at the time it provides that proposal to another agency of the government for formal review. The SAB must then review and comment on the proposal.¹²¹³ While the Administrator need not receive the SAB’s final approval, the Administrator must consider the SAB’s advice and comments.¹²¹⁴

As the SAB chair’s letter notes, EPA’s “usual process” is to inform the SAB about the publication of the agency’s semi-annual regulatory agenda and provide descriptions of actions that are contained in the agenda, including “available information regarding the science that is informing these agency actions.”¹²¹⁵ That procedure was not followed here. In its evident zeal in the name of purported “transparency,” EPA has ignored major statutory and regulatory requirements that provide actual transparency to the CAA’s scientific review process.¹²¹⁶ Should EPA decide to move forward with this Proposal, it must first allow the SAB to complete its review and take into account the SAB’s recommendations in any final rule.

¹²¹⁰ Id.

¹²¹¹ Id.

¹²¹² Id.

¹²¹³ 42 U.S.C. §4365(c)(2).

¹²¹⁴ See H. Rep. No. 95-722 (95th Cong. 1st Sees. (1977) (Conference Report).

¹²¹⁵ Letter from Dr. Michael Honeycutt, Chair, Science Advisory Board, to Scott Pruitt, EPA Administrator (June 28, 2018).

¹²¹⁶ See Memorandum “Identifying EPA Planned Actions for Science Advisory Board Consideration of the Underlying Science” from Michael Goo, Assistant Administrator for Policy, Glenn Paulsen, EPA Science Advisor, and Vanessa Vu, Science Advisory Board Office Director (Dec. 27, 2012;); Memorandum from James Mihelcic, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science to Members of the Chartered SAB and SAB Liaisons (Nov. 12, 2013) (explaining SAB Work Group process, where EPA sent to the SAB “short descriptions of major planned actions that were not yet proposed” and the SAB Work Group determined which of the actions merited their consideration in a public forum).

Response: EPA disagrees that it violated the Environmental Research, Development, and Demonstration Authorization Act (ERDDAA). EPA did seek and obtain SAB review of aspects of the proposed rule. See

[https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebProjectsCurrentBOARD/2DB3986BB8390B308525855800630FCB/\\$File/EPA-SAB-20-005.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebProjectsCurrentBOARD/2DB3986BB8390B308525855800630FCB/$File/EPA-SAB-20-005.pdf).

EPA submitted the proposed rule to OIRA for review pursuant to Executive Order 12,866. EPA did not submit the proposal “to any other Federal agency for formal review and comment” so, in according to applicable caselaw, SAB review was not triggered. See *Coalition for Responsible Regulation, Inc. v. EPA*, 684 F.3d 102, 124 (D.C. Cir. 2012) (EPA’s obligation under ERDDAA wasn’t triggered because it wasn’t clear that EPA provided the endangerment finding to any other Federal agency for formal review and comment).

Comment [8750-4447]: Commenter (9227) contends that the proposal violates these statutory commands by requiring EPA to ignore science when undertaking significant rulemakings.

In direct violation of statutory requirements to consider, for example, “any other information available” or “the latest scientific knowledge [that is] useful” or “best available science,” the Proposal would prohibit EPA from considering relevant and high quality science whenever the underlying data for a study is not publicly available. Through the Proposal, EPA unlawfully tries to engraft an additional statutory requirement onto each of these statutes, requiring that to be considered a study’s underlying data must be publicly available.¹²¹⁷ For EPA’s Proposal to succeed, EPA must demonstrate that a study cannot be “other information available to the Administrator” or the “latest scientific knowledge useful in indicating” health or welfare effects or the “best available science,” or any of a number of other statutory formulations if the underlying data is not publicly available. EPA’s Proposal fails to do so, and it could not do so.

As explained *infra* at Section II.A.1, there are many reasons that underlying study data may not be available that have no bearing on the quality or validity of the study. These include legal restrictions or concerns about privacy (especially with respect to studies involving human subjects), confidentiality, CBI, or national security. Further, if this requirement were applied retroactively to existing studies, it may no longer be possible to make underlying data and models publicly available. EPA acknowledges these impediments in proposed section 30.9, which provides the Administrator with discretion—but not an obligation—to allow the agency to consider a study for which underlying data or models are not publicly available if he determines that public disclosure is infeasible. But where the Administrator fails to exercise his discretion to grant an exemption pursuant to proposed section 30.9, or where data or models are unavailable for reasons that do not satisfy the infeasibility standard, proposed section 30.5 would prohibit EPA from considering such studies, regardless of whether they meet the statutory criteria for consideration.

The only way that this prohibition could comport with EPA’s statutory obligations is if a study for which underlying data is not available cannot be, for example, “other information available” or “the latest scientific knowledge [that is] useful” or “best available science”—i.e., if the public unavailability of a study’s underlying dose response data and models makes the study ineligible

¹²¹⁷ See *Nat’l Ass’n of Homebuilders v. Defenders of Wildlife*, 551 U.S. 644, 663-64 (2007).

to meet these criteria, regardless of whether the study has been peer reviewed, is based on rigorous methodologies, or has been published in a leading journal, and regardless of the reason for the public unavailability. EPA makes no such demonstration—nor could it. There is simply no support for such a proposition; to the contrary, all of the evidence shows that studies may be “best available science,” and certainly “other information available” regardless of whether the data underlying them is publicly available.

Response: See response to Comments 2322-159, 2322-161, 8750-1450 and 1412-4472.

Comment [8796-4133]: Commenter (8817) states that the adverse environmental impacts may be horrific and require full disclosure in the NEPA required EIS.

EPA disagrees that this rulemaking is subject to NEPA. See response to Comment 3117-104.

Comment [9078-3552]: Commenter (6194) contends that the proposal is inconsistent with EPA’s statutory obligations and conflicts with other applicable federal requirements.

The Proposal would prevent EPA from relying on the best available information in discharging its duties. EPA is charged with developing regulations that provide societal benefits by reducing harm to human health and the environment from the presence of chemicals in air, soil, drinking water, food, and consumer products. The Proposal implicates research that is central to making such determinations; creating an obstacle to the consideration of such science is contrary to both primary statutory directives and requirements to conduct cost benefit analyses. Likewise, EPA fails to address how it could implement a regulation that is inconsistent with federal requirements and standards governing the use of science across agencies.¹²¹⁸

A. Statutory Requirements to Develop Health Based Standards and Conduct Cost-Benefit Analyses EPA acknowledges that it must use the “best available science” in all of its regulatory actions.¹²¹⁹

This directive is embodied in multiple statutes implemented by EPA and is reflected in other environmental statutes, further illustrating Congress’ conceptualization of “best” available science. Broadly speaking, there are three basic types of statutory requirements that the EPA and other agencies consider scientific information. First, there are requirements that the agency consider the “best available science.” Second, there are requirements that the agency consider particular factors, including scientific factors. Third, there are requirements that the agency balance economic costs or technological feasibility against public health, environmental, or other benefits that must be scientifically assessed. The precise terminology regarding the required use of science may, as illustrated below, vary across statutes, but what these provisions have in common are requirements for EPA and other agencies to use scientific information that is “best,”

¹²¹⁸ Moreover, as discussed herein, the Proposal would flip the existing default by automatically excluding the best scientific research, rather than admitting science and then deciding if circumstances exist that warrant excluding a study. The status quo makes more sense than creating a blanket preclusion of valid studies and then allowing their use only by going through a timely and expensive exemption process.

¹²¹⁹ EPA, Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18,768, 18,769 (Apr. 30, 2018) (citing Exec. Order No. 13,563, 76 Fed. Reg. 8,321 (Jan. 21, 2011)).

not simply adequate, and “available.”

Table 1: Examples of Statutory Directives regarding Use of Science by EPA and other Agencies

- **SDWA** [42 U.S.C. § 300g1(b)(3)(A)]: EPA must use “[t]he best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices,” and “[d]ata collected by accepted methods or best available methods (if the reliability of the method and the nature of the excision justifies use of the data).”
 - [42 U.S.C. § 300g1(b)(1)(b)(ii)]: EPA must use “best available public health information” in determining whether to regulate contaminants.
- **CWA** [33 U.S.C. § 1321(a)(27)]: Some provisions dealing with oil and hazardous substances on the Gulf Coast require “best available science.”
- **TSCA** [15 U.S.C. § 2625(h)]: “In carrying out sections 2603, 2604, and 2605 of this title, to the extent that the Administrator makes a decision based on science, the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science”.
- **Magnuson– Stevens Fishery Conservation and Management Act** [16 U.S.C. § 1851(a)(2)]: “Conservation and management measures shall be based upon the best scientific information available.”
- **Endangered Species Act** [16 U.S.C. § 1536(a)(2)]: In consultation to ensure no jeopardy to endangered or threatened species, “each agency shall use the best scientific and commercial data available.”
 - [16 U.S.C. § 1536(c)(1)]: Advice that an endangered or threatened species may be present in a location should be “based on the best scientific and commercial data available.”
 - [16 U.S.C. § 1536(h)(2)(b)(i) 16 U.S.C. § 1533(b)(1)(A)]: Permanent exceptions shall be given to prevent extinction of species “based on the best scientific and commercial data available.” The Secretary must determine whether a species is a threatened or endangered based upon “the best scientific and commercial data available.”
- **Marine Mammal Protection Act** [16 U.S.C. § 1371(a)(4)(C)]: “If the Secretary determines, using the best scientific information available, that certain forms of deterrence have a significant adverse effect on marine mammals, the Secretary may prohibit such deterrent methods, after notice and opportunity for public comment, through regulation under this chapter.”
 - [16 U.S.C. § 1371(a)(3)(A)]: The decision to waive the ban on taking must be based on the “best scientific evidence available and in consultation with the Marine Mammal Commission.”

None of these statutory provisions link the concept of the “best available science” to the availability of underlying raw data, nor can such a limitation be read into the statutes. Where Congress wanted to direct EPA’s decision regarding what science to consider or how—it did

so.¹²²⁰ When Congress wanted to link “best available science” to data being publicly available—it did so.¹²²¹ Thus, if Congress had wanted to put a blanket limitation on EPA’s consideration of science for which underlying data is not publicly available, it clearly knew how to do so—and it chose not to.

As EPA has previously explained, the agency would be unable to fulfill statutory mandates if it could not consider studies that follow federal laws and ethical standards regarding the privacy of patient and individual data:

If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. . . . [S]uch data are often the property of scientific investigators and are often not readily available because of the proprietary interests of the investigators or because of arrangements made to maintain confidentiality regarding personal health status and lifestyle information of individuals included in such data. Without provisions of confidentiality, the possibility of conducting such studies could be severely compromised.¹²²²

Examples of EPA statutory mandates that could be impeded by the Proposal include (i) the development of standards to control emissions from burning hazardous waste fuels under the Resource Conservation and Recovery Act (“RCRA”) “as may be necessary to protect human health and the environment,” 42 U.S.C. § 6924(q)(1); and (ii) determinations of whether hazardous sites need to be placed on the Comprehensive Environmental Response, Compensation, and Liability Act’s (“CERCLA”) National Priorities List. With respect to the latter, CERCLA provides that, if a health assessment indicates that a release or threatened release may pose a serious threat to human health, the Administrator of the ATSDR shall “notify the Administrator of EPA who shall promptly evaluate such release or threatened release in accordance with the hazard ranking system . . . to determine whether the site shall be placed on the National Priorities List.” 42 U.S.C. § 9604 (i)(6)(H). As referenced in footnote 41, health

¹²²⁰ See, e.g., Toxic Substances Control Act, 15 U.S.C. § 2625(h) (directing EPA to consider, as applicable, the following factors: “(1) the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information; (2) the extent to which the information is relevant for the Administrator’s use in making a decision about a chemical substance or mixture; (3) the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented; (4) the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and (5) the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models”); see also Comprehensive Environmental Response, Compensation, and Liability Act, 42 U.S.C. § 9604(i)(10) and (13) (providing that the Agency for Toxic Substances and Disease Registry give EPA specified data and information for review biennially and requiring that “[a]ll studies and results of research conducted under this subsection (other than health assessments) shall be reported or adopted only after appropriate peer review”).

¹²²¹ See, e.g., Clean Water Act, 33 U.S.C. § 1321(a)(27) (defining “best available science” in the context of natural resource protection and restoration projects on the Gulf Coast as science that: “(A) maximizes the quality, objectivity, and integrity of information, including statistical information; (B) uses peer-reviewed and publicly available data; and (C) clearly documents and communicates risks and uncertainties in the scientific basis for such projects”).

¹²²² National Ambient Air Quality Standards for Particulate Matter, 62 Fed. Reg. 38,652, 38,689 (Jul. 18, 1997).

assessments provided by ATSDR to EPA on a scheduled basis are exempt from peer review as a prerequisite to submission.

The Proposal would also cut EPA off from information needed to complete the cost-benefit analysis of regulations required under certain statutes and government-wide requirements.¹²²³

Not only would the Proposal impede EPA's fulfillment of its statutory duties, it would also be contrary to judicial precedent, which holds that "best available science" includes "all existing scientific evidence relevant to the [agency] decision [in question]." *Ecology Ctr., Inc. v. U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006) (quoting *Heartwood, Inc. v. U.S. Forest Serv.*, 380 F.3d 428, 436 (8th Cir. 2004)). While agencies need not produce new evidence,¹²²⁴ they must seek out information and "cannot ignore existing data." *Id.* (emphasis added). Even if an agency is anticipating the arrival of better evidence, it must act on the basis of the evidence it currently has.¹²²⁵ Many of the fundamental public health studies on which EPA has based key rules and standards under the statutes are studies for which the raw data was not or could not have been released. Nonetheless these studies have been examined and validated,¹²²⁶ as will future studies. Arbitrarily cutting off consideration of a category of science is inconsistent with EPA's statutory obligations.¹²²⁷

Response: This rule describes how the EPA will determine the consideration to afford pivotal science of the EPA's final significant regulatory actions and influential scientific information based on the availability of the underlying dose-response data and other applicable factors. The rule applies only to EPA and will not impact standards governing the use of science across other agencies. See response to Comments 1320-4331, 2322-159, 2322-161, 2322-205, and 1412-4472.

Comment [9217-3564]: Commenter (9225) writes that the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA's

¹²²³ See, e.g., Exec. Order No. 13,783, 82. Fed. Reg. 16,093 (Mar. 31, 2017) ("It is also the policy of the United States that necessary and appropriate environmental regulations . . . are of greater benefit than cost, when permissible, . . . and are developed through transparent processes that employ the best available peer-reviewed science and economics."); see also 42 U.S.C. § 7411(a)(1) (CAA provision requiring EPA to consider costs when establishing performance standards for new stationary sources of pollution); 42 U.S.C. § 7412(n)(1)(A) (CAA provision directing EPA to regulate power plants if such regulation is "appropriate and necessary," which includes consideration of costs); 42 U.S.C. § 300g-1(b)(3)(C) (SDWA provision establishing requirements for health risk reduction and cost analysis under which quantifiable and non-quantifiable benefits of a proposed rule must be measured against its cost); 15 U.S.C. § 2605(c)(2)(A)(iv) (TSCA provision requiring EPA to consider "the reasonably ascertainable economic consequences" of a proposed rule).

¹²²⁴ See *Friends of Blackwater v. Salazar*, 691 F.3d 428, 435 (D.C. Cir. 2012) (quoting *Sw. Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000)) ("[U]nder the 'best ... data available' standard, 'the Secretary has no obligation to conduct independent studies.'").

¹²²⁵ See, e.g., *San Luis & Delta-Mendota Water Auth. v. Jewell*, 747 F.3d 581, 630 (9th Cir. 2014) ("[T]he fact that science must advance further before the complicated ecosystem interactions in the Bay-Delta are fully understood does not necessarily mean that the Fish and Wildlife Service failed to rely on the best available science.")

¹²²⁶ See the Harvard Letter, *supra* note 6.

¹²²⁷ The Proposal is also arbitrary in suggesting that science that cannot be used in setting regulations could still be used in individual permitting decisions.

authority. This includes, but is not limited to, the CAA; CWA; TSCA; Lautenberg Chemical Safety Act; SDWA; FIFRA; and more.

Response: See response to Comments 31-135 and 1412-4472.

1.4 Evidence Act (SNPRM Comments)

Comment [49-214]: Commenter (12718) states that the Bipartisan Policy Center (BPC) dialogue squarely placed future open data and open science activities at EPA within the context of the Foundations for Evidence-Based Policymaking Act of 2018 (P.L. 115-435; Evidence Act), which EPA neglects to reference, cite, or align in the SNPRM. Instead EPA relies on OMB M-13-13, rather than new legal requirements signed into law during the current administration. The absence of incorporating the Evidence Act, which fully applies to EPA, in the course of the proposed regulatory action is a misstep and major omission. Excluding the bipartisan Evidence Act throughout the SNPRM also raises questions about the motivation and intent of EPA's current proposal, not to mention concerns about the fidelity EPA is employing in implementing current law expectations under the Evidence Act.

Response: The Agency did not cite the Evidence Act in either proposal but does acknowledge it in the final rule preamble. Nothing in the final rule conflicts with or contradicts the Act. The final rule furthers the goal of the Act by increasing transparency of the science that underlies significant regulatory actions and ISI. Further, EPA's Plan to Increase Access to Results of EPA Funded Scientific Research established procedures for providing public access to studies, funded in whole or in part by EPA, and their underlying data and models.

Comment [49-216]: Commenter (12718) suggests that the final EPA regulatory action could still calibrate to the Evidence Act's new legal authority, while also addressing issues identified from across the scientific community about the SNPRM. A report released by BPC in early 2020 from our dialogues with EPA stakeholder-representatives offered the following suggestions to promote meaningful transparency at the agency:

- Strengthen EPA's Learning Culture
- Improve EPA's Data Governance and Management
- Enhance EPA's Policy Analysis and Evaluation Functions
- Bolster Public Trust and Enrich Communication

In short, the project highlighted that being serious about meaningful transparency required multiple threads of activities. It suggested that a single action to encourage data availability would be insufficient at really supporting transparency and accountability as envisioned and unanimously agreed to by the U.S. Commission on Evidence-Based Policymaking. Below I highlight several options from this report that EPA could still incorporate in conjunction with SNPRM revisions to promote meaningful and real transparency for the Agency:

#3: Explore New Models for Incorporating Expert and Stakeholder Feedback

#7: Establish and Empower an Office of the Chief Data Officer

- #8: Establish and Prioritize and Agency-Wide Data Governance Board
- #9: Establish and Sufficiently Resource a Legally Recognized Statistical Unit
- #13: Establish or Identify a Partnership for a Secure Data Enclave
- #14: Establish an Independent and Centralized Evaluation Unit
- #16: Support International Environmental Systematic-Review Processes
- #18: Establish an Advisory Body for Evidence-Building Activities

Taken together, these options could create an infrastructure and ecosystem at EPA that would position the agency as a leader in the federal government and the world for promoting transparency. Additional details about each option and the implications for EPA are available in BPC's final options paper on the EPA dialogues.

Response: The EPA does not intend for this final rule to serve as the agency action taken to comply with the Evidence Act. A workgroup has been established to develop implementation plans to address the requirements of the Act, which may cover the activities described in the comment.

1.5 Consistency with the Peer Review Processes Required Under Environmental Statue (NPRM Comments)

Comment [6163-1276]: Commenter (6133) states that in addition to addressing how and whether the agency will consider science, the Proposal also contains a seemingly unrelated provision regarding agency peer review. The Proposal, in § 30.7, reads:

What role does independent peer review in this section?

EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

Because transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results. (83 Fed. Reg. at 18,774.)

There is no statutory authority for EPA to "conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein." The federal statutes that EPA lists as putative authority for the Proposal provide no authority for proposed § 30.7. See 83 Fed. Reg. at 18,769/2 (citing CAA sections 103,

301(a), 42 U.S.C. 7403, 7601(a); CWA sections 104, 501, 33 U.S.C. 1254, 1361; SDWA sections 1442, 1450(a)(1), 42 U.S.C. 300j–1, 300j– 9(a)(1); RCRA sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; CERCLA (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; EPCRA section 328, 42 U.S.C. 11048; FIFRA sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; and TSCA, as amended, section 10, 15 U.S.C. 2609, and the APA). The claimed authorities that EPA lists do not mention peer review or even allude to the concept. *Id.* Neither the Proposal nor accompanying docket materials identify any provision of any federal statute that authorizes EPA to promulgate proposed § 30.7. Our own research revealed no provision of any federal statute that authorizes EPA to promulgate proposed § 30.7.

When Congress writes federal statutes, Congress knows how to create legal authority for peer review, who shall conduct that peer review, what role, if any, that EPA or other parties will play, and how that peer review may be conducted. None of the provision in the law authorize EPA’s Proposal in § 30.7. Instead, the statutes require that EPA use peer-reviewed science, regardless of whether it would meet EPA’s definition of the term in § 30.7. And in cases where the law requires EPA to conduct the review, the statutes often spell out specifically how that should happen.

Statute Provisions on Peer Review CAA § 7511b. Federal ozone measures:

CAA

§ 7511b. Federal ozone measures

(g) Ozone design value study The Administrator shall conduct a study of whether the methodology in use by the EPA as of November 15, 1990, for establishing a design value for ozone provides a reasonable indicator of the ozone air quality of ozone nonattainment areas. The Administrator shall obtain input from States, local subdivisions thereof, and others. The study shall be completed, and a report submitted to Congress not later than 3 years after November 15, 1990. The results of the study shall be subject to peer and public review before submitting it to Congress. (42 U.S.C. § 7511b (emphasis added)).

§ 7412. HAP

(p) NUATRC (3) SAP the Board of Directors shall be advised by a SAP, the 13 members of which shall be appointed by the Board, and to include eminent members of the scientific and medical communities. The Panel membership may include scientists with relevant experience from the NIEHS, the CDC, the EPA, the NCI, and others, and the Panel shall conduct peer review and evaluate research results. The Panel shall assist the Board in developing the research agenda, reviewing proposals and applications, and advise on the awarding of research grants. (42 U.S.C. § 7412 (emphasis added)).

CWA

§ 1321. Oil and hazardous substance liability

(a) Definitions (27) the term “best available science” means science that-- (A) maximizes the quality, objectivity, and integrity of information, including statistical information; (B) uses peer-reviewed and publicly available data; and (C) clearly documents and communicates risks and uncertainties in the scientific basis for such projects; (33 U.S.C. § 1321 (emphasis added)).

SDWA

§ 300g-1. National drinking water regulations

(b) Standards

(3) Risk assessment, management, and communication

(A) Use of science in decision-making in carrying out this section, and, to the degree that an Agency action is based on science, the Administrator shall use--

(i) the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and(ii) data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).

(B) Public information

In carrying out this section, the Administrator shall ensure that the presentation of information on public health effects is comprehensive, informative, and understandable. The Administrator shall, in a document made available to the public in support of a regulation promulgated under this section, specify, to the extent practicable--

(i) each population addressed by any estimate of public health effects;

(ii) the expected risk or central estimate of risk for the specific populations;

(iii) each appropriate upper-bound or lower-bound estimate of risk;

(iv) each significant uncertainty identified in the process of the assessment of public health effects and studies that would assist in resolving the uncertainty;

(v) peer-reviewed studies known to the Administrator that support, are directly relevant to, or fail to support any estimate of public health effects and the methodology used to reconcile inconsistencies in the scientific data.

(12) Certain contaminants

(B) Sulfate

(i) Additional study Prior to promulgating a national primary drinking water regulation for sulfate, the Administrator and the Director of the CDC shall jointly conduct an additional study to establish a reliable dose-response relationship for the adverse human health effects that may result from exposure to sulfate in drinking water, including the health effects that may be experienced by groups within the general population (including infants and travelers) that are potentially at greater risk of adverse health effects as the result of such exposure. The study shall be conducted in consultation with interested States, shall be based on the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices, and shall be completed not later than 30 months after August 6, 1996. (42 U.S.C. § 300g-1 (emphasis added)).

§ 300j-2. Grants for State programs

(d) NYC watershed protection program

(1) In general The Administrator is authorized to provide financial assistance to the State of New York for demonstration projects implemented as part of the watershed program for the protection and enhancement of the quality of source waters of the NYC water supply system, including projects that demonstrate, assess, or provide for comprehensive monitoring and surveillance and projects necessary to comply with the criteria for avoiding filtration contained in 40 C.F.R. 141.71. Demonstration projects which shall be eligible for financial assistance shall be certified to the Administrator by the State of New York as satisfying the purposes of this subsection. In certifying projects to the Administrator, the State of New York shall give priority to monitoring projects that have undergone peer review. (42 U.S.C. § 300j-2 (emphasis added)).

RCRA

§ 6939a. Exposure information and health assessments

(b) Health assessments

(2) Whenever in the judgment of the Administrator, or the State (in the case of a State with an authorized program), a landfill or a surface impoundment poses a substantial potential risk to human health, due to the existence of releases of hazardous constituents, the magnitude of contamination with hazardous constituents which may be the result of a release, or the magnitude of the population exposed to such release or contamination, the Administrator or the State (with the concurrence of the Administrator) may request the Administrator of the ATSDR to conduct a health assessment in connection with such facility and take other appropriate action with respect to such risks as authorized by section 9604(b) and (i) of this title. If funds are provided in connection with such request the Administrator of such Agency shall conduct such health assessment.

(e) Periodic reports. The Administrator of such Agency shall issue periodic reports which include the results of all the assessments carried out under this section. Such assessments or other activities shall be reported after appropriate peer review. (42 U.S.C. § 6939a (emphasis added)).

CERCLA

§ 9604. Response authorities

(i) ATSDR; establishment, functions, etc.

Any toxicological profile or revision thereof shall reflect the Administrator of ATSDR's assessment of all relevant toxicological testing which has been peer reviewed. The profiles required to be prepared under this paragraph for those hazardous substances listed under subparagraph (A) of paragraph (2) shall be completed, at a rate of no fewer than 25 per year, within 4 years after October 17, 1986. A profile required on a substance listed pursuant to subparagraph (B) of paragraph (2) shall be completed within 3 years after addition to the list. The profiles prepared under this paragraph shall be of those substances highest on the list of priorities under paragraph (2) for which profiles have not previously been prepared. Profiles required under this paragraph shall be revised and republished as necessary, but no less often than once every 3 years. Such profiles shall be provided to the States and made available to other interested parties.

(7) (A) Whenever in the judgment of the Administrator of ATSDR it is appropriate on the basis of the results of a health assessment, the Administrator of ATSDR shall conduct a pilot study of health effects for selected groups of exposed individuals in order to determine the desirability of conducting full scale epidemiological or other health studies of the entire exposed population.

(B) Whenever in the judgment of the Administrator of ATSDR it is appropriate on the basis of the results of such pilot study or other study or health assessment, the Administrator of ATSDR shall conduct such full scale epidemiological or other health studies as may be necessary to determine the health effects on the population exposed to hazardous substances from a release or threatened release. If a significant excess of disease in a population is identified, the letter of transmittal of such study shall include an assessment of other risk factors, other than a release, that may, in the judgment of the peer review group, be associated with such disease, if such risk factors were not taken into account in the design or conduct of the study.

(13) All studies and results of research conducted under this subsection (other than health assessments) shall be reported or adopted only after appropriate peer review. Such peer review shall be completed, to the maximum extent practicable, within a period of 60 days. In the case of research conducted under the NTP, such peer review may be conducted by the BOSC. In the case of other research, such peer review shall be conducted by panels consisting of no less than three nor more than seven members, who shall be disinterested scientific experts selected for such purpose by the Administrator of ATSDR or the Administrator of EPA, as appropriate, on the basis of their reputation for scientific objectivity and the lack of institutional ties with any person involved in the conduct of the study or research under review. Support services for such panels shall be provided by the ATSDR, or by the EPA, as appropriate. (42 U.S.C. § 9604 (emphasis added)).

EPCRA

No mentions of peer review

FIFRA

§ 136w. Authority of Administrator

(e) Peer review The Administrator shall, by written procedures, provide for peer review with respect to the design, protocols, and conduct of major scientific studies conducted under this subchapter by the EPA or by any other Federal agency, any State or political subdivision thereof, or any institution or individual under grant, contract, or cooperative agreement from or with the EPA. In such procedures, the Administrator shall also provide for peer review, using the advisory panel established under subsection (d) of this section or appropriate experts appointed by the Administrator from a current list of nominees maintained by such panel, with respect to the results of any such scientific studies relied upon by the Administrator with respect to actions the Administrator may take relating to the change in classification, suspension, or cancellation of a pesticide. Whenever the Administrator determines that circumstances do not permit the peer review of the results of any such scientific study prior to the Administrator's exercising authority under section 136d(c) of this title to immediately suspend the registration of any pesticide to prevent an imminent hazard, the Administrator shall promptly thereafter provide for the conduct of peer review as provided in this sentence. The evaluations and relevant documentation constituting the peer review that relate to the proposed scientific studies and the results of the completed scientific studies shall be included in the submission for comment forwarded by the Administrator to the advisory panel as provided in subsection (d). As used in this subsection, the term “peer review” shall mean an independent evaluation by scientific experts, either within or outside the EPA, in the appropriate disciplines. (7 U.S.C. § 136w (emphasis added)).

§ 136w-8. Pesticide registration service fees

(a) Definition of costs: In this section, the term “costs”, when used with respect to review and decision-making pertaining to an application for which registration service fees are paid under this section, means-- (1) costs to the extent that—

(A) officers and employees provide direct support for the review and decision-making for covered pesticide applications, associated tolerances, and corresponding risk and benefits information and analyses; (B) persons and organizations under contract with the Administrator engage in the review of the applications, and corresponding risk and benefits information and assessments; and (C) advisory committees and other accredited persons or organizations, on the request of the Administrator, engage in the peer review of risk or benefits information associated with covered pesticide applications; (2) costs of management of information, and the acquisition, maintenance, and repair of computer and telecommunication resources (including software), used to support review of pesticide applications, associated tolerances, and corresponding risk and benefits information and analyses; and (3) costs of collecting registration service fees under subsections (b) and (c) and reporting, auditing, and accounting under this section. (7 U.S.C. § 136w-8 (emphasis added)).

TSCA

§ 2625. Administration

(h) Scientific standards In carrying out sections 2603, 2604, and 2605 of this title, to the extent that the Administrator makes a decision based on science, the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science, and shall consider as applicable-- (1) the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information; (2) the extent to which the information is relevant for the Administrator's use in making a decision about a chemical substance or mixture; (3) the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented; (4) the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and (5) the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models. (15 U.S.C. § 2625 (emphasis added)).

§ 2617. Preemption

(b) New statutes, criminal penalties, or administrative actions creating prohibitions or other restrictions (1) In general Except as provided in subsections (c), (d), (e), (f), and (g), beginning on the date on which the Administrator defines the scope of a risk evaluation for a chemical substance under section 2605(b)(4)(D) of this title and ending on the date on which the deadline established pursuant to section 2605(b)(4)(G) of this title for completion of the risk evaluation expires, or on the date on which the Administrator publishes the risk evaluation under section 2605(b)(4)(C) of this title, whichever is earlier, no State or political subdivision of a State may establish a statute, criminal penalty, or administrative action prohibiting or otherwise restricting the manufacture, processing, distribution in commerce, or use of such chemical substance that is a high-priority substance designated under section 2605(b)(1)(B)(i) of this title.

(f) Waivers (2) Required exemptions Upon application of a State or political subdivision of a State, the Administrator shall exempt from subsection (b) a statute or administrative action of a State or political subdivision of a State that relates to the effects of exposure to a chemical substance under the conditions of use if the Administrator determines that-- (A)(i) compliance with the proposed requirement of the State or political subdivision of the State would not unduly burden interstate commerce in the manufacture, processing, distribution in commerce, or use of a chemical substance; (ii) compliance with the proposed requirement of the State or political subdivision of the State would not cause a violation of any applicable Federal law, rule, or order; and (iii) the State or political subdivision of the State has a concern about the chemical substance or use of the chemical substance based in peer-reviewed science; or (B) no later than the date that is 18 months after the date on which the Administrator has initiated the prioritization process for a chemical substance under the rule promulgated pursuant to section 2605(b)(1)(A) of this title, or the date on which the Administrator publishes the scope of the risk evaluation for a chemical substance under section 2605(b)(4)(D) of this title, whichever is sooner, the State or political subdivision of the State has enacted a statute or proposed or finalized an administrative action intended to prohibit or otherwise restrict the manufacture, processing, distribution in commerce, or use of the chemical substance. (15 U.S.C. § 2617 (emphasis added)).

§ 2605. Prioritization, risk evaluation, and regulation of chemical substances and mixtures

(b) Risk evaluations (E) Metals and metal compounds In identifying priorities for risk evaluation and conducting risk evaluations of metals and metal compounds, the Administrator shall use the Framework for Metals Risk Assessment of the Office of the Science Advisor, Risk Assessment Forum, and dated March 2007, or a successor document that addresses metals risk assessment and is peer reviewed by the SAB. (15 U.S.C. § 2605 (emphasis added)).

Under longstanding federal case law, when Congress authorizes an approach in one section of a statute using specific language but does not do the same in other sections of a statute, courts presume that Congress acted purposefully and did not mean to address or authorize that approach in those other statutory sections. See, e.g., *Dean v. United States*, 556 U.S. 568 (2009) (“It is generally presumed that Congress acts intentionally when including particular language in one section of a statute but not in another.” (citing *Russello v. United States*, 464 U.S. 16, 23 (1983))). Not only are there no implied grants of authority to an agency in the other statutory sections, but the congressional decisions to authorize the approach elsewhere in the statute give even greater force to the conclusion that the agency has not been given authority where Congress did not use the same or similar authorizing language.

The EPA approach proposed in § 30.7 is even more unlawful than would be the case, independently, under this case law. Proposed § 30.7 says “EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” 83 Fed. Reg. at 18,774/2 (emphasis added). EPA proposes to bind itself (“shall”) to conduct a particular form of peer review on “all pivotal regulatory science” based on an unenforceable, non-binding OMB bulletin that has never been the subject of notice and comment rulemaking and that itself is not authorized by any federal law. To the contrary, treating the content of the unenforceable bulletin as a binding regulation would itself violate the federal statutes that EPA implements, because those statutes do not codify the bulletin, and EPA would be unlawfully codifying a mere policy preference. This EPA may not do.

This Proposal is unlawful, arbitrary, and capricious, and an abuse of EPA discretion. To reiterate, the Proposal identifies no statutory authority for EPA to conduct independent peer review for any, much less all, “pivotal regulatory science” consistent with the dense content (and exceptions) of the OMB bulletin. The Proposal identifies no statutory authority for EPA to bind itself, and future administrations, to conduct peer review only in this fashion, unless and until future notice-and-comment rulemaking is undertaken. The Proposal identifies no suggestion in statutory language or legislative history that Congress intended EPA to conduct binding peer review consistent with this OMB bulletin, notwithstanding that Congress has known about this bulletin since 2005. EPA has simply made up proposed § 30.7—with its the link to the OMB bulletin, and the putative authority for the Proposal—out of whole cloth. This EPA may not do.

Response: None of the statutory provisions cited by the commenter prohibits EPA from conducting additional peer review of studies the agency evaluates as support for significant regulatory decisions and ISI. That said, the final rule provides that if EPA determines that studies

have already undergone adequate peer review, EPA will not conduct de novo independent peer review. Adequate peer review is peer review that is consistent with both OMB's and EPA's peer review guidance. The intent of the rule is for EPA to go beyond current OMB/EPA guidance by recognizing that peer review that actually examined the underlying data will lead to even more confidence in the results of a peer reviewed study and that pivotal science that has had this deeper peer review will be given greater consideration in study quality weighting.

The final rule states in § 30.3 that “[i]n the event the procedures outlined in this rule conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.” Additionally, EPA intends to promulgate future science transparency rules under its substantive environmental statutes that may address peer review requirements consistent with those authorities.

Comment [7869-3376]: Commenter (8272) contends that EPA's regulatory process already involves peer review, solicitation of expert opinion, steps to ensure data quality, and public comment periods that allow stakeholders to raise questions or concerns and present additional evidence. If it had undertaken a similarly thorough process in developing this rule, it could have asked the National Academies of Sciences, Engineering, and Medicine (NASEM) to investigate and report on whether the current level of transparency has resulted in outcomes contrary to EPA's statutory mandates or executive orders; procedures and considerations related to transparency in the scientific community; and the potential results of applying the proposed criteria when regulating.

Response: EPA agrees with the commenter that its regulatory processes provide for peer review, solicitation of expert opinion, steps to ensure data quality, and public comment periods. While EPA did not consult with NASEM on this rule, it did solicit peer review and expert opinion from the SAB and provided for public notice and comment.

Comment [8750-1449]: Commenter (9227) asserts that as EPA acknowledges in footnote 3 of the Proposal, in at least two instances the D.C. Circuit Court of Appeals has recognized that studies for which underlying data is not publicly available may constitute “best available science.”¹²²⁸ The D.C. Circuit's decisions in these cases further demonstrate that the public unavailability of a study's underlying data does not render a study incapable of constituting “best available science” otherwise unworthy of EPA's consideration.

In *American Trucking Associations v. EPA*, the petitioner challenged EPA's reliance on scientific studies for which underlying data was not publicly available in deciding to strengthen the NAAQS for PM.¹²²⁹ The Court held that the CAA did not require EPA to make public underlying data where EPA relied on the study itself and not the raw data underlying the study. The Court agreed with EPA's position that requiring agencies to obtain and publicize the data

¹²²⁸ 83 Fed. Reg. at 18769.

¹²²⁹ 283 F.3d 355, 372 (D.C. Cir. 2002).

underlying all studies on which they rely “would be impractical and unnecessary.”¹²³⁰ Importantly, the Court concluded that:

If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. . . . Such data are often the property of scientific investigators and are often not readily available because of. . . proprietary interests. . . or because of [confidentiality] arrangements [with study participants].¹²³¹

The court accordingly recognized that ignoring relevant scientific information simply because the underlying data is not available would violate EPA’s obligations to consider “best available science.” *Coalition of Battery Recyclers Association v. EPA* involved another challenge to EPA’s reliance on a scientific study for which the underlying data was not publicly available.¹²³² In that case, EPA had relied upon the study in question to determine the “concentration-response relationship between blood lead levels and IQ changes.”¹²³³ The D.C. Circuit again upheld EPA’s reliance on studies without making the underlying data publicly available and explained, “raw data often is unavailable due to proprietary interests of a study’s scientific investigators or confidentiality agreements with study participants.”¹²³⁴ Likewise, in *City of Waukesha v. EPA* the D.C. Circuit concluded that agency peer review satisfies the requirement to use best, peer reviewed science and supporting studies.¹²³⁵

Response: While EPA recognizes that courts have held that the agency can rely on studies where the underlying data and models are not publicly available, EPA finds that public confidence in the regulatory actions taken by EPA will be enhanced by increased transparency and the ability of the public to conduct independent validation of the studies’ findings and conclusions.

Comment [8750-1629]: Commenter (9227) contends that there is broad agreement in the scientific literature, reflected in EPA’s own guidance, that a “weight of the evidence” approach is an optimal way to analyze and synthesize an array of scientific information in a decision-making context.¹²³⁶ This approach, which is described in more detail below, calls for scientific

Wood, Weight-of-Evidence Concepts: Introduction and Application to Sediment Management 5-8 (US Army Corps of Engineers ERDC/EL SR-18-1, Mar. 2018), <http://www.dtic.mil/dtic/tr/fulltext/u2/1048843.pdf> (reviewing literature on development of and best practices in weight-of-evidence assessment, and observing that “Within the US, the USEPA and its partner agencies use and recommend the use of WOE extensively.”); Cf. John P.A. Ioannidis, All science should inform policy and regulation, PLOS Med 15:5 (May 3, 2018) (“Even the strongest science may have imperfections. In using scientific information for decision-making, it is essential to examine evidence in its totality, recognize its relative strengths and weaknesses, and make the best judgment based on what is available.”); U.S. EPA. Preamble to the Integrated Science Assessments (ISA). U.S. Environmental Protection Agency, Washington, DC, EPA/600/R-15/067, 2015.

assessments to be based on a broad array of studies—reflecting multiple lines of inquiry, where appropriate—each of which is carefully weighted based on various indicia of credibility. This careful and rigorous process is incompatible with the requirements of the Proposal, which would bar EPA from considering even highly credible, persuasive studies based solely on whether the underlying data is available. Yet the Proposal never acknowledges the conflict between its requirements and EPA’s proven practices for scientific assessments, and never provides any good reasons for this change of course. One prominent example of this “weight of the evidence” approach is contained in EPA’s Preamble to the ISA.¹²³⁷ The ISA are pollutant-specific reports that EPA produces as the scientific basis for establishing and updating EPA’s NAAQS, which establish health-based standards for critical air pollutants. The ISA are intended to implement the CAA’s directive to “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of identifiable effects on public health and welfare which may be expected from the presence of [a] pollutant in the ambient air.”¹²³⁸ These are some of the most consequential scientific evaluations that EPA performs, in terms of the health, environmental, and economic impacts of the resulting standards, and they must withstand the highest level of technical and legal scrutiny.¹²³⁹ Thus, EPA uses the very best and most defensible scientific methods to produce them, which are described in the Preamble to the ISA.

The Preamble to the ISA is an “overview document outlining the basic steps and criteria used in developing the Integrated Science Assessments,” which EPA references as a companion document to each ISA.¹²⁴⁰ As EPA explains, the “Preamble describes the process of searching the literature, selecting studies for consideration, evaluating study quality, synthesizing and integrating the evidence, and characterizing the evidence for public health and welfare impacts of criteria air pollutants.”¹²⁴¹ It also “describes the five-level causal framework for evaluating weight of evidence and drawing scientific conclusions and causal judgments.”¹²⁴² Central to this scientific assessment process is the understanding that evidence from all types of studies, such as animal studies, human observational studies (cohort, time series), controlled chamber studies, and exposure assessments, among others, must be evaluated and incorporated into final determinations of effects. No single study alone drives the final determinations of causality; rather, the weight of evidence from several lines of inquiry is critical.¹²⁴³ This framework to

See also EPA Science Policy Council, A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information at 2 (June 2003) (describing EPA’s guidance for carcinogen risk assessment and ecological risk assessment as additional examples of the agency’s “weight-of-evidence” approach).

evaluate all available science builds upon decades of accrued knowledge and thinking drawing from expertise across several disciplines, including evidence-based decision making.¹²⁴⁴

The Preamble states: “In its evaluation and integration of the scientific evidence on health or welfare effects of criteria pollutants, the U.S. EPA determines the weight of evidence in support of causation and characterizes the strength of any resulting causal classification.”¹²⁴⁵

The Preamble explains in further detail:

In the ISA, the U.S. EPA assesses the body of relevant literature, building upon evidence available during previous NAAQS reviews, to draw conclusions on the causal relationships between relevant pollutant exposures and health or environmental effects. ISAs use a five-level hierarchy that classifies the weight of evidence for causation. This weight-of-evidence evaluation is based on the integration of findings from various lines of evidence from across health and environmental effect disciplines that are integrated into a qualitative statement about the overall weight of the evidence and causality.¹²⁴⁶

Similarly, section 26 of the TSCA requires that decisions made under sections 4, 5, or 6 of the law must adhere to certain scientific standards including use of best available science and a weight of the scientific evidence approach.¹²⁴⁷ In its final regulation, Procedures for Chemical Risk Evaluation Under the Amended TSCA, EPA defines weight of scientific evidence as:

Weight of scientific evidence means a systematic review method, applied in a manner suited to the nature of the evidence or decision, that uses a pre-established protocol to comprehensively, objectively, transparently, and consistently, identify and evaluate each stream of evidence, including strengths, limitations, and relevance of each study and to integrate evidence as necessary and appropriate based upon strengths, limitations, and relevance.¹²⁴⁸

Systematic review in turn requires a full review of the body of scientific evidence available, where study quality is evaluated largely according to methodological design and not the degree to which underlying data are publicly available.¹²⁴⁹ EPA’s Proposal contravenes TSCA’s requirements to apply a weight of the scientific evidence approach, as defined by the agency, by instating a process that, among other things, conflicts with applying a systematic review approach in the evaluation of chemicals under TSCA.

The Proposal’s approach of preemptively barring studies based on the unavailability of data cannot be reconciled with EPA’s detailed policies for scientific assessment.

Response: The final rule does not categorically exclude studies from consideration if the underlying data and models are not publicly in a manner to allow independent validation. The

final rule describes how EPA will consider studies underlying significant regulatory actions and ISI, based on data and model availability and study quality factors. EPA will continue utilizing systematic review and weight of the evidence processes to evaluate scientific studies.

1.6 Administrative Procedures Act (APA)

1.6.1 APA (NPRM and SNPRM Comments).

1.6.1.1 APA (NPRM Comments)

1.6.1.1.1 Was the Proposed Rule Consistent with the APA?

Comment [2157-149]: Commenter (2171) suggests that the intent of this rule is ill-considered, and its potential for implementation is severely limited. EPA asked for input in the public notice that would have been better addressed through an Advanced NPRM. The record provided with the docket for this proposed rule is nonexistent, and EPA has failed to meet many of the basic requirements in preparing rule proposals for public notice and comment. The rule will likely be determined to be arbitrary and capricious and is certain to be challenged legally. The commenter states that the EPA should withdraw this proposed rule immediately.

Response: This rulemaking establishes internal EPA procedures for considering the dose-response data underlying pivotal science to be used in EPA's significant regulatory decisions. Because this is a procedural rulemaking that exclusively governs EPA and no other party outside of the agency, it is not subject to the APA's notice and comment requirements. *See* 5 U.S.C. § 553(b) (exempting "rules of agency organization, procedure, or practice" from § 553 notice and comment requirements) (emphasis added). Nevertheless, and consistent with § 553(b), the proposal, supplemental proposal, and other relevant rulemaking notices were published in the *Federal Register* and included: "(1) a statement of the time, place, and nature of public rule making proceedings; (2) reference to the legal authority under which the rule is proposed; and (3) either the terms or substance of the proposed rule or a description of the subjects and issues involved." *Id.* Taken together, these documents provided enough detail and rationale to support this action and for the public to meaningfully comment on the rulemaking.

Moreover, EPA made relevant technical and supporting documents available to the public in the rulemaking docket, and those documents are consistent with the stated rationale for the rule. Finally, in addition to meeting the notice requirements of § 553(b), both the proposal and supplemental proposal were subject to public comment. The proposal received nearly 130,000 comments and the supplemental proposal received over 70,000 comments.

Comment [6906-3975]: Commenter (6927) agrees that this proposed rule is consistent with the APA as well as programmatic statutes that EPA administers to disclose to the public the bases for agency rules and to rationally execute and adequately explain agency actions.

Response: The environmental statutes EPA administers do indeed require that EPA provide the bases for decision making. This rule advances that transparency by giving greater consideration to pivotal science that is available for independent validation.

Comment [3117-103]: Commenter (3132) argues that the proposal violates the APA in many ways. (See, e.g., May 7, 2018 Comment Letter of Attorneys General for seven states and the District of Columbia at page 1 and the May 7, 2018 Comment Letter of the Environmental Protection Network (EPN) (included in Docket for this rulemaking)).

For example, the commenter contends that the proposal is both impermissibly misleading and ambiguous. APA section 553 requires the EPA to provide a concise general statement for the proposal. In contrast, the proposal obfuscates rather than informs. Rather than concede that the proposal would be a dramatic departure from past EPA practices, the proposal tries to downplay court and agency decisions that support the use of the data banned under the proposal. See Proposal, FR 18769 note 3. The vagueness and misleading nature of statements regarding the proposal thwart the fundamental APA goal of keeping the public informed.

Response: See response to Comment 2157-149.

Comment [4399-3922]: Commenter (4410) states that the promulgation of this proposed rule would set a dangerous and potentially life-threatening precedent regarding the use of health-based data, modeling, and research in regulatory decision-making. As proposed, the rule is arbitrary, capricious, unethical, and intellectually dishonest. The commenter suggests that the EPA should immediately announce that it is withdrawing this proposal.

Response: See response to Comment 2157-149. EPA notes that this rule is not being finalized as proposed.

Comment [4577-332]: Commenter (4588) states that the aim of the EPA's proposed rule is to make "data and models underlying the science publicly available in a manner sufficient for validation and analysis." The commenter strongly supports the open exchange of information to ensure the validity of and to build upon research. However, the commenter believes the proposed rule is unnecessary, makes erroneous assumptions about the scientific process, and would unadvisedly limit the kind of scientific research that should be considered in decisions affecting human health and our environment. Moreover, this proposed policy change would unnecessarily, and likely unlawfully, lead the EPA away from its mandate—in its mission and under various environmental statutes—to use the best scientific evidence in assessing environmental risks, and its obligation under the APA to refrain from arbitrary decision making. The practical effect of this rule would be to limit EPA's ability to protect public health and meet its statutory obligations as well as its overall mission.

The commenter provides that a Congressional bill similar in intent to the EPA's proposed rule – the HONEST Act – was offered and defeated last year. Members of Congress had serious and valid concerns about the negative impact the bill would have by significantly reducing the amount of scientific evidence that EPA can consider when adopting regulatory standards to protect public health and the environment. Given the requirements of the APA and federal environmental statutes, the agency cannot do by regulation what Congress declined to do through legislation.

Response: EPA disagrees that this rulemaking will compromise its ability to carry out its mandate to protect human health and the environment and meet its statutory obligations. By contrast, and as discussed in the final rule preamble at III.A, EPA is taking this procedural action to help strengthen the transparency of the data and models underlying EPA's significant regulatory actions and influential scientific information, which will further advance EPA's mission.

As explained in III.E, the final rule adopts a weighting approach to considering data availability and not the categorical exclusion presented as an option in the proposal and supplemental proposal. This procedural rule does not interpret or apply provisions of the statutes that it administers. EPA has explained that this rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. If implementing this procedural rule will result in a conflict with an environmental statute that EPA administers, then this procedural rule will yield.

Moreover, EPA plans to issue statute-specific transparency regulations or programmatic regulations. See the final rule preamble at III.A. EPA will conduct any necessary conflict analyses as appropriate when EPA develops those subsequent rulemakings.

Regarding the HONEST Act, see response to Comment 1370-4426.

Comment [4829-2022]: Commenter (4840) asserts that under the provisions of the APA, the EPA administrator does not have the authority to refuse to consider any comment submitted to the agency. If she or he thinks it is not valid, inaccurate, or inapplicable, she or he must explain why. Under the APA, submissions, including scientific studies, cannot arbitrarily or capriciously be discarded because the underlying data are not provided. When I was OSHA Administrator, we wanted to protect the integrity of the science used in setting regulations, so we explored asking for conflict-of-interest disclosures, similar to those requested by every leading scientific journal. Our legal experts determined that we could request this disclosure, but we could not reject submissions that failed to include them. This is a comparable situation – rejecting submitted studies because the underlying data are not available is prohibited under the APA.

Response: As explained in the final rule preamble at III.E, the final rule adopts a weighting approach to considering data availability and not the categorical exclusion presented as an option in the proposal and supplemental proposal.

This procedural rule does not interpret or apply provisions of the statutes that it administers. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. If implementing this procedural rule will result in a conflict with an environmental statute that EPA administers, then this procedural rule will yield.

Comment [4838-4075]: Commenter (4879) contends that first, the proposal is too vague as written to provide the public with a meaningful opportunity to comment.

The Proposed Rule lacks credible specificity and is overly vague in its terms and scope. Under the APA, EPA is required to articulate the specifics of its proposed rulemakings in a manner that provides a valid opportunity for public comment.

In this proposal, however, the commenter states that the EPA solicits comment across a long list of topic areas but fails to provide the Agency's own "sufficient detail and rationale" [APA § 553(b)(3)] on the solicited comment areas. The commenter asserts that they are left in the position of speculating on EPA's views and on those of other commenters that would presumably shape EPA's final rule. It is well settled law that this approach fails to provide adequate notice for informed public comment.

Response: See response to Comment 2157-149.

Comment [5011-2648]: Commenter (5022) contends that the proposal will not meet its purported scientific goals and will instead undermine the scientific basis for decision-making by the agency. Since its inception, EPA has developed rules with demonstrable efficacy in protecting the public by relying in large part upon the kinds of data that EPA would now preclude from consideration. Some of EPA's greatest public health accomplishments, such as eliminating lead in gasoline and classifying secondhand smoke as a cause of cancer (which led to banning smoking from indoor public places), were based on the kinds of data that would be discarded under the proposal. Such data are widely used in rulemaking proceedings by other U.S. government agencies and around the world.

Response: See response to comment 4577-332.

Comment [5153-4078]: Commenter (5164) provides that in an April 23, 2018 letter submitted by 985 scientists and technical experts, the scientists and technical experts say:

As scientists and technical experts, we urge you to cease any plans to restrict the types of science that the EPA can use in regulatory decision-making. EPA can only adequately protect our air and water and keep us safe from harmful chemicals if it takes full advantage of the wealth of scientific research that is available to the agency.

The commenter notes that an electronic copy of the letter is attached to their letter and that the letter can also be found at: https://www.eenews.net/assets/2018/04/27/document_gw_01.pdf

By itself, the commenter states that the attached letter constitutes legally sufficient evidence to compel the conclusion that the proposed rule must be rejected as bad for the environment. In addition, the letter provides more than sufficient evidence that adoption of the proposed rule without careful and public consideration of the letter constitutes arbitrary and capricious action violating the APA.

Response: See response to Comment 4829-2022.

Comment [5985-4089]: Commenter (5995) states that both individually and as editors, the editors of InternationalMosaic.com object to the proposal to limit the use of scientific evidence

in rulemaking proceedings. The proposal has generated a maelstrom of critical comments. See, e.g., https://www.eenews.net/assets/2018/04/27/document_gw_01.pdf (letter of 985 scientists and experts); Indeed, on August 2, 2018, at 11:00 a.m., PST, the www.regulations.gov site reported that 219,818 public comments had been logged in. <https://www.regulations.gov/docket?D=EPA-HQ-OA-2018-0259>

The commenter adds that, as explained in their previous comments, there is a wealth of scientific evidence that compels the conclusion that the proposed rule should be rejected as bad for the environment. In addition, the commenter claims that the adoption of the proposed rule would constitute arbitrary and capricious action violating the APA.

Response: See response to Comment 4829-2022.

Comment [6099-568]: Commenter (6109) states that the proposed rule is likely to run afoul of the APA. The commenter provides that the APA requires agencies to consider and respond to all information presented to it pursuant to a rule making. In an April 24, 2018 letter to Administrator Pruitt, members of the U.S. Senate Environment and Public Works Committee write, "Were a comment that contained scientific information that the proposed new policy would exclude from consideration to be submitted as part of a rulemaking, the APA would require that you consider it, setting up a direct conflict between the APA and the proposed new policy."

Response: See response to Comment 4829-2022.

Comment [6106-3183]: Commenter (6116) notes that while EPA states that the new rule would be applied prospectively, it notes that the rule could impact prior records for prior, older rules that are subject to recurring updates and reviews, such as the NAAQS. The new rule does not point to any basis in law or fact to question the validity and rationality of prior EPA rulemakings, such as NAAQS, and thus, it would be improper and contrary to the APA for EPA to reopen prior regulations for review based on the specious, unsupported claim that there were fundamental, substantive issues due to alleged lack of transparency in past scientific studies. Without specific evidence, particular findings, and robust legal analysis regarding individualized federal agency decisions, it is wholly unorthodox and legally suspect for EPA to issue a new regulation based on blanket assertions of a generalized, non-specific nature.

Response: The rule does not apply retrospectively to EPA regulations.

Comment [6112-1641]: Commenter (6137) states that not only is EPA's Proposed Rule unlawful both substantively and procedurally, but it is also impermissibly arbitrary. Indeed, according to the commenter, the Proposed Rule is the epitome of arbitrary rulemaking: in crafting the rule, EPA relie[s] on factors which Congress has not intended it to consider, entirely fail[s] to consider an important aspect of the problem, offer[s] an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.

State Farm, 463 U.S. at 43 (defining "arbitrary and capricious" agency action). EPA wholly fails to "examine the relevant data and articulate a satisfactory explanation for its action including a

‘rational connection between the facts found and the choice made.’” Id. (quoting *Burlington Truck Lines v. United States*, 371 U.S. 156, 168 (1962)). To the contrary, as described below, EPA has mischaracterized its prior policy, relied on authorities that undermine its reasoning and conclusions, failed to adequately account for the Proposed Rule’s costs and benefits, granted itself unfettered discretion to decide whether and how the Rule will apply, and created an unjustified inequity between what science can be used to support a decision not to regulate dangerous chemicals as compared to what can be used to support a decision to regulate. For all of these reasons, the Proposed Rule cannot stand.

Response: The differential is based on whether a regulatory action is significant under Executive Order 12866. The designation of a rule as a significant regulatory action has been a long-standing practice by the Federal Government to identify those regulations that have the potential to have the greatest impact on the American public.

Comment [6112-2497]: Commenter (6137) states that under the terms of the Proposed Rule, EPA must ensure that underlying data is publicly available only “[w]hen promulgating significant regulatory actions.” 83 Fed. Reg. at 18,773 (proposed to be codified as 40 C.F.R. § 30.5). But as defined in the Proposed Rule, a significant regulatory action refers only to the promulgation of a new rule or regulation.¹²⁵⁰ Accordingly, as written, the Proposed Rule arguably allows EPA to utilize non-public studies or studies that rely on non-public data to justify a decision not to regulate at all. This creates a lopsided and inequitable playing field whereby EPA can rely upon studies that it prohibits others to use when it decides not to issue a new regulation.

An example highlights the dangerousness of this inequity. Under TSCA, many provisions involve go/no-go decisions about whether to promulgate regulations at all. Thus, upon consideration of whether to regulate a chemical, EPA could arguably utilize non-public studies or studies that rely on non-public data to justify a decision not to regulate. For example, EPA could use non-public data to justify a finding that a chemical does not pose an unreasonable risk to health or the environment under Section 2605 and thus does not require regulation. Pursuant to the definitions in the Proposed Rule, such a decision does not qualify as a significant regulatory action, because a finding of no unreasonable risk does not trigger any new rule or regulation. By contrast, EPA would not be able to rely on non-public studies or studies that rely on non-public data to justify a decision to regulate a chemical.

The Proposed Rule thus creates a regulatory regime in which EPA can consider science based on non-public data if it shows that a chemical is not harmful (or minimizes the harmful effects of a chemical) and supports not regulating the chemical, but cannot consider science that shows that a chemical has harmful effects if it is similarly based on non-public data but supports a decision to

¹²⁵⁰ In the Proposed Rule, a significant regulatory action means “final regulations determined to be ‘significant regulatory actions’ by the Office of Management and Budget pursuant to Executive Order 12866.” 83 Fed. Reg. at 18,773 (proposed to be codified as 40 C.F.R. § 30.2). In turn, Executive Order 12,866 defines a significant regulatory action, in relevant part, as “any regulatory action that is likely to result in a rule that may: (1) Have an annual effect on the economy of \$100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities; (2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency . . .” Exec. Order 12,866, 58 Fed. Reg. 51,735 (emphasis added).

regulate the chemical. EPA has not, and indeed cannot, provide any explanation or basis for this differential treatment. For this reason, too, the Proposed Rule is arbitrary and capricious and cannot stand.

Equally problematic, the Proposed Rule could lead to absurd results. For example, when determining whether a chemical poses an unreasonable risk of harm under TSCA, EPA has to consider all relevant scientific studies. If EPA finds that a chemical poses an unreasonable risk and that it must issue a regulation on that basis, the Proposed Rule mandates exclusion of studies based on non-public data from consideration, even if those same studies provide the basis for the unreasonable risk finding. Absent these particular studies, the remaining research may show no unreasonable risk of harm, obviating the need for regulation, and in turn, eliminating the Proposed Rule's requirement that EPA not consider the excluded studies. Instead, when determining no unreasonable risk of harm, EPA must consider the excluded studies because such a finding does not result in a significant regulatory action and thus the Proposed Rule's ban on non-public data would not apply. But because the excluded study demonstrates that the chemical is unreasonably risky, EPA could not go forward with an unreasonable-risk determination. This could create an endless cycle of review and re-review with certain studies included, then excluded, and then included again ad infinitum. In such situations, application of the Proposed Rule creates a catch-22 in which EPA cannot make any determination that complies with both the APA's requirement of reasoned decision-making and the requirements of the Proposed Rule.

The commenter contends that these flaws would plague any decision made under any provision of the statute in which EPA is required to choose between issuing or not issuing a regulation and, therefore, renders the Proposed Rule arbitrary and capricious. See e.g. 15 U.S.C. § 2603(a) (EPA must require testing if it finds that a chemical “may present an unreasonable risk”)

Response: See response to Comment 4829-2022.

Comment [6112-2867]: Commenter (6137) states that the EPA's Proposed Rule requires the Agency to “give explicit consideration to high quality studies that explore . . . various threshold models across the dose or exposure range[.]” 83 Fed. Reg. at 18,774 (proposed 40 CFR § 30.6). A “threshold” is a dose or exposure “below which effects do not occur or are extremely unlikely.”¹²⁵¹ A “threshold model” – a type of “non-linear” model¹²⁵² – is a dose-response model in which there is no response below the threshold dose or exposure.¹²⁵³ According to the commenter, the EPA's proposed prioritization of threshold models is arbitrary, for at least three reasons.

First, EPA provides no evidence to justify the proposed requirement that it consider threshold models in dose-response assessments. EPA baldly asserts that “there is growing empirical

¹²⁵¹ National Research Council, Science and Decisions: Advancing Risk Assessment at 128 (2009), <https://www.nap.edu/catalog/12209/science-and-decisions-advancing-risk-assessment>.

¹²⁵² EPA uses the terms “threshold” and “nonlinear” repeatedly but does not define them in the Proposed Rule. According to EPA Risk Assessment Guidelines, “the term ‘nonlinear’ refers to threshold models (which show no response over a range of low doses that include zero) and some nonthreshold models[.]” EPA, Guidelines for Carcinogen Risk Assessment at 1-11, n.3 (2005), https://www.epa.gov/sites/production/files/2013-09/documents/cancer_guidelines_final_3-25-05.pdf.

¹²⁵³ A threshold model “show[s] no response over a range of low doses that include zero[.]” Id.

evidence of non-linearity [i.e., a threshold¹²⁵⁴] in the concentration-response function for specific pollutants and health effects[,]” but provides not a single example or citation for this unsubstantiated claim.¹²⁵⁵ Id. at 18,770. By contrast, EPA has found strong empirical evidence of no-threshold concentration-response functions for lead and reduced IQ, and particulate matter and increased mortality, following extensive reviews of the relevant literature to inform the Agency’s national ambient air quality standards.¹²⁵⁶ EPA’s failure to provide any support for its claim is telling.

Second, the proposed requirement to consider threshold models ignores essential science, namely the approach to dose-response assessment recommended by the NAS in *Science and Decisions: Advancing Risk Assessment*. Historically, researchers applied no-threshold dose-response models to carcinogens and threshold models to non-carcinogens.¹²⁵⁷ But in *Science and Decisions*, NAS determined that, due to the variability in susceptibility and exposures to other chemicals (background exposures) within populations, the effects of non-carcinogens may lack thresholds in populations even when these effects have thresholds in certain individuals who are less susceptible and/or have lower background exposures.¹²⁵⁸ In other words, thresholds vary by individual; for some, effects have high thresholds, while for others, effects have practically no threshold due to increased susceptibility or background exposures,¹²⁵⁹ and this latter group may develop disease when a population is exposed, even at very low levels.¹²⁶⁰ Based on these findings, NAS concluded that no-threshold models should be applied to both carcinogens and non-carcinogens unless reliable data affirmatively support a threshold model based on detailed assessments of mode of action (how a chemical causes disease), susceptibility, and background exposures.¹²⁶¹ EPA’s Proposed Rule entirely ignores *Science and Decisions*, its recommended approach to dose-response assessment, and the need for a detailed assessment before concluding that a threshold model is appropriate.

The commenter states that “explicit consideration” of “studies that explore . . . various threshold models” required under the Proposed Rule does not qualify as a “detailed assessment” of the type recommended by NAS. While NAS recommends consideration of the available data on mode of action, susceptibility, and background exposure before deciding whether dose-response

¹²⁵⁴ EPA appears to use the terms “non-linearity” and “threshold” interchangeably. If so, then EPA has asserted that there is growing evidence of thresholds in unspecified concentration-response functions but has failed to provide a supporting example or citation. If not, then EPA has not even asserted that there is growing evidence of such thresholds and has failed to state, let alone support, any scientific rationale for the proposed requirement to give explicit consideration to studies that explore threshold models.

¹²⁵⁵ A “concentration-response function” is a dose-response model in which the “dose” is the concentration of an air pollutant.

¹²⁵⁶ EPA, Integrated Science Assessment for Lead at lxxxviii (2013), http://ofmpub.epa.gov/eims/eimscomm.getfile?p_download_id=518908 (“[T]here is no evidence of a threshold below which there are no harmful effects on cognition from [lead] exposure.”). EPA, Integrated Science Assessment for Particulate Matter at 2-25 (Dec. 2009), http://ofmpub.epa.gov/eims/eimscomm.getfile?p_download_id=494959 (“Overall, the studies evaluated further support the use of a no-threshold log-linear model[.]”).

¹²⁵⁷ NAS, *Science and Decisions*, supra n.110, at 127-128.

¹²⁵⁸ Id. at 131.

¹²⁵⁹ See id.

¹²⁶⁰ See id.

¹²⁶¹ See id. at 148.

models are appropriate,¹²⁶² the Proposed Rule requires consideration of threshold models regardless of this data. EPA provides no justification for ignoring NAS' researched approach to dose-response data.

Third, EPA's proposed requirement also disregards the Agency's own Guidelines for Carcinogen Risk Assessment, which expressly state that, in cancer risk assessments, no threshold should be assumed unless the mode of action is known and the chemical does not cause cancer by inducing DNA mutations that initiate tumor development.¹²⁶³ Like *Science and Decisions*, the *Cancer Guidelines* state that it is necessary to assess mode of action to determine whether a threshold or no-threshold model is appropriate.¹²⁶⁴ EPA has historically followed this approach to ensure that its cancer risk assessments are adequately health protective.¹²⁶⁵ The Proposed Rule breaks from this prior practice and instead disregards science that the *Cancer Guidelines* say should be considered. EPA's reversal of longstanding policy is unjustified and arbitrary and should not be permitted.

Response: This rule is not being finalized as proposed. This rule does not apply to dose-response models.

Comment [6112-3062]: Commenter (6137) argues that the Proposed Rule is arbitrary and capricious because its standardless provisions give EPA unfettered discretion in deciding whether and how the Rule applies. It has long been held that regulations must contain "narrow, objective, and definite standards to guide the [decision-making] authority," . . . thereby to guard against the danger of arbitrary action." *United States v. Abney*, 534 F.2d 984, 986 (D.C. Cir. 1976) (quoting *Shuttlesworth v. City of Birmingham, Ala.*, 394 U.S. 147, 149 (1969)). "When administrators provide a framework for principled decision-making" by "articulat[ing] the standards and principles that govern their discretionary decisions in as much detail as possible," "the result will be to . . . enhanc[e] the integrity of the administrative process." *Env'tl. Def. Fund, Inc. v. Ruckelshaus*, 439 F.2d 584, 598 (D.C. Cir. 1971). But where a regulation is "wholly silent as to what factors the agency is to consider in granting exceptions . . . [a]gency discretion is unfettered," and the regulation is "arbitrary, capricious and contrary to law." *Nat. Res. Def. Council, Inc. v. EPA*, 863 F.2d 1420, 1432 (9th Cir. 1988).

The commenter states that the EPA's Proposed Rule lacks the requisite standards and principles that are the hallmark of lawful agency decision-making. The vague definitions proposed in 40 C.F.R. § 30.2 invite limitless agency discretion to decide when the Rule's requirements apply. For example, the Proposed Rule defines "regulatory science" as "scientific information . . . that provide the basis for EPA final significant regulatory decisions." 83 Fed. Reg. at 18,773. But this definition lacks any discernible meaning. There is no standard or definition for determining when scientific information does or does not "provide the basis" for a regulatory decision, nor are there

¹²⁶² *Id.* The sequence of steps recommended by NAS, including the assessment of mode of action, susceptibility of vulnerable populations, and background exposure before model selection is depicted by Figure 5-8. *Id.* at 144.

¹²⁶³ Specifically, the Guidelines say that a linear model is used as a default approach unless these conditions apply. See EPA, Guidelines for Carcinogen Risk Assessment, *supra* n.111, at 3-21. A linear model, known more fully as a low-dose-linear model, is a model "whose slope is greater than zero at a dose of zero[.]" which implies no threshold. *Id.* at 1-11, n.3.

¹²⁶⁴ *Id.* at 3-21.

¹²⁶⁵ *Id.*

any standards or definitions for what subset of “regulatory decisions” should be deemed “significant.” Likewise, the Proposed Rule defines “pivotal regulatory science” as studies that “drive the requirements and/or quantitative analysis” of EPA’s action, *id.*, but this too lacks any understandable meaning. There is no standard governing what science does or does not “drive” the regulatory action. The lack of regulatory standards here means that EPA staff will impermissibly determine applicability of the rule “based upon their own unwritten personal standards.” *White v. Roughton*, 530 F.2d 750, 754 (7th Cir. 1976).

In contrast to the definitions of proposed section 30.2 – which lack any meaning or standards at all – proposed section 30.9 provides a veritable grab bag of reasons the Administrator may use in his discretion to decide when not to apply the Rule. It allows the Administrator to grant a case-by-case exemption to the Rule’s requirements if the Administrator determines it is not “feasible” to ensure that data may be made publicly available “in a manner sufficient for independent validation, in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security.” 83 Fed. Reg. at 18,774. It also authorizes the Administrator to exempt application of the Rule if it is not “feasible” to conduct peer review for the multiple reasons outlined in OMB guidance. *Id.* Here, the many vague and discretionary “exception[s] . . . threaten[] to swallow the rule,” *Nat. Res. Def. Council, Inc.*, 863 F.2d at 1432, empowering the Administrator to pick and choose the preferred scientific studies he wants considered or excluded from consideration in any given rulemaking procedure with no clear standards or principles to keep this discretion in check.

Proposed sections 30.2 and 30.9 thus give EPA unfettered discretion to be a case-by-case arbiter of scientific information, without notice-and-comment, any oversight, or any stated standards or principles limiting this discretion. These provisions allow for arbitrary application of the Rule, rendering the Proposed Rule arbitrary and thus unlawful.

Response: EPA disagrees with the commenter’s contention that there are not standards or definitions for what subset of “regulatory decisions” should be deemed “significant.” EPA has defined significant regulatory actions as those determined to be “significant regulatory actions” by the OMB pursuant to Executive Order 12866. That determination is made for every rule EPA proposes and finalizes. The criteria for the determination are listed in the Executive Order.

As to “drive,” as EPA states in the preamble in Section III.E, those studies that are integral to characterizing dose-response relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information

EPA notes that the Administrator exemption is now contained in section 30.7 of the final rule. In granting an exemption to the final rule’s procedural requirements, the Administrator must apply specifically enumerated standards and provide a justification for the Administrator’s decision. The final rule outlines the standards to be applied and imposes a process for documenting an exemption decision precisely to ensure that section 30.7 will not be applied in an arbitrary or capricious manner.

Comment [6112-4452]: Commenter (6137) states that in the preamble to the Proposed Rule, EPA states – with no evidence or justification – that “the benefits of this proposed rule justify the costs.” 83 Fed. Reg. at 18,772. This conclusory statement is the very definition of arbitrary and capricious. *State Farm*, 463 U.S. at 42-43. EPA provides no evidence of what it considered to reach this statement, much less why its conclusion is rational. Indeed, EPA provides no information at all about what the “benefits” or “costs” of the Proposed Rule are, or what it evaluated to reach its conclusion. There is simply nothing in the record to support EPA’s conclusory statement.

Despite the lack of evidence in the regulatory docket, as these and other comments make clear, the costs of this Proposed Rule are far-reaching and substantial, while EPA has failed to identify any alleged benefits at all, other than vague and unsupported references to improved transparency. EPA’s Proposal to undermine, exclude, and ignore important and relevant health science in rulemaking proceedings will have serious implications on public health, privacy, the environment, and the judicial review process, and thus the costs will be significant. EPA cannot ignore these harms in its cost-benefit analysis,¹²⁶⁶ even if the costs are not readily quantifiable. See, e.g., *Michigan v. EPA*, 135 S. Ct. 2699, 2707 (2015) (costs include “harms that regulation might do to human health or the environment”); Executive Order 12,866, 58 Fed. Reg. 51,735, 51,735 (Oct. 4, 1993) (it is “essential to consider” the “qualitative measures of costs and benefits that are difficult to quantify”); see also Food Labeling: Nutrition Labeling of Standard Menu Items in restaurants and Similar Retail Food Establishments; Extension of Compliance Date; Request for Comments, 82 Fed. Reg. 20,825, 20,828 (May 4, 2017) (acknowledging that delaying a nutrition labeling requirement would lead to millions of dollars in lost health benefits). Yet the commenter states that there is no evidence that EPA evaluated any of these adverse impacts, quantitatively or qualitatively.¹²⁶⁷ Moreover, EPA itself estimated that the economic cost of this type of restriction on science would cost “considerably more” than \$250 million.¹²⁶⁸

¹²⁶⁶ Not only does EPA provide no support for its claim that the benefits justify the costs for this Proposed Rule, but it likewise failed to follow the procedures ordinarily used to obtain confirmation of its cost benefit analysis. In fact, EPA entirely sidestepped the procedures set forth in Executive Order 12,866 pursuant to which the Office of Information and Regulatory Affairs reviews regulatory actions to ensure the Agency’s analysis of costs and benefits is accurate, to provide time for interagency review and stakeholder meetings, and to provide the agency with any necessary changes to the proposed rule. For this Proposed Rule, OIRA completed its review only four days after receiving it. And these four days fell over the weekend, meaning that OIRA spent roughly two working days reviewing a rule that will have significant and far-reaching consequences across multiple statutes.

¹²⁶⁷ Indeed, in a recent report on rulemakings related to health – the very type of rulemakings most impacted by the Proposed Rule – EPA and OMB quantified some of the benefits of various regulations that would be dramatically weakened under the new rule. See, e.g., OMB, 2017 Draft Report to Congress on the Benefits and Costs of Federal Regulations, https://www.whitehouse.gov/wpcontent/uploads/2017/12/draft_2017_cost_benefit_report.pdf; (URL No Longer Available) EPA, Benefits & Costs of the Clean Air Act from 1990 to 2020, the Second Prospective Study (Apr. 2011), <https://www.epa.gov/clean-air-act-overview/benefits-and-costs-clean-air-act-1990-2020-second-prospective-study>, https://www.epa.gov/sites/production/files/2015-07/documents/fullreport_rev_a.pdf. These recent studies show health rulemakings, particularly air rulemakings, create significant benefits (including health and protection of life, reductions in the need for health care and health care costs, as well as job creation, and other economic values in avoiding days lost at work and school) that are quantitatively larger and more qualitatively valuable than the costs of pollution controls or other economic costs of the regulations.

¹²⁶⁸ EPA, CBO Questions for EPA Regarding H.R. xxxx, the HONEST Act of 2017 at 1, 2, 8, 10 (2017), <https://www.scribd.com/document/344731162/EPA-analysis-of-Honest-Act-to-CBO>.

Response: This rule exclusively governs internal EPA procedures and does not regulate any entity outside of the agency. The final rule preamble discusses potential costs and benefits to EPA at Section III.J.

Comment [6116-1119]: Commenter (6141) urges EPA to adopt clear, even-handed, and effective rules that are consistent with the objectives and principles enunciated in the APA as well as well-established federal administrative policies for good government. Notably, APA establishes rules for how federal agencies may develop and issue regulations. These rules include explicit requirements for all federal agencies to ensure that the public has meaningful opportunity to comment on proposed rules or other binding regulatory obligations. In effect, the APA rules direct EPA to disclose to the public the legal and technical bases for its binding regulatory actions and to rationally execute and adequately explain EPA's rationale for those final actions.¹²⁶⁹

Response: See response to Comment 2157-149.

Comment [6119-1361]: Commenter (6144) states that, while EPA does not cite the APA as a source of its authority, this proposal would be violating the law because the agency would be arbitrarily and capriciously selecting which information to use in decision-making. Furthermore, under the APA, agencies are required to consider and respond to all information presented in the docket. If EPA chooses to ignore a portion of this evidence because it cannot access or publicize the dose response data, models, and codes, such action would be on its face arbitrary and capricious.

Response: See responses to Comments 2157-149 and 4829-2022.

Comment [6152-3754]: Commenter (6122) notes that the response from mentioned journals correctly pointed out that the proposed rule limits the science that could be used in decision-making and that peer reviewed science that has already been scrutinized by the scientific community should be used in making life or death decisions on environmental regulations: "it does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them: rather, it is paramount that the full suite of relevant science vetted through peer review, which includes more rigorous features, inform the landscape of decision making."¹²⁷⁰

The commenters state that ignoring peer-reviewed studies because they are unable to publish data or because it is not reproducible is arbitrary and capricious. Many public health studies — including those focusing on acute environmental impacts — are not reproducible because reproducing them would require intentional, unethical exposure of toxins on human beings, other living beings, or the environment.¹²⁷¹ This is not a limitation, nor does it discount the importance and reliability of those studies. By deliberate design, the proposed rule would have EPA ignore

¹²⁶⁹ See Section 553 of the APA (generally requiring a federal agency to provide public notice and an opportunity for comment on any proposed rule, which is broadly defined to encompass any agency rule or action imposing a binding requirement on what regulated entities must do in the future).

¹²⁷⁰ *Id.*

¹²⁷¹ Letter from scientists to Scott Pruitt: <https://s3.amazonaws.com/ucs-documents/science-and-democracy/secret-science-letter-4-23-2018.pdf>.

some of the most rigorous, long-term, peer-reviewed studies conducted by leading independent researchers. For example, a recent study found that for children younger than age two even extremely short exposure to soot particles, like those created by burning fossil fuels such as coal oil and natural gas, increases the kinds of respiratory infections that are a leading cause of sickness and death.¹²⁷² This is the kind of study the EPA would ignore because undisclosed data would include the identities and health histories of the nearly 150,000 people in the study. Furthermore, HIPAA correctly makes it illegal for the researchers to release this kind of personal health information.

Response: See response to Comment 4829-2022.

Comment [6155-645]: Commenter (6125) states that EPA programs do not differ among each other in how they treat the desirability of making raw data available in the consideration of relevant science and research. If some EPA programs need the changes that EPA has proposed, then they all do. Indeed, much of the justification in EPA's preamble reads as though the proposal would in fact apply to all EPA regulatory decisions.

The specific discussion from the proposal begins:

The best available science must serve as the foundation of EPA's regulatory actions. Enhancing the transparency and validity of the scientific information relied upon by EPA strengthens the integrity of EPA's regulatory actions and its obligation to ensure the Agency is not arbitrary in its conclusions. By better informing the public, the Agency in (sic) enhancing the public's ability to understand and meaningfully participate in the regulatory process. In applying the best available science to its regulatory decision-making, EPA must comply with federal transparency and data integrity laws and must also ensure that its decision-making is marked by independence, objectivity, transparency, clarity, and reproducibility. 83 Fed. Reg. at 18769 [footnotes omitted]

One would think from this language that the proposal applies to all EPA regulatory activities under all of the statutes listed in the proposal. And indeed, to the extent that EPA's purported concerns have validity, the proposal should so apply. But it does not. In fact, EPA states that it applies only to "major rules" and, by a serendipitous and unexplained coincidence, does not apply to many types of decisions where industry is seeking a benefit from the government. Specifically, it does not apply to air or water permits for major industrial facilities, to standards for hazardous waste cleanups, to registration or reregistration of pesticides, or the setting of tolerances for pesticide residues on food, or to the approval for market of new chemicals. Such differential application is itself arbitrary. See *American Trucking Ass'ns v. EPA*, 175 F. 3d 1027, 1052-53 (agency arbitrarily applied different criteria for considering certain studies). Any defensible EPA proposal would have to explain why the need for transparency is so compelling that it could support a drastic change in the decision-making standards for, "major regulatory actions," and yet so weak that it does not apply at all to a host of other EPA decisions, many of

¹²⁷² Horne, Benjamin D., et al. "Short-term Elevation of Fine Particulate Matter Air Pollution and Acute Lower Respiratory Infection." *American journal of respiratory and critical care medicine* ja (2018). <https://www.atsjournals.org/doi/abs/10.1164/rccm.201709-1883OC>.

which benefit industry directly and that collectively are probably far more important for protection of human health and the environment.

Response: This rule applies to significant regulatory actions, not simply to the subset of significant regulatory actions that are major rules. EPA plans to issue statute-specific transparency regulations or programmatic regulations. See the final rule preamble at Section III.A. The designation of a rule as a significant regulatory action has been a long-standing practice by the Federal Government to identify those regulations that have the potential to have the greatest impact on the American public.

Comment [6155-648]: Commenter (6125) states that the proposal on its face does not apply to other federal agencies or to states and tribes, (or for that matter, even to EPA outside of major rulemaking). But it does not acknowledge that this would mean two different federal definitions of science or address the potential confusion this would create.

In some cases, sister federal agencies have a formal role in EPA decision-making. Several provisions of the CWA require that EPA act “after consultation with appropriate Federal and State agencies and other interested persons.” E.g. CWA 304(a), 33 USC 1314(a) . See also CWA 104 (c) (providing for cooperation with HHS on research on the harmful effects of pollutants on health or welfare); SDWA 1412(d) (in proposing and promulgating regulations, EPA “shall consult with the Secretary”); CERCLA 104(i)(1),(2),(3),(10) (creating ATSDR with representatives from many federal agencies, including EPA reporting to the Surgeon General, to examine, summarize, and interpret “available toxicological information and epidemiologic evaluations” of “hazardous substances”). Because the proposal does not acknowledge the existence of any such provisions, it does not explain how any such consultation will be affected. If EPA receives comments from agencies during rulemaking based on the best available science, would EPA examine the data underlying the comments to decide whether to disregard those comments? Would disregarding them result in a decision that is arbitrary for disregarding relevant information in the record? Or will it consider them, effectively overriding the terms of this proposal when it comes to science from other agencies? EPA has not attempted to explain how the different federal definitions of science would work, or even identified it as a source of potential problems for EPA or other agencies. According to the commenter, this is another instance of inadequate notice under the APA.

Response: The differential is due to a determination under Executive Order 12866. The designation of a rule as a significant regulatory action has been a long-standing practice by the Federal Government to identify those regulations that have the potential to have the greatest impact on the American public.

Regarding compliance with the APA, see response to Comment 2157-149. As discussed in the final rule preamble at Section III.A, EPA plans to issue statute-specific transparency regulations or programmatic regulations. EPA will address any statutory conflicts and potential implementation issues as appropriate when EPA develops these subsequent rulemakings.

Comment [6155-649]: Commenter (6125) states that the EPA’s proposal fails all of the general administrative law requirements to provide adequate notice and opportunity for informed public

comment. Indeed, this proposal ostensibly to support “transparency” in science is shrouded in so many vague generalities and so few specifics that any reader going beyond the introductory paragraph will learn next to nothing about the rule. As explained above, the proposal sends contradictory signals even about its substance--whether it is mandatory or hortatory, and whether a study that can be replicated but where the raw data is not available can be used. Compare the preamble summary (EPA “should” ensure that the data underlying its rulemaking is publicly available) and 30.4 (EPA “shall” identify the studies it is relying on and “should” make all such studies available to the public to the extent practicable) with 30.1 (rule “directs” EPA to ensure public availability) and 30.8 (authorizing exemptions). Compare 30.5 (information in a study is publicly available where it includes enough information to enable the public to “replicate” its findings) with Preamble note 3 (rule would “preclude” use of two studies that have been replicated). Assuming that such an incoherent, ambiguous, and self-contradictory proposal would even be possible to implement, it falls pathetically short of stating with the required detail and specificity the substance and basis of the agency action.

EPA proposes to adopt rules restricting its use of science under at least eight statutes. Yet, the entire support for that radical step is set forth in a proposal of 21 paragraphs (and 24 footnotes), 8 of the paragraphs of which are filled with thirty questions posed to commenters rather than a clear explanation of the purpose, legality, or implications of the proposal. The requested comments cover a wide array of topics, including such basic questions as how the proposal “can best be implemented” and the legal bases for EPA’s authority to issue the proposal. Providing answers to these questions is the responsibility of the agency, not the commenting public.

Ordinarily, an agency should fully understand how it proposes to answer those questions in order both to understand its rule, and to meet its legal obligation “to disclose to the public the bases for agency rules and to rationally execute and adequately explain agency actions.” That explanation should be included in the preamble, which can serve as a guide to interpreting the regulation. The commenter notes that the proposal does not do that and fails also to discuss how it will actually work under each of the eight statutes. It lists research and general rulemaking authorities under eight statutes but does not even identify any statutory requirements for science it might affect, much less the likely effects of those proposed changes to programs under the eight statutes. See *Connecticut Light & Power Co. v. Nuclear Regulatory Commission*, 673 F.2d 525, 530 (D.C.Cir.) (NPRM should provide an accurate picture of the agency's reasoning so that interested parties may comment meaningfully upon the agency's proposed rule). See *Billington v. Underwood*, 613 F.2d 91, 94 (5th Cir.1980) (“Such a statement must be sufficiently specific for it to enable an applicant to prepare rebuttal evidence to introduce at his hearing appearance.”) In that context, in which the principles are similar to those in rulemaking, the purposes of adequate notice, including having the opportunity to prepare for the hearing and rebut the agency's allegations, require that a statement of reasons include a brief description of the event including when it occurred, who was involved, and what provision was violated. See *id.*, see also *Edgecomb*, 824 F.Supp. at 314; *Driver*, 713 N.W.2d at 673.”); *Owner-Operator Independent Drivers Ass'n, Inc. v. Federal Motor Carrier Safety Admin.*, 494 F.3d 188, 209 (D.C Cir. 2007). It is certainly true that a notice can be “too general to be adequate.” *Small Refiner Lead Phase–Down Task Force*, 705 F.2d at 549.

Response: See responses to Comments 2157-147 and 4829-2022.

Comment [6155-668]: Commenter (6125) contends that there is neither a legal basis nor a need for this rule. It would require that EPA violate explicit statutory provisions and would undermine environmental protection and critical health protections the public has come to rely on. It unlawfully shifts the basis for deciding what science to use in rulemaking away from the statutory goals of scientific reliability and environmental protection to so-called transparency, a term not used in the relevant EPA statutory provisions. The proposal is brief, evasive, superficial and ambiguous, and provides far too little information to meet the legal requirement that the public must be alerted to its substance and basis in order to understand sufficiently to provide public feedback and ultimately to create a workable legal framework the public must be fully alerted to its substance and basis. In other words, according to the commenter, the proposal is unintelligible, unlawful, and unworkable. The commenter requests that EPA withdraw it.

Response: See responses to Comments 2157-147 and 4829-2022.

Comment [6155-958]: Commenter (6125) states that if commenters on a future proposed rule submit studies barred by this *per se* rule, will EPA refuse to consider them? Two other questions: What if the studies are submitted by a federal agency, either consulting or commenting on a rule, or a state, or a tribe? What would be the legal basis, under the relevant statute, for refusing to do so? If EPA will consider them at this stage of rule development, what is the argument for not considering them when framing EPA's proposal of that same rule? To provide adequate notice, an agency must of course disclose all underlying supporting data on which it relies. See e.g. *Chamber of Commerce v. SEC*, 443 F. 3d at 899; CAA Section 307 (d)(3) (A) and (B).

Here, EPA has included only an undifferentiated data dump of citations without identifying passages of particular relevance (e.g. footnotes. 9-12 [of comment letter]), or explaining references to policies of other federal agencies (e.g. 83 FR 18770).¹²⁷³ As explained above and in Appendix D [of the commenter's letter] most of these sources are either mischaracterized or provide no support for the proposal. But in any case, such undifferentiated references do not provide adequate notice of the agency's thinking or intentions. *Jackson v. Des Moines Mun. Housing Agency*, 2008 WL 10707693, at *4 (S.D.Iowa, 2008) states this clearly in the context of the necessity of giving individuals adequate information to prepare rebuttal evidence against the government ("This is incorrect, however, because even a citation that includes a statement of the general language of a regulation is not sufficient to provide adequate notice. 'Agency notice must describe the range of alternatives being considered with reasonable specificity[;][o]therwise, interested parties will not know what to comment on ' *Small Refiner Lead Phase-Down Task Force*, 705 F.2d at 549"). The commenter asserts that the proposal does not identify any alternatives it may be considering, much less discuss them.

Response: See responses to Comments 2157-147 and 4829-2022.

Comment [6155-2153]: Commenter (6125) states that instead of acknowledging and discussing the implications of having two definitions of science, one of them applicable only to major rulemaking, the proposal simply takes the major rule limitation as a given, offering no

¹²⁷³ The regulatory docket is likewise devoid of meaningful information, consisting of a handful of executive orders and copies of the OMB Data Quality Act Guidelines and related Guidance (which, ironically, specifically endorse the Harvard Six Cities study as satisfying all criteria for transparency).

explanation to support it and then asks the public to comment on the scope of the rule, giving no indication of what approach EPA plans to take [or of whether the new definition of science should be applied more universally]. The rule effectively proposes two different definitions of science for purposes of agency decision-making, one for major rules and the other for everything else; in other words there would be two different EPA definitions of science for actions addressing the same subject, the risk from the conduct, under the same statute. According to the commenter, this is the very definition of arbitrary.

Response: The differential is due to a determination under Executive Order 12866. The designation of a rule as a significant regulatory action has been a long-standing practice by the Federal Government to identify those regulations that have the potential to have the greatest impact on the American public.

Comment [6155-2485]: Commenter (6125) states that instead of acknowledging and discussing the implications of having two definitions of science, one of them applicable only to major rulemaking, the proposal simply takes the major rule limitation as a given, offering no explanation to support it and then asks the public to comment on the scope of the rule, giving no indication of what approach EPA plans to take [or of whether the new definition of science should be applied more universally]. The commenter suggests that the rule effectively proposes two different definitions of science for purposes of agency decision-making, one for major rules and the other for everything else; in other words there would be two different EPA definitions of science for actions addressing the same subject, the risk from the conduct, under the same statute. This is the very definition of arbitrary.

Response: The differential is due to a determination under Executive Order 12866. The designation of a rule as a significant regulatory action has been a long-standing practice by the Federal Government to identify those regulations that have the potential to have the greatest impact on the American public. Further, this rule applies to significant regulatory actions, not only the subset of significant regulatory actions that are designated as major rules.

Comment [6155-2602]: Commenter (6125) suggests that since no reasonable argument can be made that the proposal is legally required, the only possible theory upon which the rule itself and its categorical nature might be justified is as an exercise of the agency's discretionary authority to implement particular statutory provisions.

The commenter provides that their comments explore the defects of EPA's proposal that are probably common to all the statutory provisions it would affect. The commenter states that they do this with the significant handicap of being forced to comment on a very spare, uninformative proposal rather than the more detailed proposal that the law requires, particularly when a proposal would make such far-reaching changes as this one envisions.

We begin by addressing the relevant legal principles.

EPA has completely failed to follow well-established principles establishing the legal need for reasoned agency decision-making generally, and in particular for any change to a prior position.

To comply with these requirements, an agency must, among other things:

- Explain why the agency is rejecting policy judgments or factual determinations underlying the prior rule or position.¹²⁷⁴
- Provide a “reasoned explanation” for changing course;¹²⁷⁵
- Demonstrate that the new policy is itself consistent with the governing statute;¹²⁷⁶
- Ensure that the new policy is itself supported by the record, “based on consideration of the relevant factors,” and supported with “rational connection[s] between the facts found and the choice made”;¹²⁷⁷ and
- Consider relevant alternatives reflected in the prior rule’s record, in particular, alternatives most consistent with statutory goals and purposes, and explain why the agency is not adopting them in the new rule.¹²⁷⁸

The commenter contends that the proposal does not comply with any of these requirements.

Response: See responses to Comment 2157-149 and 4829-2022.

Comment [6155-3040]: Commenter (6125) states that given the total lack of justification for EPA’s affirmative proposal, it is of no legal significance that EPA proposes to grant itself the power to waive its per se bar. What EPA needs to justify are the cases in which the policy applies, not those cases where the exemption will be used to avoid it. Otherwise, studies might be subject to an illegal bar on use unless EPA saw fit to grant them an exemption that rested in its discretion.

It is well established that existence of a waiver or exemption mechanism cannot be used to justify a provision otherwise beyond an agency’s legal authority. *Dimension Financial Corp. v.*

¹²⁷⁴ *State Farm*, 463 U.S. at 51 (finding that NHTSA had arbitrarily failed to explain its rejection of option of requiring airbags despite its prior finding “that airbags are an effective and cost-beneficial life-saving technology”); *Pub. Citizen v. Steed*, 733 F.2d 93, 100 (D.C. Cir. 1984) (setting aside suspension of rule because NHTSA “failed to explain why alternatives, which the rulemaking record indicates were available to the agency, could not correct” the problem the agency relied on as a basis for suspending rule); *Int’l Ladies’ Garment Workers’ Union v. Donovan*, 722 F.2d 795, 816 (D.C. Cir. 1983) (agency impermissibly failed to consider alternatives to repeal “raised in [the] original notice and the comments”)

¹²⁷⁵ *State Farm*, 463 U.S. at 42. See also *AMB Onsite Services-West v. NLRB*, 849 F.3d 1137, 1146 (D.C. Cir. 2017) (“It is well-settled that NLRB . . . cannot ‘turn[] its back on its own precedent and policy without reasoned explanation.’”) (quoting *Dupuy v. NLRB*, 806 F.3d 556, 563 (D.C. Cir. 2015)); see *Public Citizen v. Steed*, 733 F.2d

Cir. 2004).

¹²⁷⁷ See *State Farm*, 463 U.S. at 43 (agency decision must be “‘based on a consideration of the relevant factors’” and agency cannot have “relied on factors which Congress has not intended it to consider”) (quoting *Burlington Truck Lines v. United States*, 371 U.S. 156, 168 (1962)); *Pub. Citizen v. Fed. Motor Carrier Safety Admin.*, 374 F.3d 1209, 1216 (D.C. Cir. 2004); 42 U.S.C. 7607(d)(9).

¹²⁷⁸ *State Farm*, 463 U.S. at 51 (finding that NHTSA had arbitrarily failed to explain its rejection of option of requiring airbags despite its prior finding “that airbags are an effective and cost-beneficial life-saving technology”); *Pub. Citizen v. Steed*, 733 F.2d 93, 100 (D.C. Cir. 1984) (setting aside suspension of rule because NHTSA “failed to explain why alternatives, which the rulemaking record indicates were available to the agency, could not correct” the problem the agency relied on as a basis for suspending rule); *Int’l Ladies’ Garment Workers’ Union v. Donovan*, 722 F.2d 795, 816 (D.C. Cir. 1983) (agency impermissibly failed to consider alternatives to repeal “raised in [the] original notice and the comments”).

Board of Governors of Federal Reserve System, 744 F.2d 1402, 1410 (10th Cir. 1984) (“The possible exception to the initial impact of Regulation Y (Part 225.21(B)(4)) contains requirements with no objective standard and thus unbounded agency discretion. This is a device to meet objections to the new regulation and cannot cure the exercise of powers denied by Congress or not provided for by Congress. *Public Utilities Comm. of Calif. v. United States*, 355 U.S. 534; 78 S.Ct. 446, 2 L.Ed.2d 470; *In re Surface Mining Regulation Litigation*, 627 F.2d 1346 (D.C.Cir.)”)

EPA moreover has failed to explain or seek comment on how it will administer the exemption provision. The provision itself gives EPA discretion by providing that it “may” allow exemptions in any case where “it is not feasible to ensure that all dose response data and models underlying pivotal regulatory science is publicly available in a manner sufficient for independent validation, in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security,” or where peer review is not feasible. Proposed section 30.9, 83 FR at 18774. Of course, if it were feasible in either case, there would be no need for an exemption. The proposal provides no standards or criteria for picking and choosing among exemption requests. That lack of standards or criteria is particularly

troubling because it could lead to arbitrary decision-making in a politically charged climate.

EPA has asked for comments on the general subject of when exemptions should be available but has provided no suggestions of its own on that subject. With no standards or criteria in the exemption discussion, there is evidently nothing to prevent the exemptions from being granted and withheld arbitrarily. Highly relevant and reliable studies for which data cannot be shared could still be excluded, no matter how authoritative the science might be, and even if it has been subject to peer review, multiple replications, a third-party reanalysis, and been approved for use in regulatory decisions and analyses by EPA’s external science advisors.¹²⁷⁹

Response: See responses to Comments 4829-2022 and 6112-4452.

Comment [6155-4298]: Commenter (6125) writes that given the basic purpose of EPA’s statute - - to authorize regulations to protect the public health and the environment -- one would expect EPA to consider those impacts before adopting a per se rule that could affect such decisions. At a minimum, EPA should identify the key studies that its proposal would bar that had been used to support regulations in the past and evaluate the impact of their loss on those regulations and thereby on human health and the environment.

Indeed, reasoned decision making requires an agency to identify and address the impact of its proposed actions on its ability to perform its Congressionally mandated functions, *State Farm*, 463 U.S. at 43, because the likely impacts of the proposal are a critical issue in deciding whether to proceed with the rule. Nevertheless, the proposal outright fails to consider any impacts at all — literally none at all! Failure to consider potential environmental impacts in a proposal that fundamentally affects each of EPA’s core statutory responsibilities is fatally arbitrary. See *Sierra Club v. Costle*, 657 F.2d 298, 326 (D.C. Cir. 1981) (“[W]e can think of no sensible interpretation

¹²⁷⁹ Note this is exactly the status of the Harvard Six City and American Cancer Society epidemiology studies noted above and discussed in Appendix B [of the commenter’s letter.

of the statutory words ‘best technological system’ which would not incorporate the amount of air pollution as a relevant factor.”) See also *N.L.R.B. v. Creative Food Design Ltd.*, 852 F.2d 1295, 1306 (D.C. Cir. 1988) (noting that agencies “may not ignore relevant factors” in making decisions); *Small Refiner Lead Phase-Down Task Force v. U.S.E.P.A.*, 705 F.2d 506, 521 (DC. Cir. 1983) (“Arbitrary and capricious” review generally refers to the requirement that an agency “must consider all the relevant factors” and reach a “reasonable” conclusion; *Sierra Club v. Costle*, 657 F.2d at 323.”); *Environmental Defense Fund, Inc. v. Costle*, 657 F.2d 275, 283 (DC Cir. 1981) (“Thus, we must be assured that the agency action was “based on a consideration of the relevant factors,” *Citizens to Preserve Overton Park, Inc. v. Volpe*, supra, 401 U.S. at 416, 91 S.Ct. at 823; and that “the agency has exercised a reasoned discretion, with reasons that do not deviate from or ignore the ascertainable legislative intent,” *Ethyl Corp. v. EPA*, supra, 541 F.2d at 35-36, quoting *Greater Boston Television Corp. v. F.C.C.*, 444 F.2d 841, 850 (1970), cert. denied, 403 U.S. 923, 91 S.Ct. 2229, 29 L.Ed.2d 701 (1971).)”)

Moreover, as in *CMA v. EPA*, 217 F. 3d 861, 865-66 (D.C. Cir 2000), EPA’s assertion of potential benefits without demonstrating their existence or providing any quantitative comparison of their value as compared to costs and disbenefits to public health is yet another clear indicator of arbitrariness and lack of support in the evidence before the agency. *Id.* (citing *State Farm*, 463 U.S. at 43).

The proposal provides no supporting analysis for the following implausible assertion:

EPA believes the benefits of this proposed rule justify the costs. The benefits of EPA ensuring that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation are that it will improve the data and scientific quality of the Agency’s actions and facilitate expanded data sharing and exploration of key data sets; this is consistent with the conclusions of the National Academies.

83 FR 18772. (emphasis added)

Not only is there no support provided for the assertion that the proposal will “improve the data and scientific quality of the agency’s actions,” but for all the reasons discussed above, it is simply not true, or perhaps more aptly, transparently false. The remaining section of the regulatory “analysis” is a particularly egregious sleight of hand:

The proposed rule directs EPA to make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making dose response models and data underlying pivotal regulatory science used in significant regulatory decisions available to the public in a manner sufficient for independent validation, consistent with law and protection of privacy, confidentiality, and national and homeland security. However, it does not compel the Agency to make that information available where it concludes after all such reasonable efforts that doing so in way that complies with the law and appropriate protections is not possible.

(emphasis added) Id.

While it is not flatly untrue that the proposal “does not compel” EPA to make the information available, it is worse than disingenuous not to mention also that unless the information is publicly available it cannot be used as a basis for the rulemaking decision unless EPA grants an exemption. See at 18770 n. 7.

EPA regulations have relied on assessing many thousands of health-related studies of pollutants done in the last five decades, including epidemiological, human clinical, and animal toxicology studies. The proposal would exclude many such studies solely because the underlying data are not available, often because of legal or ethical reasons. Even for controlled human and animal studies, where subject data might ethically be released, the underlying data may no longer be accessible years after publication. Without the information provided in excluded research studies it would no longer be possible to assess the full weight of the available scientific evidence – a key guiding principle for judging the scientific integrity of the decision-making process. Some of the most useful information regarding health effects comes from real world(epidemiological) and laboratory (clinical) studies of human subjects,¹²⁸⁰ in which detailed information regarding health, lifestyle, medical status, location, and more about participants can be collected.

In fact, as far as we can judge given the ambiguity of EPA’s proposal, the per se rule could call into question and potentially invalidate a vast range of currently existing EPA regulations. The proposal says nothing about what studies it will exclude, aside from those identified but not mentioned by name in footnote 3. Appendix C [of the commenter’s letter] provides some examples that we were able to pull together in the time available.

Even though limited by time and resources, our assessment shows the magnitude of the issue and the absolute need for EPA to address the potential damages to public health and the environment before any final action. To issue a valid rule, the commenter asserts that the EPA would have to analyze this issue on its own, including what studies the proposal will exclude, present the results for public comment, and explain why the benefits of the per se rule justified the public health sacrifice and regulatory confusion that it would cause.

Response: See responses to Comments 4829-2022 and 6112-4452.

Comment [6155-4391]: Commenter (6125) states that its cost impacts both on the agency and on reviewers; among other deficiencies, the proposal unhelpfully and tautologically states that costs will be low because EPA will “implement” the rule “in a manner that minimizes costs”

¹²⁸⁰ The primary ozone NAAQS provides further examples of the pernicious effects the proposal could have. Among the key controlled human exposure studies demonstrating that exposure to ozone causes adverse health effects in even healthy subjects at levels below the level of the then-current NAAQS are Adams (2006) and Schelegle (2009). See Policy Assessment for the Review of the Ozone National Ambient Air Quality Standards (EPA -452/R 14-006 (August 2014)) at pp. 3-27 and 4-10. These studies were sponsored by the American Petroleum Institute, which controls access to the underlying data. The American Petroleum Institute refused an EPA researcher access to the data of a related Adams study it sponsored (Adams (1998))#. See “First External Review Draft Integrated Science Assessment for Ozone and Related Photochemical Oxidants” (EPA/600/R-10/076A) at p. 6-7 n. 1. So not only would these evidently “useful” (CAA section 108 (a)(1)) studies be barred from consideration under the proposal, but the proposal creates a perverse incentive for industry to refuse access to study data.

(proposed section 30.8). There is no explanation of what specific types of costs may be incurred, much less how they will be minimized. According to the commenter, this type of vague and unsupported pronouncement does not provide an adequate basis for public comment; see *Chamber of Commerce v. SEC*, 443 F. 3d 890, 904-05 (D.C. Cir. 2006) (unsupported statement that costs of action are expected to be minimal does not provide adequate notice of agency's final actions relating to cost estimates).

Response: See response to Comment 6112-4452.

Comment [6163-1114]: Commenter (6133) states that as EPA is aware, when an agency drafts a proposed rule pursuant to congressionally delegated authority, the exercise of that authority is governed by the informal rulemaking procedures outlined in the APA, 5 U.S.C. § 553.5. EPA is required to provide the public with adequate notice of a proposed rule, followed by a meaningful opportunity to comment on the rule's content. 5 U.S.C. § 553 (b)-(c).

The requirement under § 553 to provide the public with adequate notice of a proposed rule is generally achieved through the publication of a NPRM in the *Federal Register*, and the APA requires that the notice of proposed rulemaking include “(1) the time, place, and nature of public rulemaking proceedings; (2) reference to the legal authority under which the rule is proposed; and (3) either the terms or substance of the proposed rule or a description of the subjects and issues involved.” 5 U.S.C. § 553(b)1-3. Generally speaking, the notice requirement of § 553 is satisfied when the agency “affords interested persons a reasonable and meaningful opportunity to participate in the rulemaking process.” *Forester v. Consumer Prod. Safety Comm’n*, 559 F.2d 774, 787 (D.C. Cir. 1977).

The Proposal fails to reference any other legal authority to support its adoption. The agency claims its Proposal is “consistent with” APA provisions to ensure public participation in the rulemaking process, 83 Fed. Reg. at 18,769/2, but this faint “consistent with” falls far short of any legal authority for the Proposal, or even any claim of such authority. The APA provides no authority for the Proposal and, tellingly, EPA does not and cannot identify any authority therein. Even were this “consistent with” claim an attempt by EPA to claim any legal authority for the Proposal, the throw-away statement fails to provide sufficient notice for the public to comment on the proposed rule or any asserted legal authority in the APA.

Finally, the Proposal's solicitation of comment—“on whether additional or alternative sources of authority are appropriate bases for this proposed regulation”—does not and cannot itself provide any justification for EPA finalizing a rule based on additional or alternative sources of legal authority. This fails to provide sufficient notice for the public to comment on the proposed rule or any other possible legal authorities. For all these reasons, the commenter asserts that the EPA lacks any basis to finalize a rule invoking any other legal authorities to support its adoption.

Response: See response to Comment 2157-149. EPA cites Reorganization Plan No. 3 of 1970, 84 Stat. 2086 (July 9, 1970), which created the EPA, as authority for this internal procedural rule. See Section I.C of the final rule preamble. As discussed in the final rule preamble at Section I.C and elsewhere in the response to comments document, EPA's Reorganization Plan conferred EPA with authority to promulgate regulations to govern its internal affairs. This authority is

equivalent to the Federal housekeeping authority provided to Executive departments in 5 U.S.C. § 301.

Comment [6163-1174]: Commenter (6133) states that the Proposal states that it is consistent “with the principles underlying the APA and programmatic statutes that EPA administers to disclose to the public the bases for agency rules and to rationally execute and adequately explain agency actions.” 83 Fed. Reg. at 18,769. In a footnote to this sentence the Proposal states:

EPA has the authority to establish policies governing its reliance on science in the administration of its regulatory functions. Historically, EPA has not consistently observed the policies underlying this Proposal, and courts have at times upheld EPA’s use nonpublic data in support of its regulatory actions. See *Coalition of Battery Recyclers Ass’n v. EPA*, 604 F.3d 613, 623 (D.C. Cir. 2010); *American Trucking Ass’ns v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002). EPA is proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions.

83 Fed. Reg. at 18,769 n.3.

EPA recognizes the cited cases contradict the proposed rule but attempts to waive them away and asserting it has discretionary authority to do the opposite of what the D.C. Circuit decided. EPA’s consideration of peer reviewed scientific studies that do not have public data is the norm, required by the APA and the programmatic statutes that EPA administers. See sections II, IV, & V. The proposed departure from this norm to preclude the use of such data, which the Proposal makes explicit in this footnote, is not within EPA’s discretion and would violate the programmatic statutes. As explained above, nothing the Proposal provides EPA with authority to do so. The Proposal’s citations to two cases that contradict its proposed actions does not support the unexplained assertion of authority.

The court in *American Trucking* stated:

More generally, we agree with EPA that requiring agencies to obtain and publicize the data underlying all studies on which they rely “would be impractical and unnecessary.” Particulate Matter NAAQS, 62 Fed. Reg. at 38,689. As EPA persuasively stated in denying Petitioners’ original request for the information:

If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment.... [S]uch data are often the property of scientific investigators and are often not readily available because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants].

Am. Trucking Associations, Inc., 283 F.3d at 372.

In *Coalition of Battery Recyclers*, the D.C. Circuit cited *American Trucking*, explaining that the court had “rejected the notion that EPA had improperly failed to obtain and make public data underlying studies on which it had relied during a NAAQS rulemaking, holding that ‘[t]he Clean Air Act imposes no such obligation’ and that ‘requiring agencies to obtain and publicize the data underlying all studies on which they rely would be impractical and unnecessary.’” 604 F.3d at 623 (citations omitted). The court noted “that raw data often is unavailable due to proprietary interests of a study’s scientific investigators or confidentiality agreements with study participants.” *Id.* The Proposal at least concedes that D.C. Circuit law does not support its actions. Yet, according to the commenter, EPA does not explain how the Proposal is consistent with the principles underlying the APA and programmatic statutes that EPA administers. To the extent EPA believes this to be true, it should withdraw the Proposal and explain its belief.

Response: See responses to Comments 2157-149 and 4829-2022. As discussed in the final rule preamble at III.A, EPA plans to issue statute-specific transparency regulations or programmatic regulations. EPA will address any statutory conflicts as appropriate when EPA develops these subsequent rulemakings.

Comment [6163-2726]: Commenter (6133) asserts that the Proposal unlawfully restricts EPA’s consideration and use of “dose response data and models that underlie” what the Proposal calls “pivotal regulatory science.” 83 Fed. Reg. at 18,770/2. The Proposal goes on to state:

Pivotal regulatory science’ is the studies, models, and analyses that drive the magnitude of the benefit-cost calculation, the level of a standard, or point-of-departure from which a reference value is calculated. In other words, they are critical to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, risks and other impacts on which a final regulation is based.

Id. By restricting EPA’s implementation of its federal organic statutes and the APA in this fashion, and by defining “pivotal regulatory science” in this manner, the Proposal violates federal laws. The Proposal does so by requiring EPA to implement federal laws based on the Proposal’s criteria and conception of “pivotal regulatory science,” rather than on the congressional criteria and requirements in federal statutes that contradict, disallow, or fail to include those criteria and concepts in the Proposal.

Response: See response to Comment 6163-1174.

Comment [6163-2871]: Commenter (6133) provides that in proposed § 30.6, EPA proposes to “evaluate the appropriateness of using default assumptions, including assumptions of a linear, no-threshold dose response, on a case-by-case basis.” 83 Fed. Reg. at 18,774. In proposed § 30.9, the Proposal grants the Administrator the ability to “grant an exemption to this subpart on a case-by-case basis if he or she determines that compliance is impracticable” for a number of enumerated reasons. The commenter contends that both of these provisions inject additional arbitrariness into the rule, in that they ensure that the Proposal may be applied unevenly—for certain rulemakings, the “rules” of the Proposal can be discarded or ignored where desired. This, in addition to and with other sections of the Proposal, underscores that it is arbitrary and capricious and must be withdrawn.

Response: EPA notes that it has finalized changes to proposed sections 30.6 and 30.9 (sections 30.5 and 30.7 in the final rule, respectively) in response to public comments raising similar issues. While sections 30.5 and 30.7 of the final rule allow EPA to make certain decisions on a “case-by-case basis,” both provisions require EPA to document and explain the basis and rationale for its decisions in the associated significant regulatory decision or influential scientific information. In addition, as finalized, section 30.7 governing the Administrator’s ability to grant exemptions outlines the specific circumstances under which the Administrator may use that mechanism.

Comment [6163-2934]: Commenter (6133) states that in the Proposal, EPA professes concern with transparency, clarity, and independence; using the best available information; making sure that information is replicable and verifiable, and ensuring the public is able to participate meaningfully in the regulatory process. The Proposal says this will help EPA carry out its mission in a manner the public can trust and understand:

The proposed regulation provides that, for the science pivotal to its significant regulatory actions, EPA will ensure that the data and models underlying the science is publicly available in a manner sufficient for validation and analysis.

83 Fed. Reg. at 18,769/1.

The best available science must serve as the foundation of EPA’s regulatory actions. Enhancing the transparency and validity of the scientific information relied upon by EPA strengthens the integrity of EPA’s regulatory actions and its obligation to ensure the Agency is not arbitrary in its conclusions. By better informing the public, the Agency in enhancing the public’s ability to understand and meaningfully participate in the regulatory process.

Id. at 18,769/2.

When EPA develops significant regulations using public resources, including regulations for which the public is likely to bear the cost of compliance, EPA should ensure that the data and models underlying scientific studies that are pivotal to the regulatory action are available to the public. This proposed rule is designed to increase transparency in the preparation, identification, and use of science in policymaking.

Id. at 18,769/3.

Regulatory determinations based on science should describe and document any assumptions and methods used and should address variability and uncertainty.

Id. at 18,770/2.

Pivotal regulatory science' is the studies, models, and analyses that drive the magnitude of the benefit-cost calculation, the level of a standard, or point-of-departure from which a reference value is calculated. In other words, they are critical to the calculation of a final

regulatory standard or level, or to the quantified costs, benefits, risks and other impacts on which a final regulation is based.

Id.

This [P]roposal will help ensure that EPA is pursuing its mission of protecting public health and the environment in a manner that the public can trust and understand.

Id. at 18,769/1.

In this section of our comments, we make the following points opposing the Proposal and supporting its withdrawal:

- First, the Proposal as written sweeps broadly to capture—and thereby to prohibit EPA from considering—studies, models, and analyses that are integral to the functioning of EPA regulatory programs, implementation of statutes like the CAA, and protection of public health and the environment. It is both destructive and unlawful for EPA to refuse or fail to consider these additional studies, models, and analyses. We discuss numerous examples below.
- Second, to the extent that the Proposal does capture one or more of the studies, models, or analyses below, the Proposal would require EPA to conduct independent peer review of these materials before considering or using them, or before continuing to make them available for public use and awareness. See 83 Fed. Reg. at 18,774 (proposed § 30.7). This is objectionable and absurd. It is also unlawful for the same reasons that the Proposal is unlawful, as detailed in these comments and others.
- Third, to the extent that EPA disagrees that one or more of these studies, models, and analyses are captured by the Proposal, continuing to consider these materials while prohibiting EPA from considering other materials would be arbitrary and capricious. This is because these studies, models and analyses have the same hallmarks as “pivotal regulatory science” that the Proposal would exclude, as discussed in greater detail below. We emphasize that we do not believe EPA should or that EPA may fail to consider these other studies, models, or data, for the reasons set forth in these comments. Rather, our point is that continuing to consider these materials demonstrates additionally that the Proposal is arbitrary, capricious, and an abuse of discretion.

The Proposal states that “[t]he provisions of this subpart apply to dose response data and models underlying pivotal regulatory science that are used to justify significant regulatory decisions regardless of the source of funding or identity of the party conducting the regulatory science.” 83 Fed. Reg. at 18,773/3 (proposed § 30.3). Next, the Proposal defines “dose response data and models” to mean:

the data and models used to characterize the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and the magnitude of a predicted health or environmental impact. Such functions typically underlie pivotal regulatory science that drives the size of benefit-cost calculations, the level of a standard,

and/or the points of departure from which reference values (reference doses or reference concentrations) are calculated.

Id. at 18,773/2 (proposed § 30.2). Then, the Proposal defines “pivotal regulatory science” to mean “the specific scientific studies or analyses that drive the requirements and/or quantitative analysis of EPA final significant regulatory decisions.” Id. Finally, the Proposal defines “regulatory science” to mean “scientific information, including assessments, models, criteria documents, and regulatory impact analyses, that provide the basis for EPA final significant regulatory decisions.” Id.

The Proposal either covers on its face, or appears to cover, examples of studies, models, and analyses that are integral to the functioning of EPA regulatory programs, implementation of statutes like the CAA, and protection of public health and the environment. The commenter states that it would be harmful, unlawful, arbitrary, and capricious, and an abuse of EPA’s discretion to include these materials within the sweep of the Proposal’s prohibitions.

Alternatively, according to the commenter, if EPA disagrees that the following examples are covered by the Proposal, then continuing to consider these materials that have the same hallmarks as the prohibited materials, and that raise the same issues and concerns that cause EPA to prohibit their consideration, demonstrates that the Proposal is arbitrary and capricious, biased, and internally inconsistent and contradictory.¹²⁸¹ Moreover, the commenter states that in this case, the Proposal would suffer from fatal failures to explain why EPA may consider these materials, while the Proposal would prohibit EPA from considering other materials.

Response: See response to Comment 4829-2022. EPA notes that the rule requires any peer review to be conducted in accordance with applicable OMB guidance. EPA notes that the final rule does not apply to models and applies to only the subset of data that consists of dose-response data.

Comment [6163-2935]: Commenter (6133) states that dose response data and models is defined as “the data and models used to characterize the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and the magnitude of a predicted health or environmental impact. Such functions typically underlie pivotal regulatory science that drives the size of benefit-cost calculations, the level of a standard and/or the points of departure from which reference values (reference doses or reference calculations) are calculated.” (§ 30.2). Despite being an important phrase repeated through the Proposal and the proposed text, this compound definition is vague and arbitrary. It also is circular—the very terms being defined are used in the definition. It’s unclear what data EPA is referring to in this phrase and definition. Moreover, it’s unclear what EPA means by “[s]uch functions typically under pivotal regulatory science . . .” And the problems with “pivotal regulatory science” have already been discussed [in their comment letter]. As explained in section XII [of their comment letter], the definition does

¹²⁸¹ See, e.g., *Air Transport Ass’n of Am. v. DOT*, 119 F.3d 38, 43 (D.C. Cir. 1997) vacating regulation: “the most serious logical problem with [the] regulation -- which we simply cannot accept,” is that the agency’s explanation “is internally inconsistent”).

not adequately describe what the proposal covers. This definition, according to the commenter, along with the rest of the Proposal, is arbitrary and capricious and must be withdrawn.

Response: EPA has clarified the distinction between dose-response data and data. See Sections III.B, III. C and III.E of the final rule preamble.

Comment [6163-3025]: Commenter (6133) states that in proposed § 30.6, EPA proposes to “evaluate the appropriateness of using default assumptions, including assumptions of a linear, no-threshold dose response, on a case-by-case basis.” 83 Fed. Reg. at 18,774. In proposed § 30.9, the Proposal grants the Administrator the ability to “grant an exemption to this subpart on a case-by-case basis if he or she determines that compliance is impracticable” for a number of enumerated reasons. The commenter contends that both of these provisions inject additional arbitrariness into the rule, in that they ensure that the Proposal may be applied unevenly—for certain rulemakings, the “rules” of the Proposal can be discarded or ignored where desired. This, in addition to and with other sections of the Proposal, underscores that it is arbitrary and capricious and must be withdrawn.

Response: See response to Comment 6163-2871

Comment [6163-3346]: Commenter (6133) states that the Proposal at section 30.3 states that:

Except where explicitly stated otherwise, the provisions of this subpart do not apply to any other type of agency action, including individual party adjudications, enforcement activities, or permit proceedings.

83 Fed. Reg. at 18,773.

This provision most clearly highlights one of the arbitrary and capricious advantages that industry stakeholders enjoy under the Proposal: it exempts from its censoring coverage EPA activities where industry is the primary party likely to submit confidential information that EPA may consider and rely upon. This, notwithstanding that the submitted information is not “publicly available in a manner sufficient for independent validation,” while still being highly relevant and even integral to EPA’s legal responsibilities. *Id.* at 18,768.

Permitting activities are one key example. For permitting actions taken under the CAA, RCRA, CWA, etc., the Proposal arbitrarily and capriciously allows EPA to continue to rely on highly relevant regulatory science and other information supplied by industry that is not “publicly available in a manner sufficient for independent validation.” *Id.* at 18,771–73. A company seeking a permit or permit revision may submit regulatory science, confidential business information or other non-confidential information that is not “publicly available in a manner sufficient for independent validation.” *Id.* EPA could consider non-peer reviewed, nontransparent industry science or information to conclude that a non-transparent industry model demonstrates no adverse air quality impact on a neighboring national park or wilderness area. This, despite the inputs and assumptions behind the model being unavailable to the public. An applicant could assert that there are safe exposure levels for PM_{2.5} or lead, and therefore EPA need not require any mitigation measures at concentrations below NAAQS levels in attainment

areas. Industry applicants could rely upon hidden CBI to project no emissions increases for purposes of NSR permitting under the so-called “demand growth” exclusion, notwithstanding the unavailability of information critical to industry’s claim and EPA’s acceptance of that claim. Considering this and other non-transparent information, EPA could conclude that permits or permit revisions may be granted in situations where they should not lawfully be granted, notwithstanding that the non-transparent, unavailable information is scientifically erroneous and even absurd.

A second example is public information submitted during enforcement proceedings. The Proposal arbitrarily and capriciously allows EPA to continue to rely on highly relevant regulatory science and other information supplied to the agency by industry during enforcement proceedings, even when that information is not “publicly available in a manner sufficient for independent validation.” *Id.* at 18,771–73. Consider, for example, a company that receives a notice of violation from EPA and meets with the agency to make the case that EPA and the DOJ should not file a complaint. The company may submit regulatory science, CBI, or other non-confidential information that is not “publicly available in a manner sufficient for independent validation.” *Id.* at 18,768. EPA could consider non-peer reviewed, non-transparent, erroneous industry science to conclude that formaldehyde or asbestos are not carcinogens, or that PM_{2.5} or lead have safe exposure levels, or that CO₂ does not endanger public health or welfare. Considering this and other non-transparent information, EPA could conclude that prosecution is not warranted, or that the information represents mitigating factors for penalties or injunctive relief, notwithstanding that the non-transparent, unavailable information is scientifically erroneous and even absurd.

The third case is public information submitted during individual party adjudications. *Id.* at 18,771–73. The Proposal arbitrarily and capriciously allows EPA to continue to rely on highly relevant regulatory science and other information supplied to the agency by industry during individual party adjudications, even when that information is not “publicly available in a manner sufficient for independent validation.” *Id.* at 18,768. Consider, for example, a company facing an EPA order or applicability determination that qualifies as an adjudication under the APA or one of the federal statutes that the agency administers.

The company may submit regulatory science, CBI or other non-confidential information that is not “publicly available in a manner sufficient for independent validation.” EPA could consider non-peer reviewed, non-transparent industry science to conclude that formaldehyde or asbestos are not carcinogens, or that PM_{2.5} or lead have safe exposure levels, or that CO₂ does not endanger public health or welfare. Considering this and other non-transparent information during the individual party adjudication, EPA could conclude that adoption of the order is not warranted, or that agency regulations should be interpreted in a way that does not apply to that company’s actions. Indeed, EPA could conclude, after considering the non-transparent, unavailable information, that the regulations should not apply in ways that would affect an entire industrial sector favorably, while harming the public meant to be protected by those regulations. Under proposed section 30.3, EPA could consider the non-transparent, unavailable information to reach these objectionable outcomes, notwithstanding that the information is scientifically erroneous and even absurd. The Proposal nowhere explains why it is valid and consistent with EPA’s statutory authorities and responsibilities to consider information that is not “publicly

available in a manner sufficient for independent validation” under the situations allowed in proposed section 30.3 (individual party adjudications, enforcement activities, or permit proceedings), while prohibiting EPA consideration of that information in situations covered by the Proposal’s prohibitions. Indeed, it is striking that the Proposal does not even attempt any such explanation or justification. *Id.* at 18,771–73. This is undoubtedly because there is no coherent, lawful justification or explanation that the agency could muster; it is unsurprising that the Proposal cannot overcome this.

Indeed, it is a hallmark of the Proposal’s inherent arbitrariness and capriciousness that the Proposal prohibits EPA from considering the identical regulatory science, studies, and information in some regulatory situations, while allowing EPA to consider the identical regulatory science, studies, and information in other regulatory situations—based merely upon the type of situation, rather than any differences in availability, replicability, verifiability, or validation concerning the information. Proposed section 30.3 prohibits EPA from considering information that is not “publicly available in a manner sufficient for independent validation” 102 during so-called “significant regulatory decisions,” while prohibiting EPA from considering that identical regulatory science, studies, or information during “any other type of agency action, including individual party adjudications, enforcement activities, or permit proceedings.” 83 Fed. Reg. at 18,768, 18,771. The Proposal does not and cannot explain or justify this differential treatment, so the Proposal does not even try.¹²⁸²

Finally, proposed section 30.3 is unlawfully vague, open-ended, and arbitrary due to the capacious and unlimited way that EPA has drafted the exclusion from the Proposal’s prohibitions. Section 30.3 indicates that “the provisions of this subpart do not apply to any other type of agency action.” This grants EPA capacious and effectively unlimited discretion and authority to decide what “any other type of agency action” is and is not, without providing the public or regulated entities any criteria, understanding or advance notice as to how EPA will exercise that discretion and authority. That is the essence of arbitrary and capricious agency action. Indeed, the Proposal is structured in such a way that EPA will be exercising that discretion and authority—to decide what “any other type of agency action” does and does not cover—in secret, with no public input and no public awareness, concerning the situations in which EPA will and will not consider non-transparent, unavailable information. The commenter contends that, in addition to this being perversely ironic, considering the “transparency” title of the Proposal, this fact renders the Proposal even more arbitrary and capricious and unlawful.

Response: By focusing on significant regulatory actions and influential scientific information, EPA is applying this rule to the actions that have the potential to have the greatest impact on the American public.

Comment [6163-3479]: Commenter (6133) states that the term “pivotal regulatory science” is perhaps the most vague, unexplained, and internally inconsistent term used in the Proposal. The term has no statutory basis in any statute cited by EPA, or otherwise. Beyond having no statutory

¹²⁸² Should EPA realize and conclude that it must explain and justify this differential treatment in any final rule, EPA first must issue a supplemental proposal with these explanations and justifications for public review and opportunity for comment prior to issuing any final rule.

underpinning, the meaning of the phrase is neither self-evident nor adequately defined in the Proposal.

EPA's choice to modify "regulatory science" with the adjective "pivotal" does nothing to clarify the scope of scientific studies and information encompassed by the Proposal. "Pivotal regulatory science" is defined within the regulation as "the specific scientific studies or analyses that drive the requirements and/or quantitative analysis of EPA final significant regulatory decisions." 83 Fed. Reg. at 18,773/3 (proposed § 30.2). This definition is as unclear and unsupported as the term itself.

The use of the phrase "drive the requirements" within the C.F.R. definition is particularly incoherent. What does "drive the requirements" mean? The Proposal nowhere says. Does the definition apply only to scientific studies that were outcome determinative? Does it encompass any scientific study that was considered in making the requirements? What about studies that were useful but not determinative? Something else entirely? Can more than one study be "pivotal" to the regulatory decision, or does the term "drive the requirements" imply that only one study could be "pivotal" to a given decision? Furthermore, are most of the studies used by EPA considered to "drive the requirements" or is this term limited in some fashion, unrevealed to the public? Will EPA "know it when it sees it," making it up as the agency goes along?

According to the commenter, it is arbitrarily, vague, and unexplained under the Proposal which science would be considered "pivotal," and under what conditions. Because the term was created out of thin air to serve EPA's purposes and has no statutory grounding or intuitive meaning, this ambiguity-ridden definition is woefully inadequate. It is also arbitrary and capricious and an abuse of EPA's discretion. EPA is well aware of the insufficiency of the definition, as is evident in the agency's solicitation of comments on the definitions of "pivotal regulatory science" and "dose response data and models" within the Proposal. See 83 Fed. Reg. at 18,771.

Notably, the proposed CFR definition also differs substantially from a definition of "pivotal regulatory science" appearing earlier in the Proposal, which defines the term as "the studies, models, and analyses that drive the magnitude of the benefit-cost calculation, the level of a standard, or point-of departure from which a reference value is calculated. In other words, they are critical to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, or risks and other impacts on which a final regulation is based." 83 Fed. Reg. at 18,770.

Next, it bears repeating that EPA does not and cannot identify any statutory basis—in federal environmental statutes, the APA or otherwise—to apply the Proposal's approach "to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, or risks and other impacts on which a final regulation is based." 83 Fed. Reg. at 18,770. EPA simply makes this up.

EPA's separate explanation here suffers from additional defects, namely an internal inconsistency, incoherency and unbounded reach that do not accord with the proposed C.F.R. definition. EPA's preambular explanation says that "pivotal regulatory science" is "critical to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, or risks and other impacts on which a final regulation is based." 83 Fed. Reg. at 18,770 (emphasis added) The

Proposal nowhere explains what these “other impacts” are. Nor does the Proposal limit or bound these “other impacts,” nor link them to the sentence’s incoherent notion of what is “critical” and what is not. Moreover, the preambular gloss is inconsistent with the proposed C.F.R. definition. The former says “pivotal regulatory science” is critical to hopelessly vague “other impacts” on which a final rule is based. *Id.* The proposed C.F.R. definition, by contrast, says “pivotal regulatory science” “drive[s] the requirements and/or quantitative analysis of EPA final significant regulatory decisions.” 83 Fed. Reg. at 18,773/3 (proposed § 30.2). The Proposal does not square the contradictions between science that drives a final rule’s requirements and science that is “critical” to “other impacts” in a final rule.

Furthermore, the commenter states that the EPA not only fails to provide a passable definition for its invented term, “pivotal regulatory science,” the agency fails to provide its rationale for limiting the scope of the rule to so-called “pivotal regulatory science.” Within the unlawful, arbitrary, and capricious worldview reflected in the Proposal, why is the “public availability of science and data in a manner sufficient for independent validation” any less important or necessary or justified when the science is not “pivotal” or “critical” to a regulatory decision? Why should not all science, studies, data, and information considered by EPA meet the standards for transparency, verifiability, independent validation, and trustworthiness that are the abiding concerns of the Proposal? Why is it not arbitrary and capricious for EPA to continue to consider science and data that are unavailable and insufficient for independent validation in areas outside the reach of the Proposal? EPA offers no explanation for this disparate treatment; the agency’s reasoning, such as it is, is entirely conclusory.

By way of explanation for the limitation, EPA only suggests that the imposed standards “are of paramount importance when the government relies on science to inform its significant regulatory decisions.” 83 Fed. Reg. at 18,769. This explanation is hopelessly circular and ultimately incoherent. For starters, EPA does not explain why it believes this explanation to be true. Next, the Proposal just substitutes the word, ‘paramount,’ for the word, ‘critical,’ that it substitutes for the word, ‘pivotal.’ (The Proposal’s drafters evidently were just flipping through a thesaurus.) This failure to thoroughly explain both the term “pivotal regulatory science” in a way that meaningfully defines the scope of the regulation, and the rationale behind limiting the application only to pivotal (critical, paramount) science, makes it impossible for interested parties to comment fully and meaningfully on the Proposal. The commenter suggests that, should EPA intend to finalize this unlawful proposal, EPA first must withdraw the Proposal, then issue a supplemental proposal with the necessary definitions and explanations. Better yet, the commenter suggests that EPA abandon the illegal and harmful proposal altogether.

Response: Regarding compliance with the APA, see response to Comment 2157-149. EPA notes that the APA does not require a proposal to be withdrawn before a supplemental proposal is issued. Response to comments on pivotal science are addressed in the final rule preamble (See Sections III.C and III.E) and in Chapter 6 of this document.

Comment [6168-4103]: Commenter (6178) states that the Agencies’ proposed action in the NPRM – adopting a new standard for all scientific research to be relied on by the EPA going forward – is itself a substantive agency action, triggering certain requirements of the APA. Specifically, the requirement of the APA that agency action not be ‘arbitrary and capricious’ as

interpreted by the *Supreme Court of the United States in Motor Vehicle Manufacturers' Association v. State Farm Mutual Automobile Insurance Co.*¹²⁸³ ('State Farm').

Under Section 706 of the APA, a reviewing court can set aside agency action if the action is found to be "arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law."¹²⁸⁴ The Supreme Court provided clear guidance as to what constitutes an arbitrary and capricious agency action in *State Farm* where the Court stated: "Normally, an agency rule would be arbitrary and capricious if the agency has... relied on factors which Congress has not intended it to consider...."¹²⁸⁵

As stated above, a plain reading of the Congressional Acts cited by the EPA as support for its proposed Transparency Rule demonstrates that transparency, as contemplated by the NPRM, is not a factor on which Congress intended the EPA to rely on when evaluating what scientific research it would consider when adopting regulations pursuant to the Acts. In fact, to do so would very likely contradict the stated Congressional intent that such research be conducted with a focus on cooperation and coordination with other like-minded institutions. For these reasons, the commenter asserts that the Transparency Rule must be considered arbitrary and capricious under the APA as it would require the EPA to 'rely on factors which Congress has not intended it to consider'.

Response: See response to Comment 2157-149. This final rule builds upon and is consistent with existing federal government open data initiatives and supporting federal agency guidance.

EPA notes that the final rule does not cite any of the statutes that it administers as authority for this rule. This procedural rule does not interpret or apply provisions of the statutes that it administers. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. If implementing this procedural rule will result in a conflict with an environmental statute that EPA administers, then this procedural rule will yield. As discussed in the final rule preamble at III.A, EPA plans to issue statute-specific transparency regulations or programmatic regulations. EPA will address any statutory conflicts as appropriate when EPA develops these subsequent rulemakings.

Comment [6336-2687]: Commenter (6358) states that the EPA's process for promulgating this rule represents a gross deviation from the agency's typical action development process. EPA failed to perform an appropriate regulatory impact analysis, despite indications that implementation costs could be substantial.¹²⁸⁶ EPA has not received sufficient input from the

¹²⁸³ *Motor Vehicle Manufacturers' Association v. State Farm Mutual Automobile Insurance Co.*, 463 U.S. 29 (1983)

¹²⁸⁴ 5 U.S.C. Sec. 706(2)(A)

¹²⁸⁵ See *State Farm* Section IV.

¹²⁸⁶ Carper TR, Whitehouse S, Merkley JA, Gillibrand K, Booker CA, Markey EJ, & Van Hollen C. (April 24, 2018). [Letter to Administrator Pruitt]. Accessed May 23, 2018 at https://www.epw.senate.gov/public/_cache/files/c/2/c2f80031-e0d6-4470-838f-1e08cd47694a/5C9B6E321D31800AD3100F5D44F49353.letter-epa-pruitt-limit-scientific-data.pdf

OIRA, which conducted a highly truncated review¹²⁸⁷ and does not appear to have met with outside groups during that process, or from its SAB, which states that the rule “deals with a myriad of scientific issues for which the Agency should seek expert advice from the Science Advisory Board.”¹²⁸⁸ Taken together, these deviations from typical process leave EPA unable to consider its proposal accurately, and constitute an arbitrary and capricious approach to rulemaking.

Response: See response to Comment 2157-149. EPA’s Action Development Process is not legally binding and is a purely internal, collaborative process. In any event, the supplemental proposal underwent OMB and interagency review and was thoroughly reviewed by the SAB. The final rule discusses the SAB’s findings and the SAB’s report is available in the rulemaking docket.

Comment [6339-3188]: Commenter (6361) suggests that while EPA states that the new rule would be applied prospectively, it notes that the rule could impact prior records for older rules that are subject to recurring updates and reviews. The new rule does not point to any basis in law or fact to question the validity and rationale of prior EPA rulemakings, and thus it would be improper and contrary to the APA for EPA to reopen prior regulations for review due to alleged lack of transparency in past scientific studies. Without specific evidence, particular findings, and legal analysis regarding individualized federal agency decisions, the commenter states that it is unorthodox and legally suspect for EPA to issue a new regulation based on blanket assertions of a generalized, non-specific nature.

Response: This rule does not apply retrospectively to EPA regulations.

Comment [6340-1690]: Commenter (4879) states that they strongly support EPA’s demonstrated commitment in this proposal to build upon the principles underlying the APA, Executive Orders 12866, 13777, and 13783, and guidance of OMB.

Response: Thank you for the comment.

Comment [6425-2643]: Commenter (6447) states that the current proposal would require EPA to ignore some of the best available science, and to ignore certain information submitted during rulemaking. In particular, the proposal would make it difficult or impossible to use most epidemiological studies, where the source data are almost always comprised of sensitive personal information. The Agency does not the option of suppressing this information, and courts have

¹²⁸⁸ EPA Science Advisory Board. (2018). Memorandum: Preparations for Chartered Science Advisory Board (SAB) Discussions of Proposed Rule: Strengthening Transparency in Regulatory Science RIN (2080-AA14). Accessed May 23, 2018 at [https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/\\$File/WkGrp_memo_2080-AA14_final_05132018.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/$File/WkGrp_memo_2080-AA14_final_05132018.pdf)

held that EPA "cannot ignore existing data."¹²⁸⁹ In short, the commenter contends that the proposed action would be illegal, and would not survive a legal challenge.

Response: See response to Comment 4829-2022.

Comment [6428-1352]: Commenter (6450) states that the proposed rule is arbitrary and capricious for myriad reasons. EPA has failed to demonstrate the benefits of the proposal or how any such benefits would outweigh the associated costs.

Response: Regarding cost-benefit analysis, see response to Comment 6112-4452.

Comment [6845-1604]: Commenter (6867) provides that the APA, 5 U.S.C. § 500 et seq., prohibits agency action, findings, and conclusions that are arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law. See 5 U.S.C. § 706(1). In view of the overwhelming evidence that (i) a very high percentage of published studies are not reproducible, (ii) pre-publication peer review is not sufficient to ensure that a study lacks major errors, and (iii) pre-publication peer review is not sufficient to ensure that the computational code underlying a study lacks major errors, we respectfully submit that the Proposed Rule is necessary and arguably required by the APA. Indeed, according to the commenter, an agency action based on a study without fully disclosed data, methodology, and computational code is arguably so lacking in reasoned foundation as to be arbitrary and capricious.

Response: The commenter has not supported any of these assertions, which they contend are supported with "overwhelming evidence" with any evidence.

Comment [6888-4166]: Commenter (6909) opposes the proposed rule because it will do harm to important public health safeguards and will also negatively impact researchers and the scientific endeavor generally. The commenter states that the proposed rule's attempt to exclude perfectly reliable scientific studies from EPA's consideration is a thinly veiled attempt to allow the EPA to ignore sound science at its discretion if that science does not conform with the current Administration's political agenda. The commenter adds that the proposed rule would be very damaging and would fail to fulfill EPA's obligations under the APA for numerous reasons.

The commenter states that a ban on EPA considering relevant studies that have been vetted through peer review but whose underlying data cannot be made publicly available or which cannot be replicated will not strengthen EPA's decision-making process and its ultimate policy making, it will weaken them.

Response: See response to Comment 4829-2022.

Comment [6894-3595]: Commenter (6915) states that the EPA's proposal would violate the APA, 5 U.S.C. §501 et seq., both because it is arbitrary and capricious, and because it flouts the Act's important procedural requirements. EPA claims that the entire basis for the proposed rule is to ensure that the "pivotal regulatory science" underlying EPA regulations is transparent. But

¹²⁸⁹ Id.

EPA ignores existing laws and policies that already do exactly that and which also take into account the need to protect medical data and other confidential information. This proposed rule would promote transparency in name only; in truth, it would mean that EPA's important decisions would no longer be informed by the latest, best available, and generally accepted science. Disturbingly, the proposed rule's only failsafe is the EPA Administrator's sole discretion to determine on a case-by-case basis that compliance is "impracticable" when making data publicly available is "not feasible." But the proposal provides no standards to govern the Administrator's exercise of discretion in determining "impracticability or "feasibility"—a recipe for the very arbitrariness that the APA prohibits.

Response: See response to Comments 2157-149, 4829-2022, 6112-3062, and 6163-5030.

Comment [6895-3615]: Commenter (4879) states that the EPA's failure to solicit input from the SAB and other scientific groups is exacerbated by its failure to meet the fundamental legal requirements for a valid rulemaking proposal under the APA. The APA requires that "general notice of proposed rulemaking shall be published in the *Federal Register*," including the "terms or substance of the proposed rule." 5 U.S.C. §553(b). The straightforward purpose of this requirement is to give the affected public an opportunity to provide meaningfully informed comment on an agency's proposal. See *Home Box Office, Inc. v. Fed. Comm'n Comm'n*, 567 F.2d 9, 35-36 (D.C. Cir. 1977). But here, EPA's NPRM is vague as to the actual parameters of the proposed rule, is open-ended in terms of the alternatives under consideration, and fails to provide key information such as projected costs. Courts will not hesitate to strike down final rules based on proposals so lacking in specificity. See, e.g., *Horsehead Res. Dev. Co. v. Browner*, 16 F.3d 1246, 1268 (D.C. Cir. 1994) (noting that "general notice that a new standard will be adopted affords the parties scant opportunity for comment").

Far from meeting the requirement to "disclose in detail the thinking that has animated the form of a proposed rule and the data upon which that rule is based," *Home Box Office*, 567 F.2d at 35-36, the proposal at issue here creates far more questions than it answers. Most fundamentally, the proposal fails to provide a rationale for EPA to act contrary to accepted scientific practice, i.e., to preclude consideration of probative scientific information that has been subject to rigorous peer review for the sole reason that underlying data are confidential and therefore not publicly available. The proposal states that "EPA believes the benefits of this proposed rule justify the costs," 83 Fed. Reg. at 18,772, but fails to provide any specific information, quantification, or analysis as to what EPA believes are the proposed rule's purported benefits or expected costs, including the significant costs from the loss of probative information that the proposed rule would work to exclude. For example, Section 30.7 of the proposed rule could be read to require EPA to undertake very costly independent review of "pivotal" science on which it relies, but Section 30.8, entitled "How is EPA to account for cost under this subpart?" states only that EPA will "minimize costs." *Id.* at 18,774. The absence of data and analysis in support of EPA's cost-benefit conclusion deprives the public of a meaningful opportunity to evaluate the proposal and thus violates EPA's duty under the APA.

Response: See response to Comments 2157-149 and 6112-4452.

Comment [6894-3630]: Commenter (6915) asserts that the proposed rule disregards the APA’s bedrock requirement that an agency’s decision-making be based on a consideration of the relevant factors and data. See *Motor Vehicle Mfrs.*, 463 U.S. at 42-43 (articulating standard and citing numerous cases). An agency’s action is arbitrary and capricious not only if the agency “entirely fail[s] to consider an important aspect of the problem,” but also if it “relie[s] on factors which Congress has not intended it to consider.” *Id.* at 43. The proposed rule would call for EPA to do both. First, in excluding studies and models from its consideration based only on whether the underlying data are publicly available or have been subject to additional independent review by EPA, EPA would be excluding studies and models that Congress has instructed it to consider by requiring it to use, for example, the “best available science” or “latest scientific knowledge.” Second, because none of the statutes EPA administers specify that, in setting standards, it shall consider whether the studies and models it uses have publicly available data or have been independently reviewed by EPA, EPA would be using factors that Congress did not intend it to rely on in deciding to exclude studies and models based on the proposed rule. See *Am. Trucking*, 283 F.3d at 372 (finding that the CAA does not require EPA to “obtain and publicize the data underlying the studies on which the Agency relies”). According to the commenter, EPA’s failure to consider otherwise relevant studies and models that do not meet the proposed rule’s requirements would therefore be arbitrary and capricious. See *Motor Vehicle Mfrs.*, 463 U.S. at 42-43.

Response: See response to Comment 4829-2022.

Comment [6895-3232]: Commenter (6895) states that the Proposal claims to be “consistent with the principles underlying the Administrative Procedure Act”.¹²⁹⁰ But, the Proposal does not clearly identify the authority under which it is promulgated, is so vague as to undermine the ability to meaningfully comment, and in its substance contradicts the APA requirement that agencies must consider all the relevant matter presented in a rulemaking record.¹²⁹¹

i. The Proposal does not clearly identify the authority under which EPA has promulgated it.

As discussed above, the CAA does not authorize the Proposal, which is clearly aimed at limiting the studies EPA can rely on and consider in CAA rulemaking. Additionally, APA section 553(b)(2) requires a proposed rule to provide a “reference to the legal authority under which the rule is proposed.” While the Proposal’s preamble lists various statutes the Agency claims support its action, a closer look reveals that none of those sections actually authorizes EPA to disregard scientific studies.¹²⁹² Certainly that is the case for the CAA sections listed by the Agency in the Proposal, including the general rulemaking authority under the Act which requires the evaluation of all material in the record. EPA’s suggestion that it has “general authority” to make rules to comply with its obligations is similarly unavailing here, as the general authority does not exist to make rules that are outside EPA’s statutory obligations, or in violation of them¹²⁹³ – and a rule

¹²⁹⁰ 83 Fed. Reg. at 18,769. CAA rulemaking has governing requirements found in the Act, 42 U.S.C. § 7607d(1). To the extent that what EPA is attempting to argue is that this Proposal is not covered by 42 U.S.C § 7607(a)(1), but is consistent with the APA, that too is incorrect.

¹²⁹¹ 5 U.S.C. § 553(c).

¹²⁹² 83 Fed. Reg. at 18,769 (listing statutory sections but not explaining why the cites authorize the Proposal).

¹²⁹³ See *Am. Petroleum Inst.*, 52 F.3d at 1119 (“EPA cannot rely on its general authority to make rules necessary to carry out its functions when a specific statutory directive defines the relevant functions of EPA in [an] area”).

that would enable EPA to disregard relevant studies in a CAA rulemaking record is clearly outside the Agency's authority. Nowhere does the Act permit EPA to limit its own access to relevant science.

ii. The Proposal's terms are so vague as to fail to afford an opportunity for meaningful comment.

Significant issues are presented in the Proposal only in the broadest terms, despite an APA requirement that a proposed rule includes "the terms and substance of the proposed rule or a description of the subjects and issues involved," 5 U.S.C. § 553(b)(3), and with enough specificity "to permit interested parties to comment meaningfully."¹²⁹⁴ As noted *supra*, we assume (as we must, given no other information from the Agency), that the Proposal is aimed at precluding EPA's reliance on studies for which the data are not made public. That is the natural reading of the proposed regulatory language, which is the most choate information offered in the Proposal. But even that reading is not certain, given the very broad discretionary nature of the exemptions provided for in the rule text (see, e.g., 83 Fed. Reg. 18,774, proposed 40 C.F.R. § 30.9, giving the Administrator the ability to grant an exemption to the data publication requirement if that is "impracticable," which is undefined in the Proposal). As a result, it is unclear how this rule would apply to EPA decision making, and how it would be different than the Agency's current protocol for considering studies relevant to specific rulemaking proposals.

As one example, EPA alludes to "transparency" multiple times, but without defining what that concept means, or explaining why it believes existing statutes, regulations, guidelines and protocols fail to meet it.¹²⁹⁵ While asserting an interest in "ensur[ing] that the data and models underlying science is [sic] publicly available in a manner sufficient for validation and analysis,"¹²⁹⁶ there is no more specific statement explaining how that would be implemented or why releasing confidential health and business information is necessary. Nor is the Agency's rationale completely clear in the Proposal. When commenters are left to guess, that is not lawfully sufficient notice of the subjects and issues involved.

iii. The Proposal's substance conflicts with the APA requirement that Agencies consider relevant matter presented in the rulemaking record.

Section 553(c) of the APA requires that when finalizing a proposed rule, and after taking comment, an agency must "consider[] the relevant matter presented" in the record.¹²⁹⁷ To the extent that the Proposal envisions authorizing EPA to ignore or disregard or not to consider some studies submitted during a rulemaking comment period, such Agency action would be taken in direct violation of this provision of the APA.¹²⁹⁸ Nor, according to the commenter, is there any

¹²⁹⁴ *Honeywell Int'l, Inc. v. EPA*, 372 F.3d 441, 445 (D.C. Cir. 2004).

¹²⁹⁵ In 83 Fed. Reg. at 18,768-18,774, EPA includes 13 preamble references to "transparency," and one rule text reference, at proposed 40 C.F.R. § 30.7, without providing any indication of the intended meaning of that term. Also see generally, Dan Farber, "Pruitt's Utterly Opaque Transparency Proposal," (Apr. 26, 2018), available at: <http://legal-planet.org/2018/04/26/pruitts-utterly-opaque-transparency-proposal/>.

¹²⁹⁶ 83 Fed. Reg. at 18,769.

¹²⁹⁷ 5 U.S.C. § 553(c).

¹²⁹⁸ *NRDC*, 902 F.2d at 971 ("the Administrator must take into account all the relevant studies revealed in the record and make an informed judgment based on available evidence") (internal citations omitted) (emphasis added).

basis in the APA for EPA to decide to exclude or prohibit the consideration of otherwise relevant matter because it is based on confidential information not available to the general public.

Response: See response to Comment 2157-149.

Comment [6895-4397]: Commenter (6916) states that an agency's decision is arbitrary and capricious where it fails to consider important aspects of the problem, is counter to the evidence before it, or relies on factors Congress has not intended it to consider.¹²⁹⁹ When the action rescinds, or represents a significant about face from, previous agency rules or longstanding practice, it must provide a reasoned basis for doing so.¹³⁰⁰ If finalized as proposed, EPA's attempt to cut off access to significant scientific results would fall short on all of these factors and would also lead to further arbitrary and capricious agency decision making.

Response: EPA did not finalize the proposal as is. See responses to Comments 2157-149 and 4829-2022.

Comment [6895-4399]: Commenter (6916) asserts that the failure to adequately justify a changed agency position is one of the hallmarks of arbitrary and capricious decision making.¹³⁰¹ The Agency furthermore must "provide a more detailed justification than would suffice for a new policy...when, for example, its [revised] policy rests upon factual findings that contradict those which underlay its prior policy; or when its prior policy has engendered serious reliance interests that must be taken into account. It would be arbitrary and capricious to ignore such matters."¹³⁰²

EPA, in the Proposal, fails to engage with the reasoning or facts underlying the Agency's longstanding policy position, which respected the confidentiality of underlying data and accounted for all relevant science.¹³⁰³ Further, this position has engendered significant reliance interests. Many of the "dose response" studies the Agency singles out for attention have been relied on in decision making for many decades, and have been the basis for many other subsequent work, on which the Agency also has relied.¹³⁰⁴ The Agency seems not to understand this or have a plan for how to manage the fallout from a final rule that denies access to all of that body of work – whether in an exclusively forward-looking way, or retroactively.¹³⁰⁵ But, "[a]n agency cannot simply disregard contrary or inconvenient factual determinations that it made in the past."¹³⁰⁶

¹²⁹⁹ Id. at 43-44.

¹³⁰¹ *State Farm*, 463 U.S. at 43-44.

¹³⁰² *Fox Television Stations*, 566 U.S. at 515-16 (internal citation omitted).

¹³⁰³ See Earthjustice Comments at 80-82.

¹³⁰⁴ See, e.g., Policy Assessment; and Earthjustice Comments at 13.

¹³⁰⁵ See 83 Fed. Reg. at 18,772 (seeking comment on how the Proposal should apply to previous rulemaking records and studies, data and models "developed prior to the effective date," without explaining how EPA views the consequences of such retroactive application of the proposed policy).

¹³⁰⁶ *Fox Television Stations*, 566 U.S. at 537 (Kennedy, J., concurring).

iii. If finalized, the Proposal's requirement to disregard relevant studies would ensure further arbitrary decision making.

Were this rule to be finalized as proposed, it would permit or even require the Agency to disregard certain studies placed in the record in future substantive rulemakings under the CAA, among other statutes. Not only would that render the future substantive rules unlawful under the Act's requirements, but it would also make them arbitrary and capricious, as "failure to consider the evidence proffered renders [a decision] arbitrary and capricious"¹³⁰⁷ and the Agency may not "hastily discount[]" relevant studies.¹³⁰⁸ The Agency seems completely unaware that its new policy, if finalized, could lead to future rulemaking actions that are unlawful, arbitrary, and capricious.

Response: See response to Comment 4829-2022.

Comment [6912-3753]: Commenter (6933) suggests that the NPRM be withdrawn because to the extent it can be understood what it requires—through the haze of vague definitions and exceptions—it both fails to address the issue which it purports to be concerned with, and is inconsistent with EPA's obligations to use best available science under both statutory requirements and caselaw. In essence, the rule identifies the goal of improving the quality and transparency of EPA's science and uses it as an excuse to adopt policies that actually reduce the quality, and likely the transparency, of EPA's scientific decision-making. According to the commenter, there is a fundamental mismatch between the problem identified and the solution adopted. Such an approach is plainly arbitrary and capricious and inconsistent both with the APA and with the environmental statutes under which EPA purports to act.

Response: See final rule preamble at Section III.A for a discussion of the match between the problem and the solution provided by this rule. See response to Comment 4829-2022

Comment [8750-1475]: Commenter (9227) states that in addition to violating the requirements of the various statutes that EPA administers or is subject to, the Proposal suffers from a total failure to consider important dimensions of the profound shift in policy that it implements. In the Proposal, EPA neglects to consider the many legitimate reasons why a study's underlying data may not be publicly available—reasons that have nothing to do with the quality of the study—and fails to offer solutions consistent with these legitimate limitations. EPA makes vague gestures to various guidelines and practices issued by other agencies and scientific organizations, none of which actually support the Proposal's radical position that EPA should exclude consideration of studies that rely upon confidential data. EPA does not even establish that there is a real problem that the Proposal would actually address: nowhere in the Proposal does EPA

¹³⁰⁷ *Southwest Power Pool v. FERC*, 736 F.3d 994, 999 (D.C. Cir. 2013); see also *Mississippi v. EPA*, 723 F.3d 246, 269 (D.C. Cir. 2013) (agency must explain why evidence submitted is not reliable if choosing to ignore it); see also *NRDC v. EPA*, 902 F.2d at 971 (same).

¹³⁰⁸ *Am. Farm Bureau Fed'n v. EPA*, 559 F.3d 512, 525 (D.C. Cir. 2009) (citing *Am. Radio Relay League, Inc. v. FCC*, 524 F.3d 227, 241 (D.C. Cir. 2008) (Agency's inadequate explanation for dismissing empirical studies rendered decision arbitrary and capricious); cf. *Am. Trucking Ass'ns*, 175 F.3d at 1052-53 (EPA arbitrarily and capriciously placed upon some studies "higher information threshold" than it placed upon others"); *Bus. Roundtable v. SEC*, 647 F.3d 1144, 1150-51 (D.C. Cir. 2011) (vacating rule for ignoring relevant studies); and *Chlorine Chem. Council v. EPA*, 206 F.3d 1286 (D.C. Cir. 2000)

identify any prior agency action that has been called into serious question due to a failure to release study data. According to the commenter, the EPA's utter failure "to consider an important aspect of the problem" and to provide an explanation for the Proposal that is consistent with the evidence before the agency renders the Proposal wholly arbitrary and capricious. See *Motor Vehicle Mfrs. Ass'n. v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983). Likewise, the commenter suggests that the EPA's failure to explain its 180-degree change in position from its former belief that the lack of publicly available data does not render a study inappropriate for consideration in regulating is a hallmark of arbitrary and capricious decision-making. *FCC v. Fox Telev. Stations, Inc.*, 556 U.S. 502, 515-16 (2009).

Response: See the final rule preamble at Section III.A for an explanation of why a change in policy is needed. See response to Comment 4829-2022.

Comment [8750-1480]: Commenter (9227) states that there are multiple reasons why underlying data are not publicly available for all studies.

There are legal and ethical requirements that restrict making public the data underlying studies, including rules to shield private personal information, requirements to maintain confidential business information, situations where obtaining the necessary permissions to release data are logistically difficult or impossible, and situations in which researchers have made significant investments in developing datasets that they intend to continue to work with for future studies. Not all of these barriers can be overcome, nor can they be overcome in every case. While there are ways potentially to address some of them, they can be extremely costly and burdensome, and/or may harm the prospects for further research. Accordingly, while the scientific community has made efforts to make more data publicly available, to the best of our knowledge all of the policies adopted by government and academic journals recognize that data is not, and need not be, publicly available to evaluate their quality.

a) Strong legal and ethical requirements limit the release of data in human subjects studies.

Particularly with respect to human subjects, there are strong legal and ethical privacy and confidentiality protections, which researchers are bound to respect.¹³⁰⁹ In some cases, researchers would be subject to civil or criminal penalties for violations.¹³¹⁰

The environmental health dose response studies targeted by EPA's proposal are likely to include human population studies (or epidemiological studies). Often the best available epidemiological studies contain extensive and sensitive data on individuals, such as environmental exposures, medical history (such as infant reproductive developmental abnormalities, children's behavioral and development problems, heart attacks or dementia among the elderly), dates of birth, residential address, drug use, race, socio-economic status (income, education), status of subjects'

¹³⁰⁹ See, e.g., The National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research, The Belmont Report (Apr. 18, 1979), https://www.hhs.gov/ohrp/sites/default/files/the-belmont-report-508c_FINAL.pdf; Federal Policy for the Protection of Human Subjects; Final Rule, 82 Fed. Reg. 7,149 (Jan. 19, 2017); HIPAA Privacy Rule, 45 C.F.R. §§ 160, 164.102-06, 164.500-534.

¹³¹⁰ See, The Health Insurance Portability and Accountability Act of 1996 (HIPAA), Public Law 104-191 (enacted Aug. 21, 1996) (providing for criminal and civil penalties for violations).

marriages, employment history, etc. For example, air pollution studies commonly use residential address information to assign air pollution exposures and link them to health effects.¹³¹¹ Other studies focused on genetically susceptible populations may also be linked to genetic databases or contain information on key genetic mutations that are strongly predictive of serious health risks, such as risk of Alzheimer's disease, and are thus very sensitive.¹³¹²

To conduct these studies, investigators must obtain informed consent from the study participants to collect protected health information, and investigators must sign documents promising to protect the privacy of this individually identifiable health information. Absent complex, difficult, and costly de-identification and redaction techniques, these data simply cannot be released publicly. As discussed below in section II.A.2.b), in some cases such techniques are simply not applicable or still leave significant risk of breach of privacy.

Additional protections apply to specific types of human subject information. For example, medical records are subject to strict requirements governing the use and disclosure of such information under the HIPAA of 1996.¹³¹³ HIPAA requires researchers to protect identifiable information, and it provides that such information may only be disclosed for research purposes with the written consent of the person providing the information.¹³¹⁴

Another limitation on public availability of data is the requirement under the Federal Policy for the Protection of Human Subjects (also known as the Common Rule) that for all federally funded studies involving human research subjects, researchers must first obtain IRB approval and informed consent from study participants.¹³¹⁵

An IRB reviews each human subjects research project to ensure that the specific research protocol protects individual rights. Participants must be notified about the degree to which the confidentiality of their records will be maintained, and must receive appropriate notification and give consent if study data is to be shared outside the research team.¹³¹⁶ The IRB also considers risks to the participants and how use of the information obtained may adversely impact

¹³¹¹ See, e.g., Kaufman, Joel D., et al., Association between air pollution and coronary artery calcification within six metropolitan areas in the USA (the Multi-Ethnic Study of Atherosclerosis and Air Pollution): a longitudinal cohort study, 388.10045 *The Lancet* 696-704 (2016).

¹³¹² See, e.g., Richardson JR, Roy A, Shalat SL, von Stein RT, Hossain MM, Buckley B, Gearing M, Levey AI, German DC, Elevated serum pesticide levels and risk for Alzheimer disease, 71(3) *JAMA Neurology* 284-90 (Mar. 1, 2014).

¹³¹³ Public Law 104 – 191.

¹³¹⁴ National Research Council, *Expanding Access to Research Data: Reconciling Risks and Opportunities*, The National Academies Press (2005).

¹³¹⁵ 45 C.F.R. §§ 46.101-124 is the U.S. Department of Health and Human Services ("HHS") citation for the Common Rule. A total of 18 federal agencies have adopted it; each agency has its own separate entry in the Code of Federal Regulations. This federal rule governs ethical constraints that federally funded studies must follow, including academic research, responding to earlier concerns of ethical lapses in medical research. See, e.g., Jerry Menikoff, Could Tuskegee happen Today?, 1 *St. Louis U. J. Health L. & Pol'y* 311, 312-16 (2008) (describing the Congressional response to public outcry when the details of the Tuskegee experiment were brought to light). The thrust of the Common Rule is to address such matters of research ethics as informed consent, informational risk, and institutional oversight when research involves human subjects.

¹³¹⁶ See, 82 Fed. Reg. 7,149-7,274.

the rights and welfare of the subjects.¹³¹⁷ Most institutions have committed to comply with the Common Rule for all of their research, even when it is not federally-funded.¹³¹⁸

For studies that had received IRB approval prior to finalization of this proposed rule, there may be no practical opportunity to make the data publicly available. Even for new studies going forward, it may be extremely difficult, require additional (often unavailable) funding for elaborate protective measures, or simply impossible to obtain IRB approval for protocols that would allow the data to be made publicly available.

EPA's own SAB voiced these concerns that EPA was discounting the challenges to making even limited releases of data, saying:

The proposed rule oversimplifies the argument that “concerns about access to confidential or private information can, in many case, be addressed through the application of solutions commonly in use across some parts of the Federal government.” For studies already completed or underway, the participation of human subjects is undertaken according to terms approved by the cognizant IRB. These terms can vary from study to study. In some cases, the data cannot be released simply by redacting portions of it. For example, data may have been collected with an assurance to the participating individuals that their data would be kept confidential.¹³¹⁹

Some researchers might respond by choosing to work only on public administrative datasets, but this would harm rather than strengthen science quality by curtailing scientific inquiry. Thus, the effects of EPA's proposed approach would cause some researchers to choose not to pursue research with human subjects, stifling scientific discovery, while others would forgo compliance with EPA's regulatory requirements and have their research ignored by EPA. As a result, EPA's proposal would both discourage the development of best available science as well as EPA's use of it.

b) There are especially significant barriers to public release of underlying data and models from studies that have already been completed.

With respect to studies that have already been completed, there are additional formidable barriers to public release of underlying data and models. Particularly, with older studies, simply finding the data sets and determining ownership may be expensive or impossible. For older studies with human subjects, obtaining consent to release of data may be practically impossible, and the data may have been collected in ways that would make protecting privacy with release difficult or impossible.¹³²⁰

¹³¹⁷ Id.

¹³¹⁸ HHS, Federal wide Assurance (FWA) for the Protection of Human Subjects, <https://www.hhs.gov/ohrp/register-irbs-and-obtain-fwas/fwas/fwa-protection-of-human-subjecct/index.html>

¹³¹⁹ Memorandum by Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science (May 12, 2018).

¹³²⁰ See, e.g., National Academies of Sciences, Engineering, and Medicine, Principles and obstacles for sharing data from environmental health research: Workshop summary, 61-63 The National Academies Press (2016), <https://www.nap.edu/catalog/21703/principles-and-obstacles-for-sharing-data-from-environmental-health-research>.

For some studies, administrative issues related to the data could be the most difficult barrier to overcome in providing for public release. Larger and more costly studies are often performed by groups of researchers within a university, across multiple institutions, or across multiple individual companies. Over time, the data itself may become lost or misplaced, or it may become unclear who actually owns and controls access to the data. Academics move among institutions, companies merge and spin off, and the initial agreements were not always clear in the first instance. Obtaining consent from multiple institutional players takes extensive time and resources, at minimum, and simply may no longer be possible in some instances.¹³²¹

These problems are exacerbated with respect to human subject studies. Researchers are legally and ethically obliged either to protect the privacy of the individual study subjects or attain each subject's consent to share data.¹³²² This can be impractical for older studies and virtually impossible for larger studies, and extremely burdensome. For example, the Harvard Six cities study was started in 1975 and had 8,111 participants.¹³²³ The ACS CPSII extended analysis by Krewski in 2009, which is central to PM2.5 NAAQS standards, was initiated in 1979 and encompassed data from 500,000 study participants who lived in 116 metropolitan areas.¹³²⁴ For these types of situations, tracking down participants (or where the participants have passed away, their family members) to get consent is simply not realistically possible.

Even in situations where investigators might theoretically be able to attain consent, it would require extensive financial and human resources, which are usually simply not available, especially to academic researchers or to EPA. EPA ignores this prohibitive constraint and makes no attempt to address it.

c) There are additional significant barriers to public release of data in some situations, even for prospective studies.

Even with respect to prospective application of EPA's proposal, providing for public release of underlying data and models is costly and resource intensive, creating a serious disincentive for researchers to meet EPA's proposed requirements. Investigators willing to make their study underlying data publicly available would still face the logistical hurdle of making the data and models available in a manner sufficient for independent validation by the public. In addition to the cost of thoughtful and effective deidentification or redaction of sensitive information, the proposed text would likely require researchers to prepare annotated manuals including precise detail as to what variables were collected, how information was collected, and the rationale for each step taken. Some manuals alone run into hundreds of pages. One press account noted the example of publicly available datasets from the National Center for Health Statistics (NCHS), which can come with 100-page manuals; researchers would need to hire additional staff to meet

¹³²¹ Id. at 45.

¹³²² Federal Policy for the Protection of Human Subjects; Final Rule, 82 Fed. Reg. 7,149 (Jan. 19, 2017); HIPAA Privacy Rule, 45 C.F.R. §§ 160, 164.102-106, 164.500-534.

¹³²³ Dockery, D.W., Pope, C.A., Xu, X., Spengler, J.D., Ware, J.H., Fay, M.E., Ferris Jr, B.G. and Speizer, F.E., An association between air pollution and mortality in six US cities, 329(24) *New England Journal of Medicine*, 1753-1759 (1993).

¹³²⁴ Krewski D, Jerrett M, Burnett RT, et al., *Extended Follow-Up and Spatial Analysis of the American Cancer Society Study Linking Particulate Air Pollution and Mortality*, 140 Health Effects Institute, Boston MA (2009). (last accessed Aug. 13, 2018).

such requirements.¹³²⁵ Yet EPA fails even to recognize (much less propose any means to address) the cost to researchers in time and money, on top of the constraints on academic research already imposed by the very limited funding available for this type of work.

In addition, there are other barriers to public release of underlying data. Studies conducted on behalf of industry or with industry cooperation may contain confidential business information, the release of which could jeopardize a company's competitiveness.

Also, in some instances, researchers cannot make their data sets public without losing much of the value to the researcher of these laboriously and meticulously collected sets of information. Research, especially those studies that include large numbers of human subjects, are incredibly human and capital-intensive endeavors. Moreover researchers may base years of work and multiple papers on unique datasets they developed and hold, and many scientists build their careers on carefully harvesting information from single large studies for years to come. It is not only unreasonable, but also unfair, to expect academic scientists to turn over their intellectual property and research investments, forgoing potential earnings and career advancements. Moreover, EPA's myopic and inflexible approach to data access gives no consideration to data sharing arrangements between researchers and the agency that could be developed to support EPA's consideration and integration of research.

If scientists are forced to choose between giving away their hard-earned data or forgoing any regulatory impact, it will discourage scientists from engaging in critical science that is targeted to help prevent disease and disability in our population. It appears that in many cases, scientists will choose to retain their datasets, with a worst-of-both-worlds result—EPA will be deprived of valid scientific information and the scientific community will be discouraged from contributing their critical expertise to policymaking. EPA's Proposal does not consider the real-world implications of forcing such choices on researchers.

The commenter argues that the agency's failure to consider or examine any of these legitimate reasons for not making data publicly available is arbitrary and capricious.

Response: See the final rule preamble at Section III.A and Chapter 2 of this document for an explanation of the need for greater transparency. See response to Comment 4829-2022. EPA notes that the final rule does not preclude EPA from considering studies based on data that is not publicly available. See § 30.5 of the final rule.

Comment [8750-1497]: Commenter (9227) states that in the proposal, the EPA blithely and irrationally ignores or assumes away real and significant issues, suggesting that existing mechanisms and techniques can be used to protect privacy and confidentiality while making underlying research data publicly available. In fact, according to the commenter, the evidence (including several of the sources that EPA cites) indicates that the potential mechanisms alluded to by EPA would only have the potential to address some of the barriers cited above, have

¹³²⁵ Alessandra Potenza and Rachel Becker, Scott Pruitt's new 'secret science' proposal is the wrong way to increase transparency. Here's what scientists think a science transparency rule should include, The Verge (May 1, 2018, 8:30am EDT), <https://www.theverge.com/2018/5/1/17304298/epa-science-transparency-rule-scott-pruitt-datasharing>.

serious limitations even for those, and are actually becoming less effective as it becomes easier to combine and manipulate public data sets.

Response: This rule does not require that dose-response data be made publicly available, nor does this rule categorically exclude any dose-response data based on the availability of the dose-response data. As discussed in Section III.E of the final rule preamble, EPA will give greater consideration to pivotal science if the underlying dose-response data is available, including through tiered or restricted access, for independent validation.

Comment [8750-1637]: Commenter (9227) states that the EPA begins by stating that the “proposed rule is consistent with the principles underlying the Administrative Procedure Act and programmatic statutes that EPA administers to disclose to the public the bases for agency rules and to rationally execute and adequately explain agency actions.”¹³²⁶ While EPA is correct that it must disclose the basis and provide an adequate explanation for rulemaking (principles EPA manifestly fails to follow in this Proposal), it does not follow that these principles either require or support the quite specific notion that dose response data and models must be publicly available. Nor does EPA attempt to explain how these broadest of rulemaking principles support EPA’s specific proposed approach here.

Response: This rule does not require that any data be made publicly available.

Comment [8750-1678]: Commenter (9227) states that the Proposal turns away from EPA’s Scientific Integrity Policy, which stresses “a firm commitment to evidence,”¹³²⁷ endorses use of “the best available science”¹³²⁸ and “[r]equire[s] reviews. . . regarding the content of a scientific product to be based only on scientific quality considerations.”¹³²⁹ The Proposal, on the other hand, inhibits use of sound scientific information and evidence by arbitrarily excluding science for reasons unrelated to its quality. While the policy “[r]ecognizes the value of independent validation of scientific methods”¹³³⁰ and facilitating “the free flow of scientific information” by making information available “including access to data and non-proprietary models underlying Agency policy decisions,”¹³³¹ this is proposed as a flexible standard and an ideal to aspire to, not an absolute rule that takes priority over other competing interests—such as use of the best scientific information. As discussed more in Section VII.C [of the commenter’s letter], this Administration has blatantly violated key aspects of the policy by silencing scientists and the dissemination of scientific information, which this Proposal seems aimed at continuing, directly undoing “EPA’s longstanding commitment to the timely and unfiltered dissemination of its scientific information – uncompromised by political or other interference” and goal to communicate scientific findings openly and actively to the public.¹³³² By now placing “transparency” ahead of use of the best available science, aside from violating statutory requirements, EPA is changing its own policies and priorities and must justify this new position.

¹³²⁶ 83 Fed. Reg. at 18,769.

¹³²⁷ EPA, Scientific Integrity Policy 3.

¹³²⁸ Id. at 3-4.

¹³²⁹ Id. at 4.

¹³³⁰ Id.

¹³³¹ Id.

¹³³² Id. at 5.

In footnote 2, EPA dubiously claims the Proposal is consistent with the Memorandum for the Heads of Executive Department and Agencies on Scientific Integrity (Mar. 9, 2009).¹³³³ Notably, the Memorandum specifies, “Except for information that is properly restricted from disclosure under procedures established in accordance with statute, regulation, Executive Order, or Presidential Memorandum, each agency should make available to the public the scientific or technological findings or conclusions considered or relied on in policy decisions.”¹³³⁴ Not only does the Memorandum provide no support for the notion that agencies should be barred from relying on studies where the underlying data is properly restricted from disclosure it additionally discusses disclosure only of findings and conclusions, not underlying data.

Thus, despite EPA’s claims to the contrary, the Proposal marks a shift in policy that EPA has up to this point followed EPA arbitrarily fails to acknowledge this shift, to identify good reasons for the change, or to explain why EPA believes the proposed rule would be an improvement over current mechanisms utilized by EPA to ensure the integrity of EPA’s actions.

Response: See the final rule preamble at Section III.A and Chapter 2 of this document for an explanation of the need for greater transparency. EPA notes that this final rule does not require EPA to categorically exclude any studies. See response to Comment 4829-2022.

Comment [8750-1682]: Commenter (9227) states that an agency rule is arbitrary and capricious if it “entirely failed to consider an important aspect of the problem.”¹³³⁵ EPA’s Proposal completely fails to consider the numerous barriers that currently exist to making underlying data public. As highlighted in OMB and EPA policies, there is an understanding that the worthy goal of ensuring greater transparency of scientific information is in tension with other compelling, competing interests such as privacy and confidentiality. When these two are in tension, existing policies have recognized that this will prevent certain data from being publicly released—and that agencies still need to be able to use scientific information in these circumstances.

Transparency goals should not override the ability of the agency to rely on otherwise valid scientific information as it goes about achieving its core mission. While the Proposal purports to take into account privacy and confidentiality concerns, it appears to do so by either grossly oversimplifying EPA’s ability to address these concerns or by deeming all such information unusable—essentially completely failing to consider the problems of this approach.

OMB Circular A-130 recognizes that the values of openness, transparency, and allowing the free flow of information between the federal government and the public are important values, they must be contextualized. Thus, it cautions: “Promoting openness and interoperability, subject to applicable legal and policy requirements, increases operational efficiencies, reduces costs, improves services, supports mission needs, and increases public access to valuable Federal

¹³³³ 83 Fed. Reg. at 18,769 n. 2 (“If scientific and technological information is developed and used by the Federal Government, it should ordinarily be made available to the public. To the extent permitted by law, there should be transparency in the preparation, identification, and use of scientific and technological information in policymaking.”)

¹³³⁴ Memorandum for the Heads of Executive Department and Agencies on Scientific Integrity (Mar. 9, 2009), 74 Fed. Reg. 10671 (Mar. 11, 2009), <https://obamawhitehouse.archives.gov/the-press-office/memorandum-heads-executive-departments-and-agencies-3-9-09> (emphasis added).

¹³³⁵ *Motor Vehicle Mfrs. Ass’n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983).

information.”¹³³⁶ Similarly it states: “The open and efficient exchange of scientific and technical Federal information, subject to applicable security and privacy controls and the proprietary rights of others, fosters excellence in scientific research and effective use of Federal research and development resources.”¹³³⁷ Circular A-130 makes clear that “[p]rotecting an individual’s privacy is of utmost importance. The Federal Government shall consider and protect an individual’s privacy throughout the information life cycle.”¹³³⁸ It requires that agencies recognize that “Federal information is managed by making information accessible, discoverable, and usable by the public to the extent permitted by law and subject to privacy, security (which includes confidentiality), or other valid restrictions pertaining to access, use, dissemination, and disclosure. . . .”¹³³⁹

Further, Circular A-130 requires agencies to “[l]imit the creation, collection, use, processing, storage, maintenance, dissemination, and disclosure of [personally identifiable information] to that which is legally authorized, relevant, and reasonably deemed necessary for the proper performance of agency functions” and “[t]o the extent reasonably practicable. . . reduce all [personally identifiable information] to the minimum necessary for the proper performance of authorized agency functions.”¹³⁴⁰

The appendix to the Circular realizes that privacy protections require ongoing progress and:

Emerging technologies and services may continue to shift the ways in which agencies acquire, develop, manage, and use information and technology. As technologies and services continue to change, so will the threat environment. Agency programs must have the capability to identify, respond to, and recover from current threats while protecting their information resources and the privacy of the individuals whose information they maintain.¹³⁴¹

OMB Memorandum M-14-06 specifically lays out policies intended to help agencies make the most of “administrative data that cannot be made publicly available due to statutory, regulatory, or policy protections,” for statistical purposes, including “activities typically characterized as research, evaluation, and analysis, as long as the focus of those activities is on reporting aggregate findings about a group.”¹³⁴² It notes “[s]ome administrative data can be publicly released, whereas other administrative data cannot be released. . . [and] it is the case that both types of administrative data (public and nonpublic) can be useful for Federal statistical purposes,” suggesting agencies should not abandon reliance on data not able to be publicly released.¹³⁴³

OMB Memorandum M-11-02 “strongly encourages Federal agencies to engage in coordinated efforts to share high-value data” but notes that in certain cases sharing data will contravene other compelling concerns and that federal agencies need to think about applicable privacy laws,

¹³³⁶ OMB Circular A-130 at 3 (emphasis added).

¹³⁴² OMB Memorandum M-14-06 at 6.

¹³⁴³ *Id.* at 2.

regulations, and policies to “fully protect[] individual privacy” and preserve public trust.¹³⁴⁴ Unlike the Proposal, it takes a more nuanced approach recognizing that sharing data is not always appropriate and should only be done “responsibly and appropriately.”¹³⁴⁵

OMB recognizes that even when just sharing information among agencies, privacy concerns must be weighed against those benefits that agencies can achieve with sharing data: “Agencies should work together to determine what data sharing opportunities are desirable, feasible, and appropriate. In general, data sharing should only be pursued if the benefits outweigh the costs.”¹³⁴⁶

OMB Memorandum M-10-06 also encourages “a plan for timely publication of the underlying data. . . in an open format and as granular as possible, consistent with statutory responsibilities and subject to valid privacy, confidentiality, security, or other restrictions.”¹³⁴⁷ The memorandum aims to achieve “transparency, participation, and collaboration,”¹³⁴⁸ recognizing that not making data available does not deter those goals when there are valid concerns and the legitimacy of the data is not otherwise questioned.

EPA’s Draft Strategic Data Action Plan Version 1.0 similarly aims to work towards a more open government, and to increase the public’s access to high quality data. However, the agency recognizes barriers to this goal, not applying the plan to “data resources containing CBI or sensitive data that are not available for public access.”¹³⁴⁹ EPA similarly recognizes that “[i]n order to protect the privacy and security of the public, businesses, and US Government staff and operations, some types of data may be deemed sensitive and will not be made public or published on Data.gov.”¹³⁵⁰

The commenter states that these examples all highlight instances where EPA and OMB have recognized that privacy and confidentiality present ongoing concerns that are not easily addressed and that conflict with other aims of federal government. Yet, they recognize that protecting information in these cases is a valid path, and not making data public does not compromise the validity of the findings or conclusions upon which the data is based and should prevent agencies from using those findings, conclusions, and data to inform their work. According to the commenter, the Proposal provides no explanation for why EPA is now changing its view to a conflicting one, making the Proposal arbitrary.

Response: See the final rule preamble at Section III.A and Chapter 2 of this document for an explanation of the need for greater transparency.

¹³⁵⁰ *Id.* at 14.

Comment [8750-1697]: Commenter (9227) states that the proposed rule asserts that a broad interest of the current Administration is to “ensure that the data and models underlying scientific studies that are pivotal to . . . regulatory action are available to the public”¹³⁵¹ and to “change agency culture and practices regarding data access so that the scientific justification for regulatory actions is truly available for validation and analysis.”¹³⁵² However, the Proposal specifies a particular interest and initial focus on “dose response data and models” as evident throughout the preamble and proposed regulatory provisions.

Dose-response studies are a critical element of risk assessments for toxicants including air pollutants. Assessment of a toxicants risks typically proceeds through a four-step process: 1) hazard identification, 2) dose-response assessment, 3) exposure assessment, and 4) risk characterization.¹³⁵³ Dose-response assessment describes the relationship between exposure to a toxicant and observed effect on human or ecological receptor. EPA provides the following description of dose-response on its website: “Dose-Response Assessment . . . characterizes the quantitative relationship between chemical exposure and each credible health hazard. These quantitative relationships are then used to derive toxicity values.”¹³⁵⁴ Dose-response plays a central role in the evaluation of chemical risks as it provides the characterization of the potency or effect size of the toxicant. In other words, dose-response assessment is used to determine the levels of exposure at which adverse effects will occur and thus informs what risk management actions should be taken to protect human and ecological health. Dose-response assessments are commonly used to derive chemical toxicity values. The lower a substance’s toxicity value the greater its potency and the less exposure is necessary for an effect to occur.

EPA reveals the underlying motivation behind its interest in transparency of dose response data and models on page eight of the Proposal, where it states:

In addition, this proposed regulation is designed to increase transparency of the assumptions underlying dose response models. As a case in point, there is growing empirical evidence of non-linearity in the concentration-response function for specific pollutants and health effects. The use of default models, without consideration of alternatives or model uncertainty, can obscure the scientific justification for EPA actions. To be even more transparent about these complex relationships, EPA should give appropriate consideration to high quality studies that explore: A broad class of parametric concentration-response models with a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the exposure range; and spatial heterogeneity. EPA should also incorporate the concept of model uncertainty when needed as a default to optimize low dose risk estimation based on major competing models, including linear, threshold, and U-shaped, J-shaped, and bell-shaped models.¹³⁵⁵

¹³⁵¹ Proposed Rule, 83 Fed. Reg. at 18769-70..

¹³⁵² Proposed Rule, 83 Fed. Reg. at 18770

¹³⁵³ EPA, Conducting a Human Health Risk Assessment, <https://www.epa.gov/risk/conducting-human-health-riskassessment> (last accessed Aug. 16, 2018).

¹³⁵⁴ EPA, Basic Information about the Integrated Risk Information System, <https://www.epa.gov/iris/basic-information-about-integrated-risk-information-system> (last accessed Aug. 16, 2018).

¹³⁵⁵ Proposed Rule, 83 Fed. Reg. at 18770.

This excerpt raises several troubling and erroneous concepts that are contrary to core scientific tenets and best practices in chemical hazard and risk assessment as discussed extensively in a seminal 2009 report by the National Academies (Academies): *Science and Decisions: Advancing Risk Assessment (Science and Decisions)*.¹³⁵⁶ The report was requested and sponsored by EPA's National Center for Environmental Assessment and was developed over a three-year period by a 15-member committee that included state environmental agencies, non-governmental organizations, industry, and academic institutions. The committee was specifically tasked with "developing scientific and technical recommendations for improving risk analysis approaches used by EPA, including providing practical improvements that EPA could make in the near term (2-5 years) and in the longer term (10-20 years)."¹³⁵⁷ The report has been cited over 400 times in the scientific literature.

The Proposal fails to discuss these best practices for risk assessment, much less provide any persuasive reason for departing from them. The Proposal provides no support for its assertion that there is "growing empirical evidence" of nonlinearity in dose-response relationships; fails to acknowledge or contend with the National Academies' finding that nonthreshold dose-response relationships are common for toxicants, and should be assumed as a default; fails to discuss the well-known rationales put forward by the National Academies for using default models; and irrationally prioritizes consideration of studies that employ a wide range of dose-response models, without any consideration for whether those alternative dose-response models are appropriate for risk assessment. Alarming, the Proposal offers no analysis of how the proposed requirements to consider threshold-response relationships and avoid default models would further the protection of human health and the environment—and gives no indication that the Agency has considered whether its proposed approach affords appropriate protection for the public in evaluating the risks of dangerous pollutants and toxicants. The proposed requirement is irretrievably arbitrary and unjustified and must be withdrawn.

Response: EPA notes that the final rule only applies to dose-response data underlying pivotal science used in significant regulatory actions.

Comment [8750-1761]: Commenter (9227) states that it is arbitrary and capricious to "entirely fail[] to consider an important aspect of the problem" when deciding whether regulation is appropriate." *Michigan v. EPA*, 135 S. Ct. 2699, 2707 (2015) (quoting *State Farm*, 463 U.S. at 43). As in *Michigan*, failure to consider the costs and benefits of a regulation where there is no statutory bar to doing so is arbitrary and capricious.

The proposed rule entirely fails to comply with the requirements of non-arbitrary-and capricious rulemaking because it fails to disclose, much less analyze or consider, any of the costs of the rule; barely discusses and does not analyze or quantify the benefits; does not provide any reasoned explanation of why the benefits of the rule justify its costs; and does not consider potential alternatives. The Proposal's discussion of costs and benefits is a scant two paragraphs¹³⁵⁸ (and was apparently not included at all in the version sent to the Office of

¹³⁵⁶ National Academies, *Science and Decisions: Advancing Risk Assessment* (2009), <https://www.nap.edu/catalog/12209/science-and-decisions-advancing-risk-assessment>.

¹³⁵⁷ *Id.*

¹³⁵⁸ Proposed Rule, 83 Fed. Reg. at 18,772.

Management and Budget).¹³⁵⁹ The proposed rule begins by conclusory asserting that “EPA believes the benefits of this proposed rule justify the costs.”¹³⁶⁰ It then briefly discusses the perceived benefits, incorrectly suggesting that the NAS shares EPA’s view by citing to a publication that discusses both risks and opportunities of expanding access to research data, and does not discuss at all the costs and benefits of ignoring relevant science in regulatory decision-making.¹³⁶¹ It then merely states that the “action should be implemented in a cost-effective manner,” citing vaguely to “recent activities of the scientific community and other federal agencies” without any concrete examples or analysis.¹³⁶² The preamble’s discussion emphasizes that the Proposal does not compel EPA to make information available where it concludes that doing so is not possible, but omits that if compliance is not possible, EPA will not consider the study, which has its own costs. It then concludes by citing the working paper of the Mercatus Center¹³⁶³ that baldly asserts that improvements in reproducibility “can be thought of as increasing the net benefits of regulation because they would avoid situations in which costs or benefits are wrongly estimated to occur or in which regulatory costs are imposed without corresponding benefits.”¹³⁶⁴ Setting aside the lack of substantiation for this assertion, it entirely omits situations in which costs and benefits are wrongly estimated because the relevant science is not used—and the costs that would be imposed on society if EPA inadequately protects communities from harmful pollution or toxic exposures.

Indeed, the Proposal nowhere discusses its significant costs in either quantitative or qualitative terms, costs that have actually been examined by independent organizations, and that are susceptible to analysis. If the Proposal is truly “designed to provide a mechanism to increase access to” data “in a manner consistent with statutory requirements for protection of privacy and confidentiality of research participants,” 83 Fed. Reg. at 18,770, then it will have significant costs. And if, as it appears, the Proposal’s true “mechanism” is excluding science from regulatory decision-making, its costs will be even greater in the form of insufficiently protective regulations.

If it were not possible to quantify and monetize any of the costs, which is not the case here as discussed below, EPA would still be required under Executive Order 12866 and the requirements of rational rulemaking to identify and discuss the qualitative costs of this Proposal. It is inherently irrational for an agency to take an action without any consideration of any costs, disadvantages, or negative effects of that action. The qualitative costs of this Proposal include the costs to researchers of actions they must undertake to protect the confidentiality of patient and subject data, as well as to compile and make public their raw data, and the potential loss of subjects (and attendant damage to research efforts and results) due to confidentiality concerns.

¹³⁵⁹ Compare, EO 12866 Proposal 2080-AA14 OIRA Conclusion Document (Docket ID. No. EPA-HQ-OA-2018-0259-0006) with EO 12866 Proposal 2080-AA14 OIRA Review Start Document (Docket ID. No. EPA-HQ-OA2018-0259-0007).

¹³⁶⁰ Proposed Rule, 83 Fed. Reg. at 18,772.

¹³⁶¹ *Id.*

¹³⁶² *Id.*

¹³⁶³ For a proposal allegedly aimed at increasing transparency, it is notable that EPA does not disclose that Charles Koch—an outspoken opponent of public health protections who stands to gain financially from deregulation—is a board member of the Mercatus Center. Mercatus Center, Charles Koch, <https://www.mercatus.org/charles-koch> (last accessed: Aug. 1, 2018).

¹³⁶⁴ Proposed Rule, 83 Fed. Reg. at 18,772.

There are also various costs to the agency of administering the regulation, which include contacting researchers, gathering data, ensuring that patient confidentiality and confidential business information are not disclosed. Additional costs could also be incurred through conducting any additional peer reviews required by proposed section 30.7 and any additional analyses imposed by proposed section 30.6's requirement that "EPA shall clearly explain the scientific basis for each model assumption used and present analyses showing the sensitivity of the modeled results to alternative assumptions." Most importantly, there are potentially huge costs of regulating without using the relevant science merely because the underlying raw data is not publicly available. If studies supporting a stronger standard are excluded and EPA can therefore only justify a weaker requirement that leaves large numbers of people at risk of health effects from a pollutant, pesticide, or chemical, then this Proposal could impose enormous costs for each insufficiently protective regulation.¹³⁶⁵ Yet the Proposal fails even to mention these costs, let alone discuss their scope and significance.

In addition, many of these costs can be quantified and monetized, but EPA has neither attempted to do so nor explained why it could not. For example, EPA has extensive information available to it on what the agency would need to do to implement this Proposal and how much those activities would cost. In fact, EPA already gathered much of this data and provided it to the CBO for use in estimating the costs of a similar (though not identical) proposal from Congress, the HONEST Act. With respect to the Congressional proposal, CBO concluded, just with respect to the costs to EPA, that "based on information from the EPA and other federal agencies, as well as organizations and researchers in the scientific community that publish in peer-reviewed journals," EPA "could spend between a few million dollars per year to more than one hundred million dollars per year ... to ensure that data and other information underlying studies are publicly available in a format sufficient to allow others to substantially reproduce the results of studies."¹³⁶⁶ In the 2017 estimate, CBO concluded that "[i]f the EPA continued to rely on as many scientific studies as it has used in recent years ... then CBO estimates that the agency would need to spend at least \$100 million dollars per year to upgrade the format and availability of those studies' data," "on average, \$10,000 per scientific study."¹³⁶⁷ Such costs would cover the costs of "obtaining all the underlying data used in a study, reviewing the data to address any confidentiality concerns, formatting the data for public access, providing access to the computer codes and models used in the study's analysis, and providing descriptions and documentation on how to access the data."¹³⁶⁸ Notably, this does not include the cost to researchers to engage in this effort. As Deputy Assistant Administrator Nancy Beck noted, during the development of the

¹³⁶⁵ In footnote 3 of the Proposal, Proposed Rule, 83 Fed. Reg. at 18,769, EPA suggests that the studies underlying the NAAQS for particulate matter, at issue in the case cited—*Am. Trucking Ass'ns v. EPA*, 283 F.3d 355, 358 (D.C. Cir. 2002)—are an example of data the agency would be "preclude[d]" from using in the future. The benefits of these NAAQS included up to \$75,100 million in annual benefits from avoided cases of mortality in 2010 alone for a partial attainment scenario. National Research Council (US) Committee, *Estimating the Health-Risk-Reduction Benefits of Proposed Air Pollution Regulations*, 43 National Academies Press (2002), <https://www.ncbi.nlm.nih.gov/books/NBK221028/>.

¹³⁶⁶ Congressional Budget Cost Estimate for H.R. 1430, *Honest and Open New EPA Science Treatment (HONEST) Act of 2017* (Mar. 29, 2017) ("2017 CBO Estimate"); see also Congressional Budget Office Cost Estimate, S. 544, *Secret Science Reform Act of 2015* (June 5, 2015) (estimating that another similar congressional proposal would cost up to \$250 million per year).

¹³⁶⁷ 2017 CBO Estimate at 3.

¹³⁶⁸ *Id.*

Proposal, requiring “a huge amount of data to be submitted to the agency” would “be incredibly burdensome” and “not practical.”¹³⁶⁹

Even the Mercatus working paper—apparently the only thing EPA relied upon in discussing the costs and benefits of the Proposal, 83 Fed. Reg. 18,772 n. 24, notes, with respect to the HONEST Act, that “[t]he cost of providing access to data has been one of the primary concerns about requiring access to data used by the federal government.”¹³⁷⁰ Far from concluding, as the Proposal suggests, an increase in net benefits from greater reproducibility, the Mercatus working paper simply explained a figure the authors were suggesting could be calculated (the point where net benefits would be positive); the authors do not themselves calculate the benefits, and admit that their “estimates of the benefits of public access to data supporting federal regulatory decisions fall short of proving that the benefits outweigh the associated costs.”¹³⁷¹ And while the Mercatus working paper disagrees with CBO’s cost estimates, it does not argue that that requiring access to data is cost-less; indeed, it discusses the “costly activities and services that need to be performed,” including activities related to “data collection and data accessibility.”¹³⁷² According to that working paper, data collection requires “correspond[ing] with researchers and publishers to obtain the data, review[ing] the data for confidentiality concerns, format[ing] the data for public access, publicly post[ing] the computer code and models used in each study’s analysis, and provid[ing] descriptions and documentation on how to obtain the data.”¹³⁷³ Data accessibility requires “computer processing services to construct and maintain data bases to store study-related information.”¹³⁷⁴ While the actual calculations put forward by the Mercatus working paper appear faulty (for example, it entirely omits the cost to researchers to compile and make their data public, does not include the costs of ensuring patient privacy is protected,¹³⁷⁵ and makes assumptions about the similarity of a chemical manufacturer collecting its own studies and EPA collecting and disseminating information of other researchers), the working paper at least acknowledges that there are costs, something EPA’s Proposal completely ignores.

Nor does the proposed rule disclose the cost—highlighted on the very first page of a NAS report on data access—that “perceived risks to privacy and confidentiality reduce survey participation,” a cost that the NAS explains is “borne out by research.”¹³⁷⁶ NAS explains that this “threatens the research enterprise itself, because concerns about privacy and confidentiality are among the reasons often given by potential respondents for refusing to participate in surveys, and those concerns have been shown to affect behavior as well.”¹³⁷⁷ The NAS panel emphasized: “Any confidentiality breach that became known would be likely to heighten such concerns and, correspondingly, reduce survey response rates. Efforts to increase researchers’ access to data

¹³⁷⁴ *Id.* at 20-21 (quoting CBO, “Cost Estimate, S. 544, Secret Science Reform Act of 2015,” June 5, 2015).

¹³⁷⁵ For example, this may require special archiving and access arrangements to limit data sharing, such as those in NIH data sharing plans, which NIH requires only for studies that receive more than \$500,000 in federal funding in a year. NIH, NIH Data Sharing Policy and Implementation Guidance, https://grants.nih.gov/grants/policy/data_sharing/data_sharing_guidance.htm (last accessed Aug. 16, 2018).

¹³⁷⁶ National Research Council, *Expanding Access to Research Data: Reconciling Risks and Opportunities*, vii (National Academies Press (2005)).

¹³⁷⁷ *Id.* at 51; see also *id.* at 52-54 (describing the research supporting this risk).

must, therefore, take into account the need to avoid increasing the actual and perceived risks of confidentiality breaches.”¹³⁷⁸ The Proposal does not so much as discuss this potential cost.

This confidentiality risk has a further cost: it affects the quality of the data collected. As the NAS explained:

The reason for confidentiality pledges and for stringent procedures to prevent disclosure is that they improve the quality of data collected from individuals, households, and firms. It is essential that respondents believe they can provide accurate, complete information without any fear that the information will be disclosed inappropriately. Indeed, if the information was disclosed, harm might come to an individual respondent.¹³⁷⁹

The Proposal’s only acknowledgment of this complex problem and cost is its statement that “EPA believes that concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions commonly in use across some parts of the Federal government.”¹³⁸⁰ Remarkably, EPA does not cite a single example of these common solutions, citing only vaguely to “examples from the U.S. Department of Health and Human Services, National Institute of Standards and Technology, U.S. Department of Education, and the U.S. Census Bureau” and some hyperlinks not in the Proposal added to the docket almost a month into the comment period.¹³⁸¹ Accordingly, not only does the Proposal include no analysis of these alleged solutions and their costs and benefits, it does not even explain what the solutions are that EPA believes address this concern.

And if EPA complies with the regulation not by spending the money to make data publicly available, and if the research community does not bear those costs itself, see 83 Fed. Reg. at 18,770-71 (“Nothing in the proposed rule compels the disclosure of any confidential or private information in a manner that violates applicable legal and ethical protections.”), then it appears that EPA would simply ignore studies that do not comply with the regulation. See 83 Fed. Reg. at 18,769 n. 3 (“EPA is proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions.”). That course of action has its own significant costs, and EPA provides no analysis in the Proposal of the magnitude of studies that it has previously relied upon that it could no longer rely upon in regulating. See 2017 CBO Estimate (“EPA officials have explained to CBO that the agency would implement H.R. 1430 with minimal funding and generally would not disseminate information for the scientific studies that it uses to support covered actions. That approach to implementing the legislation would significantly reduce the number of studies that the agency relies on when issuing or proposing covered actions....”). As the SAB noted in its May 12, 2018 letter, “[t]he proposed rule does not include any assessment of the impact of data restrictions on existing or future regulatory programs. Without access to the restricted data, regulatory programs could become

¹³⁷⁸ Id. at 51.

¹³⁷⁹ Id.

¹³⁸⁰ 83 Fed. Reg. at 18,770.

¹³⁸¹ Id.

more or less stringent than they otherwise would be, with consequences for both regulatory costs and benefits.”¹³⁸²

Likewise, EPA has included only a cursory mention of the expected qualitative benefits of the Proposal, with no discussion of the anticipated likelihood, scope, or impact of the suggested benefits, let alone any effort to quantify them, much less monetize them. EPA simply assumes that the Proposal will “improve the data and scientific quality of the Agency’s actions and facilitate expanded data sharing an exploration of key data sets” without any analysis or evidence. In fact, as we have explained, the likely outcome of the Proposal is that it will degrade the data and scientific quality of the Agency’s actions by ignoring relevant science simply because the underlying data is not publicly available. Moreover, EPA’s finding is not consistent with the conclusions of the National Academies, as the Proposal suggests. As also explained above, the NAS report highlighted both the risks and benefits of making data publicly available and nowhere concluded that there were benefits to excluding data from the agency’s regulatory decisions simply because the underlying data was not publicly available. Nor does the agency analyze how likely its Proposal is to actually facilitate expanded data sharing, and its main aim appears to be excluding science as it does not actually provide any funding, mechanisms, or best practices for sharing data.

It is more than ironic that EPA claims—without any data or analysis—that its Proposal will increase the net benefits of other regulations while it does nothing to actually consider the costs and benefits of the Proposal itself. Moreover, there is no reason to think that excluding relevant science merely because the underlying data is not publicly available would increase the net benefits of a regulation. For example, it appears that under the proposed rule EPA would exclude a peer-reviewed, published study whose conclusion had been reproduced based upon numerous different datasets (and whose underlying data, though not publicly available, had been reevaluated by outside experts), while including a study that had had no peer review, was not published, had no corroborating studies, and had not actually been replicated or reproduced, merely because the underlying data was made publicly available. That is simply not a recipe for more accurate decision-making.

The proposed rule also violates the APA and other statutes’ requirements for reasoned decision-making by failing to consider any alternative approaches, much less their costs, here. This is particularly irrational in this context where it appears that many of the benefits sought by EPA could be largely achieved with much less burdensome and costly approaches. A critical element of reasoned decision-making is consideration of alternatives which are congruent with agencies’ statutory responsibilities and objectives. *Motor Vehicle Mfrs. Ass’n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 48, 50 (1983) (safety agency acted arbitrarily in failing to consider alternative safety measures after rejecting passive restraints). EPA failed to consider other methods to ensure scientific robustness at the agency. For example, the SAB letter notes that “[t]he proposed rule fails to mention that there are various ways to assess the validity of prior epidemiologic studies without public access to data and analytic methods.”¹³⁸³ The Proposal does

¹³⁸² Memorandum from Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science to Members of the Chartered SAB and SAB Liaisons 3 (May 18, 2018).

¹³⁸³ *Id.* at 4 (pointing to the Health Effects Institute re-analysis of the Harvard Six Cities and American Cancer Society epidemiological studies).

not consider any alternatives to ensuring that studies are reliable even where the underlying data cannot be made public because of privacy or other concerns.

Furthermore, by failing to consider costs and benefits, the Proposal contravenes Executive Order 12866. Executive Order 12866 requires agencies to assess the costs and benefits of proposed regulations and propose or adopt a regulation only upon a reasoned determination that the benefits justify the costs.¹³⁸⁴ For “significant regulatory actions,” like the proposed rule, 83 Fed. Reg. at 18,772, the agency must provide:

An assessment, including the underlying analysis, of benefits anticipated from the regulatory action (such as, but not limited to, the promotion of the efficient functioning of the economy and private markets, the enhancement of health and safety, the protection of the natural environment, and the elimination or reduction of discrimination or bias) together with, to the extent feasible, a quantification of those benefits;

An assessment, including the underlying analysis, of costs anticipated from the regulatory action (such as, but not limited to, the direct cost both to the government in administering the regulation and to businesses and others in complying with the regulation, and any adverse effects on the efficient functioning of the economy, private markets (including productivity, employment, and competitiveness), health, safety, and the natural environment), together with, to the extent feasible, a quantification of those costs; and

An assessment, including the underlying analysis, of costs and benefits of potentially effective and reasonably feasible alternatives to the planned regulation, identified by the agencies or the public (including improving the current regulation and reasonably viable nonregulatory actions), and an explanation why the planned regulatory action is preferable to the identified potential alternatives.¹³⁸⁵

The agency must also make these assessments and analyses “available to the public.”¹³⁸⁶ Executive Order 13563 reaffirms these principles and requirements, explaining that agencies “must take into account benefits and costs, both quantitative and qualitative.”¹³⁸⁷

Agencies are further encouraged to weigh the costs and benefits of developing higher information quality in OMB’s Information Quality Guidelines.¹³⁸⁸ Costs that the Guidelines encourage agencies to consider include “costs attributable to agency processing effort, respondent burden, maintenance of needed privacy, and assurances of suitable confidentiality.”¹³⁸⁹ EPA’s existing information quality guidelines track the OMB Guidelines

¹³⁸⁹ OMB, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies; Republication, 67 Fed. Reg. 8452, 8453 (Feb. 22, 2002).

closely. EPA's disregard of the Guidelines' recommended weighing costs and benefits further contributes to the arbitrariness of EPA's failure to consider the costs of the Proposal.

The Proposal's failure to analyze and disclose costs and benefits cannot be cured in a final regulation. Should EPA not abandon this misguided Proposal, it must re-propose it after first analyzing its costs (both to public health, to researchers, and to the agency itself) and benefits, and providing the requisite opportunity for public comment on its analysis. As discussed further below in Section VIII.D [of their comment letter], the public cannot meaningfully comment on the proposed rule without understanding the actual costs and benefits of the Proposal, the alternatives EPA considered, and the analyses underlying EPA's assessments.

Response: See response to Comment 6112-4452. Any further cost-benefit analyses associated with implementing this procedural rule will be conducted as appropriate in forthcoming rulemakings.

Comment [8750-1824]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter states that Exec. Order No. 13563, 76 Fed. Reg. 3821 (Jan. 21, 2011) provides: “Our regulatory system must protect public health, welfare, safety, and our environment while promoting economic growth, innovation, competitiveness, and job creation. It must be based on the best available science.”

Executive Order No. 13563 requires agencies to utilize the “best available science” in regulatory actions.¹³⁹⁰ This requirement is further encoded in numerous statutes and policies that EPA implements. EPA states in the proposed rule that: “The best available science must serve as the foundation of EPA's regulatory actions.”¹³⁹¹ However, as the comments raise more thoroughly, by arbitrarily restricting the scientific studies EPA will consider, this proposed rule will hinder EPA's use of the best available science and therefore violates the command of Exec. Order No. 13563 and other versions of these requirements.

Furthermore, this Executive Order requires agencies to “ensure the objectivity of any scientific and technological information and processes used to support the agency's regulatory actions” consistent with the President's Memorandum for the Heads of Executive Departments and Agencies, “Scientific Integrity” (March 9, 2009). As their comments note, however, the proposed rule along with the provision allowing the Administrator to grant discretionary exemptions will harm the objectivity of scientific and technological information and processes at EPA by paving the way for politics, rather than objective scientific criteria, to dictate which scientific studies are considered.

¹³⁹⁰ Exec. Order No. 13563, 76 Fed. Reg. 3821 (Jan. 21, 2011). [658] 83 Fed. Reg. at 18,769.

¹³⁹¹ 83 Fed. Reg. at 18,769.

Response: See response to Comment 6163-1114. EPA issued this rulemaking consistent with its obligations under all applicable Executive Orders.

Comment [8750-1826]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter notes that the EPA claims about the proposal that “[b]y better informing the public, the Agency in[sic] enhancing the public’s ability to understand and meaningfully participate in the regulatory process.” EPA then cites to the Memorandum for the Heads of Executive Departments and Agencies on Scientific Integrity.¹³⁹² Not only does the proposal conflict with this memorandum, but it will make it more difficult for the public to meaningfully participate in the regulatory process.

The memorandum sets out a number of actions for agencies to take to ensure scientific integrity.¹³⁹³ Just one of these factors involves making scientific and technological information publicly available, notably specifying, “Except for information that is properly restricted from disclosure under procedures established in accordance with statute, regulation, Executive Order, or Presidential Memorandum, each agency should make available to the public the scientific or technological findings or conclusions considered or relied on in policy decisions.”¹³⁹⁴ The memorandum thus supports only making scientific findings and conclusions publicly available, not the data underlying those findings and conclusions. Further, it correctly notes that some information is properly restricted from disclosure. It does not say that the inability to disclose such information should prevent it from being considered by agencies. The memorandum thus provides no support for the notion that agencies should be barred from relying on studies where the underlying data cannot be disclosed. The memorandum’s narrow approach to public disclosure should not be taken to support EPA’s proposal but rather counsels against the proposal’s mandate that all underlying data be made publicly available.

According to the commenter, the EPA’s proposal fundamentally conflicts with the heart of the memorandum—that “[t]he public must be able to trust the science and scientific process informing public policy decisions.”¹³⁹⁵ To earn this trust, the memorandum declares: “Political officials should not suppress or alter scientific or technological findings and conclusions.”¹³⁹⁶ By discarding scientific studies where underlying data cannot be made publicly available, this proposal will result in scientific findings being suppressed. By allowing the Administrator to grant exemptions to this policy based on their discretion with no public record or explanation, the proposal allows for the Administrator to pick and choose based on their preference the science

informing the agency's actions, eroding the public's trust in the science informing public policy decisions.

The memorandum provides a number of ways in which agencies can ensure scientific integrity which the proposal does not consider including: hiring candidates for science and technology position based on their "knowledge, credentials, experience, and integrity," having in place appropriate rules and procedures to ensure integrity of the scientific process, establishing scientific processes such as peer review and accurately reflecting scientific and technological information, establishing procedures to identify when scientific integrity may be compromised, including establishing whistleblower protections.¹³⁹⁷ EPA does not explain why any of these pathways would not serve as a better means of ensuring scientific integrity.

Response: See the final rule preamble at Section III.A and Chapter 2 of this document for an explanation of the need for greater transparency.

Comment [8750-1828]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter states that in footnote 3 of the proposal, EPA notes that "courts have at times upheld EPA's use [sic] non-public data in support of its regulatory actions" and cites to *Coalition of Battery Recyclers Ass'n v. EPA*, 604 F.3d 613, 623 (D.C. Cir. 2010) and *American Trucking Ass'ns v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002).¹³⁹⁸ These cases indeed held that EPA's prior, longstanding position of relying on scientific studies even when the underlying data could not be made publicly available was reasonable. It is well-established that agencies must acknowledge changes in position and "show that there are good reasons for the new policy."¹³⁹⁹ This footnote, the only mention of EPA's previous policy, does not sufficiently acknowledge or explain why EPA is now changing its position.

In *American Trucking Ass'ns v. EPA* the Court held that the CAA did not require EPA to make public underlying data where EPA relied on the study itself and not the raw data underlying the study.¹⁴⁰⁰ The Court stated that such a requirement "would be impractical and unnecessary."¹⁴⁰¹ They agreed with EPA's then statement that:

If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment.... Such data are often the property of scientific

¹³⁹⁷ Memorandum for the Heads of Executive Departments and Agencies on Scientific Integrity (Mar. 9, 2009), 74 Fed. Reg. 10671 (Mar. 11, 2009).

¹³⁹⁸ 83 Fed. Reg. at 18,769.

¹³⁹⁹ *FCC v. Fox Television Stations, Inc.* 556 U.S. 502, 515 (2009).

¹⁴⁰¹ *Id.* at 372 (quoting Particulate Matter NAAQS, 62 Fed. Reg. at 38,689.)

investigators and are often not readily available because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants].¹⁴⁰²

In *Coalition of Battery Recyclers Ass'n v. EPA*, the Court cited *American Trucking Ass'n v. EPA* and held, again, that EPA was permitted to rely on studies without making the underlying data public.¹⁴⁰³ They noted, “raw data often is unavailable due to proprietary interests of a study's scientific investigators or confidentiality agreements with study participants.”¹⁴⁰⁴ These court cases thus not only upheld EPA's prior practice as permissible, but went on to agree that EPA's prior practice was preferable and necessary in light of these other policy concerns.

The commenter notes that the EPA provides no response to this history, saying only: “Historically, EPA has not consistently observed the policies underlying this proposal. . . .”¹⁴⁰⁵ EPA fails explicitly to recognize that this proposal changes its past policy and provides no justification in light of the compelling opposing points that both EPA and the Courts previously recognized as deterring this approach.

Response: See the final rule preamble at Section III.A and Chapter 2 of this document for an explanation of the need for greater transparency. EPA notes that neither decision precludes EPA from considering data availability when developing significant regulatory actions or influential scientific information.

Comment [8750-1829]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter states that the EPA claims that the proposal is consistent with Executive Order No. 13777.¹⁴⁰⁶ This Executive Order provides no support for the proposal, and in fact is targeted at eliminating regulations including those that are “unnecessary” and “ineffective,” which, as our comments detail, the proposal clearly would be.¹⁴⁰⁷

This Executive Order creates a Regulatory Reform Task Force and calls for them to identify for repeal, replacement, or modification regulations that among other criteria are inconsistent with the requirements of section 515 of the Treasury and General Government Appropriations Act, 2001 (44 U.S.C. 3516 note), or the guidance issued pursuant to that provision, in particular those regulations that rely in whole or in part on data, information, or methods that are not publicly available or that are insufficiently transparent to meet the standard for reproducibility.¹⁴⁰⁸

As described in detail in our comments and below, contrary to the inference drawn here in Exec. Order No. 13777, the Data Quality Act and OMB's guidelines issued pursuant to it do not

¹⁴⁰² Id.

¹⁴⁰³ 604 F.3d 613, 623 (D.C. Cir. 2010).

¹⁴⁰⁴ Id. at 315.

¹⁴⁰⁵ 83 Fed. Reg. at 18, 769.

¹⁴⁰⁶ 83 Fed. Reg. at 18, 769. [674] [675 [676]

¹⁴⁰⁷ Exec. Order No. 13777, 82 Fed. Reg. 12285, 12286 (Mar. 1, 2017).

¹⁴⁰⁸ Exec. Order No. 13777, 82 Fed. Reg. 12285, 12286 (Mar. 1, 2017).

require research data and models to be made publicly available for reproducibility purposes in order for agencies to rely on the scientific findings and conclusions produced using that data.

Executive orders cannot override the statutory requirements that EPA use the best available science or the laws governing administrative procedure including the APA. The proposal's "consistency" with this executive order then cannot serve as a legal basis for EPA to adopt an arbitrary and capricious policy that contravenes these best available science requirements reflected in the statutes EPA administers.

Additionally, Executive Order No. 13777 by its terms requires only the identification of regulations that rely in whole or in part on data not publicly available, it says nothing about precluding agencies from relying on such studies and does not and cannot require agencies to adopt such practices. However, if the proposed rule is to be "consistent" with the executive order then it must also follow section 3(e):

In performing the evaluation described in subsection (d) of this section, each Regulatory Reform Task Force shall seek input and other assistance, as permitted by law, from entities significantly affected by Federal regulations, including State, local, and tribal governments, small businesses, consumers, non-governmental organizations, and trade associations.¹⁴⁰⁹

There is no evidence that EPA consulted with the many stakeholders impacted by this policy, including the medical or scientific research communities, which have been largely opposed to this policy.

Response: EPA issued this rulemaking consistent with its obligations under all applicable Executive Orders.

This procedural rule does not interpret or apply provisions of the statutes that it administers. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. If implementing this procedural rule will result in a conflict with an environmental statute that EPA administers, then this procedural rule will yield.

In addition, EPA notes that government and private stakeholders have extensively engaged with this rulemaking. See response to Comment 2157-149.

Comment [8750-1834]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter states that the EPA claims the proposal is consistent with Executive Order No. 13783.¹⁴¹⁰ However, Executive Order No. 13783 calls for agencies to

¹⁴⁰⁹ Exec. Order No. 13777, 82 Fed. Reg. 12285, 12286 (Mar. 1, 2017).

¹⁴¹⁰ 83 Fed. Reg. at 18,769.

consider salient information that the proposal has patently ignored. Executive Order No. 13783 calls for agencies to consider the costs and benefits “that are based on the best available science and economics” to ensure sound regulatory decision-making.¹⁴¹¹ The proposal provides no analysis of the costs and benefits of implementing this new policy, despite there likely being high costs to making research data public with little evidence of significant benefits achieved from this policy alone. Further, by arbitrarily excluding scientific information that EPA may use in its regulatory analyses, the proposal conflicts with the executive order’s command to employ the best available science and economics.¹⁴¹²

Response: See the final rule preamble at Section III.A and Chapter 2 of this document for an explanation of the need for greater transparency. See response to Comment 4829-2022 and 6112-4452. EPA issued this rulemaking consistent with its obligations under all applicable executive orders. Regarding cost-benefit analysis, see response to Comment 6112-4452.

Comment [8750-1836]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter states that the EPA wrongly claims that the proposal is “consistent with. . . the focus on transparency in OMB’s *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies*.”¹⁴¹³ To say that OMB’s Guidelines have a “focus on transparency” that is furthered by EPA’s proposal is a gross oversimplification. EPA here appears to suggest that transparency is the highest objective to be achieved, divorced from any consideration of whether transparency hinders or furthers any other goals. The OMB Guidelines, while imposing high standards of quality, objectivity, utility, and integrity of information disseminated by Federal Agencies, recognize the need to implement controls “flexibly, and in a manner appropriate to the nature. . . of the information to be disseminated.”¹⁴¹⁴ They suggest thinking about transparency strategically to further the aims of good government, unlike the proposal, which conflates transparency and quality without consideration of other factors.

As part of ensuring “objectivity” of information these guidelines encourage agencies which disseminate influential scientific, financial, or statistical information, “to include a high degree of transparency about data and methods to facilitate the reproducibility of such information by qualified third parties.”¹⁴¹⁵ However, they emphasize the need to treat certain data differently, due to privacy and confidentiality concerns.¹⁴¹⁶ While they recommend agencies “identify the sources of the disseminated information” they note that this is “to the extent possible, consistent with confidentiality protections.”¹⁴¹⁷ Importantly, they take great pains to urge agencies not to

¹⁴¹¹ Exec. Order No. 13783, 82 Fed. Reg. 16093, 16095 (Mar. 31, 2017).

¹⁴¹² Exec. Order No. 13783, 82 Fed. Reg. 16093 (Mar. 31, 2017).

¹⁴¹³ 83 Fed. Reg. at 18,769-70.

¹⁴¹⁴ OMB’s Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information, 67 Fed. Reg. 8452, 8453 (Feb. 22, 2002).

¹⁴¹⁵ 67 Fed. Reg. 8452, 8460.

¹⁴¹⁶ *Id.*

¹⁴¹⁷ 67 Fed. Reg. 8452, 8459.

subject all data to a reproducibility requirement where this could hamper agencies.¹⁴¹⁸ They require agencies, instead, to consult with “the relevant scientific and technical communities” to identify data that “can practicable [sic] be subjected to a reproducibility requirement, given ethical, feasibility, or confidentiality constraints.”¹⁴¹⁹ There is no indication that EPA consulted with the scientific and technical community, with EPA’s own SAB raising concerns about the proposal and finding that “[t]his action merits further review by the SAB.”¹⁴²⁰ The Guidelines make clear:

Making the data and methods publicly available will assist in determining whether analytic results are reproducible. However, the objectivity standard does not override other compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections.¹⁴²¹

In direct conflict with the reasoning underlying EPA’s proposal, the Guidelines specifically provide that it is possible to verify the objectivity of information that cannot be made publicly available through other types of “robustness checks.”¹⁴²² As an example, they point to the Harvard Six Cities Study, where underlying data could not be made publicly available due to confidentiality concerns, but the raw data was released instead to researchers at the HEI, bound to the same confidentiality requirements as the original researchers, who were able to replicate its results.¹⁴²³ In contrast, EPA’s proposal would not allow for the consideration of this study.¹⁴²⁴

The guidelines also recommend agencies recognize that information quality comes at a cost, and that agencies should weigh the costs and benefits, which EPA has not done in the proposal.¹⁴²⁵

Thus, the proposal completely turns away from OMB’s guidelines where OMB “urges caution in the treatment of original and supporting data because it may often be impractical or even impermissible or unethical to apply the reproducibility standard to such data.”¹⁴²⁶ As the comments discuss further, the proposal rule thus unlawfully conflicts with this flexible approach that prioritizes agencies’ ability to use science as set out by OMB under the IQA.

Response: Transparency in addition to quality is important to EPA decision making. See the final rule preamble at Section III.A and Chapter 2 of this document for an explanation of the need for greater transparency.

¹⁴²⁶ 67 Fed. Reg. 8452, 8456.

Comment [8750-1837]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter states that the EPA claims the proposal is consistent with OMB’s memorandum on Open Data Policy.¹⁴²⁷ This is incorrect, however, as the memorandum supports downstream information processing and dissemination—not through complete public disclosure without regard to privacy or security—but through instituting a framework of data collection, formatting, and storage that allows for public dissemination, if possible.¹⁴²⁸ Recognizing that not all data can be publicly disclosed, and that such data is still useful, the memorandum declares: “Whether or not particular information can be made public, agencies can apply this framework to all information resources to promote efficiency and produce value.”¹⁴²⁹

The proposal is thus inconsistent with the memorandum, which stresses the importance of information stewardship and “review of information for privacy, confidentiality, security, or other restrictions to release.”¹⁴³⁰ When information cannot be released, the memorandum does not suggest agencies ignore the information or not rely on it for regulatory purposes. It focuses on prescribing agency practices to maximize the downstream usability of data that can be made publicly available, including through “using machine-readable and open formats, data standards, and common core and extensible metadata for all new information creation and collection efforts”¹⁴³¹ as well as “building or modernizing information systems in a way that maximizes interoperability and information accessibility, maintains internal and external data asset inventories, enhances information safeguards, and clarifies information management responsibilities.”¹⁴³² Thus, while the memorandum centers on how agencies can marginally increase the utility of information they possess for use by the public, the proposal turns this on its head by advocating for discard of otherwise high quality scientific information if the data underlying such information cannot be made publicly available.

OMB stresses that to achieve “open data,” agencies should adopt a presumption in favor of openness that is importantly limited by countervailing privacy, confidentiality, security, or other valid restrictions.¹⁴³³ Thus, agencies are expected to “exercise judgment before publicly distributing data residing in an existing system by weighing the value of openness against the cost of making those data public.”¹⁴³⁴ The proposal does not at all weigh the costs, to the agency or to the public, of requiring all underlying data to be made publicly available.

While requiring agencies to adopt measures to strengthen privacy protections and data security, the memorandum recognizes serious limitation to data disclosure that EPA completely fails to

consider. For example, the memorandum mandates that agencies take into consideration the “mosaic effect,”¹⁴³⁵ which EPA does not at all acknowledge—all while making superficial and unsupported statements about how privacy concerns can be easily addressed.¹⁴³⁶ The memorandum recognizes and stresses the challenge of responding to this threat, which requires undertaking a “risk-based analysis, often utilizing statistical methods whose parameters can change over time, depending on the nature of the information, the availability of other information, and the technology in place that could facilitate the process of identification.”¹⁴³⁷ OMB importantly notes this analysis “may affect the amount, type, form, and detail of data released by agencies.”¹⁴³⁸ According to the commenter, because it ignores these concerns, EPA’s proposal is arbitrary and capricious.

Response: EPA notes that the final rule does not require EPA or any party outside of the agency to disclose protected information, nor does it require EPA to exclude studies based on data that cannot be disclosed due to its protected status. See response to Comment 6163-5030 and the final rule preamble at Section III.E.

Comment [8750-1901]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter states that the EPA purports that the Proposal builds upon “the experience of other federal agencies in this space” but the citations reveal that is simply not the case.¹⁴³⁹ To support this statement, EPA provides only a hyperlink to a U.S. Census Bureau website along with vague references to entire executive branch agencies, with no explanation or discussion of which of their policies EPA believes the Proposal is building upon. Without a more specific citation, it is impossible to know which policies EPA is referencing or to respond to them meaningfully.

EPA cites to the U.S. Census Bureau’s Federal Statistical Research Data Centers (FSRDC) as an example of use of secure facilities that allow the Census Bureau to provide controlled access to authorized researchers to use restricted-use microdata for statistical purposes only. In order to

¹⁴³⁵ OMB explains: “The mosaic effect occurs when the information in an individual dataset, in isolation, may not pose a risk of identifying an individual (or threatening some other important interest such as security), but when combined with other available information, could pose such risk. Before disclosing potential PIT or other potentially sensitive information, agencies must consider other publicly available data—in any medium and from any source—to determine whether some combination of existing data and the data intended to be publicly released could allow for the identification of an individual or pose another security concern.” Memorandum for the Heads of Executive Departments and Agencies on Open Data Policy—Managing Information as an Asset, M-13-13 at 4-5 (May 9, 2013).

¹⁴³⁶ Memorandum for the Heads of Executive Departments and Agencies on Open Data Policy—Managing Information as an Asset, M-13-13 at 9-10 (May 9, 2013). See, e.g., 83 Fed. Reg. at 18,770 (“EPA believes that concerns about access to confidential or private information can, in many cases, be addressed. . . .”)

¹⁴³⁷ Memorandum for the Heads of Executive Departments and Agencies on Open Data Policy—Managing Information as an Asset, M-13-13 at 9-10 (May 9, 2013).

¹⁴³⁸ Memorandum for the Heads of Executive Departments and Agencies on Open Data Policy—Managing Information as an Asset, M-13-13 at 10 (May 9, 2013).

¹⁴³⁹ 83 Fed. Reg. at 18,770.

gain access, researchers must obtain Census Bureau Special Sworn Status by passing a moderate risk background check and swearing to protect respondent confidentiality for life. While this “solution” meets the U.S. Census Bureau’s needs by allowing access to confidential information only to researchers whose proposals meet certain criteria, who go through a vetting process, and who agree to protect the information, this is done at a cost—which EPA has not accounted for—and would not satisfy EPA’s requirement to make data and models “publicly available.” Thus, according to the commenter, this example provides no support for the Proposal.

Response: See response to Comment 8750-1837.

Comment [8750-1905]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 10 of the proposal:

These include policies and recommendations from: the Administrative Conference of the United States’ Science in the Administrative Process Project; National Academies’ reports on Improving Access to and Confidentiality of Research Data, Expanding Access to Research Data, and Access to Research Data in the 21st Century; the Health Effects Institute; Center for Open Science; members of the Risk Assessment Specialty Section of the Society of Toxicology, the Dose Response Section of the Society for Risk Analysis, and the International Society for Regulatory Toxicology and Pharmacology; and the Bipartisan Policy Center’s Science for Policy Project.

The commenter notes that in footnote 10 of the Proposal, EPA lists a number of organizations whose recommendations and policies the Proposal allegedly took into consideration. In fact, since the Proposal was published, many of these organizations have issued statements opposing the Proposal and contesting EPA’s claim that their policies and recommendations endorse the Proposal. In this footnote, EPA provided no hyperlinks or specific citations for which recommendations and policies it was referencing, making it impossible to understand why EPA believed these organizations supported the Proposal or to respond to them. The commenter provides the following specific comments:

I. The Administrative Conference of the United States’ Science in the Administrative Process Project

The EPA cites to the Administrative Conference of the United States’ Science in the Administrative Process Project—Recommendation 2013-3: Science in the Administrative Process. Wendy Wagner, sole author of ACUS’s final report *Science in Regulation: A Study of Agency Decision-Making Approaches* and who served on the panel that produced the recommendations strongly opposed the notion that the Proposal builds upon these recommendations, saying: “They don’t adopt any of our recommendations, and they go in a

direction that's completely opposite, completely different. . . . They don't adopt any of the recommendations of any of the sources they cite. I'm not sure why they cited them.”¹⁴⁴⁰

While ACUS recommends agencies increase transparency of how they rely on scientific information and strive to make data underlying scientific information publicly available, nowhere do they suggest that agencies should not consider or rely on studies where underlying data and models cannot be made publicly available, or that these circumstances make scientific information less valid. They instead suggest that information be made publicly available for assessment and reproducibility purposes “[c]onsistent with the limitations in the Information Quality Act (IQA) guidelines issued by the Office of Management and Budget and its own IQA guidelines.”¹⁴⁴¹ They acknowledge valid limitations such as legal protections for privacy, trade secrets, and CBI.¹⁴⁴² Thus, they recommend data be made public only “[t]o the extent practicable and permitted by law and applicable policies.”¹⁴⁴³ Unlike the Proposal, the recommendation acknowledges that agencies may still use information where underlying data cannot be publicly disclosed, and suggest agencies “note that fact and explain why they used the results if they chose to do so.”¹⁴⁴⁴ It thus provides a much more nuanced policy recommendation than that outlined in the Proposal—which suggests EPA either find a way to make underlying data and models public, despite the numerous potential obstacles and concerns in doing so, or completely disregard the research study.

II. National Academies Improving Access to and Confidentiality of Research Data

Rather than containing any particular recommendations or policy proposals, this report discusses a number of issues pertaining to data disclosure and privacy protection, the tradeoffs “between increasing data access on the one hand and improving data security and confidentiality on the other,”¹⁴⁴⁵ and “alternative approaches to limiting disclosure risk while facilitating data access the benefits and limitation of various approaches to these issues.”¹⁴⁴⁶ Thus, rather than calling on agencies to rely only on scientific studies where the underlying data and models are made public, the report in fact discusses challenges and obstacles to achieving greater data disclosure, for which the Proposal provides no substantive or meaningful explanation.

The report discusses why exercising caution with respect to disclosing confidential personal information is so important, because if such information is exposed it could lead to

¹⁴⁴⁶ *Id.* at 3.

being arrested for a crime, being denied eligibility for welfare or Medicaid, being charged with tax evasion, losing a job or an election, failing to qualify for a mortgage, or having trouble getting into college. Disclosure of a history of alcoholism, mental illness, venereal disease, or illegitimacy can result in embarrassment and loss of reputation. Less directly, research results based on personal data can cause harm by affecting perceptions about a group to which a person belongs.¹⁴⁴⁷

The report reveals very legitimate reasons why researchers and study participants would be reluctant to allow underlying data to be made publicly available—and these reasons in no way compromise the validity of the scientific conclusions based upon this data.

The report also discusses the nuances of selecting methods to protect privacy while making underlying data publicly available. For example, while EPA casually makes claims that controlled access is an example of a solution in place across federal agencies¹⁴⁴⁸—this report points out the drawbacks of such an approach:

The use of restricted access arrangements, which has been deemed necessary to provide adequate protection for confidential information about individuals and businesses, results in increased costs to conduct research. Custodians of the data files need additional resources to process applications, operate inspection systems, staff research data centers, and inspect outputs to ensure that disclosure does not occur. Researchers require resources to prepare applications for access, to provide appropriate physical security for the data, or to visit a secure site.¹⁴⁴⁹

The report also discusses the difficulty of funding such centers—noting that while the costs are currently covered by a combination of federal agency budgets and user fees, including grants from the NSF and National Institute on Aging, federal funding may no longer be able to support such efforts.¹⁴⁵⁰ EPA’s cursory mention to use of restricted access facilities as a potential solution to the concerns implicated by the Proposal fail to mention or address any of these challenges.

III. National Academies Expanding Access to Research Data: Reconciling Risks and Opportunities

EPA’s Proposal in no way takes into consideration the recommendations of the National Academies report *Expanding Access to Research Data: Reconciling Risks and Opportunities*. This report considers competing approaches to increase use of research data while protecting confidentiality, and concludes that “no one way is optimal for all data users or all purposes” and, importantly, that “the nation’s statistical and research agencies must provide both unrestricted access to anonymized public-use files and restricted access to detailed, individually identifiable confidential data for researchers under carefully specified conditions.”¹⁴⁵¹ In other words, the

¹⁴⁴⁹ Id. at 48.

¹⁴⁵⁰ Id.

¹⁴⁵¹ The National Academies, *Expanding Access to Research Data: Reconciling Risks and Opportunities*, National Academies Press 2 (2005).

report finds that making data publicly available without restriction while respecting confidentiality concerns is not currently feasible or compatible with the missions of federal agencies.

Furthermore, the report mainly concerns itself with how agencies might increase access to data in their control and possession to allow for more research in social issues and provide a better basis for more informed policy decisions—it does not discuss whether federal agencies should make data publicly available in order to allow for independent validation of scientific research they rely on for regulatory purposes and thus cannot be a basis for the Proposal.¹⁴⁵² While the report discusses that one of the benefits of data sharing is that it allows for “verification, refutation, or refinement of original results,” nowhere does the report suggest that agencies should rely only on research studies that make data publicly available or that such verification is necessary to validate a research study.¹⁴⁵³ Indeed, it details a discussion on this topic that presents competing views on requirements to make research data available to the public to allow for replication. John Bailer raised concerns that researchers would be deterred from doing certain kinds of work if they feared it would be subject to “hostile scrutiny” and that competitors could seize data for their interests.¹⁴⁵⁴ Others disagreed with this position.¹⁴⁵⁵ However, EPA failed to engage any of these considerations or at all justify its decision to implement a policy that could have severe negative implications. None of the researchers stated agencies should disregard the study if underlying data could not be made public.

The “recommendations” made by the report do not endorse EPA’s proposal. The report provides 15 recommendations in Chapter 5.¹⁴⁵⁶ Recommendations 1-4 concern documentation and data access and call on agencies to better document how the data they make available is used; to use a variety of modes to provide access to data they produce or fund using a combination of restricted access to confidential data and unrestricted access to appropriately altered public-use data; to support research to guide more efficient allocation of resources among different data access modes; and to involve users in planning modes of access to their data.¹⁴⁵⁷

In this Proposal, EPA does nothing to better document use of data that it makes public, has only called for a requirement to make research data and models “publicly available” rather than recognizing that a variety of modes and levels of access may be necessary, and does nothing to support more research into methods of making data more widely available without compromising confidentiality—indeed blithely assuming that such means are already available and sufficient—and also has not indicated that there has been any widespread call for EPA to make such data available or pointed to any comments of users of this data in this process.

Recommendations 5-8 concern public use data and call on agencies to support research on techniques to provide useful innovative public-use data that minimizes the risk of disclosure; streamlined procedures to allow researchers access to public-use microdata through existing and

¹⁴⁵² Id. at 7.

¹⁴⁵³ Id. at 39.

¹⁴⁵⁴ Id. at 105-06.

¹⁴⁵⁵ See id. at 107.

¹⁴⁵⁶ Id. at 63.

¹⁴⁵⁷ Id. at 66-69.

new data archives; a warning on all public-use data that they are provided for statistical purposes only and that any attempt to identify an individual is a violation, and requiring users to attest to having read the warning; and restricting access to public-use data to those who agree to abide by confidentiality protections, subject to meaningful penalties.¹⁴⁵⁸

EPA's proposal once again ignores these recommendations that call for greater research and a measured approach to making data more widely available. The Proposal provides no ideas or methods or support for research that would help strengthen confidentiality protections while making data more available.

Recommendations 9-13 concern research data centers, remote access, and licensing agreements and call on the Census Bureau to (1) broaden the interpretation of the criteria for assessing the benefits of access to data; (2) maintain the continuous review cycle; and (3) take account of prior scientific review of research proposals by established peer review processes when awarding access to research data centers; for more research on cost effective means of providing secure access to confidential data by remote access; increasing use of licensing agreements for access to confidential data; working with data users to develop flexible, consistent standards for licensing agreements and implementation procedures for access to confidential data; and including auditing procedures and legal penalties in licensing agreements for willful misuse of confidential data.¹⁴⁵⁹

EPA's proposal does not increase any research into use of remote data centers or licensing agreements, simply making passing references to these modes as potential solutions with no discussion or explanation—and ignoring the recommendations here suggesting that more work is needed to realize their potential.

Recommendations 14-15 concern maintaining the public's trust and call on agencies to give certain basic information about confidentiality and data access to everyone asked to participate in statistical surveys; and to support continuing research on the views of data providers and the public about research benefits and risks.¹⁴⁶⁰

EPA's proposal does not involve anything that increases the public knowledge about confidentiality protections or their views on research benefits and risks.

Recommendations 16-19 concern training, monitoring, and education to complement other protections on data. They call on data collection agencies to provide employees with continually updated written guidelines on confidentiality protection and training in confidentiality practices and data management and to institute procedures for monitoring violations of confidentiality protections practices and confidentiality breaches. They also call on educational and professional organizations to provide training in ethical issues for all those involved in the design, collection,

¹⁴⁵⁸ Id. at 69-74.

¹⁴⁵⁹ Id. at 74-80.

¹⁴⁶⁰ Id. at 80-81.

distribution, and use of data obtained under pledges of confidentiality and for the development of strong codes of ethical conduct that reflect the need to protection confidentiality.¹⁴⁶¹

EPA's proposal also contains no provisions on increasing training, monitoring, or education, within the agency or among researchers to allow for more careful handling of confidential data.

Thus, EPA's Proposal completely ignores the careful research and thinking the National Academies and researchers have done on what is needed from federal agencies in order to make data more publicly available, and how to do so in a responsible manner. It does not implement any of the recommendations in the report, and in no way builds upon this work.

IV. National Academies Access to Research Data in the 21st Century: An Ongoing Dialogue Among Interested Parties: Report of Workshop

EPA cites to the National Academies' Access to Research Data in the 21st Century: An Ongoing Dialogue Among Interested Parties: Report of Workshop as one for which it took into consideration "policies or recommendations," despite the fact that this report comes with the explicit limitation that:

The goal of the workshop was not to reach conclusions or recommendations; nor could it address other pressing issues beyond the regulatory process, such as protection of intellectual property, the influence of broader access on scientific competition, the potential for increased administrative burdens and changes in the research process, and the challenge of providing data access in an increasingly electronic world.¹⁴⁶²

Thus, this report stresses the many unanswered, challenging policy questions that must be addressed as agencies contemplate how to make data publicly available. These are the questions EPA should have addressed in its Proposal but did not.

The Report offers a look into the scientific review process that also calls into question the underlying assumption in EPA's proposal—that making data publicly available is necessary to ensure the validity of a scientific finding. The report notes that scientific claims "are not 'binary'" they instead "fall in the category of being uncertain to various degrees."¹⁴⁶³ The reliability of a particular scientific finding can be assessed using various mechanisms, starting with an examination of the strength of the design, methods, and statistical results.¹⁴⁶⁴ Then "one asks whether there is consistency within the data (pertaining to mechanisms of effect or related outcomes) and with other studies and scientific theories."¹⁴⁶⁵ Finally, "the robustness of the findings is evaluated through the use of different analytical approaches."¹⁴⁶⁶

¹⁴⁶¹ Id. at 81-84.

¹⁴⁶² Science, Technology, and Law Panel; Policy and Global Affairs; National Research Council, Access to Research Data in the 21st Century: An Ongoing Dialogue Among Interested Parties: Report of Workshop, The National Academies Press ix (2002).

¹⁴⁶³ Id. at 5.

¹⁴⁶⁴ Id. at 7.

¹⁴⁶⁵ Id.

¹⁴⁶⁶ Id.

The report describes how studies may be validated through a range of approaches.¹⁴⁶⁷ While it notes that in some cases it is possible to exactly replicate the original study, this is not always the case, especially in large epidemiological studies where “repeating a study is seldom either possible or desirable.”¹⁴⁶⁸ Then “replication” can take a variety of forms, not all of which require access to underlying data, including:

- Additional analyses done on the data set by the original or collaborating Investigators;
- New results generated from older data sets;
- New studies addressing the same hypothesis;
- Independent analysis of the same data set by different people;
- Monitoring of the results of actions taken on the basis of the findings.¹⁴⁶⁹

Another form of replication the report describes is meta-analysis, which is a systematic strategy for comprehensively describing and summarizing a body of research evidence from two or more studies. The goal is to produce a quantitative synthesis of the evidence presented in multiple studies that relate to a research question. In a typical meta-analysis, all the data used have been published in the public domain and are easy to inspect and analyze.¹⁴⁷⁰

The report specifically mentions the Harvard Six Cities Study as an example of a study where data could not be made publicly available, but which was verified to allow the agency to justifiably rely on it to set important air standards.¹⁴⁷¹ Thus, unlike the Proposal the report acknowledges the many different pathways that exist to for researchers to assess other studies, and does not suggest that allowing the general public access to underlying data and models is necessary.

One of the panels of the workshop discussed the Shelby Amendment, and public access to data underlying agency regulation. A bench scientist expressed concerns that, though the idea of sharing data was a good idea, because any person could request information for any reason, this mechanism could be used to harass scientists whose work was found objectionable.¹⁴⁷² A representative of NIH similarly stated that while sharing data with other researchers was good scientific practice, allowing for indiscriminate public access to data serves “little purpose for those without the skills to reanalyze it.”¹⁴⁷³ Additionally, access through FOIA does not allow for limitations to be put on the use of the data, which is typically available in other data-sharing modes.¹⁴⁷⁴ A representative from EPA raised issues including:

The Shelby Amendment. . . raises several questions for the EPA about rulemaking as a legal and deliberative process. At what point should the agency disclose what type of regulation is going to be considered or issued? The timing of the release can influence its reception. Should the agency use contracts to support the research needed for regulations? Contracting, as opposed to grants

¹⁴⁷⁴ Id.

that support more flexible work, might narrow the type of information the agency receives and could possibly limit the scope of the science underlying the regulation.¹⁴⁷⁵

These questions and concerns are highly relevant to the Proposal as well, yet EPA provides no indication that it has given them any consideration.

Finally, a representative from NRDC pointed to other mechanisms that are already in place to ensure agencies rely on high quality data. For example, under the APA, agencies must respond to any comments that raise questions about a scientific studies design, performance, or conclusion.¹⁴⁷⁶ Courts can determine whether an agency was reasonable in its decision to refuse to accept the findings of a study because it could not access underlying data or refuses a request from a study participant.¹⁴⁷⁷ EPA does not explain why these existing mechanisms are not sufficient to ensure the integrity of the science it relies on.

V. The HEI

In the original *Federal Register* notice, EPA provided no specificity as to which Health Effects policy EPA was referring to or why it supported the Proposal. Such a vague and unspecified reference does not meet the notice requirements of the APA and other statutes and makes it impossible to respond.

VI. COS

In the original *Federal Register* notice, EPA provided no specificity as to which COS policy EPA was referring to or why it supported the Proposal. Such a vague and unspecified reference does not meet the notice requirements of the APA and other statutes and makes it impossible to respond.

VII. Members of the Risk Assessment Specialty Section of the Society of Toxicology (SOT), the Dose Response Section of the Society for Risk Analysis (SRA), and the International Society for Regulatory Toxicology and Pharmacology (ISRTP)

In the original *Federal Register* notice, EPA provided no specificity as to which policy of the Members of the Risk Assessment Specialty Section of the SOT, the Dose Response Section of the SRA, and the ISRTP EPA was referring to or why it supported the Proposal. Such a vague and unspecified reference does not meet the notice requirements of the APA and other statutes and makes it impossible to respond.

VIII. Bipartisan Policy Center's Science for Policy Project

In the original *Federal Register* notice, EPA provided no specificity as to which Bipartisan Policy Center's Science for Policy Project policy EPA was referring to or why it supported the

Proposal. Such a vague and unspecified reference does not meet the notice requirements of the APA and other statutes and makes it impossible to respond.

Response: Regarding the original proposal, see response to Comment 2157-149.

Comment [8750-1908]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 11 of the proposal:

For example, see related policies from the Proceedings of the National Academy of Sciences, PLOS ONE, Science, and Nature.

The commenter states that the EPA claims that the Proposal takes into consideration policies adopted by scientific journals, but does not specify which “related policies” from these journals.¹⁴⁷⁸ While some of these journals have adopted certain policies encouraging or requiring researchers to share underlying data for the studies they publish, they all allow for exceptions when data cannot be released for compelling reasons, such as confidentiality protections.

Furthermore, the editors of these journals have issued a joint statement opposing the Proposal and noting that their policies do not endorse such an approach by EPA. They note that some data sets cannot be shared publicly, and that there are still other methods available to verify scientific findings. The statement also strongly condemns the notion of excluding scientific information from consideration when underlying data cannot be made publicly available:

It does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them; rather, it is paramount that the full suite of relevant science vetted through peer review, which includes ever more rigorous features, inform the landscape of decision making. Excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes.¹⁴⁷⁹

Thus, EPA cannot claim that the Proposal is in any way supported by the data sharing policies of these scientific journals.

Response: See response to Comment 4829-2022.

Comment [8750-1911]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the

¹⁴⁷⁸ 83 Fed. Reg. at 18,770. [768] Jeremy Berg et. al., Joint statement on EPA proposed rule and public availability of data, Science (Apr. 30, 2018), <http://science.sciencemag.org/content/early/2018/04/30/science.aau0116>.

¹⁴⁷⁹ Jeremy Berg et. al., Joint statement on EPA proposed rule and public availability of data, Science (Apr. 30, 2018), <http://science.sciencemag.org/content/early/2018/04/30/science.aau0116>.

sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 12 of the proposal:

See: <https://www.nature.com/articles/s41562-016-0021>;
<http://journals.plos.org/plosmedicine/article?id=10.1371/journal.pmed.0020124>;
<http://science.sciencemag.org/content/343/6168/229.long>;
<https://www.economist.com/news/leaders/21588069-scientific-research-has-changed-world-now-it-needs-change-itself-how-science-goes-wrong>.;
<http://stm.sciencemag.org/content/8/341/341ps12.full>.

The commenter states that the EPA claims that the Proposal is informed by the policies of scientific journals in response to the “replication crisis.”¹⁴⁸⁰ EPA provides no explanation or evidence to support the fact that such a “crisis” is occurring or that EPA’s Proposal would do anything to address the crisis. The sources EPA cites for this proposition speak to a concern about scientific studies being reproducible or replicable due to a number of different conditions related to poor scientific practices. While some of the articles speak about making data more available as an ideal to aspire to, none of them support the idea that a research study whose underlying data has not been made publicly available should, for that reason alone, be considered invalid. Further, many of these articles speak to how current scientific norms do not result in underlying data being available, which is a huge barrier to EPA’s Proposal that EPA does not at all address. Specific commenter provided by the commenter include the following:

I. Marcus R. Munafó et. al, A Manifesto for Reproducible Science, 1 Nature Human Behavior 1 (2017)

Far from suggesting that agencies rely only on scientific studies if the underlying data is made public, or even that making underlying data public is necessary to ensure validity of scientific conclusions, the article discusses at a high level a number of systemic and cultural challenges to reproducible science. By ignoring the nuances of this article and presenting it without any explanation as support for its Proposal, EPA runs into the problem the article specifically cautions against, warning: “Some solutions may be ineffective or even harmful to the efficiency and reliability of science, even if conceptually they appear sensible.”¹⁴⁸¹

This article does not endorse the existence of a “replication crisis” and in fact says, “[w]hether ‘crisis’ is the appropriate term to describe the current state or trajectory of science is debatable.”¹⁴⁸² Instead it notes a very different problem than the one EPA appears to target with the Proposal. It points broadly to an issue of there being “substantial room for improvement with regard to research practices to maximize the efficiency of the research community’s use of the public’s financial investment in research.”¹⁴⁸³

¹⁴⁸² Id. at 1.

¹⁴⁸³ Id. at 1.

This article makes clear that open data requirements are just one of many solutions and steps to take towards increasing efficiency of use of resources and robustness of scientific findings—and never suggests that a lack of publicly available underlying data should automatically disqualify a research finding from consideration. It discusses a number of other improvements including protecting against cognitive biases through blinding, improving methodological training, implementing methodological support, encouraging collaboration and team science, promoting study pre-registration, improving quality of reporting, diversifying peer review, and changing incentives to promote efficient and effective research instead of just innovative outcomes.

While the article recognizes transparency as a “scientific ideal”¹⁴⁸⁴ it notes many challenges that currently exist to achieving this ideal, which EPA does not at all address. The article notes, “In reality, science often lacks openness: many published articles are not available to people without a personal or institutional subscription, and most data, materials and code supporting research outcomes are not made accessible, for example, in a public repository.”¹⁴⁸⁵ It further finds “substantial barriers to meeting these ideals, including vested financial interests (particularly in scholarly publishing) and few incentives for researchers to pursue open practices.” Nowhere does the article suggest that the many scientific studies for which data is not available due to prevailing scientific norms and practices be completely discarded. These challenges suggest that many studies EPA wishes to rely on may not be able to meet the rigid requirements of EPA’s proposal severely restricting the science EPA can use, degrading the quality of its decision-making.

Marcus R. Munafó, lead author on this paper, has since published a piece specifically dismissing science policy approaches that overemphasize the importance of replication.¹⁴⁸⁶ It states that the overemphasis on replicability is detrimental to science—that “[i]f a study is skewed and replications recapitulate that approach, findings will be consistently incorrect or biased.”¹⁴⁸⁷ Instead, the author suggests that “an essential protection against flawed ideas is triangulation” or “the strategic use of multiple approaches to address one question.”¹⁴⁸⁸ This involves looking at a broad base of different scientific studies and does not require underlying data to be made publicly available, not individual studies based on whether or not they can be replicated.¹⁴⁸⁹ By excluding scientific studies from EPA’s consideration, the Proposal overemphasizes the value of replication to the detriment of being able to evaluate a study in the context of many other studies examining the same issue through a variety of methods. The Proposal may well lead to reliance on less robust science and is thus arbitrary.

II. John P.A. Ioannidis, Why Most Published Research is False, 2 PLoS Medicine 0696 (2005)

The article suggests “the high rate of non-replication (lack of confirmation) of research discoveries is a consequence of the convenient, yet ill-founded strategy of claiming conclusive research findings solely on the basis of a single study assessed by formal statistical significance,

¹⁴⁸⁹ Id.

typically for a p-value less than 0.05.”¹⁴⁹⁰ It looks at a number of different contributors to false positive findings and discusses solutions to this problem. Importantly, it stresses the need to focus on large studies, consider the totality of the evidence, and improve understanding of pre-study odds.¹⁴⁹¹ These solutions each involve considering more evidence and more scientific studies to contextualize any one given study. Nowhere does the article suggest requiring underlying data be made public or fewer studies be considered. EPA’s proposal contrarily emphasizes data disclosure above all other practices for ensuring scientific integrity—and will result in fewer studies being considered to shed light on the scientific truth.

The author of this article has specifically criticized EPA’s Proposal, saying that, if it is finalized, “science will be practically eliminated from all decision-making processes” and “[r]egulation would then depend uniquely on opinion and whim.”¹⁴⁹² The author highlights the inherent problem in EPA’s Proposal, that “most of the raw data from past studies are not publicly available” and that indeed “[i]n a random sample of the biomedical literature (2000–2014) none of 268 papers shared all of their raw data. . . [and] [o]nly one shared a full research protocol.”¹⁴⁹³ EPA has not addressed this major issue that suggests the Proposal would bar EPA from relying on massive amounts of scientific research. The article notes that reproducibility issues vary across the disciplines and that in many areas in which EPA operates, a solid and large foundation of scientific research has produced credible and widely-affirmed findings, including “in fields such as air pollution and climate change.”¹⁴⁹⁴ Even in these other fields, however, it firmly states that “simply ignoring science that has not yet attained such standards, is a nightmare.”¹⁴⁹⁵

III. Marcia McNutt, Reproducibility, 343 Science 229 (2014)

EPA cites an announcement by Science that, in response to reports “that a troubling proportion of peer-reviewed preclinical studies are not reproducible,”¹⁴⁹⁶ Science is adopting new policies requiring authors making submissions to the journal to disclose “whether there was a pre-experimental plan for data handling (such as how to deal with outliers), whether they conducted a sample size estimation to ensure a sufficient signal-to-noise ratio, whether samples were treated randomly, and whether the experimenter was blind to the conduct of the experiment.”¹⁴⁹⁷ While the article considers steps to increase reproducibility of science, it notes that data availability is not a necessary or sufficient step to ensure credibility of research findings, and that “ultimate responsibility lies with authors to be completely open with their methods, all of their findings, and the possible pitfalls that could invalidate their conclusions.”¹⁴⁹⁸ EPA’s Proposal ignores the ability to assess studies through these other important indicators to assure their validity.

VI. How Science Goes Wrong, Economist (Oct. 21, 2013)

This article opposes the view that verification of a study depends solely on the underlying data being made publicly available. While it identifies that much scientific research is unable to be replicated, the solution it proposes include tightening standards, particularly in statistics, registering research protocols in advance and monitoring them, and: “[w]here possible, trial data also should be open for other researchers to inspect and test.”¹⁴⁹⁹ Thus, even to the extent it discusses data availability, it suggests data should be open for other researchers, as opposed to the public, and recognizes this may not always be possible.¹⁵⁰⁰

VII. Steve N. Goodman, What does research reproducibility mean?, 8 Science Translational Medicine 1 (2016)

Rather than saying anything about agencies relying only on scientific studies where underlying data is made public, this article discusses the importance of clearly defining key terms in the discussion about scientific reproducibility, noting that there is a lack of standardized definitions of terms such as “reproducibility, replicability, reliability, robustness, and generalizability.”¹⁵⁰¹ This raises a key issue of vagueness in EPA’s proposal—EPA does not provide definition for key terms such as “independently validate” or “reproducible” and confusing mentions a “replication crisis” while citing to articles that speak to a “reproducibility crisis.”

While providing definitions for these various terms, the article notes that there terms all represent various methods of attempting to verify studies to ensure “scientific claims based on scientific results are true” and cautions against “treating reproducibility as an end in itself— rather than as an imperfect surrogate for scientific truth.”¹⁵⁰² Instead, it promoted the view of looking across studies to “assess their cumulative evidential weight.”¹⁵⁰³ EPA Proposal thus directly contradicts the suggestions of this article.

Response: See the final rule preamble at Section III.A and Chapter 2 of this document.

Comment [8750-1912]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 13 of the proposal:

¹⁴⁹⁹ How Science Goes Wrong, Economist (Oct. 21, 2013), <https://www.economist.com/news/leaders/21588069-scientific-research-has-changed-world-now-it-needs-change-itself-how-science-goes-wrong>.

¹⁵⁰² Id.

¹⁵⁰³ Id. at 3.

EPA has not consistently followed previous EPA policy (e.g., EPA's Scientific Integrity Guidance, referenced above) that encouraged the use of non-proprietary data and models.

The commenter states that while EPA in a footnote suggests that EPA has not consistently followed EPA's Scientific Integrity Policy encouraging the use of non-proprietary data and models, it misses the fact that EPA's policy was not written as an absolute standard, but was intended to be a flexible one. The policy states only that "the use of non-proprietary data and models are encouraged, when feasible, to increase transparency."¹⁵⁰⁴ EPA must thus explain and justify its deviation from its prior flexible approach that the Proposal now imposes.

Response: See the final rule preamble at Section III.A and Chapter 2 of this document for an explanation of the change in policy and the need for greater transparency.

Comment [8750-1913]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 14 of the proposal:

<https://www.whitehouse.gov/wp-content/uploads/2017/11/2005-M-05-03-Issuance-of-OMB-Final-Information-Quality-Bulletin-for-Peer-Review-December-16-2004.pdf>

The commenter states that the Proposal appears to issue a requirement for independent peer review of all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB *Final Information Quality Bulletin for Peer Review*. EPA cites to OMB's *Final Information Quality Bulletin for Peer Review*, explaining existing peer review requirements that nowhere does EPA suggest are not already being complied with.

According to the commenter, there is some vagueness as to whether the Proposal maintains, expands, or narrows these already existing requirements. OMB's bulletin underwent a rigorous stakeholder process including response to comments on multiple drafts from stakeholders, a federal agency workshop at NAS, outreach to major scientific organizations and societies, a formal interagency review.¹⁵⁰⁵ EPA's Proposal has not gone through nearly the same level of review, or as our comments detail, even met the minimum legal requirements for consultation and review. OMB's guidance further provides that agencies should consider the "tradeoffs between depth of peer review and timeliness"¹⁵⁰⁶ This includes considering a benefit cost framework for peer review that takes into account "the direct costs of the peer review activity and those stemming from potential delay in government and private actions that can result from peer review."¹⁵⁰⁷ As our comments detail, EPA has not provided any meaningful benefit-cost

¹⁵⁰⁴ EPA, Scientific Integrity Policy at 4.

¹⁵⁰⁵ Final Information Quality Bulletin for Peer Review, 70 Fed. Reg. 2664 (Jan. 14, 2005).

¹⁵⁰⁷ Id. at 2,668.

analysis of the Proposal. Thus, it would be improper and in conflict with OMB’s guidance for EPA to be expanding the peer review requirements through this Proposal.

Response: See the final rule preamble at Section III.H and Chapter 13 of this document.

Comment [8750-1914]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 15 of the proposal:

February 22, 2002 (67 FR 8453) OMB’s Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information
(2002) <https://www.federalregister.gov/documents/2002/02/22/R2-59/guidelines-for-ensuring-andmaximizing-the-quality-objectivity-utility-and-integrity-of-information>.

The commenter states that as discussed on their comments regarding Proposal Federal Register notice footnote 6, EPA’s attempt to align its proposal with OMB’s guidelines is misguided.

Response: See Section III.A of the final rule preamble and Chapter 2 of this document.

Comment [8750-1916]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 16 of the proposal:

See examples from the U.S. Department of Health and Human Services, National Institute of Standards and Technology, U.S. Department of Education, and the U.S. Census Bureau.

The commenter states that in the original Proposal EPA provided no specific “examples” and this vague cite provided very little direction about what EPA was referencing here—making it impossible to review these examples or respond to them.

Response: See Section III.A of the final rule preamble and Chapter 2 of this document.

Comment [8750-1917]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 17 of the proposal:

<https://www.hhs.gov/hipaa/for-professionals/privacy/special-topics/deidentification/index.html>.

The commenter states that the EPA states that other agencies have tools to de-identify information private information but fails to recognize that these methods are not transferable to EPA's context.¹⁵⁰⁸ EPA links to guidance on de-identification requirements under HIPAA. This guidance provides two methods for de-identifying data: (1) expert determination method, where an expert determines that, after application of statistical and scientific principals and methods, the risk is very small that the information alone or with other available information could be used to identify the subject; and (2) the safe harbor method, requiring that a number of identifiers are removed. The first method requires case-by-case work and EPA has provided no information regarding how EPA could implement it or how much it might cost and thus the feasibility of requiring researchers or EPA to de-identify data this way is questionable. The second method requires removal of much information useful for research that may be necessary to be able to independently validate the research, so it is unclear that it would satisfy the Proposal's demands. Furthermore, the safe harbor method has been shown to provide potentially insufficient privacy protections.¹⁵⁰⁹

Response: See Section III.A of the final rule preamble and Chapter 2 of this document.

Comment [8750-1918]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 18 of the proposal:

<https://www.nap.edu/catalog/11434/expanding-access-to-research-data-reconciling-risks-and-opportunities>.

The commenter states that in this footnote, EPA cites to a report by the National Academies for the proposition that “The National Academies have noted that simple data masking, coding, and de-identification techniques have been developed over the last half century. . . .”¹⁵¹⁰ This incorrectly makes it seem as though the National Academies have identified simple techniques to de-identify data for public release without compromising personal privacy. A full review of the report reveals the opposite is true, that The National Academies in fact recognize that complex, evolving, and yet undeveloped techniques are needed to resolve these concerns. It offers recommendations that are intended to improve upon existing techniques, indicating that this area is under constant change and many advances are left to be made.¹⁵¹¹ Further, the report notes this improvement requires “strong partnership between the research community and statistical and

¹⁵⁰⁸ 83 Fed. Reg. at 18,771.

¹⁵¹¹ *Id.* at 35.

research agencies in the design of innovative research on disclosure avoidance techniques and data access modalities and in the implementation of the advances that result from such research.”¹⁵¹² The Proposal takes no steps towards advancing design of new techniques or providing resources to undertake all that needs to be done to make the Proposal remotely feasible.

Further, the Report notes that a changing landscape is making it increasingly difficult to apply past techniques to sufficiently protect data from identification, saying: “Initially, relatively simple data masking techniques, such as top coding income amounts. . . were used to generate restricted data products [,] [d]uring the last decade the increasing risks of confidentiality breaches have led researchers to develop increasingly sophisticated methodologies for restricted data products.”¹⁵¹³ They state, “more research is clearly needed to assess the relative ability of different masking methods, and of synthetic data, to reduce the risk of disclosure while preserving data utility.”¹⁵¹⁴ EPA does not acknowledge these newly emerging concerns.
