Commenter (0040) provides that publication study results need to go through the peer review publication and replication processes. As such, the commenter states the conclusions are based on strengths of evidences and are weighed according to their merit. The commenter adds that this methodology-based process leads to more robust research and stronger evidence. Commenter (0732) provides that scientists convene multi-scientist panels to extensively review literature from all known sources, evaluate each article for many criteria of well-done studies, and then factor it into their carefully assessed estimates that are used to create health standards. Commenter (4838) asserts that studies with confidential data can still be appropriately peer-reviewed and subject to rigorous scientific scrutiny over their methods and conclusions without making confidential health or business information publicly available and that EPA should not provide blanket limits on the use of studies where information cannot be made public. Commenter (4595) states that, when preparing studies with protected data for peer review and publishing, researchers summarize the analysis of raw data and draw conclusions based on that analysis and that these methodologies are not 'secret' but rather common practice.

Commenter (6196) provides that study reports typically explain the protocols used to gather data, the methods used for data analysis, the doses or exposure concentrations at which effects were and were not observed, the nature, severity, and incidence of such effects, and any unusual occurrences that may affect interpretation of the results. The commenter adds that this information plays an important role in the peer review process, informing the judgment of independent reviewers as to whether a study is worthy of publication in the scientific literature. According to the commenter, Agency reviewers likewise consider these indicators of reliability in deciding how much weight a study deserves in making judgments about hazard and risk. The commenter notes that in its narrow focus on a single criterion for study acceptability, the proposal departs from this comprehensive, multi-faceted approach for determining the “best available science” to inform decision-making.

Commenter (1203) asserts that good science makes use of all verifiable data and if published in a peer-reviewed journal there is a paper trail that points back to the data, even if the raw data themselves are not available to every reader.

Commenter (5013) states that, in order to have reliable data and large sample sizes, researchers frequently study the records of patients treated in hospitals. Although all the underlying privacy data cannot be available for public review, reviewers wanting to reproduce a study in order to validate it can arrange to have confidential access to key data. Furthermore, the commenter contends that scientists can assess the merits of published research without seeing its data directly by considering such publicly released features as the study's research design, the methods used for data collection and analysis, and comparisons with previous results.

Commenter (6708) states that, if the EPA has an appropriate scientific peer-review process for its internal studies, studies should not be disqualified from consideration in rulemaking on the grounds that they could not release enough information to the public. The commenter adds that, in fact, the public's need for action on many issues regarding pollutants and the risk of exposure to dangerous substances should justify EPA rule-making based on some studies that require that some crucial information be kept private and thereby are rendered unrepeatable. The commenter contends that, instead of prioritizing this onerous, unnecessary, and potentially harmful attempt

at transparency, the EPA should instead invest in having academic scientists available to its internal researchers and policymakers to review studies produced within and outside the agency to provide appropriate, timely, and independent feedback on findings regarding the health of the public.

Commenters (6875, 9224) states that, for data that is not produced by EPA, such as in scientific journals, and particularly when dealing with sensitive data, the process of peer reviewing should often be sufficient. According to the commenter, if multiple studies have gone through the peer review process and have come to the same conclusions, the Agency should not disregard these findings simply because the raw data is not available.

Commenter (6108) asserts that, for policy decisions based upon peer-reviewed journals and literature, the articles should be available to the public (for a nominal fee, if necessary), but it is not necessary to provide every underlying data point for public inspection in rulemaking. According to the commenter, requiring every individual data point from such studies to be made available will greatly reduce the number of sound scientific articles available for rulemaking and the peer review process is widely accepted in the scientific community. The commenter provides that Journals that publish peer-reviewed articles have ethical guidelines for reviewers and reputable publishers use a robust peer-review process that has a series of quality controls.^{2518,2519}

Response: This rule does not categorically exclude any study because the underlying dose-response data are not available, either publicly or via restricted access, for independent validation. If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation. Further, nothing in this rule precludes EPA from considering peer reviewed data. EPA will continue to consider peer reviewed data. Finally, if there is a conflict between an environmental statute EPA administers and this rule, this rule will yield.

Public Notice and Comment Process for Significant Rulemakings Sufficient

Comment: Commenter (6922) notes that the EPA follows a robust public notice and comment process for its significant rulemakings. According to the commenter, where the public has valid reason to doubt the assumptions or data underlying a particular study or is aware of a study that EPA has not considered, the public can share conflicting studies and other information with EPA during the public participation process of the rulemaking. The commenter adds that the EPA is obliged to exercise independent reasoned judgment to disregard information the Agency deems unreliable or biased. The commenter provides that this is the traditional, well-settled process of reasoned administrative rulemaking.

Response: EPA agrees with the commenter and will continue to critically evaluate studies as described in 40 CFR 30.5.

²⁵¹⁸ Science publication Peer Review Ethical Guidelines - <http://www.sciencemag.org/authors/peer-review-science-publications>

²⁵¹⁹ Wiley's Best Practice Guidelines on Publishing Ethics A Publisher's Perspective, Second Edition - <https://authorservices.wiley.com/ethics-guidelines/index.html>

Inconsistency with EPA Policies on Data Access and Availability

Comment: Commenter (9227) states that the EPA has previously stated in several different forums that a scientific study can be valid even if the underlying dose response data and models are not publicly available. For example, the commenter notes that the EPA recently explained in its own Plan to Increase Access to Results of EPA-Funded Scientific Research that even though “some research data cannot be made fully available to the public but instead may need to be made available in more limited ways,” the lack of full public availability “does not affect the validity of the scientific conclusions from peer-reviewed research publications.”²⁵²⁰ Under the plan, the commenter explains that the EPA must make publications resulting from EPA-funded research publicly accessible on NIH’s PubMed Central (PMC).²⁵²¹ The commenter provides that the plan aims to “maximize access, by the general public and without charge, to digitally formatted data resulting from EPA funded research, while protecting confidentiality and personal privacy, recognizing proprietary interests, business confidential information and intellectual property rights, and preserving the balance between the relative benefits and costs of long-term preservation and access.”²⁵²² The commenter adds that the plan recognizes important exceptions for when “the research data cannot be released due to one or more constraints, such as requirements to protect confidentiality, personal privacy, proprietary interest, or property rights.”²⁵²³ According to the commenter, it specifically declares: “The validity of scientific conclusions drawn from research publications or their associated research data, or EPA’s ability to consider those conclusions and data in its actions, does not depend on compliance with this Plan.”²⁵²⁴

Likewise, commenter (9227) notes that the EPA’s Science Policy Council explains in *A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information* that EPA’s determination as to the quality and reliability of a particular scientific study does not depend on one single factor (e.g., the public availability of underlying data), but instead turns on the agency’s consideration of five general factors.²⁵²⁵ The commenter states that Congress implicitly endorsed this approach by including a directive for EPA to use these same five factors in evaluating science under the TSCA Amendments passed in 2016,²⁵²⁶ and just last year this Administration included these same factors in a recent regulation implementing TSCA.²⁵²⁷ The commenter adds that the factors comprise: (1) soundness; (2) applicability and utility; (3) clarity and completeness; (4) uncertainty and variability; and (5) evaluation and

²⁵²⁰ EPA, Plan to Increase Access to Results of EPA-Funded Scientific Research 4-5 (Nov. 29, 2016), <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf>.

²⁵²⁵ EPA Science Policy Council, *A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information*, EPA 100/B-03/001 (June 2003) <https://www.epa.gov/risk/summary-general-assessment-factors-evaluating-quality-scientific-and-technical-information>.

²⁵²⁶ Id. at 7.

²⁵²⁷ EPA Science Policy Council, *A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information*; 15 U.S.C. § 2625(h)(1)-(5); 82 Fed. Reg. 33,726, 33,731 (July 20, 2017), 42 U.S.C. § 300g-1(b)(3)(A).

review.²⁵²⁸ Of these, the commenter states that the only ones with any possible direct relevance to EPA's proposed approach are the third and fifth factors, but neither supports the elevation of public availability of data above all other considerations or the exclusion of studies with non-public data. The commenter adds that the third factor, "clarity and completeness" requires EPA to consider "[t]he degree of clarity and completeness with which the data, assumptions, methods, quality assurance, sponsoring organizations and analyses employed to generate the information are documented," and the fifth factor, "evaluation and review," requires EPA to consider "[t]he extent of independent verification, validation and peer review of the information or of the procedures, measures, methods or models." According to the commenter, even clear and complete "documentation" of the data used does not require that the data be made publicly available. Nor, according to the commenter, does factor five require either that a study's findings must have been replicated using the same data, or that the data must be available to allow for such replication. The commenter provides that, moreover, these are only portions of two of five key factors to consider.²⁵²⁹

Similarly, commenter (9227) asserts that the *EPA's Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of the Information Disseminated by the Environmental Protection Agency*,²⁵³⁰ ("EPA Information Quality Guidelines") issued pursuant to Section 515(a) of the *Treasury and General Government Appropriations Act for Fiscal Year 2001* (Public Law 106-554; H.R. 5658) (the "Data Quality Act") make it clear that the public unavailability of underlying data or models does not render a study inappropriate for EPA's consideration. Specifically, the commenter notes that the *EPA Information Quality Guidelines* acknowledge that even with respect to science that will have "a clear and substantial impact on important public policies or private sector decisions," there will be circumstances where "access to data and methods cannot occur due to compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections."²⁵³¹ Significantly, the commenter notes that the *Guidelines* do not instruct EPA to ignore such science. Rather, according to the commenter, the *Guidelines* instruct that if underlying data or methods are unavailable, "EPA should, to the extent practicable, apply especially rigorous robustness checks to analytic results and carefully document all checks that were undertaken."²⁵³² The commenter adds that the *Guidelines* further explain: "Original and supporting data may not be subject to the high and specific degree of transparency provided for analytic results; however, EPA should apply, to the extent practicable, relevant Agency policies and procedures to achieve reproducibility, given ethical, feasibility, and confidentiality constraints."²⁵³³

²⁵²⁸ Note that TSCA and the regulations do not include the headers for the five factors ("soundness," "applicability and utility," etc.) included in the Science Policy Council guidance, but the description of each factor to be considered is largely identical.

²⁵²⁹ See EPA Science Policy Council, A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information.

²⁵³⁰ EPA, *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the EPA* (2002), <https://www.epa.gov/quality/guidelines-ensuring-and-maximizing-quality-objectivity-utility-and-integrity-information>.

²⁵³¹ *Id.* at 21.

²⁵³² *Id.*

²⁵³³ *Id.*

Commenter (9227) asserts that, far from instructing EPA not to consider scientific studies for which underlying data or models are unavailable, the *EPA Information Quality Guidelines* expressly acknowledge that EPA must balance a variety of important aims to fulfill its statutory obligations to protect public health and the environment. The commenter notes that the EPA explains in the guidelines that “most environmental statutes obligate EPA to act to prevent adverse environmental and human health impacts” and that “[f]or many of the risks that we must address, data are sparse and consensus about assumptions is rare.”²⁵³⁴ Thus, the commenter provides that rather than set rigid rules regarding what science and information EPA can rely upon in its rulemakings, EPA “seek[s] to strike a balance among fairness, accuracy, and efficient implementation.”²⁵³⁵ The commenter conveys that the EPA states: “Refusing to act until data quality improves can result in substantial harm to human health, safety, and the environment.”²⁵³⁶

Commenter (9227) provides that even this Administration, in the context of promulgating regulations under TSCA, has adopted a regulatory definition of “best available science” expressly incorporating a multi-factor analysis, and that definition recognizes that public unavailability of data does not render a study incapable of being “best available science.”

Response: This rule does not categorically exclude any study because the underlying dose-response data are not available, either publicly or via restricted access, for independent validation. If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation. Further, nothing in this rule precludes EPA from considering peer reviewed data. EPA will continue to consider peer reviewed data. Finally, if there is a conflict between an environmental statute EPA administers and this rule, this rule will yield.

As described in the preamble and provided in 40 CFR 30.5, EPA will consider a number of factors in determining the degree of consideration to give studies underlying pivotal science for which the dose-response data are not available for independent validation.

Strengthen Rule for Keeping Health, Personal and Proprietary Data Confidential

Comment: Commenter (6119) states that EPA should refine and strengthen the proposed rule for keeping health, personal, and proprietary data confidential to alleviate the apprehension of public access to personal or sensitive data while still ensuring that relevant epidemiological or toxicological studies can continue to be used to establish public health-based air quality and other standards.

Response: EPA is not requiring that health, personal and proprietary dose-response data underlying studies considered to be pivotal science be made available in a manner that would violate confidentiality.

²⁵³⁴ Id. at 52

²⁵³⁵ Id.

²⁵³⁶ Id.

Court Cases Have Ruled that EPA Should be Allowed to Use Studies Where Data is Not Entirely Available

Comment: Commenter (0566) states that, in two cases, the court has ruled that EPA should be allowed to use studies where data is not entirely available. The commenter provides that, in *American Trucking Associations, Inc. v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002), the court said, “[i]f EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment [S]uch data are often the property of scientific investigators and are often not readily available because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants].”

Commenter (0566) adds that, in 2010 the court reaffirmed its view that “raw data often is unavailable due to proprietary interests of a study’s scientific investigators or confidentiality agreements with study participants” and that EPA is entitled to rely on published study results instead (*Coalition of Battery Recyclers Ass’n v. EPA*, 604 F.3d 613, 623 (D.C. Cir. 2010)).

Commenter (6922) notes that the Courts rejected a challenge to a CAA rulemaking, the U.S. Court of Appeals for the District of Columbia held that requiring agencies to obtain and publicize the data underlying all studies on which they rely “would be impractical and unnecessary.”^{2537, 2538} The commenter provides that, where EPA relied on the results of the scientific studies in the rulemaking record rather than on the raw data underlying those studies, the public was not denied meaningful participation in the rulemaking process.

Response: This rule does not categorically exclude any study because the underlying dose-response data are not available, either publicly or via restricted access, for independent validation. If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Alternative Approaches to Data Availability

Comment: Commenter (6362) recommends that greater weight be given to studies using validated test methods and procedures, models, and approaches when and where those data are based on publicly accessible data, and transparent computer algorithms. The commenter states that other scientifically relevant and reliable studies and data should not be eliminated from consideration, but rather, accorded less weight when integrating evidence from multiple studies within and across different lines of evidence.

Commenters (6918, 9224) recommend that when data unavailable to the public is used, it should be acknowledged in an open process, including in the proposed or final rule’s preamble, and that

²⁵³⁷ See, e.g., *Coal. of Battery Recyclers Ass’n v. EPA*, 604 F.3d 613, 622-23, 624 n.3 (D.C. Cir. 2010); *Am. Trucking Ass’n*, 283 F.3d at 372 (D.C. Cir. 2002).

²⁵³⁸ *Am. Trucking*, 283 F.3d at 372; see also, *Coal. of Battery Recyclers*, 604 F.3d at 622-23.

the Administrator should take the unavailability of underlying data and/or models into account in deciding what weight to give to a study.

Response: The commenters' recommendations are generally consistent with this rule. If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

4.1.1.1.2 Disclosability of Underlying Data

Privacy Data

Does the Handling of Privacy Data Conflict with Federal Laws?

Conflicts with Federal Privacy Laws/Policies and Confidentiality Agreements/Case Law

Comment: Commenters (0569, 0777, 1476, 1791, 1973, 1997, 2002, 2004, 2171, 2413, 2431, 2907, 2908, 4410, 4542, 4588, 4590, 4595, 4840, 4872, 5012, 5173, 5176, 5180, 6098, 6111, 6117, 6125, 6133, 6137, 6170, 6181, 6188, 6191, 6195, 6446, 6788, 6898, 6916, 6919, 6924, 6932, 8275, 8281-PH20, 8281-PH46, 9227) assert that, in many cases, releasing privacy data in the manner EPA proposed could be a violation of health privacy laws and confidentiality agreements with human subject participants. Commenters cite health privacy laws and/or confidentiality agreements legally mandated by IRB regulations, HIPPA, 21st Century Cures Act, Health and Human Services' "Federal Policy for the Protection of Human Subjects" regulations, the Food and Drug Administration (FDA) "Protection of Human Subjects" (also known as the Common Rule) and other FDA requirements, Procedures for Disclosure of Records Under the Freedom of Information Act (FOIA) requirements, and the National Death Index.

Commenter (4590) states that virtually all studies of population-level human health effects of pesticides, air pollutants, water contaminants, drugs, and nutrients, as well as post market surveillance for adverse reactions to medications, require a commitment to the confidentiality of the involved or impacted persons. According to commenter (6181), it is not possible for a host of epidemiological studies and long-term health studies to open their datasets without publishing sensitive information that cannot, by law, be made public. Commenter (6916) states that the proposal provides no discussion of how underlying data of relevant studies can be released consistent with the various laws and regulations protecting privacy and prohibiting disclosure. The commenter asserts that the failure to "consider an important aspect of the problem" renders the proposal arbitrary and capricious.²⁵³⁹ Commenter (6133) expresses concern that the proposal conflicts with decades of statutory, regulatory and institutional progress to simultaneously protect public health and privacy. Commenters (5176, 6898) notes that the proposed rule would require researchers to make all data publicly available, which in some circumstances would not be ethical because of important patient confidentiality protections.

Commenters (2171, 5012, 6111, 6133, 6188, 6924, 8281-PH20, 8281-PH46, 9227) assert that the proposal conflicts with requirements of HIPAA. Commenter (6111) states that, for any research carried out by healthcare providers that involves the handling of individually identifiable health

²⁵³⁹ *Motor Vehicle Mfrs Ass'n v. State Farm Mut. Life Ins. Co.*, 463 U.S. 29, 43 (1983).

information, the HIPAA Privacy Rule imposes strict confidentiality requirements. Commenter (6188) states the proposal would require the sharing of data protected under HIPAA and otherwise barred from disclosure.

Commenters (2171, 4410, 4542, 4590, 4840, 6111, 6133, 6919, 6924, 8281-PH20, 9227) express concern that disclosure of analytic data sufficient to fully replicate study analysis could breach confidentiality requirements upheld by public and private research through IRBs. Commenters (4840, 9227) assert that under the Federal Policy for the Protection of Human Subject (also known as the Common Rule), for all federally-funded studies involving human research subjects, researchers must first obtain IRB approval and informed consent from study participants.²⁵⁴⁰ Commenter (4590) states that Institutional committees for human subjects' protection routinely require non-disclosure of the subjects' identities; when disclosure is permitted, it is only in the most urgent and rare circumstance, usually when it is essential to the protection and safety of an individual subject. Commenter (6133) states that the proposal's provisions concerning the public sharing of underlying data from these studies directly contradict the requirements researchers adhere to under the purview of IRBs, which typically require investigators to ensure study participant confidentiality and data security. Commenter (6916) states that the criteria for IRB approval of research are at the very least in tension with the proposal's directive that "dose response data" are "publicly available in a manner sufficient for independent validation." Commenters (6924, 9227) provide that IRB reviews each human subjects research project to ensure that the specific research protocol protects individual rights. The commenters add that participants must be notified about the degree to which the confidentiality of their records will be maintained and must receive appropriate notification and give consent if study data is to be shared outside the research team.²⁵⁴¹ Commenter (9227) suggests that for studies that had received IRB approval prior to finalization of this proposed rule, there may be no practical opportunity to make the data publicly available. The commenter contends that, even for new studies, it may be extremely difficult, require additional (often unavailable) funding for elaborate protective measures, or simply impossible to obtain IRB approval for protocols that would allow the data to be made publicly available.

Commenter (6098) provides that FDA regulations and Procedures for Disclosure of Records Under FOIA requirements prohibit the sharing and disclosing of CBI and personal data:

1. FDA- 21 CFR Chapter 1 Part 20 subpart D

a. 61

²⁵⁴⁰ 45 C.F.R. §§ 46.101-124 is the U.S. Department of Health and Human Services ("HHS") citation for the Common Rule. A total of 18 federal agencies have adopted it; each agency has its own separate entry in the Code of Federal Regulations. This federal rule governs ethical constraints that federally funded studies must follow, including academic research, responding to earlier concerns of ethical lapses in medical research. See, e.g., Jerry Menikoff, Could Tuskegee happen Today?, 1 St. Louis U. J. Health L. & Pol'y 311, 312-16 (2008) (describing the Congressional response to public outcry when the details of the Tuskegee experiment were brought to light). The thrust of the Common Rule is to address such matters of research ethics as informed consent, informational risk, and institutional oversight when research involves human subjects.

²⁵⁴¹ See, 82 Fed. Reg. 7,149-7,274.

1. "Trade secrets and commercial or financial information which is privileged or confidential."

b. 63

1. "Personnel, medical, and similar files, disclosure of which constitutes a clearly unwarranted invasion of personal privacy.
2. (a) "The names or other information which would identify patients or research subjects in any medical or similar report, test, study, or other research project shall be deleted before the record is made available for public disclosure."
3. (b) "The names and other information which would identify patients or research subjects should be deleted from any record before it is submitted to the Food and Drug Administration. If the Food and Drug Administration subsequently needs the names of such individuals, a separate request will be made."

2. 6 CFR Chapter 10, Part 1001.4(a) (Procedures for Disclosure of Records Under the FOIA, Categories of Exemptions)

1. (4) "Trade secrets and commercial or financial information obtained from a person and privileged or confidential;"
2. (6) "Personnel and medical files and similar files the disclosure of which would constitute a clearly unwarranted invasion of personal privacy;
3. (7)(iii) "Could reasonably be expected to constitute an unwarranted invasion of personal privacy;"
4. (7)(iv) "Could reasonably be expected to disclose the identity of a confidential source, including a state, local, or foreign agency or authority or any private institution that furnished information on a confidential basis, and, in the case of a record or information compiled by a criminal investigation, or by an agency conducting a lawful national security intelligence investigation, information furnished by a confidential source;
5. (7)(vi) "Could reasonably be expected to endanger the life or physical safety of any individual"
6. (9)" Geological and geophysical information and data, including maps, concerning wells."

Response: This rule does not require the release of any privacy or other confidential data. This rule does not conflict with HIPPA or any other privacy statute.

Does Not Conflict with Federal Laws

Comment: Commenter (6179) states that neither HIPAA nor the Privacy Rule place a blanket prohibition on releasing dose response data and models when protected health information (PHI)

is de-identified. The commenter contends that the proposal does not explicitly claim new authority under existing environmental statutes to disclose protected sensitive and confidential information. According to the commenter, instead, they understand the proposal as seeking to provide the public with information that contextualizes pivotal regulatory science so comments on significant regulatory decisions can be more meaningful, while still protecting private, sensitive, and confidential information. The commenter suggests that EPA can clarify this position by explicitly stating that any final regulations arising from the proposal do not assert authorization under the law to disclose protected sensitive or confidential information, and that any such claim must be independently based on a statutory grant of authority from Congress.

Response: This rule does not require the release of any privacy or other confidential data. This rule does not conflict with HIPPA or any other privacy statute.

International Privacy Data Laws

Comment: Commenters (1973, 6873) express concern that the proposal does not address conflicts with international requirements for data disclosure.

Commenter (1973) states that European and Canadian privacy laws do not allow personal information from participants in research studies to be made public. The commenter states that Europe has just tightened its data privacy laws with the General Data Protection Regulation. According to the commenter, regulation limits movement of private data outside of the EU, which would prohibit the type of data access EPA proposes. The commenter states that it defines private data to include medical, physical, physiological, genetic, mental, economic, cultural or social identity of that natural person and it states that the data controller must “demonstrate that the data subject has consented to processing of his or her personal data.” According to the commenter, if the data were made public, even (if possible) in unidentifiable ways, the data controller could still not demonstrate that it was only being used for the purposes and by the people to which the participant in the study consented. The commenter provides:

As an example of the highly confidential personal information included in these types of studies, consider the Canadian Community Health Survey Cohort, which followed a cohort of 300,000 people and looked at the association of PM_{2.5} with mortality²⁵⁴². The participants were linked to their tax records to obtain individual level information on income, which was used as a variable in the analysis. The data includes individual education, marital status, age, sex, immigrant status, minority status, weight, smoking, diet, alcohol consumption, and neighborhood level census data. Because of the highly confidential nature of the data, even the investigators did not have the data. They performed their analyses on the computers at Statistics Canada, where the data resides. Yet this study is a critical study for EPA to consider as it reviews the adequacy of its current 12 µg/m³ PM_{2.5} standard, because essentially all the participants lived in locations below that standard (the 95th percentile of exposure was 11.3 µg/m³). The Canadian

²⁵⁴² Pinault L, Tjepkema M, Crouse DL, Weichenthal S, van Donkelaar A, Martin RV, Brauer M, Chen H and Burnett RT. Risk estimates of mortality attributed to low concentrations of ambient fine particulate matter in the Canadian community health survey cohort. *Environmental Health* . 2016;15:18.

Statistics Act prevents these data from being made public, yet how can EPA set standards based on the best available science without considering it?

Or consider the recent study of the Medicare cohort by Di and coworkers²⁵⁴³. One key result came from a restricted analysis including only people residing in U.S. ZIP Codes with annual PM_{2.5} concentration below the 12 µg/m³ NAAQS. That analysis included 247,682,367 person-years of follow-up and 11,908,888 deaths. They found a 1.36% (95% Confidence Interval (CI) 1.31%, 1.41%) increase in mortality rate per 1 µg/m³ increase in PM_{2.5} below 12 µg/m³. Yet their Data Use Agreement with Medicare prohibits them from providing these data to anyone. How can EPA set a standard based on the best available science when such a huge study, with hundreds of millions of observations in the range relevant for determining the adequacy of the standard is excluded from consideration? Particularly when anyone else can apply to the Centers for Medicare and Medicaid Services for access to the data?

Or consider the ESCAPE study²⁵⁴⁴. This study combined 22 cohorts across Europe, estimated address specific concentrations of multiple air pollutants for each participant, and examined the association of air pollution with mortality in these participants. European data privacy laws would certainly prevent the data from these people being made public as EPA proposes requiring before considering the results in setting standards for air pollution.

Response: This rule does not require the release of any privacy or other confidential data.

Comment: Commenter (6873) states that there are well-established requirements and procedures for protecting the privacy rights of research participants encoded in the international Helsinki Declaration of the World Medical Association. The commenter contends that coming up with new guidelines for releasing private data, even if the intent is to mask this data and make it available only to government scientists, will require review and approval by the U.S. (the FDA and other agencies) and the global research community.

Response: This rule does not require the release of any privacy or other confidential data. This rule does not conflict with HIPPA or any other privacy statute.

Handling of Privacy Data Under the Proposal

Comment: Commenters (0040, 1331, 4872, 5122, 6098, 6126, 6376, 6708, 6898, 6919, 6920, 8281-PH10, 8281-PH24, 8817) urge EPA to ensure the protection of individuals' privacy data. Commenters (0040, 6920) state that research participants enter into non-disclosure confidentiality agreements that require that their information be protected. Commenters (1006, 1011, 1459, 4588, 6191, 6932, 6935) express concern that it may not be reasonable to expect that all data can be made publicly available without inadvertently exposing privacy data. Commenter (6126) suggests that, in order to protect individual's privacy data, more attention is needed to assess the risk of re-identifying data before public releases occur and to ensure important disclosure avoidance practices.

Commenter (4588) states that researchers could redact and anonymize personal health data, but that (1) redaction would involve considerable time, cost, and administrative burden, (2) there are limits as to how much an individual's identity can be protected, especially in small communities where basic identifiers may be enough to recognize an individual. If the number of affected individuals in a study is small—and this is not unusual with rare or serious outcomes—then there is virtually no capacity to maintain anonymity for individuals who have consented to participate.

Commenter (1331) notes that, in the proposed rule, the mechanisms used to determine whether data can be made available or not do not go far enough to ensure regulations involving public health data will not be available to the public. The commenter states that the rule suggests the transparency requirement could be waived if not practical to implement in certain cases, but given the similarities between the data used in environmental epidemiology, a more specific protocol for the handling of this data in relation to the transparency rule would ensure privacy. The commenter states that a section specific to exempting public health data in the rule would lower regulatory costs significantly compared to case-by-case mechanism currently proposed.

Commenter (6098) encourages the EPA to coordinate and work with the other science based regulatory bodies to create an appropriate system of protecting and ensuring patient data to ensure that studies dealing with impact on human health are not discounted nor are subjected to privacy violating policy decisions as in this proposed regulation. The commenter states that patient data demonstrating the effects of substances on human health must not be excluded from any assessment performed by the EPA on determination of the hazards of a substance. The commenter further encourages the EPA to coordinate health data efforts with the FDA, OSHA and other Health and Human Services bodies to ensure a comprehensive system and consistent treatment and verbiage across all regulatory bodies when handling such data.

Commenter (6376) suggests that scientific studies involving or including sensitive health data should not be at risk of exclusion over concerns related to personal information being exposed. The commenter requests that EPA clearly establish guidelines to ensure transparency does not come at the cost of widespread exclusion due to inadequate protections for the variety of sensitive data included in different pertinent studies. The commenter states that the EPA has already shown sensitivity on this issue but should expand the mechanisms to include more than CBI, so as not to exclude widely accepted, peer-reviewed studies, which will now be entered into the public domain.

Commenter (6919) states that government agencies have a legal responsibility to protect residents from any risks associated with sharing personal health information – this includes discrimination. According to the commenter, while transparency is important, health-related data still holds a special status that must be maintained. The commenter contends that researchers can only conduct high-quality and reproducible research by protecting the personal health information of study participants. The commenter asserts that public health professionals must retain private personal data in their own study records in order to conduct accurate and useful surveillance to inform local, state, and national policies.

Commenter (8275) states that the principal focus of the proposed rule is to require full access to original data for scientific studies in order for those studies to be used for regulatory decision-making. The commenter suggests that, while the preamble to the rule indicates that this could be done while maintaining the protection of privacy and confidentiality of research participants, the proposed rule does not include specific provisions to make these protections possible.

Commenter (9227) states that even EPA’s own Science Advisory Board (SAB) voiced concerns to making even limited releases of privacy data, saying:

The proposed rule oversimplifies the argument that “concerns about access to confidential or private information can, in many case, be addressed through the application of solutions commonly in use across some parts of the Federal government.” For studies already completed or underway, the participation of human subjects is undertaken according to terms approved by the cognizant IRB. These terms can vary from study to study. In some cases, the data cannot be released simply by redacting portions of it. For example, data may have been collected with an assurance to the participating individuals that their data would be kept confidential.²⁵⁴⁵

Response: This rule does not require the release of any privacy or other confidential data.

Comment: Commenters (2171, 2182, 2495, 6133) assert that EPA has not presented a compelling rationale for why the standard privacy needs to be violated. According to commenter (2495), understanding public health impacts requires only conducting valid statistical analyses on available data, and the disclosure of privacy information is not required to conduct these analyses.

Response: This rule does not require the release of any privacy or other confidential data. This rule does not conflict with HIPPA or any other privacy statute.

Comment: Commenters (1997, 5011, 6788, 9227) generally assert that the proposal would require researchers to choose between protecting study participant privacy (which is their legal responsibility) or informing the EPA's efforts to protect public health and safety. Commenter (6788) asserts that if researchers respect the privacy of their subjects, their research cannot be used by the EPA. Commenter (9227) states that some researchers might respond by choosing to work only on public administrative data sets, but this would harm rather than strengthen science

²⁵⁴⁵ Memorandum by Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science (May 12, 2018).

quality by curtailing scientific inquiry. Thus, the commenter believes that the effects of EPA's proposed approach would cause some researchers to choose not to pursue research with human subjects, stifling scientific discovery, while others would forgo compliance with EPA's regulatory requirements and have their research ignored by EPA. As a result, the commenter contends that the EPA's proposal would both discourage the development of best available science as well as EPA's use of it.

Response: This rule does not require the release of any privacy or other confidential data. This rule does not conflict with HIPPA or any other privacy statute. Thus, this rule would not "require researchers to choose between protecting study participant privacy (which is their legal responsibility) or informing the EPA's efforts to protect public health and safety."

Comment: Commenters (0569, 2477, 4590, 4878, 5173, 6111, 6446) assert that, even when medical data is masked or coded, subjects can be identified if the population size is small enough or the defining characteristics described are rare enough (e.g., age, gender, income, illnesses, geographic location, specific profession).

Response: This rule does not require the release of any privacy or other confidential data. This rule does not regulate how medical or other private data are to be handled.

Comment: Commenter (6935) suggests that a final rule should encourage, but not mandate, that future studies provide transparency through confidentiality protections such as data masking.

Response: This rule does not regulate how medical or other private data are to be handled.

Comment: Commenter (0559) states that the NIH has established effective policies governing the sharing of data among researchers and with appropriate access by the public at large. The commenter further states that many journals, including the Endocrine Society, are establishing guidelines and standards for the submission of datasets to repositories that are consistent with NIH policies and the FAIR (findable, accessible, interoperable, re-usable) principles for scientific data management and stewardship. According to the commenter, research that abides by these policies and has been published in high-quality peer-reviewed journals should be considered independently validated and sufficiently available to the public.

Response: This rule does not regulate how medical or other private data are to be handled or require that they be shared.

Balancing Transparency and Handling of Privacy Data

Comment: Commenters (2788, 4589, 5129, 6111, 6125, 6133, 6188, 6366, 6909) suggest that the EPA rule needs to provide a balanced approach between transparency and privacy data privacy concerns of study participants and legal and ethical restrictions on the sharing of sensitive data. Commenter (6908) states that transparency is a virtue but not the only virtue and the agency should not be tempted to equate transparency with quality. The commenter states that, in addition to its own quality standards, the objective of the transparency is to improve quality through additional higher levels of trust or higher levels of scrutiny (which in turn generates higher trust).

Commenter (6111) asserts that transparency does not mean violating the confidentiality of study participants or making all raw data publicly available. According to the commenter, the proposed rule does not comport with the fundamental approach to conducting scientific and medical research that is the standard practice for experienced, advanced scholars and researchers. The commenter states that, in the professional scientific and medical research community, “transparency” means clear and detailed disclosure of all methods, data, assumptions, and uncertainties. Studies are considered “transparent” when the study design and methodology are clear enough to allow other scientists to challenge assumptions, test hypotheses, and either reproduce or replicate the study to determine whether the results obtained are consistent with the original study.

Response: EPA agrees that the clear and detailed disclosure of all methods, data, assumptions, and uncertainties is important. This rule does not require the disclosure of privacy data or otherwise violating confidentiality.

Commenter (4589) expresses concern that the proposal places undue emphasis on the need for “transparency” in the assessment of published studies and does not establish clear guidelines regarding the use of studies that include privacy data that have important relevance for risk assessment. The commenter requests that the proposal state explicitly that data “transparency” must necessarily be waived regarding the medical status of individuals who may have suffered adverse health problems as a result of occupational and environmental exposures. The commenter further suggests that the proposal clarify how medical confidentiality will be protected under considerations of expanded disclosure.

Commenter (6125) states that the National Research Council analyzed the balancing of transparency and disclosure of privacy data as one of many competing factors that needs to be balanced in the interest of making gradual progress over time.²⁵⁴⁶ According to commenter, the report presents a summary of recommendations which include:

No one way is optimal for all data users or all purposes. To meet society’s needs for high quality research and statistics, the nation’s statistical and research agencies must provide both unrestricted access to anonymized public-use files and restricted access to detailed, individually identifiable confidential data for researchers under carefully specified conditions.

Ultimately, decisions about how much disclosure risk is acceptable in order to achieve the benefits of greater access to research data involve weighing the potential harm posed by disclosure against the benefits potentially foregone, as well as a judgment about who should make those decisions.

Commenter (6188) states that, while EPA specifically solicits comment on balancing “increased transparency” with protection for copyrighted or CBI, EPA has asked for input only on how to “provide protected access,” not how to balance that access with appropriate privacy protections, creating the impression that no such balancing calculus is required in the case of individual

²⁵⁴⁶ Expanding Access to Research Data: Reconciling Risks and Opportunities, National Research Council. 2005

health data. According to the commenter, this focus overlooks the significant personal privacy pitfalls of the proposal.

Commenter (2788) urges EPA to not censor science in the name of transparency. The commenter quotes former Associate Director for Environmental Health Emergencies at CDC Dr. Scott Deitchman:

"Transparency in science is a movement whose time has come, but it can't be used to hobble science. Such a rule needs to explain how relevant data that can't be made public, particularly health data containing personally identifiable information (PII), can be used to contribute to the regulatory process. Such a rule also should call for a level playing field, requiring that ALL parties participating in the discussion of proposed regulation must transparently disclose the existence of all relevant studies - you can't bury a study whose conclusions don't support your position - as well as making the data available within necessary constraints to protect PII. The rule also should explain how the agency will transparently comply with the Office of Management and Budget's guidelines on the selection of peer reviewers, who will assess whether the data were correctly interpreted."

Similarly, commenter (5129) states that transparency should not be prioritized over the best conclusive data. The commenter notes that EPA should not create a false conflict between violating the privacy of the people who participate in research studies and protecting the public's health. The commenter contends that EPA's job is not to help industrial studies that are inherently biased to help their profits but to support the health of the American people.

Commenter (6909) states that this rule is based on false premises about transparency and scientific reliability. The commenter states that, in general, transparency in science is a good thing, however, EPA seems to have proposed this rule under the false premise that *only* scientific studies for which all underlying data is made publicly available can be adequately evaluated. The commenter states that this is simply not the case, and any discussion about mandating transparency through a bright line rule such as the one currently being proposed should be grounded in this fact.

Response: This rule does not regulate how medical or other private data are to be handled or require that they be shared.

Potential Harms Posed by Disclosure of Privacy Data

Harassment, Stigma and/or Retaliation

Comment: Commenters (5176, 6119, 6125, 6153, 6874, 6896, 6943, 8281-PH13) express concern that the proposal does not address the issue that the proposal requirements for open access to study data could make those who provide this information vulnerable to harassment and/or retaliation.

Commenter (5176) asserts that research participants often agree to provide their information on the condition that it remain confidential, out of fear of retaliation for participating in a study that

may negatively impact the interests of powerful parties (i.e., landlords, employers, industry leaders, advocacy groups, etc.). Commenter (6119) states that protection of individuals', households', and families' private information cannot be assured if such information is openly available to the public.

Commenter (6125) states that the NRC report²⁵⁴⁷ recognizes that protecting confidential information is critical to assuring research participants that they do not need to fear harm:

It is essential that respondents believe they can provide accurate, complete information without any fear that the information will be disclosed inappropriately. Indeed, if the information was disclosed, harm might come to an individual respondent. Many government-sponsored surveys ask about sensitive topics (e.g., income or alcoholic beverage consumption), as well as about stigmatizing and even illegal behavior. The disclosure of such information might subject a respondent to loss of reputation, employment, or civil or criminal penalties.

Commenters (6153, 6874) state that privacy is of concern where data sets include information that could lead to participants facing stigma if it were to be made public. Commenters express concern that in reproductive health research, such information includes pregnancy outcomes such as abortion and miscarriage, and developmental delays that can result from environmental exposures during pregnancy or early life. Commenter (6943) states that study participants should not be subjected to additional stress over legitimate concerns that their personal health information could be released, be put at risk even if redacted, or, worse still, interpreted incorrectly.

Commenter (6896) states that protecting sensitive worker information is of concern in the construction industry as construction is a highly physical occupation; hiring is done quickly and often without much oversight; and construction employees are concerned about being blackballed when employers have reason to view them as physically compromised or vulnerable to health or safety risks on the jobsite. The commenter states that, for example, construction employers confirmed that they would be likely to refuse to hire employees whose medical records revealed decreased lung function.²⁵⁴⁸ The commenter further states that construction workers have also expressed reticence to report injuries and illnesses because they feared employer retaliation or loss of future work opportunities.²⁵⁴⁹ According to the commenter, when construction workers participate in research, they risk individual entitlements, impairment of family relationships, job retention, peer pressure, promotion opportunities, and obtaining and retaining medical and health benefits.²⁵⁵⁰

²⁵⁴⁷ Expanding Access to Research Data: Reconciling Risks and Opportunities, National Research Council. 2005

²⁵⁴⁸ See OSHA-2010-0034-2319 at 117.

²⁵⁴⁹ Moore, J.T., Cigularov, K.P., Sampson, J.M., Rosecrance, J.C., Chen, P.Y. (2013). Construction Workers' Reasons for Not Reporting Work-Related Injuries: An Exploratory Study, 19 Int'l J. of Occ. Safety and Ergo. 97-105.

²⁵⁵⁰ Rose, S. L., & Pietri, C. E. (2002). Workers as research subjects: a vulnerable population. Journal of Occupational and Environmental Medicine, 44(9), 801-805.

Commenter (8281-PH13) states that people talk to them about being exposed to pesticides, and that they are afraid to make a report because they fear losing their job, or fear retaliation.

Response: This rule does not regulate how medical or other private data are to be handled or require that they be shared. Dose-response data that contains privacy data or any other confidential data would be considered available for independent validation if it were available through restricted access consistent with all privacy laws.

De-identification of Data May Reduce or Negate the Usefulness of the Data

Comment: Commenters (1420, 1945, 4542, 4878, 5170, 5173, 5176, 6111, 6896, 6919) assert that there are many studies where it is impossible to de-identify data to a level where the data is both usable and participants are properly protected. Commenters (0100, 1954, 5419, 6120, 6125) assert that, in epidemiological studies, redacting information consistent with privacy requirements may render health effects data meaningless/unusable.

Commenter (6919) asserts that researchers can only conduct high-quality and reproducible research by protecting the personal health information of study participants. Likewise, the commenter states that public health professionals must retain private personal data in their own study records in order to conduct accurate and useful surveillance to inform local, state, and national policies. The commenter suggests that the proposed rule would effectively keep critical studies in the dark – the opposite of transparency.

Commenter (6120) expresses concern that the proposed rule will prevent the use of key public health data whenever epidemiologists keep personal data confidential despite publishing in peer reviewed journals. The commenter suggests that, while the proposed rule cites requirements of major scientific journals for the availability of data, the editors of those journals have also issued a joint statement discussing the importance of including all relevant studies articulating circumstances where data cannot be fully shared, such as when it includes personal identifiers.

Commenter (4542) states that de-identification methods can degrade the accuracy of data for multi-variate statistical analysis or data mining, potentially masking important relationships, such as racial differences in outcomes.²⁵⁵¹ Commenters (0100, 1954, 5176, 6125) assert that since an address is identifying information, it cannot be released with the epidemiological data; but without that information, the health effect data is meaningless as there is no longer a means of correlating the effects to degree of exposure.²⁵⁵² Commenter 5149 contends that de-identification of data it develops to a form that would be acceptable for sharing would preclude their use in meaningful air pollution epidemiological research because identifying information such as the ZIP codes of residence is required to assign pollutant exposures, and identifying information

²⁵⁵¹ Barth-Jones, D. C. 2014. Challenges associated with data-sharing: HIPAA de-identification. Presentation at the workshop Principles and Obstacles for Sharing Data from Environmental Health Research, Washington, DC. Available: <https://www.nap.edu/read/21703/chapter/5>

²⁵⁵² R.T.Burnett. 2018; Particulate Matter Reproducibility and Air Pollution Epidemiology. Presentation to Health Effects Institute 2018 Annual Conference, Chicago, IL. April 30, 2018). <https://www.healtheffects.org/sites/default/files/burnett-reproducibility-hei-2018.pdf>

such as age, gender, and race is required to allow adjustment for these factors in epidemiological models.

Commenter (4878) states that, while a study showed that consuming water from a private well located in an area with historical pesticide use is associated with an increased risk of Parkinson's disease,²⁵⁵³ due to the nature of wells — typically serving a relatively limited number of people within a very small radius — the detail needed to perform the study renders proper de-identification impossible. Commenter (6111) states that, for some studies (e.g. prospective cohort studies that include extensive personal data; environmental health effects studies), it is impossible to de-identify the data without negating its scientific value.²⁵⁵⁴

Commenter (6133) states that the 2009 Integrated Science Assessment for PM_{2.5} notes that “[a]ppropriate statistical adjustment for confounders requires identifying and measuring all reasonably expected confounders.”²⁵⁵⁵ Commenter states that exclusion of some potentially sensitive confounding variables from an underlying dataset likely would lead a different team of investigators to a different result—not as a result of any true difference in the quantitative exposure-effect relationship, but because the original work relied on complete data sets and the new analyses would not—due to the proposal. Commenter states that the resulting discrepancies in quantitative findings could serve as motivation to call the original study results into question due to faulty and incomplete re-analyses.

Response: This rule does not require that in order to be used dose-response data be anonymized to the point that it is not informative. Dose-response data that contains privacy data or any other confidential data would be considered available for independent validation if it were available through restricted access consistent with all privacy laws.

Comment: Commenter (6125) states that at a 2014 NAS workshop on data sharing, Greenbaum of the Health Effects Institute (HEI) noted that sharing de-identified data files would not be useful for air pollution cohort studies “because a de-identified one would not allow you to have location and a variety of other things that are absolutely essential.”²⁵⁵⁶

Response: This rule does not require that in order to be used dose-response data be anonymized to the point that it is not informative. Dose-response data that contains privacy data or any other confidential data would be considered available for independent validation if it were available through restricted access consistent with all privacy laws.

Comment: Commenters (2336, 2429, 6133, 6158, 6373, 6446, 6924, 9227) assert that, to protect against re-identification as required by HIPPA, it would be necessary to remove so much

²⁵⁵³ Nicole Gatto, et al., Well Water Consumption and Parkinson's Disease in Rural California, *Envtl. Health Persp.*, Dec. 2009, at 1912-1918.

²⁵⁵⁵ U.S. EPA, Integrated Science Assessment (ISA) for Particulate Matter (Final Report, Dec 2009), 1–16, Washington, DC, EPA/600/R-08/139F, 2009.

²⁵⁵⁶ D. Greenbaum., in National Academies of Sciences, Engineering, and Medicine. 2016. Principles and obstacles for sharing data from environmental health research: Workshop summary. Washington, DC: The National Academies Press. doi: 10.17226/21703

demographic information from the dataset that other scientists would not be able to perform a meaningful reanalysis or validation of the data. Commenter (2336) states that, under HIPAA, researchers would have to redact the participants' names, birthdates and death dates, among other information, before they could release their health-outcomes data publicly.

Commenter (9227) cites the HIPAA guidelines document: "Of course, de-identification leads to information loss which may limit the usefulness of the resulting health information."²⁵⁵⁷

Commenters (6158, 6924) state that a workshop organized by the National Research Council in 2000²⁵⁵⁸ highlighted that the more identifiers within a dataset are redacted, the less useful the resulting data become in terms of reanalysis. Commenters assert that this indicates that in many cases, the results of a re-analysis completed with de-identified or masked data would necessarily be different than the original study. Commenters argue this runs counter to the rule's stated intent of using these techniques to allow public disclosure of data and validation of scientific findings. Commenters assert that the agency can't make data available (given its need to be de-identified) and simultaneously have its reanalysis be meaningful.

Response: This rule does not require that in order to be used dose-response data be anonymized to the point that it is not informative. Dose-response data that contains privacy data or any other confidential data would be considered available for independent validation if it were available through restricted access consistent with all privacy laws.

Comment: Commenters (2429, 5015, 6909, 6925, 8281-PH20) express concern that the proposed rule does not address impacts on the quality of analysis that arise due to information loss.

Commenter (2429) asserts that, after simple data masking, coding, and de-identification, it is not guaranteed that statistical and inferential reproducibility will be achieved. Commenter (5015) expresses concern that it is not possible to conduct a high-quality air pollution and health study without knowing the locations of those being studied, i.e. where they live, and what are the sources and levels of their air pollution exposure. Commenter (8281-PH20) states that data de-identification and masking techniques can degrade the accuracy of data for further analysis.

Commenter (6909) states that de-identification techniques have the unfortunate side-effect of degrading the data's analytical integrity for purposes of further analysis²⁵⁵⁹ – exactly the kind of further analysis EPA says it wants to enable by promulgating this rule. Commenter states that any claim that it is a simple matter for health data underlying a study to be anonymized and made public should be met with deep skepticism.

²⁵⁵⁷ HHS, Guidance Regarding Methods for De-identification of Protected Health Information in Accordance with the Health Insurance Portability and Accountability Act (HIPAA) Privacy Rule, <https://www.hhs.gov/hipaa/for-professionals/privacy/special-topics/de-identification/index.html>.

²⁵⁵⁸ National Research Council (2000). Improving Access to and Confidentiality of Research Data: Report of a Workshop. Committee on National Statistics, Christopher Mackie and Norman Bradburn, Eds. Commission on Behavioral and Social Sciences and Education. Washington, D.C.: National Academy Press.

²⁵⁵⁹ See Cologne et al. at 1-2. Masking destroys the usefulness of any fields that are masked for purposes of a reanalysis, and perturbing data with random noise "may lead to statistically invalid results that require complex, task-specific procedures to correct" if later researchers seek to recreate the analysis. NASEM Report at 43.

Commenter (6925) states that, requiring that health study data be made public, while protecting privacy, would likely dilute the results by introducing noise into the measurements. Commenter states that one of the most critical pieces of information that would certainly be protected from disclosure is patient addresses – this could potentially be “de-identified” by providing a larger geographic identifier, such as a zip code or county of residence. Commenter states that this process of deidentifying also leads to greater misclassification of exposure, and the higher likelihood that any true effect that exists will not be detected, simply due to imprecise exposure estimation.

Response: This rule does not require that in order to be used dose-response data be anonymized to the point that it is not informative. Dose-response data that contains privacy data or any other confidential data would be considered available for independent validation if it were available through restricted access consistent with all privacy laws.

Participation in Research Studies

Comment: Commenters (1335, 1831, 1973, 2171, 2904, 4410, 5012, 6111, 6125, 6133, 6170, 6171, 6446, 6872, 6876, 6882, 6884, 6896, 6898, 6909, 8281-PH6, 8281-PH10, 8281-PH13, 8281-PH35, 8281-PH-10, 8281-PH48, 8818) express concern that this proposal will decrease people's willingness to participate in future studies of environmental exposures, due to concerns about trust and privacy.

Commenter (2904) states that, while transparency is important in science in order to maintain rigorous scientific method, a balance must occur to protect individuals involved in that research. The commenter states that the proposed rules will jeopardize research in small vulnerable communities who are often the very ones needing EPA and public health research. According to the commenter, a change in current standards will greatly impact research in these communities and their participation in much needed public health and environmental science. The commenter notes that tribes will not participate in research if their confidentiality and intellectual property rights are not ensured. The commenter adds that many important and disadvantaged populations are located in rural and other small communities that make de-identification of individuals and their data a significant challenge. The commenter explains that many participants or subjects in research studies come from protected groups who have a history of exploitation by the United States government, including Native American and Alaska Natives, and that Native peoples in the U.S. are unduly burdened by health disparities and by health disparities related to environmental hazards.

Commenter (1395) states that, if researchers are allowed to reveal confidential medical records, no one would agree to have their medical records used for such studies, and then this research could not be conducted. Commenter (1831) states that if, for instance, someone could not participate in a drug trial for a cure for genital herpes without announcing his affliction to the world, he would likely not participate; as a result, knowledge would not advance, suffering would go unrelieved, and medical research becomes impossible. Commenter (8281-PH35) states that the proposal would make public health research impossible, or much, much more difficult.

Commenters (2171, 4410) assert that it is well documented that privacy assurances are essential to recruit and maintain population-based cohorts. Commenter (1973) states that concern about privacy would have widespread ramifications for health research in general, since many of the cohort studies of air pollution (e.g. Framingham Heart Study, American Cancer Society Study, Nurses' Health Study, MESA study) were originally funded for other purposes and continue to do important research on cardiovascular disease and cancer.

Commenters (1420, 6125, 6133, 6872, 8281-PH6, 8281-PH10, 8281-PH24, 8281-PH13, 8281-PH48, 8281-PH48, 8817) assert that the proposal does not consider the negative effects it would have on recruitment for future epidemiological studies if members of the public had to permit access to sensitive personal and health information as a condition for study participation.

Commenter (1420) states that, while the proposed regulation sounds well-intentioned, the reality is that public health research relies heavily on personal health data and few people will allow their data to be used if those data were publicly available. Commenter (6125) expresses concern that informing prospective survey participants that data that could be used to identify them might be made publicly available could make it more difficult to enroll subjects in future studies.²⁵⁶⁰ Commenter (6872) states that the threat of confidential data disclosure would create a strong disincentive for people considering participation in such studies going forward. Commenter (8281-PH6) states that it may be more challenging for researchers to recruit participants for their studies because of the fear that personal data could be shared. Commenter (8281-PH24) states that volunteers will cease to come forward for scientific research if their medical history and geographic information will be made public, thus putting critical scientific research at risk. Commenters (8281-PH10, 8281-PH13, 8281-PH48, 8281-PH48, 8817) assert that, if we could not assure patient confidentiality, we would not have their participation.

Commenters (6133, 6170, 6171, 6884, 6896, 6898) assert that human subjects will not be willing to provide sensitive information without a guarantee of confidentiality from the researchers for this information.

Response: This rule does not require that dose-response data that contains privacy or other confidential data be made publicly available. Dose-response data that contains privacy data or any other confidential data would be considered available for independent validation if it were available through restricted access consistent with all privacy laws. Thus, the rule should not have a negative effect on study participants.

Comment: Commenter (6170) asserts that, in epidemiologic studies, most, if not all, human subjects will not be willing to provide such sensitive information without a guarantee of confidentiality from the researchers for this information. Commenters (6171, 6898) state that the inability of a scientist to guarantee confidentiality would be a major barrier to being able to recruit an appropriately diverse population of participants. Commenter (6884) states that farmworkers agree to participate because they are guaranteed that their information will remain anonymous, so that they do not risk retaliation for participating. Commenter (6896) states that

²⁵⁶⁰ K. Casey, in National Academies of Sciences, Engineering, and Medicine. 2016. Principles and obstacles for sharing data from environmental health research: Workshop summary. Washington, DC: The National Academies Press. doi: 10.17226/21703.

construction workers will not participate in scientific research unless they know they will be protected from employer retaliation. Commenter (6896) states that sharing a dataset publicly as required by the proposed rule would directly violate the participant's consent.

Response: This rule does not require that dose-response data that contains privacy or other confidential data be made publicly available.

Comment: Commenters (6446, 6909) state that the fact that the public would be able to de-anonymize much epidemiological data, after de-identification processes have been applied, would almost certainly have a chilling effect on voluntary public participation in important research. Commenter (6909) states that, while it is not perfectly clear what EPA's intent is, it is possible given the vagueness of the proposed rule's language that EPA will see fit under some circumstances to make data public itself when it wishes to use a study as a basis for a regulatory action. Commenter (6909) states that, even where it is possible to recruit study participants, it could become challenging to recruit enough participants who adequately represent the population to make the study useful from a statistical standpoint.

Response: This rule does not require that dose-response data that contains privacy or other confidential data be made publicly available. Dose-response data that contains privacy data or any other confidential data would be considered available for independent validation if it were available through restricted access consistent with all privacy laws. Thus, the rule should not have a negative effect on study participants.

Comment: Commenters (1973, 6909, 8281-PH6) express concern that states that, if the proposed rule is implemented it is possible that EPA will conduct less epidemiological research and scientists, organizations, and research institutions will be less inclined to participate in EPA-funded research because of the risk of improperly disclosing personal information. Commenter (1973) states that concern about privacy would prevent future research on environmental exposures.

Commenter (6125) states that the NRC report²⁵⁶¹ recognizes that protecting confidential information can be critical to getting good data: "The reason for confidentiality pledges and for stringent procedures to prevent disclosure is that they improve the quality of data collected from individuals, households, and firms. It is essential that respondents believe they can provide accurate, complete information without any fear that the information will be disclosed inappropriately."

Response: This rule does not require that dose-response data that contains privacy or other confidential data be made publicly available. Thus, this rule will not create a disincentive to new research.

Other Potential Harms

Comment: Commenter (6137) states that, as the Seventh Circuit has explained, people may have privacy interests in unidentifiable personal information: "Imagine if nude pictures of a woman,

²⁵⁶¹ Expanding Access to Research Data: Reconciling Risks and Opportunities, National Research Council. 2005

uploaded to the Internet without her consent though without identifying her by name, were downloaded in a foreign country by people who will never meet her. She would still feel her privacy had been invaded.”²⁵⁶² Commenter states that, according to a 1993 study, more than 60 percent of Americans want hospitals, pharmaceutical companies, and researchers to obtain patient consent before using medical information—even if that information has been de-identified.²⁵⁶³

Response: This rule does not require that dose-response data that contains privacy or other confidential data be made publicly available.

Comment: Commenter (6147) states that there are sensitive ecological, cultural, and archeological data which must be kept private to assure their safety from vandalism, terrorism, and wanton destruction.

Response: This rule does not require that dose-response data that contains privacy or other confidential data be made publicly available.

Comment: Commenter (4877) states that many studies also contain data that is sensitive in terms of security, business confidentiality, and intellectual property reasons, and this data should also be exempt from blanket data sharing requirements. Commenter (6373) states that, because an increasing number of epidemiological studies rely on spatial (e.g., residential address) and temporal (e.g., date of treatment) information to identify risk factors associated with exposures to environmental pollutants, releasing more data publicly can itself compromise national security.

Commenter (8913) states that an unintended consequence of the rule is the national security hazard which flows from the requirement of publication of data sets featuring personal identifiers. Commenter states that the proposal would open a portal into troves of personal confidential information, including the medical, mental health and lifestyle records of cohorts, including individuals associated with military activity and critical infrastructure (frequently the subject of study due to exposure to dangerous chemicals and radiation) who may then be subject to blackmail. Commenter states that hacking and other cybersecurity incidents in recent years demonstrate the inability to fully safeguard such information.

Response: This rule does not require the public disclosure of any sensitive or confidential data.

Confidential Business Information

Does the Handling of Confidential Business Information (CBI) Conflict with Legal Requirements?

Comment: Commenter (6098) states that trade secrets, commercial or financial information that is privileged or confidential are all protected by laws and regulations.

²⁵⁶² *Nw. Mem'l Hosp. v. Ashcroft*, 362 F.3d 923, 929 (7th Cir. 2004).

²⁵⁶³ N. Nina Zivanovic, Medical Information as a Hot Commodity: The Need for Stronger Protection of Patient Health Information, 19 *Intell. Prop. L. Bull.* 183, 201 (2015).

Commenter (6133) contends that the proposed rule's handling of CBI is unlawfully vague and arbitrary and capricious. According to the commenter, the differential treatment of health data and CBI submissions relevant and even integral to EPA's rulemakings, is the essence of arbitrary and capricious action.

Commenter (6196) expresses concern that industry-conducted studies may contain CBI required to be withheld by law.

Response: This rule does not require the public disclosure of any sensitive or confidential data, regardless of whether it is CBI or PII.

Comment: Commenter (6143) states that TSCA §14 provides explicit protections for CBI that is submitted to EPA. The commenter contends that TSCA itself recognizes that specific, limited classes of information should remain confidential, even if they play a role in decisions that the Agency makes pursuant to TSCA.

Response: This rule does not require the public disclosure of CBI. CBI will be handled in accordance with applicable statutes and regulations.

Handling of CBI Under the Proposal

Comment: Commenters (2401, 2787, 6133, 6148, 6196, 6361, 6872, 6920) oppose or express concern with the proposal's approach to CBI.

Commenter (6148) states that in some circumstances full transparency may not be achievable due to CBI. Commenter (2787) states that industry representatives have expressed concerns about requiring public disclosure of data, such as CBI, citing the potential for improper use of such data by competitors.²⁵⁶⁴

Commenter (6361) expresses concern that many studies performed using data from industrial sources would be excluded because they contain CBI, such as product formulations. The commenter states that, under federal law, there are criminal penalties for disclosing CBI, and without demonstrating how compliance will be achieved in tandem with making research data publicly available, it creates serious liability concern for the EPA's intentions.

Commenter (2401) opposes the proposed rule because it will have a negative effect on the relationship between private businesses across a variety of sectors and the EPA. The commenter states that, for proprietary reasons, many firms cannot publicly share results from research they have conducted (in companies in diverse sectors including construction, pharmaceutical, and retail products). The commenter states that this rule would effectively gag companies from sharing such research with the EPA because the work would then have to be made public in its entirety, effectively stopping private companies from cooperating and reaching out to the federal government to help inform regulation and best practice.

²⁵⁶⁴ <https://news.bloombergenvironment.com/environment-and-energy/pesticide-makers-back-public-data-plan-but-not-for-trade-secrets>

Commenter (6872) states that, while CBI data is the least transparent information utilized by EPA and legitimate questions exist regarding the scope of CBI designations, the mandatory public release of appropriate CBI risks undercutting U.S. businesses that are increasingly working to formulate greener, less toxic chemical products that provide a market advantage. The commenter states that mandatory public release of data appropriately considered CBI would create disincentives to the generation and submission of such data to EPA, hindering TSCA and pesticide assessments and could also jeopardize US environmental business innovations.

Commenter (6175) states that agricultural landowners have unique concerns as many also maintain places of residence on their farms, and data disclosed could include physical addresses and other identifying information. Any new data disclosure requirements should maintain consistency with established statutory privacy protections and judicial precedent.

Response: This rule does not require the public disclosure of CBI, nor does it include any requirements for the use or management of CBI data. CBI will be handled in accordance with applicable statutes and regulations.

Comment: Commenters (6857, 6935, 9243) suggest that any final rule should include a process for safeguarding CBI. Commenter (3971) contends that confidentiality can be protected in all the studies upon which EPA relies. Commenter (6935) reports that many states have CBI strategies that might be evaluated. Commenters (6857, 9243) state that, in some instances, there could be legal requirements preventing CBI from being disclosed while in others there may be concerns centered around competition in the marketplace. Commenters (6857, 9243) state that, in either instance, EPA should consider and provide some sort of mechanism for entities to share information with the agency when necessary without suffering unnecessary adverse impacts.

Commenter (6362) suggests EPA consider the following strategies to protect CBI.

- If necessary, when specialized expertise is needed, EPA could contract with an independent third-party science reviewer to confirm those findings.
- EPA might also consider an approach followed under FIFRA where Data Evaluation Records of studies are made publicly available, but not full studies.²⁵⁶⁵
- Another approach is that of the European Union's REACH program, which makes Robust Study Summaries (RSS) publicly available, while protecting from disclosure the competitively sensitive underlying data of health and safety studies.
- When protecting data while also promoting data access, the NIH guidelines should be consulted.²⁵⁶⁶ Many of these guidelines could be applied in EPA's implementation of this proposed policy under each of the statutory programs EPA administers to ensure the guidelines adopted suit the specific needs of each statute.
- In circumstances where company CBI and other intellectual property may be implicated, EPA should confer with the CBI data owner to determine how to make that data available

²⁵⁶⁵ See, e.g., <https://archive.epa.gov/pesticides/chemicalsearch/chemical/foia/web/pdf/010501/010501-050.pdf>

²⁵⁶⁶ See <https://osp.od.nih.gov/2016/05/02/protecting-data-promoting-access-improving-our-toolbox/>; <https://www.niaid.nih.gov/research/data-security>; and <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5302472/>

to the greatest extent possible without disclosing the CBI within that data, study, or model. The commenter provides the following example:

For example, under TSCA, while the summarized study results, analysis, and final report may be publicly available, the underlying data in a health and safety study may qualify as CBI when the underlying data are not in the public domain and that data provides a commercial value to its owner. In such circumstance, it is the availability of the underlying data that determines whether or not an unpublished study can be used by a competitor to support its notification or registration of a substance overseas without obtaining ownership or citation rights to use such data, depriving the data owner of the value of its investment in the underlying data. Current EPA regulations require chemical manufacturers to submit health and safety studies under some circumstances. However, it is noteworthy that none of these regulations routinely require study submitters to submit underlying data along with a final report. This indicates that the final report likely communicates sufficient information about the potential health and environmental effects to the public when a company has submitted health and safety studies in which it has a commercial interest in protecting.

Commenter (6376) commends the EPA for understanding the need to blind CBI in the proposal. The commenter states that the ability to shield CBI is essential for the business community to share relevant scientific studies under the new proposal. The commenter adds that similar measures should be provided for other sensitive data or information from studies unrelated to CBI.

Response: This rule does not require the public disclosure of CBI, nor does it include any requirements for the use or management of CBI data. CBI will be handled in accordance with applicable statutes and regulations.

Comment: Commenters (0559, 6116, 6130, 6133, 6147, 6920) generally support increased access to CBI. Commenter (0559) states that responsible authorities, including state agencies, the EPA, and independent scientific reviewers should be able to request and have access to CBI when necessary to evaluate hazards due to chemical exposures. Commenter (6130) states that refinement of EPA dose-response models would be more likely accomplished by increased disclosure of CBI, not by the increased protection of CBI and decreased availability of scientific information. Commenter (6147) asserts that the codes for chemical formulations which are patented or are protected by CBI should be open to scrutiny by scientists and the community.

Commenters (6116, 6133, 6446, 6920, 6922) express concern that many studies performed using data from industrial sources would be excluded because they contain CBI. Commenter (6920) states that the proposed rule establishes increased protections for CBI, diminishing the amount of information available to the public to inform policy, whether from the scientific community or from the business community. The commenter asserts that these proposed provisions reduce rather than increase public transparency.

Commenter (6133) states that industry stakeholders may submit studies, data or information for which CBI redactions would prevent EPA from considering those materials, because the information is not “publicly available in a manner sufficient for independent validation.” According to the commenter, this could prevent EPA from adopting standards, exclusions, or other regulatory provisions informed by that information. Commenter (6446) states that EPA has long recognized that, while CBI submitted to EPA cannot be shared with the public, the Agency routinely relies on that information, including scientific studies and other scientific information, as the foundation for important regulatory decisions.

Commenter (6133) states that other industry stakeholders opposed to the appeals and demands sought by the first set of stakeholders, would be harmed if EPA nonetheless considers the latter industry’s submissions, notwithstanding redacted CBI that is not “publicly available in a manner sufficient for independent validation”—while at the same time EPA refuses to consider confidential non-business information submitted by the opponent-stakeholders.

Response: This rule does not require the public disclosure of CBI, nor does it include any requirements for the use or management of CBI data. CBI will be handled in accordance with applicable statutes and regulations.

Comment: Commenter (6922) states that any rule should continue to protect CBI. The commenter asserts that, because the proposal risks disclosure of CBI, the proposal could discourage industry and research institutions from working with EPA and contributing information if the Agency cannot ensure that intellectual property, trade secrets, and customer data would be protected from disclosure. According to the commenter, if companies are reluctant to submit CBI to EPA, the Agency’s rules will not be based on the best available data.

Response: This rule does not require the public disclosure of CBI, nor does it include any requirements for the use or management of CBI data. CBI will be handled in accordance with applicable statutes and regulations.

Balancing Transparency and Handling of CBI

Comment: Commenter (6143) states that TSCA itself recognizes that specific, limited classes of information should remain confidential, even if they play a role in decisions that the Agency makes pursuant to TSCA. The commenter asserts that EPA should ensure that any final action it takes on the proposed rule respects this balance, encouraging transparency while making limited exceptions to accommodate legitimate, protected privacy interests such as CBI.

Commenter (6366) states that there is a need to address consideration of private and confidential information that is contained within the pivotal regulatory science being used. The commenter contends that a final rule can be crafted that balances the responsibility EPA has under existing statutes for private and confidential information.

Response: This rule does not require the public disclosure of CBI, nor does it include any requirements for the use or management of CBI data. CBI will be handled in accordance with applicable statutes and regulations.

De-Identification Procedures and the Potential for Re-identification

De-identification Procedures Have Limitations

Comment: Commenters (0569, 0100, 1008, 1346, 1420, 1461, 1476, 1481, 2171, 2477, 2548, 2687, 4542, 4872, 5019, 5176, 6111, 6125, 6137, 6153, 6125, 6158, 6170, 6446, 6772, 6868, 6873, 6877, 6909, 6924, 6932, 8281-PH20, 8281-PH46, 9227) are generally opposed to the proposed disclosure provisions because de-identification procedures to anonymize personal health data and information can be burdensome and may not sufficiently mask personal identifiable information.

Commenter (6111) states that EPA’s suggestion in the proposed rule that “simple data masking, coding, and de-identification” will be able to overcome these confidentiality concerns is incorrect. The commenter asserts that EPA’s SAB states “[i]n some cases, the data cannot be released simply by redacting portions of it. For example, data may have been collected with an assurance to the participating individuals that their data would be kept confidential.”

Commenter (9227) asserts that EPA ignores the real concerns, based in empirical evidence, about reidentification of individuals through cross linking with existing public datasets and the ensuing breach of privacy. The commenter states that experts have observed that even the disclosure of redacted or “de-identified” data sets have become more fraught as public health studies have become more rigorous, because these studies are relying upon greater quantities of ever more granular personal information.²⁵⁶⁷

Response: This rule does not require the disclosure of PII or mandate any procedures on the use or management of PII.

Comment: Commenter (6125) asserts that the proposal’s unsecured promissory note that it will “make all reasonable efforts to explore methodologies, technologies, and institutional arrangements” for making data available and preserving privacy both fails to say how and fails to acknowledge the extreme difficulties in doing so. Commenter states that, by ignoring all the issues raised (including in the very sources it cites), the agency arbitrarily ignores key issues and record evidence. *State Farm*, 463 U.S. 43.

Response: This rule does not require the disclosure of PII or mandate any procedures on the use or management of PII.

Comment: Commenters (0100, 6873, 6896) explain there are barriers with respect to older studies.

²⁵⁶⁷ See Letter from Daniel S. Greenbaum, Health Effects Institute, to Lek Kadeli, Environmental Protection Agency 3 (Aug. 27, 2013) (describing the use of increasingly fine-grained community-level and zip code-level data in public health studies, and noting that “these characteristics – which have in general enhanced the quality and the sensitivity of the studies – increase the difficulty of providing a fully “de-identified” data set while also enabling a different investigator to conduct a full replication and sensitivity analysis of the original study results.”).

Commenter (0100) states that each IRB committee usually specifies a fixed time period after completion of the study at which the researcher must destroy his or her copies of the raw data and, thus, would no longer have it available to supply to the EPA after this fixed destruction date. Commenter (6896) states that many data sharing and informed consent agreements include clauses for destroying or returning raw data sets after a study's completion, and so data sharing may not be possible. Commenter (6873) states that, for older studies, improving data access to the degree necessary to pass the openness requirements of this proposed rule could end up being almost impossible given that consent forms written 10-20 years ago were largely silent on the issue of broad sharing of data. The commenter adds that IRBs cannot release private data without consent and getting this consent from study participants where the personal information has long since retired and participants have either died or moved multiple times will be extremely challenging and costly at best, and effectively impossible at worst, therefore possibly rendering "old" studies unusable. Commenter (6896) states that data confidentiality laws have changed to increase protections for research subjects throughout the years and older datasets may contain data that would be considered illegal under current laws. The commenter states that requirements that subjects be notified on how their personally identifiable information is used and shared may prove so cumbersome as to make data sharing impossible for older datasets. The commenter adds that the individuals may be no longer living or be reachable through the contact information originally provided to researchers.

Commenter (6915) asserts that the proposal's suggestion that concerns about access to confidential or private data can simply be addressed through the application of tools used by other federal agencies, *id.* at 18,770-71, will be unworkable or impracticable for many past and even future studies. For example, the commenter provides that the proposal cites to guidance regarding methods to de-identify protected health information under the privacy rules of the 1996 HIPAA, Pub. L. No. 104-191, 110 Stat. 1936. *Id.* at 18,771 n.17. The commenter states that the cited guidance document is 28 pages, contains detailed instructions for de-identification, including how experts are to assess the risk of identification of information, and emphasizes the importance of data-sorting systems to manage protected health information for the de-identification process, including use of a one-way cryptographic function to obscure personally identifiable information.²⁵⁶⁸ Among other things, the commenter states that the guidance provides that various identifiers of individuals—including all names, geographic subdivisions smaller than a state (with one exception), dates directly related to an individual, telephone numbers, biometric identifiers, and so forth—must be de-identified. HIPAA Guidance at 4-5. According to the commenter, the guidance thus highlights that, in fact, it is not easy to address confidentiality concerns: the de-identification process is complex and must be designed into the overall study process, something that cannot be done for historic studies. Moreover, the commenter asserts that, to the extent that one of the purposes of the proposal is to enable persons to replicate studies, this may not be possible where the de-identified data is critical to the studies' findings and conclusions.

²⁵⁶⁸ See U.S. Dept. of Health & Human Servs., Guidance Regarding Methods for De-Identification of Protected Health Information in Accordance with the Health Insurance Portability and Accountability Act (HIPAA) Privacy Rule 6 (Nov. 26, 2012) [hereinafter HIPAA Guidance], <https://www.hhs.gov/hipaa/for-professionals/privacy/special-topics/de-identification/index.html>.

Response: This rule does not require that dose-response data that contains privacy or other confidential data be made publicly available. It does not mandate any procedures on the use or management of PII. Dose-response data that contains privacy data or any other confidential data would be considered available for independent validation if it were available through restricted access consistent with all privacy laws.

Possibility of Re-identification

Comment: Commenters (1973, 2171, 2548, 2906, 6125, 6446, 6868) assert that data masking, coding and de-identification techniques have limitations because re-identification of participants is still possible.

Commenter (2548) states that data transparency and data sharing are not always viable options when researchers study human beings and must estimate exposures as a function of location and time. Commenter (5170) states that when individual characteristics are combined by linking datasets (for example, death records, age, sex, and exposure information), individuals can be identified. Commenter (6133) states that research has documented that de-identification techniques to render data anonymous are not “simple” as the proposal characterizes and can lead to the publication of protected confidential or private data. Commenter (4542) states that re-identification of participants is also made possible by using external information available online and through other sources.²⁵⁶⁹ Commenter (6909) states that even when “direct identifiers” like names, addresses, and birth dates are removed, “the data values themselves may possess some degree of subject specificity or uniqueness” that could potentially be used to identify individual study participants.²⁵⁷⁰ Commenter (6133) asserts that, with the shift away from paper to electronic medical records in recent decades, “the potential for individuals to access, use, and disclose sensitive personal health data” has increased.²⁵⁷¹

Commenters (2477, 3135) suggest that it is not always possible to de-identify the data set. Commenter (2477) states that Deoxyribonucleic Acid (DNA) samples/data can be delinked from identity, but the ability to re-link that later is inherent in DNA. Commenter (3135) states that the geneticist Craig Ventner and colleagues reported the ability to identify persons using their genetic code alone (without needing to do a DNA match).²⁵⁷²

²⁵⁶⁹ See, for example, the extensive discussion on re-identification here: National Academies of Sciences, Engineering, and Medicine. 2016. Principles and obstacles for sharing data from environmental health research: Workshop summary. Washington, DC: The National Academies Press. doi: 10.17226/21703.

²⁵⁷¹ Thacker SB. “HIPAA Privacy Rule and Public Health: Guidance from CDC and U.S. Department of Health and Human Services.” *MMWR* 52:1–12 (April 11, 2003).

²⁵⁷² “Here, we show that phenotypic prediction from WGS data can enable re-identification without any further information being shared. If conducted for unethical purposes, this approach could compromise the privacy of individuals who contributed their genomes into a database. In stratified analyses, we see that risk of re-identification correlates with variability of the cohort. Although sharing of genomic data is invaluable for research, our results suggest that genomes cannot be considered fully de-identifiable and should be shared by using appropriate levels of security and due diligence.” From: Christoph Lippert, Riccardo Sabatini, M. Cyrus Maher, Eun Yong Kang, Seunghak lee, et al. *Genomics of physical traits*, *PNAS* Sep 2017, 201711125; 001: 10.1073/pnas.1711125114

Commenters (2171, 6446) specifically state that data masking, coding, and other procedures suggested to protect privacy, particularly in the context of epidemiological research, would not work. Commenter (6446) explains that even when medical data is masked or coded, subjects can be identified if the sample size is small enough, the characteristics described are rare enough, and/or the data includes, for example, subjects family structure, geographic location, dates of birth, sex/gender, medical conditions, occupations, and/or dates and causes of death. Commenter (2171) states that data availability, as proposed under this rule, would disclose information such as geocoded latitude/longitude residential locations; demographic covariates; and repeated measures in longitudinal population-based studies. According to the commenter, if made publicly available, as required by the proposed rule, the specificity of these non-private covariates would facilitate, with relative ease, the re-identification of individuals and their protected health information. The commenter states that it is this very specificity in geographic, demographic, and health information that contribute to epidemiological studies with the most robust quantification of dose-response and uncertainty relationships.

Commenter (1973) states that the arguments that data can be redacted to be non-identifiable are belied by modern data science. Re-identification can easily happen. The commenter provides the following examples.

Consider the Harvard Six City study. To get good exposure estimates participants were recruited not across the cities involved but from one neighborhood in each city. In Boston that neighborhood was Watertown with a population of about 35,000. From data obtainable from the MA department of Public Health, the average number of deaths per year in Watertown is 208. Applying the average U.S. mortality rate per 1000 people to the population of Watertown would give very similar results. This is less than one death per day. Obviously knowing the date of death alone would uniquely identify most of the participants. But even if the data made public were restricted to providing only the year of death (which is required to replicate the analysis or do any reasonable analysis of the effect of air pollution on annual mortality) the analysis of such data also requires knowing the age, race, sex, and cause of death of each individual. Again, with only 200 deaths in a year, it is likely that most people can be identified from knowing those facts. After all, that is only 100 deaths per year for each sex, and those deaths occur across a range of at least 40 ages at death, and many different causes. Combining this with publicly available obituary data, or publicly available death certificate data, would complete the identification of each person.

The Medicare cohort which followed over 60 million Medicare participants might seem less susceptible to this issue. But consider that exposure was assigned to people by Zip code. From the data provided in the paper, the average number of deaths per year in a Zip code was only 23. If one knew the age, race, and sex, age at entry into Medicare (people who work after 65 often enter at a later age), year of death, and Zip code of those people, it would not be difficult to identify them. Since all of that data except the Zip code would have to be made public under EPA's proposal, the question of whether the data are sufficiently de-identified becomes how difficult would it be to identify the Zip code of the participants, given all the information used in the analysis, which EPA would like to make public? Since everyone in a given Zip code was assigned the same exposure and

same covariates in the same year, it is easy to group observations into Zip codes, even without their identity being known. After this, can they be identified? The data that was used in the analysis of the Medicare cohort included region of the country. So, the matching is already made easier by knowing which of 10 regions each Zip code is in. Then, for each Zip code, the annual average of ozone and PM_{2.5} is part of the analysis data. There is considerable variability in both of these variables, and, moreover, there are public maps showing how they vary across the U.S., including in the published paper of Di and coworkers. EPA also has ~1800 monitoring sites to provide guidance on what levels prevail where, in what year. Using those, it should be easy to assign each Zip code to a sub region that corresponds to that range of PM_{2.5} and ozone. But over 13 years, these exposures changed differently over time in different Zip codes, and since annual analyses were done in the paper, that data would have to be available under the proposed EPA rules as well. Looking at levels and trends can assign the unknown Zip codes to much smaller sub regions. Then consider that the analysis controlled for, and therefore under EPA's proposal, should make public, percent of the Zip code that is age 65 or older, is black, is Hispanic, percent of people 65 and older living below the poverty level, or not having completed high school, percent of owner occupied housing in the Zip code, population density in the Zip code, median house value in the Zip code, percent of owner occupied housing in the Zip code, and the annual average temperature in the Zip code. All of these data are, of course publicly available from the U.S. Census with the Zip codes identified. How hard is it then to match? Consider median housing value. This varies greatly in the U.S., and even between nearby neighborhoods. Restricted to a sub-region, this provides a lot of information on where a Zip code could possibly be. So does mean annual temperature, and all of the other variables listed. The analysis data includes additional variables that were controlled for, including county level percent smokers and mean body mass index, and percent of people age 65 and over who had hemoglobin A1c and LDL cholesterol tested each year, and percent who had an annual checkup, by hospital service area. All of this data is publicly available with the location identified. How hard would it be to match? Indeed, consider the simple calculation that if each of the 15 area level variables were classified as high vs low, there would be 32,768 unique combinations in each region which contains only about 3900 Zip codes. And, of course those variables are continuous, giving many more unique combinations. And this is without the ozone and PM_{2.5} concentrations. Given all this information, we believe that most and likely all of the individual Zip codes, and hence most of the individuals who died, would be identifiable. About a third of the Medicare participants died during follow-up in that study. This would certainly violate rules of the Center for Medicare and Medicaid Services for use of their data, as well as general prevailing standards of individual privacy.

Commenters (1973, 6111, 6125, 6133, 6137, 6874) reference several other studies where researchers have demonstrated the potential for “re-identification” of data.

Commenters (1973, 6111) reference a recent peer-reviewed study²⁵⁷³ which examined the identifiability of records from an environmental health study in Northern California. Commenter

²⁵⁷³ Sweeney L, Yoo JS, Perovich L, Boronow KE, Brown P and JG B. Re-identification Risks in HIPAA Safe Harbor Data: A study of data from one environmental health study. Technology Science. 2017.

(1973) states that, using data considered by HIPAA to be sufficiently de-identified to be made public, which involved far fewer variables than would be required to make public in the cohort studies, they were able to correctly identify over 25% of the participants. Commenter (6111) concluded from this study that even if EPA or the researchers spend money and time to de-identify data to comply with the proposed rule, that effort will not necessarily protect patient or research subject confidentiality.

Commenters (1973, 6874) reference another study²⁵⁷⁴ which searched the Lexis-Nexis database for stories that mentioned hospitalization. Commenter (1973) states that by matching that with age, race, sex and Zip code from a supposedly anonymized hospital admissions data base they were able to match 43% of the people named in the news stories to their medical records. Commenter (1973) states that, since large numbers of obituaries are printed every day, the numbers that could be identified by such a process is even larger. Commenter (1973) states that is before considering the other data available to help matching.

Commenters (6133, 6874) reference a study²⁵⁷⁵ which examined the identifiability of records. Commenter (6133) states the study explains that “any data that is even minutely useful can never be perfectly anonymous.” Commenter (6874) states that the study has demonstrated the potential of “re-identification” techniques, which combine seemingly innocuous data from multiple publicly available sources, to identify individuals.

Commenters (6125, 6133) refer to a study²⁵⁷⁶ that explained “87% (216 million of 248 million) of the population in the United States had reported characteristics that likely made them unique based only on [5-digit ZIP, gender, date of birth].” Commenter (6125) states that the level of detail in the data supporting many of these studies precludes simply redacting portions of the information to protect privacy as suggested in the proposal.

Commenter (6125) states that, as Herring notes, the better-characterized the cohort in studies (e.g., personal information on potentially confounding contexts and behaviors, well-characterized exposures, clinically-confirmed outcomes), the more limitations on data sharing due to federally-mandated personal privacy protections (Common Rule, HIPAA Privacy Rule, informed consent restrictions).²⁵⁷⁷

Commenter (6133) states that anonymizing data (through techniques such as data masking, coding, and de-identification techniques) might not adequately protect confidentiality or privacy. The commenter contends that various studies have documented that de-identification techniques render data anonymous is not “simple,” despite what the proposal suggests, and can lead to the publication of protected confidential or private data. According to the commenter, that one study explained that “[b]y linking demographics to public records such as voter lists, and mining for

²⁵⁷⁶ Sweeney, L., Simple Demographics Often Identify People Uniquely, Carnegie Mellon University, Data Privacy Working Paper 3 at 2. Pittsburgh 2000, available at <https://dataprivacylab.org/projects/identifiability/paper1.pdf>.

²⁵⁷⁷ A.H.Herring, 2018. Study Design, Data Analysis, Reporting, and Interpretation: Choices and Consequences. Presentation to Health Effects Institute 2018 Annual Conference, Chicago, IL. April 30, 2018). <https://www.healtheffects.org/sites/default/files/herring-reproducibility-hei-2018.pdf>

names hidden in attached documents, we correctly identified 84 to 97 percent of the profiles for which we provided names.”²⁵⁷⁸

Commenter (6137) states that de-identifying personal information has thus far proven to be ineffective. The commenter states that, under the Privacy Rule, the entity may remove multiple enumerated categories of information, including patient names, social security numbers, full face photographs, and biometric identifiers (such as fingerprints). Id. § 164.514(b)(2). The commenter explains that an entity following this approach must generalize each patient’s birth date to the relevant year and may include only the first three digits of a patient’s zip code. Id. § 164.514(b)(2)(i)(B), (C). According to the commenter, despite these seemingly thorough requirements for de-identification, the Privacy Rule is significantly less protective than it appears. The commenter states that, in the years since its adoption, publicly available personal information has proliferated, and new databases are created every day.²⁵⁷⁹ The commenter contends that to “reidentify” de-identified data, an adversary need only discover an individual’s “data fingerprint”—that is, the combination of values shared by nobody else in an anonymized data set.²⁵⁸⁰ The commenter states that the adversary can then link this fingerprint to publicly available, non-anonymized information to discover the individual’s identity.

Commenter (6909) states that the NAS, Engineering, and Medicine (NASEM) have discussed this problem in a recent report, agreeing that “it has become clear that even anonymized data can reveal private information about the human subjects.”²⁵⁸¹ The commenter states that as the NASEM Report went on to explain, there is a significant challenge presented by the fact that “even attributes that are not labeled as personally identifiable may still contain sensitive information that associates an individual, and that by linking those data to other publicly available resources, individuals can be re-identified.”²⁵⁸² According to the commenter, a recent case study cited by NASEM which looked at a dataset containing 2.8 million hospital records showed that “even after removing from the dataset all information except the procedures received by a patient, the percentage of patients with a unique set of procedures is still 42.8 percent; in other words, as the investigators state, ‘an adversary would have about a 42.8 percent chance of linking the anesthesia record to the hospital database, thereby discovering the patient’s sensitive information.’”²⁵⁸³ The commenter states that “anonymizing” techniques cannot

²⁵⁸² Id.

²⁵⁸³ Id.

guarantee a prospective study participant that his or her confidential patient information will in fact remain confidential.

Commenter (6137) states that adversaries need not resort to such sophisticated methods. The commenter states that, as the Seventh Circuit explained in the context of medical records relating to abortion, once a patients' de-identified records are made available, "persons of their acquaintance, or skillful 'Googlers,' sifting the information contained in the medical records concerning each patient's medical and sex history, will put two and two together, 'out' the . . . women, and thereby expose them to threats, humiliation, and obloquy."²⁵⁸⁴

Response: This rule does not require that dose-response data that contains privacy or other confidential data be made publicly available. It does not mandate any procedures on the use or management of PII. Dose-response data that contains privacy data or any other confidential data would be considered available for independent validation if it were available through restricted access consistent with all privacy laws.

Relationship to Existing Data Sharing Practices

Comment: Commenters (6117, 6125, 6170) expresses concern that the proposal does not align with existing data sharing policies

Commenter (6170) asserts that IRBs do not allow for such data to be made publicly available i.e. in any form that may allow one to identify the research subject. The commenter states that this is often impossible to achieve since researchers need geographic identifiers (geocoded addresses) to go along with the health data in order to identify exposures. According to the commenter, even so called de-identified human data would have to be made available at a level of detail for replication studies - as proposed by this rule – such that it would allow for individuals to be identified especially for rarer diseases such as some cancers, autism and Parkinson's disease.

Commenter (6125) states that HHS's guidance on de-identification of protected health information provides safe harbor as an acceptable method, requiring that certain identifiers are removed. The commenter states, however, that it is unclear whether this method would be adequate/suitable to de-identify information from data relied upon by EPA. Commenter (6868) expresses that, while the proposed rule cites guidance from the Department of Health and Human Services on proper techniques for deidentifying protected patient data, the very webpage EPA cites includes the following text about the risks of data de-identification: "Both methods, even when properly applied, yield de-identified data that retains some risk of identification. Although the risk is very small, it is not zero, and there is a possibility that de-identified data could be linked back to the identity of the patient to which it corresponds." According to the commenter, even sources that EPA cites in support of de-identification of data recognize that patients' protected information could still be breached.

Commenter (6117) refers to the following policies as not aligning with EPA's proposal:

²⁵⁸⁴ Nw. Mem'l Hosp. 362 F.3d. at 929.

- NIH policies, including the policy that researchers conducting agency-funded research pre-register clinical trials, pre-specify study endpoints and statistical plans, and report research results.
- Many federal agencies, including the EPA, require that any published articles based on federally-funded research be made available via the PubMed Central (PMC) website.
- The International Committee of Medical Journal Editors (ICMJE) has adopted a policy requiring pre-registration of clinical trials, and publication of a data-sharing statement.
- In 2015, the Institute of Medicine (IOM) published a report recommending that trials be registered prospectively (i.e., at or before the time of first patient enrollment), that summary-level results be shared with the public after trial completion, and that the metadata and patient-level data be responsibly shared with researchers 6 months after scientific publication, or 30 days after regulatory approval.

Response: This rule does not prescribe any data-sharing methods. The rule simply requires that EPA give greater consideration to pivotal science where the underlying dose-response data are available in a manner sufficient for independent validation.

Comment: Commenters (1973, 4542, 6125, 6909, 6924, 9227) refer to work of the National Academy of Sciences (NAS) and assert that de-identification procedures have significant limitations.

Commenters (6117, 6125, 6133) assert that the proposal's reference to NIH data sharing policy does not acknowledge certain limitations.

Commenter (6125) states that the proposal's reliance on NIH is misplaced. The commenter states that NIH policies regarding data sharing generally recognize the need for restricting access to protect privacy or CBI and note that in some cases access may need to be restricted to data enclaves or other limited sharing agreements available only to qualified investigators.

Commenters (6117, 6125) state that NIH requires a data sharing plan for extramural research projects requesting \$500,000 or more in a single year and some institutes of the NIH share data with researchers via a secure website. Commenter (6125) asserts, however, that this requirement is not absolute, since NIH will also accept an explanation for why data sharing is not possible. The commenter asserts that, under the proposal, EPA would not accept such an explanation as anything but a basis for a waiver request, either for its own science or for NIH's. The commenter states that, for research with such plans, NIH funds the costs of necessary data and methodology sharing arrangements as part of the project. The commenter states that EPA's proposal provides no such funding and does not even acknowledge that it may be needed.

Commenter (6133) states that the NIH policy cited in footnote 21 of the proposal states that "[t]he investigator must be a tenure-track professor, senior scientist, or equivalent, to be able to submit" a data access request. The commenter contends that this fatally undermines the notion in the proposal that data must be available to all members of the public in order to meet the reproducibility threshold. The commenter states that the Census Bureau resource, also cited in footnote 21 of the proposal, describes the Federal Research Data Centers. According to the commenter, these centers restrict access to certain individuals, who "must obtain Census Bureau Special Sworn Status – passing a moderate risk background check and swearing to protect

respondent confidentiality for life, facing significant financial and legal penalties under Title 13 and Title 26 for failure to do so.” The commenter states that, again, this fatally undermines the notion in the proposal that data must be available to all members of the public. According to the commenter, while the proposal simply says that members of the “public” can access these centers, the reality is that access to such controlled spaces is carefully restricted and not accessible to all members of the public. The commenter contends that EPA does not seriously confront the significant challenges involved in enabling access.

Response: This rule does not prescribe any data-sharing methods. The rule simply requires that EPA give greater consideration to pivotal science where the underlying dose-response data are available in a manner sufficient for independent validation.

Comment: Commenter (2906) states that de-identification of study subjects remains a difficult, costly, and time-consuming process. Particularly where study data intersects with consumer data collected by data brokers, de-identification may not be possible, which could dramatically limit the amount of data available to EPA regulatory officials.

Response: This rule does not require the de-identification of study subjects or the public disclosure of personPII. This rule does not prescribe any data-sharing methods. The rule simply requires that EPA give greater consideration to pivotal science where the underlying dose-response data are available in a manner sufficient for independent validation. For PII, CBI and other sensitive data, the dose-response data can be made available for independent validation through restricted or tiered access.

Comment: Commenters (6125, 6133) note that the proposal cites to various agencies and documents to support its general statement “that concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions commonly in use across some parts of the Federal government.” The commenters state that the proposal includes references to examples from HHS, National Institute of Standards and Technology, U.S. Department of Education, the U.S. Census Bureau., and the Bipartisan Commission on Evidence Based Policy. According to the commenters, the documents cited in the proposal do not support the position taken in the proposal.

Response: These documents are consistent with the restricted or tiered-access approach proposed in the 2020 SNPRM and finalized in today’s rule.

Lack of Discussion of Implementation in the Proposal

Comment Commenters (2241, 3135, 6116, 6125, 6133, 6188, 6896, 6924) contend that EPA has not identified the specifics of how it will implement the rule. Commenter (6133) asserts that the proposal does not propose or analyze any strategies it notes EPA should consider, even though it seeks to implement a binding legal change. Commenter (2241) states that the proposed rule has the following critical shortcoming that disqualifies it as regulation: it fails to explain how PII, such as health information, can be used in the rulemaking process. The commenter states that, without clear guidelines on the use of PII, such data may be excluded from regulatory analyses, which could lead to epidemiologically biased data sets and incorrect conclusions.

Commenters (3135, 6116, 6924) express concern that the proposed rule does not address who would assume potential liability if confidential information is disclosed to comply with the rule. Commenter (3135) states that, for human studies, to manage potential risks of disclosure of sensitive human data, the EPA would not be able to rely solely on data submitters to have de-identified the data but, to avoid liability, would have to perform checks to assure that EPA would not inadvertently disclose any personal health information. Commenter (6116) expresses concern that, under federal law, there are criminal penalties for disclosing CBI – a serious risk of liability for EPA that the agency does not address except to say generically that all such laws will be followed, without demonstrating how compliance will be achieved in tandem with making research data publicly available.

Response: This rule does not require the disclosure of confidential information.

Comment: Commenters (6125, 6133) state that the proposal does not explain what would happen if an available de-identifying method does not meet the applicable standards.

Response: This rule provides for independent validation of dose-response data that contains PII through restricted access. Thus, the dose-response data do not have to be anonymized.

Comment: Commenter (6133) states that the proposal does not identify a plan for EPA to manage mandatory agreements to maintain confidentiality, data encryption, electronic firewalls and locked storage facilities, password authentication of users, audit trails, disaster prevention and recovery plans, or security measures for backup tapes. The commenter states that the NIH Data Sharing Workbook specifies that “[s]ome investigators withhold parts of the sample; others block access to specific variables, especially items with low prevalence rates that make it easier to identify participants with unusual characteristics.” The commenter states that, within this policy, the “measures used to minimize the risk of breaching the confidentiality of data” are unworkable given the depth and breadth of peer-reviewed research that would fall under the rule.

Response: EPA will handle this consistently with how it currently manages PII, CBI and other sensitive data.

Comment: Commenter (6896) expresses concern that the proposal does not recognize or address the extensive efforts needed for data to be shared with the EPA and maintain confidentiality of sensitive health and employment information. The commenter states that the appropriate IRB would have to be consulted on the approach to de-identification and each individual record would have to be personally reviewed by a subject expert and appropriately de-identified. According to the commenter, for some datasets, multiple IRBs would have to be consulted. The commenter asserts that the requirements and dedication to protecting research participants who served our country in Department of Energy (DOE) complexes would result in countless hours spent notifying all participants, gaining informed consent, and de-identifying each individual record before underlying data could be shared with EPA. The commenter states that the Building

Trades National Medical Screening Program (BTMed)²⁵⁸⁵ dataset characterizes the strenuous challenges to protecting sensitive worker information.

Response: This rule provides for independent validation of dose-response data that contains PII through restricted access. Thus, the dose-response data do not have to be anonymized.

Comment: Commenter (6188) states that the rule's scant text entirely omits a discussion of privacy protections or how EPA would navigate those protections to adequately shield the identities of study participants while still providing "the information necessary for the public to understand, assess, and replicate findings." According to the commenter, the proposal amounts to a proposal to shirk EPA's statutory obligations and ignore patient privacy laws administered by other agencies. The commenter states that the proposal only says that data will be made publicly available "in a fashion that is consistent with law, protects privacy, confidentiality, CBI, and is sensitive to national and homeland security." According to the commenter, it is entirely unclear how EPA means to satisfy this direction, which is diametrically opposed to the proposal's requirement that EPA make an unprecedented amount of protected scientific data publicly available.

Commenter (6133) states that the proposal refers to a statement of the National Academies that "[n]othing in the past suggests that increasing access to research data without damage to privacy and confidentiality rights is beyond scientific reach." According to the commenter, this is not fully supported as experience shows increasing access to data can damage privacy and confidentiality rights. The commenter asserts that the proposal does not say which, if any of these techniques the EPA will use, or how the EPA will use them. The commenter states that, while the National Academies may believe that increasing access to data without damage to privacy and confidentiality is not beyond scientific reach, the proposal does not explain how this belief translates to past, present, and future scientific studies EPA considers in regulatory decision making. According to the commenter, this document does not explain how EPA will address concerns about confidential or private information and does not support EPA's proposal to preclude consideration of those studies that do not make public underlying data for those, or other reasons.

Commenter (6133) also states that the proposal suggests that EPA should identify strategies in the future and that these strategies should be cost-effective. The commenter asserts that the proposal does not say what cost-effective means, nor what EPA should do if it does not identify any cost-effective strategies, yet it still seeks to alter legal obligations and regulatory decision making in reliance on this unexplained suggestion. The commenter also states that the EPA also does not point to any authority for the proposition that the agency's consideration of peer reviewed scientific studies depends on the cost-effectiveness of some strategy the agency develops for publicizing and protecting the underlying data. According to the commenter, the proposal suggests that it will exclude a large class of scientific studies from regulatory decision

2585

The Building Trades National Medical Screening Program. (2018). Published Medical Findings. Retrieved from <https://www.btmed.org/Public/Publications/MedicalFindings.cfm>

making but contains a vague assertion that it will look for “cost effective” ways in the future to exclude less them.

Response: These comments relate to proposed 40 CFR 30.8 which was not finalized.

Other Data Disclosure Issues

Proposal Regarding How Privacy Data/CBI is Handled Could Bias Study Selection

Comment: Commenters (2171, 4410) assert that it is well-documented that privacy assurances are essential to mitigate nonrandom selection bias. Commenter (8817) asserts that studies done on human subjects where the subjects' privacy is not protected may produce false or biased results. Commenters (6171, 6898) state that the inability of a scientist to guarantee confidentiality would be a major barrier to being able to recruit an appropriately diverse population of participants, potentially causing significant bias in research findings. Commenter (2171) states that the proposed rule does not make clear how it would assess or address bias or systematic errors in population studies that were able to release unmasked analytic data to the public.

Response: The rule does not require the disclosure of sensitive data, including PII and CBI. The rule requires that the Agency give greater consideration to pivotal science based on dose-response data that include CBI, proprietary information or PII if these data are available through restricted access in a manner sufficient for independent validation. Thus, there should not be the bias suggested by the commenter.

Comment: Commenter (2548) states that exposure estimates based on highly-aggregated data typically lead to biased and flawed analyses upon which decisions cannot be reliably based.

Response: The requirements of this rule will not lead to the generation of highly-aggregated data as suggested by these comments on the 2018 proposed rule. Thus, there should not be the bias suggested by the commenter.

Comment: Commenter (4590, 4595) expresses concern that an incomplete pool/smaller pool of scientific evidence creates an inherent bias that could skew regulatory decision-making toward studies that are less rigorous and trustworthy.

Response: No study will be categorically excluded. Thus, there should not be an incomplete pool/smaller pool of scientific evidence and no resulting bias.

Transparency Proposal Creates a Double Standard Between How Privacy Data and CBI Data Would Be Handled

Comment: Commenters (0044, 1012, 1388, 2907, 5170, 6109, 6133, 6152, 6157, 6895, 6919) express concern that the proposed rule would require independent public and private institutions to release confidential data behind environmental health studies while at the same time seeking to exempt private industry from being required to do the same. Commenter (6133) asserts that,

this would result in EPA not being able to rely on the best available science, while industry-funded research would not be subject to similar data release requirements, or even peer-review and independent reevaluation. Commenter (6133) states that this approach is asymmetric and favors selective, opaque, and questionable research methods over the consensus of robust peer-reviewed scientific investigation.

Response: The rule does not require the disclosure of sensitive data, including PII and CBI. The rule requires that the Agency give greater consideration to pivotal science based on dose-response data that include CBI, proprietary information or PII if these data are available through restricted access in a manner sufficient for independent validation.

Comment: Commenters (1012, 2907, 5170, 6109, 6919) state that, unlike the Proposal does for CBI, it does not seek comments on how to balance patient privacy or confidentiality with requirements for increased transparency, which is also protected by federal law. The commenters state that this omission makes it seem that protections for CBI are being given higher priority by the EPA over protections for personal health information. According to the commenters, prioritizing the confidentiality of private entities could lead to the publication or release of data that is supported by industry and could bias the usable body of evidence for the EPA towards a particular industry position. Further, commenter (6109) requests that EPA clarify what is meant by the phrase "balance appropriate protections" for CBI and why EPA has not used the same phrase for protecting private health data?

Commenter (6895) states that, given that the confidential data held by independent institutions are also protected by law, EPA should be seeking the same transparency privilege as that afforded the private sector. According to the commenter, otherwise, this rule would grant authoritative power to the regulated industry to direct public and environmental health regulation since much of the private sector's data is not "publicly available in a manner sufficient for independent validation." Similarly, commenter (6152) states that, while they support protections for justifiable claims of CBI, any requirements that EPA puts on research must be evenly applied.

Response: The rule does not require the disclosure of sensitive data, including PII and CBI. The rule requires that the Agency give greater consideration to pivotal science based on dose-response data that include CBI, proprietary information or PII if these data are available through restricted access in a manner sufficient for independent validation.

Comment: Commenter (2012) states that that the exclusion of available data on any basis that is not statistically justified can result in a biased perspective and, consequently, ill-informed policy. Commenter states that EPA should promote rules for increased data transparency across their fellow governmental agencies, while still recognizing the reality of the system in which they operate, and the need for as much data as possible in creating any public policy that governs human health. Commenter states that when considering any question of interest pertaining to the EPA's focus on the dose-response relationship of potential pollutants, regulators should consider the proportion of data and studies that are available exclusively through the new proposed method of "publicly available data" - as opposed to the data that would be available if incorporating non-public data. Commenter states that this partition is to be considered after

employing any of the tools mentioned in the proposal - data masking, de-identification, etc. - to include as much data as possible under this heading. Commenter states that, if this difference is anything more than obviously negligible then the agency should opt to include all sources of data, at the expense of using only data that can be made publicly available.

Response: The rule does not require a categorical exclusion of any study based on data availability. The rule incrementally increases transparency by requiring that EPA give greater consideration to pivotal science where the underlying dose-response data are available in a manner sufficient for independent validation.

4.1.1.1.3 Competing Models, Linear, Threshold, U-Shaped, J-Shaped, Bell-Shaped

Default Linear Non-Threshold (LNT) Model

Model Selection Objectivity

Comment: Commenter (4881) contends that research funded by industry and research funded by federal agencies often disagree on evidence for non-linearity, with industry generally preferring models that incorporate a threshold below which the pollutants are harmless,²⁵⁸⁶ while independent research often finds harmful effects even at low doses.²⁵⁸⁷ The commenter asserts that who makes the decisions which studies have given “appropriate consideration to...a broad class...of models” of dose response becomes critical in guaranteeing balanced consideration of public health risks and industry concerns.

Response: This rule does not apply to models, including dose-response models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Support Proposal to no Longer Use the LNT as the Default Model

Comment: Commenters (1010, 1273, 4541, 6148, 6151, 6362, 6449, 6942) support EPA’s Proposal to no longer use the LNT as the default model in cancer risk assessment and agree with EPA’s contention that there is growing empirical evidence of non-linearity for the concentration response for specific pollutants and health effects.²⁵⁸⁸ Commenter (1273) asserts that, until now, the EPA has enshrined the LNT as the basis for its regulations, ignoring the overwhelming evidence of biological defense mechanisms indicating thresholds and/or hormetic dose-responses. Commenter (4541) suggests that the EPA has had a troubled history with scientific models as a general matter. The continued use of default models, without consideration of

²⁵⁸⁶ For example, see J. Bukowski, M. Nicolich and R.J. Lewis, “Extreme Sensitivity and the Practical Implications of Risk Assessment Thresholds,” *Dose-Response* 11, 130 (2013).

²⁵⁸⁷ For example, see M. Lippmann, “The Search for Non-Linear Exposure-Response Relationships at Ambient Levels in Environmental Epidemiology,” *Nonlinearity in Biology, Toxicology and Medicine* 3, 125 (2005).

²⁵⁸⁸ Substantial criticisms of the historical and scientific foundations of the LNT model for cancer risk assessment have been published in the peer-reviewed literature as noted in these cited publications (Calabrese 2011, 2012, 2015b, 2017a-c). These publications show that the LNT was based on a flawed scientific foundation that were undetected within the scientific community until recently.

alternatives or admission of model uncertainty, creates a false scientific justification for EPA actions, policies, and regulatory burdens.

Response: This rule does not apply to models, including dose-response models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

IRIS Assessment

Comment: Commenter (6369) asserts that an example where an IRIS assessment has led to EPA toxicity values below natural background levels and not reflective of real-world human exposures is for formaldehyde. The commenter states that the published literature provides considerable evidence of observed thresholds for effects from formaldehyde exposure.^{2589,2590}. Commenter (6911) also expresses concern that EPA's draft risk assessment on this chemical will result in a "safe dose" determination that would likely be incomprehensible below background level.

Commenters (6369, 6911) state that other international agencies have also recognized alternative models other than the default linear modeling approach for formaldehyde exposure. The commenters conclude that the importance of using non-linear or biologically-based dose-response modeling, when the published data supports it, cannot be overstated and further ensures that the most robust science is the foundation for regulatory decisions.

Response: This rule does not apply to models, including dose-response models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data. Further, formaldehyde is not the subject of this rulemaking.

LNT Dose Response Model

Comment: Commenter (0039) expresses that they have long been concerned about politicized distortions of dose-response science. The commenter provides that a notable example is the status of the LNT dose-response model for the biological effects of nuclear radiation. The commenter provides that the prominence of the model stems from the June 29, 1956 Science paper, "Genetic Effects of Atomic Radiation"· authored by the AS Committee on the Biological Effects of Atomic Radiation. The commenter states that this paper is now widely questioned and has been seriously critiqued in many peer-reviewed publications, including two detailed 2015 papers. According to the commenter, these criticisms are being taken seriously around the world, as summarized in a December 2, 2015 Wall Street Journal commentary. The commenter contends that this is a consequential matter that bears on a great deal of national public policy, as the LNT model has served as the basis for risk assessment and risk management of radiation and chemical carcinogens for decades. The commenter asserts that a reassessment of that model could profoundly alter many regulations from the Environmental Protection Agency, the Nuclear

²⁵⁹⁰ Starr, T.B. and Swenberg, J.A. 2016. The bottom-up approach to bounding potential low-dose cancer risks from formaldehyde: an update. *Regulatory Toxicology and Pharmacology*, 77: 167-174. Available at www.sciencedirect.com/science/article/pii/S0273230016300228?via%3Dihub.

Regulatory Commission, and other government agencies.²⁵⁹¹ Yet, according to the commenter, due to the complacency of the scientific establishment and, no doubt, the prestige of some of the scientific bodies implicated in the cover-up, no one in a position or authority until now has been willing to challenge the linear no threshold dose-response orthodoxy.²⁵⁹²

Response: This rule does not apply to models, including dose-response models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (0062) states that the use of the LNT as the default model for radiation-induced cancers by the EPA and other regulatory agencies worldwide during the past several decades, in spite of accumulating evidence supporting radiation hormesis, has not served the public well because of the unjustified fear of even small amounts of radiation it has generated, and the resulting expensive and harmful defensive actions. According to the commenter, it has increased regulatory burden on the enterprises that utilize radiation without any corresponding benefit of avoided diseases. The commenter contends that there are indeed many adverse effects due to the use of the LNT model.²⁵⁹³ According to the commenter, this is an example of the harm to the public from the use of default models without supportive evidence.

Response: This rule does not apply to models, including dose-response models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

LNT Zero Tolerance Risk Paradigm

Comment: Commenter (4541) contends that the EPA's campaign to regulate away all risks is doomed to fail since risk is inherently subjective.

Response: The comments are beyond the scope of this rulemaking.

Oppose Proposal Requirement to Use Alternate Dose-Response Models and Justification for Use of LNT Model

Comment: Commenter (6191) believes that the historic approach that EPA has taken to err on the side of protecting human health when there is insufficient evidence to rule out harm is correct and states that EPA's reference to "considering the breadth of dose response data and models used" would seem to reflect a change to the EPA's traditional practice of opting for a protective

stance. Commenter (3840) asserts that the dose-response part of the Proposal is essentially a challenge to the default hypotheses and models used by EPA in cancer risk regulation, as developed over the years, and approved by scientific review bodies. The commenter contends that only believers in alternate dose-response models claim that there exists science to justify a change in long-standing practice-- science that will withstand judicial review.

Commenter (6914) provides that the proposal states “the widespread occurrence of non-linear dose responses in toxicology and epidemiology for chemicals and radiation and the need to incorporate such data in the risk assessment process.” According to the commenter, the chemical industry long has attempted to convince regulatory agencies of non-linearity in order to ignore real dose-response relationships and weaken regulatory requirements that protect people. The commenter asserts that this is an attack on science and on credible and peer-reviewed risk assessment methodology.²⁵⁹⁴ The commenter states that the chemical industry specifically targets low dose exposures and uncertainty factors that are more protective for vulnerable populations, such as workers. (The TSCA law specifically named workers as a “potentially susceptible subpopulation” that deserved specific considerations because of their unique exposure profiles and disproportionate adverse health effects to chemicals.) Commenter (5022) asserts that the pro-industry orientation of the proposal is revealed once more in its assault on the linearity assumption in the dose/concentration-response function. (This approach assumes that there is no safe threshold at the population level for most chemical pollutants.)

Commenter (6117) contends that it is inappropriate to establish major changes in research priorities through insertion of additional language in a proposed regulation ostensibly on another topic, as was done here with regards to dose-response model selection, rather than to use the normal channels of consultation with stakeholders, advisory boards, and reference to prior commissioned studies from the National Academies of Sciences.²⁵⁹⁵ The commenter asserts that the proposed changes are antithetical to the governing law, existing regulations, and well-established agency practice.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenters provide that (1) EPA provides no evidence to justify the proposed requirement that it consider threshold models in dose-response assessments and that there is “growing empirical evidence of non-linearity in the concentration-response function for specific pollutants and health effects” (5022, 6117, 6137, 6144, 6191, 6881, 6924, 9227); (2) the proposed requirements to consider threshold models ignores essential science, namely the approach to dose-response assessment recommended by the National Academy of Sciences (NAS) in *Science and Decisions: Advancing Risk Assessment* (6117, 6125, 6137, 6158, 6881, 6924, 8281-PH46, 9227); and (3) EPA’s proposed requirement disregards the Agency’s own

²⁵⁹⁴ Environmental Protection Agency. *Science and Decisions: Advancing Risk Assessment* (NAS Final Report). 2009. <https://cfpub.epa.gov/ncea/risk/recordisplay.cfm?deid=202175>

Guidelines for Carcinogen Risk Assessment (6125, 6137, 6915).²⁵⁹⁶ Commenter (6924) adds that EPA's conclusions on linearity vs. non-linearity in dose response are incorrect.

Commenter (6446) asserts that the proposed approach to non-linear cancer dose-response modeling suggested by the proposed rule is inconsistent with scientific guidance for determining when defaults can be replaced by alternative modeling approaches that are backed by chemical-specific data. The commenter states that EPA cancer modeling generally assumes that no exposure threshold exists for carcinogenesis unless data to the contrary exist. Commenter states that this assumption includes the recognition of the study design of most cancer bioassays, which use a relatively small sample size, resulting in a low detection power. Commenter states that this low detection power often makes it difficult or impossible to determine the existence of a threshold for carcinogenicity for a specific chemical. Commenter states that this current EPA cancer modeling practice was developed in documents that received public comment and peer-review. Commenter states that, in contrast, the proposed rule's requirement for re-justification of established and accepted modeling practices has not undergone any scientific peer review, including peer review by EPA's own SAB, lacks scientific consensus, and is not scientifically justified in the rule.

Commenters (1589, 6137, 8281-PH46, 8771) state that, contrary to the Proposal's statement about the growing evidence of non-linearity in concentration response functions, there is a body of empirical evidence that points to the opposite. Commenter (1589) asserts that there are very few, highly specific cases in which data supports any non-linear relationships between concentration of pollutants and health effects, suggesting that the data are not statistically significant or that they are outliers. According to the commenter, conversely, there is an enormous preponderance of data supporting the linear relationship for a variety of pollutants.²⁵⁹⁷ Commenter (6137) states, for example, that EPA has found strong empirical evidence of no-threshold concentration-response function for lead and reduced IQ, and particulate matter and increased mortality. Commenter (8281-PH46) contends that for most chemicals and pollutants there is likely no safe threshold on a population level because of ongoing exposures and preexisting vulnerabilities.

Commenter (8771) states that there's growing theory and evidence that at the population level, more and more dose-response functions are linear in the range of interest of actual community and occupational exposures in the real world (Crawford and Wilson 1996; NAS 2009). The commenter asserts that a regulatory agency should be completely uninterested in the behavior of the dose-response curve, threshold or otherwise, below the exposure level that it seeks to regulate to. The commenter provides that the possibility that there may be a "threshold somewhere" in no way implies that there is a threshold in the narrow window between (a) the current level of exposure to the population and (b) the new level EPA or another agency seeks to achieve through regulation. The commenter also states that, depending entirely on where the threshold is, threshold and linear models may well predict the same amount of risk reduction for a regulation, because the dose-response is linear where it counts.

²⁵⁹⁶ EPA, Guidelines for Carcinogen Risk Assessment. EPA/630/P-03/001 F (2005).

²⁵⁹⁷ (<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2657836/> ; <https://ehp.niehs.nih.gov/1205862/>; <https://onlinelibrary.wiley.com/doi/full/10.1111/j.1365-2222.2005.02336.x>)

Commenter (9227) provides that, as discussed by NAS, individual risk is determined by both the chemical exposure and an individual's unique circumstance of factors (e.g., co-exposures and susceptibilities). Cancer incidence in the population illustrates the significance of these additional factors in considering actual individual risk to a particular chemical exposure. Individual lifetime risk of developing cancer is 1 in 3, and 1 in 5 for dying from cancer,²⁵⁹⁸ indicating a substantial population baseline risk resulting from a large number of exposures and other risk factors. The commenter asserts that assuming that there is somehow a threshold for everyone cannot be supported by the evidence. Therefore, given that the mission of EPA is to protect public health, the commenter provides that the linear approach is most appropriate unless there is strong evidence in favor of an alternative as recommended by the NAS in Science and Decisions: Advancing Risk Assessment.

Commenters (6137, 9227) note that, historically, researches applied no-threshold dose response models to carcinogens and threshold models to non-carcinogens. Commenter (6137) provides that because thresholds vary by individuals, for some, effects will have high thresholds, while for others, effects have practically no threshold due to increased susceptibility or background exposures. Based on these findings, the commenters (6137, 9227) provide that the NAS concluded that no-threshold models should be applied to both carcinogens and non-carcinogens unless reliable data/strong evidence affirmatively support a threshold model based on detailed assessments of mode of action, susceptibility, and background exposures. Commenter (6158) states that applying the linear assumption is designed to avoid an arbitrary, case-by-case treatment of potential exceptions without justification to do so. Commenter (6144) is concerned that the Proposal gives unjustified weight to non-linear models to assess relationships between pollutants and health in EPA policy decisions that will likely disproportionately affect the sensitive populations that the EPA is charged to protect. The commenter provides that for ozone and particulate matter, for example, evidence suggests that health effects (including mortality, cardiovascular effects, and respiratory effects) below the current NAAQS are more pronounced for the elderly, children, low-income individuals, and African Americans.²⁵⁹⁹

Commenters (6137, 6915) provide that the Agency's own Guidelines for Carcinogen Risk Assessment expressly state that, in cancer risk assessments, no threshold should be assumed unless the mode of action is known, and the chemical does not cause cancer by inducing DNA mutations that initiate tumor development. Commenter (6915) states that these guidelines state that EPA's default dose response modeling approach for carcinogenic substances is linear extrapolation from the point-of-departure (essentially the lower limit of the range of the experimental data) to the origin (zero exposure, zero risk). (This default no-threshold approach assumes that any dose of a carcinogen results in some level of risk, making it the most protective of human health.) The commenter provides that, threshold models, by contrast, assume that there is some dose of a carcinogen at which there is no cancer risk, an assumption that is less health

²⁵⁹⁸ American Cancer Society, Lifetime Risk of Developing or Dying from Cancer, <https://www.cancer.org/cancer/cancer-basics/lifetime-probability-of-developing-or-dying-from-cancer.html> (last revised Jan. 4, 2018).

²⁵⁹⁹ Qian, D. et al. 2017. Air Pollution and Mortality in the Medicare Population. *New England Journal of Medicine*. 376:2513-2522. Online at <https://www.nejm.org/doi/pdf/10.1056/NEJMoa1702747>, accessed May 30, 2018.; US EPA. 2015. Integrated Science Assessment for Ozone and Related Photochemical Oxidants. Online at <https://www.epa.gov/isa/integrated-science-assessment-isa-ozone-and-related-photochemical-oxidants>, accessed May 30, 2018.

protective and that has not been conclusively established in most cases. The commenter notes that, in most cancer risk assessments, dose response data within the low risk range, which is the range of interest for regulatory purposes, are lacking. Thus, the commenter provides that low-dose extrapolation is used to estimate risks in the lower dose range where data are unavailable. For estimation of risks below the range of the data, the commenter states there are an infinite number of possible threshold and non-threshold assumptions regarding the shape of the dose response curve that can be envisioned, with no substantive basis for assuming the general superiority of one assumption over another. The commenter contends that, to deviate from the default assumption that any dose of a carcinogen results in some risk in the absence of chemical-specific data that demonstrate a threshold mode-of-action of carcinogenicity²⁶⁰⁰ would be mere speculation and would assume, with no scientific support, that Americans can be safely exposed to those substances. The commenter adds that, to “evaluate the appropriateness” of the linear, non-threshold approach for low-dose extrapolation by also considering non-linear and threshold models would provide no cognizable benefit in modeling accuracy or clarity, but instead could result in the manipulation of results, delay, and obfuscation. The commenter states that it is unclear what EPA means by “explicit consideration,” or what EPA would consider to be “high quality studies,” but insofar as those terms are intended to mean that EPA will give preference to studies utilizing threshold models, such a preference would be inconsistent with EPA’s 2005 Guidelines for Carcinogen Risk Assessment as well as generally accepted practice in the field of toxicology. Commenter (6137) asserts that EPA’s reversal of longstanding policy is unjustified and arbitrary and should not be permitted.

Commenter (6915) states that, in the limited circumstances where the data support threshold modeling, the EPA’s 2005 Guidelines for Carcinogen Risk Assessment already provide for departure from the default linear extrapolation in risk assessment and instead allow for the use of threshold modeling. *Id.* at A-8. In fact, the commenter asserts that the EPA has used a threshold approach for carcinogen risk assessment when there is clear, chemical-specific, empirical evidence of a threshold mode of action.²⁶⁰¹ The commenter notes that this careful, well-founded approach is generally considered both scientifically supportable and protective of public health, as opposed to the proposed rule’s requirement for justification of the default linear approach on a case-by-case basis and “explicit consideration [of] high quality studies that explore various threshold models across the dose or exposure range.” 83 Fed. Reg. at 18,774. According to the commenter, without a well-founded and substantiated scientific basis, EPA should not entertain such a fundamental departure from accepted, public-health protective risk assessment practices.

Commenter (6125) contends that the Guidelines for Carcinogen Risk Assessment and NAS both encourage careful evaluation of all scientific information in determining the possible shape of dose response curves (based on mechanistic concentrations) as well as the application of a number of mathematical models to one or more specific sets of dose response data to determine which model provides the best fit and prediction. The commenter provides that raw data is not required for these analyses and analyses are done on a case-by-case basis dependent on the

²⁶⁰⁰ Mode of action is defined by EPA as the “sequence of key events and processes, starting with interaction of an agent with a cell, proceeding through operational and anatomical changes, and resulting in cancer formation.” Guidelines for Carcinogen Risk Assessment at 1-10 n.2.

²⁶⁰¹ See, e.g., U.S. Env’tl. Prot. Agency, Toxicological Review of Chloroform (2001), available at https://cfpub.epa.gov/ncea/iris/iris_documents/documents/toxreviews/0025tr.pdf.

nature of the data examined. According to the commenter, this can result in an outcome that concludes that the dose-response for the observed adverse effect exhibits non-linearity or that it doesn't and requires considerable scientific judgment.

Commenter (6133) opposes the case-by-case evaluation of the appropriateness of using default assumptions, including assumptions of a linear, no-threshold dose response. The commenter asserts that "case-by-case" provisions inject additional arbitrariness into the rule, in that the Proposal may be applied unevenly.

Commenter (3135) states that the Proposal seems to naively assume that single studies are used to inform risk assessors of the possible shape of dose response curves. The commenter explains that this is not the case and that the first step of the dose-response modeling process is to evaluate all of the scientific information to gain a biological understanding of how each type of toxicity or response (adverse effect) occurs; the understanding of how the toxicity is caused is called the "mode of action." The commenter notes that via this evaluation the EPA identifies a sequence of key events and processes that result in the effect. The commenter explains that frequently the data do not conclusively prove mode of action. According to the commenter, in such cases, EPA often applies default assumptions such as low dose linearity for carcinogens unless the carcinogens can be shown to have a mode of action for which a threshold would be expected. The commenter explains that such defaults have been developed to assure that, in the face of uncertainty, the EPA will protect the public's health. The commenter adds that, in recent years, it has also been determined that often noncancer effects (e.g., lead and neurotoxicity) also have no threshold.

Commenter (1589) expresses concern that the Proposal places an emphasis on threshold models. The commenter provides that a threshold model is a form of a spline, a model where, for example, the slope of a linear association is allowed to change at a certain point. The commenter provides that in a threshold model, one considers a piecewise linear dose-response, where the slope is assumed to be zero below some dose "T", and some positive number above "T". According to the commenter, spline models are quite common in environmental epidemiology, but rather than, in the example above, forcing the slope below T to be zero, they allow the slope to change at "T", but allow the slope below "T" to take on any value the data dictates. The commenter asserts that the EPA has provided no reason to justify their proposed approach, or for constraining the slope to be zero when the data might differ. Moreover, the commenter disagrees with the EPA's assertion that there is growing evidence for nonlinear dose-response relationships and the implication that science is finding more evidence of thresholds. According to the commenter, in human studies the opposite is true. The commenter explains that there is a clear biological reason for this – most of these toxins act on pathways in the human body that produce the diseases of aging and that any incremental stimulus along these pathways would be expected to produce incremental damage to the body. The commenter asserts that this is why the National Academy of Sciences committee on risk assessment "recommends that cancer and non-cancer responses be assumed to be linear as a default."²⁶⁰²

²⁶⁰² Assessment CoR. Science and Decisions: Advancing Risk Assessment; Washington, D.C.: National Academies Press; 2009.

Response: This rule does not apply to models, including dose-response models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Consideration of High-Quality Studies

The proposed rule requires that EPA give explicit consideration to high quality studies that explore: A broad class of parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity.

Parametric and Nonparametric Dose-Response Models with Adjustments for Confounding Variables

Comment: Commenter (6148) supports the use of parametric and nonparametric dose-response models that include adjustments for confounding variables (e.g. contaminants with health impacts distinct from the target pollutant being modeled). The commenter provides that these confounding factors must be quantitatively factored into the selection of a threshold or non-threshold no observed-adverse-effect-level (NOAEL). According to the commenter, the EPA has not historically adjusted for model uncertainties to optimize low dose risk estimation based on competing models. The commenter asserts that such adjustments should be applied utilizing all available science, including, linear, threshold, U-shaped, J-shaped, and bell-shaped models.

Response: This rule does not apply to models, including dose-response models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (6122) asserts that EPA deliberately mischaracterizes science in the Proposal statement that the “EPA should give appropriate consideration to high quality studies that explore a broad class of parametric concentration-response models with a robust set of potential confounding variables” and those that examine “spatial heterogeneity.” According to the commenter, this approach would allow the EPA to give priority, regardless of the best available science, to studies that have data that fit a certain distribution (i.e. that use parametric tests). The commenter provides that not all data fit the assumptions for parametric models, and thus data may well be of high quality and constitute the best available science regardless of whether it fits into those assumptions. In addition, the commenter states that the proposed rule recommends EPA consider studies with a “robust set of potential confounding variables.” The commenter asserts that, with many confounding variables, it is difficult for a study to attribute results to any specific chemical; instead studies control for confounding variables- holding them constant while varying the target chemical. The commenter states that controlling for confounding variables is the only way to detect any causation of the experimental variable on the dependent variable. Instead, the proposed rule would give priority to poorly designed studies with confounding variables such as, for example, age, weight, race, location, etc. According to the commenter, only studies that control for confounding variables can detect causation or high correlation with the pollutant, such as a pesticide or air pollutant, in question.

Response: This rule does not apply to models, including dose-response models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (6915) states that for approximately 20 years, EPA has employed parametric modeling in risk assessment by providing and using benchmark dose response modeling software. According to the commenter, although the proposal implies that this is not the case, this software already allows investigation of the most appropriate parametric model(s) for risk assessment and currently provides “a broad class of parametric dose response, concentration-response models.” The commenter states that there is no obvious benefit to adding an additional layer of analysis—nonparametric modeling—on top of this longstanding approach. The commenter asserts that nonparametric models are useful only when the quantity and quality of the data are sufficient to infer a clear and plausible estimate of the overall pattern. The commenter states that when there are few data and/or data are of poor quality, as is often the case in situations to which the proposed rule would apply, nonparametric models can produce a wide variation of results with few, if any, constraints on plausibility. The commenter states that, in such cases, the use of nonparametric models is not scientifically supportable, and moving forward, little would be gained from considering them in terms of accuracy and clarity of the predictions, while the potential for delay and obfuscation would again multiply. The commenter contends that the proposed rule’s requirement that nonparametric models be explicitly considered, without regard to the applicability of a particular model, is therefore misguided and scientifically unsound.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (6955) contends that the non-parametric modeling technique can be abused. According to the commenter, it is a misnomer, because one or more smoothing parameters must be assumed or fit to the data using debatable assumptions. The commenter provides that there are a large number of smoothing methods to choose from, especially when there are covariates, increasing the effective number of degrees of freedom. The commenter asserts that the analysis is hardly transparent. The commenter contends that such approaches are vulnerable to overfitting, which is why sophisticated error analysis is essential, but not always carried out. The commenter states that different analysts can come up with very different conclusions as is exemplified by contradictory fits to A-bomb survivor data by Sasaki et al. (hormesis result)²⁶⁰³ and by Dropkin (supralinear result).²⁶⁰⁴ The commenter notes that only Dropkin had error analysis on his outcomes (count rate errors only). *Additionally, the commenter states that “uncontrolled confounding” is an objection commonly raised by those unhappy with the outcome of a study.* The commenter asserts that they have learned that many who use the term “uncontrolled confounding” may not realize that confounding requires correlation with both the outcome and exposure under study. In any case, the commenter states that there are always data sets in the world that will so correlate, if a stakeholder searches long enough. The commenter contends that such searches are a form of post-hoc analysis and represent a form of multiple comparison that must be accounted for, if making a scientific claim. The commenter also states that there are also legitimate questions about confounding, including residual confounding, that are a problem for most studies. The commenter concludes that there are no

²⁶⁰³ Sasaki MS, Tachibana A, Takeda S. Cancer risk at low doses of ionizing radiation: artificial neural networks inference from atomic bomb survivors. J Radiat Res 55: 391-406; 2014.

²⁶⁰⁴ Dropkin G. Low dose radiation risks for women surviving the a-bombs in Japan: generalized additive model. Environmental Health 15: 112; 2016.

perfect studies and that strengths and weaknesses of studies are the rule, which is why studies need to be assessed all together.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Nonparametric Models that Incorporate Fewer Assumptions

Comment: Commenter (6122) states that the proposed rule also recommends the EPA consider studies with “nonparametric models that incorporate fewer assumptions.” According to the commenter, while this allows for data that do not follow a certain distribution, it is unclear what “fewer assumptions” means in this case. The commenter provides that scientists state their assumptions in work submitted for peer review and follow the assumptions laid out in the model they choose to analyze data; the best model chosen based on other peer-reviewed literature or expert experience is finally deemed either appropriate or ruled out by peer-review. Accordingly, the commenter contends that the number of assumptions is itself not a separately relevant factor in evaluating the strength of a study, since it is a factor already considered in study design, data analysis, and the peer review process. The commenter asserts that work that has inappropriate assumptions will not make it past peer review and thus not be used for EPA regulations regardless.

Commenter (6373) states that encouraging nonparametric models with fewer assumptions will not necessarily lead to “better” or more accurate models. The commenter provides that one could argue the opposite: models with fewer assumptions are created by persons who are scientifically less familiar with the subject matter and/or statistical assumptions underlying the model. The commenter states that more scientifically sophisticated models are created by researchers who are more familiar with limitations and acknowledge these limitations via specific assumptions. The commenter notes that researchers should always acknowledge assumptions when defining and presenting their models and when defining existing controls during peer-review and, in the case of studies being considered for regulatory value. According to the commenter, this provides sufficient processes to determine whether the assumptions that a study relies on are sound and appropriate.

This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Methods for Assessing the Shape of a Concentration-Response Relationship

Comment: Commenter (1973) states that the EPA’s Proposal details very specific criteria for judging what types of analyses provide valuable information about what concentration or dose-response curves look like, instead of relying on the judgment of the scientific community and its own science advisory committees. The commenter asserts that the Proposal puts an inappropriate emphasis on studies looking at broad classes of parametric forms for dose response which is an approach little used in environmental epidemiology, because those parametric forms by their nature can force dose-response curves into shapes not indicated by the data. According to the commenter, environmental epidemiology prefers penalized splines and similar non-parametric approaches and no epidemiology society recommends EPA’s proposed approach. The

commenter asserts that the methods for assessing the shape of a concentration-response relationship is a scientific question and better left to scientists and EPA's science advisor, without stating preferences with no scientific justification given, and no apparent input from either the scientific community or EPA's own scientific advisors. According to the commenter, the EPA's attempt to prescribe how a scientist should assess the shape of concentration-response relationships constrains the EPA from considering studies most scientists think are relevant, rather than to serve any public health purpose.

Commenter (6881) states that the proposed rule (§30.6) is overly prescriptive regarding the modeling approaches that should be applied and demonstrates misunderstanding of the concept of model uncertainty. The commenter asserts that this component of the proposed rule relates to epidemiological studies, and more specifically, appears to target air pollution epidemiology. Commenter notes that by following this approach, EPA would place greater weight on studies that force the data into shapes that may not be indicated by the data (i.e., by using defined parametric models and threshold models). The commenter asserts that this might prioritize studies which report a range of statistical approaches even if they yield poorly fitting curves, as compared to a study which uses a widely-accepted nonparametric modeling approach that performs well.

Response: EPA has not finalized proposed 40 CFR 30.6 which is the subject of these comments.

Model Optimization

Comment: Commenters (0062, 1273) support EPA incorporating the concept of model uncertainty when needed as a default to optimize low dose risk estimation based on major competing models, including linear, and U-shaped, J-shaped, and bell-shaped models.

Response: This rule does not apply to models, including dose-response models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (6446) asserts that the statement in the proposed rule that "EPA should also incorporate the concept of model uncertainty when needed as a default to optimize low dose risk estimation based on major competing models" is unclear.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (1971) asserts that over the last two decades it was extensively shown that U-shaped, J-shaped, and bell-shaped (i.e. hormesis) dose responses are induced by chemical agents and radiation in hundreds of biological models, as reflected in hundreds of endpoints

(Agathokleous et al.²⁶⁰⁵; Calabrese^{2606,2607}; Calabrese and Baldwin^{2608,2609,2610}; Calabrese and Blain^{2611,2612}; Calabrese et al.²⁶¹³; Costantini et al.²⁶¹⁴; Kim et al.²⁶¹⁵). The commenter states that, more recently, it was shown that several environmental factors can induce hormesis in plants and animals and that hormesis can occur not only at the individual level and at the community level (Agathokleous²⁶¹⁶; Agathokleous et al.^{2617,2618}). The commenter, therefore, agrees with the optimization of low dose risk estimation based on linear, threshold, and U-shaped, J-shaped, and bell-shaped models. According to the commenter, failure to consider U-shaped, J-shaped, and bell-shaped dose-responses would be equal to a failure to conduct a realistic and validated risk assessment with potential consequences to animals, including humans, and to the environment.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (3840) contends that the implication in the language of the Proposal is that the default models are too conservative, as can be gleaned from the language of the proposal, such as “model optimization,” a phrase used in a comment for this rule and other papers by the hormesis supporter, E.J. Calabrese (Calabrese et al. 2018b, Calabrese et al. 2018a). The commenter states that this is also inferred by the descriptors of other models the EPA should consider: threshold, U-shaped, J-shaped, and bell-shaped model primarily imply sub-linearity. The commenter states that only a bell-shaped model could qualify as a supralinear model, but there are many other types. According to the commenter, without inclusion of the full range of supralinear models, the consideration of non-linear models will shift the balance to weaker

standards, with subsequent increases in chemical and radiation exposures in the workplace, home, and outdoor environment, including the vicinity of superfund sites. The commenter provides that, if supralinear models are left out of the mix, as proposed by commenters, Calabrese et al. (Calabrese et al. 2018a), the analysis will be biased low. On the other hand, the commenter states that if supra-linearity is included, the mid-point curve will likely be (roughly) linear, possibly with a modest DDREF (Rühm et al, 2015) – interpreted not as an indication of truth but as an indication of the mid-point of an uncertain region.

Furthermore, the commenter (3840) asserts that when it comes to consideration of dose-response models other than linear, whether sub- or supralinear, it should be recognized that they are generally not mature enough to be considered for regulatory analysis, because they do not prescribe how they behave over the full range of temporal dose-delivery patterns for which regulators must deal. The commenter notes that there already is a standard form of model optimization for uncertain situations, namely, uncertainty risk analysis. The commenter explains that dose-response models cannot be optimized at low doses, because there is no data on which to check their performance, which is why a risk analysis with uncertainty up and down is necessary. The commenter concludes that they would certainly like to see more consideration of uncertainty ranges at low doses and low dose rates, but they state that they doubt those who think regulations are too strict would be happy with the outcome, which would likely focus on risks greater than linear, out of a desire to be prudent.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (1010) suggests that, the best answer, for the foreseeable future, from theoretical data-support, and public health perspectives is the use of dose response model uncertainty, that is, using the leading dose response models and determining where they optimally converge (i.e., dose where health benefits are optimized and risks are minimized). The commenter provides that, in practice this involves finding a practical and scientific means to integrate the threshold, LNT, and hormetic dose response models, the three models with the most toxicological gravitas based on the peer-reviewed published literature. According to the commenter, each model has its strengths and limits, its advocates and detractors, but authors favor the hormesis model over the LNT model. The commenter asserts that the combination and integration of these three models into a dynamic risk assessment framework works best because it has the potential to integrate the best scientific features of the three models while limiting/minimizing the possibility of error. The commenter provides that the case for this integrated dose response approach has been published in several peer-reviewed chemical and radiation health risk assessment publications (Calabrese, 2015a; Calabrese, et al., 2015, 2016). The commenter states that the attractive features of this integrative approach are that the nadir of the hormetic dose response, based on a large number of studies in the hormetic data base (Calabrese and Blain, 2011), and the “safe” exposure estimate using the threshold dose response model with a standard 100-fold uncertainty factor yield essentially the same value. Thus, the commenter provides that these two models provide an agreement even though they offer a different toxicological interpretation (i.e., no effect/safe threshold interpretation versus beneficial hormetic interpretation). The commenter concludes that the integration of the three most credible scientific models within a model uncertainty suggest that more research still needs to be

undertaken to improve the reliability of model-based low dose estimates. However, the commenter contends that despite the remaining uncertainties of this approach, it offers considerable scientific and societal advances and should be adopted by the U.S. EPA and other environmental regulatory agencies in other countries.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (6911) states that a tool to optimize exposure assessments is probabilistic risk assessment (PRA). The commenter states that PRA is an analytic tool used to incorporate information regarding variability and uncertainty into analyses to provide insight regarding the degree of certainty of a risk estimate. The commenter notes that, as the best estimate of risk reduction benefits should be used in a benefit-cost analysis, EPA should adopt PRA as the preferred risk assessment method to provide the benefits estimates for its benefit-cost implementing regulations. The commenter asserts that EPA's traditional approaches, such as deterministic risk assessment, produce unrealistic, overly conservative outputs. Commenter includes the following additional information regarding PRA.

EPA's use of compounded conservative assumptions is not only improper as a scientific matter; it is also contrary to EPA's own policy documents, which recognize that the Agency does not need to use excessively conservative input values on all equation parameters in order to yield adequately protective regulations. Indeed, EPA's 2014 Risk Assessment Forum White Paper on probabilistic risk assessment (PRA) The White Paper identifies situations in which PRA "may be particularly useful," including situations in which "uncertainty in some aspect of the risk assessment is high, and decisions are contentious or have large resource implications," as well as situations in which "the scientific rigor and quality of the assessment is critical to the credibility of the EPA decision." (<http://www.gpo.gov/fdsys/pkg/FR-2014-08-12/pdf/2014-19065.pdf>.)

Other scientific disciplines use PRA. For example, in safety engineering, the designers of chemical manufacturing plants, nuclear power plants, highways and air traffic control systems use probabilistic approaches to assess risk. Fisheries biology uses Monte Carlo (probability) simulation to study alternate management practices. Financial analysts commonly use Monte Carlo simulation. EPA should acknowledge that probabilistic methods are well defined mathematically and have long been used in other professions and disciplines. The simple fact that EPA still uses deterministic methods in most of its human health risk assessments indicates that EPA does not recognize the benefits of adopting probabilistic methods. Deterministic methods hide a potentially great deal of uncertainty about the actual risk and also hide policy judgements. The lack of transparency involved in these judgements affects the credibility of scientific outcomes and results in poorer policy decisions. The potentially higher resource costs that are required for PRA are well justified by the far greater certainty and transparency of the risk-reduction benefits and ultimately the efficiency of the optimal regulatory standard.

Response: These comments are not within the scope of this rulemaking.

Spatial Heterogeneity

Comment: Commenter (6122) states that spatial heterogeneity is also something that is already appropriately addressed through scientific peer review, as spatial heterogeneity is incorporated into data collection methods, data analysis models, and in uncertainty analyses.

Response: The fact that spatial heterogeneity is considered during peer review is not sufficient justification to exclude it from consideration in determining the degree of consideration to afford pivotal science for which the dose-response data are not available for independent validation.

Commenter (6373) states that encouraging models that include *spatial heterogeneity* (that is, variability across geographic regions) may potentially lead to models that dilute the effects of a toxic exposure if the exposure was concentrated in one geographic region—leading to scientifically invalid conclusions (e.g., that an exposure was not associated with negative health effects).

Response: This rule does not apply to models and thus does not encourage models that include spatial heterogeneity.

Comment: Commenter (6881) states that the call to consider spatial heterogeneity is largely pertinent to only national-scale air pollution epidemiology and does not consider whether such an analysis is indicated by the study design and available data.

Response: The proposed regulatory text the commenter refers to is part of proposed 40 CFR 30.6. Proposed 40 CFR 30.6 was not finalized. The term “spatial heterogeneity” is included in 40 CFR 30.5 as part of one of the factors EPA will consider in determining the degree of consideration to afford pivotal science for which the dose-response data are not available for independent validation. The commenter has not provided a rationale for why spatial heterogeneity’s pertinence to air pollution epidemiology should exclude it as a factor in 40 CFR 30.5 (or in the original proposed 40 CFR 30.6).

Linear versus Non-Linear Dose Response Relationships

Comment: Commenter (6373) states that the Proposal repeatedly uses the term “dose response” (i.e., concentration-response), but neglects to recognize that “dose” cannot be measured in observational epidemiological studies. The commenter is concerned that this has implications for EPA’s establishment of NAAQS. The commenter provides that the issues with linear versus non-linear “dose response” relationships are different between animal toxicological studies and epidemiological studies. Observational epidemiological studies often do not have control over the potential heterogeneity in vulnerability in the population being studied or the spatial variation (and/or error in measurements) in pollutants’ concentrations where the subjects reside. Thus, the commenter states that the apparent “dose response” relationships in epidemiological studies do not simply reflect biological response function, making the interpretation of “dose response” curves in observational epidemiological studies not just a matter of fitting a “right” statistical model. The commenter states that the Proposal narrative describes this issue as merely statistical,

which is not correct, and therefore the Proposal's application to epidemiological research is unclear and contrary to scientific practice.

Commenter (6373) states that, because there is frequently significant variation within the exposure to a pollutant and the reaction of different individuals in a study group to that exposure, and because it is impossible to test the impact of high levels of toxic exposure to humans, modeling practices may require that linear dose response assumptions are applied despite outlying data or uncertainty about high-exposure predictability. The commenter states that this does not invalidate best efforts to create responsive and predictive models, and current scientific best practices already require a thorough explanation of modeling practices, assumptions, and options for dose response curves within a study.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Support Dose-Response Model Selection Guidance/Guidelines Over a Rule

Comment: Commenter (6449) states that they support EPA considering and expanding the variety of dose-response models to include threshold and nonmonotonically-increasing functions, but they suggest that it should be part of guidance or EPA Guidelines, and not part of the rule. The commenter suggests that EPA may want to provide a method for interested parties to submit papers on these issues that would be publicly available prior to workshops and other methods of discussion. The commenter contends that this could provide EPA not only with multiple options but also with some of the strengths and weaknesses of these models. The commenter states that a draft of how EPA is considering use of such models, including some examples, would provide further comment that could be incorporated before guidance is final.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Inquiry Regarding Researcher Model Use Requirements/Reanalysis of Studies to Fit Criteria

Comment: Commenter (6881) asks, given most journal articles would not include such a wide range of models, if EPA is proposing that individual researchers should produce additional models and provide them to EPA, or that EPA plans to reanalyze studies to fit these specific criteria?

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

4.1.1.2 Models

4.1.1.2.1 Use of Proprietary Models

Models Developed by EPA Should be Constructed in Freeware

Comment: Commenter (6449) recommends that models developed by EPA be constructed in R or other freeware, and the code posted with the document in which they were used. The commenter states that renting or buying proprietary software can impede the transparency advocated in this proposal.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Use of Commercially Available Computer Software

Comment: Commenters (0562, 6108, 6941) assert that commercially available computer software is acceptable for rulemaking. Commenters (0562, 6941) take the position that it is acceptable to use results from commercially available models for regulatory decisions without the need to release proprietary code or internal algorithms and that requiring commercial model developers to release this intellectual property would likely restrict their ability to continue developing and supporting their models. Commenter (0562) states that, in some cases, availability of an open source model or use of both commercial and open source models together may be the “best available approach”.

Commenter (6108) states that industry often uses commercially available computer code and software to design, build, and operate chemical facilities, and to predict emissions. The commenter provides that it is unlikely that commercial software makers would be willing to surrender their extensive code, as that could give competing software companies an advantage. The commenter states that the key is to use the computer code and/or software within its intended applicability range and with appropriate assumptions. The commenter defines “commercially available” as published software or code with a sound scientific basis, available for use by the public or government. The commenter suggests that any commercially available models or computer codes that are used in rulemaking decisions include a disclosure about the basis, applicability limits, and assumptions of the parameters used with the computer code/software. The commenter states that making the complete computer code or software code available for review is not necessary. The commenter suggests that if, however, computer code is used in a novel way specific only to the study at hand, such code be made public.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Grants and Cooperative Agreements Should Stipulate that Models Used be Publicly Available

Comment: Commenter (6356) asserts that EPA grants and cooperative agreements should stipulate that models developed as the basis for studies and the generation of data EPA intends to use to support regulatory actions must be available for the public to utilize, even if they are copyrighted. The commenter states that any use should be available only if the user is willing to agree to copyright protections, which could be encoded into software for downloading such information from public servers, that would identify the user and his agreement to be liable if he or she evades copyright protections for his or her own gain. The commenter contends that this

general usage agreement is no different in fields of science than in the fields of art and music or other intellectual property.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

4.1.1.2.2 Consideration of Alternative Models

Support Proposal to Consider Alternative Models

Comment: Commenters (1011, 1971, 6911) support EPA's proposed rules for consideration of different models.

Commenter (1971) agrees with the proposal to consider “high quality studies” that explore: i) “A broad class of parametric concentration-response models with a robust set of potential confounding variables”; ii) “nonparametric models that incorporate fewer assumptions”; iii) “various threshold models across the exposure range”; and iv) “spatial heterogeneity”. The commenter asserts that this requirement is an important step towards a more dynamic and flexible risk assessment which will not face animals, plants, and ecosystems as static entities but as biological entities that display complex responses which differ upon environmental conditions/constraints.²⁶¹⁹ The commenter states that this need is highlighted for vegetation response to ground-level ozone which can be highly driven by soil water or nutrient availability. The commenter contends that it would be ironic to have the same ozone critical levels for a northern region with high water availability and a southern region with notable drought. Thus, the commenter agrees that high quality studies should be considered which select the proper model among a set of statistically tested models.

Commenter (6911) states that recognizing alternative models should not be a polarizing process and the selection of the model used to estimate exposure-response relationships of chemicals can have significant impacts on estimated regulatory benefits. The commenter provides that, in 2007, Office of Information and Regulatory Affairs (OIRA) and the Office of Science and Technology Policy (OSTP) observed that a “high degree of transparency with respect to data, assumptions, and methods will increase the credibility of the risk analysis, and will allow interested individuals, internal and external to the agency, to understand better the technical basis of the analysis.”

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Do Not Support Proposal to Consider Alternative Models

Comment: Commenters (2907, 6122, 6168, 6373, 6872, 6881, 8281-PH46) do not support EPA's proposed rules for consideration of alternative models.

Commenters (2907, 6168, 6881, 8281-PH46) assert that dictating and fitting numerous specified curves to study data without an empirical basis is needlessly exhaustive and costly. Commenter (2907) states that there are literally an infinite number of possible dose-response models, as the

²⁶¹⁹ Agathokleous, E., Kitao, M., Kinose, Y. (2018d). A review study on O₃ phytotoxicity metrics for setting critical levels in Asia. *Asian Journal of Atmospheric Environment* 12: 1-16.

proposal points out; for example, linear, threshold and non-threshold, U-shaped, J-shaped, and bell-shaped.

Commenter (2907) states that the EPA has historically taken the reasonable position that toxic chemicals and pollution are deleterious to human health, and that an increase in pollution will lead to an increase in adverse effects. The commenter states that the proposal discards those default health-protective assumptions out, and instead invites literally an infinite number of model options from which the EPA can choose.

Commenter (2907) states that the proposal requires the EPA to give equal consideration to many dose-response models, including those that presume that there are safe levels of a toxic chemical—or even that it may be beneficial. The commenter states that this may be appropriate when testing medical drugs but not for toxic pollution.

Commenters (6168, 6881, 8281-PH46) assert that dictating and fitting numerous specified curves to toxicological study data without an empirical basis would remove expert judgement and biological context and does not represent best scientific practice.

Commenters (6122, 6872, 8281-PH46) provide that simply using/considering virtually all model alternatives as the proposal preference is unlikely to improve results without considering the models' assumptions and whether they fit the data set, the goals of the analysis, and other issues.

Commenter (6881) states that most available toxicological data sets do not have the resolution to differentiate among many different model forms that can have extremely different low-dose extrapolations. The commenter provides that many parametric model forms would fit the data equally well but result in a wide range of estimated risks. The commenter adds that, where the data allow for such differentiation, those models that do not fit the data well should be down-weighted, and those models that are not mechanistically supported should not even be considered. The commenter contends that best scientific practice involves using model averaging, wherein numerous mechanistically justified models are fit, and the better-fitting models receive a higher weight than more poorly-fitting models.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenters (6122, 6168, 6872) assert that this proposed requirement would further delay an already slow process for completing toxicity assessments that will defer life-saving steps to address pollution. According to commenter (6168), prioritizing model-fit in this way counteracts a health-protective timeframe, endlessly extending the timeline for determining which chemicals are safe or not. Commenter (6168) asserts that a recent example of this negligent mode of operation culminated in the court order filed August 9th, requiring EPA to finalize the ban on the pesticide chlorpyrifos.²⁶²⁰

²⁶²⁰ 9th Circuit Court of Appeals, No. 17-71636.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (6881) contends that while one can fit many curves to a set of data and show that the resulting risk estimates differ, this is not necessarily reflective of the true level of uncertainty and would thus further obscure the assessment and impede decision making.

Response: The comment refers to dose-response models. This rule does not include requirements for dose-response models.

Comment: Commenter (6373) asserts that §30.6 of the proposed rule improperly allows EPA to second guess the statistical model selected by researchers, which could motivate researchers to improperly tailor their methodologies so that their work may be “considered” during EPA’s regulatory process, to the detriment of the study’s validity. The commenter asserts that, while the proposal would improperly allow EPA to prioritize specific statistical models, the proper choice of statistical model must be determined based on the data being collected and analyzed and the study design.

Response: EPA has not finalized the proposed 40 CFR 30.6 requirements.

4.1.1.2.3 Model Evaluation Guidance/Criteria

Comment: Commenters (1011, 6446) express concern that the proposed rule does not address guidance for evaluating models.

Commenter (1011) states that changes in the use of underlying models should be further explored through appropriate guidelines that allow for appropriate input from the scientific community and NAS prior to implementation.

Commenter (6446) states that the proposed rule does not address guidance for evaluating the scientific plausibility and usefulness of alternative dose-response models. The commenter states that the proposed rule generally does not provide any guidance or direction on how alternatives to current EPA dose-response modeling practice would be evaluated for their scientific plausibility and usefulness. Commenter states that, while the preamble to the proposed rule states, "EPA should give appropriate consideration to high quality studies that explore...nonparametric models that incorporate fewer assumptions", nonparametric dose-response models lacking a biological background can be manipulated to result in output that does not correspond to the biological reality. The commenter expresses concern that the proposed rule does not compel such models to be consistent with biology and to be evaluated for biological plausibility.

Response: This rule does not apply to models. See the preamble of the rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (6362) notes that EPA should adopt model evaluation criteria to apply the greatest weight and credibility to models that are open access, describe the endpoint predicted clearly, are based on unambiguous open access computer algorithms, have a defined domain of

applicability, have been transparently verified with publicly available datasets, and are shown to be robust and scientifically sound for the intended use.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (6449) suggests that all new models be vetted separately, preferably before they were used and before they are used in another analysis. The commenter adds that exceptions and additions to existing EPA guidance may allow for improved analyses, but the strengths and limitations of those changes should undergo the same level of review, e.g., interagency comment and public comment, as the original guidance document. When performed as part of a chemical-specific analysis, the commenter contends that there is insufficient time and expertise available for a full discussion of the potential utility and limitations of the changes.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

4.1.1.2.4 Model Documentation

Comment: Commenter (6375) suggests that, with respect to dose-response models, EPA require documentation of the choices made at each step of the process and to include a scientific rationale for the selected approach. The commenter provides suggestions for documentation related to, but not limited to, data and model selection, uncertainty and variability/sensitivity analyses, model parameter estimation and use, methods/assumptions, and specific requirement considerations when documenting epidemiological studies and reporting of dose or concentration response assessments.

Commenter (6891) supports the proposed regulatory text that the underlying data or models must include “the information necessary for the public to understand, assess, and replicate findings.” The commenter agrees that such necessary information may include associated protocols necessary to understand, assess, and extend conclusions; computer codes and models involved in the creation and analysis of such information; and detailed descriptions of how to access and use such information. The commenter encourages the EPA to present data and models with adequate explanatory materials so that the public can readily understand their relevance and how they were used in reaching a decision. The commenter adds that EPA consider document format and legibility (including the use of acronyms/headings) as part of providing meaningful public access.

Commenter (6935) states that, consistent with the intent of this regulation, EPA should provide more information about the inputs, assumptions and outcomes from the Agency’s own proprietary models so that stakeholders can assess and independently validate the results, which often provide the exclusive scientific justification for new regulations.

Commenter (0555) supports the requirement that EPA describe and document its assumptions and methods and show how sensitive modeled results are to those and alternative assumptions. The commenter states that assumptions and judgments can bias the ultimate advice provided to

decision-makers and the public. The commenter states that documenting those assumptions and estimating how sensitive predicted outcomes are to them and alternative assumptions and judgments could greatly improve the transparency and quality of EPA's decisions. Commenter states that policymakers will face more difficult choices when faced with a range of reasonable estimates but argue "that is how it should be." Commenter states that this requirement comports with recommendations from various cited sources.^{2621,2622,2623,2624,2625,2626,2627}

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

4.1.1.2.5 Impacts on Current Agency Tools and Models

Comment: Commenter (6935) states that EPA should consider possible requirements of a final rule from the perspective of impacts on current Agency tools and models (e.g., IPM) used to support regulatory proceedings, especially those tools and models used not only by EPA but also by states and private entities.

Response: EPA is pursuing an incremental approach to maximizing transparency in the pivotal science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. As further described in the preamble to the final rule, the EPA is focusing on the underlying dose-response data because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or more pollutants, contaminants, or substances are integral to the Agency's mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. In addition, the data underlying the dose-response assessment are more distinct than the broad range of data and models informing an entire risk assessment.

Comment: Commenter (6133) lists the following examples of currently used EPA models and tools that may not meet the transparency requirement of the proposed rule:

²⁶²¹ Dudley, S., Belzer, R., Blomquist, G., Brennan, T., Carrigan, C., Cordes, J., Cox, L.A., Fraas, A., Graham, J., Gray, G., Hammitt, J., Krutilla, K., Linquiti, P., Lutter, R., Mannix, B., Shapiro, S., Smith, A., Viscusi, W.K., Zerbe, R. (2017). Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

4.1.1.2.6 Uncertainty and Variability

General Comments on the Requirement to Describe Variability and Uncertainty

Comment: Commenters (0068, 6150, 6913) provide general support for requirement to describe variability and uncertainty.

Commenter (6150) requests that EPA evaluate quantitatively, where possible, the effect of variability and uncertainty on results and give preference to studies that evaluate a range of models, including threshold models, and that account for spatial heterogeneity.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (6913) supports the requirement that EPA explain the scientific uncertainty that underlies their decision making. The commenter asserts that, during the most recent update for ozone, the models that EPA relied on had clear inconsistencies. The commenter asserts that the prevailing example was that some areas showed an increase in mortality with decreasing ozone concentrations. The commenter states that EPA directly linked ozone concentrations with asthma, even though research on this issue is not clear-cut. According to the commenter, the significant impact to industry and the adverse economic consequences of the lower ozone standard plainly outweighed the unverified health benefits, but EPA nevertheless implemented the lower concentration.

Response: EPA will characterize the uncertainty in its pivotal science. EPA notes that this rule does not apply to models.

Comment: Commenter (6168) states that unconventional models and novel research approaches to predict adverse health outcomes are often mischaracterized as lacking transparency, but that the proposed measures on data and model availability and use facilitate not transparency but the culture of science denialism: dismissing important evidence and dredging data to endlessly produce false uncertainty and delay scientific advances regarding the harmful effects of chemical

exposures. According to the commenter, this false uncertainty is used to justify failure to protect environmental and public health.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Uncertainty and Variability in Risk Assessment

Comment: Commenter (6155) suggests that the problem of uncertainty in risk assessment should be divided into smaller and more manageable topics. The commenter states that, for dose-response analyses, smaller and more manageable topics would include: 1) extrapolation of tested doses to human doses, or otherwise setting forth adequate and accurate measurement of doses in the study compared to actual human doses; 2) adequate definition of "positive responses" in a given study; 3) identification of parameter estimation assumptions and techniques; 4) identification of dose-response sets of data, including quantities, qualities, and types; 5) explanation and justification of the model selection for low-dose extrapolation, including identification of the type of dose-response relationship chosen (e.g., threshold vs. linear), the role of time (e.g. dose frequency, rate, and duration), 6) explanation of the pharmacokinetic model used (including clarification of the effective dose as a function of applied dose in the study in question), and 7) the impact of competing risks (i.e., addressing the correlation vs. causation issue in the particular model used and how that may have influenced the study's overall conclusions).

Commenter (6155) suggests that an alternative approach to uncertainty would incorporate by reference the "Guidelines for Exposure Assessment," 57 Fed. Reg. 22888 (May 29, 1992) (the 1992 guidelines). The commenter states that the 1992 guidelines address four areas that any final rule's data transparency requirements should address: Gathering and Developing Data for Exposure Assessments, Using Data to Determine or Estimate Exposure and Dose, Assessing Uncertainty, and Presenting the Results of the Exposure Assessment. The commenter also states that the 1992 guidelines also break down uncertainty in dose-response exposure assessments into the following three general categories and contain guidance on how to address each of the three types of uncertainty that the guidelines identify.

1. Uncertainty regarding missing or incomplete information needed to fully define the exposure and dose (scenario uncertainty).
2. Uncertainty regarding some parameter (parameter uncertainty).
3. Uncertainty regarding gaps in scientific theory required to make predictions on the basis of causal inferences (model uncertainty).

Response: This rule applies to independent validation of dose-response data underlying pivotal science. The areas suggested by the commenters are outside the scope of this regulation.

Comment: Commenter (6932) suggests that EPA identify and include variability in human exposures and vulnerability into risk assessments. The commenter states that risk assessment conclusions can differ depending on what data get used or emphasized. The commenter states that the 2014 NAS report found that "related risk-assessment results may differ substantially"

with the choices scientists make about which studies to use.²⁶²⁸ The commenter states that different risk conclusions can be reached because of “differences arising from different emphases placed on datasets and how uncertainty and variability” were considered. The commenter adds that the 2014 NAS report recommended that the EPA identify and include variability in human exposures and vulnerability into risk assessments in order to better protect health. The commenter states that epidemiology studies would be vital to this recommended approach and that while risk assessment conclusions may vary due to different points of departure or emphases on different datasets, the decisions made are not “arbitrary,” as the docket language claims.

Response: This rule concerns the availability of dose-response data underlying pivotal science. These comments address risk assessment not availability of dose-response data or even other data.

Uncertainties in Environmental Regulations

Comment: Commenter (0560) recommends consideration of *uncertainties in environmental regulations*. The commenter suggests EPA emphasize using national and international guidance on the measurement of uncertainties, including Taylor, NIST 1994, and JCGM 100:2008.²⁶²⁹ The commenter suggests EPA give especial attention to Type B errors. The commenter states that climate science publications have particularly ignored these national and international guidelines on the measurement of uncertainty.²⁶³⁰

Response: This rule applies to independent validation of dose-response data underlying pivotal science. Considerations of uncertainties in environmental regulations is outside the scope of this regulation.

Incorporation of Model Uncertainty

Comment: Commenter (0062) states that it is appropriate to consider model uncertainty in a new field of study, since data would not be available to enable development of reliable, verified models. The commenter states that in fields that have been studied for a long time, plenty of data would be available to compare with model predictions enabling identification of the most appropriate model and rejection of models that are inconsistent with data.

Commenter (0062) states that a possible approach EPA can take to resolve the issue of model ambiguity/uncertainty is to set up an open, online debate on the subject inviting key participants

Taylor BN, Kuyatt CE. *Guidelines for evaluating and expressing the uncertainty of NIST measurement results*. Gaithersburg, MD: US Department of Commerce, Technology Administration, National Institute of Standards and Technology; 1994 Sep 1. <https://dx.doi.org/10.6028/NIST.tn.1297>

²⁶³⁰ E.g., IPCC’s guidance on uncertainties for AR5 makes no reference to the 2008 international uncertainty guidelines GUM *Evaluation of measurement data—guide to the expression of uncertainty in measurement*. <https://www.ipcc.ch/assessment-report/ar5/>, https://wg1.ipcc.ch/SR/documents/ar5_uncertainty-guidance-note.pdf

on both sides to provide evidence and arguments supporting their own side and provide reasons why the opposing side's arguments and evidence are not valid. The commenter notes that the back and forth debate on individual points should be allowed to continue until a conclusion is reached, as determined by a neutral observer. The commenter provides that with such an open process, the decision on the correct model can be reached in a transparent, unbiased manner.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (6046) states that the proposed rule should not propose scientific methods, approaches or policy, such as when certain dose-response assumptions should be used or whether EPA should incorporate the concept of model uncertainty. The commenter asserts that science is a method which should be left to scientists who best understand its use.

Response: This rule does not apply to models or dictate what scientific methods should be used.

Comment: Commenter (6448) agrees that as our understanding of the evidence of non-linearity in the concentration response function for certain pollutants and health effects improves, the corresponding risk models should be appropriately refined with appropriate model uncertainty to reflect the improved understanding.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (6881) states that, while we are supportive of the concept of incorporating model uncertainty, simply fitting a prescribed list of models to a small number of observations just provides a list of varying risk numbers without any strong scientific basis or ability to move forward. The commenter notes that this reflects a fundamental misunderstanding of the concept of model uncertainty, ignoring the fact that some models are better justified than others, either based on scientific theory or empirical evidence related to curve-fitting. The commenter contends that the text is confusingly written and not well thought through and would leave the Agency ill-prepared to conduct risk assessments.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenters (0559, 5170) state that EPA needs to have precautionary policies for risk assessment and management of hazardous chemicals with low-dose effects. The commenters argue that because human health is so important and illness so costly, evidence of health risk should take precedence over model uncertainty. The commenters express concern that the introduction of model uncertainty based on competing models at low-dose ranges will result in a lack of appropriate regulatory activity, even where there is strong evidence for low-dose adversity in peer-reviewed publications. The commenters argue that, where there is evidence for adversity, particularly at low-dose ranges, it cannot be assumed that there exists a threshold below which no risk exists. Commenter (5170) states that regulation must proceed even without perfect information in order to do our best to protect public health.

Commenter (6956) asks that the agency avoid the precautionary principle approach to regulatory action. The commenter recommends that the agency be very transparent with those datasets that seek to establish the precautionary approach for a product or for all regulations within the U.S. The commenter provides that models should reflect real-world data when that data is available for comparison. The commenter states that the Agency should not accept model results that contradict actual sample data. The commenter adds that different offices within the Agency or different agencies should not have models that suggest wildly different result-scenarios for the same test subject. The commenter asserts that when you have the introduction of such model uncertainty and discrepancy based on competing models then some investigation must occur. The commenter states that, for model uncertainty at low-dose ranges, if one model shows a possible adverse condition while other models do not, that is no justification for simply accepting outliers.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

4.1.1.2.7 Model Assumptions

Scientific Basis of Model Assumptions

Comment: Commenters (0068, 0555, 1011, 6363) agree that the scientific basis for model assumptions should be clearly described and documented. Commenter (6363) states that models need to have a foundation that is replicable and reflective of relevant exposure scenarios. The commenter adds that there can be a significant gap in modeling assumptions and what occurs in relevant environmental conditions. According to the commenter, disclosure of the underlying assumptions and methodology will allow affected stakeholders to provide input that could enhance the validity (reproducibility) of modeled outcomes.

Commenter (0555) supports the requirement that EPA describe and document its assumptions and methods and show how sensitive modeled results are to those and alternative assumptions. The commenter states that assumptions and judgments can bias the ultimate advice provided to decision-makers and the public. The commenter states that documenting those assumptions and estimating how sensitive predicted outcomes are to them and alternative assumptions and judgments could greatly improve the transparency and quality of EPA's decisions. Commenter states that policymakers will face more difficult choices when faced with a range of reasonable estimates but argue "that is how it should be." Commenter states that this requirement comports with recommendations from various sources, including the following:

- Analyses that do not provide information on how sensitive the primary estimate is to assumptions, data, and models, and the range of outcomes possible under reasonable alternative analytic assumptions should raise questions. Sensitivity analysis examines different "what if" scenarios to see how changes in key assumptions (or combinations of assumptions) influence estimated outcomes. Because many uncertain factors determine the impact of any regulation, one should look for a convincing justification regarding which uncertain parameters have the most consequential effects on outcomes, and a

sensitivity analysis that varies these factors over a reasonable range to gauge their effects on the rule's net benefits.²⁶³¹

- In 2010, OSTP directed agencies to communicate scientific and technological findings to the public “by including a clear explication of underlying assumptions; accurate contextualization of uncertainties, and a description of the probabilities associated with both optimistic and pessimistic projections, including best-case and worst-case scenarios where appropriate.”²⁶³²
- This is important, because, as Dudley and Peacock explain, “scientists will never have complete information to predict outcomes with certainty, so analysts rely on what the [National Research Council]²⁶³³ calls ‘risk assessment policy’—assumptions, judgments, and rules of thumb—to guide the use of scientific information in analyses that inform policy in the face of uncertainty.”²⁶³⁴
- The Institute of Medicine observed in 2013:
 - Uncertainty is inherent in the scientific information upon which health risk estimates are based. Uncertainties enter the health risk assessment process at The George Washington University Regulatory Studies Center every step and can be caused by the potential confounders in observational studies, by extrapolation from animal studies to human studies, by extrapolation from high to low dose exposures, by inter-individual variability, and by modeling the relationships between concentrations, human exposures, and human health responses and evaluating the effect of interventions or risk control options on public health risk.²⁶³⁵
- Fundamentally, the EPA should replace risk values that are built on science-policy assumptions with risk estimates that acknowledge underlying uncertainties. For instance, the agency could follow the example of the Intergovernmental Panel on Climate Change and report a range of risks that correspond to different models. Users would then be able to see whether a value is sufficiently precise to support a particular course of action.²⁶³⁶
- The EPA’s definitive values are illusions: they conceal uncertainty that cannot be resolved scientifically. Bringing conflicting value judgements into the open will enable honest debate and improve public health.²⁶³⁷

²⁶³⁶ George Gray and Jason Cohen. “Rethink Chemical Risk Assessment.” *Nature*. September 2012; 489. p. 28.

²⁶³⁷ Gray and Cohen, p. 28.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Disagree with Limiting Assumptions Made in Models

Comment: Commenter (2023) does not agree with the proposal to limit the number of assumptions made in models for dose response data. The commenter states that assumptions are necessary unless the EPA is now willing to test dosages on humans. The commenter asserts that models are necessary after testing is done on animals, and for models to work, assumptions have to be made with the best available information. The commenter asks who will decide on whether a model is making too many assumptions?

Commenters (2023, 6373) express concern that the proposal may inappropriately be used to discredit studies that assess the impacts of exposures to pollutants. Commenter (2023) asserts that the language about impact assessment and economic impact assessment implies that valuable models will be discounted because they make assumptions based on other scientific studies. Commenter (2023) states that, if those models and estimates went away (because they are deemed "not transparent"), then the absence of guidance will cause more human health and environmental damage. Commenter (6373) states that, to require EPA to assess modeling and assumptions independently, and in addition to the assessment contained in the study itself, provides EPA with unwarranted discretion to inappropriately discount certain studies because there may be multiple dose response curves, or no dose response curve, that best or "correctly" fits a data set, despite a demonstration within the data that exposure has impacts to human health.

Response: EPA has not finalized proposed 40 CFR 30.6 so there are no requirements specific to dose-response models.

Sensitivity Analysis Requirement for Alternative Modeling Assumptions

Comment: Commenter (6446) states that the requirement for sensitivity analysis for all alternative-modeling assumptions does not require an evaluation of the scientific validity of those models. The commenter notes that the proposed rule's requirement that dose-response modeling include a sensitivity analysis including all alternative modeling assumptions does not make any mention of how those assumptions would be scientifically justified. According to the commenter, this lack of scientific justification criteria would invite the submission of models that would not have biological relevance for inclusion in the sensitivity analysis. The commenter contends that this would result in a process that would make EPA risk assessment documents unwieldy, unmanageable and unreliable.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Use of Default Assumptions

Support the Use of Default Assumptions

Comment: Commenters (6446, 6881, 6924, 8771) support the use of default assumptions and express opposition to the proposed requirements in §30.6 regarding assumptions.

Commenters (6446, 6881) assert that the need for default approaches in risk assessments has long been recognized as necessary. The commenters note that the National Academies of Sciences (NAS) has reviewed this approach to defaults throughout the years,²⁶³⁸ and the need for default approaches to perform assessments absent compelling science to the contrary has been established. Commenter (6924) states that the NAS highlights that health protective defaults are important because they incorporate factors that reflect the range of variability and susceptibility in the population to ensure risks are not underestimated.²⁶³⁹ Commenter (6446) states that EPA has therefore developed a series of practices, handbooks and guidance documents over the years that guide the development of risk assessments.

Commenter (6924) recommends that the default should always be used for factors that are known to influence risk unless there is chemical-specific data that support increasing or decreasing it. The commenter suggests that EPA's defaults should include:

- Inter-human variability, general
- Inter-human susceptibility to carcinogens, adult
- Inter-human susceptibility to carcinogens, early life (including prenatal)
- Inter-human susceptibility to non-carcinogens, early life (including prenatal)
- Animal findings are relevant to humans
- Findings from one route of exposure are considered representative unless data show otherwise.

Commenter (6881) asserts that the statement that “the use of default models, without consideration of alternatives or model uncertainty, can obscure the scientific justification for EPA actions” is incomplete, poorly defined, and does not reflect the necessity to make decisions based on uncertain information. The commenter states that it is important to recognize at the outset that default models are intrinsic to risk assessment. The commenter states that, starting with the 1983 Red Book, which established the foundations of risk assessment, federal agencies were recommended to develop uniform inference guidelines to avoid the possibility of manipulation of risk assessment outcomes and to help to standardize risk assessment across chemicals, sites, and scenarios. The commenter asserts that these so-called “defaults” were intended to be the best choice in the absence of data to the contrary, based on a strong scientific foundation but ultimately requiring some science policy judgments. The commenter states that “default” should therefore not be used as a pejorative term – it simply reflects the best current scientific understanding at a time when a decision needs to be made, for an Agency facing many similar decisions on a regular basis. The commenter provides that new scientific understanding will lead to methods that deviate from the defaults and may, in fact, lead to new defaults.

²⁶³⁸ National Academy of Sciences, National Research Council (2009) *Science and Decisions: Advancing Risk Assessment*, Washington DC, National Academy Press; *Science and Judgment in Risk Assessment*. Washington DC National Academy Press; National Academy of Sciences, National Research Council (1983). *Risk Assessment in the Federal Government; Managing the Process*, Washington DC National Academy Press

²⁶³⁹ National Research Council. *Science and Decisions: Advancing Risk Assessment*. Washington, D.C.: National Academies Press; 2009. Ch. 4-6.

According to the commenter, default models are based on current scientific understanding – far from obscuring the scientific justification for decisions, they illuminate them.

Commenter (6446) states that requiring justification for all default assumptions ignores establishment of defaults through prior public processes and external public peer reviews. The commenter notes that requiring EPA to justify the use of default assumptions for every toxicity health factor derivation ignores the detailed development process of those default assumptions. The commenter provides that those default assumptions were developed in several EPA documents (including the 2005 Guidelines for Carcinogen Risk Assessment²⁶⁴⁰), which received public comment and extensive external peer-review. The commenter contends that requiring EPA to re-justify those default assumptions every time they are used, as the proposed rule suggests, would serve no purpose other than to add unnecessary delay to risk assessments and regulatory action.

Commenter (8771) states that “reducing reliance on defaults” sounds reasonable for a brief second, but why on earth would an Agency want to reduce reliance on sound science? The commenter states that defaults should be discarded when they are wrong, either across-the-board or correct in general but wrong for a specific chemical or application (NAS 1994; Finkel 2003; NAS 2008). The commenter asserts that it is arbitrary for EPA to penalize research that relies on reasonable and time-tested models merely because they are parsimonious and have been used as “defaults.” According to the commenter, replacing evidence-based “default” models and assumptions with half-baked exculpatory theories is a recipe for the erosion of science—and has no place in this proposal. The commenter states that defaults are often simple and were arrived at decades ago—so were Newton’s laws and Maxwell’s equations— but that has no bearing on whether they are also theoretically correct, logical, and predict risk better than fancier models that look more sophisticated but may be completely unwarranted.

Commenter (6924) supports updating established defaults to account for newer science demonstrating that EPA’s typical safety factor of 10 is insufficient to account for variability due to life stage, genetics, underlying disease status, and external stressors that may be due to poverty or other difficult life conditions.²⁶⁴¹

Response: EPA has not finalized proposed 40 CFR 30.6 so there are no requirements specific to dose-response models.

Do Not Support the Use of Default Assumptions

Comment: Commenter (2426) supports the proposed rule language relating to consideration of dose response models and uncertainty, rather than relying on default assumptions.

Commenter (6911) concurs that this proposal should include EPA’s actions on exposure-response relationships and model selection. The commenter asserts that, despite the fact that significant progress has been made in the U.S. and internationally to define scientific frameworks and evaluate toxicity datasets to determine biologically plausible modes of action

²⁶⁴⁰ No. EPA/630/P-031001 F, available at https://www.epa.gov/sites/production/files/2013-09/documents/cancer_guidelines_final_3-25-05.pdf

²⁶⁴¹ National Research Council. Science and Decisions: Advancing Risk Assessment. Washington, D.C.: National Academies Press; 2009. Ch. 4-6.

and relevance to humans, the EPA, in practice, has embraced conservative default assumptions, and any movement to modify these approaches has been slow.

Response: EPA has not finalized proposed 40 CFR 30.6 so there are no requirements specific to dose-response models.

4.1.1.2.8 Other Comments on Models

Comment: Commenter (4541) asserts that the EPA's new policy of scientific integrity and transparency should be applied to computer climate models that currently prevail in EPA's funded, published, and cited climate science. The commenter contends that continued use of default models, without consideration of alternatives or model uncertainty, creates a false scientific justification for EPA actions, policies, and regulatory burdens. The commenter states that arbitrary choices made by EPA officials have resulted in assumptions about model accuracy that have been proven incorrect, unable to recreate past climate history or project future climate changes. According to the commenter, all EPA-adopted models have predicted a much higher rate of temperature sensitivity to CO₂ than has been recorded by temperature observations. The commenter adds that such direct proof of model inadequacies cannot be ignored and must be addressed before policy and regulatory actions are proposed.

Response: This rule does not apply to models. See the preamble of the final rule which explains the decision to limit the scope of the rule to dose-response data.

Comment: Commenter (9224) agrees that any data, methodology, or models produced by EPA itself should be transparent and available to the public in a reproducible manner.

Response: EPA agrees. The purpose of this rule is to increase transparency of dose-response data underlying pivotal science.

Comment: Commenter (6891) states that, when appropriate, EPA should apply transparency principles to data and models that EPA has considered but rejected, particularly when EPA relies on data or models that do not meet stated acceptance criteria for their use. The commenter states that adopting a policy of explaining acceptance and rejection of data or models would be well-supported by EPA's long-held policies of transparency, validity, and public participation. The commenter suggests that EPA make rejected data and models available for public review and evaluation. According to the commenter, by allowing comments on data and models that EPA evaluated but excluded, EPA will further its goals and provide a check on its own assumptions and analyses.

Response: This rule applies narrowly to pivotal science. Applying this rule to all information considered by EPA, which may include thousands of studies, would be unfeasible.

Comment: Commenter (8281-PH20) states that the proposed rule's requirements for specific types of defaults, test methods, dose response models, and/or analysis are not supported by current science.

Response: This rule does not apply to models or set requirements for test methods of the use of defaults.

Comment: Commenter (6373) is concerned that §30.6 imposes unsustainable burdens on EPA that will inhibit it from timely considering scientific data. The commenter suggests that the requirements of §30.6 will quickly overwhelm EPA staff and result in a backlog of relevant scientific studies.

Response: EPA has not finalized proposed 40 CFR 30.6. See the preamble of the final rule which explains the decision not to finalize this proposed provision.

4.1.1.3 Publicly Available in a Manner Sufficient for Independent Validation

4.1.1.3.1 Support/Opposition to Requirement

Comment: Several comments were received that generally supported or opposed EPA’s proposal that data and models underlying scientific studies pivotal to EPA regulations be “publicly available in a manner sufficient for independent validation.”

Commenters (0555, 1974, 6129, 6148, 6175, 6176, 6177, 6179, 6366, 6449, 6867, 8281-PH83) express support for EPA’s proposal that the data and models underlying scientific studies pivotal to EPA regulations be publicly available in a manner sufficient for independent validation. Reasons provided for their support include:

- Commenter (6176) believes that public access to underlying data will benefit the EPA. The commenter expresses that the public participation in the rulemaking process helps to inform and shape the decisions made by agencies, and EPA staff who may have access to underlying data and methodology will benefit from hearing different views on this data and methodology, including views from other scientists. The contends that even the “experts” could use the public’s feedback and the expertise of other researchers and scientists.
- Commenter (6867) asserts that promises to provide other researchers with access to data, methodology, or computational code are not an adequate substitute for public availability. According to the commenters’ experience, such promises often go unfulfilled (example provided).²⁶⁴² Significantly, the commenter states that many uncredentialed members of the public are capable of reviewing and identifying errors in data, methodology, and computational code (provides examples).
- Commenter (6449) states that increased data and model availability will facilitate and expedite corrections, for example, where changes were made in a model or to data and accompanying text was not updated. The commenter adds that data and model availability will also allow interested parties to determine if alternative data and model choices would substantially change results.
- Commenter (6175) believes that increased transparency around the assumptions and methods employed in underlying scientific studies will enhance meaningful review and public comment on proposed regulatory actions and decisions. Similarly, commenter (6366) expresses that a more-informed stakeholder community, which has access to such data, will be better suited to participate in the notice and comment process.

²⁶⁴² D. G. Roche, Evaluating Science’s Open Data Policy, 357 SCIENCE 654 (2017).

- Commenter (1974) asserts that the Proposal would result in the American public having greater confidence in the policies advanced in its (EPA's) name. According to a recent National Academy of Sciences report titled "*The Irreproducibility Crisis in Modern Science*," the commenter states that the EPA is contrasted unfavorably with agencies like the NIH for lax science standards: "*We recommend that other government agencies, especially the Environmental Protection Agency and the Department of Energy, adopt the NIH's new standards.*"
(https://www.nas.org/storage/app/media/Reports/Irreproducibility%20Crisis%20Report/NAS_irreproducibilityReport.pdf, page 50)
- Commenter (6129) notes that their experience with EPA's physiologically based pharmacokinetic (PBPK) model for trichloroethylene (TCE) indicates that replication of this model poses difficulties for even sophisticated users, based on the level of documentation that is currently available to the public in the IRIS Toxicological Review for TCE. Thus, the commenter encourages the EPA to develop a system by which the same models that EPA uses in its risk assessments can also be used by the public for independent validation efforts.
- Commenter (6148) notes that, in some cases, concerns have been raised that data have been "cherry-picked" to achieve a pre-determined outcome. According to the commenter, unless data is publicly available for independent assessment, these concerns are likely to continue. The commenter states that data transparency not only allows interested parties to know what data was used in an analysis, but also what data has been omitted. The commenter contends that the most practical means to alleviate such concerns is to enable interested parties the ability to review and comment on the raw data and resulting analysis that form the basis of EPA decisions.
- Commenter (6177) asserts that the EPA regulations based on dose response data and models to predict health or environmental impacts that are opaque end up creating unnecessary costs and competitive disadvantages for U.S. companies. The issue for many within industry has been the inability to understand the Agency's underlying analyses and conclusions, as data sets and models often are incomplete or otherwise unavailable for review. According to the commenter, the proposed rule would provide access to the information and data needed for those parties not part of EPA's SAB or peer-review panels to comment more thoroughly on proposed environmental regulations.
- Commenter (6179) asserts that the Transparency Proposal, when finalized, can enhance public input into the rulemaking process, resulting in better air regulations. The commenter adds that the Transparency Proposal will lead to increases in replicability and verification in the scientific process, thereby allowing the testing of critical methodological assumptions and mitigating biases in key studies that inform significant regulations. The commenter believes that the Proposal recognizes that transparency can be more than simply maximizing disclosure, but rather a means by which studies are contextualized to enhance public participation in the notice-and-comment process critical to effective rulemaking.
- Commenter (0555) asserts that the EPA's proposal to clearly identify available studies and make them available for public review is not only important for ensuring decisions are supported by the best information, but also consistent with policies on scientific integrity espoused by previous administrations (cites the Office of Management and Budget's (OMB's) 2002 Information Quality Guidelines, and a 2009 Memorandum

issued by President Obama that encouraged transparency) and scholarly journals (cites *Science* and *Nature*).

- Commenter (0555) states that the selection of the model used to estimate responses to different exposures to contaminants can have significant impacts on estimated regulatory benefits and notes that, in 2007, the Office of Information and Regulatory Affairs (OIRA) and the Office of Science and Technology Policy (OSTP) observed in a memorandum to agency heads on risk assessment that a “high degree of transparency with respect to data, assumptions, and methods will increase the credibility of the risk analysis, and will allow interested individuals, internal and external to the agency, to understand better the technical basis of the analysis.”²⁶⁴³

Response: The EPA agrees with commenters that the opportunity to independently validate the pivotal science that the EPA relies upon is important in furthering scientific understanding and the Agency’s mission. The EPA also believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety.

Through this rulemaking, the EPA is pursuing an incremental approach to maximizing transparency in the pivotal science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA’s most impactful actions, minimizes unintended consequences, and informs future transparency requirements. As described in the preamble of the final rule, the EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency.

Comment: Commenters (0044, 0671, 0980, 1973, 2337, 5017, 6133, 6135, 6168, 6772, 6868, 6939, 9227) express opposition for EPA’s proposal that the data and models underlying scientific studies pivotal to EPA regulations be publicly available in a manner sufficient for independent validation. Reasons provided for their opposition include:

- Commenter (0671) contends that researchers are always free to confirm a study by performing their own study, and they often do, and doing so is a much better use of limited scientific resources than reanalyzing old data. The decision to make data public (and which data to make public) should stay between the researcher, the IRB, and journal editors. The best available science should be adjudicated via the peer review process, not by applying a restrictive and unreasonable data access standard.
- Commenter (6868) notes that federal courts have already considered requests for revealing scientific data used by EPA. The commenter states that the court found these requests lacking in merit. According to the commenter, in the 2002 *American Trucking Associations v Environmental Protection Agency* heard by the D.C. District Court of Appeals, the court ruled that the CAA imposes no obligation to obtain and make public

²⁶⁴³ Susan Dudley and Sharon Hays, “Memorandum for the Heads of Executive Department and Agencies: Updated Principles for Risk Analysis.” September 19, 2007.
<https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/memoranda/2007/m07-24.pdf>

the data underlying certain "key studies" and similarly rejected arguments that a general requirement be imposed for EPA to obtain and publicize the data underlying published studies on which the agency relies. The court further stated, "requiring agencies to obtain and publicize the data underlying all studies on which they rely would be impractical and unnecessary." The commenter asserts that the court's findings call into question EPA's justification for the proposed rule.

- Commenter (0980) asserts that requiring all data and methodology to be published is completely impractical. The commenter contends that published studies will not be updated to reflect this new requirement, and new studies will only meet these standards if the authors have this requirement in mind. According to the commenter, scientists do not publish their data reduction pipelines, not because they are hiding something, but because there are standard procedures, or because they are easily reproducible by other competent scientists. The commenter states that the use of scientific studies by regulatory agencies needs to align with how scientific studies are used by others in the scientific community. According to the commenter, if a scientist wants to see more data or ask a question about some methodology, they email the author of a study.
- Commenter (1973) asserts that making data and models publicly available in a manner sufficient for independent validation is not necessary to assure people that the studies have been reasonably conducted because the study protocols, recruitment criteria, measurement techniques, and statistical modeling methods including lists of the adjustment variables have all been made publicly available, and peer reviewed. The commenter adds that tables of descriptive statistics are also already public. Moreover, the commenter asserts that the peer review process of journals means that a group of experts unrelated to the study have already commented on, and requested changes in, methods that they find wanting. Moreover, the commenter states that the scientific community has already adopted several protocols and guidelines specifically designed to improve reporting and evaluation of studies and improve the quality and transparency of the interpretation of findings.
- Commenter (6133) asserts that neither the Proposal nor docket contains any factual, scientific, technical, logical, or legal support for the suggestion that science and data that are "publicly available in a manner sufficient for independent validation" are necessary elements for the "validity," "reliability," or "transparency" of scientific information. The commenter adds that the EPA provides no basis for its assumption that science or studies for which data are publicly available yield more valid or reliable results than the best available, peer-reviewed, independent, credible science, for which the underlying data are not publicly available. Similarly, the commenter notes that the Proposal arbitrarily fails to address, much less explain, why prior EPA regulatory actions that relied upon studies, data, or other information did not reflect the "best available science" or why they were otherwise unreliable, despite failing to meet the Proposal's standards.
- Commenters (2337, 6914, 6939, 9227) assert that there are many reasons (legal/ethical/practical) why data cannot, or cannot easily, be made public, including data no longer being available (older studies), the size of the study and volume and format of the underlying data, and privacy and individual/business confidentiality concerns. Commenter (9227) asserts that the agency's failure to consider or examine any of the legitimate reasons for not making data publicly available is arbitrary and capricious.

- Commenter (6135) opposes asking scientific researchers to make publicly available administrative claims datasets (e.g., hospital admission and emergency department records, Medicare records, etc.) or other population datasets (e.g., National Health and Nutritional Examination Survey, NIH-AARP Diet and Health Study, etc.) which would not only violate data use and IRB agreements but is wholly unnecessary given that these records are already openly available to any individual or group that adheres to data privacy requirements.
- Commenter (6939) asserts that the Proposal would necessitate the sharing of data protected under health privacy laws and otherwise barred from disclosure and that its main impact would be to undermine science in regulatory decision-making by making it impossible for EPA to consider the best available science when regulating by prohibiting, except in limited circumstances, the consideration of relevant science from the decision-making process if the underlying data is not publicly available. The commenter notes that, in the absence of substantial new resources, efforts to replicate studies and prepare data for public release would reduce the resources available for new research and delay the regulatory process.
- Commenter (9227) notes that, with respect to studies that have already been completed, there are formidable barriers to public release of underlying data and models, particularly older studies where data is no longer available for a multitude of reasons.
- Commenter (6168) states that requiring full data availability and broad application of default models encourages analyses aiming to sow false uncertainty and put off protective regulation. According to the commenter, in addition to eliminating evidence from the regulatory process, the proposed measures on data and model availability facilitate not transparency but the culture of science denialism, which fits with the anti-protection agendas of fossil fuel and chemical industry lobbyists. The commenter contends that scientific uncertainty is used not only to deny risks, but to make potential benefits of regulation uncertain and to give weight to the costs; such cost-benefit analysis justifies failure to regulate. In particular, the commenter notes that external “validation”—a central component of this proposed rule—can instead take the form of “deconstruction of evidence” through “data dredging”.²⁶⁴⁴
- Commenter (9227) notes that there are legal and ethical requirements that restrict making public the data underlying studies, including rules to shield private personal information, requirements to maintain CBI, situations where obtaining the necessary permissions to release data are logistically difficult or impossible (e.g., historic studies), and situations in which researchers have made significant investments in developing datasets that they intend to continue to work with for future studies. According to the commenter, not all these barriers can be overcome, nor can they be overcome in every case. The commenter notes that, while there are ways to potentially address some of them, they can be extremely costly and burdensome, and/or may harm the prospects for further research. Accordingly, the commenter asserts that, while the scientific community has made efforts to make more data publicly available, to the best of our knowledge all of the policies adopted by government and academic journals recognize that data is not, and need not be, publicly available to evaluate their quality. The agency’s failure to consider or examine

²⁶⁴⁴ Wagner and Steinzor. 2018. Deconstructing Regulatory Science. *The Regulatory Review*. July, 2018.

any of these legitimate reasons for not making data publicly available is arbitrary and capricious.

- Commenter (9227) notes that, even with respect to prospective application of EPA's proposal, providing for public release of underlying data and models is costly and resource intensive, creating a serious disincentive for researchers to meet EPA's proposed requirements. The commenter provides that investigators willing to make their study underlying data publicly available would still face the logistical hurdle of making the data and models available in a manner sufficient for independent validation by the public. In addition to the cost of thoughtful and effective deidentification or redaction of sensitive information, the commenter notes that the proposed text would likely require researchers to prepare annotated manuals including precise detail as to what variables were collected, how information was collected, and the rationale for each step taken. According to the commenter, some manuals alone run into hundreds of pages. The commenter provides that one press account noted the example of publicly available datasets from the National Center for Health Statistics, which can come with 100-page manuals; where researchers would need to hire additional staff to meet such requirements.²⁶⁴⁵
- Commenter (5017) notes that some studies cover populations that are so limited in size or specialized in their characteristics that those data should not be posted on the web for all the world to see.

Response: Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal

²⁶⁴⁵ Alessandra Potenza and Rachel Becker, Scott Pruitt's new 'secret science' proposal is the wrong way to increase transparency. Here's what scientists think a science transparency rule should include, The Verge (May 1, 2018, 8:30am EDT), <https://www.theverge.com/2018/5/1/17304298/epa-science-transparency-rule-scott-pruitt-datasharing>.

science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

The requirements included in the final rule provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the EPA maintains a strong scientific basis for its decision-making. The incremental progress made possible by the final rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments.

4.1.1.3.2 Making Data and Models Available Does Not Make Them Understandable to the Public

Comment: Commenters (2169, 6046, 6168) assert that the Proposal to make data and models underlying scientific studies pivotal to EPA regulations be “publicly available in a manner sufficient for independent validation” does not make the studies understandable to the public.

Commenter (6168) states that the requirements of this rule fail to support significant public participation, because data and models are meaningless without explanation. According to the commenter, simply making them available does nothing to make them understandable or usable to the public. The commenter notes that there is already a huge gap at EPA between public availability of information and meaningful accessibility and transparency. The commenter states that this is true not only regarding data availability but also when analysis is made public without adequate explanation. The commenter notes, as an example, the extensive analyses underlying the NAAQS, which regulate the six criteria air pollutants. For each of these pollutants, the commenter states that the EPA synthesizes all relevant scientific information into an Integrated Science Assessment and a Risk or Exposure Assessment and then develops a Policy Assessment based on these reviews and recommendations from an advisory council. The commenter states that these thorough assessments are massive documents -- together running into the thousands of pages for each of the six pollutants -- that are publicly available. The commenter provides that the webpage for each pollutant, however, contains shockingly little information to help users understand and use this highly technical information. For example, according to the commenter, the page on particulate matter contains a single sentence describing “What Scientific and Technical Information Supports Review of the Standards” and a handful of sentences explaining the health effects of particulate matter.²⁶⁴⁶ The commenter asserts that the EPA provides nothing between this handful of sentences and the thousands of pages in the assessments that would make this sufficient for public education and engagement. The commenter contends that this form of “transparency” falsely equates availability with accessibility. The commenter concludes that, if making analyses available without context fails at transparency and public participation, then making raw data and dose-response models available without context is an even greater failure.

²⁶⁴⁶ Setting and Reviewing Standards to Control Particulate Matter (PM) Pollution and Health and Environmental Effects of Particulate Matter (PM) (EPA websites)

Commenter (6046) notes that very few members of the general public have the statistical expertise or time to properly evaluate epi or pesticide study data and very few probably have any interest. Thus, the commenter asserts that disallowing the use of non-publicized data would not impact the general public. The commenter provides that some scientific researchers may be able to and have interest in evaluating such data. The commenter provides that currently, if EPA researchers use non-publicized data, researchers can request the raw data from the study author. According to the commenter, if the researcher cannot release the data to the requester due to confidential reasons, there is frequently sufficient summary statistics and study methodology reported by EPA that a researcher can replicate and evaluate the study results (e.g. using Monte Carlo methods).

Commenter (2169) provides that releases of information/models necessary to allow the “public to understand” is not achievable. The commenter notes that public educational attainments are not at a level needed to insure understanding. Alternatively, the commenter asserts that the releases necessary to allow competent scientists, with access to statistical and other tools of scientific assessment, are possible. According to the commenter, the problem presented by the proposed standard of understanding is that simple public confusion becomes a basis for setting aside a regulation. The commenter asks: How is the public confusion to be ascertained? By public surveys? By assessing comments received from the public?

Response: In response to these comments, the EPA has clarified the purpose of the rulemaking in the preamble of the final rule. The purpose of this rulemaking is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. The EPA believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety.

Comment: Commenter (6046) notes that the proposed rule will not meet its stated goal of better informing the public. According to the commenter, by disallowing EPA researchers and analysts the use of study data which are not published, the non-published study data, regardless of their quality and applicability, will not be used or discussed by EPA, thus hiding their existence from the public. Thus, the commenter contends that the public would be less informed about the spectrum of data. Further, the commenter adds that disallowing study data would mean that a thorough critical weight of evidence evaluation cannot be conducted.

Response: Based on a consideration of these comments and other, similar comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information.

Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

Implementation of this rule will more effectively share pivotal science for external consideration and, thus, increase the opportunity for independent subject matter experts to validate pivotal science should they choose to do so. As the dose-response data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

4.1.1.3.3 What Degree of Public Availability is Sufficient

Proposal Unclear Regarding the Level of Access and Disclosure/Explanation is Needed to be Publicly Available

Comment: Commenters (2426, 6133, 6194, 6362, 6875, 6915) express that the Proposal is not clear regarding what EPA considers to be sufficient public availability and the level of access and disclosure/explanation to the public that is intended. Commenter (6362) suggests that, another important aspect relevant to “public availability” is the level of data refinement EPA will require.

Commenter (6362) expresses that the EPA does not define what it means by its use of the term, “publicly available.” The commenter explains that there is more than one definition of the term currently in use by federal agencies.²⁶⁴⁷ Commenter (2426) states that, perhaps one of the more frequently used terms that has caused the most confusion is “publicly available.” The commenter provides that, outside the context of this proposed rule, “publicly available” generally means that information is available without restriction to anyone who wants it. Commenter (6194) explains

²⁶⁴⁷ Publicly available information means “any information that you reasonably believe is lawfully made available to the general public from: (i) Federal, state or local government records;(ii) Widely distributed media; or (iii) Disclosures to the general public that are required to be made by federal, state or local law.” 17 CFR 160.3 [Title 17 -- Commodity and Securities Exchanges; Chapter I -- Commodity Futures Trading Commission; Part 160 -- Privacy of Consumer Financial Information]. Publicly available information is information that has been published or broadcast for public consumption, is available on request to the public, is accessible on-line or otherwise to the public, is available to the public by subscription or purchase, could lawfully be seen or heard by any casual observer, is made available at a meeting open to the public, or is obtained by visiting any place or attending any event that is open to the public. Office of the Director of National Intelligence & Office of the Director of National Intelligence, National Counterintelligence and Security Center, CI Glossary 2011.

that the “public” referenced in the Proposal could be scientists trained in the relevant field or members of the general public. Commenter (6875) notes that a significant number of journals require a subscription or payment in order to read their articles. The commenter asks: Does EPA consider these studies publicly available? Commenter (6362) adds, that if EPA intends to determine this on a case-by-case basis, that also be made clear.

Commenter (2426) notes that, while making the level of accessibility to information available without restriction to anyone who wants it is acceptable for most information, the commenter notes that it becomes problematic for sensitive personal information, personal health information, or CBI. In order to meet existing privacy and confidentiality laws that protect this type of information, the commenter states that increased accessibility tends to come with reduced refinement (i.e., less detailed information) in the data.

Commenter (6133) asserts that, although the phrase, “in a manner sufficient for independent validation,” is repeated frequently throughout the Proposal, and is integral to its very operation, the phrase is not defined in the proposed definitional section (§30.2). The commenter notes that, later in proposed regulatory text, the Proposal does specify that “[i]nformation is considered ‘publicly available in a manner sufficient for independent validation’ when it includes the information necessary for the public to understand, assess, and replicate findings.” 83 Fed. Reg. at 18,773–74 (proposed §30.5). The commenter adds that proposed §30.5 goes on to list categories of information that “may” be included in this concept. The commenter notes that the explanation provided by proposed §30.5 is a non-definition; it provides no additional clarification. The commenter asks: How much information is sufficient for the public to understand, assess and replicate findings? Can this standard sometimes be met by releasing methodology but not raw data?

Commenter (6133) expresses that the proposal fails to explain how the term, “in a manner sufficient for independent validation,” and the proposed §30.5 definition will increase transparency in science or why it is necessary to ensure that EPA will consider the best available science. To the contrary, the commenter contends that the Proposal’s approach would preclude EPA from considering the best available science that is relevant to EPA’s responsibilities. The commenter adds that the EPA also fails to explain why data underlying peer-reviewed studies must be publicly available “in a manner sufficient for independent validation” when independent researchers can verify science without making the underlying data, which is often confidential, publicly available.

Commenter (6194) states that the Proposal provides that, “where necessary, data would be made available subject to access and use restrictions.” 83 Fed. Reg. at 18,773-74. However, the commenter states that what this process would look like is not addressed in the Proposal or discussed at all in the preamble. According to the commenter, this leaves significant open questions, such as who will pay for and implement these restrictions and who will decide which people can access the data and under what standards.

Commenter (6915) states that the “information necessary for the public to understand, assess, and replicate findings” examples provided in the Proposal include “(a) Data (where necessary, data would be made available subject to access and use restrictions)[:]; (b) Associated protocols

necessary to understand, assess, and extend conclusions; (c) Computer codes and models involved in the creation and analysis of such information; (d) Recorded factual materials; and (e) Detailed descriptions of how to access and use such information.” 83 Fed. Reg. at 18,774. The commenter states that this could be interpreted to require maintenance of data down to the most basic level, verging on the absurd, and could impose unreasonable and impractical requirements that go well beyond those already included in current protocols. For example, the commenter notes that it could require maintenance of records that are not routinely archived by academic research labs, such as printouts of data from all calibration curves and analyses from instruments that measure clinical parameters in blood or other similar endpoints in animal and human studies, or photos of each individual organ as it is evaluated for gross pathology in toxicology studies. According to the commenter, even if such data are maintained for a period after a study is completed, it is not feasible for such records to be maintained indefinitely by research laboratories, which would then make the study that the data supports unavailable for use in future regulations. According to the commenter, for toxicology studies, such data availability requirements would result in favoring studies performed under Good Laboratory Practice (GLP) protocols, which typically retain more raw data than research studies. The commenter provides, however, that GLP studies may not evaluate the most sensitive and relevant toxicological effects of the chemical being studied and are not inherently of higher quality than studies conducted under other protocols.

Commenter (0671) cites the Proposal preamble as stating “[t]he benefits of EPA ensuring that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation are that it will improve the data and scientific quality of the Agency's actions and facilitate expanded data sharing and exploration of key data sets; this is consistent with the conclusions of the National Academies.” The commenter states that nothing in that report suggests the EPA should require publication of PII on human subjects. The commenter adds that there is also a problem here with the definition of “data... underlying pivotal regulatory science”. The commenter asks: Does this mean the raw data, or the data used to make the final figures and tables in a paper or the data as it exists at some processing step in between? If the raw data, how raw? Some raw genomic data is so large it can't be efficiently stored. The commenter contends that there is no one unique thing called “the data” for a study.

Response: In response to these comments and other, similar comments, the EPA issued a supplemental notice of proposed rulemaking (SNPRM) in 2020 that included definitions for key terms in the 2018 proposal and clarified definitions included in the 2018 proposal. The EPA also proposed a modified approach to the public availability provisions for data and models that would underly significant regulatory decisions and an alternate approach.

Data Availability Usability Certification

Comment: Commenter (0556) states that the EPA needs to specify the requirements of proper data availability as needed for usability. According to the commenter, this might be a simple checklist of questions, or perhaps something more complex. The commenter provides that there is already considerable discussion and action within the open science community, as to just what availability for the purpose of replication requires. The commenter recommends that EPA draw on this existing work and expertise. The commenter notes that the basic requirements are not that

mysterious: (1) The data and codes need to be available and properly documented. (2) The procedures followed, and decisions made along the way need to be properly explained. (There is already relevant literature on this topic in some fields, especially biomedical.) (3) Research that cannot be certified is excluded.

Commenter (0556) suggests that the EPA might need to certify that each piece of research it wants to use is properly available for attempted replication. The commenter provides that they believe that the best way to do this is for EPA to contact the researchers to determine that the research is properly available. According to the commenter, another possibility is to establish a practice of self-certification among those researchers who desire that their research be usable by EPA. The commenter adds that certification of EPA usability might also be done by third parties, such as scholarly societies. The commenter states that such certification could even become a condition of funding with some funders.

Response: As described in the preamble to the final rule, scientific information is considered available in a manner sufficient for independent validation when it includes the information necessary to understand, assess, and reanalyze findings. The EPA has identified the information that may need to be available for dose-response data to be considered publicly available in a manner sufficient for independent validation, including:

- Data (data would be made available subject to access and use restrictions);
- Associated protocols necessary to understand, assess, and extend conclusions;
- Computer codes and models involved in the creation and analysis of such information;
- Recorded factual materials; and
- Detailed descriptions of how to access and use such information.

As described in the final rule, the EPA intends to clearly identify the studies considered pivotal in the documentation at the proposed rule stage for significant regulatory actions and when influential scientific information is disseminated for peer review. The Agency will also identify the pivotal science that was given lesser consideration and provide a description of why lesser consideration was given.

The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity to make dose-response data available or determine that dose-response data are available. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Necessary Associated Protocols for Making Data and Models Available

Comment: Commenter (2426) recommends that the EPA strongly consider implementing a formal request and approval process for qualified researchers to obtain access to data that is protected by confidentiality laws, rather than aiming for all data to have unrestricted access. The commenter contends that this process would still allow identifiable or refined de-identified data

to be re-evaluated by experts external to the EPA or the original study authors, while protecting the privacy of the study participants or businesses who created the model or dataset.

Commenter (6362) states that the National Academies of Science, Engineering, and Medicine (NAS) held a workshop in 2016 to discuss obstacles for sharing data.²⁶⁴⁸ The commenter provides that the NAS defined several key terms to ensure clarity at the workshop. The commenter recommends that the EPA consider adopting a similar lexicon to increase the clarity of its regulation and refers the EPA to Table 1 of Appendix B of their comment letter for these terms (Table 1. Definitions in NAS Principles and obstacles for sharing data from environmental health research: Workshop summary). In addition, the commenter provides that the NAS Report suggests a “cleaned dataset” would be acceptable to use for all routine analyses and verification. (See Table 2 in Appendix B of their comment letter (Table 2. Data flow from NAS Report)). The commenter recommends that the EPA establish clear standards on the acceptability of “cleaned datasets.” The commenter contends that this will help to standardize data reporting and formatting. It will also prevent over- and under-reporting.

Response: Based on a consideration of these comments and other, similar comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

In the 2020 SNPRM, the EPA presented the different stages of data described in the National Academies of Science, Engineering, and Medicine (NAS) 2016 workshop reported cited by the commenter and proposed a definition for data consistent with cleaned-up data (i.e., the set of recorded factual material commonly accepted in the scientific community as necessary to validate research findings in which obvious errors, such as keystroke or coding errors, have been removed and that is capable of being analyzed by either the original researcher or an independent party).

Computer Codes and Models

Comment: Commenter (6175) that they support the broader proposed requirements to describe and document any modeling assumptions and methods used; evaluate default assumptions; explain the scientific basis for each model assumption used; conduct sensitivity analyses of the modeled results to alternative assumptions; and give consideration to high-quality studies that

²⁶⁴⁸ National Academies of Sciences, Engineering, and Medicine. 2016. Principles and obstacles for sharing data from environmental health research: Workshop summary. Washington, DC: The National Academies Press. doi: 10.17226/21703.

explore other factors, including confounding variables. The commenter recommends that the EPA also evaluate the effect of variability and uncertainty on results, giving preference to studies that evaluate a range of models.

Commenter (6175) asserts that, while scientific modeling plays an important role in informing policy and regulatory decisions, models need to have a foundation in actual real-world data. The commenter notes that often there can be a significant gap in modeling assumptions and what is really occurring on the ground. The commenter states that disclosure of the underlying data, assumptions and methodology will allow affected stakeholders to provide input that will improve the credibility and reproducibility of modeled outcomes.

Response: As explained in the preamble to the final rule, the EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. Thus, the EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency.

While the scope of the final rule is focused on dose-response data underlying pivotal science, the final rule requires the EPA to describe critical assumptions and methods used in the Agency's dose-response assessments and to characterize the variability and uncertainty of such assessments.

Access to Data

Comment: Commenter (6194) states that the Proposal provides that, "where necessary, data would be made available subject to access and use restrictions." 83 Fed. Reg. at 18,773-74. However, the commenter states that what this process would look like is not addressed in the Proposal or discussed at all in the preamble. According to the commenter, this leaves significant open questions, such as who will pay for and implement these restrictions and who will decide which people can access the data and under what standards.

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (6362) provides that several agencies and organizations, in addition to NIH, have successfully addressed the issue of data access while maintaining confidentiality that should be considered by EPA. For example:

- The existing rule requiring federally funded research to be made available to other researchers. This standard could be adopted and applied to third-party funded researchers.
- Health care claims and related data are now being made available to researchers in de-identified form by some health insurance companies, such as Optum, which offers a “proprietary research database of health care and administrative data that links patient, physician, and treatment attributes from millions of geographically diverse individuals in the U.S.” Optum appears to have developed methods and procedures to appropriately address confidentiality concerns.
- Medicare claims data are already available to researchers in de-identified form. Algorithms and methods developed by the Center for Medical Services should be examined by the EPA.
- Several professional societies have guidance on the protection of health data and de-identification, such as the Institute of Electrical and Electronic Engineers and the International Association of Privacy Professionals.²⁶⁴⁹

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

²⁶⁴⁹ <http://www.ehealthinformation.ca/wp-content/uploads/2014/08/2010-Risk-based-de-identification-of-health-data.pdf> and https://iapp.org/media/pdf/knowledge_center/Perspectives_on_Health_Data_De-Identification_final.pdf

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (2171) supports open data, and that their state is a national leader in scientific and regulatory transparency. The commenter notes that their agencies are at the forefront of making environmental and health surveillance data publicly available, providing technical assistance for using that data, and engaging partners across communities and research institutions around effective data dissemination and utilization. The commenter adds that their agencies host multiple platforms for accessing high-quality health surveillance and environmental monitoring data, while protecting privacy and providing essential risk communication and prevention strategies. According to the commenter, detailed data are similarly available for research uses, under the approval and guidance of state IRBs.

Response: Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (6726) states that one way to ensure transparency in the regulatory science aimed at solving a problem affecting our civilization is to fund two or more independent studies of the problem if questions arise about a single peer-reviewed study. According to the commenter, such questions do not often arise, but if they do it is an excellent opportunity for the authors of the original study to submit additions and corrections for peer review, as well as for others to independently study the problem. The commenter notes that everybody makes mistakes, but scientists and engineers are trained to recognize, avoid, and correct systematic errors in their experiments. The commenter provides that a peer-reviewed study usually contains a list of assumptions and approximations and an analysis of random and systematic errors to aid others in repeating the experiment and analyzing their own data.

Response: The EPA agrees with commenters that the opportunity to independently validate the pivotal science that the EPA relies upon is important in furthering scientific understanding and the Agency's mission. Through this rulemaking, the EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done

in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements.

As described in the preamble of the final rule, the EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information.

Comment: Commenter (5419) states that the proposed rule mentions data research centers that facilitate secondary data usage by the public. The commenter suggests that, if the Centers for Medicare & Medicaid Services (CMS) data are considered to fall in this category, they would encourage EPA to work with CMS to streamline and simplify the data acquisition process and make the data available to the public free of charge. Otherwise, according to the commenter, the cost and security requirements of obtaining these data may place an undue burden on stakeholders seeking to replicate analyses, since the use of this data for a project they conducted were acquired at a significant cost (> \$100,000) and a comprehensive data management plan that outlined rigorous security protocols was required. The commenter asserts that, clearly, these requirements would make replication of the work untenable for many researchers. The commenter expresses concerns that the challenges of making these data available in an equitable fashion may result in the data and insights from this study being removed from consideration in standard-setting activities for PM2.5, ozone, and NO2.

Response: The EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Commitment to Development of Permanent Long-Term Storage

Comment: Commenter (0045) asserts that a foundation for open and repeatable science is the availability of original data sets. The commenter provides that the availability of original data is often retained in government repositories, both in the USA and internationally. The commenter suggests that it should be a basic principle of the proposed rule that the U.S. government commit to the permanent long term storage of all data collected under government funding and the establishing of open access to such data, with the proper protections for data which may be subject to legal controls such as commercial confidentiality or patient HIPAA data. The commenter recommends that effective access be implemented to permit peer review, reproducible tests, or new work, based upon enabling persons to be authorized as broadly as

possible, and best practices of anonymizing data. The commenter suggests that the USA work with governments around the world to obtain similar safeguarding of fundamental data which may be of universal benefits, with reciprocal access arrangements. The commenter adds that where EPA receives data, studies, analysis, and projections from sources beyond government funded science (e.g., industry, private citizens, or foreign entities), such data, studies, and projections should be subject to the same regime of durable storage, access for peer review, independent reproducibility, and safeguards, which are accorded to government funded sources and studies.

Response: The EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

4.1.1.3.4 “Independent Validation”

Independent Validation is Not Described/Defined

Comment: Commenters (6168, 6185, 6449, 6955) assert that “independent validation” is not described/defined. Commenter (6373) notes that the impacts of the proposed Rule are difficult to predict unless EPA better defines what data the Rule applied to, and terms such as “independent validation.”

Commenter (6955) states that validation usually requires a comparison to new data; it is rarely used in scientific studies to mean a check to see that data leads to the stated results using the stated methods and/or software. The commenter notes that new studies can validate a model or numerical finding, but reproducing the analysis only validates the math. The commenter adds that neither can sensitivity analysis validate a study. The commenter provides that the meaning of the phrase, “sufficient for independent validation” is unclear and likely to raise great confusion, as different stakeholders define it differently. What would invalidate a study? We are not told. Furthermore, the commenter adds that no details are given as to what would constitute sufficiency. The commenter contends that, by not explicitly identifying its definition of validation, the agency has skipped over the statistical and regulatory implications of post-hoc analyses, losing the public comments that would otherwise have been forthcoming.

Commenter (6185) states that the approach for “independent validation” is not described. The commenter asks: Would EPA’s staff scientists conduct these validations, or would EPA contract this out to third parties? How would EPA determine that third parties have the necessary qualifications and resources to perform these validations? According to the commenter, without these listed information elements, commenters are left to guess at the scope and potential impact of EPA’s proposal as it applies to “independent validation.” For example, the commenter provides that a recent study that is likely to be considered “pivotal regulatory science” for the

current particulate matter (PM) NAAQS review is by Di, *et al.*, “Air pollution and mortality in the Medicare population.”²⁶⁵⁰ The commenter notes that this study of chronic effects, along with a complementary study on acute effects,²⁶⁵¹ uses 460,310,521 person years of follow-up and has billions of data points. According to the commenter, the computational resources necessary to replicate or validate the analysis are available only at large institutions like the Harvard-MIT Data Center.²⁶⁵² The commenter asks: How does EPA’s proposal on independent validation apply to a study like this?

Commenter (6168) states that, while the proposed rule emphasizes that data and models should be available in a manner sufficient for independent validation, the rule fails to clearly define independent validation. As a result, the commenter suggests that it is unclear if the rule applies only to replication of analysis or also to replication of entire studies. According to the commenter, by emphasizing availability of data and models, the rule seems to be narrowly focused on replicating analysis, particularly as related to dose-response relationships. Yet, the commenter notes that wording such as “using scientific information that can be independently validated” [FR 18770] can be interpreted expansively so that the rule can appear to require the ability to replicate entire studies, as was the intent of the failed HONEST Act. The commenter asserts that there are several problems with this. First, the commenter provides that if the intention is to require the ability to replicate entire studies, then this proposed rule is misleading; as written, it seems to be only about replicating analysis. As a result, the commenter states that this proposed rule is a stealth-- not at all transparent-- way to eliminate the use of a wide swath of studies that are currently used for regulatory decision-making. For example, the commenter suggests that studies based on tragic accidents involving toxic releases provide important public health knowledge, but cannot be replicated (for more on this, see EDGI’s white paper²⁶⁵³). Second and more broadly, the commenter provides that the lack of clarity on this matter would allow the EPA to pick and choose, in an arbitrary manner, which studies to include or exclude in risk analysis. The commenter contends that this misuse of power would easily influence the findings of risk analysis.

Similarly, commenter (6449) states that the definition of “independent validation” is not clear. The commenter adds that it is not clear if the intent is to reproduce study conclusions using underlying data, replicate entire studies, or validate the use of data extracted from published studies in a dose response model. The commenter also notes that it is not clear whether this means all the information required to replicate the entire study should be included or whether this is limited to data once generated. The commenter requests that EPA present a clear definition.

Response: In response to these comments and other similar comments, the EPA issued a supplemental notice of proposed rulemaking (SNPRM) in 2020 that included definitions for key

²⁶⁵⁰ Di, Q., et al. “Air pollution and mortality in the Medicare population.” *New England Journal of Medicine* 376.26 (2017): 2513-2522. DOI: 10.1056/NEJMoa1702747.

²⁶⁵¹ Di, Q., et al. “Association of short-term exposure to air pollution with mortality in older adults.” *JAMA* 318.24 (2017): 2446-2456. DOI: 10.1001/jama.2017.17923.

²⁶⁵² Harvard-MIT Data Center, The Institute for Quantitative Social Science, “Research Computing Environment,” <https://projects.iq.harvard.edu/hmdc/book/research-computing-environment> (accessed May 21, 2018).

²⁶⁵³ Public Protections Under Threat at the EPA: Examining Safeguards and Programs That Would Have Been Blocked by H.R. 1430 — White Paper (EDGI, March 2017)

terms in the 2018 proposal, such as “independent validation,” and clarified definitions included in the 2018 proposal.

Based on comments received on the 2018 proposed rule and the 2020 SNPRM, the EPA finalized the definition of “independent validation” as “the reanalysis of study dose-response data by subject matter experts who have not contributed to the development of the study to evaluate whether results similar to those reported in the study are produced.”

Comment: Commenters (6114, 6116, 6131) state that the proposed rule states that “... EPA should ensure that the data underlying those (studies) are publicly available in a manner sufficient for independent validation,” but the proposal does not say by whom. The commenters assert that scientists who are familiar with these types of studies are also familiar with the protocols under which these studies are carried out and peer reviewed, ensuring that an independent, critical assessment is performed. The commenters provide that scientists of this caliber and experience understand the assumptions and limitations that have been made during the study and are qualified to make judgments of whether the studies are valid or not. The commenters contend that, if the EPA seeks “independent validation” by those who are not familiar with these protocols or with how these studies are normally conducted, that type of validation may be meaningless.

Response: In response to these comments and other similar comments, the EPA issued a supplemental notice of proposed rulemaking (SNPRM) in 2020 that included definitions for key terms in the 2018 proposal, such as “independent validation,” and clarified definitions included in the 2018 proposal.

Based on comments received on the 2018 proposed rule and the 2020 SNPRM, the EPA finalized the definition of “independent validation” as “the reanalysis of study dose-response data by subject matter experts who have not contributed to the development of the study to evaluate whether results similar to those reported in the study are produced.”

Independent Validation of Studies/Data Submitted to EPA by the Public

Comment: Commenter (6133) asserts that it is possible (even likely) that studies or data submitted by the public during comment periods would need to be independently assessed/validated before consideration by EPA. According to the commenter, against the backdrop of EPA rulemakings with public comment periods and open rulemaking time periods and the voluminous amounts of data that would need to be de-identified, shared, and re-analyzed, it would be impossible to achieve independent verification of relevant dose-response information.

Response: The EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not

direct or require any outside entity or the EPA to independently validate dose-response data underlying pivotal science.

Independent Validation by Inspection

Comment: Commenter (0044) states that, if the Agency is so concerned about transparency and validity of studies, they may well copy the Food and Drug Administration (FDA) approach to validating data. The commenter provides that, in human research and marketing applications, manufacturers must submit *all* clinical (i.e. human) data, even for studies that don't meet the statutory requirement of "adequate and well-controlled." The commenter notes that all studies and data are used in the evaluation and decision-making processes. The commenter adds that data are validated by inspection. The commenter further adds that the FDA has an inspectorate that inspects not only clinical data (especially so-called pivotal data), but also preclinical data and manufacturing data. According to the commenter, the results of these inspections are used to determine the quality and validity of the data and thereby the studies utilizing these data.

Response: The EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to independently validate dose-response data underlying pivotal science.

Independent Verification Where Laws and Regulations Prohibit the Public Release of Data

Comment: Commenter (6831) states that, throughout their professional career, they dealt with laws and regulations that prohibited the public release of data that could identify an individual or individual business. The commenter provides that they appreciate the need for independent verifications, but there should never be a restriction on the science used to support regulations, especially those involving human or environmental health. The commenter asserts that there are work arounds that can achieve independent verifications, as needed: release of aggregate data, for example, or individuals needing access can agree to and sign confidentiality agreements to access the data, still with the same restrictions on them for publishing individual data. The commenter states that the EPA must rely on relevant science and work with researchers for independent verification of data/results as needed. According to the commenter, the proposed rule is NOT needed and should be abandoned.

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential

scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

The requirements included in the final rule provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the EPA maintains a strong scientific basis for its decision-making. The incremental progress made possible by the final rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments.

No Requirement that Data Be Independently Validated or Replicated Before EPA Can Consider It

Comment: Commenter (6133) states that there is nothing in the proposed regulatory text or preambular language that requires information, science or data to be independently validated or replicated before EPA may consider it. The commenter contends that the EPA does not base the Proposal upon any requirement or expectation that the information, science or data be shown to be accurate, trustworthy, reliable or correct before EPA may consider it. The commenter asserts that this portion of the Proposal reveals EPA's unlawful agenda to be one concerned with prohibiting EPA from considering relevant, peer-reviewed, quality science, not one concerned with actual replication or validation. The commenter adds that the Proposal's condition that science and information be "publicly available in a manner sufficient for independent validation and replication" is revealed to be mere smokescreen for an EPA enterprise to censor the best

available science that would support adoption of more protective health and environmental safeguards.

Response: The EPA believes that the opportunity to independently validate the pivotal science that the EPA relies upon is important in furthering scientific understanding and the Agency's mission. Through this rulemaking, the EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements.

As described in the preamble to the final rule, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. The EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

The requirements included in the final rule provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the EPA maintains a strong scientific basis for its decision-making. The incremental progress made possible by the final rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments.

4.1.1.3.5 Assertion that EPA's Proposal is Consistent with the Conclusions of the National Academies (NAS)

Comment: Commenter (6133) cites the proposal preamble as stating that "[t]he benefits of EPA ensuring that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation are that it will improve the data and scientific quality of the Agency's actions and facilitate expanded data sharing and exploration of key data sets; this is consistent with the conclusions of the National Academies." 83 Fed. Reg. at 18,772 (footnote omitted). The commenter provides that the last statement links to a 120 page document titled "Expanding Access to Research Data Reconciling Risks and Opportunities," by the Panel on Data Access for Research Purposes, Committee on National Statistics, Division of Behavioral and Social Sciences and Education of the National Research Council of the National Academies Press. (<https://www.nap.edu/catalog/11434/expanding-access-to-research-data-reconciling-risks-and-opportunities>). The commenter provides that the Proposal does not suggest that its plan to preclude the use of scientific studies from regulatory decision making is consistent or supported by the National Academies. Rather, the commenter notes that the Proposal generally states that benefits of data availability the Proposal seeks is consistent with conclusions of the National Academies. The commenter further states that the Proposal does not say what the conclusions of the National Academies are or how they support the Proposal. According to the commenter, the charge to the Panel in the cited document was "to assess competing approaches to promoting exploitation of the research potential of microdata—

particularly linked longitudinal microdata—while preserving respondent confidentiality.”²⁶⁵⁴ According to the commenter, the Panel was asked to consider the tradeoffs between the benefits and risks of data access and to make recommendations about “how microdata should optimally (from a societal standpoint) be made available to researchers.”²⁶⁵⁵ The commenter explains that the Panel offered various recommendations, focused on agencies that have data-collection responsibilities providing data to researchers. The commenter adds that this is a different context than EPA’s proposal to preclude the consideration scientific studies when undertaking its statutorily required decision making to protect human health and the environment. The commenter asserts that the EPA’s general citation to this 120-page document for consistent conclusions does not support the Proposal.

Response: The EPA agrees that this was an incorrect citation and has removed the reference to the document titled “Expanding Access to Research Data Reconciling Risks and Opportunities.”

4.1.1.3.6 Other

EPA Should Work with Entities Where Scientific Data are not Publicly Available in a Manner Sufficient for Independent Evaluation

Comment: Commenter (6362) recommends that where data are not available in a manner sufficient for independent evaluation, EPA attempt to work with data owners to reach an agreement to make the information available to the public to the greatest extent practicable without jeopardizing the privacy, confidentiality, or the proprietary interests that deserve protection. In circumstances where there is significant difficulty making data available in a meaningful way, the commenter suggests that the EPA consider contracting with external experts in the scientific discipline at issue, have them sign confidentiality agreements, analyze the data, and prepare a confidential report with a non-confidential summary for EPA to share publicly.

Response: The EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to independently validate dose-response data underlying pivotal science.

Proposal Not as Bad as Either Side Perceives

Comment: Commenter (0844) provides that the George Washington University Director of Regulatory Studies Susan Dudley wrote in a May 21, 2017 Forbes.com article, “Critics and Supporters of EPA’s Transparent Science Proposal: File Comments On It, But Read It First,” that the EPA transparency proposal “is not as dramatic as either side [of the political divide] would lead one to believe, however. Essentially, it requires that the studies, models, and data underlying

²⁶⁵⁴ Expanding Access to Research Data Reconciling Risks and Opportunities, The National Academies Press, 2005, at 1-2.

²⁶⁵⁵ Id.

significant regulatory decisions are ‘publicly available in a manner sufficient for independent validation.’ Independent validation is the essence of the scientific method, which depends on falsifiable hypotheses, data gathering, replication, dissent, and challenge.”

Response: The EPA agrees that the opportunity to independently validate the pivotal science that the EPA relies upon is important in furthering scientific understanding and the Agency’s mission. The EPA also believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety.

Through this rulemaking, the EPA is pursuing an incremental approach to maximizing transparency in the pivotal science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA’s most impactful actions, minimizes unintended consequences, and informs future transparency requirements. As described in the preamble of the final rule, the EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency.

Comment: Commenter (11393) expresses concern regarding the rule’s potential impacts on health risk assessments. The commenter specifically expresses opposition to language that removes or dilutes the linear no-threshold (LNT) dose response in the evaluation or establishment of radiation health risk assessments, rule-making or establishment of radioactive recommended action levels or benchmarks (influential scientific information) made available to the public.

Response: After considering comments on both the 2018 proposed rule and the 2020 SNPRM, the EPA has determined that this rule should apply to dose-response data rather than dose-response data *and models*. Therefore, the rule does not include discussion of any particular dose-response model. Given the specificity of 40 CFR 30.6 to dose-response data and models, and in particular dose-response models, the EPA is not finalizing 40 CFR 30.6. The EPA is adapting one provision of 40 CFR 30.6 as a factor in 40 CFR 30.5 in determining the consideration to afford pivotal science for which the dose-response data are not available for independent validation. Specifically, the EPA is finalizing as a factor in 40 CFR 30.5 the consideration that the EPA would give to high quality studies that explore a broad class of parametric dose-response models, non-parametric models that incorporate fewer assumptions, various threshold models, and models that investigate factors that might account for spatial heterogeneity.

Comment: Commenter (11492) indicates that the EPA continues to assign greater value to dose-response studies, which by definition reduce the use/value of epidemiological studies. Section 30.6 of the supplemental proposal has been revised but continues to give “explicit consideration to ... parametric dose-response or concentration-response models.” As the commenter suggests they stated in its 2018 comments, the EPA itself admits that, “there is frequently a lack of dose-response data available for human subjects. When data are available, they often cover only a

portion of the possible range of the dose-response relationship.”²⁶⁵⁶ The commenter states that this gives more weight to toxicological studies as opposed to epidemiological studies, which form the basis of many human health exposure studies. The commenter asserts that the EPA must continue to use epidemiological studies; to do otherwise is to compromise the health of all Americans. Commenter (12403) concurs, indicating that the SNPRM's identification of specific dose-response modeling techniques that would be given "explicit consideration" is inappropriate and ignores the improvements and refinements that are the hallmark of good science.

Response: Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7.

The EPA disagrees that the rule implies a bias against the use of epidemiology studies or data. The final rule includes sufficient flexibility in terms of the allowance for restricted access, considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data to minimize such potential unintended consequences. The EPA will continue to consider and evaluate all relevant and appropriate science, including epidemiology studies, in its significant regulatory actions and influential scientific information.

In addition, after considering comments on both the 2018 proposed rule and the 2020 SNPRM, the EPA has determined that this rule should apply to dose-response data rather than dose-response data *and models*. Therefore, the rule does not include discussion of any particular dose-response model.

Comment: In support of existing model availability, commenter (11894) provides the specific example of the trichloroethylene (TCE) case study. The commenter notes that the TCE assessment relied on approximately 15 models. The commenter notes that this is likely to be the norm with the same ones being used repeatedly. The commenter adds that most of the models EPA employs in the Toxic Substances Control Act (TSCA) program have been developed by the Agency and are publicly-available. The commenter provides that access can be gained through a number of EPA webpages and/or searches on the internet, and others are described in the peer-reviewed literature, access to which is controlled by the authors.

Response: After considering comments on both the 2018 proposed rule and the 2020 SNPRM, the EPA has determined that this rule should apply to dose-response data rather than dose-

²⁶⁵⁶ <https://www.epa.gov/risk/conducting-human-health-risk-assessment>

response data *and models*. Therefore, the rule does not include discussion of any particular dose-response model.

Comment: Commenter (12465) states that the EPA relies upon many types of data and models to support its regulatory decisions and it is unclear that the current proposal has adequately considered the numerous types. The commenter expresses concern that the treatment of existing data or models under the proposals disincentivize the generation of new data under the new requirements while reducing the importance of consideration of existing data, regardless of the scientific validity or merit of that data.

The commenter (12465) provides the example of the Westat Survey. The commenter notes that the report entitled “Household Solvent Products: A National Usage Survey” (or the Westat Survey) is a survey of consumer usage for a wide variety of products to determine various attributes and inform exposure assessments. According to the commenter, while the report was completed in 1987, it remains in use today informing the EPA’s Consumer Exposure Model and the Westat Survey informed several of the first 10 chemicals currently being evaluated under reformed TSCA. The commenter states that it is unclear in the proposal how the Westat Survey would be treated, let alone the multitude of exposure models that rely upon it.

Response: As further described in the preamble to the final rule and the overarching response to this chapter, the EPA is not finalizing the definition of “model.” The rule only applies to dose-response data and will not impact the Agency’s use or reliance on models, including exposure models. Since the Westat Survey is a consumer behavior survey for assessing exposure, it would also not be applicable to this rule.

The EPA disagrees that the rule disincentivize the generation of data. The final rule includes sufficient flexibility in terms of the allowance for restricted access, considerations in 40 CFR 30.5, the Administrator’s exemption in 40 CFR 30.7, and the EPA’s incremental approach to maximizing transparency by first focusing on dose-response data to minimize such potential unintended consequences. The EPA will continue to consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information.

4.1.1.4 Applicability of Requirements to Other Types of Data and Information

4.1.1.4.1 Arbitrary Rationale for Limiting Applicability to Dose Response Data and Models

Comment: Commenter (9227) questions why EPA has singled out dose response studies to be excluded if their underlying data and models are not publicly available and has not similarly targeted other types of studies commonly used by EPA. According to the commenter, EPA has provided no justification for targeting dose response studies and not other types of studies or scientific information. The commenter asserts that, absent any explanation from the Agency, it is impossible to comment on the factual predicates for EPA’s proposed decision, or the reasonableness of EPA’s justification, except to state that it appears to be completely arbitrary in the absence of any rationale. See, e.g., *Transactive Corp. v. United States*, 91 F.3d 232, 237 (D.C. Cir. 1996) (“A long line of precedent has established that an agency action is arbitrary when the agency offered insufficient reasons for treating similar situations differently.”).

Response: In this final rule, the EPA will be considering the availability of dose-response data underlying pivotal science, not dose-response data and models. The EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or more pollutants, contaminants, or substances are integral to the Agency's mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. In addition, the data underlying the dose-response assessment are more distinct than the broad range of data informing an entire risk assessment. Therefore, the EPA is concentrating its current efforts to increase transparency on a well-defined step in the quantitative assessment of risk supporting specific Agency actions. This final rule provides an important step in furthering the progress already being made toward maximizing transparency and will provide important insight for developing future statute-specific requirements.

4.1.1.4.2 Support Applicability to Other Data and Models

Clarification on Whether or How Proposed Rule Would Apply to Cost-Benefit Determinations

Comment: Commenter (6915) states that the EPA seeks comment as to “whether the disclosure requirements . . . should be *expanded* to cover other types of data and information, such as, for example, economic and environmental impact *data and models that are designed to predict the costs, benefits*, market impacts and/or environmental impacts of specific regulatory interventions.” 83 Fed. Reg. at 18,772 (emphasis added). However, the commenter adds that the EPA also states that the “pivotal regulatory science” to which the Proposed Rule would already apply includes “studies, models, and analyses that drive the magnitude of the benefit-cost calculation.” Id. at 18,770. According to the commenter, it is thus unclear whether and how EPA intends the Proposed Rule to apply to the cost-benefit determinations that it performs.

Response: The EPA acknowledges the lack of clarity in the proposed rule and emphasizes that this final rule only applies to dose-response data. Rather than having this final rule apply to all the studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact, the EPA is focusing on those studies that describe the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Specifically, the scope of dose-response data in this final rule is those studies consisting of the data integral to characterizing dose-response relationships. These dose-response studies that constitute pivotal science may be used to identify candidate PODs that are then employed in the benefit-cost analysis, but not all studies informing the benefit-cost calculation would be considered pivotal science.

General Support to Applying the Rule to Other Data and Models

Comment: Commenters (0844, 4541, 5185, 6141, 6150, 6161, 6182, 6360, 6375, 6867, 6913, 6915, 6917, 6921, 8771) suggest that the Agency uses other data and models (in addition to dose response data and models) to support regulatory decisions that would benefit from an improved

regulatory framework that enhances transparency with respect to underlying pivotal data and assumptions.

Commenters (0844, 4541, 6150, 6182, 6375, 6921) state that the Proposal disclosure requirements applicable to dose response data and models should be expanded to cover other types of data, such as economic and environmental impact data and models that are designed to predict the costs, benefits, market impacts and/or environmental effects of specific regulatory interventions on complex economic or environmental systems. Commenter (0844) believes it is imperative that this type of information should be applicable to EPA's proposed transparency requirements, considering the enormous economic effect EPA regulations can have on the U.S. economy.

Response: The EPA has considered applying this rule to all data and models and proposed to do so in the 2020 supplemental notice of proposed rulemaking. In this final rule, however, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as "pivotal science," the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, "pivotal science" includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. Future statute-specific rulemakings may interpret "pivotal science" more broadly.

Support Application to Economic and Environmental Data

Comment: Commenter (6921) notes that economic and environmental data are traditionally more available and generally present less of a transparency problem. However, the commenter states that, to the extent that data and models used to estimate economic or environmental impacts are not generally available, they support including them in this rulemaking if it can be done without delaying the promulgation and implementation of the rule.

Commenter (6141) notes that when the Agency employs models, such as those used in the Social Cost of Carbon (SCC) calculation (especially with respect to climate damages), to support its regulatory decisions, the EPA should at a minimum provide documentation that facilitates peer review of its analysis as well as the assumptions used to support that analysis. According to the commenter, data that models rely upon to project damages may suffer from the same peer review problems as with dose response data, leading to false or dubious conclusions that are then carried forward into regulatory requirements. The commenter adds that, in other cases, the underlying

data may be out of date and unreliable for generalizations and decision-making purposes.²⁶⁵⁷ The commenter requests that the EPA ensure that modeled projections are appropriately characterized. As an example, the commenter notes that mathematical modelling often gives the impression of precision and tempered complexity, in spite of significant and potentially problematic uncertainties involved in the calculations.²⁶⁵⁸ According to the commenter, not disclosing the uncertainties, or performing robust sensitivity analyses on them, may obfuscate shortcomings of the modelled results. The commenter suggests that an improved regulatory framework that enhances transparency and deliberation with respect to underlying pivotal data and assumptions will improve the regulatory process by increasing confidence that the rules accurately reflect and appropriately address risks to human health and the environment.

Commenter (5185) states that EPA's benefit monetization is highly subjective and controversial and that they hoped that EPA concurrently examines transparency associated with the development of regulatory cost-benefit analyses. The commenter provides that data compiled by the U.S. Chamber found that, between 2000 and 2016, EPA issued 62 rules claiming a total of \$923 billion in regulatory benefits. Incredibly, according to the commenter, \$898 billion of these benefits—or 97.2 percent—were monetized based on non-public data associated with fine particles (PM_{2.5}). The commenter states that these benefits comprise nearly 80 percent of all regulatory benefits across the entire federal government. The commenter notes that, even though the vast majority of these rules were not intended to address PM_{2.5}, and even though the vast majority of their corresponding claimed benefits came from areas of the country that are already deemed safe and in compliance with EPA's PM_{2.5} standard, the Agency repeatedly touted these figures to build public support for its regulations. The commenter contends that federal rules that impact millions of people and billions of dollars should be held to a higher standard.

Commenter (8771) asserts that the economists' analysis of the costs of regulation and the values of longevity and other benefits underlying EPA regulations are flawed, opaque, and in need of reanalysis. The commenter believes that every criticism leveled in this proposal against risk science (epidemiology, toxicology, exposure assessment) ought to be first applied to regulatory economics. The commenter notes that the EPA defines "pivotal regulatory science" as results that determine the final regulatory standard, and that costs are as "pivotal" or more "pivotal" as estimates of risk since EPA uses informal "bright lines" to reject regulatory controls if they are "too expensive" or "economically infeasible". The commenter states that regulatory cost estimates are notoriously biased high for reasons of self-interest but also due to inevitable factors such as economies of scale and technological learning. The commenter adds that cost estimates are often surrounded by more uncertainty than that surrounding risk estimates but are rarely if ever presented with error bars. According to the commenter, nothing could be more uncertain than a prediction whose very sign is incorrect (e.g., a prediction of job losses when in fact jobs will be created, or vice versa; a prediction of dire costs when in truth there will be cost savings)—and yet, the commenter complains that not a word in the Proposal requires any

²⁶⁵⁷ For example, the FUND model relies on a single study from the mid-1990s (Downing, T.E., Watts, M.J. and Bohle, H.G., 1996. Climate change and food insecurity: toward a sociology and geography of vulnerability. In *Climate change and world food security* (pp. 183-206). Springer, Berlin, Heidelberg) to project agricultural damages under various climate scenarios.

²⁶⁵⁸ See, e.g., Saltelli, A. and Funtowicz, S., 2014. When all models are wrong. *Issues in Science and Technology*, 30(2), pp.79-85 (http://www.andreasaltelli.eu/file/repository/IST_saltelli_1_.pdf).

additional transparency, disclosure, reanalysis, or sensitivity analysis be done by economists or by the industry or Agency consultants who prepare such estimates.

Commenter (8771) offers two economic study examples that they believe illustrate the need of repair:

First, in a new paper, Branden Johnson and I [the commenter] analyzed the data reported from more than 1,000 estimates of the VSL (value of a statistical life) derived from hundreds of stated-preference studies worldwide.²⁶⁵⁹ Only 42 percent of the estimates were presented with any information about the standard deviations or ranges of the individual VSL values given by subjects questioned in the study— so in the majority of cases, EPA has had to derive a value for the VSL (certainly the single most “pivotal” quantity in all of risk regulation!) with no information other than the average VSL among dozens or hundreds of persons surveyed. No one can reanalyze most of these studies to see what higher or lower values of the VSL are also completely compatible with the data, because the economists fail to provide even a summary of the variability in the individual data.

Perhaps the most well-known “study” of the aggregate costs of regulation is the (series of) reports from Mark and Nicole Crain suggesting that regulations “cost” the U.S. nearly \$2 trillion per year. This work is of no real value, since it relies on comparing the GDP [gross domestic product] growth rates of different countries to a subjective index of “regulatory quality,” which of course has no relationship to regulatory burden. And I hope needless to say, even a robust correlation between GDP and actual burden is not useful for estimating “cost.”²⁶⁶⁰ But a recent article²⁶⁶¹ details how a researcher asked the Crains for their data and data sources so he could see if their results, such as they were, would hold up after controlling for important differences among nations. The requester received no information: “Crain and Crain have refused to publish or share the data supporting their 2014 study, despite numerous requests from this author. In so doing they follow the course they adopted with their 2010 study, in which they refused to divulge their data even to the Government Accountability Office”²⁶⁶².

The commenter (8771) concludes that EPA must require all significant economic analyses to comply with whatever strictures remain in the final rule (assuming it is not withdrawn); otherwise, the commenter believes that the final rule cannot withstand judicial review, because the essence of arbitrariness is putting hurdles in front of only half of each analysis and ignoring the other half.

²⁶⁵⁹ Finkel, Adam M., and Branden B. Johnson (2018). “The Limits of Self-Interest: Results from a Novel Stated-Preference Survey to Estimate the Social Benefits of Life-Prolonging Regulations.” Forthcoming, Environmental Law (Lewis & Clark Law School).

²⁶⁶⁰ Indeed, one might say that “the Crain and Crain fails mainly to explain.”

²⁶⁶² Government Accountability Office (2014). *Small Business Administration: Office of Advocacy Needs to Improve Controls over Research, Regulatory, and Workforce Planning Activities*. GAO-14-525, 51 pp.

Commenters (6161, 6360, 6867) support EPA expanding the Proposed Rule to encompass all science. Commenter (6360) specifically points out that the EPA commonly employs fate-and-transport models, route of exposure models, cost estimation models, statistical techniques to project analytic data beyond method detection limits, and numerous other specific applications of science that involve judgement by EPA and by the application developers. According to the commenter, they see no logical principle to require transparency for one application and not another. As an example, the commenter notes that a fate and transport model could have as much economic impact as a dose-response model. The commenter notes that the importance of this principle is highlighted by EPA's current proceedings within the U.S. Court of Appeals for the D.C. Circuit where the judges are unable to follow EPA's statistical methodology for calculating the best performing sources for a MACT standard. The commenter provides that this case is instructive since it shows (1) the lack of transparency in other scientific applications besides dose-response models; (2) the cost in social resources when EPA fails to be transparent; and, (3) the risks that the lack of transparency may delay measures to protect human health and the environment. Commenter (6867) asserts that the replication crisis and public confidence rationales that underlie the Proposed Rule suggest that data, methodology, and computational code should be disclosed for all science relied upon to support Agency actions. The commenter recommends, as a first step, the phrase "dose response data and models" should be replaced with "data and models, including dose response data and models" throughout the Proposed Rule.

Commenter (6913) provides that the Proposed Rule places emphasis on dose-response data and models that provide the foundation for "pivotal regulatory science". The commenter expresses that this implies that the transparency rule may only apply to human health effects under the environmental statutes. According to the commenter, EPA's criteria, whether developed for protection of human health, aquatic health, agriculture, livestock health, or some other reason, has the same enforceable impact on industry, states, and the public. According to the commenter, there is no reason that a standard of scientific transparency should not apply to all EPA actions, including criteria developed for any environmental media (water, air, soil, etc.) and protection of all endpoints (human health, aquatic life, etc.). The commenter asserts that the EPA must implement the same transparency standard towards all their criteria derivation actions, regardless of whether they are protective of human health or specific aspects of the environment.

Commenter (6366) asserts that recent EPA action on the retrospective review of the Lead; Renovation, Repair and Painting (RRP) Program under Section 610 of the Regulatory Flexibility Act (EPA-HQ-OPPT-2016-0126) reinforces the need for the proposal. The commenter expresses that they have repeatedly called on EPA to perform an updated economic analysis of the program. According to the commenter, in finalizing the 610 review, EPA claimed a new economic analysis had been completed, yet the data provided cannot be reproduced and is insufficient to fully evaluate the decisions EPA made. The commenter notes that this is extremely disappointing given that the "new" information had a direct bearing on the Agency's findings which concluded that despite the lack of an accurate lead paint test kit, the rule's requirements should remain unchanged. The commenter states that, since the data used to conduct EPA's analysis has not been transparently presented in the associated docket, stakeholders have been unable to fully evaluate the report's underlying economic claims or their resulting impact on the review's conclusion. The commenter contends that since data is not transparently presented, it creates continuing challenges for stakeholders as they seek to work

with EPA to ensure the program is effective and robust and that all impacts on small entities have accurately been taken into consideration.

Response: The EPA has considered applying this rule to all data and models and proposed to do so in the 2020 supplemental notice of proposed rulemaking. In this final rule, however, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as “pivotal science,” the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. Future statute-specific rulemakings may interpret “pivotal science” more broadly.

The EPA is addressing the manner in which it develops cost-benefit analyses for its regulations in other rulemakings, starting with rulemakings under the CAA,²⁶⁶³ and as such the issue of what economic data the EPA considers in its cost-benefit analyses is outside the scope of this rulemaking. Pivotal science relying on dose-response data may be used to identify candidate PODs, which are then employed in the benefit-cost analysis for a significant regulatory action, but not all studies informing the benefit-cost calculation would be considered pivotal science.

Support Application to Pesticide Registrant Data

Comment: Commenters (0196 (mass campaign representing thousands of commenters), 0320, 6046) support EPA increasing availability of pesticide registrant data.

Commenter (6046) notes that pesticide registrants submit toxicology study data as well as the identity of inert ingredients to EPA in order to register a pesticide product. The commenter provides that these data are considered CBI and are thus not publicly available. According to the commenter, the public must rely on EPA scientists to appropriately evaluate the study data and the toxicology of the inert ingredients, just as the public does when EPA uses unpublished study data for other regulatory decisions. The commenter states that non-publicly available pesticide registrant toxicology data are routinely evaluated by EPA scientists. The commenter states that there are often many unpublished pesticide registrant studies for each active ingredient pesticide. The commenter asserts that not requiring that pesticide registrant study data used by EPA be publicly available, when there is a need for confidentiality for both pesticide and non-pesticide data at the same time as requiring dose response data and models be publicly available illustrates a bias and if EPA is interested in transparency to the public, then methods to make pesticide

²⁶⁶³ U.S. EPA, “Final Rule: Increasing Consistency in Considering Benefits and Costs in the Clean Air Act Rulemaking Process,” (Dec. 8, 2020). Available at <https://www.epa.gov/air-and-radiation/final-rule-increasing-consistency-considering-benefits-and-costs-clean-air-act> (accessed December 11, 2020).

registrant data available to the public should be evaluated and put into practice. The commenter notes that pesticide registrant data meets the definition of pivotal regulatory scientific data. The commenter recommends that the EPA take the lead to identify means to make inert ingredient hazard information available to the public. The commenter adds that the current list of approved inert ingredients is a start but does not provide consumers with sufficient information to determine if they may, for example, have an asthmatic allergic reaction to un-disclosed inert ingredients.

Commenters (0196, mass campaign representing thousands of commenters) note that, under the proposed “transparency” plan, the public will still lack access to key data about the effects and efficacy of commercial poisons approved for sale and application in their communities and homes. The commenters state that the proposed policy declares that it will “help ensure that EPA is pursuing its mission of public health and the environment in a manner that the public can trust and understand,” yet it applies only to a very limited set of studies used to support certain EPA regulations. According to the commenters, the pesticide registration and review processes are particularly lacking in transparency, opportunity for public review, and access to data. The commenters add that, because pesticides are toxic chemicals broadcast into the environment, nowhere is transparency more important than pesticide registration.

Commenters (0196, mass campaign representing thousands of commenters) state that, because the pesticide manufacturer produces the underlying data for these EPA approvals and controls access to them, no transparency will be provided in pesticide registration:

- The public does not have access to the underlying data provided by the manufacturer to justify registering a new pesticide for commercial distribution;
- Industry will not have to provide the data used to assess health and environmental effects and farmworker impacts to set allowable dietary and non-dietary exposure limits; and
- Neither the public nor EPA has access to the underlying efficacy data, except for very limited purposes.

The commenters assert that, to ensure full review, it is critical that the public and independent scientific community have complete access to safety testing data before pesticide products enter the marketplace. According to the commenters, if EPA applies the proposed policy to pesticides, the failure to allow consideration of independent study results without disclosing confidential patient information will cripple the validity of EPA safety reviews.

Commenters (0196, mass campaign representing thousands of commenters) contend that EPA pesticide regulation is based on secret science and is particularly lacking in transparency. The commenters provide that nonpublic data submitted by the registrant are used by EPA to assess health and environmental effects of the pesticide and impacts on farmworkers, and to set allowable human exposures through dietary and nondietary routes –all without any opportunity for public review. The commenters assert that full disclosure of known and unknown adverse effects is needed in the registration process and on the label. The commenters assert that conditional registration is missing crucial data and allows market entry for a product in the absence of certain data normally required for registration and that efficacy data on pesticide products are lacking. According to the commenters, (1) the public do not have access to, and EPA does not review, manufacturer data on pesticide efficacy, even though the statutory

registration standard requires weighing the risks of pesticides against their benefits; (2) secret (“inert”) ingredients” in pesticide products are not disclosed, although they have been classified as hazardous under a variety of environmental laws; and (3) only active ingredients, not formulations, are tested, so data on the human health and environmental effects of the actual product on the market are entirely lacking.

Commenter (0320) provides that, to ensure full review, it is critical that the public and independent scientific community have complete access to safety testing data before pesticide products enter the marketplace. The commenter contends that, if EPA applies the proposed policy to pesticides, the failure to allow consideration of independent study results without disclosing confidential patient information will cripple the validity of EPA safety reviews.

Response: Other commenters have noted that the 2018 proposed rule appeared to conflict with FIFRA pesticide registration requirements and associated implementing regulations, which require registrants to submit data and information to the EPA to enable the Agency to make its unreasonable adverse effects determinations. These commenters argued that, under the 2018 proposed rule, the EPA would not be able to consider these data, which are often claimed as CBI, when evaluating the pesticide registrations because the data could not legally be made publicly available. In this final rule, the EPA has codified in 40 CFR 30.3 that in the event the procedures outlined in this part conflict with statutes the EPA administers, or their implementing regulations, the statutes and regulations will control. This would include FIFRA and the Agency’s pesticide registration activities. This final rule does not require any dose-response data to be made publicly available in a manner that would violate law, and rather protects privacy, confidentiality, CBI, and is sensitive to national security.

Support Application to EPA Integrated Planning Model (IPM)

Comment: Commenter (6917) provides that the EPA Integrated Planning Model (IPM) is frequently used in rulemaking to estimate cost impacts of regulations on the electric utility industry. The commenter notes that the IPM data output might be considered to be in the class of "pivotal regulatory science" since the model output data is "... critical to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, risks and other impacts on which a final regulation is based." The commenter recommends that the Agency's use of IPM be made more transparent. The commenter notes that, although inputs into the model may be listed in one or more documents located somewhere on the rulemaking webpage or in the docket, finding all the input data is like looking for a needle in a haystack. In addition, according to the commenter, even if the input data can be found, it's not always clear how the model processes the data to produce the output. As a result, the commenter contends that, if the model were to produce erroneous output results, it may not be detected or the reason for a detected error may not be determined.

As an example, commenter (6917) states that, in year 2014 in the proposal for the Emission Guidelines for Existing Stationary Sources: Electric Utility Generating Units (Clean Power Plan or CPP), the supporting IPM output data erroneously indicated the retirement of Cleco's Brame Energy Center Unit 2 by year 2016. However, the commenter notes that, as written in the 2014 Cleco comments on the CPP proposal, Cleco's own predictive modeling at the time indicated

there would be normal 2016 operation. In addition, the commenter states that, at the time of the commenting on the proposed CPP, the reason for the erroneous IPM output regarding Unit 2 could not be determined. The commenter states that, as a result, confidence in the IPM model results for the CPP proposal was reduced. The commenter recommends that, to increase transparency in the application of the IPM, clear information should be shared with the regulated community regarding the data-input to the IPM model and how the model's output is arrived at.

Response: Rather than pursuing the expansive scope of pivotal science outlined in the 2018 proposed rule, which may include IPM data, the EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or more pollutants, contaminants, or substances are integral to the Agency's mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. In addition, the data underlying the dose-response assessment are more distinct than the broad range of data informing an entire risk assessment. Therefore, the EPA is concentrating its current efforts to increase transparency on a well-defined step in the quantitative assessment of risk supporting specific Agency actions. This final rule provides an important step in furthering the progress already being made toward maximizing transparency and will provide important insight for developing future statute-specific requirements.

Support Application to Other Data and Models in a Subsequent Rulemaking

Comment: Commenter (6151) suggests, in response to EPA's request for input as to whether the transparency rule should apply to other data, such as economic analyses or environmental impact models, that EPA initially focus on data related to pivotal scientific regulatory decisions as outlined in the notice.

Commenter (6375) notes that, although they support expanding the Proposed Rule to cover other types of data, they understand that this is a focused rulemaking effort and that the current rulemaking may not be the appropriate mechanism to address other types of data and information. The commenter encourages that, if EPA decides not to address other types of data and information in this rulemaking, EPA address in a subsequent rulemaking.

Response: The EPA agrees with the commenters, and notes that this final rule provides an important step in furthering the progress already being made toward maximizing transparency and will provide important insight for developing future requirements in statute-specific rulemakings.

Support Application to Economic and Environmental Data and Models but Protect CBI and PII

Comment: Commenter (1011) suggests that EPA should provide access to economic and environmental impact data and models that are designed to predict the costs, benefits, market impacts and/or environmental effects of specific regulatory interventions on complex economic or environmental systems, so long as CBI, private personal information, and other potentially sensitive data sources are not made public in a manner that could violate confidentiality (i.e., EPA should aim to make aggregated data available). The commenter adds, however, that EPA must be cognizant of the increased burden any such requirement would place on researchers, and the agency should avoid making extensive or repetitive requests for information and explanation.

Response: The EPA clarifies that this final rule only applies to dose-response data. Rather than having this final rule apply to all the studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact, the EPA is focusing on those studies that describe the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Specifically, the scope of dose-response data in this final rule is those studies consisting of the data integral to characterizing dose-response relationships. These dose-response studies that constitute pivotal science may be used to identify candidate PODs that are then employed in the benefit-cost analysis, but not all studies informing the benefit-cost calculation would be considered pivotal science. The EPA further clarifies that this rule will not place any burden on researchers, as this rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government.

Support Application to Modeling Used to Develop TMDLs

Comment: Commenter (6180) supports application of the Proposed Rule to modeling used to develop total maximum daily loads (TMDLs).

Response: The EPA clarifies that this final rule only applies to dose-response data. Rather than having this final rule apply to all the studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact, the EPA is focusing on those studies that describe the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Specifically, the scope of dose-response data in this final rule is those studies consisting of the data integral to characterizing dose-response relationships. These dose-response studies that constitute pivotal science may be used to identify candidate PODs that are then employed in TMDLs, but not all studies considered in the TMDL would be considered pivotal science. Further, the EPA notes that a future statute-specific rulemaking made under the CWA may interpret “pivotal science” more broadly.

4.1.1.4.3 Oppose Applicability to Other Data and Models

Comment: Commenters (0671, 6191, 6915), in addition to opposing the applicability of the Proposal to dose response data and models underlying pivotal regulatory science, oppose expanding the applicability of the rule requirements to other data and models used by EPA to support regulatory decisions.

Commenter (6191) states that if economic and environmental impact data and models used to support a rule are developed by EPA scientists, they would seem to be subject to the federal Open Data Policy requirements. In general, the commenter notes that economic and environmental impact data do not necessarily include data from individual humans and therefore do not pose the same challenges as for dose response data and models. The commenter, adds, however, there are issues with mandating sharing when: (1) the research was conducted without intent to inform a rule; (2) was conducted without a pre-existing mandate to share data; iii) was conducted a long time ago and accessing the data for the research is impossible. According to the commenter, there will always be reasons why not all data can be shared and a strict mandate for public access will needlessly remove important research from consideration.

Commenter (6915) notes that, in developing regulations EPA uses other types of models in addition to dose response models. The commenter explains that these include toxicokinetic models that predict a chemical's absorption, distribution, metabolism, and excretion, as well as fate and transport models that predict a chemical's movement in the environment and distribution to environmental media. The commenter asserts that the Proposed Rule's provisions that could decrease protectiveness of dose response analysis (e.g., requiring justification of default assumptions and precluding consideration of relevant studies due to data disclosure requirements) could similarly result in decreased protectiveness of these other types of models. The commenter contends that, in regulations based on dose response analysis combined with toxicokinetic and/or fate and transport analyses, the overall decrease in protectiveness would be magnified.

Response: The EPA has not expanded the applicability of this final rule, but rather has narrowed it to only dose-response data underlying pivotal science. As codified in 40 CFR 30.5 of the final rule, the EPA will rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies—based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

4.1.1.5 Impact on EPA Decision-Making

4.1.1.5.1 Need for Improvement in the Use of Scientific Evidence in Support of Regulatory Decision Making

Comment: Commenter (0068) expresses that they believe there are aspects of the proposal that, when properly revised and qualified, would represent an improvement in the use of scientific evidence in support of regulatory decision making that relies on dose-response data and models.

Commenter (0068) specifically endorses the requirement that EPA:

...describe and document any assumptions and methods used and should describe variability and uncertainty. EPA shall evaluate the appropriateness of using default assumptions, including assumptions of a linear, no-threshold dose response, on a case-by-case basis. EPA shall clearly explain the scientific basis for each model assumption used and present analyses showing the sensitivity of the modeled results to alternative assumptions. When available, EPA shall give explicit consideration to high quality studies that explore: A broad class of parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity.

The commenter asserts, however, in requiring such discussion of assumptions, and parametric analysis, EPA should simultaneously make clear that its statutory responsibility is to protect public health, and hence in making decisions based on such evidence it will adopt the public health decision rule, “when in doubt, act to protect public health and wellbeing,” as opposed to the classic decision rule used in scientific publishing, “place greatest emphasis on avoiding false positives.”

Commenter (6855) suggests that the Agency modernize its entire conceptual framework for making regulatory decisions, including how the Agency manages its risk assessment methods, assumptions, models, uncertainty, and non-risk factors at the risk management stage.

Response: Consistent with the requirements in the 2018 proposed rule, this final rule requires the EPA to describe critical assumptions and methods used in dose-response assessments conducted by the Agency that drive the requirements, quantitative analyses, or both of a significant regulatory action or influential scientific information. The final rule also requires the EPA to characterize the variability and uncertainty of such dose-response assessments.

The EPA does not agree that the Agency should codify the suggested public health decision rule or changes to the conceptual risk-based framework for making regulatory decisions in this final rule, as these activities are outside of the scope of the current rule. The purpose of this final rule is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. The EPA believes the approach described in the final rule will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure

adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

4.1.1.5.2 Limit Amount of Quality Data for Use in Support of Regulatory Decision-making

General Comments on Impacts of Limiting Data in Support of Regulatory Decision-making

Comment: Commenters (0501, 0945, 1077, 1203, 1281, 1306, 1310, 1311, 1331, 1355, 1363, 1369, 1373, 1375, 1385, 1388, 1395, 1400, 1445, 1797, 1879, 1883, 1946, 2003, 2107, 2157, 2171, 2361, 2430, 2907, 4595, 5011, 5022, 5165, 5180, 6111, 6121, 6125, 6153, 6181, 6355, 6373, 6376, 6378, 6446, 6801, 6880, 6894, 6896, 6915, 6919, 8275, 8281-PH38, 9227) oppose the rule and contend that the proposed rule will limit the use of science and quality data that can be used in EPA decision making and is contrary to statutory mandates/federal law. Science and quality data and studies that they note that EPA would not be able to consider in regulatory decision-making included, but were not limited to epidemiological studies, data/studies that rely on CBI and personal health information, and studies where the underlying data was no longer available.

Commenters (0501, 0569, 0844, 0945, 1077, 1203, 1272, 1281, 1306, 1310, 1311, 1331, 1355, 1363, 1369, 1373, 1375, 1385, 1388, 1395, 1400, 1445, 1797, 1883, 1946, 2003, 2107, 2157, 2361, 2428, 2431, 2479, 2746, 2899, 4848, 5164, 5165, 5180, 6121, 6133, 6153, 6157, 6185, 6355, 6373, 6378, 6446, 6874, 6884, 6895, 6896, 6909, 6915, 6939, 6955, 8275, 8276, 8281-PH38, 9171, 9227) note that the limitation of EPA's ability to use science and quality data will adversely affect policies/regulatory decisions (including, but not limited to, studies used as a basis for programs like the NAAQS Program, studies that link elevated lead levels to adverse health effects, and research into neurotoxins and endocrine disruptors associated with adverse reproductive health outcomes) and the mission of the Agency to protect the environment and human health.

Some specific comments regarding the proposed rule regarding the inability to use quality data/studies and the adverse impacts that would have on regulatory decision-making include:

- The rule could lead to ignoring critical evidence and could only lead to adverse consequences as it weakens decision making processes and delays important action. (1373)
- The proposed push for all studies used in government regulations to be made publicly available is not applied consistently, e.g. companies are not required to make publicly available all information and studies on pesticides. The commenter asserts that, the proposed regulation will cater to smaller, less relevant studies and will result in less evidence-based regulations to the detriment of all US citizens. (2107)
- The implementation of this rule, and censoring studies from use in EPA work because they could not be "independently validated" because of privacy issues could result in regulatory records supporting unreliable, pre-determined outcomes or decisions. (2171)

- Rather than increasing the transparency of decision-making, this proposed rule would disallow and thus hide non-publicly available studies, regardless of their scientific quality. (2361)
- Regulatory agencies are most effective when they have the entirety of the best scientific literature at their disposal for rulemaking to set new standards and policies. (2431)
- EPA's failure to consider individual health data—because it cannot be made public—would miss important data regarding particularly vulnerable populations that the NAAQS were developed to protect. (6446)
- The Proposed Rule would have an effect opposite to its claimed purpose; it would suppress important and relevant science conducted in large part by the best minds in academia and government, thereby unduly restricting the evidence available to EPA and potentially favoring data developed by industry. (5022)
- Along with the changes to the NAAQS review process outlined in EPA's May 9, 2018, "Back to Basics" memo²⁶⁶⁴ and the recent requirement that members of the Clean Air Science Advisory Committee and related panel members not receive any current EPA funding,²⁶⁶⁵ the Proposed Rule would constrain both the range of expertise and body of scientific literature that is available to be considered in these reviews, undermining the NAAQS. (6185)
- Limiting the ability of the EPA to the use of only those studies that can make their data public will drastically reduce the accuracy of rulemaking and will not allow for a full accounting of costs and benefits. The commenter states that this will lead the EPA to be blind to much of the information needed and widely concurred as valid by the scientific community. (9171)
- Commenter opposes the proposed rule because it would require discarding valid studies that have passed rigorous peer review, even if published in top journals like *Nature* or *Science*, and even if confirmed by independent research. The commenter states that a decision to not regulate is also a decision, just like a decision to regulate. The commenter asks why can a decision to not regulate be made with no supporting studies, but a decision to regulate must be supported solely by unrestricted-distribution studies? (2899)
- Sound science is critical to policy decision-making and provides a process that explores how to best answer questions through a carefully structured approach. The commenter states that it cannot replace good decision-making, but science does enable us to make well-informed decisions and to predict the consequences and outcomes of our choices. (6157)
- The proposed rule would limit consideration of science in decision making in a manner that is unjustified and arbitrary, and would lead to inadequate regulatory protections, inconsistent with federal law. The commenter states that existing law and precedent dictates that the EPA take action based on the weight of scientific evidence even in the face of some uncertainty. The commenter states that this requires that the agency consider

²⁶⁶⁴ Memorandum from E. Scott Pruitt, EPA Administrator, to [EPA] Assistant Administrators, Subject: Back-to-Basics Process for Reviewing National Ambient Air Quality Standards (May 9, 2018). Available at <https://www.epa.gov/sites/production/files/2018-05/documents/image2018-05-09-173219.pdf> (accessed May 21, 2018).

²⁶⁶⁵ U.S. EPA, "Strengthening and Improving Membership on EPA Federal Advisory Committees," (Oct. 31, 2017). Available at <https://www.epa.gov/faca/strengthening-and-improving-membership-epa-federal-advisory-committees> (accessed May 21, 2018).

all available scientific evidence in its decision making and not make arbitrary exclusions of research. (8275)

- The purpose and effect of the proposal would be to degrade the quality of science in EPA's decision making. The commenter contends that there is no reason to think that excluding relevant science merely because the underlying data are not publicly available would increase the net benefits of a regulation. The commenter states that, for example, it appears that under the proposed rule EPA would exclude a peer-reviewed, published study whose conclusion had been reproduced based upon numerous different datasets (and whose underlying data, though not publicly available, had been reevaluated by outside experts), while including a study that had had no peer review, was not published, had no corroborating studies, and had not actually been replicated or reproduced, merely because the underlying data was made publicly available. The commenter states that this is simply not a recipe for more accurate decision making. (9227)
- Commenter does not agree with the agency's assertion that the best available science is that for which underlying datasets are fully open to public inspection. The commenter states that, if the EPA restricts the science it relies upon to only those studies that publish open datasets, the outcomes and data from key areas of scientific inquiry related to EPA's decision-making will be put beyond the reach of agency staff. (6181)
- Commenter urges EPA to withdraw the proposed rule as it limits EPA's ability to use the best available science, such as studies produced by leading research institutions to protect construction workers and the public in future rulemaking proceedings. (6896)
- The proposed rule would directly contradict the mandates of many Acts that require that the scientific review draw upon the best available science. (6378)
- The proposed rule would violate the agency's common sense and statutory duty to consider the sound scientific data. The commenter states that the proposed regulation turns the statutory scheme of Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) upside down by forcing the Agency to ignore data that EPA can use to prevent Love Canal type disasters in the future. (6801)
- The proposed rule would prohibit the continued and future use of studies by EPA thereby obstructing EPA's statutory duty to consider the "best," "reasonably" available information in its decision-making processes. The commenter states that the resulting information vacuum would occur for no other reason than that the underlying human subject data are private and cannot be publicly disseminated.²⁶⁶⁶ (6111)
- The proposed rule would in many instances prohibit EPA from relying on the best available science relevant to many of the regulatory issues that the agency faces. The commenter adds that this proposed requirement contravenes five decades of EPA practice in which EPA has repeatedly affirmed that its mission requires it to rely on the best available scientific evidence, without ever asserting that it should exclude from consideration studies for which the underlying data were not publicly available. (6111)
- When considering the likely consequences of EPA's proposal to base its regulations solely on studies for which data are publicly available or for which exceptions are made, it is instructive to consider examples of research into neurotoxicants and endocrine

²⁶⁶⁶ The commenter notes that some of the Statutes require EPA to use the "best" available information and others have a lower standard. For example, the Toxic Substances Control Act compels EPA to take "reasonably" available information into account. 15 U.S.C. § 2625(k).

disruptors, which are associated with adverse reproductive health outcomes. The commenter notes that the EPA efforts to reduce lead and methylmercury exposure for pregnant women and children might not have been so successful if the agency had used the overly stringent definition of transparency it now proposes. The commenter adds that programs that might not exist, or exist in less-effective forms, include those to reduce lead exposure from paint, gasoline, and drinking water; limit mercury emissions; and advise pregnant women to steer fish consumption away from species that often contain high levels of methylmercury.²⁶⁶⁷ (6939)

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

²⁶⁶⁷ Environmental Protection Network. (2018). Preliminary Assessment of Pruitt's Proposed Regulation to Restrict EPA's Use of Sound Science. Accessed May 18, 2018 at https://docs.wixstatic.com/ugd/4868e0_8bbc47f8b66848e4a60503d4dd3a9e72.pdf

The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Limiting Consideration of Epidemiological Data/Studies in Support of Regulatory Decision-making

Comment: Commenters (0039, 0501, 1331, 1388, 1424, 2064, 2171, 2495, 4537, 4828, 5981, 6113, 6125, 6133, 6144, 6153, 6174, 6181, 6874, 6884, 6895, 6915, 6919, 6932, 6939, 8272, 8281-PH38, 9227) express concern that this regulation would dramatically limit the consideration of epidemiological research data in future EPA regulations because patients' data must be kept confidential. Specific comments include:

- Commenters (1375, 1395, 2171, 5165, 6111, 6373, 6915, 6919, 8281-PH38) express specific concern that the rule would bar, due to confidential data, EPA's consideration of relevant scientific literature in the establishment of regulations designed to protect human health and the environment, including the Six Cities Study and related studies (e.g., American Cancer Society Study (ACS)).²⁶⁶⁸ Specific comments include:
 - From a risk assessment perspective, not including epidemiology studies in regulatory science is not sound or prudent. According to the commenter, laboratory, toxicology, and epidemiology are complementary and necessary pieces of understanding and quantifying effects of a pollutant on human health and that excluding evidence from one of these three essential disciplines threatens the science basis for regulatory decisions and actions. The commenter contends that the proposed rule would put regulators tasked with protecting human health in an impossible situation of relying primarily on animal models or in-vivo models that cannot be directly extrapolated to human dose response estimates. (2171)
 - Most of the cost-benefit analyses for air regulations are based on Six Cities and ACS studies because they present the best epidemiological data available for use in such analyses. According to the commenter, if the EPA determines that it cannot use the Six Cities and ACS studies in future regulatory action, this would also prevent their use for the EPA's cost-benefit analyses. The commenter argues that exposure and epidemiology studies have been fundamental to the policy through which public health agencies protect public health. The commenter points out that the EPA's proposal states that, "[f]or regulatory programs, like the National Ambient Air Quality Standards program, in which future significant

²⁶⁶⁸ The Six Cities Study, Douglas W. Dockery, et al., An Association between Air Pollution and Mortality in Six U.S. Cities, 329 NEW ENGLAND J. MED. 1753 (1993), whose results were subsequently confirmed by independent reanalysis, Health Effects Institute, Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality (2000), <https://www.healtheffects.org/system/files/HEI-Reanalysis-2000.pdf>. Indeed, according to the commenter, both the Six Cities Study and the American Cancer Study of Particulate Air Pollution and Mortality have each been reproduced and replicated. The commenter provides that the findings are consistent with the original studies. See, e.g., Qian Di, Francesca Dominici, Joel D. Schwartz, et al., Air Pollution and Mortality in the Medicare Population, 376 NEW ENGLAND J. MED. 2513-2522 (2017), available at <https://www.nejm.org/doi/full/10.1056/nejmoa1702747>.

regulatory actions may be based on the administrative record from previous reviews – particularly where the governing statute requires repeated review on a fixed, date-certain cycle – the EPA seeks comment on the manner in which this proposed rule should apply to that previous record.” According to the commenter, this request for comment suggests that previous regulatory actions, like those using the Six Cities and ACS studies, are in peril because they were properly conducted in accord with health privacy regulations to protect sensitive personal data from the health studies on which these regulations are based. (6919)

- Commenter (1395) estimates that EPA cites approximately 50,000 studies each year, many of which are based on analyses of confidential medical records. The commenter states that, if this rule is put into effect, these studies, including the Six Cities Study, would not be able to be used and the rule could be used as a basis to undo rules protecting public health.
- Commenter (1375) states that this proposed regulation is an attempt to exclude the most impactful and important public health studies in history. The commenter states that public health research requires the collection of personal data from study participants in order to understand their lifestyle and environmental exposures. The commenter states that this data must be extensive and detailed to capture the many possible variables impacting health outcomes, precisely so that the actual cause of the observed health impact can be assessed while accounting for confounding variables. The commenter states that the personal data are often so extensive that even if the participants were anonymized, it would still be possible to determine from the information collected who the actual participant was.
- Commenter (5165) asserts that EPA should publicly confirm that it would consider existing literature such as the Six Cities Study in future rulemakings, should the proposed rule be enacted. The commenter notes that EPA suggests in footnote 3 of the proposal that it would exclude such studies from consideration.
- Commenter (6111) states that, contrary to EPA’s stated goal of improving the basis for its regulatory decisions, requiring the public availability of all raw data will instead undermine EPA’s ability to make reasonable decisions. The commenter states that this requirement will effectively prohibit EPA from considering studies that by design are based on data that cannot be made publicly available due to laws and contracts designed to protect patient and human subject privacy and ensure willingness of people to participate in research by sharing their private information with researchers. The commenter states that the proposed rule precludes consideration of studies based on confidential data, even when those results have been confirmed by other studies.²⁶⁶⁹

²⁶⁶⁹ One example provided by the commenter is the Six Cities Study, Douglas W. Dockery, et al., An Association between Air Pollution and Mortality in Six U.S. Cities, 329 NEW ENGLAND J. MED. 1753 (1993), whose results were subsequently confirmed by independent reanalysis, Health Effects Institute, Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality (2000), <https://www.healtheffects.org/system/files/HEI-Reanalysis-2000.pdf>. Indeed, the commenter notes that both the Six Cities Study and the American Cancer Study of Particulate Air Pollution and Mortality have each been reproduced and replicated. The findings are consistent with the original studies. See, e.g., Qian Di, Francesca Dominici, Joel D. Schwartz, et al., Air Pollution and Mortality in the Medicare Population, 376 NEW ENGLAND J. MED. 2513-2522 (2017), available at <https://www.ncbi.nlm.nih.gov/pubmed/8179653>.

- Commenters (6373, 6915) assert that, if EPA excludes relevant studies because the underlying data cannot be made public, the efficacy of EPA regulations themselves will be threatened. The commenters suggest that, if EPA had disregarded the Six Cities and ACS Cohort Studies²⁶⁷⁰ based on the lack of publicly released data, air quality standards would not have been tightened; they might have been relaxed to allow increased levels of pollution because relevant and reliable scientific evidence would not have been before EPA. The commenters state that this could have had significant negative public health implications, including greater excess morbidity and mortality attributable to air pollution. Commenter (6915) states that EPA estimates that reductions in ambient particulate matter under the 1990 CAA Amendments will prevent 230,000 adult deaths by 2020.²⁶⁷¹
- Commenter (9227) expresses concern that EPA's proposed regulation would preclude the Agency from using key studies to support the proposed rule regarding methylene chloride in paint and coating removers. The commenter asserts that the effect would be to severely jeopardize the finalization of this life-saving rule. The commenter notes that EPA has proposed a ban on the use of methylene chloride in paint and coating removers²⁶⁷² and that methylene chloride is associated with a number of hazardous health effects, including impaired visual and motor functions, respiratory irritation, headaches, nausea, and death.²⁶⁷³ The commenter provides that the scientific basis for the proposed regulation is provided in the Agency's 2014 risk assessment.²⁶⁷⁴ According to the commenter, the raw data underlying key studies used to derive the benchmark margin of exposure for chronic exposure and acute exposures to methylene chloride are not publicly available.
- Commenters (6153, 6874, 6939, 8272) state that programs that might not exist, or exist in less-effective forms, include those to limit mercury emissions; and advise pregnant women to steer fish consumption away from species that often contain high levels of methylmercury.¹⁵ Commenters state that EPA efforts to reduce methylmercury exposure for pregnant women and children might not have been so successful if the Agency had used the overly stringent definition of transparency it now proposes.
- The lead rules are based on risk analyses conducted by EPA using epidemiology studies published in the 1990s that correlate childhood blood lead levels with impaired brain

²⁶⁷⁴ EPA, Office of Chem. Safety & Pollution Prevention, EPA Doc. No. 740-R1-4003, TSCA Work Plan Chemical Risk Assessment: Methylene Chloride: Paint Stripping Use (2014) [hereinafter Methylene Chloride Work Plan Risk Assessment], https://www.epa.gov/sites/production/files/2015-09/documents/dcm_opptworkplanra_final.pdf.

function and adverse behavioral effects.²⁶⁷⁵ The commenter states that many of the published studies are longitudinal cohort studies that include measurements of lead in blood from children decades ago, and then follow them out over time to observe lasting effects. The commenter notes that it makes it impossible to replicate the exposure conditions at the time the original children in the study cohort had their blood lead levels measured, such as the Port Pirie cohort study population living near a lead smelter in the 1980s.²⁶⁷⁶ The commenter asserts that longitudinal cohort studies, particularly those that capture exposures that may no longer occur—are not reproducible. (6133). Some specific regulations cited by commenters that have been developed as a result of lead studies include:

- Regulations governing lead in paint. (1424, 5981, 6125, 6144, 6153, 6174, 6874, 6939, 8272)
- Regulations governing lead in gasoline. (1424, 5981, 6153, 6874, 6895, 6939, 8272)
- Regulations governing lead in dust and/or soil. (6125, 6144, 6174)
- EPA’s drinking water standards for lead. (4828, 6125, 6144, 6153, 6174, 6874, 6939, 8272)
- EPA’s Lead and Copper Rule (LCR) of 1991. (6133)
- EPA’s 2006-2008 lead air standards. (6125)
- Commenters (6125, 9227) express concern that, if the proposed rule were applied retroactively or if EPA re-evaluates the maximum contaminant level (MCL) for arsenic, the proposed rule would likely mean that EPA could not rely on two key studies²⁶⁷⁷ because the data are four to five decades old and include confidential individual health information. According to the commenter (9227), the MCL finalized by EPA was based on the two epidemiological studies, both of which were peer reviewed, published in prestigious health and environmental journals, and have been cited numerous times by other researchers.
- Commenters (6133, 6932) specifically express concern that regulation of chlorpyrifos could be impacted by the proposed rule because the epidemiologic studies²⁶⁷⁸ of chlorpyrifos can no longer be reproduced. Commenters (6153, 6874, 8272) state that agricultural workers, the majority of whom are Hispanic,²⁶⁷⁹ bear the greatest burden of

²⁶⁷⁹ National Agricultural Workers Survey. (no date). Agricultural Worker Tables: Demographic Characteristics.

current chlorpyrifos exposure.²⁶⁸⁰ Failing to take regulatory action to reduce these exposures because individual-level data sets from high-quality research are not publicly available would allow the persistence of environmental injustice. Commenter (6113) states that a striking example of the risks posed by the proposed regulation were highlighted when the Ninth Circuit USCA released its decision in *League of United Latin American Citizens v. Wheeler*.²⁶⁸¹ The commenter provides that, in that case, the Ninth Circuit ruled that EPA had to ban the use of chlorpyrifos on food products because of the studies indicating harm to humans.²⁶⁸² According to the commenter, in the event the EPA's regulation were in effect, chlorpyrifos could not be banned despite the pesticide's documented risks to the brains of children.

- Commenters (0039, 4537, 6133) states that the reassessment of the LNT model for radiation could profoundly impact many regulations and non-regulatory guidance from multiple entities, including the EPA, the Nuclear Regulatory Commission, and others. A list of regulations and non-regulatory guidance that would be impacted is provided by commenter 6133 in their comments. Commenter (6133) notes that the epidemiologic science and associated studies that are the basis of adherence to the LNT and decades of protective radiation standards are likely to be expressly excluded from consideration by EPA by the terms of this Proposal. The commenter adds that NAS and other studies that EPA has long relied upon in the radiation standards setting process are epidemiological human cohort studies. The commenter states that the EPA's Proposal, if implemented, would limit EPA staff from basing regulatory actions on precisely these types of studies by requiring that the underlying data of these studies be publicly shared. Data for some of the radiation epidemiological studies are accessible to users^{2683,2684} with a detailed description of how a user can access the information. However, the commenter notes that public sharing of PII is restricted because the studies rely on confidential health data. The commenter contends that these studies are profoundly important studies that have been peer reviewed for decades and the science that has emerged from them has been validated multiple times. (6133)
- Commenters state that EPA announced that the Agency will begin the process of developing, under the SDWA, maximum contaminant levels (MCLs) for perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS), in addition to designating these chemicals as "hazardous substances," possibly under the CERCLA.²⁶⁸⁵ The commenters assert that EPA's proposed rule would limit EPA's ability to protect the public from the health hazards associated with PFOA and PFOS. (6111, 6137, 6144, 9227)
 - Researchers conducted exposure and health epidemiological studies consisting of nearly 70,000 participants to examine the health impacts of exposure to these chemicals. (6137)

²⁶⁸⁵ Press Release, EPA, In Case You Missed It: "EPA Chief Vows that Clean Drinking Water is National Priority" (May 22, 2018), <https://www.wsj.com/articles/epa-chief-scott-pruitt-vows-that-clean-drinking-water-is-national-priority-1527012180>

- Commenters provide that when EPA issued health advisories for these two chemicals in 2016, the Health Effects Support Documents relied extensively on epidemiological studies generated by the C8 Health Project.²⁶⁸⁶ According to commenters, through this work, the researchers identified probable links between exposure to these chemicals and six specific diseases: diagnosed high cholesterol, ulcerative colitis, thyroid disease, testicular cancer, kidney cancer, and pregnancy-induced hypertension.²⁶⁸⁷ (6111, 6137, 6144, 9227)
- Commenter provides that these studies looked at “demographic data, medical diagnoses (both self-report and medical records review), clinical laboratory testing, and determination of serum concentrations of 10 perfluorocarbons (PFCs),” information that is both sensitive and confidential. The commenter states that, although the results of these studies have been published in numerous articles in scientific journals, under EPA’s Proposed Rule this research would be excluded from consideration despite the clear evidence of harm these chemicals pose. (6137)
- Commenter (6137) states that turning a blind eye to this data would have dramatic public health consequences, as it would preclude evaluation of valuable evidence of harm from exposure that could and should form the foundation of protections under the statutes EPA is charged with executing for the benefit of the public and the environment. Commenter (9227) states that, in failing to consider such crucial case studies, EPA would be ignoring best available science, thereby undermining its own attempt to protect Americans from emerging health threats such as PFOA and PFOS.
- Commenter states that pyrethroid pesticides are classified by EPA as a “likely human carcinogen,” and are linked in published studies to Parkinson’s Disease and adverse behavioral problems in prenatally exposed children.^{2688,2689} The commenter provides that EPA convened a FIFRA Scientific Advisory Panel in October 2017 to assess its use of a Physiologically Based Pharmacokinetic Model (PBPK) used in its risk assessment for the

²⁶⁸⁶ EPA, EPA 822-R-16-003, Health Effects Support Document for Perfluorooctanoic Acid (PFOA), at 3-1 to 3-60 (May 2016), https://www.epa.gov/sites/production/files/2016-05/documents/pfoa_hesd_final-plain.pdf; EPA, EPA 822-R-16-002, Health Effects Support Document for Perfluorooctane Sulfonate (PFOS), at 3-1 to 3-49 (May 2016), https://www.epa.gov/sites/production/files/2016-05/documents/pfos_hesd_final_508.pdf. The C8 Health Project was funded through the settlement agreement in a lawsuit brought over drinking water contaminated by PFOA from the DuPont Washington Works facility near Parkersburg, West Virginia. The study involved close to 70,000 participants, for each of whom “demographic data, medical diagnoses (both self-report and medical records review), clinical laboratory testing, and determination of serum concentrations of 10 perfluorocarbons (PFCs)” were collected. Stephanie J. Frisbee et al., The C8 Health Project: Design, Methods, and Participants, 117 ENVTL. HEALTH PERSP. 1873, 1876 (2009) (“To protect participant privacy, the presiding judge subsequently sealed the data set.”).

²⁶⁸⁷ According to commenters (6111, 6137), through this work, the researchers identified probable links between exposure to these chemicals and six specific diseases: diagnosed high cholesterol, ulcerative colitis, thyroid disease, testicular cancer, kidney cancer, and pregnancy-induced hypertension.

²⁶⁸⁸ Interlandi, Jeneen, Consumer Reports, “Can Permethrin Treated Clothing Help You Avoid Mosquito Bites? We tested L.L.Bean and ExOfficio insect-repellent clothing,” (May 26, 2016) available at <https://www.consumerreports.org/insect-repellents/permethrin-treated-clothing-mosquito-bites/>.

²⁶⁸⁹ Furlong MA, Barr DB, Wolff MS, Engel SM. Prenatal exposure to pyrethroid pesticides and childhood behavior and executive functioning. *Neurotoxicology*. 2017 Sep;62:231–38; Viel JF, Rouget F, Warembourg C, Monfort C, Limon G, Cordier S, Chevrier C. Behavioural disorders in 6-year-old children and pyrethroid insecticide exposure: the PELAGIE mother-child cohort. *Occup Environ Med*. 2017 Mar;74(4):275–81.

pyrethroid pesticides. The commenter notes that, despite the central role of the pyrethroid PBPK model in EPA's regulatory approval for pyrethroid pesticides, scientific peer reviewers on the FIFRA Scientific Advisory Panel were unable to obtain the raw data necessary to provide a robust peer review of the model.²⁶⁹⁰ According to the commenter, at this point, the EPA Scientific Advisory Panel meeting is postponed indefinitely. The commenter states that the stated reason is "due to the unavailability of experts," but that they believe that the more likely reason is to bias the panel with the addition of industry experts, as EPA has done recently with its Scientific Advisory Boards.²⁶⁹¹ According to the commenter, a model that underestimates exposures and health risks will lead to regulations that fail to protect Americans from harmful exposures to pyrethroid pesticides.(6133)

- Commenter (2064) notes that the EPA is currently reviewing the registration of an herbicide called paraquat, which, through peer-reviewed and validated research, is strongly associated with an increased risk of Parkinson's disease. The commenter provides that much of the research relies on large, population-based studies, which is the type of research most impacted by this rule. The commenter states that, without the ability to consider this research, the EPA will miss vital information needed to protect public health, thus placing Americans at risk. The commenter contends that many of the most important studies involving environmental exposures and Parkinson's disease would be excluded from future determinations for one or more of the following reasons:
 - The authors did not previously obtain the needed consents to release the data and would thus be subject to criminal penalty if they did so.
 - The data cannot be deidentified appropriately while complying with federal privacy protection laws.
 - The cost to deidentify would be very high and many research institutions do not have people on staff who can perform the work needed to do so.
- Commenter (0501) states that epidemiological and observational studies that involve personal data are essential for identifying the links between pollution and health effects. The commenter states that it is difficult to make these data public because researchers need to protect the privacy of study participants and their data. The commenter states that the fact that the data will not be made public does not diminish the quality of these studies. The commenter states that this rule will limit the amount of quality data that can be used by the Agency and will adversely affect the mission of the Agency to protect the environment and human health.
- Commenter (1331) states that the proposed regulation underestimates the usefulness of environmental epidemiology in highlighting the areas of the environment that need remediation due to their negative effects on public health. The commenter states that, by implementing the proposed regulation, public transparency of data from studies looking at the connections between these two integral components of public policy would be illegal and ethically wrong.

²⁶⁹⁰ See Attachment 27: Email from D. Hattis to EPA DFO M. King, Sept 6, 2017; Email from D. Hattis to EPA DFO M. King, Sept 12, 2017; Email from D. Hattis to SAP Chair J McManaman, Oct 3, 2017.

²⁶⁹¹ EPA unveils new industry-friendlier science advisory boards. Science magazine. By Sean Reilly, E&E News, Kevin Bogardus, E&E News, Nov. 3, 2017, available at <http://www.sciencemag.org/news/2017/11/epa-unveils-new-industry-friendlier-science-advisory-boards>.

- Commenter (6884) states that epidemiological studies produce vital and valid scientific information that is necessary to determine impacts on humans of various types of occupational and environmental exposures. The commenter states that, without these studies, real world impacts on individuals and communities would not be captured, and important data that could affect hundreds and thousands of people would be lost.
- Commenter (6915) states that the provisions of the proposed rule would essentially prohibit the use of such epidemiology data in human health risk-based assessment despite their clear superiority over animal data for use in risk assessment. The commenter states that, in general, and specifically in EPA's 2005 Guidelines for Carcinogen Risk Assessment, human (i.e., epidemiology) data are preferred to animal data as the basis for risk assessment toxicity factors when they are of sufficient quality and are amenable to dose response modeling.²⁶⁹² The commenter states that this is because animal data always carry inherent uncertainties in regard to their relevance to humans. The commenter notes that epidemiology data collected over at least the last 40 years, however, have been generated under the auspices of IRBs working to protect the patient or participant information obtained by academic institutions, government entities, hospitals, and other organizations, and thus disclosure of that data would be difficult, if not impossible. The commenter states that these factors would all preclude EPA's or researchers' ability to provide raw, unpublished data for re-analysis as required under the proposed EPA rule.
- Commenter (6915) states that, for older epidemiology data, such as data from studies on occupational exposures to workers in factories before the advent of strict IRB requirements, raw data are seldom if ever still available. The commenter states that such data, including high quality data generated by major corporations in conjunction with academic institutions, would not be available to EPA under the proposed rule. The commenter states that, effectively, the proposed rule would restrict the epidemiology data available for use by EPA, even where the weight of the evidence clearly supports a finding of causality and risk.

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency

²⁶⁹² U.S. Env'tl. Prot. Agency, Guidelines for Carcinogen Risk Assessment 2-3 (Mar. 2005), available at https://www.epa.gov/sites/production/files/2013-09/documents/cancer_guidelines_final_3-25-05.pdf.

will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Limiting Consideration of Studies that Use Confidential Data (Personal and Business Confidential Data) and Studies Where Underlying Data is No Longer Available in Support of Regulatory Decision-making

Comment: Commenters (1281, 1306, 1445, 5011, 6111, 6181, 6378, 6895, 6909, 6915, 6919, 8281-PH38) express concern that, in developing future regulations to protect human health and the environment, EPA would be precluded from considering relevant information that has been validated through peer review, on the sole basis that the underlying data are not publicly available. Specific comments include:

- The proposed rule fails to recognize or acknowledge the existence of many studies already designed and published with terms that make complete transparency difficult or impossible because of IRB requirements and other important confidentiality protections. (6915)
- Commenters (1310, 1311, 6865) express concern that, in developing future regulations, EPA would be precluded from considering relevant studies on the sole basis that the underlying data are not publicly available. Commenter (1311) states that, given that much key research relies on confidential health data from study subjects, this proposal risks severely restricting the number and quality of studies available for use when making critical decisions. Commenter (6865) states that, discarding the opportunity to engage important studies based on their use of private data would be a costly mistake given their potential to save lives and advance scientific understanding in policy decisions.
- Commenter states that, by prohibiting the usage of information derived from anonymous sources, this largely excludes many useful scientific sources of knowledge. The commenter states that, in order to receive IRB approval to conduct work with human

subjects, assuring the anonymity of participants is an essential step. The commenter states that guaranteeing anonymity of subjects is considered the top standard for conducting research with human subjects when investigating sensitive topics such as negative health outcomes. The commenter states that excluding studies because they are upholding scientific standards is a very unwise decision. (1310)

- Commenter expresses concern that, under the misleading veil of "transparency," the proposed rule could force investigators to invade the confidentiality of research participants and make confidential and private data open to all. (5113)
- Commenter states that requiring a study's underlying datasets be fully open to public inspection would drastically limit EPA's ability to use the most up-to-date, peer-reviewed science. The commenter states that this standard conflicts with privacy protections and the confidentiality of personally identifying information. The commenter states that it is not possible for a host of epidemiological studies and long-term health studies to open their datasets without publishing sensitive information that cannot, by law, be made public. The commenter states that the cost of sanitizing such data would be immense and would be borne by researchers who do not necessarily have the resources or institutional support to complete the process. (6181)
- Commenter provides two examples of important studies that would not be available to the EPA review if the proposed rule were put in place: Kaufman et al 2016,²⁶⁹³ based on the MESA Air study, and Miller et al 2007,²⁶⁹⁴ based on the Women's Health Initiative study. The commenter states that both studies rely on human subject data that is protected. (6378)
- Concerns about protecting privacy may deter researchers from providing studies to the EPA. The commenter states that researchers have a responsibility to assure the confidentiality of data they collect from human subjects. The commenter states that combining or merging datasets can increase risk to confidentiality by increasing the likelihood of identifying individuals. The commenter states that researchers may therefore be reluctant to submit their research to the EPA because producing the required data may violate informed consent provisions. (6877)
- The proposal would effectively prevent the EPA from using many kinds of scientific studies vital to its decision-making, including studies that rely on personal health data, CBI, intellectual property, or older studies where the authors or data sources may not be accessible. The commenter asserts that EPA's proposed rule would do nothing to improve transparency for scientists, policymakers or the public. The commenter provides that scientists do not review the raw data for studies since that would reveal little; rather the scientist reviews the research questions, methods, summarized data, results and conclusions in order to assess the quality of the work. (5011)

²⁶⁹³ Kaufman JD, Adar SD, Barr RG, Budoff M, Burke GL, Curl CL, Daviglius ML, Diez Roux AV, Gassett AJ, Jacobs, Jr DR, Kronmal R, Larson TV, Navas-Acien A, Sampson PD, Sheppard L, Siscovick DS, Stein JH, Szpiro AA, Watson KE. Air Pollution and Acceleration of Coronary Artery Calcification: The Multi-Ethnic Study of Atherosclerosis and Air Pollution. *The Lancet*, 2016, Aug 13;388(10045):696-704. [Epub 2016 May 24] PMCID: PMC5019949

²⁶⁹⁴ Miller KA, Siscovick DS, Sheppard L, Shepherd K, Sullivan JH, Anderson G, Kaufman JD. Long-term exposure to fine particulate matter air pollution and cardiovascular events in women, *New England Journal of Medicine*, 356:447458, 2007. PMID: 17267905

- The proposed rule precludes consideration of studies based on confidential data, even when those results have been confirmed by other studies.²⁶⁹⁵ The commenter provides that, in the professional scientific and medical research community, “transparency” means clear and detailed disclosure of all methods, data, assumptions, and uncertainties. The commenter states that studies are considered “transparent” when the study design and methodology are clear enough to allow other scientists to challenge assumptions, test hypotheses, and either reproduce or replicate the study to determine whether the results obtained are consistent with the original study. According to the commenter, the concept of transparency promoted by the draft rule is harmful to good decision-making, to implementation of the statutes, and, most of all, to protection of public health and safety. (6111)
- The Proposal could cull the use of research that includes CBI or older studies that has data stored on older technology that can't be recovered. (8281-PH38)
- The Proposal would affect protections currently in place, such as limits on certain toxic air emissions from tail pipes and smoke stacks, and information on the health effects of many of these; where more than 150 chemicals come from older studies built on confidential patient or private business data that cannot be made public. (8281-PH38)

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater

²⁶⁹⁵ One example is the Six Cities Study, Douglas W. Dockery, et al., An Association between Air Pollution and Mortality in Six U.S. Cities, 329 NEW ENGLAND J. MED. 1753 (1993), whose results were subsequently confirmed by independent reanalysis.

consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

Additionally, the final rule does not require the EPA or other parties to make dose-response data underlying pivotal science available (publicly or through restricted access) in a manner sufficient for independent validation.

The EPA believes that the final rule will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of significant regulatory actions and influential scientific information.

4.1.1.5.3 Skew Regulatory Decision-making Toward Studies That are Less Rigorous and Trustworthy/Transparent

Decision-making Will be Less Scientific and More Arbitrary

Comment: Commenters (0569, 1203, 1355, 1879, 4595, 6895, 6909, 6916) assert that the proposed rule will deprive EPA of great amounts of useful information and will make EPA decision making less scientific and more arbitrary, by just that measure. Specific comments include:

Commenters (0569, 1203, 4595, 6880, 6895) express concern that an incomplete pool of scientific evidence could skew regulatory decision-making toward studies that are less rigorous and trustworthy even if data were available. Commenter (1203) states that a broad-brush rule that eliminates a lot of evidence is a recipe for weak, poorly informed policy that may exaggerate some public health threats and minimize others.

Specific comments include:

- By limiting the science EPA can use in policies and regulations, EPA will constrain itself to smaller groups of studies and risk biased outcomes. The commenter states that, if the pool of research is smaller--which is what this proposed rule will lead to--that smaller pool utilized creates an inherent bias and thus the rulemaking process will yield distorted results. (4595)
- Should EPA adopt this rule, established knowledge that has been through the scientific validation process will be ignored. The commenter states that acting as though established knowledge does not exist will lead to flawed decisions and threaten environmental and public health. (6895)
- Not only would that render the future substantive rules unlawful under the Act's requirements, but it would also make them arbitrary and capricious, as "failure to

consider the evidence proffered renders [a decision] arbitrary and capricious”²⁶⁹⁶ and the Agency may not “hastily discount[.]” relevant studies.²⁶⁹⁷ The commenter asserts that the Agency seems unaware that its new policy, if finalized, could lead to future rulemaking actions that are unlawful, arbitrary and capricious. (6916)

- The new rule is not an attempt to make environmental regulations more transparent, it is a rule to limit research on the impacts of deadly pollution and give free reign to deregulate industries in the direct contradiction of science. The commenter states that not including research that includes confidential information translates into not including health science. (1355)
- The provision of the rule allowing EPA to arbitrarily bypass the requirement for studies that they like is completely anti-scientific at its heart. The commenter states that the whole rigor of the enterprise is based on taking all available information into account, independent of prior preferences or ideas. The commenter states that, if to the exclusion is added the ability to include without justification some studies that would otherwise be excluded, the danger of circular self-confirmation in views already held becomes extreme. (1879)
- The proposed rule’s attempt to exclude perfectly reliable scientific studies from EPA’s consideration is a thinly veiled attempt to allow the EPA to ignore sound science at its discretion if that science does not conform with the current Administration’s political agenda. (6909)
- The proposed rule would freeze the science in procedures that may or may not make sense today but will certainly not be scientifically defensible in the future. The commenter states that issuing regulations on risk assessment methodology is a slippery slope that potentially subjects the process to at best, control by risk managers and attorneys, and at worst, politicization. (3135)
- Commenter expresses concern that the rule could replace evidence-based decision-making with arbitrary determinations based on political considerations. (5113)
- While the Proposal would eliminate many studies from EPA consideration due to confidential data, this limitation is not equally imposed by the EPA on industry and academia. The commenter states that industry-funded studies could keep their data secret by claiming it is “CBI.” The commenter asks what is the EPA justification for this unequal treatment of corporate and academic research? (2907)
- While many commenters have pointed out the potential harm from chemical exposures that could result by excluding studies from consideration in rulemaking, the proposal could also unfairly skew rulemaking against use of chemicals that would not result in an expectation of unreasonable harm. The commenter states that a recent paper based on findings of the NIH Agricultural Health Study (<https://aghealth.nih.gov/>) showed no association between exposure to glyphosate and any cancer. The commenter states that,

²⁶⁹⁶ *Southwest Power Pool v. FERC*, 736 F.3d 994, 999 (D.C. Cir. 2013); see also *Mississippi v. EPA*, 723 F.3d 246, 269 (D.C. Cir. 2013) (agency must explain why evidence submitted is not reliable if choosing to ignore it); see also *NRDC v. EPA*, 902 F.2d at 971 (same).

²⁶⁹⁷ *Am. Farm Bureau Fed’n v. EPA*, 559 F.3d 512, 525 (D.C. Cir. 2009) (citing *Am. Radio Relay League, Inc. v. FCC*, 524 F.3d 227, 241 (D.C. Cir. 2008) (Agency’s inadequate explanation for dismissing empirical studies rendered decision arbitrary and capricious); cf. *Am. Trucking Ass’n*, 175 F.3d at 1052-53 (EPA arbitrarily and capriciously placed upon some studies “higher information threshold” than it placed upon others”); *Bus. Roundtable v. SEC*, 647 F.3d 1144, 1150-51 (D.C. Cir. 2011) (vacating rule for ignoring relevant studies); and *Chlorine Chem. Council v. EPA*, 206 F.3d 1286 (D.C. Cir. 2000)

in deciding how and whether to regulate glyphosate (e.g., setting tolerances), EPA would have to ignore this real-world study, thus giving disproportionate weight to other studies (some lab-based as opposed to conducted under real-world conditions) that suggest glyphosate could cause cancer under some circumstances. The commenter states that this could result in an unfair burden on the regulated community in terms of stricter regulation or the discontinued use of products. (6880)

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Comment: Commenter (1798) asserts that GLP compliant studies are not transparent. The commenter suggests that, while industry's GLP test raw data may be available to regulators, the

industry does not allow regulators/agencies or academic scientists to access any data beyond what they make available in the GLP study. The commenter states that, in contrast, toxicity studies by academics will usually allow 3rd parties that they trust to access all raw data. The commenter states that the instances of secret industry occupational studies are too numerous to deny. According to the commenter, EPA evaluators should have the flexibility to make case by case reliability & relevance decisions.

Response: As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption, on a case-by-case basis, from the requirements of the final rule under 40 CFR 30.7.

Joint Statement by Editors

Comment: Commenters (1306, 1797, 1883, 6111, 9227) note that the editors in chief of the world's top scientific journals have notified EPA that "[i]t does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them; rather, it is paramount that the full suite of relevant science vetted through peer review, which includes ever more rigorous features, inform the landscape of decision making."²⁶⁹⁸ The commenters state that the editors conclude that EPA's proposal to exclude relevant studies from EPA's consideration based solely on the fact that underlying data or methods cannot be made available to the public "will adversely affect decision-making processes."²⁶⁹⁹ Specific comments include:

- The stringent criteria of data availability proposed by the EPA fail to enhance currently accepted standards for quality of evidence and transparency, and most certainly would exclude significant research from consideration in policy decisions. The commenter states that, while they believe in the ideal of data transparency, they also believe that where such transparency is not justifiably possible, peer-reviewed science should not be excluded from informing policy decisions. (1797)
- The proposed rule fails to take into account the fact that studies are reliable and constitute the best available science when they comply with professionally-established best practices for describing the methodology, sampling size, sampling procedure and assumptions utilized and the results are consistent with those of other studies. (6111)
- Publication in a peer-reviewed scientific journal is the way that scientists communicate their findings to other scientists and is considered the hallmark of scientific quality. (9227)
- In response to EPA's Proposal, the editors-in-chief of *Science* and *Nature*, and other leading scientists explained that though "[d]ata sharing is a feature that contributes to the robustness of published scientific results. . . in not every case can all data be fully shared."²⁷⁰⁰ For example, full sharing is not possible when data sets include "personal

²⁶⁹⁸ Jeremy Berg et al., Joint Statement on EPA Proposed Rule and Public Availability of Data, *Science* (Apr. 30, 2018), <http://science.sciencemag.org/content/early/2018/04/30/science.aau0116>.

²⁶⁹⁹ Id.

²⁷⁰⁰ Id.

identifiers.”²⁷⁰¹ The commenter states that the editors confirm that even under circumstances where underlying data cannot be made generally available, it is possible to evaluate the merits of a study, explaining: “Importantly, the merits of studies relying on data that cannot be made publicly available can still be judged. Reviewers can have confidential access to key data and as a core skill, scientists are trained in assessing research publications by judging the articulation and logic of the research design, the clarity of the description of the methods used for data collection and analysis, and appropriate citation of previous results.”²⁷⁰² (9227)

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

The requirements included in the final rule provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing

²⁷⁰¹ Id.

²⁷⁰² Id.

important technical considerations in order to ensure the EPA maintains a strong scientific basis for its decision-making. The incremental progress made possible by the final rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments.

PLOS Medicine Editorial

Comment: Commenters (2906, 6133) note that in an editorial in PLOS Medicine, Professor John Ioannidis states “[i]f the proposed rule is approved, science will be practically eliminated from all decision-making processes. Regulation would then depend uniquely on opinion and whim.”²⁷⁰³ Commenter (2906) asserts that EPA is a non-partisan organization that needs the best available research & minimal political interference in order to create regulations that balance safety with vigorous commercial growth. Commenter (6133) suggests that, instead of restricting the pool of available science by instituting an unworkable requirement for a broad category of scientific inquiry, EPA should focus on identifying weaknesses in the available evidence and targeting future investigations towards addressing specific deficiencies. The commenter adds that, assessing whether any particular study is reliable is not contingent on whether the underlying data can be made public, a fundamental point made clear in a report that EPA itself cited in the Proposal.²⁷⁰⁴ The commenter includes the following additional quotes from the PLOS Medicine editorial:

Ioannidis explains that “we should recognize that most of the raw data from past studies are not publicly available,” and “[s]ome deficiencies may be unavoidable. For example, researchers cannot ethically randomize people to harmful exposures in order to tackle confounding, nor violate informed consent agreements that prohibit open sharing of private data from past studies.” Ioannidis goes on to say that “simply ignoring science that has not yet attained such standards, is a nightmare,” and “we would see governments discarding science at massive scale because of perceived imperfections and impurities.” Ioannidis also notes that “we have extremely strong evidence that the tobacco pandemic is devastating; that the MMR vaccine is generally safe; that climate change is happening; and that air pollution is a major health hazard,” in contrast to “most dietary advice one might hope to give about specific nutrients.” The subjects that Ioannidis explains have strong evidence are the issues EPA is responsible for addressing that the Proposal seeks to discredit. Ioannidis further notes:

For example, the pivotal research on the health effects of air pollution is particularly strong. The Six Cities and American Cancer Society studies are exemplary large-scale investigations, with careful application of methods, detailed scrutiny of measurements, replication of findings, and, importantly, detailed re-analysis of results and assessment of their robustness by entirely independent investigators. The re-analysis and sensitivity analyses were conducted by the

²⁷⁰³ Ioannidis, J. P., “All science should inform policy and regulation,” PLoS Medicine 15(5) (May 3, 2018), <http://journals.plos.org/plosmedicine/article?id=10.1371/journal.pmed.1002576>. (Hereinafter “All Science”)

²⁷⁰⁴ 83 Fed. Reg. at 18,769, n.6 (citing 67 Fed. Reg. 8452, 8453, Office of Management and Budget, “Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies (February 22, 2002), available at <https://www.federalregister.gov/documents/2002/02/22/R2-59/guidelines-for-ensuring-and-maximizing-the-quality-objectivity-utility-and-integrity-of-information> (Hereinafter “OMB Guidance”)).

Health Effects Institute that was funded by stakeholders some of whom may have desired to see opposite conclusions. It would be wonderful, if in the future the same rigorous re-analysis and replication standards could become the standard for all important areas of research that can inform policy.

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

The requirements included in the final rule provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the EPA maintains a strong scientific basis for its decision-making. The incremental progress made possible by the final rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments.

4.1.1.5.4 Impacts on Addressing New and Emerging Environmental and Public Health Concerns

Comment: Commenter (1363) states that limiting scientific studies that can be used in forming the EPA's regulations to only those in which all information is "publicly available" is unreasonable and will place unnecessary constraints on scientists and slow the speed in which studies can be conducted and findings presented. The commenter states that this hurts the agency's ability to consider and form regulations and policies quickly in response to the changing environment. The commenter states that, if testing cannot be done quick enough to prove new regulations must be put in place to protect environmental and individual health, then unwanted harm will come to the people and the planet. The commenter states that the government must ensure a fine balance between accountability and efficiency. The commenter contends that this proposed rule will ruin the current balance by placing an unwarranted emphasis on accountability, hurting the efficiency of scientists and EPA policy makers. The commenter states that, while Republicans are constantly calling for a smaller government with less interventions and paperwork, so that it functions more efficiently, this rule goes against these values and will only cause more problems and delays in the future policy-making process.

Response: The EPA disagrees that the requirements of the final rule will result in any meaningful delay in promulgating regulations. While the final rule requires the Agency to evaluate the availability of dose-response data for pivotal science, the incremental burden to the EPA to carry out these requirements is expected to be small given (1) the extensive scientific review the EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of the studies the EPA would review).

Comment: Commenter (6111) states that the proposed rule would impede EPA's ability to address new and emerging public health risks in future rulemakings, including actions for two fluorochemicals, perfluorooctanoic acid ("PFOA") and perfluorooctane sulfonate ("PFOS").^{2705,2706} The commenter states that, if finalized, the proposed rule would prevent these EPA actions.²⁷⁰⁷ The commenter notes that when EPA issued health advisories for these two chemicals in 2016, the Health Effects Support Documents relied extensively on epidemiological studies generated by the C8 Health Project.²⁷⁰⁸ The commenter states that a key component of

²⁷⁰⁵ Amena H. Saiyid, Pruitt Plans to Declare Two Fluorochemicals Hazardous, BLOOMBERG BNA (May 22, 2018).

²⁷⁰⁶ Press Release, EPA, Administrator Pruitt Kicks Off National Leadership Summit on PFAS (May 22, 2018), <https://www.epa.gov/newsreleases/administrator-pruitt-kicks-national-leadership-summit-pfas>.

²⁷⁰⁷ Epidemiological studies, which the commenter states were essential to discovering the immunotoxicity of perfluorinated alkylate substances, including PFOA and PFOS, were based on confidential human health data. See Philippe Grandjean, Delayed discovery, dissemination, and decisions on intervention in environmental health: a case study on immunotoxicity of perfluorinated alkylate substances, 17:62 ENVTL. HEALTH 1 (2018), available at <https://ehjournal.biomedcentral.com/articles/10.1186/s12940-018-0405-y>.

²⁷⁰⁸ EPA, EPA 822-R-16-003, Health Effects Support Document for Perfluorooctanoic Acid (PFOA), at 3-1 to 3-60 (May 2016), https://www.epa.gov/sites/production/files/2016-05/documents/pfoa_hesd_final-plain.pdf; EPA, EPA 822-R-16-002, Health Effects Support Document for Perfluorooctane Sulfonate (PFOS), at 3-1 to 3-49 (May 2016), https://www.epa.gov/sites/production/files/2016-05/documents/pfos_hesd_final_508.pdf. The C8 Health Project was funded through the settlement agreement in a lawsuit brought over drinking water contaminated by PFOA from the DuPont Washington Works facility near Parkersburg, West Virginia. The study involved close to 70,000 participants, for each of whom "demographic data, medical diagnoses (both self-report and medical records review), clinical laboratory testing, and determination of serum concentrations of 10 perfluorocarbons (PFCs)" were

the evidence for the harmfulness of these chemicals consists of epidemiological studies based on data that are not publicly available. The commenter states that researchers published more than three dozen papers based on these data, identifying probable links between PFOA exposure and “diagnosed high cholesterol, ulcerative colitis, thyroid disease, testicular cancer, kidney cancer, and pregnancy-induced hypertension.”²⁷⁰⁹ The commenter states that this situation underlines the arbitrariness and irrationality of the proposed rule: on the one hand, EPA is proposing to take regulatory action to protect the American people from emerging health threats and on the other—through the proposed rule—it is simultaneously undermining its own ability to follow through on those proposals.

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal

collected. Stephanie J. Frisbee et al., The C8 Health Project: Design, Methods, and Participants, 117 ENVTL. HEALTH PERSP. 1873, 1876 (2009) (“To protect participant privacy, the presiding judge subsequently sealed the data set.”).

²⁷⁰⁹ The Science Panel Website, C8 SCIENCE PANEL, <http://www.c8sciencepanel.org/index.html> (last updated Jan. 4, 2017). The commenter notes that even the scientists selected to lead the research were provided with access only to de-identified data from the participants, except in the case of some participants who consented to provide additional data for follow-up studies.

science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Comment: Commenter (6903) states that the data disclosure requirements in the Proposed Rule would make it impossible for the EPA to issue or update its rules and standards, preventing the EPA from fulfilling its statutory duties. The commenter states that EPA has an explicit mandate to protect the public's health from "known or anticipated" harm and must rely on science to establish the evidence or potential for harm. The commenter states that, by requiring that the EPA use only the science where data can be made publicly available, the Proposed Rule would create an undue burden on the Agency that would effectively prevent the Agency from passing new or updating existing standards and rules.

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal

science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

4.1.1.6 Recommended Changes to and Clarifications of the Language in §30.5

4.1.1.6.1 Revise §30.5 to Require Documentation of “All Reasonable Efforts” of Making Data Available Before Concluding that it is Not Possible

Comment: Commenter (6143) requests that EPA make the following revision to the proposed text under §30.5 (underlined text reflects suggested text additions):

The agency shall make and thoroughly document all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making such data available before it concludes that doing so in a manner consistent with law and protection of privacy, confidentiality, national and homeland security is not possible.

Response: The EPA is not finalizing the commenter’s suggested language in 40 CFR 30.5. The EPA acknowledges that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. In instances where the EPA gives the pivotal science lesser consideration, the rule requires the Agency to document why lesser consideration was given per 40 CFR 30.5(c).

4.1.1.6.2 Revise §30.5 to Clarify How EPA Will Work with Third Parties to Make Data Available

Comment: Commenter (6125) states that the Proposal fails to explain how it is meant to function for third party-conducted studies (for example, the text of the Proposal says, “[w]here data is controlled by third parties, EPA shall work with those parties to endeavor to make the data available in a manner that complies with this section” and does not explain “how” (§30.5)).

Response: The EPA has removed this language from the final rule.

4.1.1.6.3 Supports EPA Granting Greater Weight to Studies, Data, and/or Models Where Underlying Data are Publicly Available

Comment: Commenter (6918) agrees that, as a general principle, where practicable, EPA should grant greater weight to studies, data, and/or models for which the underlying data are publicly available. The commenter states that the EPA’s preference for these studies is another way for EPA to increase transparency and enhance the value of public participation without violating data access limitations, such as privacy or confidentiality. The commenter adds that such a

preference also encourages third parties, when they design their studies or data-collection efforts, to make all reasonable efforts to ensure their data and models can be made public, perhaps in masked or anonymized form. The commenter suggests that incentivizing third parties to do so also demonstrates EPA's commitment to transparency, public participation, and validity.

Response: The EPA agrees with the commenter and in this final rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

4.1.1.6.4 Revise §30.5 to Clarify What Constitutes "Independent Validation"

Comment: Commenters (6126, 6137, 6185, 6447, 6906) provide that §30.5 of the Proposal states: "the Agency shall ensure that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation," and that "independent validation" is defined as "information necessary for the public to understand, assess, and replicate findings." Commenter (6137) asserts that the EPA provides no indication what this means or how it will "ensure" or what EPA will do if it is not possible to ensure this. Similarly, commenter (6164) states that the term "validation" and is not defined and suggests that what EPA means be clarified.

Commenters (6126, 6185, 6447) state that the approach for "independent validation" is not described and that the definition for "independent validation" needs to be further clarified. Commenters (6185, 6447) assert that EPA already has procedures in place for allowing independent validation that work and it is unclear what additional measures EPA is now proposing. Commenter (6126) requests that the EPA be clear about the intent and the goal for addressing independent validation.

Commenters (6125, 6126, 6162) also state that the Proposal does not define "replicate." Commenter (6126) notes that the Proposal uses both the terms "replicate" and "reproduce" and that, in scientific practice, replication and reproducibility can be interpreted as different practices where one relies on the precise data used in an initial analysis and another relies on similar methods and data. Commenter (6125) asserts that, not defining "replicate" in the rule is yet another instance of a failure to provide adequate notice. The commenter states that, in context, EPA is using replicate not in the sense of conducting a new study to determine if the original conclusions also are supported by analyses of new data, but whether the results are "reproducible" by other analysts using the original data. According to the commenter, read literally, requiring studies be reproducible as well as 'transparent' would exclude the use of the following:

- Studies of the effects of natural or human-induced disasters and interventions on health and the environment
- Studies of human exposures to historically high concentrations of environmental pollutants or to occupational exposures that could not ethically be reproduced.

Response: The EPA has defined “independent validation” in 40 CFR 30.2 as: “the reanalysis of study dose-response data by subject matter experts who have not contributed to the development of the study to evaluate whether results similar to those reported in the study are produced.”

4.1.1.6.5 Revise §30.5 to Clarify Primary Data Record Needed for Independent Validation and Analysis

Comment: Commenter (5419) states that §30.5 specifies the type of information that would be made public to allow independent validation. The commenter expresses concern that for complete independent validation and analysis, as stated in the Proposal, the primary data record would be required. According to the commenter, notwithstanding privacy concerns, which is covered under other sections of the Proposal, public posting of such large quantities of data would be unwieldy. The commenter contends that the interpretation of the term “data” has critical implications and requests that the EPA clarify its intent.

Response: The EPA has clarified in this final rule that 40 CFR 30.5 only concerns the availability of dose-response data underlying pivotal science in significant regulatory actions or influential scientific information. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies— based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science.

4.1.1.6.6 Revise §30.5 to Clarify Circumstances Where a Study Can be Used When Underlying Data Cannot be Made Publicly-Available

Comment: Commenter (6362) states that §30.5 refers specifically to the requirements that apply when “EPA uses dose response data and models underlying “pivotal” (which the commenter believes is more aptly expressed as “material”) regulatory science.” The commenter interprets this to mean that in these specific circumstances, the dose response data and models must be “publicly available in a manner sufficient for independent validation,” which EPA defines as in a manner “consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security.” The commenter states that information is considered “publicly available in a manner sufficient for independent validation” when it includes the information “necessary for the public to understand, assess, and replicate findings.” The commenter asserts that, for environmental safety, exposure-response is the more appropriate relationship to evaluate because most of the environmental test guidelines require quantifying concentrations in media external to the organism for use as the exposure metric. The commenter requests that the EPA provide greater clarity regarding what it intends to do in circumstances where raw data cannot be made publicly available.

Commenter (6918) supports enhanced transparency in EPA rulemakings but recognizes the vital importance of privacy, confidentiality or personal and business information, and national and homeland security as limits on data access. The commenter recommends that EPA more-clearly detail an objective and consistent process that would determine when release of data underlying pivotal studies would be deemed inappropriate because it would impair privacy, confidentiality,

and/or national security. The commenter also recommends that EPA specify the conditions under which it could rely on studies for which the underlying data cannot appropriately be released.

Commenter (0562) states that not all confidential or proprietary information is needed for qualified reviewers to make their weight of evidence (WOE) calls on the merits of the science, the study, or model results.

Response: The EPA disagrees with the commenter that the EPA should consider the availability of exposure-response data. The EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or more pollutants, contaminants, or substances are integral to the Agency's mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. In addition, the data underlying the dose-response assessment are more distinct than the broad range of data informing an entire risk assessment. Therefore, the EPA is concentrating its current efforts to increase transparency on a well-defined step in the quantitative assessment of risk supporting specific Agency actions. This final rule provides an important step in furthering the progress already being made toward maximizing transparency and will provide important insight for developing future statute-specific requirements.

In this final rule, the EPA has described how it will consider studies for which the underlying data cannot appropriately be released. The EPA will evaluate if the dose-response data underlying pivotal science are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

There may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

4.1.1.6.7 Revise §30.5 to Clarify How a Determination Will be Made on Information Sufficiency for the Public to Understand, Assess and Replicate Findings

Comment: Commenter (6126) states that it is not clear from the language in §30.5 on how a determination will be made on the information, or how much and what kinds of information satisfy the requirement that researchers must provide enough information for “the public to understand, assess, and replicate findings.” The commenter notes that the list of types of information that may be required based on the language of §30.5 suggests an intent to be flexible, but the language needs to be clarified.

Commenter (6125) states that proposed §30.5 is so awkwardly drafted that it is not clear if it is intended as an absolute requirement or is advisory. The commenter states that the language in footnote 3, and in §30.5 suggest that it is a requirement. The commenter states that other language does not, e.g., §30.5 (information can be used if it provides the information necessary to “replicate” findings).

Response: The types of information provided in 40 CFR 30.5(f), which are necessary for the public to understand, assess, and reanalyze findings, are provided as examples. The EPA intends to issue implementation guidelines and statute-specific rulemakings that will further describe the implementation of this rule. The EPA clarifies that the procedures codified in 40 CFR 30.5 of this final rule are requirements for the Agency.

4.1.1.6.8 Revise §30.5 to Add Requirement that Information be Sufficient for Verification/Change “Computer Codes” to “Computer Algorithms”

Comment: Commenter (6362) makes the following suggested edits to §30.5 (underlined text is the suggested new text and crossed-out text is the suggested deletion):

Section 30.5 What requirements apply to use of dose response data and models?

When promulgating significant regulatory actions, the Agency shall ensure that the dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation, verification, and analysis. This may include:

- Data (where necessary, could be subject to access and use restrictions)
- Associated protocols
- Computer algorithm~~se~~~~codes~~ and models
- Recorded factual materials
- Detailed descriptions of how to access and use such information

But in a manner consistent with law, protects privacy, confidentiality, CBI, and is sensitive to national and homeland security. Information is “publicly available in a manner sufficient for independent evaluation” when it includes the information necessary for the public to “understand, assess, and replicate findings.”

Response: The EPA is unsure what the commenter’s rationale is for suggesting this change. The EPA has altered the text at 40 CFR 30.5(f)(3) to read, “Computer codes and models involved in the creation and analysis of such information.”

4.1.1.6.9 Revise §30.5 to Minimize Exception to the Rule

Comment: Commenter (6867) recommends that EPA minimize exceptions to the rule and accordingly make the following suggested changes to §30.5 of the rule (crossed out regulatory text reflects the commenter’s suggested deletions):

- (a) EPA should amend the second sentence of §30.5 to provide that

Where the Agency is making data or models publicly available, it shall do so in a fashion that is consistent with law, and ~~protects privacy, confidentiality, confidential business information,~~ is sensitive to national and homeland security.

(b) EPA should amend the penultimate sentence of §30.5 to provide that

The agency shall make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making such data available before it concludes that doing so in a manner consistent with law and ~~protection of privacy, confidentiality,~~ national and homeland security is not possible.

Response: The EPA disagrees with the commenter and has not made this change in the final rule. The EPA is committed to upholding legal protections for privacy, confidentiality, and CBICBI. This is a rule of internal agency procedure and does not conflict with laws governing privacy, confidentiality, CBI, or national security interests.

4.1.1.6.10 Revise §30.5 to Provide for Disclosure of Dose Response Data and Models “When Available”

Comment: Commenter (6906) states that the EPA does not address how or if it can use studies where specified dose response data and models are not available. The commenter recommends that EPA amend the text of proposed §30.5 to provide for disclosure of dose response data and models “when available.”

Response: The EPA is clarifying in this final rule that the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

4.1.1.6.11 Clarify Provisions of §30.5 to Apply at an Interim Phase Prior to Issuance of the Final Rule

Comment: Commenter (6906) suggests that EPA amend §30.5 (disclosure of data and models) to require transparency steps at an interim phase prior to issuance of the final rule.

Response: The EPA agrees with the commenter and has altered the definition of “publicly available” at 40 CFR 30.2 to include “The public must be able to access the information on the date of publication of the proposed rule (or, as appropriate, a supplemental notice of proposed

rulemaking, or notice of availability) for the significant regulatory action or on the date of dissemination of the draft influential scientific information for public review and comment.”

4.1.1.7 Recommended Changes to and Clarifications of the Language in §30.6

4.1.1.7.1 §30.6 Does Not Provide the Necessary Details to Assure Meaningful Public Review and Comment

Comment: Commenter (6137) states that §30.6 addresses the “additional requirements” related to the use of dose response data and models underlying “pivotal regulatory science,” but it is devoid of details necessary to assure meaningful public review and comment on how, when, or in what way EPA will implement this. The commenter also states that §30.6 cites no specific science and gives no indication of how or why EPA is attempting to redefine scientific information on dose response differently than it has done in the past to allow for informed consideration of why EPA is even attempting to address this issue.

Response: The EPA has removed proposed 40 CFR 30.6, and has transferred some of the requirements of that section to 40 CFR 30.5 of the final rule. However, the EPA disagrees with the commenter that there is insufficient information to review and comment. The EPA is establishing additional requirements for how it considers pivotal science because these studies are the most critical to the Agency’s significant regulatory actions and influential scientific information. The EPA finds that limiting the scope of these requirements to pivotal science will still provide meaningful and impactful opportunity for reanalysis. For example, Lewandowsky et al. (2020) evaluated the cost-effectiveness of reanalysis studies under various scenarios and concluded that reanalysis studies are most cost-effective when they are focused on studies of the greatest interest to the scientific community (in this study, the number of citations was a surrogate for interest).²⁷¹⁰

4.1.1.7.2 Clarify Case-by-Case Default Assumption Evaluations Under §30.6

Comment: Commenter (2169) requests that EPA clarify how it will decide, on a case-by-case basis, what default assumptions, including assumption of a linear, no-threshold dose response, are appropriate. The commenter asks:

- What if the sensitivity of the modeled results to alternative assumptions is itself not subject to scientific consensus?
- Won’t any regulated industry potentially subject to a proposed regulation be able to exaggerate the impacts of assumptions based on disputed sensitivity to effectively diminish in the public mind the cost/benefit ratio of a proposed regulation?
- Will such an industry-inspired public confusion be sufficient to establish the procedural inadequacy of a proposed regulation?

Response: The EPA has removed proposed 40 CFR 30.6, and placed some of the requirements in 40 CFR 30.5(e). Of the language quoted by the commenter, “including assumptions of a linear,

²⁷¹⁰ Lewandowsky, S. and Oberauer, K. (2020). Low replicability can support robust and efficient science. *Nat Commun* 11, 358. <https://doi.org/10.1038/s41467-019-14203-0>.

no threshold dose-response” has been removed. Therefore, under 40 CFR 30.5 of this final rule, the EPA shall evaluate the appropriateness of using default assumptions on a case-by-case basis used in its dose-response assessment. Further, the EPA shall clearly explain the scientific basis for critical assumptions used in the dose-response assessment that the EPA relied on for the significant regulatory action or influential scientific information. The EPA disagrees that these requirements, imposed solely on EPA, will introduce increased bias or arbitrariness, as the commenter suggests. Rather, the EPA finds that openly providing the scientific rationale for its critical assumptions used in dose-response assessments will improve the assessment’s objectivity and clarity to the public.

4.1.1.7.3 Oppose §30.6 Requirement to Evaluate Appropriateness of Using Default Assumptions

Comment: Commenter (6447) states that the proposed rule, contrary to the scientific community practice, would have EPA “evaluate the appropriateness of using default assumptions, including assumptions of a linear, no-threshold dose response, on a case-by-case basis.” (Proposed §30.6) According to the commenter, requiring EPA to justify default models every time it undertakes a risk assessment or rulemaking will slow the regulatory process, and increase its cost, with no benefit and the appropriate way to deal with dose-response models is to evaluate deviations from the default model on a case-by-case basis. Commenter (6133) contends that this “case-by-case” provision injects additional arbitrariness into the rule, in that it ensures that the Proposal may be applied unevenly—for certain rulemakings the “rules” of the Proposal can be discarded or ignored where desired.

Commenter (9227) provides that the National Academies’ *Science and Decisions*²⁷¹¹ document recommends that 1) “EPA should continue and expand use of the best, most current science to support or revise its default assumptions,” 2) “work toward the development of explicitly stated defaults to take place of implicit or missing defaults,” and 3) that “departure [from defaults] should occur only when the evidence of the plausibility of alternatives is clearly superior to the evidence of the value of the default.” According to the commenter, these recommendations underscore and reaffirm the role of defaults, and make clear that deviations from defaults are to be considered carefully, on a case-by-case basis, and only when adequately justified. The commenter also provides that this deviates from EPA’s Proposal’s interest and intent to move away from “default models, without consideration of alternatives or model uncertainty” which purportedly “can obscure the scientific justification for EPA actions.”²⁷¹²

Commenter (6373) suggests that limiting researchers’ ability to use modeling and assumptions as they deem appropriate will have human health consequences because scientists may be tempted to use models that EPA has deemed acceptable but that are not the best fit for their research needs.

Commenter (6446) suggests that requiring justification for all default assumptions ignores establishment of defaults through prior public processes and external public peer reviews. The commenter adds that requiring EPA to justify the use of default assumptions for every toxicity health factor derivation ignores the detailed development process of those default assumptions.

²⁷¹¹ National Academies, *Science and Decisions: Advancing Risk Assessment* 207 (2009).

²⁷¹² Proposed Rule, 83 Fed. Reg. at 18770.

The commenter states that those default assumptions were developed in several EPA documents (including the 2005 Guidelines for Carcinogen Risk Assessment²⁷¹³), which received public comment and extensive external peer-review. Requiring EPA to rejustify those default assumptions every time they are used, as the proposed rule suggests, would serve no purpose other than to add unnecessary delay to risk assessments and regulatory action.

Response: The EPA has removed proposed 40 CFR 30.6, and placed some of the requirements in 40 CFR 30.5(e). The EPA has altered the language subject to these comments to read, “the EPA shall also describe critical assumptions and methods used in its dose-response assessment and shall characterize the variability and uncertainty of the assessment. The EPA shall evaluate the appropriateness of using default assumptions on a case-by-case basis. The EPA shall clearly explain the scientific basis for critical assumptions used in the dose-response assessment that the EPA relied on for the significant regulatory action or influential scientific information.” The EPA agrees with the commenters that the EPA should not be required to describe all default assumptions and methods it uses, and thus has limited this requirement to “critical assumptions and methods.”

In this final rule, the EPA is only required to describe critical assumptions and methods, and anticipates that the added time and cost of this practice to EPA will be small. The EPA agrees with the commenter that, “deviations from defaults are to be considered carefully, on a case-by-case basis, and only when adequately justified.” This matches the requirements of 40 CFR 30.5(e).

The EPA disagrees with the commenter that this rule will prevent researchers from using modeling and assumptions. This final rule establishes procedural requirements for the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. Further, the requirements of 40 CFR 30.5(e) do not dissuade EPA scientists from using models or assumptions, but rather requires them to provide the scientific basis for critical assumptions (not all default assumptions, as proposed).

4.1.1.7.4. Requirement to “Describe and Document Any Assumptions and Methods Used”

Comment: Commenter (6447) states that proposed §30.6 would require the Agency to “describe and document any assumptions and methods used and should describe variability and uncertainty.” The commenter asserts that this is already standard Agency practice, and EPA has not provided any evidence to suggest that its staff has ever failed to follow this practice.

Response: The EPA has removed proposed 40 CFR 30.6, and placed some of the requirements in 40 CFR 30.5(e). The EPA has altered the language subject to these comments to read, “the EPA shall also describe critical assumptions and methods used in its dose-response assessment and shall characterize the variability and uncertainty of the assessment. The EPA shall evaluate the appropriateness of using default assumptions on a case-by-case basis. The EPA shall clearly explain the scientific basis for critical assumptions used in the dose-response assessment that the EPA relied on for the significant regulatory action or influential scientific information.” The

²⁷¹³ No. EPA/630/P-031001 F, available at: https://www.epa.gov/sites/production/files/2013-09/documents/cancer_guidelines_final_3-25-05.pdf.

EPA agrees with the commenter that this is standard Agency practice and has determined to codify it in regulation.

Comment: Commenter (6449) suggests changing the regulatory text of §30.6 to read that:

In the main text of an analysis, EPA shall describe and document any assumptions and methods used, and should clearly present, in the main text, especially any procedure used for the first time in that type of evaluation (e.g., IRIS or TSCA) as well as presenting the results of using the standard procedure.

The commenter explains that deviations from standard procedures and guidance are expected, especially in cases where more than the usual amounts and types of data are available. According to the commenter, highlighting them, providing information on how the results differ from that which would result from “standard” procedures, and requesting specific review of such changes would save reviewers from each trying to discover and evaluate this information.

Response: The EPA does not understand the commenter’s suggestion that the describing and documenting assumptions and methods must occur in the main text of an analysis and has not made these changes to the regulatory text. The EPA will fulfill the requirements of this final rule in a manner that is clear and accessible to the public.

Comment: Commenter (6906) requests that the EPA amend §30.6 to require EPA make available analysis of how it weighs and/or evaluates the conclusions drawn in a study based on criteria of “best available science.”

Response: In addition to following this rule, the EPA will continue to follow its guidance and guidelines in assembling dose-response assessments. Consistent with existing Agency practice, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information.²⁷¹⁴ As discussed in the final rule, the EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review.^{2715,2716} When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Comment: Commenter (0068) suggests that, in addition to describing and documenting any assumptions and methods used, EPA simultaneously make clear that its statutory responsibility is

²⁷¹⁴ U.S. EPA. (2002). Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency. (EPA/260R-02-008). ²⁷¹⁵ U.S. EPA. (2014). Framework for Human Health Risk Assessment to Inform Decision Making. (EPA/100/R-14/001). Washington, DC: U.S. Environmental Protection Agency, Office of the Science Advisor, Risk Assessment Forum. Available at <https://www.epa.gov/sites/production/files/2014-12/documents/hhra-framework-final-2014.pdf>.

²⁷¹⁶ U.S. EPA. (2003). A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information. (EPA 100/B-03/001). Washington, DC: U.S. Environmental Protection Agency. Available at <https://www.epa.gov/sites/production/files/2015-01/documents/assess2.pdf>.

to protect public health, and hence in making decisions based on such evidence it will adopt the public health decision rule, “when in doubt, act to protect public health and wellbeing,” as opposed to the classic decision rule used in scientific publishing, “place greatest emphasis on avoiding false positives.”

Response: In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers.

4.1.1.7.5 Revise §30.6 to Clarify that it Requires Documentation of Uncertainty and Variability

Comment: Commenter (6143) requests that the EPA clarify that §30.6 sets forth a mandatory duty and requires documentation of uncertainty and variability commensurate with its requirement for other “assumptions and methods used” as described in this proposed provision. The commenter recommends that EPA replace the proposed text “and should describe variability and uncertainty . . .” with “and shall describe and thoroughly document variability and uncertainty . . .”

Response: The EPA agrees with the commenter and has revised the language (now in 40 CFR 30.5(e)) to read, “the EPA shall also describe critical assumptions and methods used in its dose-response assessment and shall characterize the variability and uncertainty of the assessment.”

4.1.1.7.6 Revise §30.6 to Require, as a Default, the Application of Causal Analytics

Comment: Commenter (6143) requests that EPA require, as a default, the application of causal analytics in studies that include, but are not limited to, dose-response or concentration-response models or data, and models that investigate factors that might account for spatial heterogeneity. The commenter recommends that EPA revise the first sentence of §30.6 to read as follows:

EPA shall describe and document any assumptions and methods used. It should describe variability, uncertainty, and treatment of missing data, exposure estimation errors, covariate estimation and classification errors, omitted explanatory variables, model specification errors and biases, data selection biases, missing data, assumptions made to support causal interpretations of dose-response or exposure-response data (e.g., unit homogeneity, no hidden confounders, etc.), and results of any tests performed to validate these assumptions and to rule out non-causal interpretations and threats to internal and external validity of causal inferences.

Response: The EPA does not understand the commenter’s rationale for suggesting these revisions and has not made these changes in the final rule.

4.1.1.7.7 EPA Should Also Consider High-Quality Studies that Address Collider Biases and Latent as Well as Observed Confounders and Colliders

Comment: Commenter (6143) suggests that EPA also consider high-quality studies that address: (a) collider biases (e.g., selection, stratification, and Berkson’s bias), and (b) latent as well as observed confounders and colliders.

Response: The EPA has removed proposed 40 CFR 30.6, and has removed the requirement that the EPA give explicit consideration to high quality studies that explore[...]. Instead, in 40 CFR 30.5(d) in determining the amount of consideration to grant pivotal science for which the underlying dose-response data are not available, the EPA may consider the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity. The EPA does not understand the commenter's rationale for suggesting this revision and has not made the suggested changes to the final rule.

4.1.1.7.8 Requirement to "Explain the Basis for Each Model Assumption and Present Analyses Showing the Modeled Results to Alternative Assumptions"

Commenter: Commenter (6125) asserts that the most puzzling, and perhaps costly requirement in the rule appears in the wording of §30.6 of the Proposal:

EPA shall clearly explain the scientific basis for each model assumption used and present analyses showing the sensitivity of the modeled results to alternative assumptions.

The commenter states that this language appears to require the Agency not only to explain the basis of each model-related assumption in the original study but also to provide an analysis of the original data using alternative assumptions. The commenter asserts that the EPA provides no reasons why this should be an automatic and invariable requirement for all studies identified as "pivotal."

Response: The EPA has eliminated the language cited, and has replaced it in 40 CFR 30.5(e) with: "The EPA shall clearly explain the scientific basis for critical assumptions used in the dose-response assessment that the EPA relied on for the significant regulatory action or influential scientific information." By limiting this to critical assumptions and removing the requirement for sensitivity analysis, the EPA has addressed the commenter's concern.

Comment: Commenter (6924) states that the proposal requires that "EPA shall clearly explain the scientific basis for each model assumption used and present analyses showing the sensitivity of the modeled results to alternative assumptions. When available, EPA shall give explicit consideration to high quality studies that explore: A broad class of parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity." The commenter asserts that these mandates inappropriately dictate how scientific studies should be conducted and are not supported by current science.

Response: The EPA has removed proposed 40 CFR 30.6, and has removed the language cited by the commenter. Instead, in 40 CFR 30.5(d) in determining the amount of consideration to grant pivotal science for which the underlying dose-response data are not available, the EPA may consider the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric

models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity. This requirement will not dictate how scientific studies should be conducted and therefore addresses the commenter's concern.

Comment: Commenter (6446) states that the requirement for sensitivity analysis for all alternative-modeling assumptions does not require an evaluation of the scientific validity of those models. The commenter adds that the proposed rule's requirement that dose-response modeling include a sensitivity analysis including all alternative modeling assumptions does not make any mention of how those assumptions would be scientifically justified. The commenter suggests that this lack of scientific justification criteria would invite the submission of models that would not have biological relevance for inclusion in the sensitivity analysis. According to the commenter, this would result in a process that would make EPA risk assessment documents unwieldy, unmanageable and unreliable.

Response: The EPA has removed the requirement for sensitivity analysis for all alternative-modeling assumptions in the final rule, and therefore has addressed the commenter's concern.

4.1.1.7.9 Use of Term "Uncertainty" in §30.6 of the Proposal is Vague

Comment: Commenter (6915) states that the proposed rule would require that EPA "describe and document any assumptions and methods used . . . and uncertainty." 83 Fed. Reg. at 18,774. However, the commenter notes that uncertainty is not defined in the proposed rule, and it is unclear what type of uncertainty is implied. The commenter provides that uncertainty could mean discussion of the magnitude of the statistically-based range of model predictions. The commenter adds that there could also be uncertainties unrelated to the model, such as qualitative uncertainty about the human relevance of the animal toxicity endpoint used as the basis for the risk assessment. According to the commenter, the EPA's failure to define the type of uncertainty at issue makes the proposed rule impermissibly vague and deprives the public of a meaningful opportunity to comment on its impacts.

Response: The EPA disagrees that the term "uncertainty" is vague or that there is significant ambiguity about what should be in the scope of a characterization of uncertainty. The characterization of uncertainty is a key factor in the assessments that the EPA conducts. It is a component of various EPA guidelines (e.g., Framework for Human Health Risk Assessment to Inform Decision Making)²⁷¹⁷ that the EPA relies upon in conducting its assessments. The scope of the uncertainty analyses that the EPA conducts necessarily varies across assessments and actions. The intent of this regulation is not to force uncertainty analyses into a one-size-fits-all approach, as that is not practical, good policy, or good science. Thus, a regulation governing internal procedures, such as this one, does not require a regulatory definition for a term that is already a key component of current EPA practices and guidelines and EPA's assessment process.

²⁷¹⁷ U.S. EPA. (2014). Framework for Human Health Risk Assessment to Inform Decision Making. (EPA/100/R-14/001). Washington, DC: U.S. Environmental Protection Agency, Office of the Science Advisor, Risk Assessment Forum. Available at <https://www.epa.gov/sites/production/files/2014-12/documents/hhra-framework-final-2014.pdf>.

4.1.1.7.10 Recommend that EPA Quantify the Impact of Key Uncertainties Where Possible

Comment: In addition to the requirements provided in §30.6 of the Proposal, commenter (6921) recommends that EPA evaluate quantitatively the impact of key uncertainties and assumptions where possible in an integrated fashion, so that the public can understand the cumulative impact of these assumptions and uncertainties in assessing potential risks and hazards.

Response: The EPA disagrees with the commenter that how uncertainty is treated in dose-response assessments should be part of this final rule. The scope of the uncertainty analyses that the EPA conducts necessarily varies across assessments and actions. The intent of this regulation is not to force uncertainty analyses into a one-size-fits-all approach, as that is not practical, good policy, or good science.

4.1.1.7.11 Revise §30.6 to Emphasize the Use of National and International Guidance on the Measurement of Uncertainties

Comment: Commenter (0560) requests that the EPA emphasize the use of national and international guidance on the measurement of uncertainties, giving special attention to Type B errors. The commenter suggests that EPA amend §30.6 as follows (underlined text reflects suggested new regulatory text and crossed out text reflects suggested regulatory text deletions):

EPA shall describe and document ~~any all~~ assumptions and methods used, ~~and should~~ EPA shall describe variability and address replicability, ~~and EPA shall systematically discuss uncertainty in measurement per national and international guidelines, particularly addressing Type B errors.~~” Taylor NIST 1994, JCGM 100:2008.

The commenter also requests that EPA add the following language to §30.6 (underlined text reflects suggested new regulatory text):

EPA shall review other relevant data and models found or brought to its attention, and discuss why those were not included.

Response: The EPA disagrees with the commenter that how uncertainty is treated in dose-response assessments should be part of this final rule. The characterization of uncertainty is a key factor in the assessments that the EPA conducts. It is a component of various EPA guidelines (e.g., Framework for Human Health Risk Assessment to Inform Decision Making)²⁷¹⁸ that the EPA relies upon in conducting its assessments. The scope of the uncertainty analyses that the EPA conducts necessarily varies across assessments and actions. The intent of this regulation is not to force uncertainty analyses into a one-size-fits-all approach, as that is not practical, good policy, or good science.

²⁷¹⁸ U.S. EPA. (2014). Framework for Human Health Risk Assessment to Inform Decision Making. (EPA/100/R-14/001). Washington, DC: U.S. Environmental Protection Agency, Office of the Science Advisor, Risk Assessment Forum. Available at <https://www.epa.gov/sites/production/files/2014-12/documents/hhra-framework-final-2014.pdf>.

4.1.1.7.12 Supports Use of Policy or Guidance Documents for Requirements Specified in §30.6

Comment: Commenter (6920) agrees with the first sentence of §30.6 (“EPA shall describe and document any assumptions and methods used, and should describe variability and uncertainty”), however, the commenter states that the remainder of the language in this section, if still desired after further evaluation, would be better placed in policy or guidance documents.

Commenter (6125) suggests that, if EPA has issues with its current risk assessment and benefit analysis procedures that currently follow NAS recommendations and its own existing guidelines, a more straightforward and fruitful approach would be to update the guidelines as needed, showing in far more detail than provided here the details of their reasoning, the conditions in which they should be employed, and the scientific bases for requiring consideration of alternative models in all risk assessments. The commenter adds that the draft guidelines should then undergo peer review by expert panels of the NAS and/or its own SAB and SAP. According to the commenter, while guideline development is arduous and time consuming, it has several advantages over rulemaking, including 1) guidance is developed by experienced risk assessors; 2) it is a science-based process that involves consensus building across the EPA as well as with the broader science community; and, 3) critically, it maintains the separation between risk assessment and risk management so that EPA’s decision makers benefit from the availability of science that is produced in an independent and objective fashion. This has been the practice at EPA since 1983 when the NAS published *Risk Assessment in the Federal Government: Managing the Process*.

Response: The EPA disagrees that the requirements of this rule are in conflict with or indicate issues with current Agency guidelines and guidance. Consistent with existing Agency practice, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information.²⁷¹⁹ The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review.^{2720,2721} When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

4.1.1.7.13 Supports §30.6 Proposed Regulatory Language

Comment: Commenters (6150, 6918, 6921) support the principles and “additional requirements” reflected in the proposed §30.6 and believe that the proposed §30.6 language reasonably reflects what ought to be EPA’s consistent practice in all rulemakings.

Response: The EPA agrees with the commenter. The Agency has removed proposed 40 CFR 30.6, and placed some of the proposed requirements in 40 CFR 30.5(d)-(e).

4.1.1.7.14 Clarify Provisions of §30.6 to Apply at an Interim Phase Prior to Issuance of the Final Rule

Comment: Commenter (6906) suggests that EPA amend §30.6 (documentation and evaluation of studies) to require transparency steps at an interim phase prior to issuance of the final rule.

Response: The EPA agrees with the commenter and has altered the definition of “publicly available” at 40 CFR 30.2 to include “The public must be able to access the information on the date of publication of the proposed rule (or, as appropriate, a supplemental notice of proposed rulemaking, or notice of availability) for the significant regulatory action or on the date of dissemination of the draft influential scientific information for public review and comment.”

4.1.1.7.15 EPA Should Not Base Any Regulatory Determination on a Single Study

Comment: Commenter (9224) encourages EPA to not base any regulatory determination on a single study, regardless of whether or not the data is publicly available. The commenter suggests that relying on a single study, no matter how robust it may be, can bring bias to a model or regulatory decision. If EPA must base a decision off of a single study, the commenter states that it should be imperative that the data be publicly available as well as the reasoning and methodology behind why the study was chosen, how it is being used and why no other studies were deemed sufficient to be included.

Response: The EPA agrees with the commenter and clarifies in this final rule that, consistent with existing Agency practice, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information.²⁷²² The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and

²⁷²² U.S. EPA. (2002). Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency. (EPA/260R-02-008). Washington, DC: U.S. Environmental Protection Agency. Available at https://www.epa.gov/sites/production/files/2020-02/documents/epa-info-quality-guidelines_pdf_version.pdf.

review.^{2723,2724} When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

4.1.1.8 Study Exceptions/Exemptions from Public Disclosure Requirements

4.1.1.8.1 EPA Should Minimize Study Exceptions to Public Disclosure Requirements

Comment: Commenter (6143) states that EPA should ensure that any final action it takes on the proposed rule encourages transparency while making limited exceptions to accommodate legitimate, protected privacy interests such as CBI.

Commenter (6375) requests that EPA minimize the use of exceptions to the extent feasible within this rulemaking, but they understand that there will be some situations in which exceptions are needed. Regardless of the criteria used, the commenter contends that it is critical that EPA provide a robust and transparent explanation in the *Federal Register* that explains in detail why the data and models in question cannot be made publicly available.

Response: The EPA generally agrees with the commenters and has finalized requirements that protect privacy, confidentiality, CBICBI, and national security interests. As described in the final rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

²⁷²³ U.S. EPA. (2014). Framework for Human Health Risk Assessment to Inform Decision Making. (EPA/100/R-14/001). Washington, DC: U.S. Environmental Protection Agency, Office of the Science Advisor, Risk Assessment Forum. Available at <https://www.epa.gov/sites/production/files/2014-12/documents/hhra-framework-final-2014.pdf>.

²⁷²⁴ U.S. EPA. (2003). A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information. (EPA 100/B-03/001). Washington, DC: U.S. Environmental Protection Agency. Available at <https://www.epa.gov/sites/production/files/2015-01/documents/assess2.pdf>.

Additionally, under 40 CFR 30.7, the Administrator may grant an exemption to the requirements in 40 CFR part 30 for a study on a case-by-case basis if he or she determines that greater consideration is warranted because making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, CBICBI, or national security.

Comment: Commenter (6867) states that, in view of the widespread problems with replicating even peer-reviewed studies published in prominent journals, the EPA should minimize exceptions to the disclosure requirements set forth in the Proposed Rule. The commenter notes that Courts have frequently rejected attempts to withhold information based on claims to privacy, etc., unless protections are specifically provided by law. See, e.g., *Johnson v. Dovey*, 2011 U.S. Dist. LEXIS 128577, at *6-7 (E.D. Cal. Nov. 7, 2011) (rejecting vague assertion of privacy rights: “CDCR’s objections are not specific in any way, and are thus insufficient to assert a privilege.”); see also *Donovan v. Nat’l Bank of Alaska*, 696 F.2d 678 (9th Cir. 1983) (“The bank cannot refuse to comply with the subpoena as a whole on the basis of its vague allegations that it might be required . . . to produce records in violation of the Financial Privacy Act.”). The commenter requests that EPA similarly reject such claims to “privacy, confidentiality, [and] confidential business information” vis-à-vis data and models, unless those claims are clearly supported by law or the Executive Branch’s inherent powers. Accordingly:

(a) EPA should amend the second sentence of Section 30.5 to provide that

Where the Agency is making data or models publicly available, it shall do so in a fashion that is consistent with law and is sensitive to national and homeland security.

(b) EPA should amend the penultimate sentence of Section 30.5 to provide that

The agency shall make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making such data available before it concludes that doing so in a manner consistent with law and protection of national and homeland security is not possible.

Further, the commenter states that, in view of the evidence that even studies published in prominent journals are often false or overstate results, the EPA should carefully consider the weight given to studies, data, and models that are not disclosed for review by the public and other researchers, even where non-disclosure is required by law.

Response: The EPA agrees that the Agency should carefully consider the weight given to pivotal science where the underlying dose-response data are not available for independent validation. When determining the degree of consideration to afford pivotal science for which the underlying dose-response data are not available for independent validation, the EPA will consider the factors included in 40 CFR 30.5(d). These factors include, for example, the extent to which there are other studies for which the dose-response data are available and the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study.

The EPA does not agree with the commenter's suggested changes to the relevant language in proposed 40 CFR 30.5. Given public comments expressing concerns related to the potential release of PII or confidential information, the Agency believes that it is important to acknowledge the need to protect privacy, confidentiality, and national security.

4.1.1.8.2 Criteria for Excepting/Exempting Underlying Data from Public Disclosure Requirements

Comment: Commenters (6125, 6446) state that the notice of the proposed rule solicits comments on which criteria it should base exceptions to the rule, including whether case-by-case exceptions to the rule may be appropriate but has provided no suggestions of its own on that subject.

Commenter (6446) argues that, because the underlying premise of the rule is flawed, and the rule is unnecessary, unlawful, arbitrary, and harmful, they decline to provide suggestions for methods to determine exceptions to the rule. The commenter argues that there are no criteria or ad hoc methods for making exceptions to the rule that would not pose an unnecessary risk of constraining use of the best available science to make regulatory decisions, particularly where political appointees rather than expert scientific panels, such as the SAB, would apply the criteria or make the ad hoc determinations.

Additionally, commenter (6446) asserts that there are no criteria or ad hoc methods that would prevent stalling vital decisions to protect public health and the environment by "analysis paralysis." The commenter states that the proposed rule, if adopted, would inevitably delay setting protective standards through prolonged evaluation of the sufficiency of the public availability of research data and methods, rather than evaluation of the actual quality and import of scientific research. The commenter adds that, a related likely consequence of the proposed rule, even if it contains ad hoc mechanisms for exceptions, is a reduction in EPA's ability to respond quickly to emerging challenges, when data and models take time to be made publicly available and/or redacted and otherwise prepared in a format appropriate for public review.

Response: In response to similar comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements.

The EPA has finalized the Administrator's exemption provision at 40 CFR 30.7. As described in the preamble to the final rule, the Agency retained the provision because there are conditions under which the Administrator may determine that greater consideration of pivotal science for which the dose-response data are not available in a manner sufficient for independent validation is warranted (e.g., age of the study). To ensure that the Administrator's decision is appropriately transparent, the EPA will document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. The EPA is confident that the Administrator's exemption provision provides sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

The EPA finds that the requirements of the final rule will result in any meaningful delay in promulgating regulations. While the final rule requires the Agency to evaluate the availability of dose-response data for pivotal science, the incremental burden to the EPA to carry out these requirements is expected to be small given (1) the extensive scientific review the EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of the studies the EPA would review).

Comment: Commenter (6046) concludes that it would be a waste of resources to identify criteria for exceptions which would be much more objective than determining exceptions on a case-by-case basis. The commenter contends that it is likely that exceptions would be complex (e.g. an exception is to be made if 4 of 5 criteria are met if 3 of the 4 are considered strictly confidential info and the other two are highly confidential).

Response: The EPA disagrees with this comment and finds that it is appropriate to identify conditions under which the Administrator may determine that greater consideration of pivotal science for which the dose-response data are not available in a manner sufficient for independent validation is warranted (e.g., age of the study). To ensure that the Administrator's decision is appropriately transparent, the EPA will document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. The EPA is confident that the Administrator's exemption provision provides sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

Comment: Commenter (6921) recommends that specific research study exemption decisions should be based on the nature of the data, including whether it is protected from release under current law, the existence of alternative publicly accessible studies of similar quality, and the need to act, based on statutory or judicial deadlines. The commenter suggests that, instead of waiting to apply enhanced transparency requirements during the rulemaking process when it is often too late to acquire and release the data for public comment, EPA should begin now to identify research studies and models that are likely to become pivotal regulatory science in future rulemakings. The commenter suggests that, once EPA has developed a list, it can begin to contact study authors to determine the optimal path forward to increase transparency while assuring continued protection of the confidentiality of research participants and CBICBI. According to the commenter, this effort will reduce the number of exemptions EPA might give in the future.

Response: The EPA agrees with the commenter, in part, and has finalized the Administrator's exemption provision with additional conditions under which the Administrator may determine that greater consideration of pivotal science for which the dose-response data are not available in a manner sufficient for independent validation is warranted. Under 40 CFR 30.7, the Administrator may determine, on a case-by-case basis, that greater consideration is warranted when:

- Technological or other barriers render sharing of the dose-response data infeasible;
- The development of the dose-response data was completed or updated before the effective date of the final rule;

- Making the dose-response data would conflict with laws and regulations governing privacy, confidentiality, CBI, or national security;
- Third-party independent validation of the study's underlying dose-response data through reanalysis has been conducted; or
- The factors in 40 CFR 30.5 used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

The EPA would like to emphasize that the final rule does not require the Agency (or other parties) to disclose or host data, but to determine if dose-response data underlying pivotal science are available and to give greater consideration to those studies for which such data are available in a manner sufficient for independent validation. The EPA may opt, at its discretion, to make dose-response data underlying pivotal science available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

4.1.1.8.3 Study Exceptions Should be Recommended by Non-Partisan, Unaffiliated Expert Scientists

Comment: Commenter (4878) states that the proposal grants the EPA Administrator broad authority to exclude individual studies. According to the commenter, this could have broad-reaching impact depending on the preference of the Administrator at the time and allows the Administrator to overrule scientists regarding their own science. The commenter asserts that allowing politically appointed officials to make decisions about whether a study qualifies for an exception is dangerous. According to the commenter, the Administrator already has broad authority to decide what action to take on an item, it should not have the power to hide evidence that does not support the action. The commenter states that the EPA should consider all relevant, peer-reviewed data when making decisions that impact American's health, and the proposed rule's exceptions process clearly undermines this goal. The commenter states that, if the proposed rule takes effect, EPA should at least require that exceptions decisions are made by an expert in the area of research. For example, the commenter recommends that a panel of non-partisan, unaffiliated expert scientists could be used to make recommendations on exceptions.

Response: The EPA does not agree with the commenter regarding the role of the Administrator in determining whether to grant an exemption and finds that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. Additionally, the EPA program or region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption.

The EPA would like to emphasize that, under the final rule, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information.

4.1.1.8.4 Request for Specific Study Exceptions

Major Scientific Studies Already Completed or Underway

Comment: Commenters (1012, 5165, 6141) request that EPA develop exemptions for scientific studies already completed or underway.

Commenter (6141) suggests that the Agency attempt to accommodate major scientific studies already completed or well underway. If EPA elects to apply the transparency rules retrospectively, the commenter suggests that EPA consider developing exemptions for those past studies for which it is not possible to release a dataset publicly for legitimate reasons pertaining to the use, for example, of human subject data. According to the commenter, in so doing, EPA should strive to establish clear and objective criteria for granting exemptions based on the inability to provide the underlying data while respecting appropriate data access limits.

Commenter (1012) requests that exceptions to the proposed rule include studies that were previously conducted or already underway prior to the implementation of this regulation as the protocols of these studies were set before the rule was finalized. Studies that were conducted and utilized by the Agency to make regulatory decisions prior to the implementation of this rule should be exempted as these studies had met the requirements previously set for inclusion in regulatory decision-making at the time, and the protocols used in these studies were already determined before the rule was finalized. Case-by-case exceptions shrouded in secrecy are not appropriate and violate the nominal title of this proposed rule. If case-by-case exceptions are sought, every step in the process of determining the exception should be made publicly available from the initial request, to the decision-making steps taken by the Administrator, in addition to the final decision.

Response: The final rule applies equally to all dose-response data underlying pivotal science, regardless of when the study or the data was created. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of the final rule under 40 CFR 30.7.

To ensure that the Administrator's decision to grant an exemption under 40 CFR 30.7 is appropriately transparent, the EPA has included a provision that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. Additionally, the EPA program or region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption.

Well-Established Effects of Particle Pollution on Mortality Risk

Comment: Commenter (6135) specifically opposes any proposed or future action that would disregard the well-established effects of particle air pollution on mortality risk in the United States, either as part of future regulatory decisions or in cost benefit analyses included in mandated regulatory impact assessments. According to the commenter, these adverse risks have been confirmed and verified both through extensive reanalysis of individual studies and more importantly through additional studies that have been completed using numerous independent study populations in the US, Canada, and many other parts of the world. Regardless of whether these effects are reported by the EPA as ranges or as combined estimates of mortality risk, the commenter asserts that the continued inclusion of mortality impacts in regulatory analysis is critical for federal regulatory decisions that impact air quality in Utah. The commenter requests that, if the proposed transparency rule is promulgated, the associations of particle pollution and mortality risk are specifically and preemptively excluded from the judgment of the EPA Administrator in adhering to data availability requirements.

Response: As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science, regardless of when the study or data was created. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption, on a case-by-case basis, from the requirements of the final rule under 40 CFR 30.7.

Study Data from Authors Outside the Agency

Comment: Commenter (6449) notes that underlying study data may be difficult to obtain from authors outside the Agency. The commenter requests that EPA allow exceptions for such instances.

Response: As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption, on a case-by-case basis, from the requirements of the final rule under 40 CFR 30.7.

Studies that Meet a Minimal Threshold of Study Quality

Comment: Commenter (6449) requests that, in order to limit the potential for exempting pivotal studies that do not meet the data transparency requirements the studies in question meet a minimal threshold of study quality.

Response: The EPA finds that establishing a minimal threshold of study quality is not practical in this rulemaking. As described in the preamble to the final rule, the EPA will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. Additionally, under 40 CFR 30.5, the EPA is required to rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Studies that Represent “Best Available Science”

Comment: Commenter (6906) recommends that the EPA amend 40 CFR §30.9 regarding exemptions, to include an exemption from publication of dose response and methods, when not available, for studies EPA concludes are the “best available science,” using factors EPA has articulated for “best available science.”

Response: As described in the preamble to the final rule, this is a rule of internal Agency procedure and, therefore, does not interpret or apply any statutory provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule.

Studies Involving Human Subjects/Health Data

Comment: Commenter (0671) states that if EPA goes ahead with this counterproductive rulemaking, studies involving human subjects should be excepted. In particular, the commenter requests that clinical and population-based studies should be excepted, which they assert produce data that is almost guaranteed to be identifiable and no IRB would allow such data to become public. The commenter states that if this proposed rule disallows EPA from using the results of such studies in formulating regulations then the EPA will have prevented itself from using the best available science, counter to requirements of the CAA and amendments.

Commenter (1272) asserts that any regulation that may affect the health and wellness of people, should and must be allowed to use research that cannot publish its data. The commenter provides that health data is generally not allowed to be freely published and thus must have an exception.

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory

actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

The requirements included in the final rule provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the EPA maintains a strong scientific basis for its decision-making. The incremental progress made possible by the final rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments.

Pesticide Registration and Tolerance Data

Comment: Commenter (6374) supports the exclusion of data submitted under FIFRA or FFDCA to support specific registration or tolerance decisions, which they say is consistent both with that threshold and with the statutory protections for such data. When issuing its final rule, the commenter requests that EPA expressly clarify that the scope of its final rule does not include such pesticide registration and tolerance data.

Response: In response to this comment and other similar comments, the EPA clarified in the 2020 SNPRM the relationship between this rulemaking, the environmental statutes and their implementing regulations by adding language to proposed 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations would control in the event of any conflicts.

With this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Confidential Business Information

Comment: Commenter (6148) recognizes that in some circumstances full transparency may not be achievable. For example, some data submissions are protected as CBI and may present transparency challenges to the Agency. In such cases, the commenter provides that it may have to be considered whether to exclude such data from the analysis or determine whether a generic format may be adequate to conceal site or company-specific proprietary information.

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, a modified version of the 2018 proposed rulemaking regulatory text at 40 CFR 30.5. In the 2020 SNPRM, the EPA proposed Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. For all other studies, data and models should be publicly available if the studies are to be used as pivotal regulatory science or pivotal science. In the 2020 SNPRM, the EPA also proposed an alternative. Under alternative proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency would, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII and appropriate techniques have been used to reduce the risk of re-identification.

Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.16.8.4.9.

Third-Party Laboratory and Research Organization Studies Should Not Be an Excepted/Exempted from Public Disclosure Requirements

Comment: Commenter (6108) asserts that, for non-peer reviewed commissioned studies such as third-party laboratory or other research organizations that may be commissioned, the underlying data should be made available to the public, along with the conclusions, assumptions, methods used, and a discussion of limits of extrapolation. The commenter notes that such third-party scientific studies may draw conclusions, but do not solicit other peers (a “fourth” party) to review the findings. The commenter contends that, because such studies lack the layers of review that accompany peer-reviewed science, they should be held to a higher standard of transparency if relied upon in rulemaking decisions.

Commenter (6375) recommends that, in cases where EPA does not control the data and models for studies, the EPA should not provide an exemption simply because a third-party does not agree to make the data and models publicly available where it does not have a valid reason (e.g. CBI, privacy, etc.) to prevent their release. In those cases, the commenter recommends that the EPA make every attempt to make as much of the data and models available for independent review as possible. According to the commenter, even if the dose-response data and models per se cannot be made publicly available, the commenter suggests that it may be possible for the results and analyses of this information to be made publicly available. According to the commenter, any such available results should be transparent as to the identification and selection of the key data, and the interpretation of those key data, in supporting the Agency's decision.

Response: As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

The EPA would like to emphasize that the final rule does not require the Agency (or other parties) to disclose or host data, but to determine if dose-response data underlying pivotal science are available and to give greater consideration to those studies for which such data are available in a manner sufficient for independent validation.

Study Exception Requests Would be Burdensome

Comment: Commenter (6373) asserts that, because the Rule's default application is to bar research where underlying data is not publicly released, EPA must separately consider exemption requests for each study, at considerable and likely prohibitive time and expense.

Response: Based on a consideration of public comments received in response to the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. As described in the preamble to the final rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

The additional procedures required by the final rule only apply to pivotal science, which is a subset of the total number of studies that the EPA would evaluate. Given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small. For similar reasons, the EPA does not find that the requirements of the final rule will result in any meaningful delay in promulgating regulations.

4.1.2 Definitions of Research Data (§30.2) and Data

4.1.2.1 Definition of “Research Data”

Comment: Commenter (6880) asserts that the proposal disregards the cited definition of “research data” and the rule applies to a much broader range of data. The commenter states that this presents serious consequences for EPA, the people whose mission it is to protect, and the regulated community because the proposal would allow EPA to ignore research findings if it were not possible to make public all the underlying data, including data that is excluded from the definition of “research data.” The commenter states that the proposed definition of “research data” excludes types of data that are nonetheless discussed throughout the proposal to strengthen transparency. The commenter states that EPA disregards this definition throughout the actual proposal, as evidenced by the following:

- Though EPA references this definition in §30.2 (“What definitions apply to this subpart?”) of the proposed rule, the term “research data” is absent from the rest of the proposed regulation (except in §30.10). EPA instead refers only to “data” without ever requiring that “data” be limited by the definition (and exclusions) of “research data.”
- In describing the data to which the proposal applies, EPA states in §30.3 “The provisions of this section do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses.” As these are already excluded from the definition of “research data,” it would be redundant for EPA to exclude them if they were using said definition. Also, by mentioning these exclusions while remaining silent on trade secrets and privacy information that are excluded from the definition of “research data,” EPA clearly signals that those data are not excluded from the “data” to which EPA refers in the proposal.
- Given that the cited definition of “research data” excludes privacy data, the following concern about privacy in §30.5 of the proposal would be a non-issue if EPA were to actually adhere to that definition: “The agency shall make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making such data available before it concludes that doing so in a manner consistent with law and protection of privacy, confidentiality, national and homeland security is not possible.”

Commenter (6924) states that there are many different kinds of data generated in a research study. The commenter states that the rule treats all these data as if they were the same when that is not the case, indicating the lack of scientific input into this rulemaking. The commenter states that a 2013 memo from Office of Science Technology and Policy recognizes different data types

and specifies that study meta-data, not individual-level data, should be made publicly available.²⁷²⁵

Commenter (6880) notes that, in §30.10, EPA states “EPA shall implement the provisions of this section consistent with the definition of ‘research data’”. The commenter states that, however, such definition applies only to §30.10. The commenter states that, if EPA meant for it to apply to the entire proposed regulation (as stated in the preamble), they would have stated that they “shall implement the provisions of this part consistent with” the cited definition.

Commenter (6126) asserts that the term “research data” in the proposed rule is ambiguous and needs clarity to assess the rule’s potential impacts and for commenters to understand how EPA intends to implement the proposed rule. The commenter states that EPA’s existing “Plan to Increase Access to Results of EPA-Funded Scientific Research” provides for exemptions to public release requirements when “the research data cannot be released due to one or more of constraints (sic), such as requirements to protect confidentiality, personal privacy, proprietary interest, or property rights.”²⁷²⁶ The commenter asserts that it is not clear if these same exemptions would apply under the proposed rule.

Commenters (6137, 6449, 6924) express concern that the definition of “research data” is not defined or impermissibly vague/has problems.

Response: Proposed 40 CFR 30.2 in the 2018 proposed rule included a definition of “research data.” In the 2020 SNPRM, the EPA deleted the proposed definition of “research data.” While one commenter on the 2020 SNPRM noted that the exclusions in the proposed definition of “research data” of trade secrets and personal and medical information were not incorporated into the proposed definition of “data,” commenters did not request that the EPA maintain a definition of “research data.” The EPA is not including a definition of “research data” in this final rule because the Agency is finalizing the definition of “data” in section 30.2 as follows:

Data means the set of recorded factual material commonly accepted in the scientific community as necessary to validate research findings in which obvious errors, such as keystroke or coding errors, have been removed and that is capable of being analyzed by either the original researcher or an independent party.

In addition, the EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. The rule allows the EPA Administrator to grant an exemption to the

²⁷²⁵ Executive Office of the President, Office of Science Technology and Policy. Memorandum for the Heads of Executive Departments and Agencies: Increasing Access to the Results of Federally Funded Scientific Research. February 22, 2013. Pg. 5. Available:

https://obamawhitehouse.archives.gov/sites/default/files/microsites/ostp/ostp_public_access_memo_2013.pdf

²⁷²⁶ Environmental Protection Agency. (2016). Plan to Increase Access to Results of EPA-Funded Scientific Research. (November 29). Available at: <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransparencyplan.pdf>

transparency requirements if the Administrator determines that greater consideration is warranted when:

- Technological or other barriers render sharing of the dose-response data infeasible;
- The development of the dose-response data was completed or updated before the effective date of this final rule;
- Making the dose-response data would conflict with laws and regulations governing privacy, confidentiality, CBI, or national security;
- Third-party independent validation of the study's underlying dose-response data through reanalysis has been conducted; or
- The factors in 40 CFR 30.5 used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

4.1.2.2 Definition of "Data"

Comment: Commenters (0671, 5419, 6373, 9224) express the need for EPA to better define/clarify what "data" the rule applies to.

Commenter (6373) states that the impacts of the proposed changes will be difficult to predict unless EPA better defines what "data" the rule applies to.

Commenter (9224) suggests that if the agency wants a rule focused on the raw data then EPA must better define what "data" would be included within this rule. The commenter asks whether it is just data produced by EPA, the methods and protocols, or the actual raw data?

Similarly, commenter (0671) notes that there is a problem with the definition of "data... underlying pivotal regulatory science". The commenter asks whether this means the raw data or the data used to make the final figures and tables in a paper or the data as it exists at some processing step in between? The commenter further asks, if the raw data, how raw? The commenter notes that some raw genomic data is so large it can't be efficiently stored. According to the commenter, there is no one unique thing called "the data" for a study.

Commenter (5419) asserts that the interpretation of the term "data" has critical implications. The commenter notes that, for complete independent validation and analysis, as stated in the proposed rule, the primary data record would be required. According to the commenter, this could include, for example, raw death certificates and raw chemical monitoring data, both of which are subject to transcription error during creation of an analytical file, as well as, in the case of death certificates, challenges related to mortality coding. The commenter states that, notwithstanding privacy concerns, which is the subject of other portions of the proposed rule, the public posting of these large quantities of data would be unwieldy. The commenter requests clarification of this issue.

Response: As described in the 2020 SNPRM, the EPA agrees that there are different stages of data. The EPA presented the different stages as described in the NAS Workshop Report. Since the purpose of 40 CFR 30.5 is to determine the consideration to afford to studies based on, among other factors, the availability of the underlying dose-response data that would support

independent validation via reanalysis of the data underlying pivotal science, the appropriate stage of data would not be the processed data (data that have been computed and analyzed to extract relevant information) or the final clean data set that is provided with a publication. At these two stages of data, the analysis has already been conducted, and the results have already been determined. In order to determine if these results are valid, data that had not already been computed and analyzed are needed. Given concerns about potentially skewed analyses, the final definition of “data” maintains the stage of data in which obvious errors have been removed.

In this final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

The definition of “data” in section 30.2 of the final rule is as follows:

Data means the set of recorded factual material commonly accepted in the scientific community as necessary to validate research findings in which obvious errors, such as keystroke or coding errors, have been removed and that is capable of being analyzed by either the original researcher or an independent party.

4.2 SNPRM Models, Variability/Uncertainty, and Assumptions/Defaults

Overarching Response: As further described in the preamble to the final rule, based on public comments and other considerations, the EPA is concentrating its efforts in the final rule to increase transparency of dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. The EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA’s most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings. Because this rule only applies to dose-response data, the Agency is not finalizing the definition of “model.”

4.2.1 Modeling Definitions

Comment: Commenters (11401, 12406) express support for the clarity achieved by defining “model.” Commenters (12406, 12463) also express support for the clarification of the terms “models” and “model assumptions.”

Conversely, several commenters (11894, 12435, 12720) express criticism of modeling definitions as being unclear or too broad.

Commenter (12435) indicates the supplemental notice of proposed rulemaking (SNPRM or supplemental proposal) definition of “model” is too broad to be useful. Commenter (12727) states that the definition, among other definitions, fails to adequately comprehensively describe the scope of its proposal. As a result the commenter contends that the EPA has denied the public the information it needs to comment in an informed way.

Commenter (11894) asks whether the definition of “model” applies only to “computational models”. The commenter notes that previous guidance documents use the same definition of “model” to focus on the subset of all models termed “computational models” by the National Research Council (NRC). The commenter provides that these are models that use measurable variables, numerical inputs, and mathematical relationships to produce quantitative outputs. The commenter requests clarification as to whether the Agency envisions the same scope of applicability in the promulgation of the proposed rule.

Commenter (12720) states the definition of “model” is overly general and vague does not address how EPA engages with models and modeling output in conducting its scientific activities. The commenter adds that the definition does not distinguish between physical models, conceptual models, and software modeling packages, nor does it explicitly account for models applicable within the human health context, even though that type of tool is commonly deployed by EPA in its scientific work. According to the commenter, in failing to define models and distinguish between modeling inputs and outputs, EPA’s definition is flawed and insufficient.

Response: EPA appreciates these comments. As discussed in the overarching response to this chapter, the Agency is not finalizing the definition of “model.” Because this rule only applies to dose-response data, the rule does not apply to computational models.

4.2.2 Models (General) and Best Science Practices

Comment: Commenter (11484) indicates that by expanding the proposed rule to include all data and models rather than just dose-response data and models, it restricts the use of scientific information for arbitrary and non-scientific reasons. The commenter states that the newest version of the proposed rule expands the range of decisions that will be hampered by lack of access to the best available science.

Commenter (11347) suggests a connection between the impact of this rule and the present coronavirus pandemic. They note that policy and action should be increasingly based upon scientific results coming from powerful and reliable models in a constant state of evolution as the models themselves improve and as the inputs change. The commenter contends that the supplemental proposal would place such work in limbo. In other words, the commenter states that it doesn’t take advantage -- in fact, it denies the efficacy of advances in computational science and other ways of creating reliable and complex models to help us solve these countless problems.

Commenter (11894) indicates that it is imperative to understand that empirical data do not exist for every element of a risk evaluation and that models, many of which have already been peer-

reviewed and validated, are employed to fill the data gaps and allow the Agency to reach conclusions about risk.

Commenter (12688) states that EPA's proposed rule will require the Agency to ignore both foundational and cutting-edge research in core areas of public health and other scientific inquiry. According to the commenter, these could include, for example, models key to understanding earth and atmospheric systems and a limitless range of other research. In short, the commenter contends that the proposal would undermine EPA's ability to use science to protect the health of US residents across all facets of the agency's work.

Response: See response to prior comment. The EPA disagrees that implementation of the rule would undermine public health protections. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the public's understanding of the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. As further described in the preamble to the final rule, the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be hampered by lack of access to the best available science or prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Finally, this rule will not impact the Agency's use or reliance on models.

Comment: Commenter (11393) expresses concern regarding the rule's potential impacts on health risk assessments. The commenter specifically expresses opposition to language that removes or dilutes the linear no-threshold (LNT) dose response in the evaluation or establishment of radiation health risk assessments, rule-making or establishment of radioactive recommended action levels or benchmarks (influential scientific information) made available to the public.

Response: After considering comments on both the 2018 proposed rule and the 2020 SNPRM, the EPA has determined that this rule should apply to dose-response data rather than dose-response data *and models*. Therefore, the rule does not include discussion of any particular dose-response model. Given the specificity of 40 CFR 30.6 to dose-response data and models, and in particular dose-response models, the EPA is not finalizing 40 CFR 30.6. The EPA is adapting one provision of 40 CFR 30.6 as a factor in 40 CFR 30.5 in determining the consideration to afford pivotal science for which the dose-response data are not available for independent validation. Specifically, the EPA is finalizing as a factor in 40 CFR 30.5 the consideration that the EPA would give to high quality studies that explore a broad class of parametric dose-

response models, non-parametric models that incorporate fewer assumptions, various threshold models, and models that investigate factors that might account for spatial heterogeneity.

Comment: Commenter (11492) indicates that the EPA continues to assign greater value to dose-response studies, which by definition reduce the use/value of epidemiological studies. Section 30.6 of the supplemental proposal has been revised but continues to give “explicit consideration to parametric dose-response or concentration-response models.” As the commenter suggests they stated in its 2018 comments, the EPA itself admits that, “there is frequently a lack of dose-response data available for human subjects. When data are available, they often cover only a portion of the possible range of the dose-response relationship.”¹ The commenter states that this gives more weight to toxicological studies as opposed to epidemiological studies, which form the basis of many human health exposure studies. The commenter asserts that the EPA must continue to use epidemiological studies; to do otherwise is to compromise the health of all Americans. Commenter (12403) concurs, indicating that the SNPRM's identification of specific dose-response modeling techniques that would be given "explicit consideration" is inappropriate and ignores the improvements and refinements that are the hallmark of good science.

Response: Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7.

The EPA disagrees that the rule implies a bias against the use of epidemiology studies or data. The final rule includes sufficient flexibility in terms of the allowance for restricted access, considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data to minimize such potential unintended consequences. The EPA will continue to consider and evaluate all relevant and appropriate science, including epidemiology studies, in its significant regulatory actions and influential scientific information.

In addition, after considering comments on both the 2018 proposed rule and the 2020 SNPRM, the EPA has determined that this rule should apply to dose-response data rather than dose-response data *and models*. Therefore, the rule does not include discussion of any particular dose-response model.

Comment: In support of existing model availability, commenter (11894) provides the specific example of the trichloroethylene (TCE) case study. The commenter notes that the TCE assessment relied on approximately 15 models. The commenter notes that this is likely to be the

norm with the same ones being used repeatedly. The commenter adds that most of the models EPA employs in the TSCA program have been developed by the Agency and are publicly-available. The commenter provides that access can be gained through a number of EPA webpages and/or searches on the internet, and others are described in the peer-reviewed literature, access to which is controlled by the authors.

Response: After considering comments on both the 2018 proposed rule and the 2020 SNPRM, the EPA has determined that this rule should apply to dose-response data rather than dose-response data *and models*. Therefore, the rule does not include discussion of any particular dose-response model.

Comment: Commenter (12465) states that the EPA relies upon many types of data and models to support its regulatory decisions and it is unclear that the current proposal has adequately considered the numerous types. The commenter expresses concern that the treatment of existing data or models under the proposals disincentivize the generation of new data under the new requirements while reducing the importance of consideration of existing data, regardless of the scientific validity or merit of that data.

The commenter (12465) provides the example of the Westat Survey. The commenter notes that the report entitled “Household Solvent Products: A National Usage Survey” (or the Westat Survey) is a survey of consumer usage for a wide variety of products to determine various attributes and inform exposure assessments. According to the commenter, while the report was completed in 1987, it remains in use today informing the EPA’s Consumer Exposure Model and the Westat Survey informed several of the first 10 chemicals currently being evaluated under reformed TSCA. The commenter states that it is unclear in the proposal how the Westat Survey would be treated, let alone the multitude of exposure models that rely upon it.

Response: As further described in the preamble to the final rule and the overarching response to this chapter, the EPA is not finalizing the definition of “model.” The rule only applies to dose-response data and will not impact the Agency’s use or reliance on models, including exposure models. Since the Westat Survey is a consumer behavior survey for assessing exposure, it would also not be applicable to this rule.

The EPA disagrees that the rule disincentivize the generation of data. The final rule includes sufficient flexibility in terms of the allowance for restricted access, considerations in 40 CFR 30.5, the Administrator’s exemption in 40 CFR 30.7, and the EPA’s incremental approach to maximizing transparency by first focusing on dose-response data to minimize such potential unintended consequences. The EPA will continue to consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information.

4.2.3 Public Availability of Models/Data

Comment: Several commenters (11392, 11393, 11407, 11576, 11894, 12430, 12472, 12474, 12720, 12727) express opposition to requiring models and data be publicly available. Commenter (11393) opposes these expansions; and contends that the SNPRM takes a bad proposal and makes it worse.

Commenter (12727) indicates that EPA has not demonstrated—and cannot demonstrate—that a study cannot be scientifically valid unless the underlying data and models are publicly disclosed. The commenter states that mechanisms are already in place to validate studies for which disclosure of underlying data and models is either illegal or impracticable.

Commenter (12472) indicates that expanding the scope to include all models would place a particular burden on air quality models and potentially have an adverse impact on public health. According to the commenter, if air quality models are included, the data access requirements described in the SNPRM may pose difficulties in some instances, particularly for emissions inventories used in modeling.

Commenter (11576) highlights the impact on environmental-fate studies and models if these types of studies are included in its new, broader scope. The commenter provides that these data and models are critical for the EPA's assessments of the environmental risks of pesticides, for example, and the Agency has relied on well-established studies that were conducted before mechanisms existed for sharing data publicly. The commenter adds that the EPA also mentions bioaccumulation data as an example of the types of studies included in the new expansion, which they contend could unjustifiably undermine established science on the accumulation of mercury, lead, and other metals in aquatic systems and wildlife, as well as models used by the EPA for decades to describe accumulation.² The commenter contends that the requirement for publicly available data underlying all model parameters would be particularly problematic and potentially impossible for models developed iteratively over decades, in which model parameters and structure evolve with growing science without the need for publicly available documentation of all the underlying parameters' source data.

Commenter (11894) points out that databases of publicly available models already exist, such as the Registry of EPA Applications, *Models and Data Warehouses* (READ) (available at https://ofmpub.epa.gov/sor_internet/registry/systmreg/searchandretrieve/basic/search.do), which catalogs publicly-available models that the agency uses. The commenter provides that there are currently 2,197 entries in this library of tools, a subset of which are models. And, specific to EPA's Existing and New Chemicals programs, Office of Chemical Safety and Pollution Prevention (OCSPP) hosts a web page (Predictive Models and Tools for Assessing Chemicals under the TSCA, available at <https://www.epa.gov/tsc-screening-tools>). The commenter adds that using these two sources and others available by searching the internet, one can access the publicly-available, Agency-developed models that it employs. The commenter notes that if the Agency has to resort to the use of a proprietary model to conduct some aspect of its work, it is not within its purview to release the code to it. Under that circumstance, the commenter notes that one must arrange that with the owner of the model. This, according to the commenter, however, has become an increasingly rare circumstance.

Commenter (11894) notes that securing the release of proprietary modeling information is difficult, and places an undue burden on EPA. The commenter adds that if the Agency has to resort to the use of a proprietary model to conduct some aspect of its work, it is not within its purview to release the code to it.

Commenter (12430) states that models are critical to help humans assess and analyze large quantities of data, but they are nearly always proprietary. The commenter provides that most scientists and agencies purchase access use these models for data. The commenter contends that restricting models to those that are publicly available would severely limit the science that U.S. EPA may consider or reference.

Commenter (12720) indicates that for many studies, proprietary software and/or proprietary code is necessary in order to effectively work with underlying study data. However, the commenter states that these models are generally not freely available to the public, and many require advanced technical training and considerable technical resources to operate. The commenter notes that the EPA has not discussed this issue in the proposal, even though it presents a major obstacle to the goals of the proposal. According to the commenter, for already burdened researchers, it is not feasible to expect them to provide underlying code (which may be subject to other release requirements and advance permissions) to the Agency and places an undue burden on the EPA.

Conversely, commenter (12712) expressed support for making models/data publicly available wherever possible. The commenter suggests that the default rule for all work funded by the EPA must be that relevant code and data are available online or on request. The commenter adds that the EPA must be clear that making data available means that the actual final dataset used in statistical analysis is made available.

Response: As further described in the preamble to the final rule, based on public comments and other considerations, the EPA is concentrating its efforts in the final rule to increase transparency of dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. The rule does not apply to other types of data and models, including bioaccumulation data and environmental fate and transport models. The EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

EPA does not take the position that studies for which the underlying data are not publicly available are per se invalid. Rather, EPA acknowledges that where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty.

EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum "Increasing Access to the Results of Federally Funded Scientific Research" and the 2016 EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research." EPA researchers, grantees, and contractors are required to make peer-reviewed journal articles and the underlying data and models resulting from EPA-funded research accessible to the public.

4.2.4 Weighting of Models

Comment: Commenter (9362) supports the wording of section 30.6 “When available, EPA shall give explicit consideration to high quality studies, including but not limited to those that explore: A broad class of parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity.” However, the commenter states that “nonparametric models that incorporate fewer assumptions” should be explicitly stated in this sentence. The commenter notes that parametric models may be more appropriate in many cases.

Commenter (11395) suggests that the “explicit consideration” language of section 30.6 is inappropriate because the scientific information, techniques and models used in risk assessments are developing rapidly. Therefore, the commenter suggests that risk assessment methodology should be addressed in guidelines, which can be adjusted as more information becomes available, rather than with fixed regulations. Instead of establishing inflexible regulatory requirements, the commenter adds that the Agency should focus on continuing to improve its existing guidelines, in concert with other federal agencies. The commenter adds that the specific identification of modeling considerations in a regulation is inappropriate because multiple analyses using a variety of models do not necessarily make a study more credible, there is no scientific justification for this stipulation. The commenter adds that model choices consider such factors as biological plausibility and the degree of protection to human health. According to the commenter, an evaluation of a study that uses modeling should assess model assumptions, the fit of the model to the dataset, the goal of the analysis, and other issues. The commenter contends that the use of a greater number of models does not in itself improve results or make a study more plausible. Therefore, the commenter asserts that giving priority to studies based on the number or range of models used is scientifically inappropriate and may create an incentive for using inappropriate models without scientific justification, which may generate inaccurate outputs.

Commenter (10740) states that, under the supplemental proposal, EPA would be required not only to prepare its own models with multiple assumptions, but also to “give explicit consideration” to a long list of models that could be prepared by outside stakeholders. The commenter provides that the proposal presents a list of these models that EPA must *explicitly* consider, such as a “broad class of parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity.”

The commenter (10740) suggests that perhaps it is the intent of this proposed rule to *preclude* scientific evidence based on data and models informed by raw data, including medical records, that is required to be held confidential. The commenter asserts that this is not transparency and nor is it science.

Response: As further described in the preamble to the final rule, based on public comments and other considerations, the EPA is concentrating its efforts in the final rule to increase transparency of dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. The rule does not apply to dose-response models or other types of data and models. Therefore, the rule does not include discussion of any particular dose-response model. The EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

4.2.5 Scope of Models Included

Comment: Commenter (11894) contends that the EPA has not adequately explained why the scope should be expanded to include far more models. The commenter asserts that when a federal Agency proposes to make such far ranging changes, it is obligated to explain why and to support that with data and information.

Response: As further described in the preamble to the final rule, based on public comments and other considerations, the EPA is concentrating its efforts in the final rule to increase transparency of dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. The rule does not apply to dose-response models or other types of data and models.

Comment: Commenter (12472) expresses that the expansion could potentially impact on air quality models, and requests that EPA make explicit whether these models are included under the rule. The commenter specifically requests that the EPA clarify whether air quality and associated models such as Comprehensive Air Quality Model with Extensions (CAMx) are included as models subject to the rule.

Response: As further described in the preamble to the final rule, based on public comments and other considerations, the EPA is concentrating its efforts in the final rule to increase transparency of dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. The rule does not apply to dose-response models or other types of data and models, including air quality models.

Comment: Commenter (12699) quotes § 30.3 "The provisions of this part apply to data and models, underlying pivotal science supporting influential scientific information and/or

underlying pivotal regulatory science used to justify significant regulatory decisions regardless of the source of funding or identity of the party conducting the science.” The commenter notes that the comma after “data and models” appears to be communicating that the provisions apply to data and models, underlying *pivotal science*, and/or underlying *pivotal regulatory science*. Unfortunately, the commenter contends that this language could create confusion by giving the impression that the provisions only apply to data and models. According to the commenter, since this is unlikely what the EPA intends, they recommend that EPA make § 30.3 clearer.

Commenter (12699) adds that, if in fact the EPA does only intend to cover data and models, then this would make little sense and beg the question why it would not cover *pivotal science* and *pivotal regulatory science*. The commenter notes that both are critical in practice and for purposes of the rule. The EPA would be creating a transparency rule to help the public evaluate the science, and then arbitrarily only allow the public to evaluate a subset of what informs *influential scientific information* and *significant regulatory actions*.

Response: As further described in the preamble to the final rule and the overarching response to this chapter, the Agency is not finalizing the term “model.” Therefore, the rule does not apply to dose-response models or other types of data and models. The text from 40 CFR 30.3 quoted by the commenter has also been clarified to now read: “The provisions of this part apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.”

The EPA acknowledges confusion over the definition of “science that serves as the basis for informing a significant regulatory action” and is altering the definition of the term in 40 CFR 30.2 to mean “studies, analyses, models, and assessments of a body of evidence that provide the basis for EPA significant regulatory actions.” Examples of models include those used in regulatory impact analyses. Examples of assessments of a body of evidence include risk assessments, hazard identifications, IRIS assessments, and criteria documents. The EPA also clarifies in the final rule that the scope of science that serves as the basis for informing a significant regulatory action is equivalent to the science included in the public docket as part of a rulemaking, but not all of that body of science would typically be considered “pivotal science.”

4.2.6 Assumptions/Defaults-Variability/Uncertainty

Comment: Commenter (11403) expresses that in peer-reviewed scientific publications, scientists state their assumptions as well as all model assumptions in the method sections (or else cite a publication that discusses those assumptions), so the peer-review process already provides this level of transparency. In addition, the commenter states that parametric models should not be favored over non-parametric ones. The commenter asserts that favoring one type of modeling over another does not support good science.

Response: As detailed in OMB’s Final Information Quality Bulletin for Peer Review, “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review does not typically include reanalysis of the underlying data (i.e., the

proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule. Where underlying dose-response data in pivotal science are available, subject matter experts could do more than evaluate the validity of an assumption; experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. The EPA is confident that this approach will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

Finally, the final rule does not apply to dose-response models and does not prioritize types of dose-response models.

Comment: Commenter (12430) states that requiring justification for all default assumptions ignores the establishment of defaults through prior public processes and external public peer reviews. For example, the commenter notes that requiring justification for the use of default assumptions for every toxicity health factor derivation ignores the detailed development process of those default assumptions. The commenter states that those default assumptions were developed in several U.S. EPA documents (including the 2005 Guidelines for Carcinogen Risk Assessment³), which received public comment and extensive external peer-review. Requiring EPA to re-justify those default assumptions every time they are used, as the SNPRM seems to require, would serve no purpose other than to add unnecessary delay to risk assessments, regulatory action, and publication of influential scientific information.

Conversely, commenter (9362) expresses support for language that states that the “EPA shall describe and document any assumptions and methods used and shall describe variability and uncertainty”. The commenter further supports language that states “EPA shall clearly explain the scientific basis for critical assumptions used in the analysis that drove the analytical results and subsequent decisions and shall present analyses showing the sensitivity of the modeled results to alternative assumptions.” The commenter notes that it is good if all source information is disclosed. The commenter further supports language that states “[b]ecause transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA’s justification for the assumptions applied and the implications of those assumptions for the results,” noting that it is great as long as all pertinent scientific information is included.

Response: The EPA clarified in the SNPRM that the use of the terms “model assumptions,” “assumptions” and “models” in the proposed regulatory text at 40 CFR 30.6 apply to the critical assumptions that drive the model’s analytic results, not to each assumption used in the model. In the final rule, the EPA maintained the use of “critical assumptions” rather than “all assumptions” in what is now 40 CFR 30.5(e). The EPA also made edits to the text that the commenter quoted regarding peer review in what is now 40 CFR 30.6 to conform with the applicability of the

rule to dose-response data. The EPA agrees with the commenter that greater data availability will allow peer reviewers to better evaluate and articulate the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results.

Comment: Commenter (11361) provides that the EPA describes its intent for the proposed public data requirements to "allow stakeholders to reanalyze the data and models and explore the sensitivity of the conclusions to alternative assumptions." The commenter contends that this begs the questions of who the assumed "stakeholders" are and what the purposes are behind developing alternative assumptions.

The commenter (11361) adds that the EPA goes on to say the rule would "allow assessment of the robustness of the original analysis and conclusions by, for instance, showing the variability that can occur when a previously omitted variable is added to the statistical model, different functional form assumptions are made (e.g., a linear marginal effect of treatment), or different assumptions are made when estimating standard errors and drawing statistical inferences (e.g., allowing for spatial correlation in error terms)." According to the commenter, this is highly problematic, however, and is an overt way to attack credible science with unfounded critiques. The commenter notes that all statisticians know that including too many variables is at least as flawed, and often more so, than including too few variables, and one can artificially increase or decrease model fit without any theoretical grounding. Likewise, the commenter adds that decisions about functional forms are typically grounded in theory, and even if they are not, clear relationships can be obfuscated by limiting or overwriting functional forms. According to the commenter, applying a different functional form (e.g. linear rather than log-transformed) would always change the results and could obscure meaningful relationships. The commenter contends that the EPA is not providing an opportunity to improve science through this proposed rule. The commenter states that, for research that has gone through peer review (as the EPA, thankfully, clarifies it expects for research that is included in significant agency decisions), altering model inputs, structure, and assumptions are easy mechanisms for unsophisticated and inappropriate muddling of credible and substantiated models.

Commenter (11495) notes that the proposed rule suggests that data reanalysis will be completed by "stakeholders", who will have the opportunity to "reanalyze the data and models and explore the sensitivity of the conclusions to alternative assumptions while accessing only the data and aspects of the models that they need". The commenter states that there is a lack of clarity over who the "stakeholders" involved in this analysis may be, and that the suggestion that they may cherry pick data to force into models that support "alternative assumptions" goes directly against the scientific process and certainly looks at least superficially like exactly the sort of bias the EPA is hoping to avoid with their rule. According to the commenter, while good faith use of alternative methodologies to test sensitivity of various inputs is good scientific practice, expecting the same research data to yield the same results when put through alternative methodologies, potentially employed by undefined stakeholders who have the potential to intentionally introduce bias, is not a credible deployment of the scientific process.

Response: The EPA agrees that the word "stakeholders" in the SNPRM preamble was not defined. In this context, stakeholders meant any subject matter expert who has not contributed to

the development of the study. The EPA fixed this inconsistency in the final rule and only uses the term “subject matter expert.” Researchers generally use a number of assumptions in their development of a scientific assessment. The impact of the use of the assumptions is not always clear, particularly when the underlying data are not available. The intent of the language was to explain a benefit of greater transparency in the underlying data—that subject matter experts could validate the study conclusions using the same assumptions, but also reanalyze the data using alternative assumptions to better understand the sensitivity of the results to the assumptions.

The EPA disagrees that the rule does not offer an opportunity to improve science. The benefits of greater data transparency and the significance of reanalyzing and validating study results are well-documented in scientific literature. McNutt (2014) noted, “reproducibility, rigor, transparency, and independent verification are cornerstones of the scientific method.”²⁷²⁷ The National Academies of Sciences, Engineering, and Medicine (NAS) workshop on Reproducibility and Replicability in Science also noted that “certainly, reproducibility and replicability play an important role in achieving rigor and transparency.”²⁷²⁸ Munafò et al. (2017) state, “the credibility of scientific claims is rooted in the evidence supporting them, which includes the methodology applied, the data acquired, and the process of methodology implementation, data analysis and outcome interpretation. Claims become credible by the community reviewing, critiquing, extending and reproducing the supporting evidence. However, without transparency, claims only achieve credibility based on trust in the confidence or authority of the originator. Transparency is superior to trust.”²⁷²⁹ The 2019 NAS workshop on Reproducibility and Replicability in Science also concluded, “the scientific enterprise depends on the ability of the scientific community to scrutinize scientific claims and to gain confidence over time in results and inferences that have stood up to repeated testing.”²⁷³⁰ The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety.

Comment: Commenter (12472) provides that non-public data or tools are often used in EPA modeling, replication and verification of data and models, therefore, the commenter suggests that the use of these data and tools should be addressed in the SNPRM. For example, the commenter notes that the Integrated Planning Model (IPM) is used to generate future year Electricity Generating Units (EGU) emissions. The commenter states that the IPM is a proprietary model which is used extensively by EPA and cannot be verified or replicated by

states. The commenter requests that the EPA provide additional details on the suitability of using EPA's modeling results in specific regulatory settings based on these variability, uncertainty, and verification issues.

Response: As further described in the preamble to the final rule, based on public comments and other considerations, the EPA is concentrating its efforts in the final rule to increase transparency of dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. Because this rule only applies to dose-response data, the Agency is not finalizing the definition of "model."

4.2.7 Impacts on Older/Existing Models

Comment: The supplemental proposal maintains its original position in section 30.5 that the rule would apply to studies, data, and models regardless of when they were published, but requests comments on whether this should apply only to data and models that are generated after the effective date of the rule making.

Several commenters (11386, 11407, 11490, 11491, 12474, 12546, 12702, 12727) express opposition to applying the rule to existing/older models. Commenter (11576) provides that the EPA's own SAB has warned that "[f]or studies published many years ago, it may not be feasible to deliver public access to data and analytic methods[.]" and "[t]here are also sensitive situations where public access may infringe on legitimate confidentiality and privacy interests, and where exceptions from complete public access may be appropriate."

Commenter (11894) states that the Agency is again asking for commenters to weigh options for addressing older studies without providing any analysis of the relative costs, benefits and disruption not only to the Agency and the processes it manages, but for those scientists who produced the studies in question.

Commenter (12710) states that, in 2018, they stated their concern that most studies prior to the digital age would not meet the proposed requirements for data transparency; this would lead EPA to dismiss most of the science conducted in the 20th century, including seminal studies on the health and environmental effects of pesticides. The commenter provides that the preamble of the SNPRM clearly confirmed this concern by stating "[p]roposed 40 CFR §30.5 would maintain the temporal approach to data and models taken in the regulatory text of 40 CFR §30.5 of the 2018 proposed rulemaking, and thus would apply to data and models evaluated at the time a significant regulatory action or influential scientific information is developed, regardless of when the data and models were generated." The commenter asserts that if EPA were to go forward with the proposal, we strongly recommend that the new transparency guidelines apply only to studies conducted after the proposal goes into effect.

Commenter (11490) opposes applying the rules to older models and studies. The commenter states that high quality studies published to date must not be excluded on the grounds that authors did not follow data sharing practices which were not required nor expected at the time of publication.

Commenter (11386) states that if this rule were to be put into practice, it is clear that this should only apply to data and models that are generated after the effective date. According to the commenter, even if the transparency of data and ability to be reanalyzed did indicate quality of science, then this information was available to EPA when considering past rules. The commenter adds that nothing about the science used to make previous rules will be changed as a result of this new rule. Thus, the commenter asserts that to suddenly treat previous studies in a way different from how they were previously treated by the EPA would be arbitrary and capricious, as nothing about the studies themselves had changed. The commenter notes that if new information came to light, such as new studies or a reanalysis of previous studies, then it would be quite reasonable for this to potentially change how older studies are considered. However, the commenter concludes that to apply different consideration to previous studies due to factors that have nothing to do with the science itself would be completely arbitrary.

Commenter (12727) states that there are compelling reasons why it may be impossible or infeasible to provide access to data and models underlying older studies. The revised and alternative approaches therefore fail to address one of the most substantial shortcomings of the original proposal—one that EPA has explicitly acknowledged in its supplemental proposal.

Commenter (11921) asserts that older studies that did not and are unable to comply after a prolonged interval still have substantial scientific merit and value for informing regulations. Some such studies, *e.g.* the NIOSH/NCI Diesel Exposed Miners Study (DEMS) have made their data available through federal Research Data Centers. However, the data for other critical studies, *e.g.* the North American Rubber Workers Study, which has played and continues to play a key role in assessment of risk from 1,3-butadiene and styrene, was designed and implemented at a much earlier time and would not be readily available. Although the proposed supplemental proposal does suggest that the age of a study and the difficulty of gaining access to the underlying data could be a basis for the Administrator finding it impractical to make such data and methods available, and therefore exempting the study from this rule, such after-the-fact and potentially arbitrary determination would obstruct the continued use of a larger body of evidence – especially occupational studies that are critical to consider the effects of the toxicity of a number of specific chemicals.

Conversely, several commenters (11499, 11922, 12454) support applying the rule to older/existing models generated/developed before the effective date of the rule. Commenter (11499) supports including all existing models and studies in the scope of the proposed rule and giving the Administration discretion over the case-by-case exemptions.

Commenter (12454) states that given the rule's goal of enhancing transparency in science, the support existing data and models being covered if they underlie "pivotal regulatory science" in a rulemaking or "pivotal science" in the development of influential scientific information.

Commenter (11922) states that the rule should apply to all models and studies when evaluated for pivotal or influential utilization in decision-making as opposed to only those developed after this rulemaking.

Commenter (11491) asserts that a case-by-case exemption granted by the Administrator for the consideration of older data and models to be unacceptable. If the proposed rule is finalized, the commenter states that it should prevent all retroactive application by placing older data and models outside the scope of the rule. The commenter notes that case-by-case exemptions are not an adequate substitute for removing this older category of science from the rule's scope; not only does the use of exemptions for this purpose increase uncertainty and internal process, but it introduces the possibility of bias by this or a future EPA.

Response: The EPA considered these comments in the development of the final rule. The EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. One of the criteria the Administrator may use in his/her determination to grant a waiver is that the development of the dose-response data was completed or updated before the effective date of the rule. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The EPA also maintains that the Administrator is the appropriate decision maker in the context of granting exemptions under this rule. To ensure that the Administrator's decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will also provide clear documentation.

4.2.8 Linear vs Nonlinear Modeling

Comment: Commenter (11479) objects to EPA's recommendation to use non-linear modeling over linear modeling. The commenter states that force-fitting non-linear models, without scientific justification, could bias the data to such a degree that low doses of a pollutant may

appear less harmful – or even beneficial – to the health of person. The commenter adds that if scientifically unjustified weight is given to non-linear models to assess relationships between pollutants and health in EPA policy decisions, these decisions are likely to disproportionately affect the sensitive populations that EPA is charged with protecting.

Commenter (11499) states that the EPA should not be so prescriptive in the use of linear vs non-linear modeling. The commenter recommends that EPA tweak the language in proposed 40 C.F.R. Section 30.6 to say: “EPA shall evaluate the appropriateness of using default assumptions on a case-by-case basis, including assumptions of a linear, no-threshold dose response and other default assumptions as appropriate.” The commenter notes that the public needs to understand clearly why EPA selects particular models to evaluate dose-response effects of exposure to different substances and what uncertainty factors are included for the model chosen in regulatory decision-making for those substances. The commenter adds that public access to information on model selection and uncertainty factors is as important as transparency of underlying data. According to the commenter, if the final rule fails to include this discussion, the Agency has lost an important opportunity to guide regulators and the public on evaluating these underlying default models, particularly when they involve metals risk assessments.

Commenter (12454) supports the use of a non-linear model relationship because many metals are essential nutrients that result in non-linear dose-response toxicity relationships, but EPA often fails to consider non-linear dose-response approaches in assessing metals and metal compounds. The commenter posits that the Agency can include a specific reference to “assumptions of a linear, no-threshold dose response” without implying that the Agency should not evaluate other default assumptions by tweaking the language in proposed 40 C.F.R. section 30.6 as recommended by the North American Metal’s Council (NAMC) in their comments (references commenter 11499).

Response: In the 2020 SNPRM, in response to public comments, the EPA proposed a variation of the regulatory text which did not include the phrase “including assumptions of a linear, no threshold dose-response,” because this could imply that the regulation is specific to those particular assumptions. After considering comments on both the 2018 proposed rule and the 2020 SNPRM, the EPA has determined that this rule should apply to dose-response data rather than dose-response data *and models*. Given other changes to the regulatory text, the text quoted or referenced by the commenters is now in 40 CFR 30.5(e) and reads: “The EPA shall also describe critical assumptions and methods used in its dose-response assessment and shall characterize the variability and uncertainty of the assessment. The EPA shall evaluate the appropriateness of using default assumptions on a case-by-case basis. The EPA shall clearly explain the scientific basis for critical assumptions used in the dose-response assessment that the EPA relied on for the significant regulatory action or influential scientific information.”

4.2.9 Impacts on Specific Models

Comment: Commenters (11894, 12727) question the impacts of the supplemental proposal on Greenhouse Gases, Regulated Emissions, and Energy Use in Transportation (GREET)⁹, Motor Vehicle Emission Simulator (MOVES)¹⁰, Benefits Mapping and Analysis Program (BENMAP)¹¹ CE, Integrated Planning Model (IPM)¹², Model for the Assessment of

Greenhouse Gas Induced Climate Change (MAGICC)¹³ and Global Change Assessment Model (GCAM)¹⁴ models, as well as various Community Multiscale Air Quality Modelling System (CMAQ)¹⁵ models. The commenters suggest that it is incumbent on EPA to evaluate potential impacts of the proposal on all of its standard modeling tools and then provide the public with notice and opportunity for comment on these findings.

Commenter (12720) provides comments on the impacts of the proposed rule on the PBPK model. The commenter states that the EPA convened a FIFRA Scientific Advisory Panel in October 2017 to assess its use of a Physiologically Based Pharmacokinetic Model (PBPK) used in its risk assessment for the pyrethroid pesticides. The commenter notes that the PBPK model was sponsored and submitted to EPA by the Council for the Advancement of Pyrethroid Human Risk Assessment, L.L.C. (CAHRA). CAHRA identifies its participating parties as chemical and agrochemical manufacturers. CAHRA describes its intentions as follows: “The general area of CAHRA’s planned activity is to generate and submit to the [U.S. EPA] studies necessary to address EPA’s concerns for the potential for age-dependent sensitivity to Pyrethroids.”

Despite the central role of the pyrethroid PBPK model in EPA’s regulatory approval for pyrethroid pesticides, the commenter states that it appears that scientific peer reviewers on the FIFRA Scientific Advisory Panel (SAP) were unable to obtain the raw data necessary to provide a robust peer review of the model. According to the commenter, SAP Panelist Dr. Dale Hattis requested these data from EPA on September 6 and September 12 without receiving them, including “key data” for “evaluating the uncertainty in the modeling” and “data needed for assessment of the calibration of the PBPK models.”

Commenter (12720) provides comments on the impacts on the BenMAP, CO-Benefits Risk Assessment (COBRA) Health Impacts Screening and Mapping Tool,¹⁶ and other PM_{2.5} models. The commenter notes that a key component of those models is the application of exposure-response epidemiology to estimate the health implications of specific energy, climate, and air quality scenarios. The commenter states that the proposed rule does not explain how significant and burdensome data transparency requirements imposed on data and models used by the Agency would affect the existing models that EPA currently hosts and distributes to the international research community.

The commenter (12720) adds that it is not clear that the dose-response studies incorporated into these models would remain and, if not, the detrimental impact that change would have on efforts to describe health implications of future proposed rules. Importantly, the commenter notes that the EPA itself uses the BenMAP model to conduct health impact assessments as part of proposed rules; and the supplemental proposal does not include any discussion of the implications of data transparency requirements on the future implementation and use of EPA-endorsed software packages.

Response: As further described in the preamble to the final rule, based on public comments and other considerations, the EPA is concentrating its efforts in the final rule to increase transparency of dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. The rule does not apply

to dose-response models or other types of data and models, including the models noted by the commenters.

Also as described in the preamble to the final rule, based on the comments on the 2018 proposed rule and the 2020 SNPRM, including that the number of studies that would be subject to the rule might hinder rulemaking, the EPA determined that the Agency should pursue an incremental approach to maximizing transparency in the science that it relies upon by focusing the final rule requirements on dose-response data and, in particular, only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). The EPA considered commenters' assertions that the scope of the 2018 proposed rule would be so broad as to make implementation infeasible. The 2018 proposed definition of "dose-response data and models" would apply to dose-response data [and models] "used to characterize the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and the magnitude of a predicted health or environmental impact." This relationship of the dose-response data to the magnitude of a predicted health or environmental impact would require the consideration of an array of studies beyond those that characterize dose-response relationships, including, for example, studies that inform the dose-response modeling (e.g., benchmark response selection); studies that identify data for toxicokinetic adjustments that inform calculation of a human-equivalent point of departure (POD); and studies that inform the selection of uncertainty factors. The number of studies that are used to establish the relationship between dose-response data and models and the magnitude of a predicted health or environmental impact can potentially be very large. This may make implementing the rule as proposed infeasible for at least some significant regulatory actions and influential scientific information. While transparency in EPA decision making is the purpose of this action, transparency cannot be effectively accomplished if the means to that transparency are not feasible. Rather than having this final rule apply to all the studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact, the EPA is balancing transparency and feasibility by focusing on those studies that describe the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Specifically, the scope of dose-response data in this final rule is those studies consisting of the data integral to characterizing dose-response relationships. Therefore, the rule does not apply to PBPK models.

4.3 SNPRM Data, Variability/Uncertainty, and Assumptions/Defaults

4.3.1. Clarity of Proposed Definitions

Comment: Commenter (11391) quotes the SAB's review of the proposal that in the new requirement that all "data be made available is vague and, as a result, can be interpreted in different ways"²⁷³¹ and carries that sentiment to the supplemental proposal definition of data.

²⁷³¹ Science Advisory Board (SAB) Consideration of the Scientific and Technical Basis of EPA's Proposed Rule titled Strengthening Transparency in Regulatory Science 18 (2020), <https://perma.cc/D34M-979N>.

Response: This final rule does not require that all data be made available. Instead, the EPA may give greater consideration to pivotal science where the underlying dose-response data is available for independent validation.

Comment: Commenter (11894) asks whether the definition of “model” applies only to “computational models”. The commenter notes that previous guidance documents use the same definition of “model” to focus on the subset of all models termed “computational models” by the National Research Council (NRC). The commenter provides that these are models that use measurable variables, numerical inputs, and mathematical relationships to produce quantitative outputs. The commenter requests clarification as to whether the Agency envisions the same scope of applicability in the promulgation of the proposed rule.

Comment: Commenter (11919) also encourages EPA to better define what data must be publicly available. The commenter asserts that without a clear definition, the requirements of the rule will be open to a variety of interpretations leading to confusion and potential misuse.

Commenter (12435) indicates the supplemental notice of proposed rulemaking (SNPRM or supplemental proposal) definition of “model” is too broad to be useful. Commenter (12727) states that the definition, among other definitions, fails to adequately comprehensively describe the scope of its proposal. As a result the commenter contends that the EPA has denied the public the information it needs to comment in an informed way.

Commenter (12720) The commenter states the definition of “model” is overly general and vague does not address how EPA engages with models and modeling output in conducting its scientific activities. The commenter adds that the definition does not distinguish between physical models, conceptual models, and software modeling packages, nor does it explicitly account for models applicable within the human health context, even though that type of tool is commonly deployed by EPA in its scientific work. According to the commenter, in failing to define models and distinguish between modeling inputs and outputs, EPA’s definition is flawed and insufficient.

Conversely, commenters (9587, 11922, 11390, 11401, 12406, 12463) assert that the definitions of data and models provided in the supplemental proposal are clear. Commenter (11390) notes that it is hard to imagine a scientific study, dataset, or model that would not be subject to the supplemental proposal.

Response: The EPA has removed requirements pertaining to model because this regulation applies only to dose-response data, and therefore has removed the definition for model from 40 CFR 30.2.

In this final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by some commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

4.3.1.1 Stage of Data being Requested

Comment: Commenters (10740, 11495, 12435, 12471, 12546, 12712, 12720) note that there is a lack of clarity in whether the data being requested is the raw data collected throughout the experiment or only the finalized data set used to generate the study results. Specific examples of comments include:

Commenter (10740) states that, while the rule proposes an exclusionary test that eliminates individual studies based solely on whether the data is transparent, there is, however, no clear mandate that the raw data underlying these models be publicly available in a manner sufficient for independent evaluation.

Commenter (11495) discusses the level of data necessary for validation or replication. They highlight that epidemiological studies utilize several individual, but related, data sets to formulate conclusions. The commenter notes that only after the evaluation of these data sets by experts of different fields is a “final data set” established from which the study findings are finalized. The commenter notes that the supplemental proposal toggles between the need for all data from a study and only requiring the final data set that includes the interactions of all underlying data, and also indicates that the EPA’s discussion of data is alternating and confusing.

Commenter (12435) asserts that the definition of data is too broad to clarify the application of the rule and leaves room for the coverage of potentially any information. As published scientific results are often the final steps in a process involving several processing and analysis steps, the commenter contends that the definition provided does not clarify what step of data processing would be subject to this rule.

Commenter (12471) recommends that an additional definition for “Validated Data” be provided to mean “data with a proper level of quality assurance and has all obvious errors removed and that is capable of being analyzed by either the original researcher or an independent party” and the definition of “Data” in the supplemental proposal be edited to read “the set of observed and recorded material in a format that is commonly accepted in the scientific community as necessary to validate research findings.

Commenter (12546) indicates that “Cleaned-up” data is not the same as a data set in which “obvious errors” have been removed. This cleaned data set may also include harmonizing or transforming data to ensure consistency. The commenter notes that when comparing the definition of data used in the supplemental proposal and the 2016 EPA *Plan to increase access to results of EPA-funded research* (2016 EPA Plan), the 2016 EPA Plan’s definition is several steps after the raw data collection, indicating the EPA is inconsistent in its use of “raw” and “clean” data.

Commenter (12712) states the EPA must be clear that the actual final dataset used in statistical analysis is what needs to be made available, referencing an unacceptable form of data

presentation in “Assessing PM_{2.5} Exposures with High Spatiotemporal Resolution across the Continental United States.”²⁷³²

Commenter (12720) asserts that the definition of “data” is inadequate and an additional definition for “raw” data must be published by EPA.

Response: In this final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required for this rule would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information. However, given concerns about potentially skewed analyses, the final definition of “data” maintains the stage of data in which obvious errors have been removed. The EPA acknowledges that this definition of data is different the 2016 EPA *Plan to increase access to results of EPA-funded research*, but emphasizes that the definition for this final rule has been chosen in order to best meet the goal of reanalysis.

4.3.1.1.1 Accessibility of Raw Data

Comment: Commenters (11408, 11576, 10742) express concern that this rule may exclude older studies where the raw data and/or models may no longer exist and/or are difficult to access due to outdated methods of storage.

Commenter (11576) states that the EPA’s own SAB has warned that “[f]or studies published many years ago, it may not be feasible to deliver public access to data and analytic methods[,]” and “[t]here are also sensitive situations where public access may infringe on legitimate confidentiality and privacy interests, and where exceptions from complete public access may be appropriate.”²⁷³³ The commenter states that the rule could have the effect of excluding studies where it is not possible to make the underlying data publicly accessible would unnecessarily and irrationally exclude reliable science for no legitimate reason. The commenter states the requirement for publicly available data underlying all model parameters would be particularly problematic and potentially impossible for models developed iteratively over decades, in which model parameters and structure evolve with growing science without the need for publicly available documentation of all the underlying parameters’ source data. The commenter states that, while the size and storage practices for many large datasets and model outputs may not be suited for open sharing, this should not exclude them from consideration.

Commenter (10742) provides that the rulemaking is not clear if this rulemaking will allow EPA to cite and use studies where the data is no longer available due to antiquated technology or

²⁷³² 50 Environ. Sci. Technol 47124721 (2016), OI: 10.1021/acs.est.5b06121

²⁷³³ Science Advisory Board Consideration of EPA Proposed Rule: Strengthening Transparency in Regulatory Science (June 28, 2018) at 3 (attached), available at [https://yosemite.epa.gov/sab/sabproduct.nsf/cf0020ec3f99320a85256eb4006b6bd1/4ecb44ca28936083852582bb004ade54/\\$FILE/EPA-SAB-18-003%20Unsigned.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/cf0020ec3f99320a85256eb4006b6bd1/4ecb44ca28936083852582bb004ade54/$FILE/EPA-SAB-18-003%20Unsigned.pdf).

shifting norms in science (*i.e.* studies published before posting data and code publicly was widely encouraged and expected).

Commenter (11576) notes that raw data is less likely to be available over time compared to more processed data.

Response: In this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

4.3.1.1.2 Definition Fails to Acknowledge Common Errors

Comment: Commenter (12430) states that unscrubbed “raw” data can inappropriately skew results and cause significant issues in modeling and analysis for third parties who were not familiar with the data collection process due to various errors in the data set. The commenter notes that these errors can include outliers or incomplete data, which are not covered by the SNPRM’s definition. The commenter recommends scrubbed data that removes these errors remain valid under the proposed definition.

Response: In this final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required for this rule would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

However, given concerns about potentially skewed analyses, the final definition of “data” maintains the stage of data in which obvious errors have been removed.

4.3.1.1.3 Definition Oversimplifies Data

Comment: Commenter (12720) references the SAB’s suggestion that “it might be reasonable to consider the initial compilation of data (original data) in a spreadsheet as “raw” data,”²⁷³⁴ and points out that the Agency uses data from researchers that are not working from simple spreadsheets.

Response: The EPA is not finalizing its definition of “data” as specifically being the “initial compilation of data in a spreadsheet.”

4.3.1.2 Definition Is Not Corroborated With Scientific Community

Comment: Commenters (12720, 12727) provide that the definition of data used within the supplemental proposal is not in line with the definition generally used among the scientific community.

Commenter (12720) first asserts that the general conception of data does not include analysis by “an independent party” and that EPA does not provide rationale for the phrase’s inclusion in the definition. Additionally, the commenter considers the definition overly broad and that it is the scientific method that allows researchers to arrive at the study result. Furthermore, the commenter asserts that “obvious errors” are not “data,” even though some errors may be part of raw data sets not included in the analytical data sets used for the investigation and validation. Lastly, the commenter notes that the “original researcher” in question is not defined nor is there any consideration for typical scientific practice where teams of researchers and others are involved in the collection, analysis, and interpretation of data.

Commenter (12727) contends that EPA is attributing a flawed notion of validation to the scientific community through the definition and has failed to provide any analysis to suggest what the scientific community believes to be involved in study validation.

Response: The EPA disagrees that the definition of data provided conflicts with that generally accepted by the scientific community. The EPA has included “capable of being analyzed by either the original researcher or an independent party” in its definition of data because this rule is a reflection of the value the EPA places in the ability of subject matter experts being able to independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven

²⁷³⁴ EPA Science Advisory Board letter to Administrator Wheeler. EPA-SAB-20-005. 2020. “Science Advisory Board (SAB) Consideration of the Scientific and Technical Basis of EPA’s Proposed Rule Titled Strengthening Transparency in Regulatory Science,” April 24, 2020.

decisions in future rulemakings or in revisions to existing rules or influential scientific information.

4.3.1.3 Definition of Data Excludes Information

Comment: Commenter (11361) raises a concern that metadata is explicitly omitted from the requirement that clean data be made public. According to the commenter, metadata is used to orient users to the data, including its design, purpose, collection protocols, measurement precision, data architecture, etc. The commenter contends that, without this information, users may misuse or misinterpret the data, incorrectly calling data and analyses into question.

Response: The EPA notes that in 40 CFR 30.5(f), the EPA clarifies that “dose-response data is considered ‘publicly available in a manner sufficient for independent validation’ when it includes the information necessary for the public to understand, assess, and reanalyze findings,” and provides a list of information that may compose the relevant metadata.

Comment: Commenter (11892) asserts that due to tiering exemptions, the data that would be available for analysis by a third party would be limited. The commenter suggests that “supporting QA/QC [Quality Assurance/Quality Control] information” be included in addition to the “set of recorded factual material” to address this limitation.

Response: The EPA disagrees with the commenter, as data is factual material beyond simply information supporting QA/QC, and has therefore not made the suggested change in the final rule.

4.3.1.4 Expansion from Dose-Response Data and Models to All Data and Models

4.3.1.4.1 Opposition/Support for Expansion

Comment: Commenters (9493, 11103, 11362, 11390, 11392, 11393, 11396, 11399, 11400, 11404, 11479, 11484, 11492, 11576, 11895, 11920, 12412, 12430, 12466, 12474, 12540, 12546, 12688, 12715, 12719, 12727, 13549, 14397) oppose expanding the applicability from “dose-response” data and “dose-response” models to all types of data and models.. Specific impacts include:

Commenter (9493) contends that this was a significant expansion. As a result of this, members of the public will be required to address the implications of limiting the Agency’s reliance on “environmental fate studies, bioaccumulation data, water-solubility studies, environmental fate models, engineering models, data on environmental releases, exposure estimates, quantitative structure activity relationship data, and environmental studies”.

Commenter (11103) notes that the data included in the new definition would include those that inform decisions such as the 2011 Mercury and Air Toxics Standards (MAT), which saves up to

11,000 premature deaths in the United States according to the EPA's own projections.²⁷³⁵ The SNPRM, according to the commenter, would undermine EPA's fundamental mission to develop and enforce regulations that protect human health and the environment.²⁷³⁶

Commenter (11362) states that internal scientific assessments as well as policies under the CAA, Safe Drinking Water Act (SDWA), and TSCA require information that would be covered by the new definition, thus requiring them to disregard crucial and accurate data based on accessibility.

Commenter (11390) indicates that the proposed expansion is virtually all inclusive - given the parameters, it is hard to imagine a scientific study, dataset, or model that would not be subject to the proposed rule.

Commenters (11392, 11484, 11895, 11920, 12466, 11492) contend that the proposed expansion of the rule to all models would hinder EPA's use of the best available science in regulatory decisions.

Commenter (11392) provides that the expansion would impact the application of several data types (bioaccumulation data, data on environmental releases, and exposure estimates) used in EPA's regulation of toxic chemicals. Also, the commenter states there is no rationale for how this expansion would improve the Agency's ability to consider the best available science nor any evidence provided in support of the expanded scope.

Commenters (11393, 14397) note that the expansion would create an even higher burden on scientists or the Agency to maintain the increased amount of information that this definition provides for.

Commenter (11404) contends that the calculation of economic benefits from environmental regulation would not be possible without the data now covered by the expanded definition. The commenter provides the EPA's calculation that a Particulate Matter of 2.5 um or smaller (PM2.5) standard of 11 micrograms per cubic meter would contribute to health gains and lives saved worth as much as \$20 billion a year and the Bay Area's estimated cost savings of \$456,400 per ton of PM2.5 reduced in the area.^{2737,2738} According to the commenter, epidemiological data is critical to these analyses and should not be overlooked. Furthermore, the commenter states that covering all data would be harmful from the national level down to the local level and undermine the ability of environmental health agencies to carry out their mission.

²⁷³⁵ "Healthier Americans," last modified December 7, 2016, <https://www.epa.gov/mats/healthier-americans>.

²⁷³⁶ "About EPA: Our Mission and What We Do," last modified on February 7, 2018, <https://www.epa.gov/aboutepa/our-mission-and-what-we-do>.

²⁷³⁷ "Critics see hidden goal in EPA data access rule," Warren Cornwall, Science Magazine, May 4, 2018 • Vol 360 Issue 6388, <http://science.sciencemag.org/>.

²⁷³⁸ Bay Area Air Quality Management District 2010 Final Clean Air Plan, Volume 1, p. 1-13, <https://www.baaqmd.gov/~media/files/planning-and-research/plans/2010-clean-air-plan/cap-volume-i-appendices.pdf>

Commenters (11479, 12430) indicate that the expanded rule places more burden on modelers, and does not necessarily support best available science. Commenter (12430) states that the expanded scope would limit many studies on public health, and provides the example of *fecal indicator bacteria concentrations at beaches*, *EPA lifetime health advisories for Perfluorooctanoic Acid*, The Harvard Six Cities study and the American Cancer Society studies that informed the NAAQS.

Commenter (11576) asserts that the expansion introduces new types of privacy and sensitivity concerns for a broader set of public-health and epidemiological studies and a new set of concerns for many types of environmental data.

Commenter (12540) notes that the move from only dose-response data to all environmental and health data would eliminate studies from consideration by EPA, including those that underly EPA's rules under the SDWA, NAAQS, CAA, and Federal, Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Commenter (12727) states that the expanded SNPRM would conflict with EPA's ability to regulate emissions of hazardous pollutants under the CAA. The commenter references section 112 of the CAA, providing that EPA's definition of "data and models" to include "data on environmental releases" would eliminate data underlying emission standards under the section.

Commenter (12715) contends that while risk assessment evaluations performed under EPA's IRIS are not regulatory in nature, the toxicity factors provided by IRIS are used as the basis for many regulatory standards developed by EPA and numerous states, as well as federal and state guidance values and cleanup decisions. The commenter notes that some states' regulations require that IRIS toxicity factors be used as the basis for human health standards for environmental contaminants. According to the commenter, the SNPRM would significantly limit IRIS's consideration of and reliance on many key studies that are crucial for the assessment of human health effects and development of toxicity factors for environmental contaminants.

Commenter (12719) states that the expansion of the definition would have likely lead to the exclusion of data that contributed to the 1990 amendments to the CAA, which EPA estimated as preventing 230,000 early deaths in 2020.²⁷³⁹

Conversely, commenters (9587, 11397, 11401, 11499, 11500, 11922, 12406, 12467, 12612) promote the expansion of data coverage. Support for this expansion is due to:

Commenters (11397, 12467, 12612) state that limiting the scope of the proposal to the narrow definition of dose-response data and dose-response models would limit the efficacy of the proposal. Additionally, the commenter (11397) provides that the original limitation to dose-response data would have failed to carry out the directives in Executive Order 13777.

²⁷³⁹ "The Benefits and Costs of the Clean Air Act from 1990 to 2020." EPA 2011. <https://www.epa.gov/clean-airact-overview/benefits-and-costs-clean-air-act-1990-2020-second-prospective-study>

Commenter (11500) specifically outlines the necessity to apply the transparency rules to NAAQS proceedings, which would require the expansion as there are several types of data in addition to dose-response materials that are key considerations.

Commenter (11922) asserts that the public and regulated entities will have greater confidence in EPA's implementation of its policies and regulatory programs with the expansion of the supplemental proposal to cover all data and models.

Response: The EPA has considered these comments and determined to limit the scope of this final rule to dose-response data. The EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or more pollutants, contaminants, or substances are integral to the Agency's mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. In addition, the data underlying the dose-response assessment are more distinct than the broad range of data informing an entire risk assessment. Therefore, the EPA is concentrating its current efforts to increase transparency on a well-defined step in the quantitative assessment of risk supporting specific Agency actions.

Comment: Commenter (12472) expresses that the expansion could potentially impact on air quality models, and requests that EPA make explicit whether these models are included under the rule. The commenter specifically requests that the EPA clarify whether air quality and associated models such as Comprehensive Air Quality Model with Extensions (CAMx) are included as models subject to the rule.

Response: The EPA has removed requirements pertaining to model because this regulation applies only to dose-response data, and therefore has removed the definition for model from 40 CFR 30.2.

Comment: Commenter (12699) quotes § 30.3 "The provisions of this part apply to data and models, underlying pivotal science supporting influential scientific information and/or underlying pivotal regulatory science used to justify significant regulatory decisions regardless of the source of funding or identity of the party conducting the science." The commenter notes that the comma after "data and models" appears to be communicating that the provisions apply to data and models, underlying *pivotal science*, and/or underlying *pivotal regulatory science*. Unfortunately, the commenter contends that this language could create confusion by giving the impression that the provisions only apply to data and models. According to the commenter, since this is unlikely what the EPA intends, they recommend that EPA make § 30.3 clearer.

Commenter (12699) adds that, if in fact the EPA does only intend to cover data and models, then this would make little sense and beg the question why it would not cover *pivotal science* and *pivotal regulatory science*. The commenter notes that both are critical in practice and for purposes of the rule. The EPA would be creating a transparency rule to help the public evaluate

the science, and then arbitrarily only allow the public to evaluate a subset of what informs *influential scientific information* and *significant regulatory actions*.

Response: The EPA acknowledges the lack of clarity and has altered the portion of 40 CFR 30.3 relevant to this comment to read, “to dose-response data underlying pivotal science.”

4.3.1.4.2 Necessity for Expansion

Comment: Commenter (10972) contends that the rulemaking effort proceeds on the premise that you can have the same set of requirements for models and data across different fields. The commenter states that no factual basis is presented for the choice to shoehorn all models and all data in all sectors under the same standard; it is an arbitrary approach. The commenter provides that for example, the preference for non-parametric models in section 30.6 may have been understandable in the context of dose-response models, but it seems irrational to simply extend that attitude to all other models and data in all sciences with no meaningful consideration of the propriety of this approach to those other circumstances. According to the commenter, thoughtful assessments are required to create clear-cut requirements in each sector based on the terms of statute concerned, the goals of the statute concerned, sectoral privacy and other legal requirements and challenges, sectoral ethical issues, the nature of the data predominantly used in a specific sector, and other concerns. The commenter also notes that sectoral sensitivity is the route counselled by the statutory considerations stated above and the nature of the EPA as an Agency with expertise. The commenter states that EPA highlights the former when it notes that there is some conflict between this proposed regulation and some of the laws which it is meant to effectuate and that the generalist approach in this rulemaking ignores relevant factors and considerations.

Response: The EPA has limited the scope of this final rule to dose-response data, thereby addressing the commenter’s concern that the Agency was implementing a “one-size-fits-all” approach to models and data across different fields.

Comment: Commenter (11490) states that their previous testimony’s question of “What is the problem this proposed rule seeks to fix? Where is the study for which the lack of access to raw data resulted in misinterpretation or in the promulgation of an inappropriate regulatory standard?” According to the commenter, these questions remain unanswered with respect to dose-response data in regulatory science, and no new information has been provided that rationalizes extending the rule to other data and scientific assessments at EPA.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better

understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenter (11894) asserts that the proposal overwhelmingly focused on health effects data, and specifically epidemiology, yet the supplemental proposal greatly expands the range of studies while not providing discussion or investigation that the same “problems” asserted in the originally covered studies are also present among the much greater range covered in the supplemental proposal. The commenter notes that such far ranging changes require explanation and supporting data and information.

Response: The EPA has limited the scope of this final rule to dose-response data, thereby addressing the commenter’s concern.

4.3.2 Application of the Rule in Respect to Data

4.3.2.1 Variable Application to Types of Data

4.3.2.1.1 Application of Rule to Variety of Data Types

Comment: Commenter (12720) asserts that there is an enormous diversity of data used in EPA decisions and they reference the SAB’s urging of EPA to consider how it could tailor approaches to varied data sets, including a trusted third party like the Health Effects Institute (HEI), Data Use Agreements, certification processes, a data archive accessed with confidentiality agreements and others.²⁷⁴⁰ The commenter notes that the supplemental proposal does however propose a single approach for all types of data and no analysis of how the likely exclusion of specific data types due to this would affect its decisions.

Commenter (9587) states that the widened scope of the supplemental proposal will require detailed follow-up rulemaking, to apply the rule appropriately to every subcategory of data and models used by EPA. The commenter suggests the rulemaking include provisions for committees deputed to provide detailed guidance for how it should be implemented in every relevant subcategory.

²⁷⁴⁰ EPA SAB (2019) Science Advisory Board (SAB) Consideration of EPA Proposed Rule: Strengthening Transparency in Regulatory Science. EPA-SAB-18-003. Pg. 12-13

Response: The EPA has limited the scope of this final rule to dose-response data, thereby addressing the commenter's concern that the Agency was implementing a "one-size-fits-all" approach to models and data across different fields.

Comment: Commenter (11892) notes that the example assumptions of "parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity," do not typically apply to the data used by wetland managers. Instead, the commenter provides, wetland data is mostly obtained from the field (*e.g.* plant species occurrence and distribution, and surface and groundwater levels and movement), although laboratory analyses may be incorporated if results are found useful. The commenter also states that wetland managers rely on expertise in the literature and their own expertise in order to determine whether or not their data or other reports yield usable information with implications for wetland management. Furthermore, the commenter provides several reasons the additional transparency requirements do not neatly fit wetland data:

- Wetland data is frequently collected according to peer-reviewed procedures approved by EPA through State Wetland Program Development Grants and 106 programs.
- While not unique to the topic of wetlands, states and tribes typically have limited independent resources for wetland data collection and rely on peer-reviewed publications for science applicable to their management concern.
- Wetland data, when published in peer-reviewed journals, doctoral dissertations or masters' theses represent very specific situations and often limited geographic areas making independent validation difficult to conduct or inappropriate for informing managers in other areas or for similar, but related water resources. Some data are collected on private land and the landowner(s) may not allow others to access these sites.
- More current data is often unavailable. However, many older, but still critical data and analyses remain useful in making technical and scientific assessments that can guide management decisions.
- Formal literature reviews which achieve the rigor of research best practices and peer review should be included in available science used by EPA when used in concert with the data from the original studies. The in-depth comparative analysis of a formal literature review can add insights from the body of science about a specific topic.
- Wetland management is highly influenced by stream management. Stream management often relies on use of engineering models, which typically are in the public domain for use by applicants for regulated activities.

Response: The EPA has limited the scope of this final rule to dose-response data. Wetland data will only fall under this rule insofar as they are integral to characterizing ecological dose-response relationships.

4.3.2.2 Logistics of Handling Data

4.3.2.2.1 Data Sharing of Large Datasets is Logistically Challenging

Comment: Commenters (9362, 11386, 11392, 11495, 11576, 12617, 12720) note that the rule will be burdensome due to the extremely large nature of the raw data being worked with. Specifics:

Commenter (9362) agrees that the rule would require scientists provide their data upon request so that their analyses can be repeated, but does not believe all scientific papers could be applicable due to the volume of data being analyzed.

Commenter (12617) states that the broad application of public-data requirements would eliminate many instructive and valid studies from consideration because of the burden of finding ways to publicly share all code and data. The commenter states that many studies crucial for EPA to consider when developing rules related to these chemicals, may not be considered due to the proposed data access requirements. The commenter states that, since any such studies are based upon very large data sets analyzed with chemometrics, data reduction, and commercial or customized computer programs, it would be no small task to host all data and code in a public manner.

Commenter (11386) uses the example of Tropospheric Monitoring Instrument (TROPOMI), a satellite instrument that provides daily, global observations of column methane in $5.5 \times 7\text{km}^2$ pixels at the highest available resolution. As such, the commenter states the data are not easily stored, let alone manipulated, without significant computing resources that are unavailable on a typical personal computer.

Commenter (11392) asserts that the data required by the supplemental proposal would encompass almost all of the raw data generated in a study. The commenter notes that EPA would be obligated to ensure many different types of data, including meteorological data, pollution values, and data that serves as the basis for epidemiological studies and other research, were publicly available in an organized format. According to the commenter, this could mean hundreds of files for any given study and require its own unique code simply to maintain the necessary organization. Currently, the commenter states that the EPA does not possess any data sharing system capable of performing this task, nor does the supplemental proposal address how the Agency would develop the additional capacity necessary to comply with the rule. The commenter provides that the rule does not explain the logistical methods that EPA would use to process and manage this enormous amount of data, nor how the Agency would make it accessible to the public. Additionally, the commenter notes that the rule does not clarify whether

the Agency intends to develop an internal data storage system, or whether the Agency would utilize external parties.

Commenter (11576) states that studies involving continuous monitoring of air or water pollutants, greenhouse-gas emissions, or any other type of time-series data require sizable infrastructure and data-handling considerations to accommodate the vast size of these datasets.²⁷⁴¹ The commenter contends that without advance notice and creation of the infrastructure required to securely support the storage and transfer of large volumes of data, the EPA cannot require researchers to categorically accommodate publicly available data and models for all types of pivotal regulatory science and pivotal science.

Commenter (12617) provides examples of per- and polyfluoroalkylated substances (PFAS) research data sets that include extensive data sets analyzed with chemometrics, data reduction, and commercial or customized computer programs. The commenter asserts that hosting this data and code would be no small task.

Commenter (12720) states that the supplemental proposal does not engage with the idea of “big data” and large datasets that may not lend themselves to data sharing.

Response: The EPA agrees with the commenters and has limited the scope of this final rule to dose-response data underlying pivotal science. Rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as “pivotal science,” the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). This limited scope increases the feasibility of this rule at this stage, and addresses the commenters’ concerns.

4.3.2.2.2 Capability of EPA to Host Data

Comment: Commenters (11192, 11193, 11361) state that EPA is not prepared to host information in a manner sufficient for the proposal. Specific concerns include:

Commenters (11192, 11361) assert the EPA must identify and create a structure for publicly available data before requiring studies to make their data public or make decisions about what data can safely be made public through that architecture. The commenters state that, if the EPA seeks to make more studies’ data public, then the Agency should, at the minimum: (1) create a public repository and user interface for such data, (2) provide funding explicitly for data de-identification in new federally funded research grants, and (3) admit de-identified data to the repository and into full consideration for influential scientific information.

²⁷⁴¹ Noel Cressie, *Massive Data Sets: Problems and Possibilities, with Application to Environmental Monitoring* (1996)

Commenter (11193) contends that the Agency has provided no methods or structure by which they will inventory, store, process, and analyze the data, analyses, and models they would require to be made public. The commenter notes that currently, the Agency struggles to maintain its data systems consistent with current standards and to serve their own data efficiently to the public. According to the commenter, requiring the Agency to inventory, manage, distribute, analyze, etc. the quantity and density of data that would be involved in the proposed rule and supplemental proposal has not been thought out and no presentation of any such management system or standard operating procedure has been provided. The commenter states that no infrastructure exists for such a system, such that there is effectively no way to implement this program. Also, the commenter notes that the management of such a data system will involve a substantial cost for storage, management of flow, and security. The commenter asserts that no description of the Agency's ability to pay for this effort was presented.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenters (9372, 11900) suggest that, to adequately protect privacy, all data associated with human study participants should only be accessible through secure data enclaves. Commenter (9372) states that, even for data that is already anonymized, most data providers are unwilling to budge on the requirement that data are kept on secure servers.

Response: The EPA agrees and clarifies that in this final rule the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

Comment: Commenter (11176) provides reservations concerning the data sharing infrastructure for classes of data that could inform EPA actions:

- **Data owned by the EPA or other federal entity:** While there is a push to provide expanded access to data in the federal government, the commenter states that the effort is still in its infancy. The commenter provides that the National Center for Health Statistics (NCHS) Research Data Center (RDC) is one example for providing some level of tiered access, and the National Opinion Research Center (NORC) Data Enclave and the Inter-university Consortium for Political and Social Research (ICPSR) Virtual Data Enclave may provide additional flexibility of providing access. However, the commenter notes that EPA's involvement in such programs is minimal, limited to a single survey. Given this limited involvement, it is premature to enact this rule.

- Federally funded non-EPA data:** For a snapshot of the status of data repositories for federally funded research, the commenter considers the NIH, the federal government's likely leader in federally funded data sharing, an effort started more than a decade ago. The commenter provides that, in its frequently asked questions (FAQ) page for data sharing,²⁷⁴² the NIH responds, "maybe," to question #20 on whether researchers should consider contributing their data to a data archive. The commenter contends that the reply equivocates, of course, because of the many factors involved but also indicates how far the NIH is from achieving full data sharing for the research it funds. For the next question of where to find guidance on preparing data for sharing and archiving, the commenter notes that the NIH FAQ does not provide its own guidance but, except for molecular biology information, refers readers of the guidance to an outside entity, the aforementioned ICPSR. According to the commenter, EPA is a relative newcomer to encouraging data sharing and, while it will benefit from the advances and experiences of other federal entities, is still likely to be years away from providing or encouraging the data access assumed in this rule. The commenter also notes that EPA does not seem to require a data management plan, unlike the National Science Foundation and NIH, which it planned to do by 2018 in the 2016 EPA Plan.²⁷⁴³ The commenter states that such a requirement might be a first step towards the eventual goal of EPA funded research data being more widely accessible. And while data management plans and sharing strategies remain work in progress, the commenter contends that they are a mechanism to ensure that large swaths of data become accessible to as broad a public as possible, including through some of the same restricted-access mechanisms mentioned previously. According to the commenter, without ready access to this category of data, the commenter believes it is premature to enact the rule but encourages EPA's continued work to make such data available

Response: In this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For

²⁷⁴² <https://grants.nih.gov/faqs#/data-sharing.htm>

²⁷⁴³ The most recent update on this plan is from 2018: <https://www.epa.gov/sites/production/files/2018-07/documents/reportonepaplantoincreaseaccesstoresearch.pdf>.

example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (11361) states that there is currently no central place for academics to publish their data, let alone to publish data with tiered access. The commenter provides that when discussing tiered access, EPA offers the Centers for Disease Control and Prevention (CDC) RDC as an example repository and system.²⁷⁴⁴ However, the commenter notes that EPA fails to discuss, however, the costs associated with building, maintaining, and providing access to that repository, nor the cost of reviewing and evaluating applications for access. According the commenter, EPA must identify and create a structure for publicly available data before requiring studies to make their data public or make decisions about what data can safely be made public through that architecture. The commenter suggests that the Agency should, at the minimum: (1) create a public repository and user interface for such data, (2) provide funding explicitly for data de-identification in new federally funded research grants, and (3) admit de-identified data to the repository and into full consideration for influential scientific information.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (11479) states that even with the clarifications provided in the supplemental proposal, there is no information on where the raw data collected would reside, how the resources to manage the data would be obtained, or how EPA would deal with legally and ethically protecting confidential or sensitive data. The commenter notes that ensuring all this extra information is received, stored, and made publicly accessible would be no small undertaking. Additionally, the commenter provides that EPA's SNPRM references a system used by the NIH to collect health data,²⁷⁴⁵ but the NIH system is not publicly accessible and requires

²⁷⁴⁴ EPA, "Strengthening Transparency in Regulatory Science" SNPRM, 15402.

²⁷⁴⁵ National Institutes of Health. 2018. Requesting Access to Controlled-Access Data Maintained in NIH-Designated Data Repositories (e.g., dbGaP). Online at <https://osp.od.nih.gov/scientific-sharing/requesting-access-to-controlled-access-data-maintained-in-nih-designated-data-repositories-e-g-dbgap/>, Accessed July 26, 2018.

significant resources to manage and share with researchers – a clear contradiction to the administration’s apparent interest in transparency. The commenter contends that at a time when EPA’s budget and capacity continues to decrease,²⁷⁴⁶ it is unreasonable for the Agency to initiate such an undertaking.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (11408) quotes a 2013 study that reviewed requests through the Information Quality Act between 2002 and 2012 that suggests the Agency should establish a database that “registers studies and obtains systematic sets of parameters and results” rather than making all raw data available, such as the NIH’s clinical trials database.²⁷⁴⁷

Response: The EPA disagrees, and notes that where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information.

Comment: Commenters (11894, 11900) express concern that information regarding the RDC pilot project has not been provided for public comment. Commenter (11900) requests that the details and results of that pilot study be made public.

Commenter (11894) states that EPA staff confirmed that the EPA was working with the NCHS at the CDC to conduct a pilot study using a secure data enclave to host EPA data sets in a restricted use environment to examine how PII data could be protected. The commenter states that they suggested the pilot would be completed in about six months (*i.e.* end of March) and that “the final rule would build upon the information obtained from the pilot.” The commenter states that apparently, this work, which was to be a foundation for the final rule, was not completed in time to inform the SNPRM or the EPA chose to move forward without waiting to get its results. The commenter states that the preamble states that “EPA is currently conducting a pilot study using the RDC’s secure data enclave” referring to the Research Data Center (RDC) of the NCHS/CDC. The commenter states that this key study that the EPA told SAB would be “used to inform the final rule” has not been made available for public comment. The commenter states

²⁷⁴⁶ Sellers, C. et al. 2020. EDGI. An Embattled Landscape Series, Part 2b: The Declining Capacity of Federal Environmental Science. Online at <https://envirodatagov.org/embattled-landscape-series-part-2b-the-declining-capacity-of-federal-environmental-science/>, Accessed May 14, 2020.

²⁷⁴⁷ Goldman LR, Silbergeld EK. Assuring Access to Data for Chemical Evaluations. Environ Health Perspect. 2013;121(2):149-152.

that, apparently, in its place, the preamble notes that the RDC itself is “a model of tiered access for data involving PII.” The commenter states that the EPA’s inability to define tiered access is emblematic of the utter disregard of both the tradition of sound science/policy principles and the rulemaking process at EPA. The commenter states that this is a violation of adequate notice and opportunity for comment.

Response: The EPA disagrees with the commenter because this final rule does not depend on the RDC pilot study. This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available.

Comment: Commenter (11900) asks how the EPA intends to address issues of ownership and responsibility for data deposited in the restricted enclave. The commenter states that stewardship of data involves maintenance of the infrastructure for storing and accessing the data, accountability for the data quality and underlying methods that generated it, and moral responsibility to the study participants. The commenter states that researchers may be reluctant—or unable—to cede moral responsibility and accountability for the data to EPA, even if they can cede maintenance of the data. The commenter states that, in light of their ongoing responsibilities, the original study investigators should be granted some input over who is allowed access to their data and for what purposes. The commenter states that one way to do this would be to give the original study investigators an automatic seat on the Data Access Committee for any application seeking to use their data. The commenter states that, in this way study investigators will have the opportunity to review and comment on research proposals seeking to use their data.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Further, it does not direct parties outside the EPA on how to provide access to data deposited in a restricted enclave. This is a rule of internal agency procedure and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government.

Comment: Commenters (11184, 11407, 12412, 12474, 13549) state that, in August 2018, the National Tribal Air Association (NTAA) expressed concerns about EPA’s belief that confidential or private information could be dealt with by the application of solutions in use across other parts of the federal government. The commenter states that the NTAA also expressed concerns about the cost of doing so and the reduction in studies this would cause the EPA to consider. The commenter states that eighteen months later the SNPRM did not address any of these concerns or analyze the costs or impacts. The commenter states that, before the EPA can finalize a rule that relies on certain approaches to provide, yet protect data, it must lay out and analyze those approaches for public review and comment.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt,

at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenters (12546, 12720) express concern that, while the SNPRM describes development of standard data repositories as “ongoing,” the EPA does not explain why the EPA should introduce burdensome new public data release requirements at a time when such repositories have not demonstrated the ability to handle such a massive influx of data and models in a way that actually improves public access to data in a meaningful way.

Commenter (12546) notes that in the SNPRM, the EPA indicates that it “...is currently conducting a pilot study using the RDC’s secure data enclave to host EPA datasets in a restricted use environment. Development of standard data repositories is still ongoing.” The commenter states that the EPA is proposing to change the scientific basis of their rulemaking based on an untested and unverified method for data security enclaves. The commenter states that the EPA needs to put out a rule that has a tested security method in place, not a ‘plan’ for a system that has not been tested and evaluated. The commenter states that the EPA should not be basing regulations on pilots, but rather should focus on implementing the EPA’s own 2016 *Plan to increase access to results of EPA-funded scientific research*.²⁷⁴⁸

Response: The EPA disagrees that the practices informing this final rule are untested. The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency’s goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. For example, in 2002 the OMB released its Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies, which includes discussion of the importance of the reproducibility of analyses underlying influential information²⁷⁴⁹. The EPA’s 2016 Plan to Increase Access to Results of EPA-Funded Scientific Research noted that “transparency is a core EPA value” and that increased availability of research data would accelerate scientific breakthroughs that support the Agency’s mission and policymaking efforts²⁷⁵⁰. The EPA’s Open Government Plan 5.0²⁷⁵¹ also details the EPA’s progress in implementing the tenets of the numerous data transparency initiatives in the federal

government prior to 2018, including OMB M-10-06²⁷⁵², the Office of Science and Technology Policy Memorandum of February 22, 2013²⁷⁵³, and OMB M-13-13²⁷⁵⁴. In 2019, Congress passed the Foundations for Evidence-Based Policymaking Act of 2018 (or OPEN Government Data Act, Pub. L. 115-435) into law, which included requirements for federal agencies to prioritize making their data available to the public, and OMB has released additional guidance for implementing the act.^{2755,2756}

4.3.2.3 Addressing Data From Various Sources

4.3.2.3.1 Application to States and the Federal Government

Requirements of Federal Agency Research

Comment: Commenter (12402) recommends that studies and data developed under EPA testing programs, where EPA test guidelines or other validated and accepted test methods such as those developed by the Organisation for Economic Co-operation and Development (OECD), American Society for Testing and Materials (ASTM) International have been used, and EPA Good Laboratory Practices have been followed and certified should be candidates for exemption from the SNPRM. It can reasonably be assumed that such studies and data have already been subject to adequate validation review by the Agency and have been subject to appropriate public notice and comment in accordance with statutory requirements of the relevant EPA programs. For example, the commenter acknowledges an extensive chemical fate and environmental effects testing program under an enforceable testing Consent Order under the TSCA for which EPA was involved in all aspects of the data development.²⁷⁵⁷ The commenter notes these same studies were reviewed again by the Office of Water as part of an extensive review of available data for the development of Ambient Aquatic Life Water Quality Criteria for Nonylphenol (NP) in 2005.²⁷⁵⁸ According to the commenter, it is likely that these same studies will be reviewed again when EPA conducts its TSCA risk evaluation on this substance, which is listed on EPA's 2014 update to the TSCA Work Plan.²⁷⁵⁹ Considering that these studies are now thirty years old, the commenter states that providing public access to raw data will likely be difficult and should be

unnecessary considering that the studies were developed under EPA oversight and reviewed previously under EPA programs.

Response: The EPA believes that its efforts under this rule can be additive to existing validated and accepted test methods. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Further, the EPA directs the commenter to the factors in 40 CFR 30.5(d) that the EPA shall evaluate when determining the amount of consideration to grant pivotal science where the underlying dose-response data are not available for independent validation.

Comment: Commenter (12720) asserts that EPA has not explained or anticipated the impact of the supplemental proposal on other federal agencies that rely on similar types of scientific data and models to develop influential scientific information. The commenter provides the recent joint publication of the Safer Affordable Fuel-Efficient(SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks²⁷⁶⁰ by EPA and the National Highway Traffic Safety Administration as an example of potentially impacted projects. Additionally, the commenter states that the supplemental proposal does not explain how requirements introduced at EPA would affect significant scientific work at other federal agencies and appears to undermine longstanding scientific review processes at other federal agencies, including the Department of the Interior.^{2761,2762}

Response: This is a rule of agency procedure internal to the EPA. Where the EPA is collaborating on a significant regulatory action or influential scientific information with another federal agency, this rule would apply. However, the EPA notes that The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. For example, in 2002 the OMB released its Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies, which includes discussion of the

importance of the reproducibility of analyses underlying influential information²⁷⁶³. The EPA's 2016 Plan to Increase Access to Results of EPA-Funded Scientific Research noted that "transparency is a core EPA value" and that increased availability of research data would accelerate scientific breakthroughs that support the Agency's mission and policymaking efforts²⁷⁶⁴. The EPA's Open Government Plan 5.0²⁷⁶⁵ also details the EPA's progress in implementing the tenets of the numerous data transparency initiatives in the federal government prior to 2018, including OMB M-10-06²⁷⁶⁶, the Office of Science and Technology Policy Memorandum of February 22, 2013²⁷⁶⁷, and OMB M-13-13²⁷⁶⁸. In 2019, Congress passed the Foundations for Evidence-Based Policymaking Act of 2018 (or OPEN Government Data Act, Pub. L. 115-435) into law, which included requirements for federal agencies to prioritize making their data available to the public, and OMB has released additional guidance for implementing the act.^{2769,2770}

States

Comment: Commenter (12456) asserts that it may not be possible for certain information to be made public due to state requirements that prevent the release of specific information related to private lands under the Colorado Open Records Act²⁷⁷¹. It is also noted that the data covered by this Act should not be at the discretion of the EPA Administrator, nor excluded from consideration due to the study taking place on private lands in Colorado.

Response: The EPA does not require external parties to make their dose-response data available. Where the Agency is making dose-response data publicly available, it shall do so in a fashion

²⁷⁷¹ C.R.S. § 24-72- 204(3)(a)(XXI)

that is consistent with law, protects privacy, confidentiality, CBICBICBICBI, and is sensitive to national security.

Comment: Commenter (10974) is concerned that the supplemental proposal could undermine state-level efforts at developing health-based benchmark values used in air toxics and permitting reviews.

Response: The EPA disagrees with the commenter that this final rule will undermine state-level air toxics activities or permitting reviews. The Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

4.3.2.3.2 Treatment of Studies From Subscription and Open Source Journals

Comment: Commenter (12455) raises a concern that depending on the nature of the journal the data is published in; the data will be treated differently.

Response: Consistent with existing Agency practice, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information.²⁷⁷² The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review.^{2773,2774} When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Only after a study has been designated as pivotal science, the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

4.3.2.4 Reporting Funding Sources

Comment: Commenter (11892) recommends that the rule make it clear that the same stringent standards for transparency and quality of data to all information used in decision-making regardless of its source, whether provided by public agencies, the academic community, regulated entities or other sources. Moreover, the commenter states transparency would be increased by requiring information regarding financial support for the research. According to the commenter, funding by federal agencies and many foundations are typically identified in research reports, but corporate and other private funders may not be.

Response: The EPA notes that the final rule codifies in 40 CFR 30.3: “The provisions of this part apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.” The EPA anticipates that giving greater consideration to pivotal science where the underlying dose-response data is available for independent validation will offer increased transparency, but notes that this rule is an incremental part to increasing transparency in EPA significant regulatory actions and influential scientific information.

Chapter 5: Influential Scientific Information; Expansion of Proposal; Determining and Weighting ISI (Supplemental Notice of Proposed Rulemaking (SNPRM))

In the supplemental notice of proposed rulemaking (SNPRM), the EPA proposes to expand the scope of the notice of proposed rulemaking (NPRM) to apply to “influential scientific information”, defined as follows:

Influential Scientific Information means scientific information the Agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions.

The SNPRM also provides revisions to the NPRM regulatory text at 40 Code of Federal Regulations (CFR) 30.5 from that in the Proposal. Under the proposed new approach at 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing influential scientific information, the EPA would only use pivotal regulatory science and/or pivotal science if the data and models are available in a manner sufficient for independent validation. The SNPRM provides that this includes studies with data and models that are publicly available as well as studies with restricted data and models (*i.e.*, those that include confidential business information (CBI), proprietary data, or personally identifiable information (PII) that cannot be sufficiently de-identified to protect the data subjects) if there is tiered access to these data and models in a manner sufficient for independent validation.

As an alternative, the SNPRM preamble states that under proposed 40 CFR 30.5, when promulgating significant regulatory decisions or finalizing , other things being equal, the EPA would give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because they are publicly available or because they are available through tiered access when the data includes CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects. The SNPRM preamble further states that EPA would identify those studies that are given greater consideration and provide a short description of why greater consideration was given.

Several comments were received regarding the SNPRM coverage and use of influential scientific information. These comments are organized under the following topics:

- Definition of Influential Scientific Information
- Expansion of Scope to Include Influential Scientific Information
- Determining What Constitutes Influential Scientific Information

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in

this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

5.1 Definition of Influential Scientific Information

5.1.1 General Support/Dissent for Definition

Comment: Commenter (14397) states that the term “influential scientific information” remains vague and unworkable.

Commenter (11390) asserts that the new definitions provided in the supplemental proposal are so expansive and vague as to render the proposed rule applicable to any scientific study that EPA considers for nearly any meaningful purpose, outside of the supplemental proposal’s exceptions for adjudications and enforcement activities.

Commenter (12546) states that this definition of “influential scientific information” essentially includes all decisions and documents that EPA generates which use science, in addition to the already expanded definition of “pivotal regulatory science.” The commenter also notes that the definition does not include impact on human health/public health, which is EPA’s mission.

Conversely, commenters (9587, 11401, 11499, 12406, 12471) support EPA’s proposed definition for “influential scientific information”. Specific comments include:

Commenter (12471) states that having such a definition seems appropriate as the term appears in the Memorandum and yet the Memorandum does not specify a definition, nor is one found in the 2002 Office of Management and Budget (OMB) Guideline. The commenter suggests a minor revision to the definition of influential scientific information as follows:

Influential scientific information means pivotal science in an area of inquiry, when taken together, represents the synthesis of scientific information the Agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions,” in order to link the definition to pivotal science.

Response: The definition of influential scientific information in 30.2 of the final rule remains, “scientific information the agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions.” The Agency will not be taking suggestions to modify the definition because this definition of influential scientific information is the same definition as in OMB Bulletin for Peer Review. In addition, the Agency does not believe this definition is expansive or vague. The EPA adopted this definition because it intended the scope to be consistent with how that term has been interpreted and applied in the context of peer review. Given that the definition is both established and has been routinely applied by the EPA, the EPA disagrees that the term is inherently too narrow or too broad.

Rather than modify the proposed 40 CFR 30.2 definition of influential scientific information, the EPA is modifying 40 CFR 30.3 to clarify the Agency's intent that the requirements in 40 CFR Part 30 will apply to influential scientific information, unless the influential scientific information is exempted from peer review requirements as described in Section IX of the OMB Final Information Quality Bulletin for Peer Review. Consistent with this approach, the EPA is finalizing the definition of "influential scientific information" as proposed in the 2020 SNPRM. The EPA's Peer Review Handbook provides greater guidance on how the Agency identifies influential scientific information.

5.1.2 What is Covered by the Definition of Influential Scientific Information

Comment: Commenter (11381) provides that EPA defines influential scientific information without defining the predicate noun. The commenter notes the supplemental proposal definition approximates a key Information Quality Guidelines (IQG) definition²⁷⁷⁵, but that the supplemental proposal definition is narrower – it excludes financial or statistical information – without provision of a rational basis for the departure from the IQG. As such, the commenter asserts this leaves the Agency's definition ambiguous at best. The commenter states that the only subsets of information that assuredly lie within the definition are data²⁷⁷⁶ and models,²⁷⁷⁷ and thus leave the public and Agency staff confused. Furthermore, the commenter questions if the supplemental proposal includes only data and models, or all information ("any communication or representation of knowledge such as facts or data, in any medium or form") that is influential ("information the Agency can reasonably determine that dissemination ... will have or does have a clear and substantial impact on important public policies or important private sector decisions"). The commenter notes that because elsewhere the supplemental proposal focuses on data and models, this is not an insignificant concern and that, unless the matter is clarified, it will be the cause of wholly unnecessary and pointless argument.

Commenter (11390) notes that the defined terms are so broad they ostensibly could apply even to science that never actually impacts any Agency policy or regulation: The commenter states that if EPA finds science reasonably "will have" an impact in the future, that is enough to bar the Agency from considering key data in the present, whether or not such an impact ultimately

²⁷⁷⁵ Cf. U.S. Environmental Protection Agency (2020, p. 15405) ("Influential scientific information means scientific information the Agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions") and Office of Management and Budget (2002, p. 8460) ("Influential', when used in the phrase 'influential scientific, financial, or statistical information', means that the Agency can reasonably determine that dissemination of the information will have or does have a clear and substantial impact on important public policies or important private sector decisions.")

²⁷⁷⁶ U.S. Environmental Protection Agency (2020, p. 15405): "Data means the set of recorded factual material commonly accepted in the scientific community as necessary to validate research findings in which obvious errors, such as keystroke or coding errors, have been removed and that is capable of being analyzed by either the original researcher or an independent party."

²⁷⁷⁷ U.S. Environmental Protection Agency (2020, p. 15405): "Model means a simplification of reality that is constructed to gain insights into select attributes of a physical, biological, economic, or social system. A formal representation of the behavior of system processes, often in mathematical or statistical terms. The basis can also be physical or conceptual."

occurs. Moreover, the commenter states that a wide range of EPA activities might be found to impact “private sector decisions” outside the scope of the Agency’s own regulatory authority, making the potential reach of this provision virtually limitless.

Commenter (11399) provides that the definition provided in the supplemental proposal does little to clarify the meaning of “influential scientific information,” which is troubling in a rule concerned with transparency. Thus, the commenter does not support this expansion to the proposed regulatory language.

Commenter (12645) asserts that a quick look at the recent Health Effects Institute (HEI) Review Committee reports shows a median of over 20 references that are cited by the reviewers.²⁷⁷⁸ According to the commenter, the reviewers do not look at the raw data in order to write their influential analysis, nor would all cited references have such data available. Therefore, the commenter questions if EPA plans to tell HEI not to allow its Review committee to consider any literature for which the committee members have not personally evaluated the completed data, or at least are certain that the completed data are available? Similarly, the commenter notes the EPA’s own analyses, such as the Integrated Science Assessments (ISA) reviewed by the Clean Air Science Advisory Committee (CASAC), often simply cites previous EPA documents, or other reviews such as those performed by the National Academy of Science (NAS), as foundations on which they then overlay the more recent scientific studies. The commenter questions whether the EPA now plans to remove these foundations, or to subject the literally thousands of papers that went into the weight of evidence for previous EPA analyses to considerations as to which are pivotal or influential.

Commenter (12727) states that there is not an adequate notice of the types of influential scientific information to which the rule could apply. The commenter notes that although some influential scientific information could have been indirectly excluded from use by the Agency by the Proposal —e.g., if destined to support a significant regulatory decision—the supplemental proposal imposes an independent and immediate restriction on the development of all influential scientific information.

Commenter (12715) provides that the supplemental proposal’s statement that the requirement only apply to studies that “could drive [EPA’s] subsequent decisions,” 85 Fed. Reg. at 15,399, is inconsistent with information EPA provided to staff of the House Committee on Science, Space, and Technology that for scientific evaluations designated as influential scientific decisions “every study considered by the Agency in writing a rule, regulation, risk assessment, and more would be subject to these data transparency requirements.”²⁷⁷⁹

Response: The definition of influential scientific information in 30.2 of the final rule remains, “scientific information the agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions.” This definition of

²⁷⁷⁸ <https://www.healtheffects.org/publications>

²⁷⁷⁹ Letter from Honorable Eddie Bernice Johnson to Democratic Members of the House Committee on Science, Space and Technology (May 6, 2020), at 3.

influential scientific information is the same definition as in OMB Bulletin for Peer Review. The EPA adopted this definition because it intended the scope to be consistent with how that term has been interpreted and applied in the context of peer review. Given that the definition is both established and has been routinely applied by the EPA, the EPA disagrees that the term is inherently too narrow or too broad. The EPA's Peer Review Handbook provides greater guidance on how the Agency identifies influential scientific information. All Agency influential scientific information, besides going through peer review, will also be subject to public notice and comment.

However, in the 2020 SNPRM, the EPA did not incorporate the OMB Bulletin for Peer Review Section IX exemptions to peer review, including routine statistical information and financial information. Rather than modify the proposed 40 CFR 30.2 definition of influential scientific information, the EPA is modifying 40 CFR 30.3 to clarify the Agency's intent. As a result, the requirements in 40 CFR Part 30 will apply to influential scientific information, unless the influential scientific information is exempted from peer review requirements as described in Section IX of the OMB Bulletin for Peer Review. Consistent with this approach, the EPA is finalizing the definition of "influential scientific information" as proposed in the 2020 SNPRM. It is the Agency's intent to be consistent with the OMB Bulletin for Peer Review regardless of how commenters may interpret that intent or potential inconsistency.

The application of this final rule to influential scientific information applies only during the develop of the study and then is narrowed even further as it only addresses dose-response data underlying the pivotal science used to develop that influential scientific information. To address the commenter's concern directly, though there may be "thousands of papers that went into the weight of evidence for previous EPA analyses," only a small number of studies will be consider pivotal science when applying the provisions of this final rule to either significant regulatory actions or influential scientific information.

In addition, the final rule focuses solely on dose-response data. The scope of dose-response data in this final rule is those studies consisting of the data integral to characterizing dose-response relationships. In some instances, this group will consist of a handful of studies. In other instances, where there are multiple toxicity endpoints, there may be more studies that are crucial to characterizing dose-response relationships. In some other cases, there may be a large number of studies that are used to characterize a dose-response relationship (e.g., where the dose-response is based on a meta-regression of epidemiology studies). However, not all of these studies would be considered pivotal science (see Section III.C.6 for the definition of "pivotal science").

Past briefings to Congress were intended to informational as of that moment during the Agency's deliberative process. The final rule, including its applicability, definitions, etc., considers all comments and represents the Agency's final decisions.

The EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

And finally, this final rule does not regulate any entity outside the EPA (e.g. the commenters reference to HEI). Rather, the requirements modify the EPA's internal procedures regarding the transparency of pivotal science underlying significant regulatory actions²⁷⁸⁰ and influential scientific information.

5.2 Expansion of Scope to Include Influential Scientific Information

5.2.1 General Support/Dissent for Expansion

Comment: Several commenters (10865, 11388, 11407, 11895, 12702, 13788) generally oppose the expansion of coverage of the rule to include influential scientific information. Specific comment examples include:

- Commenter (11388) does not support the expansion due to the complexity and impracticality of including influential scientific information and instead recommends the final rule only apply to underlying studies, data, and models when promulgating significant regulatory actions.
- Commenter (11895, 11407) states that with the expansion, the supplemental proposal takes a bad proposal and makes it worse and that the expansion does nothing to address the crux of the problem: there are many valid and important scientific studies that cannot legally, ethically, or efficiently publicly release all their data.
- Commenter (10865) states that it is troubling that the scope of the SNPRM now includes “influential scientific information” in addition to significant regulatory actions.
- Commenter (12702) provides that the expansion broadens uncertainty and possible regulatory conflict.
- Commenter (13788) states that the expansion of the scope to include ISI is unwarranted and inconsistent with the IQA.

Conversely, several commenters (11397, 11401, 11499, 11500, 11922, 12402, 12612, 12699) generally support the expanded scope as defined. Specific comment examples include:

- Commenter (11397) asserts that the expansion is clearly in keeping with the goal of the rulemaking, and of Executive Orders 13777 and 13783, to apply transparency provisions not just when EPA is promulgating regulatory decisions or engaging in notice and comment rulemaking but also when the Agency is finalizing key scientific information upon which EPA may rely in the future. The commenter believes that the currently proposed extension of transparency to finalization of key scientific information —

²⁷⁸⁰ Consistent with OMB guidance, this rule would not apply to the following regulatory actions: individual party adjudications, enforcement activities, site-specific actions, or permit proceedings.

regardless of whether it is attached to a particular regulatory decision — is the correct approach.

- Commenter (11401) states that all scientific information used by EPA should adhere to the highest scientific standards.
- Commenter (11500) notes that the final regulation should make it clear that such policies or decisions include potential use of the information in public or private litigation. The commenter asserts that the need to apply the transparency rules to all key scientific information is highlighted by the EPA's current Integrated Science Assessment (ISA) for particulate matter (PM). The commenter notes that the EPA's CASAC did not support the ISA's findings that PM that have a diameter of less than 2.5 micrometers (PM_{2.5}) is "likely to be causal" for cancer and that the PM that have a diameter of 10 micrometers and smaller (PM₁₀) data are "suggestive" of causality, yet they remain in the final ISA, which can be relied upon in toxic tort litigation or other proceedings as official EPA findings.
- Commenter (11922) believes these expansions along with the SNPRM's proposed definitions and clarifications would enhance the transparency proposal's objectives to ensure that the data and models underlying the science supporting significant regulatory actions are publicly available in a manner to allow for analysis and validation. The commenter states that the more transparent the underlying scientific and regulatory science utilized in formulating policy decisions effecting regulated entities, the more confidence both the public at large and regulated entities will have in EPA and its implementation of policies and regulatory programs.
- Commenter (12612) notes that the expansion is an improvement that will increase the functionality of the Proposal in increasing EPA transparency.
- Commenter (12699) states that the expansion is an important change that indicates EPA's recognition that the science the Agency disseminates even outside the regulatory context can have a major impact. The commenter notes the definition of influential scientific information used in the supplemental proposal is drawn from OMB's "Final Information Quality Bulletin for Peer Review".²⁷⁸¹
- Commenter (11499) supports retroactive application in stating that existing data and models should be covered if they underlie "pivotal regulatory science" in a rulemaking or "pivotal science" in the development of influential scientific information. Commenter (13788) states that the expansion of the scope to include ISI is unwarranted and inconsistent with the IQA.

Response: Influential scientific information remains in the scope of the final rule. Because of the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best scientific information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA fully demonstrate that commitment. Where underlying dose-response data in pivotal science are available, subject

²⁷⁸¹ Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies; Republication, 67 Fed. Reg. 8452 (Feb. 22, 2002), <https://www.federalregister.gov/documents/2002/02/22/R2-59/guidelines-for-ensuring-and-maximizing-the-qualityobjectivity-utility-and-integrity-of-information> (last visited May 18, 2020)

matter experts can independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information.

The EPA is finalizing the applicability of this final rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

5.2.2 Justification/Necessity for Expanding Scope

Comment: Commenters (10048, 10866, 11392, 11404, 11894, 12456, 12727, 12715) note that the supplemental proposal does not provide adequate justification for the expansion in scope to include influential scientific information. Specific comment examples include:

- Commenter (10048) states that the vague and broad scope is problematic and the supplemental proposal does not provide justifications for these changes, just as there is no justification for the proposal itself.
- Commenter (10866) notes the supplemental proposal fails to adequately justify the proposed rulemaking as it applies to “influential scientific information as well as significant regulatory actions.”
- Commenter (11392) states that the supplemental proposal does not provide justification for the sweeping expansion, which makes it difficult for the public to assess the extent of the impact that the rule would have on the Agency's ability to consider the best available science. As such, the commenter asserts that EPA should remove influential scientific information from the scope of the rule. The commenter notes that, if EPA insists on maintaining influential scientific information within the scope of the rule, EPA must address why it decided to apply the rule to influential scientific information as well as significant regulatory actions and provide a detailed explanation of the factual evidence that it used to justify its decision.
- Commenter (11404) provides that the expansion is unnecessary, vague, and dangerous.
- Commenter (11894) states that the supplemental proposal does not in any way address either the legal support for this proposal or the policy need for it. Nor does it delineate its scope or how it would work.
- Commenter (12456) notes such a vague and broad scope is problematic, and the supplemental proposal does not provide justification for these changes.
- Commenter (12727) asserts that the closest the Agency comes to an explanation is a passing reference to OMB implementation updates recommending that “[a]gencies should prioritize increased access to the data and analytic frameworks (e.g., models) used to generate influential information.”²⁷⁸² The commenter contends that the provisions in the proposed rule that would allow the EPA to disregard data and analytic frameworks in

²⁷⁸² See 85 Fed. Reg. at 15,402.

developing influential information are inconsistent with the OMB implementation updates. As such, the commenter provides that absent any rationale for expanding the scope of its rule to influential scientific information, finalizing the supplemental proposal would be arbitrary.²⁷⁸³

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. OMB defines both significant regulatory actions and influential scientific information and has provided guidance as to how to identify and manage these actions because of the potential impact of these actions on American lives and livelihoods. This narrow but impactful scope of Agency actions is an important first step towards creating greater transparency.

These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information. The EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

5.2.3 Application Guidance for EPA Programs

Comment: Commenter (12406) supports the inclusion of "influential scientific information", but believes that each program office at EPA should establish criteria and guidance to determine the circumstances under which the rule will be applied to "influential scientific information" within the context of each statutory and regulatory scheme, subject to public notice and comment. The commenter states this would reduce the risk and uncertainty of an overly expansive definition that might needlessly slow implementation within the context of some statutes. For example, the commenter notes that applying the Strengthening Transparency rule to Toxics Substances Control Act (TSCA) Section 5 new chemicals program may render review of premanufacture

²⁷⁸³ See *State Farm*, 463 U.S. at 48-49, 55-57; *Physicians for Soc. Responsibility*, 2020 U.S. App. LEXIS 12727, at *19 ("It is axiomatic that the APA requires an Agency to explain its basis for a decision.").

notices impossible within the 90-day statutory timeframe. For these reasons, the commenter recommends that EPA clarify applicability with subsequent criteria and guidance.²⁷⁸⁴

Response: In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA intends to issue implementation guidelines and statute-specific rulemakings, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. In this action, the EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information for independent validation.

5.2.4 Public Comment on Expanded Scope

Comment: Commenters (11361, 11377, 11396, 11492, 11920) state that the expansion to include “influential scientific information” will undercut EPA’s ability to fulfill its mission to protect human health and the environment. Commenter (11377) asserts that systematically and arbitrarily favoring fully public data for even more of the Agency’s work only further imperils citizens whose health depends on EPA’s use of the best science, not just the most public.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions. The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Expanding this final rule to include influential scientific information will not undercut the Agency’s missions but rather by having a better understanding of the underlying data, this final rule will enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information.

The EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions and finalizing influential scientific information. Rather, the Agency

²⁷⁸⁴ EPA is proposing to add definitions for “influential scientific information” and “pivotal science” at 40 CFR 30.2 that will pertain to the science underlying influential scientific information, which are not regulatory, and is making conforming changes to proposed 40 CFR 30.3, 30.5, 30.6 and 30.7. EPA is retaining the definition of “pivotal regulatory science” from the 2018 proposed rulemaking regulatory text. See, 85 Fed. Reg. 15396, 15398.

will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

Comment: Commenters (11393, 11407) state that if EPA refuses to consider a valid scientific study when finalizing "influential scientific information," the public might never be informed, have the opportunity to comment, or bring a legal challenge.

Response: The EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation.

As stated in section 30.5, "The Agency will identify the pivotal science that was given lesser consideration and provide a short description of why lesser consideration was given." This will ensure that the public is properly informed and has the opportunity to comment.

Comment: Commenters (9493, 11894, 12727) contend that the expansion of the proposal requires additional comment to fully address the new reach of the rule. Specifically:

- Commenter (9493) provides that due to the sprawling set of documents that play critical roles in protecting human health and the environment listed in the Agency's most recent Peer Review Agenda,²⁷⁸⁵ additional comment is necessary to fully address all of these materials.
- Commenter (11894) asserts that EPA must afford the public notice and opportunity to comment on findings on the rationale concerning the actual effects of its supplemental proposal as it is presently unavailable to commenters.
- Commenter (12727) provides that commenters cannot anticipate the reach of the supplemental proposal or account for any potential overlap with the original due to a lack of evaluation on the breadth of the rule in regards to influential scientific information.

Response: The EPA disagrees with these comments. The SNPRM clearly states the potential new scope of the rule, provides background documentation and definitions (e.g. what is influential scientific information) to allow the public to understand the scope and rationale and asks the public to comment on various options presented.

²⁷⁸⁵ Peer Review Agenda, available at https://cfpub.epa.gov/si/si_public_pr_agenda.cfm (noting that "influential scientific information" includes the Agency's integrated review plans, integrated science assessments, risk and exposure assessments, policy assessments peer reviews, health models, economic models, and other important materials).

5.3 Determining What Constitutes Influential Scientific Information

Comment: Commenters (9362, 11390, 11404, 11892, 12430, 12465, 12688, 12720) contend that the supplemental proposal states the applicability to “influential scientific information” but provides no clarification as to what information the Agency will consider to fall under this category. Specific comments include:

Commenter (9362) questions how “the Agency reasonably can determine” whether a scientific study “will have or does have a clear and substantial impact on important public policies and private sector decisions.”

Commenter (11390) provides that the supplemental proposal does not explain how EPA will determine particular science has such a “clear and substantial impact”; there are no factors for the Agency to consider when making such a determination, nor examples of scientific information that would be encapsulated within the definition.

Commenter (11404) notes that determining a level of “influence: and deeming what knowledge qualifies as “pivotal” is too subjective. According to the commenter, science is science; it should be evaluated as such and sufficient methods of evaluation already exist.

Commenter (11892) states that it is unclear how “influential scientific information” will be used differently than has already been done by EPA in the past, while maintaining consistency with the OMB guidance on peer reviews and the Data Quality Act. Additionally, the commenter notes it is unclear how EPA will make the decision on whether something is “influential scientific information” and what the detailed criteria would be for that evaluation. The commenter suggests that the final rule make this clear.

Commenter (12430) asserts that the definition of influential scientific information offers no parameters for determining whether scientific information could have “a clear and substantial impact” or which hypothetical “public policies or private sector decisions” should be considered “important.” Accordingly, the commenter states that the breadth of the definition would empower the administrator to make subjective, *ad hoc*—and potentially inconsistent or politically motivated—determinations about whether theoretical “policies” and “decisions” would be “important” and thus would justify the application of the supplemental proposal.

Commenter (12465) provides that the supplemental proposal is unclear what transparent criteria for the dissemination of “influential scientific information” would meet a “novel, controversial, or precedent-setting” determination. Additionally, the commenter states that scientific advancements are invariably “novel, controversial, or precedent-setting” which would tend to discourage advancement of science and is counter to basic scientific principles. The commenter contends that it is also not clear how the scope of the regulation interplays with scientific information that is outside of the scope initially but later becomes within the scope. For example, the commenter notes that a series of smaller studies outside of the scope of the rule would not be

held to the transparency requirements, however, if they are appropriately scientifically rigorous, and are at some future point incorporated into a larger activity, they would be precluded from inclusion.

Commenter (12688) notes that the supplemental proposal sets out no test, or even parameters or factors to guide the Agency in determining what information might have a “clear and substantial impact,” thus amplifying all the concerns the commenter had with the Proposal.

Commenter (12720) states that the definition of “influential scientific information” is overly vague, as it does not describe how, when, or why the Agency makes such a determination about any such information. Furthermore, the commenter notes the SNPRM does not define what a “clear and substantial” impact is and does not specify if and how such a determination is made or documented. Additionally, according to the commenter the definition is not specific to EPA’s research review context and is vague and overly expansive in not describing the types of “public policies” and “private sector decisions” are affected by the nature of influence of the science itself, rather than EPA’s determinations about that scientific content within the larger context of all available research. Notably, the commenter asserts EPA does not restrict “influential scientific information” to include only “publicly available” scientific information, because a large portion of important science may or may not be publicly available. As such, the commenter provides that the inconsistency between what EPA currently considers to be influential science on its own web site²⁷⁸⁶ and how it is defined in the SNPRM signals EPA’s lack of adequate advance consideration to define this term.

Response: The definition of influential scientific information in 30.2 of the final rule remains, “scientific information the agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions.” This definition of influential scientific information is the same definition as in OMB Bulletin for Peer Review. The EPA adopted this definition because it intended the scope to be consistent with how that term has been interpreted and applied in the context of peer review.

The interpretation of the term “influential” is consistent with OMB’s government-wide information quality guidelines (IQG) and the IQG of the Agency. At EPA, scientific and technical work products that will have or do have a clear and substantial impact on important public policies or private-sector decisions would be considered influential. The following factors (See Chapter 3.2 EPA’s Peer Review Handbook, 4th Edition²⁷⁸⁷) are considered when determining whether a product is likely to be influential:

- Establishes a significant precedent, model or methodology.
- Is likely to have an annual effect on the economy of \$100 million or more, or adversely affect in a material way the economy; a sector of the economy; productivity; competition; jobs; the environment; public health or safety; or state, tribal or local governments or communities.

²⁷⁸⁶ U.S. Environmental Protection Agency. n.d. “Influential Products with Completed Peer Reviews | Science Inventory | Science Inventory | US EPA.” https://cfpub.epa.gov/si/si_public_pr_agenda_archive.cfm.

²⁷⁸⁷ https://www.epa.gov/sites/production/files/2020-08/documents/epa_peer_review_handbook_4th_edition.pdf

- Addresses significant controversial issues.
- Focuses on significant emerging issues.
- Has significant cross-agency and/or interagency implications.
- Involves a significant investment of agency resources.
- Considers an innovative approach for a previously defined problem, process, or methodology.
- Satisfies a statutory or other legal mandate for peer review.

The Agency disagrees with commenters that the definition, use or application of the term influential scientific information is vague or unclear.

Comment: Commenter (12715) provides that the current supplemental proposal states EPA would continue to use standard processes for identifying, evaluating, and reviewing available data, models, and studies,”²⁷⁸⁸ and that the requirement that studies have data and models available for independent validation would only apply to studies that “could drive [EPA’s] subsequent decisions.”²⁷⁸⁹ The commenter asserts the distinction does not appear to be logical or defensible. Using human health risk assessment as an example, the commenter notes that the elements of the scientific evaluation other than the quantitative basis of the toxicity factor are just as important. Additionally, the commenter states that it is not logical that EPA would exclude studies from consideration in the quantitative part of its scientific evaluation but would consider these same studies in other equally important components of the scientific evaluation.

Response: The final rules defines pivotal science as “the specific dose-response studies or analyses that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.” The rule also states, “This action establishes how the Environmental Protection Agency (EPA) will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information for which the conclusions are driven by the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation.”

Based on the comments on the 2018 proposed rule and the 2020 SNPRM, including that the number of studies that would be subject to the rule might hinder rulemaking, the EPA determined that the Agency should pursue an incremental approach to maximizing transparency in the science that it relies upon by focusing the final rule requirements on dose-response data and, in particular, only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). The EPA considered commenters’ assertions that the scope of the 2018 proposed rule would be so broad as to make implementation infeasible. The 2018 proposed definition of “dose-response data and models” would apply to

²⁷⁸⁸ 85 Fed. Reg. at 15,399

²⁷⁸⁹ 85 Fed. Reg. at 15,398

dose-response data [and models] “used to characterize the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and the magnitude of a predicted health or environmental impact.” This relationship of the dose-response data to the magnitude of a predicted health or environmental impact would require the consideration of an array of studies beyond those that characterize dose-response relationships, including, for example, studies that inform the dose-response modeling (e.g., benchmark response selection); studies that identify data for toxicokinetic adjustments that inform calculation of a human-equivalent point of departure (POD); and studies that inform the selection of uncertainty factors. The number of studies that are used to establish the relationship between dose-response data and models and the magnitude of a predicted health or environmental impact can potentially be very large. This may make implementing the rule as proposed infeasible for at least some significant regulatory actions and influential scientific information. While transparency in EPA decision making is the purpose of this action, transparency cannot be effectively accomplished if the means to that transparency are not feasible. Rather than having this final rule apply to all the studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact, the EPA is balancing transparency and feasibility by focusing on those studies that describe the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Specifically, the scope of dose-response data in this final rule is those studies consisting of the data integral to characterizing dose-response relationships. In some instances, this group will consist of a handful of studies. In other instances, where there are multiple toxicity endpoints, there may be more studies that are crucial to characterizing dose-response relationships. In some other cases, there may be a large number of studies that are used to characterize a dose-response relationship (e.g., where the dose-response is based on a meta-regression of epidemiology studies). However, not all of these studies would be considered pivotal science (see Section III.C.6 of the final rule for the definition of “pivotal science”).

Based on comments and other considerations, the EPA is concentrating its efforts in the final rule to increase transparency on dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. This final rule provides an important step in furthering the progress toward maximizing transparency and will provide insight for future statute-specific requirements.

Comment: Commenter (9455) states that the only measurable criterion of monetary cost in the supplemental proposal is that “influential scientific information which sways public policies and private enterprise decisions and highly influential scientific information which leads to large policies and decisions that would cost \$500 million in a given year,” fails EPA’s fundamental purposes and negates environmental laws. Instead, the commenter provides that bins of scientific information and science should be defined by numbers of lives saved or lost, numbers of cases of chronic conditions avoided or incurred, costs of medical care avoided or incurred, acreage of land contamination avoided or incurred, and other measures of success or failure of policies and decisions.

Response: There are many ways that scientific information can be defined and put into bins, but with respect to this final rule and with regard to influential scientific information, the interpretation of the term “influential” is consistent with OMB’s government-wide information quality guidelines (IQG) and the IQG of the Agency. At EPA, scientific and technical work products that will have or do have a clear and substantial impact on important public policies or private-sector decisions would be considered influential. The following factors (See Chapter 3.2 EPA’ Peer Review Handbook, 4th Edition) are considered when determining whether a product is likely to be influential:

- Establishes a significant precedent, model or methodology.
- Is likely to have an annual effect on the economy of \$100 million or more, or adversely affect in a material way the economy; a sector of the economy; productivity; competition; jobs; the environment; public health or safety; or state, tribal or local governments or communities.
- Addresses significant controversial issues.
- Focuses on significant emerging issues.
- Has significant cross-agency and/or interagency implications.
- Involves a significant investment of agency resources.
- Considers an innovative approach for a previously defined problem, process, or methodology.
- Satisfies a statutory or other legal mandate for peer review.

Comment: Commenter (12645) states that studies can only be considered “scientifically influential” in retrospect, *i.e.*, this term is more suitable to the history of science. The commenter posits that if the original Atomic Energy funded studies of radioactive particles had not been confirmed in many ways, we would not have had such an interest in fine particles. So, the commenter queries, aren’t these confirmatory studies scientifically influential? To the commenter, the definition given in the supplemental proposal is little more than handwaving and can be used by a variety of parties. Finally, the commenter states that citation of research within an EPA document on which a regulatory decision is based could also be used to define pivotal or influential science, and while imperfect, it is still far more understandable and accountable than any of the definitions in the supplemental proposal.

Response: The definition of influential scientific information in 30.2 of the final rule remains, “scientific information the agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions.” This definition of influential scientific information is the same definition as in OMB Bulletin for Peer Review. The EPA adopted this definition because it intended the scope to be consistent with how that term has been interpreted and applied in the context of peer review. The intent of prospectively designating studies as influential scientific information is to gain from the additional attention and required peer review. Retrospective designation may be more accurate but provides no benefits to the Agency in terms of ensure a sounder more scientifically robust product.

The interpretation of the term “influential” is consistent with OMB’s government-wide information quality guidelines (IQG) and the IQG of the Agency. At EPA, scientific and

technical work products that will have or do have a clear and substantial impact on important public policies or private-sector decisions would be considered influential. The following factors (See Chapter 3.2 EPA' Peer Review Handbook, 4th Edition) are considered when determining whether a product is likely to be influential:

- Establishes a significant precedent, model or methodology.
- Is likely to have an annual effect on the economy of \$100 million or more, or adversely affect in a material way the economy; a sector of the economy; productivity; competition; jobs; the environment; public health or safety; or state, tribal or local governments or communities.
- Addresses significant controversial issues.
- Focuses on significant emerging issues.
- Has significant cross-agency and/or interagency implications.
- Involves a significant investment of agency resources.
- Considers an innovative approach for a previously defined problem, process, or methodology.
- Satisfies a statutory or other legal mandate for peer review.

With regard to pivotal science, the Agency has considered comments and Part 30.2 of the final rule provides an final definition.

5.3.1 Limits to EPA's Application of the Rule

Comment: Commenter (12435) asserts that the supplemental proposal's coverage of influential scientific information essentially removes any limit to what information is applicable per the Agency's determination, so the effect is to allow the rule to apply at the Agency's discretion.

Response: The EPA disagrees with this comment. The definition of influential scientific information in 30.2 is "scientific information the agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions." This definition of influential scientific information is the same definition as in OMB Bulletin for Peer Review. The EPA adopted this definition because it intended the scope to be consistent with how that term has been interpreted and applied in the context of peer review. The interpretation of the term "influential" is consistent with OMB's government-wide information quality guidelines (IQG) and the IQG of the Agency. At EPA, scientific and technical work products that will have or do have a clear and substantial impact on important public policies or private-sector decisions would be considered influential. The following factors (See Chapter 3.2 EPA' Peer Review Handbook, 4th Edition) are considered when determining whether a product is likely to be influential:

- Establishes a significant precedent, model or methodology.
- Is likely to have an annual effect on the economy of \$100 million or more, or adversely affect in a material way the economy; a sector of the economy; productivity; competition; jobs; the environment; public health or safety; or state, tribal or local governments or communities.
- Addresses significant controversial issues.

- Focuses on significant emerging issues.
- Has significant cross-agency and/or interagency implications.
- Involves a significant investment of agency resources.
- Considers an innovative approach for a previously defined problem, process, or methodology.
- Satisfies a statutory or other legal mandate for peer review.

The requirements of this final rule will apply to influential scientific information, unless the influential scientific information is exempted from peer review requirements as described in Section IX of the OMB Peer Review Bulletin.

Chapter 6: Pivotal Science

The supplemental notice of proposed rulemaking (SNPRM) includes a definition for “pivotal science” at 40 CFR 30.2 that would pertain to the science underlying influential scientific information, which is not regulatory, and made conforming changes to the notice of proposed rulemaking (NPRM) regulatory text at 40 CFR 30.3, 30.5, 30.6 and 30.7. These proposed revisions were made to provide clarity on key terminology used in the regulatory text in the 2018 proposed rulemaking as well as in this supplemental proposal.

The SNPRM proposed “pivotal science” definition follows:

Pivotal science means the specific scientific studies or analyses that underly influential scientific information.

Several comments were received regarding the definition of “pivotal science” and scope of coverage. In this section these comments are organized under the following sections:

Section 6.1: NPRM Pivotal Regulatory Science

- How Should the Proposed Rule Apply to Dose Response Data and Models Underlying Pivotal Regulatory Science If Those Data and Models were Developed Prior to the Effective Date?
- Could Prospective or Retrospective Application Introduce Bias Regarding the Timeliness and Quality of Scientific Information Available?
- How Does What this Rule Would Require Compare to Requirements of Environmental Statutes?
- Recommended Changes to the Definition of Pivotal Regulatory Science at §30.2

Section 6.2: SNPRM Pivotal Science

- Need for Additional Clarity/Specificity
- Support for Expanded Scope

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

6.1 NPRM Pivotal Regulatory Science

6.1.1 How Should the Proposed Rule Apply to Dose Response Data and Models Underlying Pivotal Regulatory Science Developed Prior to the Effective Date?

6.1.1.1 Support Some Application of the Rule to Data and Models Developed Prior to the Effective Date

6.1.1.1.1 Recommend that EPA Revisit Regulatory Decisions Based on Studies Conducted in the Past that have had Major Impacts to Regulated Entities

Comment: Commenter (3971) suggests that for regulations that have had major impact on the economic well-being of certain corporations or the national economy, the EPA should selectively revisit decisions of the past. The commenter states that many older studies that the Agency relied upon as a basis for regulation were outdated, poorly conducted, and improperly interpreted. According to the commenter, the Agency often said that although the data were weak, it was all that was available, and suggested that action is warranted. The commenter notes that this bar may have been adequate in the past when we were dealing with major problems, such as a serious ambient air problem in cities, but that the trend toward invoking the Precautionary Principle in times of doubt has sometimes led to this Principle to be misapplied. The commenter contends that more studies and a proper interpretation of them will allow EPA to drift away from policy-driven regulation.

Response: EPA disagrees that this rule should require EPA to require the dose-response data underlying pivotal science to be publicly available for past rules. Such retroactive application would be time consuming and impracticable to do for all regulatory actions EPA has promulgated and influential scientific information EPA has developed. This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on existing significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data.

6.1.1.1.2 Recommend that Studies Used as Pivotal Regulatory Science be Made Available Early in the Rulemaking Process

Comment: Commenter (6375) states that, in general, they did not believe that EPA needed to perform a retrospective review of all past final regulations to ensure compliance with the proposed rule when the rule is published. The commenter suggests that, at a minimum, however, the proposed rule should apply to any rule in the Advance Notice of Proposed Rulemaking (ANPRM) or proposed rule phase as of the effective date of this regulation and that enough time be available prior to any statutory or court-ordered deadlines to make public all data and models from dose-response studies as early as possible. The commenter states that this approach should apply to dose-response studies even if they were developed prior to the effective date of this rule. The commenter adds that, if there are instances when EPA cannot apply this rule, then the

Agency should identify in the final rule which dose-response studies used as pivotal regulatory science have not been made publicly available and a schedule for making those studies available.

Response: EPA agrees with the commenter that this rule should not apply retrospectively to past final regulations, but should apply to studies developed prior to the effective date of this rule. This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. For future significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. EPA further notes that it sees no need to include the proposed rule stage of significant regulatory actions in the regulatory text because as a practical matter proposed rules must comply with this final rule before being finalized. As a general matter, the EPA does not introduce the studies and analyses it relies on for a rulemaking at the final rule stage. The scientific basis for a rulemaking is provided for public review and comment in the public docket when the proposed rule is issued or, if subsequently added to the docket, through a separate opportunity for public comment. Advance notices of proposed rulemakings are not consistent with the purpose of this rule, given their preliminary nature and frequent focus on soliciting comments on a regulatory issue or approach.

6.1.1.1.3 Recommend that Rule Apply to All Pivotal Regulatory Science Regardless of When Data and Models Developed

Comment: Commenter (6921) recommends that apply the enhanced transparency requirements included in the Proposed Rule to all pivotal regulatory science regardless of when the data and models were developed. The commenter asserts that, given that EPA generally relies on previously published research, applying the rule prospectively to any new study would undermine any effect from the rulemaking for years. According to the commenter, this would allow EPA to continue to use research that has not been replicated or validated. The commenter notes that, given the importance of EPA regulatory decisions that can impose millions, if not billions, of dollars on the regulated community and the American public, the EPA should make every effort to assure public access to all models and data used to support significant regulatory actions, regardless of when the study was first published or relied upon for regulatory decisions. The commenter asserts that the relative importance of the study to significant regulatory actions, rather than its age, should be the main determinant of the applicability of the enhanced transparency requirements.

Response: EPA agrees with the commenter. The final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data.

6.1.1.2 Oppose Application of the Rule to Data and Models Developed Prior to the Effective Date

Comment: Commenters (1012, 5170, 6373, 6448, 6916) take the position that this rule should not apply to data and models developed prior to the rule's effective date. Specific comments include:

Commenters (1012, 5170) assert that data and research that were conducted prior to a final date of this proposed rule should be exempted as the protocols were already approved. Commenter (5170) states that this approach would be similar to the manner in which pesticides that EPA approved for use in the past with less current research protocols have been and continue to be 'grandfathered in', often for widespread use.

Commenter (6373) states that it would be difficult, if not impossible, to apply the Rule's new requirements related to dose response assumptions and models to studies where the methodology was developed prior to the effective date of the Rule.

Commenter (6916) states that application of the proposed rule to dose response data and models developed prior to the effective date would have the potential effect, on Clean Air Act (CAA) rulemakings, of prohibiting the use of the well-developed dose response information resulting from two landmark studies, the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality, that have been called "the poster children of good-science reforms." The commenter expresses opposition to such an outcome, as it would remove from EPA's rulemaking toolbox the "best available science" on the link between air quality and health and is both unnecessary and unjustified.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. For future significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data.

Consistent with existing Agency practice, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information. The requirements of this final rule provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Comment: Commenter (1012) states that data, studies and research that were initiated prior to the final date of this proposed rule should be excepted from this proposed rule as the protocols were already set before the rule was finalized. Similarly, commenter (6448) recommends that the provisions of this rule not apply to data and models currently underway.

Commenter (6373) requests that EPA state whether the Rule will apply to scientific studies that have already commenced, where human participants have already signed data use agreements or other agreements that place limits on the use of their private data.

Response: For future significant regulatory actions and influential scientific information, this final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Consistent with existing Agency practice, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information. The requirements of this final rule provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

6.1.2 Could Prospective or Retrospective Application Introduce Bias Regarding the Timeliness and Quality of Scientific Information Available?

6.1.2.1 Conditional Retrospective Application to Past Studies Used as Pivotal Regulatory Science

Comment: Commenter (6141) states that, in the event that EPA elects to apply the transparency rules retrospectively, the EPA should consider developing exemptions for those past studies for which it is not possible to release a dataset publicly for legitimate reasons pertaining to the use, for example, of human subject data.

Response: EPA notes that this final rule applies prospectively to future significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. That said, EPA agrees with the commenter that additional reasons for exemption from this rule are merited, and has amended 40 CFR 30.7 (proposed 40 CFR 30.9) to read,

“The Administrator may grant an exemption to this part for a study on a case-by-case basis if he or she determines that greater consideration is warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study’s underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.”

Comment: Commenter (6141) states that instead of imposing an absolute ban on the use of past studies in all cases, EPA should develop reasonable rules and guidelines on when EPA may consider these past studies in future rulemakings.

Response: EPA clarifies that the rule does not impose a ban on the use of any studies regardless of when they took place. Under the final rule no studies are categorically excluded from consideration, even studies where the underlying dose-response data are not available for independent validation. EPA will continue to assess the full body of science to evaluate the quality and transparency of available science for significant regulatory actions and influential scientific information using the factors outlined in § 30.5(b) of the final rule. The EPA will also consider the degree to which pivotal science is available and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation.

Comment: Commenter (6360) recommends that, if EPA elects a retrospective application, EPA should develop a process by which stakeholders could petition EPA based on objective criteria for the retrospective application of this rule to an existing administrative record for a final agency action. The commenter recommends that the criteria require a demonstration that the lack of transparency in the past undermines confidence in policies that significantly and adversely impact today's consumers, economy, or environment. Commenter states that this process could draw from the existing petition for rulemaking processes under the Administrative Procedures Act (APA) and requests for data correction under the Data Quality Act.

Commenter (6143) suggests that requirements apply on a case-by-case basis to retrospective assessment of research information to the extent that such actions are based or depend on research information.²⁷⁹⁰

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. Such retroactive application would be time consuming and impracticable to do for all significant regulatory actions EPA has promulgated and influential scientific information EPA has developed. For future significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data.

²⁷⁹⁰ The commenter suggests that the EPA phase-in the requirements for retrospective assessments, starting with Agency actions and documents having the most widespread effects, e.g., the highest number of permit applications, alleged violations, etc., and the least transparent by the modernized criteria. (However, ordinarily there should be no need for the Agency to retroactively assess NAAQS that are subject to scheduled reviews.) The commenter expresses that they recognize that the effort to uncover the original data for existing regulations may be difficult, costly and infeasible. In such cases, the commenter suggests that where new studies would provide at least the same information, EPA should begin anew under the modernized transparency requirements, with research protocols vetted by an independent organization such as the National Academy of Sciences.

6.1.2.2 Support for Retrospective Application to Past Studies Used as Pivotal Regulatory Science

Comment: Commenter (6362) states that the rule should generally apply prospectively to EPA decision making. The commenter also states that, in cases where EPA has developed analytical tools and models, e.g., ECOSAR, in the past that incorporate dose response data, it may be valuable to apply this rule retrospectively. The commenter notes that, in other cases, such as Integrated Risk Information System (IRIS) assessments, where the Agency has yet to articulate a periodic review schedule for updating scientific assessments dating back 10-20 years or longer, the EPA should develop appropriate mechanisms for application of the rule.²⁷⁹¹

Response: EPA agrees with the commenter that this rule should apply prospectively to EPA decision making. This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. For future significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. In the case of tools and models (e.g. ECOSAR) or IRIS assessments, this rule will only apply to those if they are used as pivotal science in future significant regulatory actions and influential scientific information.

Comment: Commenter (6449) states that in many cases the EPA relies upon toxicological assessments that have already been published by the Agency. The commenter recommends that the Rule make clear that for major or significant regulatory actions, the requirements of this rule will apply at the regulatory phase regardless.

Response: EPA clarifies that for future significant regulatory actions and influential scientific information, this final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data.

6.1.2.3 Oppose Retrospective Application

6.1.2.3.1 Regulatory Uncertainty

Comment: Commenters (6116, 6125, 6141, 6360, 6866, 6905, 6918) suggest that the EPA require only prospective application of the Proposed Rule and express concern that the Proposed Rule could increase regulatory uncertainty for industry.

Commenter (6125) states that even though limited by time and resources, our assessment shows that, if the proposed rule were to apply retroactively with few or no exceptions/exemptions, most of the EPA cancer classifications and reference values would be vacated. The commenter suggests that, given the magnitude of the issue, EPA must address the potential damages to

²⁷⁹¹ In addition, the commenter notes that the stakeholders who seek to urge EPA to undertake a retrospective review do have options at their disposal, e.g., they can develop a voluntary new evaluation under TSCA, petition EPA, or file an Information Quality Request (IQA) requesting a correction.

public health and the environment before any final action. The commenter adds that, to issue a valid rule, EPA would have to analyze this issue on its own, including what studies the proposal will exclude, present the results for public comment, and explain why the benefits of the per se rule justified the public health sacrifice and regulatory confusion that it would cause.

Commenters (6141, 6360) recommend that the EPA require only prospective application of the reforms. According to the commenters, a forward-looking process that does not disrupt any previously published proposed or final rule strikes a reasonable balance between EPA's positive efforts to increase transparency and the need for certainty, finality, and reasonable implementation burdens. Commenter (6360) states that reopening existing administrative records of final agency actions could result in significant unintended consequences that could undermine EPA's ability to implement the proposed rule.

Commenter (6866) states that retrospective application would put in doubt all current regulations – rules that provide business with certainty about requirements and that protect the public – even though there is no reason to assume they are faulty. The commenter expresses that the EPA can always reopen rules on a case-by-case basis if there is reason to do so, and some environmental statutes require periodic reviews of the latest science.

Commenter (6905) understands that this rule would only be used prospectively and urges EPA to retain that limitation. The commenter notes that the Proposed Rule, if implemented, would present increased litigation risk for states who rely on existing rules and standards set by the EPA and would increase regulatory uncertainty.

Commenter (6918) supports a forward-looking process in which EPA applies its new regulatory procedures to new proposed rules but does not disturb already-issued proposed or final rules. According to the commenter, a forward-looking process that does not disrupt any previously issued proposed or final rule strikes a reasonable balance between EPA's efforts to increase transparency and the need for certainty, finality, and reasonable implementation burdens.

Response: EPA agrees with the commenters, and this final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. For future significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Since this rule applies only prospectively to significant regulatory actions it is unnecessary to assess potential damages associated with a retrospective application of the requirements of this rule.

Comment: Commenter (6117) does not recommend any retroactive application of this regulation. The commenter states that the EPA has already embarked on a well-thought-out plan to require and promote research transparency, as described in the EPA's 2016 *Plan to Increase Access to Results of EPA-Funded Scientific Research* ("Plan"). The commenter provides that, although the preamble to the proposed regulation cites and "applies concepts and lessons learned" from the *Plan*, there are some concerning differences. The commenter states that the *Plan* indicates that it

does not apply to “scientific research data collected before its implementation.”²⁷⁹² The commenter states that, in contrast, the preamble and the proposed regulation suggest that the regulation may apply retrospectively.

Commenter (6141) suggests that EPA focus the new rules for scientific transparency on future studies rather than on past studies that are already designed and published with terms that may not fully comply with transparency requirements of the Proposed Rule. The commenter states that it should be noted that the epidemiologic science community has been making significant efforts in recent years to make data available where possible and to develop studies based on publicly available data where appropriate. The commenter contends that the Proposal would strengthen and expand upon this trend by further encouraging researchers to make increased efforts toward transparency so that the results of their research are eligible to be considered in future EPA rulemakings or other regulatory proceedings.

Response: EPA disagrees with the commenters that all past studies should be exempt from the requirements of this rule. This final rule applies prospectively to significant regulatory actions or influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information, but applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Under the final rule no studies are categorically excluded from consideration, even studies where the underlying dose-response data are not available for independent validation. EPA will continue to assess the full body of science to evaluate the quality and transparency of available science for significant regulatory actions and influential scientific information. The EPA will also consider the degree to which pivotal science is available and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation.

6.1.2.3.2 Legal Considerations

Comment: Commenters (6117, 6133, 6137) assert that it is well established that agency rules cannot be applied retroactively unless Congress expressly grants the agency that power. The commenters cite *Bowen v. Georgetown Univ. Hospital*, 488 U.S. 204, 208 (1988). Commenter (6137) also cites *Sierra Club v. Whitman*, 285 F.3d 63, 68 (D.C. Cir. 2002) (referring to “unusual ability to implement rules retroactively”). Commenters (6133, 6137) contend that EPA has not identified any such congressional intention in any of the statutes at issue, and thus retroactive application of the Rule would be unlawful.

Commenter (6117) states that there is no specific grant of power to apply this proposed regulation retroactively. The commenter provides that the two bills upon which this proposed regulation is modeled, the Honest and Open New EPA Science Treatment (HONEST) Act of

²⁷⁹² Environmental Protection Agency, Plan to Increase Access to Results of EPA-Funded Scientific Research, Version 1.1 (Nov. 29, 2016), p. 5. Available at <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf>. (Last accessed December 23, 2020).

2017 (H.R. 1430 – 115th Congress, 2017-2018), and the Secret Science Reform Act of 2015 (H.R.1030 – 114th Congress 2015-2016), were not enacted.

Commenters (6133, 6137) assert that the Supreme Court strongly disfavors retroactive application of rules and cite the following Court decision:

"Retroactivity is not favored in the law. Thus, congressional enactments and administrative rules will not be construed to have retroactive effect unless their language requires this result. [] By the same principle, a statutory grant of legislative rulemaking authority will not, as a general matter, be understood to encompass the power to promulgate retroactive rules unless that power is conveyed by Congress in express terms. [] Even where some substantial justification for retroactive rulemaking is presented, courts should be reluctant to find such authority absent an express statutory grant." *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208–09 (1988) (internal citations omitted).

Commenter (6133) states that the Proposal ignores an entire body of case law that has considered and roundly rejected both retroactivity in rulemakings and limiting data that underlies rulemakings to “publicly available data.” That commenter adds that, in so doing, the Proposal is arbitrary and capricious, and should be rejected. The commenter notes that the suggestion in the Proposal, for example, that EPA may invoke the Proposal’s approach to review all prior health and scientific studies underlying the national ambient air quality standards (NAAQS) is illegitimate, arbitrary and capricious, and contrary to caselaw. The commenter provides that *Bowen* and its progeny do not permit agency rules to have retroactive effect to disallow health studies and regulatory science generated prior to, or relied upon by EPA prior to, adoption of any final rule based on the Proposal. The commenter asserts that this caselaw does not entertain any such exception and accepting any such exception for these circumstances would circumvent the holdings and reasoning of this case law.

Response: EPA agrees with the commenters that this rule should not apply retroactively. This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. For future significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. EPA also notes that despite proposing to promulgate this rule under the substantive environmental statutes EPA administers, EPA is finalizing the rule solely under its authority to promulgate procedural regulations governing its internal affairs (or “housekeeping authority”).

Comment: Commenter (6133) states that, despite its assertion that the rulemaking is “intended” to apply prospectively, the Proposal contemplates prohibiting EPA—or will prohibit EPA—from relying on studies generated prior to rulemakings that fail to meet the Proposal’s ill-defined criteria for “publicly available data.” According to the commenter, this approach is arbitrary and capricious, runs counter to the specific language of many statutes the agency is tasked with

administering, and would destroy the agency's ability to promulgate health-based standards to protect the American public using the best available science.

Commenter (6137) states that the statutes upon which EPA relies do not support retroactive application. The commenter notes, for example, the CAA does not allow—and, as the D.C. Circuit has held, certainly does not require, e.g., *American Trucking*, 283 F.3d at 372—applying the so-called transparency provisions of the Proposed Rule at all in rules subject to the procedural requirements of CAA§ 307(d). The commenter provides that such rules include NAAQS. The commenter states that, far from suggesting that EPA could lawfully reopen long-settled NAAQS to apply a new and novel standard of review, the CAA requires EPA to review and revise air quality criteria and NAAQS at least every five years and to “promulgate such new standards as may be appropriate.” 42 U.S.C. § 7409(d)(1). The commenter asserts that this carefully chosen language confirms that Congress did not intend for EPA to apply rules like the Proposed Rule to undo existing NAAQS, but instead intended for regular reviews of scientific information to result in new NAAQS.

Commenter (6137) states that, even if EPA had statutory authority to apply the Proposed Rule retroactively, it could not do so rationally. The commenter cites *Sierra Club*, 285 F.3d at 68 (if EPA had authority to implement a rule retroactively, “retroactivity must be ‘reasonable,’”). According to the commenter, retroactive application of the Proposed Rule would undo well-settled rules in a tremendously unfair and irrational way and would lead to widespread confusion about countless environmental and public health policies and protections.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. Such retroactive application would be time consuming and impracticable to do for all regulatory actions EPA has promulgated and influential scientific information EPA has developed. For future significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. EPA also notes that this final rule is relying exclusively on the Agency's housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. Some of these subsequent rulemakings will be substantive rules issued under the associated environmental statutes and will be subject to judicial review. By contrast, in this action, the EPA finalizes a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information for independent validation.

6.1.2.3.3 Retrospective Application May Not Be Practical

Comment: Commenters (2171, 2426, 6126, 6866, 6895) express that retrospective application of the proposed rule may not be feasible or practicable within a reasonable timeframe, both because

of the volume of significant environmental rules already in place and because of the expertise that would be needed to reanalyze rules and supporting studies underpinning those rules. Commenter (2426) states that there was insufficient time and expertise to reanalyze the technical and legal aspects of these rules while maintaining oversight of ongoing agency business.

Commenter (6866) states that a retroactive application would be practically impossible to achieve in a timely manner and would impose unnecessary burdens on the agency while achieving little. The commenter provides that data access and sharing plans developed by National Institutes of Health (NIH), NSF, and EPA for their own funded research have all been prospective.²⁷⁹³

Commenter (6895) states that applying the proposed rule retroactively to health studies, potentially initiated decades ago, would provide no additional protection and would be difficult and time consuming, if not impossible.

Commenter (6141) asserts that there are many reasons why it is not feasible or practicable for EPA to require retroactive application of its proposed transparency policy in the case of existing EPA regulations.

Commenter (6126) states that EPA will not likely have the resources or capability to assess the entire suite of regulations and the evidence-base retrospectively. The commenter notes, for example, that the EPA is technically required to evaluate every regulation promulgated under the Resource Conservation and Recovery Act (RCRA) on a triennial basis; recent research suggests that statutory requirement has been largely unfulfilled due to a lack of resources to comply with the decades-old mandate.²⁷⁹⁴ The commenter states that, in the absence of a major influx of new resources, EPA would be unlikely to engage in such meaningful and transparent reviews while also complying with statutory obligations.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. Such retroactive application would be time consuming and impracticable to do for all regulatory actions EPA has promulgated and influential scientific information EPA has developed. For future significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. EPA also notes that this final rule does not require that EPA, a member of the public or other entity to independently validate a study through reanalysis before it can be considered to be pivotal science.

Comment: Commenters (1449, 6141, 6907) state that there are situations where public access to data and analytic methods used in past published studies may infringe on legitimate

²⁷⁹³ NIH: https://grants.nih.gov/grants/policy/data_sharing/, NSF: <https://www.nsf.gov/bfa/dias/policy/dmp.jsp>, EPA: <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransparencyplan.pdf>.

²⁷⁹⁴ Hart, N. (2016). Evaluation at EPA: Supply at the U.S. Environmental Protection Agency. Diss. Washington, D.C.: George Washington University. Available at: <http://pqdtopen.proquest.com/doc/1812333751.html?FMT=AI>.

confidentiality and/or privacy interests, and where exceptions from the requirement to provide full public access is justified and therefore appropriate.

Commenters (6141, 6191) state that the cost and effort of redoing or updating these past studies also may be too onerous and costly in the case of large and complex existing data sets used in many cases. Commenter (6191) states that enforcement of data sharing for previously completed projects would introduce undue financial burden on principal investigators and may be largely impossible. The commenter provides that Institutional Review Board (IRB)-approved studies include provisions regarding disposal of data following study completion. The commenter states that researchers abiding by these provisions would have securely deleted and disposed of all raw data in the allotted time following project completion.

Commenter (6119) states that the requirements laid out in the rulemaking may not be practicable and/or feasible in the development of toxicity values, which rely heavily on epidemiology studies, case reports and clinical control settings. The commenter asserts that epidemiology studies and case reports are not reproducible as they come from uncontrolled public environmental settings. The commenter explains that uncontrolled public environmental settings are real life exposure scenarios and ultimately what “pivotal regulatory science” is trying to protect. The commenter adds that trying to reproduce the conditions in which a release is occurring or according to conditions 50 years ago is not practicable nor feasible. The commenter further adds that clinical controlled settings can also contain confidential data that cannot always be released for public viewing.

Commenter (6909) states that this proposed rule could have the devastating effect of undermining the scientific bases underpinning many of EPA’s key regulatory regimes if it is applied retroactively – as the language of the proposed rule indicates it may be. The commenter provides that many older epidemiological studies that have provided support for numerous of EPA’s key CAA and Clean Water Act (CWA) programs utilized confidential health data that may not be possible to make public at this point.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. Such retroactive application would be time consuming and impracticable to do for all regulatory actions EPA has promulgated and influential scientific information EPA has developed. For future significant regulatory actions and influential scientific information, this final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Under the final rule no studies are categorically excluded from consideration, even studies where the underlying dose-response data are not available for independent validation. EPA will continue to assess the full body of science to evaluate the quality and transparency of available science for significant regulatory actions and influential scientific information. The EPA will also consider the degree to which pivotal science is available and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation.

Further, the EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

6.1.2.3.4 Retrospective Application is Complicated

Comment: Commenter (6362) states that retrospective application of any regulation (and its underlying scientific evaluations) is rife with complication, confusion, and significant ambiguity for EPA and stakeholders alike. Commenter states that, for example, it is unclear which administrative NAAQS records would be covered by the proposal and how far back it would apply.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. Such retroactive application would be time consuming and impracticable to do for all regulatory actions EPA has promulgated and influential scientific information EPA has developed. For future significant regulatory actions (e.g. a future NAAQS regulation) and influential scientific information, this final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data.

6.1.2.3.5 Retrospective Application Would Undermine Existing Public Health Protections

Comment: Commenters (1012, 2171, 6191, 6895, 6907, 6909, 8281-PH6) oppose retroactive application because it could undermine existing public health protections.

Commenter (1012) states that retroactive application of this proposed rule would open a tremendously convoluted process that could undermine existing public health protections. Commenter (2171) states that this rule must not be applied retrospectively; such application would only serve to create confusion with the intent of undermining existing public health regulations. Commenter (6191) states that the retroactive imposition of this rule would invalidate well-conducted research to the detriment of public health. Commenter (6895) states that retroactive application of the Proposed Rule would be detrimental to public health. Commenter (8281-PH6) states that retroactive application would severely undermine existing public health and environmental protections that keep the public safe and healthy. Commenter (6907) expresses concern that, under the proposed rule, if applied retrospectively, older studies on pesticides may not be considered. The commenter notes that this is of concern for older pesticides which are now unregistered where there are older studies that indicate that these pesticides pose harm to humans or the environment.

Commenter (6909) states that, if EPA applies the proposed rule to studies retroactively, the core programs of the CAA and CWA may suddenly be left without any scientific basis that the agency will recognize. The commenter expresses that the prospect of the agency promulgating a rule that it can use to selectively hollow out core programs that not only protect public health but provide huge economic benefits (in the form of prevented lost workdays and hospital admissions, for example)²⁷⁹⁵ is extremely troubling.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. Such retroactive application would be time consuming and impracticable to do for all regulatory actions EPA has promulgated and influential scientific information EPA has developed. For future significant regulatory actions and influential scientific information, this final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Under the final rule no studies are categorically excluded from consideration, even studies where the underlying dose-response data are not available for independent validation. EPA will continue to assess the full body of science to evaluate the quality and transparency of available science for significant regulatory actions and influential scientific information. The EPA will also consider the degree to which pivotal science is available and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation.

6.1.2.4 Bias in the Quality of Scientific Information Available

Comment: Commenters (0671, 4590, 6126, 6137, 6152, 6191, 6895) express concern that retroactive application could result in the exclusion of studies that currently represent the “best available science” and, thus, reduce the quality of scientific information available for EPA’s regulatory decision-making.

Commenter (6137, 6191) states that retrospective application of the provision would directly introduce bias regarding the quality of the scientific information available, as applying the rule would exclude most data/scientific information from consideration.

Commenter (4590) expresses concern that an incomplete pool of scientific evidence could skew regulatory decision-making toward studies that are less rigorous and trustworthy. The commenter states that, often, research that provides real insight into the impact of pollution on individuals and communities requires precisely the types of data most at risk of exclusion from EPA consideration under this rule.

Commenter (0671) states that the proposed regulatory change should not cover past or future dose response data or models. The commenter asserts that the previous rules were created using

²⁷⁹⁵ U.S. EPA, The Clean Air Act and the Economy, available at: <https://www.epa.gov/clean-air-act-overview/cleanair-act-and-economy>.

the best available science when they were promulgated. According to the commenter, science doesn't disappear because the EPA now wants to apply an unreasonable standard of evidence.

Commenter (6152) states that it appears that EPA may prohibit the use of older scientific studies that were developed before this rule was proposed and therefore may not conform to the requirements in this proposal. The commenter asserts that this arbitrary exclusion and potential retroactive culling of studies would surely undermine the quality of science used in rulemakings. The commenter states that this would impact worker epidemiology studies that often take years and sometimes decades to complete.

Commenter (6895) opposes the rule as an impediment to examination of the current state of the science and strongly opposes any retroactive application of the rule to an existing record. The commenter states that such application will arbitrarily introduce bias into previous decisions to the detriment of public and environmental health. The commenter states that applying the proposed rule retroactively would de facto preclude EPA's reliance on previously validated scientific findings from published, peer-reviewed research.

Commenter (6373) states that both the prospective and retrospective application of the proposed rule requirements will impact the quality of the scientific information that would be available to EPA. The commenter asserts that the Rule would require researchers to spend significant extra time and funds preparing public-use data, which would likely compromise EPA's ability to review and incorporate the most up-to-date relevant epidemiological and toxicological evidence of the health effects of pollutants into its regulations.

Commenter (1012) states that retroactive or prospective application of this proposed rule would ultimately bias the quality of the scientific information available by only allowing studies that support industry positions, which could bias the EPA towards that position.

Commenters (0569, 4590) express concern that the proposed language at subparts §30.2 and §30.9 could impact the quality of the science available because it could allow the EPA to selectively choose studies to meet its agenda. Commenter states that subpart §30.2 contains an a priori criterion of "pivotal regulatory science" while §30.9 gives the EPA Administrator discretion to issue exemptions from the policy on a case-by-case basis. Commenter states that these sections are vague on how and by what measures determinations would be made, opening the door for drawing upon studies driven by unknown interests or by political considerations rather than, as EPA's Mission Statement notes, "...the best available scientific information."²⁷⁹⁶ Commenter (4590) states that empowering the Administrator with the discretion to implement case-by-case exemptions risks arbitrary policymaking, untethered from clearly established principles regarding when it is appropriate to rely on non-publicly available data as the best available scientific evidence.

²⁷⁹⁶ United States Environmental Protection Agency. Our Mission and What We Do. Available: <https://www.epa.gov/aboutepa/our-mission-and-what-we-do>

Commenter (6362) states that bias should not be presumed. According to the commenter, if EPA uses a weight-of-the-evidence approach (as required under TSCA)²⁷⁹⁷ and EPA has concerns about bias having been introduced, it can assess this using a sensitivity analysis by evaluating the impact of each study and/or model on the overall outcome of the analysis.²⁷⁹⁸ The commenter asserts that bias should not be inferred if newer, more scientifically robust studies based on modern, up to date knowledge of biology and dose response are determined to be of better quality, relevance, and evidentiary value.

Commenter (6375) states that, in general, if the right processes and systems are in place to manage the public sharing of dose-response studies, then no unintended bias will occur for any prospective application of the rule. The commenter recognizes the challenge this may present and recommends that EPA consider a process ensuring that new dose-response studies are identified and assessed when they are completed and not wait until the rulemaking process begins. The commenter states that the NAAQS process is an example where EPA could develop a continual review process. The commenter asserts that continual assessment of new dose-response studies to determine if they have the potential to be pivotal regulatory science is key to ensuring that this rule does not cause bias or otherwise slow the rulemaking process. According to the commenter, this will allow enough time for independent verification to be completed prior to the rulemaking process, thus minimizing unnecessary delays.

Commenter (6449) states that there may be bias against the following:

- high quality studies published in the past where underlying data is not available;
- studies published outside the U.S;
- studies performed by authors or in a journal not informed by the rule; and
- proprietary models.

Commenter (6375) states that, regarding retrospective application, if EPA does not ensure that data and models from past dose-response studies are made publicly available when reviewing a previously finalized rule or creating a new rule, EPA could be giving the same weight to studies that may not have the same level of quality or veracity. The commenter notes that this could bias the rulemaking decisions toward results which do not represent the best available science. The commenter suggest that the Agency should release underlying data from older studies including methodologies so that strength and weaknesses of these data sets can be identified and that bias toward lower quality studies can be identified and constrained going forward.

²⁷⁹⁷ The TSCA Risk Evaluation rule provides an excellent definition of “weight-of-the-scientific-evidence” that should be adopted across the federal government, but certainly across EPA, at a minimum. That definition is: “ a systematic review method, applied in a manner suited to the nature of the evidence or decision, that uses a pre-established protocol to comprehensively, objectively, transparently, and consistently identify and evaluate each stream of evidence, including strengths, limitations, and relevance of each study and to integrate evidence as necessary and appropriate based upon strengths, limitations, and relevance.” See 82 Fed. Reg. 33726, 33733 (July 20, 2017).

²⁷⁹⁸ EPA’s implementation and adherence to systematic review in the implementation of this proposal as it has committed under TSCA, will serve to guard against the introduction of bias. See EP’s Application of Systematic Review in TSCA Risk Evaluations at https://www.epa.gov/sites/production/files/2018-06/documents/final_application_of_sr_in_tsc05-31-18.pdf

Commenter (9227) notes that EPA's proposal would regulate not the scientists, but EPA itself and that the EPA would "ensure" that data and models underlying scientific studies "pivotal" to regulatory action are publicly available simply by barring EPA's own use in regulatory actions of any studies for which the authors do not make the data and models publicly available. The commenter asserts that the "mechanism" mentioned in the preamble is not technical assistance or funding to encourage greater availability of data; it is simply the pressure generated by EPA's refusal to consider the results of a study if the authors do not release publicly the underlying data and models. The commenter states that most of the significant barriers to release data and models are not a matter of the researcher's preference, but rather take the form of legal and ethical constraints, significant costs, large time investments, or the loss of proprietary data critical to a researcher's future career prospects. The commenter suggests that while it seems plausible that having their research applied in a regulatory context would be viewed as an incentive by some, or perhaps many, researchers, there is no reason to believe that such an incentive would be sufficient to overcome the significant barriers to public release of data where those barriers exist. The commenter contends that the party most likely to be incentivized by EPA's proposed requirements is the regulated community which has vested financial interests in regulatory actions the agency may take—a situation that almost certainly will lead to significant bias and conflicts of interests in the scientific evidence that the agency considers.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. Such retroactive application would be time consuming and impracticable to do for all regulatory actions EPA has promulgated and influential scientific information EPA has developed. For future significant regulatory actions and influential scientific information, this final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data.

EPA disagrees with the commenters that this rule will result in the exclusion of studies from consideration for EPA significant regulatory actions and influential scientific information.

Under the final rule no studies are categorically excluded from consideration, even studies where the underlying dose-response data are not available for independent validation. EPA will continue to assess the full body of science to evaluate the quality and transparency of available science for significant regulatory actions and influential scientific information. The EPA will also consider the degree to which pivotal science is available and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation.

EPA disagrees with the commenter that the Administrator's exemption outlined in proposed 40 CFR 30.9 will result in arbitrary policymaking. The EPA believes that retaining the Administrator's exemption provision because there are conditions under which compliance with the requirements in 40 CFR part 30 might be impracticable. For example, the underlying dose-response data for some studies, particularly older studies, may not be readily publicly available because of the technological barriers to data sharing (e.g., differences in data storage devices or data retention practices) that existed when they were developed, such as the age of the study. As

a result, the EPA is finalizing the Administrator's exemption provision as proposed in the 2020 SNPRM, with additional conditions described here. Due to other changes in the final rule, the Administrator's exemption provision, which was previously in 40 CFR 30.9 in the 2018 proposed rule and the 2020 SNPRM, is now 40 CFR 30.7 in the final rule. To ensure that the Administrator's decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation. The EPA is also including criteria that may be used by the Administrator when he or she is determining whether greater consideration should be afforded to pivotal science for which the underlying dose-response data are not available in a manner sufficient for independent validation. As a result, the Administrator may determine that greater consideration is warranted when:

- Technological or other barriers render sharing of the dose-response data infeasible;
- The development of the dose-response data was completed or updated before the effective date of the final rule;
- Making the dose-response data would conflict with laws and regulations governing privacy, confidentiality, CBI, or national security;
- Third-party independent validation of the study's underlying dose-response data through reanalysis has been conducted; or
- The factors in 40 CFR 30.5 used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

To assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption. The EPA will document the rationale for the Administrator's exemption in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

Finally, EPA disagrees with the commenters that by taking into consideration the availability of data and models underlying pivotal science, EPA will be biased against considering the best available science. The EPA does not agree that its approach will be biased. As discussed in the preamble, the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. When characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, the EPA will identify pivotal science and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation.

Including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties. This approach will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

6.1.2.5 Bias in the Timeliness of Scientific Information Available

6.1.2.5.1 Analysis Paralysis and Data Dredging

Comment: Commenter (6446) expresses concern that there are no criteria or ad hoc methods that would prevent stalling vital decisions to protect public health and the environment by "analysis paralysis." The commenter contends that the proposed rule, if adopted, would inevitably delay setting protective standards through prolonged evaluation of the sufficiency of the public availability of research data and methods, rather than evaluation of the actual quality and import of scientific research.

Commenter (6122) states that the decision to delay action in favor of more refined data or models is a decision in-of-itself, and often has real consequences for ecosystems and endangered species. The commenter contends that forcing EPA to consider virtually every possible model in any decision will not lead to better decision-making, but instead will lead to regulatory paralysis, and EPA will defer taking life-saving steps to address pollution.

Response: The EPA disagrees with the commenters that requirements of this rule will result in any meaningful delay in promulgating regulations. While this rule does require the Agency to evaluate the availability of data and models for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of all the studies the EPA would review). See section III.J of the rule preamble for further explanation.

Comment: Commenter (6897) states that the proposed rule would encourage data dredging and deconstruction that are the antithesis of good science. The commenter notes that epidemiological studies consider a huge number of variables and can relate them to a variety of outcomes in order to determine one significant association, such as the impact of poor air quality and asthma. The commenter explains that data dredging involves systematically retesting data sets such as those underlying epidemiologic studies through multiple models and statistical tests in order to produce desired outcomes. The commenter states that the proposed rule would allow regulated industries to request data and subject it to endless dredging to slow or entirely forestall regulation that would hurt their economic interests. The commenter adds that, similarly, data "deconstruction" is a term that has been used to describe a variety of sophisticated attacks on data, including reconsidering raw data through unreliable models and confounding data to obscure findings of harm. By explicitly requiring that the EPA consider a vast array of alternative models, which may be prepared by outside stakeholders, the commenter states that the proposed rule has the potential to buoy well-financed stakeholders who benefit from

undermining good science and stalling sound policy by enforcing their ability to endlessly test and manipulate data.²⁷⁹⁹

Response: EPA disagrees with the commenter. Because of the potential impact of final significant regulatory actions, independent validation of studies that are pivotal to the EPA's final significant regulatory actions and influential scientific information will increase public confidence in the findings and conclusions presented in those studies. As noted in preamble to the final rule, the EPA's Science Advisory Board (SAB) noted that it "recognizes the importance of this rule and its purpose, establishing transparency of the influential scientific information used for significant regulations and enhancing public access to scientific data and analytical methods to help ensure scientific integrity, consistency and robust analysis. Strengthening transparency by improving access to data can lead to an increase in the quantity and the quality of evidence that informs important regulatory and policy decisions. The scientific community is moving toward adopting the precept of sharing accurate data and information to increase credibility, high-quality outcomes and public confidence in science. The SAB supports the adoption of this precept."²⁸⁰⁰ The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals²⁸⁰¹ and the emergence of organizations, such as the Center for Open Science, and international initiatives like Findable, Accessible, Interoperable, and Reusable (FAIR) data principles; Facilitate Open Science Training in European Research (FOSTER); and Guidelines for Transparency and Openness Promotion (TOP) in Journal Policies and Practices that incentivize greater transparency in research.^{2802,2803}

6.1.2.5.2 Barrier to Timely EPA Rulemaking

Comment: Commenter (1012) states that retroactive or prospective application of this proposed rule would ultimately bias the timeliness of the scientific information available by introducing procedural hurdles to the Agency's review process which could bias the EPA towards industry positions.

Commenter (6373) states that the prospective and retrospective application of these requirements will impact the timeliness of the scientific information that would be available to EPA. The commenter states that, even if it were feasible to recreate past studies so that they use a new data set that may be made public, it would be neither time-efficient nor cost-effective to repeat these studies merely to create a public data set for an "independent validation" in order that they be considered in the regulatory process.

²⁷⁹⁹ <http://www.hup.harvard.edu/catalog.php?isbn=9780674047143>

²⁸⁰⁰ The SAB also provided several constructive comments and recommendations, which have been considered in the development of this final rule.

²⁸⁰¹ McNutt, M. (2016). Taking up TOP. *Science* 352, 1147. Available at <https://doi.org/10.1126/science.aag2359>

²⁸⁰² NAS (National Academies of Sciences, Engineering, and Medicine). (2019). Reproducibility and replicability in science. Washington, DC: The National Academies Press. Available at <https://www.nationalacademies.org/our-work/reproducibility-and-replicability-in-science>.

²⁸⁰³ 17. Nosek, B. A. et al. (2015). Promoting an open research culture. *Science* 348, 1422-1425. Available at <https://doi.org/10.1126/science.aab2374>

Commenter (6119) states that it is their assessment that the proposal could further delay development and update of toxicity values or reference values published in the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), Toxic Substances Control Act (TSCA), CWA, Safe Drinking Water Act (SDWA) and other federal acts authorized by EPA. The commenter notes that states, EPA and the public are already struggling to respond to emerging contaminants for which toxicity values and risk-based standards have yet to be developed. There are currently more than 129 million organic and inorganic substances identified with a chemical abstracts service number in the open scientific literature. Yet, the commenter notes that only a handful have been studied and even fewer with “*dose response data and models*” (reference values (reference dose and/ or reference concentrations)) used for “*pivotal regulatory science*” as noted in the proposed rule. In Alaska, for example, the commenter states that a cleanup level for sulfolane has yet to be set, awaiting a National Toxicology Program (NTP) study on the public health impacts of long-term exposure to the environmental contaminant.

Commenter (6119) recommends that, if finalized, the rule should be applied only going forward and not retroactively due to the disruption that would cause. The commenter states that making it retroactive would lead to a lengthy and expensive hiatus in environmental management (protection and permitting) while the past decisions are explored, and the public provided notice.

Commenter (1012) states that retroactive application of this proposed rule would cause needless delays in the already beleaguered NAAQS review process. Commenter (6125) asserts that the proposed rule would likely impair significantly the Agency’s ability to meet regulatory deadlines for the NAAQS or other programs.

Commenter (1012) states that retroactive application of this proposed rule would open a tremendously convoluted process that could undermine existing public health protections and set the Agency up for years of legal challenges. Commenter (5170) states that retroactive application of this proposed rule would make the Agency vulnerable to an onslaught of legal challenges while public health is held in limbo.

Commenter (6116) states that this proposal would slow the EPA’s work to a near standstill or leave it open to criticism in terms of credibility, leaving states with data gaps that they cannot fill. The commenter adds that delays and lack of data due to convoluted, ill-defined requirements to achieve “independent validation” will cause harm to tribal governments who need quick, reliable information to address their environmental protection needs.

Commenter (6373) states that the Rule would require researchers to spend significant extra time and funds preparing public-use data, which would likely cause critical delay in the publication of findings and compromise EPA’s ability to review and incorporate the most up-to-date relevant epidemiological and toxicological evidence of the health effects of pollutants into its regulations.

Response: EPA notes that this final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. Such retroactive application would be

time consuming and impracticable to do for all regulatory actions EPA has promulgated and influential scientific information EPA has developed. For future significant regulatory actions and influential scientific information, this final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data.

Further, EPA disagrees with the commenters that requirements of this rule will result in any meaningful delay in promulgating regulations. While this rule does require the Agency to evaluate the availability of data and models for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of all the studies the EPA would review). See section III.J of the preamble for further explanation.

Comment: Commenter (6119) states that the proposal could further delay development and update of toxicity values or reference values published in the CERCLA, TSCA, CWA, SDWA and other federal acts authorized by EPA. The commenter asserts that states, EPA and the public are already struggling to respond to emerging contaminants for which toxicity values and risk-based standards have yet to be developed. The commenter provides that, while there are currently more than 129 million organic and inorganic substances identified with a chemical abstracts service number in the open scientific literature, only a handful have been studied and even fewer with “*dose response data and models*” used for “*pivotal regulatory science*” as noted in the proposed rule. According to the commenter, unnecessarily restricting the data currently in practice or potentially used for regulatory development would do little to rectify this situation in a timely or “transparent” manner.

Response: EPA disagrees with the commenter that requirements of this rule will result in any meaningful delay in promulgating regulations. While this rule does require the Agency to evaluate the availability of data and models for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of all the studies the EPA would review). Further, EPA notes that this final rule does not restrict the science that EPA can consider in its final significant regulatory actions and influential scientific information. Under the final rule no studies are categorically excluded from consideration, even studies where the underlying dose-response data are not available for independent validation. EPA will continue to assess the full body of science to evaluate the quality and transparency of available science for significant regulatory actions and influential scientific information. The EPA will also consider the degree to which pivotal science is available and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation. See section III.J of the preamble for further explanation.

Comment: Commenter (6137) asserts that the provisions in the proposed rule related to independent peer review of all pivotal regulatory science used to justify regulatory decisions is inconsistent with the provisions in the Office of Management and Budget (OMB) Bulletin that state agencies should “ensure peer review does not unduly delay the release of urgent

findings.”²⁸⁰⁴ The commenter asserts that, if EPA wants to independently peer review all pivotal science, then it must clearly outline how it will ensure the process will not lead to undue delay. According to the commenter, the EPA has failed to do so. The commenter notes, for example, there is nothing in the Proposed Rule outlining how EPA will conduct an independent review of the studies underlying the NAAQS standard, which they state will require review of hundreds if not thousands of science documents, within the NAAQS review cycle. The commenter provides that the standard review period in the independent peer review process (i.e., from submission of a manuscript to final review) is time intensive. The commenter states that, if it can take months to review one manuscript,²⁸⁰⁵ it is difficult to envisage how EPA could subject every piece of pivotal regulatory science to the same standard of review and still complete scientific assessments in a timely manner.

Commenter (6137) also asserts that the absence of a provision in the proposed rule to account for time-sensitive health and safety disseminations is inconsistent with such provisions in the OMB Peer Review Bulletin. The commenter contends that this encompasses most of the studies that EPA intends to review, including but not limited to, IRIS assessments, TSCA risk evaluations, and National Emissions Standards for Hazardous Air Pollutants (NESHAP) risk assessments.²⁸⁰⁶ The commenter states that, in each of these cases, EPA utilizes scientific data to make safety determinations for chemical pollutants and impacts on human health and the environment, and thus, timely review is tantamount to protecting public health. The commenter argues that the Proposal adds another layer of review – one that is wholly unnecessary and duplicative – that is antithetical to the time sensitive nature of these reviews.

Response: EPA disagrees with the commenters that requirements of this rule will result in any meaningful delay in promulgating regulations. While this final rule requires the Agency to evaluate the availability of dose-response data for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of all the studies the EPA would review). See section III.J of the preamble for further explanation. The EPA further notes that the requirements of this final rule do not apply to influential scientific information or pivotal science that is part of a time-sensitive health or safety dissemination. See 40 CFR 30.3 “The provisions of this part do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses, and influential scientific information or pivotal science that meet one or more of the exemptions identified in Section IX of the OMB Final Information Quality Bulletin for Peer Review.” Implementation guidelines and statute-specific transparency regulations or programmatic regulations are forthcoming.

²⁸⁰⁴ OMB, Final Information Quality Bulletin for Peer Review at 1 (Dec. 16, 2004), http://www.cio.noaa.gov/services_programs/pdfs/OMB_Peer_Review_Bulletin_m05-03.pdf.

²⁸⁰⁵ Janine Huisman & Jeroen Smits, Duration and quality of the peer review process: the author’s perspective, *Scientometrics* 113:633 (2017), <https://doi.org/10.1007/s11192-017-2310-5>.

²⁸⁰⁶ EPA, Basic Information about the Integrated Risk Information System (last updated March 7, 2018), <https://www.epa.gov/iris/basic-information-about-integrated-risk-information-system>; EPA, Risk Evaluations for Existing Chemicals under TSCA (last updated June 11, 2018), <https://www.epa.gov/assessing-and-managing-chemicals-under-tsca/risk-evaluations-existing-chemicalsunder-tsca>; EPA, Risk and Technology Review (last updated June 22, 2018), <https://www3.epa.gov/airtoxics/rrisk/rtrpg.html>.

Comment: Commenter (6147) states that the requirement to review past decisions may delay or halt the normal process of EPA decisions. The commenter provides that much of the early data may not be easily obtained and there may be no new data. The commenter expresses that the debate over what is “sound science” has become politicized and has raised a barrier to releasing information in a timely manner. The commenter contends that this attempt to focus on the uncertainties that are inherent in any complex analysis tends to detract from the purpose of seeking a solution to environmental problems. According to the commenter, while it is important to assure the public that regulatory decisions are based on the best available science, it is also important to seek resolution and begin the activities that will restore or protect the environment.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. Such retroactive application would be time consuming and impracticable to do for all regulatory actions EPA has promulgated and influential scientific information EPA has developed. For future significant regulatory actions and influential scientific information, this final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. EPA disagrees with the commenters that requirements of this rule will result in any meaningful delay in promulgating regulations.

Comment: Commenter (6446) expresses concern that a related likely consequence of the proposed rule, even if it contains ad hoc mechanisms for exceptions, is a reduction in EPA's ability to respond quickly to emerging challenges, when data and models take time to be made publicly available and/or redacted and otherwise prepared in a format appropriate for public review. Commenter (6903) states that the Proposed Rule would be a barrier to effective and timely EPA rulemaking and would make it nearly impossible for the Agency to expediently respond to existing and emerging issues and uphold its statutory mandates to protect the public's health.

Response: EPA disagrees that this rule will reduce EPA's ability to respond quickly to emerging challenges. The rule contains no requirement that dose-response data underlying pivotal science be made publicly available. Instead, it governs internal agency procedures for how the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation when promulgating significant regulatory actions or developing influential scientific information for which the conclusions are driven by the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect.

6.1.2.5.3 Other Comments Regarding Prospective or Retrospective Application

Comment: Commenter (0559) encourages EPA to clarify how historical and new studies will be treated under the proposed rule, including how model uncertainty will treat studies demonstrating low-dose effects.

Commenter (6191) states that proposed rule does not describe the process for retrospective application within the text of the rule.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on either significant regulatory actions or influential scientific information. Such retroactive application would be time consuming and impracticable to do for all regulatory actions EPA has promulgated and influential scientific information EPA has developed. For future significant regulatory actions and influential scientific information, this final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. 40 CFR Part 30.5 discusses uncertainty, “The EPA shall also describe critical assumptions and methods used in its dose-response assessment and shall characterize the variability and uncertainty of the assessment. The EPA shall evaluate the appropriateness of using default assumptions on a case-by-case basis. The EPA shall clearly explain the scientific basis for critical assumptions used in the dose-response assessment that the EPA relied on for the significant regulatory action or influential scientific information.”

Comment: Commenter (6373) asserts that EPA should state whether it will decline to consider contemporaneous and future scientific studies that rely in part on past scientific work for which certain data were not or are not currently available.

Response: Under the final rule no studies are categorically excluded from consideration, even studies where the underlying dose-response data are not available for independent validation. EPA will continue to assess the full body of science to evaluate the quality and transparency of available science for significant regulatory actions and influential scientific information. The EPA will also consider the degree to which pivotal science is available and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation.

6.1.3 How Does What this Rule Would Require Compare to Requirements of Environmental Statutes?

Comment: Commenter (0671) states that the proposed regulatory change will force the EPA to ignore the best available science on dose response and models, which is counter to the intent and text of the CAA and amendments, and which will introduce bias by preventing the EPA from using what are often the most relevant and well-designed studies.

Response: Under the final rule no studies are categorically excluded from consideration and the EPA will continue to assess the full body of science to evaluate the quality and transparency of available science for final significant regulatory actions and influential scientific information. The EPA will also consider the degree to which pivotal science is available and give greater consideration to those studies with greater data and model availability. Further, as discussed in the final rule preamble in section III.A, this internal procedural rule does not interpret or apply any provisions of the statutes that EPA administers, and the EPA is maintaining language in 40 CFR 30.3 stating that the statutes EPA administers, or their implementing regulations, will control in the event of any conflicts with the requirements of this rule. When implementing this procedural rule in forthcoming statute-specific transparency regulations or programmatic regulations, the Agency will continue to comply with and abide by the requirements in those statutes and implementing regulations, including regulatory deadlines.

Comment: Commenters (6117, 6133, 6137) assert that it would be unlawful for this rule to have a retrospective effect.

Response: See discussion and response in section 15.2 of this Chapter (Could Prospective or Retrospective Application Introduce Bias Regarding the Timeliness and Quality of Scientific Information Available?) subsection B.3 (Oppose Retroactive Application; Legal Considerations) of this Chapter (15. Strengthening Transparency in Regulatory Science – Pivotal Regulatory Science).

Comment: Commenter (6133) states that the Proposal conflicts with the statutes that EPA administers. The commenter provides that the Proposal unlawfully restricts EPA’s consideration and use of “dose response data and models that underlie” what the Proposal calls “pivotal regulatory science.” 83 FR 18770/2.

Pivotal regulatory science' is the studies, models, and analyses that drive the magnitude of the benefit-cost calculation, the level of a standard, or point-of-departure from which a reference value is calculated. In other words, they are critical to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, risks and other impacts on which a final regulation is based. Id.

Commenter (6133) asserts that, by restricting EPA’s implementation of its federal organic statutes and the APA in this fashion, and by defining “pivotal regulatory science” in this manner, the Proposal violates federal laws. The commenter states that the Proposal does so by requiring EPA to implement federal laws based on the Proposal’s criteria and concept of “pivotal regulatory science,” rather than on the congressional criteria and requirements in federal statutes that contradict, disallow, or fail to include those criteria and concepts in the Proposal.

Response: EPA disagrees that this final rule conflicts with the statutes EPA administers. As a threshold matter, and as discussed in the final rule preamble in section III.A, this internal procedural rule does not interpret or apply any provisions of the statutes that EPA administers. Furthermore, 40 CFR 30.3 states that the statutes and regulations will control in the event of any conflicts, and EPA clarifies that the requirements in this final rule set the overarching structure and principles for science transparency in the EPA’s final significant regulatory actions and influential scientific information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

Comment: Commenter (6133) complains that EPA not only fails to provide a passable definition for its invented term, “pivotal regulatory science,” the agency also fails to provide its rationale for limiting the scope of the rule to so-called “pivotal regulatory science.” The commenter asks (1) why is the “public availability of science and data in a manner sufficient for independent validation” any less important or necessary or justified when the science is not “pivotal” or “critical” to a regulatory decision, (2) why should not all science, studies, data and information considered by EPA meet the standards for transparency, verifiability, independent validation, and

trustworthiness that are the abiding concerns of the Proposal, and (3) why is it not arbitrary and capricious for EPA to continue to consider science and data that are unavailable and insufficient for independent validation in areas outside the reach of the Proposal? The commenter states that EPA offers no explanation for this disparate treatment; the agency's reasoning, such as it is, is entirely conclusory. The commenter provides that, by way of explanation for the limitation, EPA only suggests that the imposed standards "are of paramount importance when the government relies on science to inform its significant regulatory decisions." According to the commenter, this explanation is hopelessly circular and ultimately incoherent. The commenter states that EPA does not explain why it believes this explanation to be true. The commenter adds that the Proposal just substitutes the word, 'paramount,' for the word, 'critical,' that it substitutes for the word, 'pivotal.' The commenter asserts that this failure to thoroughly explain both the term "pivotal regulatory science" in a way that meaningfully defines the scope of the regulation, and the rationale behind limiting the application only to pivotal (critical, paramount) science, makes it impossible for interested parties to comment fully and meaningfully on the Proposal. The commenter suggests that, should EPA intend to finalize this unlawful proposal, the EPA first must withdraw the Proposal, then issue a supplemental proposal with the necessary definitions and explanations.

Response: EPA agreed that there was value in issuing a supplemental proposal to make clarifications, modifications and additions to certain provisions in the rulemaking and therefore issued a supplemental notice of proposed rulemaking in March 2020. In the supplemental, EPA clarified, that "EPA would continue to use standard processes for identifying, evaluating, and reviewing available data, models, and studies. When the Agency has potentially identified multiple key studies or models of similar quality that could drive its subsequent decisions, the Agency will investigate the availability of the underlying data."²⁸⁰⁷ EPA has limited the primary requirements of this rule to pivotal science, which is one or two studies, for two primary reasons. First, although this rulemaking does not require reanalysis of studies, it is informative to evaluate published findings on the patterns of such attempts since journal data sharing policies have been adopted. Lewandowsky et al. (2020) evaluated the cost-effectiveness of reanalysis studies under various scenarios and concluded that reanalysis studies are most cost-effective when they are focused on studies of the greatest interest to the scientific community (in this study, the number of citations was a surrogate for interest) (Ref. 43). This finding is consistent with results in other studies that found and encouraged narrowing the focus of attempted reanalysis studies to those studies of greater significance (Refs. 70, 72, 73, 74). Consistent with the recommendations of these studies and commenters and the EPA's commitment to cost-effective government practices, it is logical to narrow the applicability of this rule to those studies that are most pivotal or "key" to the development of final significant regulatory actions and influential scientific information. Second, though it was never the Agency's intent, the EPA finds that implementing the data and model availability requirements of this final rule for all the studies EPA considers in final significant regulatory actions and influential scientific information may be infeasible.

²⁸⁰⁷ U.S. EPA (U.S. Environmental Protection Agency). Strengthening Transparency in Regulatory Science; Supplemental Notice of Proposed Rulemaking. (85 FR15396, March 18, 2020) (FRL-10004-72-ORD). <https://www.federalregister.gov/documents/2020/03/18/2020-05012/strengthening-transparency-in-regulatory-science>.

Finally, EPA disagrees that the Agency should not consider science where the underlying data and models are not publicly available. The EPA will continue to consider all peer-reviewed science evaluated in the EPA's influential scientific information and final significant regulatory actions, consistent with existing study quality assessment factors and the statutory mandates specific to that rulemaking.

Comment: Commenter (6133) states that the EPA does not and cannot identify any statutory basis—in federal environmental statutes, the APA or otherwise—to apply the Proposal's approach. The commenter provides that EPA's preambular explanation says that "pivotal regulatory science" is "critical to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, or risks and other impacts on which a final regulation is based." According to the commenter, the Proposal nowhere explains what these "other impacts" are. The commenter states that the Proposal does not limit or bound these "other impacts," nor link them to the sentence's incoherent notion of what is "critical" and what is not. Commenter states that the preambular gloss is inconsistent with the proposed CFR definition. According to the commenter, the former says "pivotal regulatory science" is critical to vague "other impacts" on which a final rule is based. The commenter states that the proposed CFR definition, by contrast, says "pivotal regulatory science" "drive[s] the requirements and/or quantitative analysis of EPA final significant regulatory decisions." The commenter contends that the Proposal does not square the contradictions between science that drives a final rule's requirements and science that is "critical" to "other impacts" in a final rule.

Response: The EPA intends to promulgate regulations under the environmental statutes EPA implements to further clarify how the Agency will apply the definition of pivotal science in specific programs authorized under those statutes (e.g., CAA, CWA, SDWA, RCRA, FIFRA, TSCA, Emergency Planning and Community Right-to-Know Act (EPCRA)). The specific criteria for determining pivotal science may necessarily be specific to the authorizing statute, as well as the final significant regulatory action or the influential scientific information. The EPA intends to explain in each final significant regulatory action and for each influential scientific information how the pivotal studies were identified.

6.1.4 Recommended Changes to the Definition of Pivotal Regulatory Science at §30.2

6.1.4.1 Pivotal Regulatory Science

6.1.4.1.1 Support for the Proposed Definition

Comment: Commenters (6150, 6180) support the Proposed Rule's definition of pivotal regulatory science as referring to the specific studies or analyses that drive the requirements and/or quantitative analysis of EPA's significant regulatory decisions. Commenter (6150) states that, as noted in the Preamble, this includes scientific studies, models, and analyses that drive the magnitude of the benefit-cost calculation, the level of a standard, or point-of-departure from which a reference value is calculated.

Commenter (6375) concurs with the general definition of "pivotal regulatory science" in the Proposed Rule. Commenter states that the definition of "pivotal regulatory science" could be further clarified, however, to include examples that illustrate situations in which the definition

would and would not apply. The commenter suggests that examples where the rule would apply should include:

- Studies cited as the basis for Causal or Likely Causal determinations in a NAAQS Integrated Science Assessment, if they are not part of a generalized weight-of-evidence approach that incorporates a broader literature base;
- Studies EPA uses for its mortality or morbidity projections in a NAAQS Health Risk and Exposure Assessment, or the specification of a definitive concentration-response function upon which projections are based; and
- Studies EPA cites as a basis for quantifying a NAAQS.

Response: EPA acknowledges the commenters' support for the definition of pivotal regulatory science, and notes that the term has been combined with the term "pivotal science," proposed in the 2020 supplemental notice of proposed rulemaking²⁸⁰⁸. This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. An integrated science assessment would be considered influential scientific information, but the final rule focuses on only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.

6.1.4.1.2 Do Not Support the Proposed Definition

General Comments

Comment: Commenter (0671) states that EPA should not attempt to define the concept of "pivotal regulatory science," because the premise of this proposed regulatory change is flawed.

Commenter (3971) suggests that EPA assemble small groups of dedicated scientists in order to produce a definition of "pivotal regulatory science" and how to implement such definition.

Response: When promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data, the Agency shall follow best practices to evaluate potential links between exposure to a pollutant, contaminant, or substance and the effect and the nature of the dose-response relationship. The EPA will use the following factors to assess the quality of studies identified in the systematic review: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. The EPA will rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence of a relationship between exposure and effect, the EPA will identify those studies based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints that would inform a dose-response assessment for those effect

²⁸⁰⁸ U.S. EPA (U.S. Environmental Protection Agency). Strengthening Transparency in Regulatory Science; Supplemental Notice of Proposed Rulemaking. (85 FR15396, March 18, 2020) (FRL-10004-72-ORD). <https://www.federalregister.gov/documents/2020/03/18/2020-05012/strengthening-transparency-in-regulatory-science>.

endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. The EPA intends to issue implementation guidelines and statute-specific rulemakings that will further describe these criteria and how the EPA will identify pivotal science in its assessments and rulemakings.

Definition Not Adequate and Lacks a Scientific or Legal Foundation

Comment: Commenters (1011, 1272, 4881, 6114, 6116, 6131, 6133, 6144, 6361, 6362, 6373, 6909, 6924, 8281-PH20) express concern that the term “pivotal regulatory science” is not adequately defined. Commenter (4881) states that a central element of the proposed rule is the vague definition of “pivotal regulatory science” to which the rule would apply. Commenter (6114) states that it is difficult to understand why the agency would publish a rule with such an obvious flaw, as this could leave the interpretation of this term up to the courts, which may not turn out the way the EPA intended. Commenter (6133) states that the term “pivotal regulatory science” is perhaps the most vague, unexplained and internally inconsistent term used in the Proposal. Commenter (6144) states that the term used in the proposed rule, “pivotal regulatory science” has no precise meaning in science and seems to be contrived to cover an arbitrary set of information without clear articulation and basis. Commenters (6114, 6116, 6131, 6361) state that although the term “pivotal regulatory science” is used several times in the notice and appears to be a focus for this rule, it is not adequately defined in the *Federal Register* notice.

Commenter (1272) states that the Food and Drug Administration (FDA) describes “regulatory science as a science-based decision-making process needed to fulfill the responsibilities of a public health agency”, while the dictionary describes pivotal as “of crucial importance in relation to the development or success of something else”. The commenter provides that, using these two in conjunction, pivotal regulatory science would mean any using science-based decision making whenever there is importance in the developing regulation, which they state that one could argue is every decision the EPA makes.

Commenters (1011, 6133, 6362) express concern that, in the proposed rule, EPA variably defines *pivotal regulatory science* as “the studies, models, and analyses that drive the magnitude of the benefit-cost calculation, the level of a standard, or point-of-departure from which a reference value is calculated,” and “the specific scientific studies or analyses that drive the requirements and/or quantitative analysis of EPA final significant regulatory decisions.” Commenter (1011) states that these designations are vague and without further guidance for what constitutes *pivotal regulatory science*, EPA will introduce uncertainty into its decision-making process. The commenter adds that it is unclear why EPA is choosing to create a new class of scientific information and holding it to a standard of data access that the rulemaking does not require for “non-pivotal” regulatory science.

Commenters (4839, 4881, 6924) express concern that “pivotal regulatory science” is not a phrase defined in or widely used in scientific literature.

Commenter (4839) states that the draft regulation embraces a policy agenda that lacks a foundation in scientific research, peer review and application to regulatory policy. The commenter asserts that the proclamation of new terms such as “pivotal regulatory science” is

more rhetorical than real and demonstrates no connectivity to probabilistic risk assessment or other well-established methodologies that guide public health and environmental policies. The commenter contends that the term "pivotal regulatory science" is un-peer reviewed and lacks transparency regarding key decision factors used to weigh the role and utility of data used in linear or non-linear dose response functions, cost benefit analysis, identification of policy options or regulatory impact analysis. The commenter adds that pivotal regulatory science is presented as a cornerstone "to change agency culture and practices," an agenda that embodies a political objective rather than a scientific purpose.

Commenter (6924) states that "pivotal regulatory science" is not scientific terminology and is not used in the scientific literature. According to the commenter, the proposed rule's definition appears to attempt to delineate a smaller subset of relevant studies that would be "pivotal regulatory science", but the term is not useful because the entire body of relevant scientific evidence would meet the definition of pivotal regulatory science. The commenter adds that this is because a properly conducted assessment considers the entire body of evidence in the evaluation, integration and development of conclusions. The commenter provides that, for example, though there may be one study or several studies that contribute to the numerical calculation of a point of departure, the rest of the body of scientific evidence is used to make determinations that also are important in the magnitude of the benefit-cost calculation, including: (1) uncertainty factors used in calculations of risk; (2) whether particular sub-populations are susceptible and need greater protections; (3) the modeling of dose-response; (4) the likely occurrence and severity of potential health effects; (5) population exposure levels, etc. The commenter adds that a typical EPA assessment draws upon hundreds to thousands of studies, and according to this definition all the underlying data of those studies would need to be made publicly available.

Commenters (4881, 6114, 6116, 6131, 6361) assert that although the term "pivotal regulatory science" is used several times in the notice and appears to be a main focus for this rule, it does not appear anywhere else in the legal records, court decisions, or rules that address environmental protection or the role of the EPA.

Commenters (6116, 6131, 6361) state that, with no grounding in the law, it is unclear what EPA is trying to achieve by designating certain research as "pivotal regulatory science."

Commenter (6133) states that the term has no statutory basis in any statute cited by EPA, or otherwise. Commenter states that, beyond having no statutory underpinning, the meaning of the phrase is neither self-evident nor adequately defined in the Proposal.

Response: EPA disagrees that the term pivotal science (which encompasses the proposed term pivotal regulatory science in this final rule) is inadequately defined. 40 CFR Part 30.2 clearly defines pivotal science as meaning "the specific dose-response studies or analyses that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information."

In the 2020 SNPRM, the EPA introduced the term "pivotal science," defined in proposed 40 CFR 30.2 as "the specific scientific studies or analyses that underly [sic] influential scientific

information.” This term was proposed as a parallel to “pivotal regulatory science,” defined in 40 CFR 30.2 of the 2018 proposed rule as “the specific scientific studies or analyses that drive the requirements and/or quantitative analysis of EPA significant regulatory decisions.” The EPA received comment on the use of “regulatory” in “pivotal regulatory science.” Some commenters contended that there is no such thing as science that is regulatory; rather, there is science used to support regulation. Some commenters also noted that the terms “pivotal science” and “pivotal regulatory science” have similar scopes. The EPA acknowledges that no scientific study is inherently regulatory; rather, the EPA uses science to inform its significant regulatory actions. In order to increase the clarity of this final rule, to take into account the similarities between the two definitions, and to more accurately describe the science that the EPA uses, the EPA is removing the term “pivotal regulatory science” and combining the definitions of “pivotal science” and “pivotal regulatory science” under the single term “pivotal science” in 40 CFR 30.2. The EPA is responding to comments on both terms together.

The EPA also acknowledges that the term “regulatory science” may be confusing because it suggests either the term refers to a scientific discipline of regulatory decision-making (akin to FDA), or that some science the EPA considers is inherently regulatory. Neither of these interpretations reflects the Agency’s intent in defining this term. The EPA considers the breadth of scientific evidence in its rulemakings; while this scientific evidence informs policy decisions, the EPA’s consideration of the science does not make it “regulatory science.” To reflect this fact, in the final rule the EPA is changing the proposed term “regulatory science” to “science that serves as the basis for informing a significant regulatory action.”

In this final rule, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as “pivotal science,” the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. Future statute-specific rulemakings may interpret “pivotal science” more broadly.

Definition Does Not Clarify Pivotal Regulatory Science Applicability

Comment: Commenters (6114, 6116, 6131, 6361) state that it is impossible to determine exactly what the ramifications of this rule would be.

Commenters (6114, 6116, 6131) state that, for example, it is unclear whether the term “pivotal regulatory science” would apply to studies or modeling conducted by industry groups, meaning that the research performed by these groups could be held to a lower standard than research performed by reputable scientists around the world.

Commenter (6133) states that EPA's choice to modify "regulatory science" with the adjective "pivotal" does nothing to clarify the scope of scientific studies and information encompassed by the Proposal. The commenter states that it is arbitrarily vague, and unexplained under the Proposal which science would be considered "pivotal," and under what conditions. The commenter adds that, because the term was created out of thin air to serve EPA's purposes and has no statutory grounding or intuitive meaning, this ambiguity-ridden definition is woefully inadequate. The commenter further adds that it is also arbitrary and capricious and an abuse of EPA's discretion and that EPA is well aware of the insufficiency of the definition, as is evident in the agency's solicitation of comments on the definitions of "pivotal regulatory science" and "dose response data and models" within the Proposal.

Response: In the 2020 SNPRM, the EPA introduced the term "pivotal science," defined in proposed 40 CFR 30.2 as "the specific scientific studies or analyses that underly [sic] influential scientific information." This term was proposed as a parallel to "pivotal regulatory science," defined in 40 CFR 30.2 of the 2018 proposed rule as "the specific scientific studies or analyses that drive the requirements and/or quantitative analysis of EPA significant regulatory decisions." The EPA received comment on the use of "regulatory" in "pivotal regulatory science." Some commenters contended that there is no such thing as science that is regulatory; rather, there is science used to support regulation. Some commenters also noted that the terms "pivotal science" and "pivotal regulatory science" have similar scopes. The EPA acknowledges that no scientific study is inherently regulatory; rather, the EPA uses science to inform its significant regulatory actions. In order to increase the clarity of this final rule, to take into account the similarities between the two definitions, and to more accurately describe the science that the EPA uses, the EPA is removing the term "pivotal regulatory science" and combining the definitions of "pivotal science" and "pivotal regulatory science" under the single term "pivotal science" in 40 CFR 30.2. The EPA is responding to comments on both terms together.

The EPA also acknowledges that the term "regulatory science" may be confusing because it suggests either the term refers to a scientific discipline of regulatory decision-making (akin to FDA), or that some science the EPA considers is inherently regulatory. Neither of these interpretations reflects the Agency's intent in defining this term. The EPA considers the breadth of scientific evidence in its rulemakings; while this scientific evidence informs policy decisions, the EPA's consideration of the science does not make it "regulatory science." To reflect this fact, in the final rule the EPA is changing the proposed term "regulatory science" to "science that serves as the basis for informing a significant regulatory action."

The EPA notes that implementation guidelines and statute-specific transparency regulations or programmatic regulations are forthcoming. At that time, the agency will be better able to determine and assess potential ramifications of implementing this procedural rule.

Comment: Commenter (6909) states that EPA has not made it clear in the proposed rule how or even whether the rule would apply in a variety of frequently encountered situations. The commenter notes that, for example, EPA is openly unsure whether the rule would apply to a study underlying a guidance document; whether it would apply to a study that merely affirms an existing EPA standard; whether it would apply to a study underlying an individual party adjudication, or an enforcement action, or a site-specific permitting action.

Response: The EPA has considered the public comments and finalized the scope of this rule to apply to significant regulatory actions and influential scientific information. The EPA notes that implementation guidelines and statute-specific transparency regulations or programmatic regulations are forthcoming.

Comment: Commenter (6909) states that many of the central terms that will dictate how and to what studies the rule would apply are undefined or unclear.

Response: The EPA agrees that some terms were unclear. The final rule, in response to comments, defines the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” Each definition is discussed further in the preamble to the final rule.

Definition Allows for Limitless Discretion

Comment: Commenter (4881) states that there is no useful guidance in the language of the proposed rule for an EPA Administrator to apply in deciding which issues fit and which do not fit the fluid definition of “pivotal.” According to the commenter, this ambiguity invites intrusion of political preference and prejudice into the essential scientific process of public health risk assessment.

Commenter (6137) states that the EPA’s Proposed Rule lacks the requisite standards and principles that are the hallmark of lawful agency decision-making. The commenter asserts that the vague definitions proposed in 40 CFR §30.2 invite limitless agency discretion to decide when the Rule’s requirements apply. The commenter notes that the Proposed Rule defines “pivotal regulatory science” as studies that “drive the requirements and/or quantitative analysis” of EPA’s action, but this lacks any understandable meaning. The commenter states that there is no standard governing what science does or does not “drive” the regulatory action. According to the commenter, the lack of regulatory standards here means that EPA staff will impermissibly determine applicability of the rule “based upon their own unwritten personal standards.” *White v. Roughton*, 530 F.2d 750, 754 (7th Cir. 1976). The commenter adds that these provisions allow for arbitrary application of the Rule, rendering the Proposed Rule arbitrary and thus unlawful.

Commenter (6373) states that the Rule does not clarify who will be determining which studies are considered “pivotal regulatory science” or at what stage or stages of EPA’s review process this determination will be made. According to the commenter, this is particularly concerning given the former EPA Administrator’s directive last year to remove or refuse to consider for membership former and current recipients of EPA grants from the Clean Air Scientific Advisory Committee (CASAC) and other advisory committees.²⁸⁰⁹ Commenter states that, unless EPA has in place a fair review process for determining “pivotal regulatory science,” the Rule can be misused to disregard or discredit relevant studies.

²⁸⁰⁹ This directive is currently being challenged by the Union of Concerned Scientists, which alleges that the action violates the Federal Advisory Committee Act. See *Union of Concerned Scientists, et al., v. Pruitt, et al.*, 18-10129 (D. Mass.).

Response: The EPA notes that implementation guidelines and statute-specific transparency regulations or programmatic regulations are forthcoming. The EPA has clarified in this final rule that in general, the EPA will rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify a subset of those studies based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints that would inform a dose-response assessment for those effect endpoints and drive the requirements and/or quantitative analyses of an EPA final significant regulatory action or influential scientific information will be identified as pivotal science. The EPA disagrees that designating a set of key studies as “pivotal science” will necessarily be biased or without accountability. The EPA follows an objective, unbiased process for identifying and evaluating scientific studies and already identifies key or pivotal studies in some of its actions (e.g., IRIS assessments).

6.1.4.1.3 Recommendations for Specific Changes to the Definition

Comment: Commenter (0567) recommends the EPA delete the words “final” and significant” in the proposed definition of pivotal regulatory science. The commenter interprets that the Agency identifies pivotal regulatory science as the key scientific data and methods used to translate research results into application in the regulatory process. The commenter asserts that there is no reason not to apply appropriate processes in all regulations.

Commenter (4932) recommends that EPA alter the definition of “pivotal regulatory science” by striking the word “final” from the proposed definition to make the Transparency Proposal fully consistent with Executive Order 12866. The commenter notes that “regulatory action” under Executive Order 12866 means “any substantive action by an agency (normally published in the *Federal Register*) that promulgates or is expected to lead to the promulgation of a final rule or regulation, including notices of inquiry, advance notices of proposed rulemaking, and notices of proposed rulemaking.” The commenter adds that the necessary (and seemingly unintended) implication of including the word “final” in the definition is that the transparency objective (i.e., the disclosure of pivotal regulatory science) does not apply to advanced notices of proposed rulemaking or proposed rulemaking. According to the commenter, the public must have access to pivotal regulatory science at these earlier steps in the rulemaking process in order to assess effectively the merit of the Agency’s regulatory science. The commenter contends that disclosure of pivotal regulatory science when final agency action is issued is too late in the rulemaking process as any opportunity for public comment will have ended.

Commenter (6155) states that the following language from EPA's regulations adopted under the Data Quality Act may help further clarify the terms "pivotal regulatory science" and "significant regulatory actions" as defined in §30.2 of the proposed rule. The commenter provides that EPA will generally consider the following classes of information to be influential, and, to the extent that they contain scientific, financial, or statistical information, that information should adhere to a rigorous standard of quality:

- Information disseminated in support of top Agency actions (i.e., rules, substantive notices, policy documents, studies, guidance) that demand the ongoing involvement of the Administrator's Office and extensive cross-Agency involvement; issues that have the potential to result in major cross-Agency or cross-media policies, are highly controversial, or provide a significant opportunity to advance the Administrators priorities. Top Agency actions usually have potentially great or widespread impacts on the private sector, the public or state, local or tribal governments. This category may also include precedent-setting or controversial scientific or economic issues.
- Information disseminated in support of Economically Significant actions as defined in Executive Order 12866, entitled Regulatory Planning and Review (58 FR 51735, October 4, 1993), Agency actions that are likely to have an annual effect on the economy of \$100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, Tribal, or local governments or communities.
- Major work products undergoing peer review as called for under the Agency's Peer Review Policy. Described in the Science Policy Council Peer Review Handbook, the EPA Peer Review Policy regards major scientific and technical work products as those that have a major impact, involve precedential, novel, and/or controversial issues, or the Agency has a legal and/or statutory obligation to conduct a peer review. These Major work products are typically subjected to external peer review. Some products that may not be considered "major" under the EPA Peer Review Policy may be subjected to external peer review but EPA does not consider such products influential for purposes of these Guidelines.
- Case-by-case: The Agency may make determinations of what constitutes "influential information beyond those classes of information already identified on a case-by-case basis for other types of disseminated information that may have a clear and substantial impact on important public policies or private sector decisions."²⁸¹⁰

Commenter (6356) suggests EPA remove the word “significant” from the proposed definition of “pivotal regulatory science” or it should simply remove the term from the final rule and replace it with the definition of another proposed term “regulatory science”—from which it also should delete the word “significant.” According to the commenter, it does not appear that both terms are necessary, and they make cryptic distinctions between data and assumptions that drive the agency’s regulatory decisions.

Commenter (6362) states that, assuming the intent is to define and distinguish the subset of scientific studies and analyses that form the scientific foundation for EPA’s regulatory decisions from the larger universe of all the scientific information reviewed and considered by the agency, a more precise word than “pivotal” would be “material.” The commenter provides that those scientific studies and analyses that are material to its regulatory decision must be or be made publicly available in a manner sufficient for independent validation.

Commenter (6449) states that it is not clear whether “pivotal regulatory science” means studies and analyses performed by the EPA, or those studies published by others in peer-reviewed

²⁸¹⁰ Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency," § 6.2, P. 20.

journals that might support EPA’s analysis. The commenter suggests that EPA consider that pivotal studies may also be those that determine qualitatively the weight of evidence (WOE) that a specific toxic endpoint is of relevance to human health or the species of concern. The commenter contends that selection of the appropriate toxic endpoint based on WOE after systematic review of the literature is as important as appropriate quantitative analysis.

Response: The EPA has removed the word “final” from the definition, so that pivotal science applies to EPA significant regulatory actions. The EPA also notes that this action also requires the EPA to identify and make publicly available the science that serves as the basis for informing a significant regulatory action at the proposed or draft stage to the extent practicable. Pivotal science is defined as the specific dose-response studies or analyses that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. Therefore pivotal science is not limited only to the science developed by the EPA.

6.1.4.1.4 Need More Clarity in the Definition

Comment: Commenter (1011) states that they do not interpret the proposed rule’s classification of *pivotal regulatory science* as a change to the current understanding of what constitutes “best available science”. The commenter urges EPA to continue to use the best available science when building the foundation for regulatory actions. The commenter asserts that the studies used by EPA should adhere to good laboratory and field practices, with results being peer-reviewed and any associated methods, models, and data made available for further review and analysis. The commenter recommends that, in cases where patient confidentiality or other circumstances prevents the dissemination of data, EPA should continue to follow the guidelines set forth in the OMB’s *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies*. These guidelines appropriately state that the worthwhile goal of allowing public access to data and methods “does not override other compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections.” The commenter further recommends that, if any aspect of the proposed rule is intended to alter EPA’s definition and use of the best available science, the Agency should issue further guidance clarifying these changes and allow for public comment and consultation with the scientific community prior to implementation.

Commenter (6448) states that it is unclear how “pivotal regulatory science” differs from “best available science”, if at all, and when well understood “best available science” would become “pivotal regulatory science.” The commenter contends that the introduction of an additional ill-defined term would only lend towards confusion and inconsistency in regulatory decisions. The commenter recommends that EPA reconsider this approach and utilize the existing “best available science” standard along with solicitation of public comment and consultation with the EPA SAB and/or broader scientific community.

Commenter (6126) suggests that EPA reduce the vagueness and ambiguity in the definitions. The commenter asserts that the lack of clarity about the definitions cited here limits the ability to interpret intent and potential impact of the proposal. The commenter states that, after EPA clarifies definitions, a new round of public comment will likely be needed to address the basic questions raised by EPA in the proposed rule on other matters. The commenter asserts that

“pivotal regulatory science” is a new term, undefined and unused in the existing text of Title 40 of the Code of Federal Regulations. The commenter notes that the meaning appears to hinge on whether a study or analysis “drives” EPA’s actions. According to the commenter, this appears to be a dichotomous designation (“drives”/ “doesn’t drive”), which may not reflect how many individual studies or analyses are factored into the development of regulation. The commenter adds that, in practice, the use of evidence involves different types of use considerations.^{2811,2812} The commenter states that further clarification is needed about how EPA intends to interpret this term.

Response: This purely internal procedural rulemaking is not intended to modify the Agency’s interpretations of “best available science.” “Pivotal science” is a statutorily neutral term and therefore is more generally applicable. The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. The EPA will then identify and consider “pivotal science in accordance with the provisions of this rule,” unless the implementation of the rule conflicts with statutory requirements and associated implementing regulations. It should also be noted that under the final rule no studies are categorically excluded from consideration, even studies where the underlying dose-response data are not available for independent validation. EPA will continue to assess the full body of science to evaluate the quality and transparency of available science for significant regulatory actions and influential scientific information. The EPA will also consider the degree to which pivotal science is available and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation.

6.1.4.1.5 “Drives the Requirements” Phrase

Comment: Commenter (2169) states that, because there is no mechanism in the regulation for assuring that the science drives the decision, there is no means for judging the term pivotal. The commenter asserts that, without transparent consideration of all the information available and public comment on whether all pertinent information was considered, it is pointless to promulgate rules on the availability of the information.

Commenter (6133) states that the use of the phrase “drive the requirements” within the CFR definition is particularly incoherent. The commenter asks the following questions:

- What does “drive the requirements” mean?
- Does the definition apply only to scientific studies that were outcome determinative?
- Does it encompass any scientific study that was considered in making the requirements?
- What about studies that were useful but not determinative? Something else entirely?
- Can more than one study be “pivotal” to the regulatory decision, or does the term “drive the requirements” imply that only one study could be “pivotal” to a given decision?

²⁸¹¹ Nick Hart, Sandy Davis, and Tim Shaw. (2018). Evidence Use in Congress: Challenges for Evidence-Based Policymaking. Washington, D.C.: Bipartisan Policy Center. Available at: <https://bipartisanpolicy.org/library/evidencein-congress-volume-1/>

²⁸¹² Nick Hart. (2018). Making Evaluations Useful: Perspective from the U.S. Testimony for the European Commission’s Regulatory Scrutiny Board. (June 15) Brussels, Belgium

- Are most of the studies used by EPA considered to “drive the requirements” or is this term limited in some fashion, unrevealed to the public?
- Will EPA “know it when it sees it,” making it up as the agency goes along?

Commenter (6137) asserts that the Proposed definition of “pivotal regulatory science”, as studies that “drive the requirements and/or quantitative analysis” of EPA’s action, lacks any understandable meaning. The commenter notes that there is no standard governing what science does or does not “drive” the regulatory action. According to the commenter, the lack of regulatory standards here means that EPA staff will impermissibly determine applicability of the rule “based upon their own unwritten personal standards.” *White v. Roughton*, 530 F.2d 750, 754 (7th Cir. 1976). The commenter contends that these provisions allow for arbitrary application of the Rule, rendering the Proposed Rule arbitrary and thus unlawful.

Response: The EPA clarifies that “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. With regard to the meaning of “drive the requirements and/or quantitative analysis,” these are the studies that are integral to quantitatively characterizing dose-response relationships for the toxicity endpoints that underlie the requirements or analyses of EPA significant regulatory actions or influential scientific information. The EPA may further interpret the meaning of “drive,” and describe the process for designating key studies as pivotal science in subsequent implementation guidelines and/or statute-specific rulemakings.

6.1.4.1.6 Significant Regulatory Decisions

Comment: Commenter (6909) states that there are numerous ways in which the proposed rule is unacceptably vague. The commenter notes that many of the central terms that will dictate how and to what studies the rule would apply are undefined or unclear, including “pivotal regulatory science”. The commenter provides that, even though the proposed rule offers a limited definition of “pivotal regulatory science,” that definition hinges on the phrase “significant regulatory decisions.” The commenter states that there is no explanation of how EPA would decide which regulatory decisions are significant and which are not.

Commenter (6137) argues that the EPA’s Proposed Rule lacks the requisite standards and principles that are the hallmark of lawful agency decision-making. The commenter notes that the Proposed Rule defines “regulatory science” as “scientific information . . . that provide the basis for EPA final significant regulatory decisions.” The commenter adds that there are no standards or definitions for what subset of “regulatory decisions” should be deemed “significant.” According to the commenter, these provisions allow for arbitrary application of the Rule, rendering the Proposed Rule arbitrary and unlawful.

Response: The EPA notes that the operable definition in the final rule is for “significant regulatory actions,” not “significant regulatory decisions.” Significant regulatory actions are defined in the final rule as “final regulations determined to be ‘significant regulatory actions’ by the Office of Management and Budget pursuant to Executive Order 12866.” The EPA disagrees that this term is vague, arbitrary, or unlawful.

6.1.4.2 Pivotal Regulatory Science and Regulatory Science

Comment: Commenters (1427, 6133, 6362) express that the proposed definitions of pivotal regulatory science and regulatory science lack clarity and overlap.

Commenter (1427) states that the proposed definitions of pivotal regulatory science and regulatory science are not sciences, overlap each other and obscure any legitimate need to distinguish between regulation and pivotal regulation. The commenter clarifies that, for example, there is no difference between chemistry and regulatory chemistry. According to the commenter, if this regulation is ultimately deemed necessary, the EPA might want to define pivotal regulation.

Commenter (6362) states that the proposed definitions of “pivotal regulatory science” and “regulatory science” can be interpreted as simultaneously referencing something identical as well as one being a subset of the other. The commenter asserts that, therefore, the definitions are vague and need clarification.

Commenter (6133) states that, as proposed, the terms “regulatory science” and “pivotal regulatory science” are vague, even incoherent terms with definitions that lend no assistance to commenters in understanding the Proposal. The commenter argues that the terms lack statutory authority and are vague, inconsistent, unexplained, and otherwise arbitrary and capricious.

Commenter (6133) expresses concern that the Proposal is internally confusing through the workings of its proposed regulatory text. Commenter states that EPA alternates between explaining the Proposal in terms of “regulatory science” and “pivotal regulatory science.” The commenter cites, for example, in proposed §30.1, the Proposal “directs EPA to ensure that the regulatory science underlying its actions is publicly available . . .” and, later, in proposed §30.3, the Proposal indicates that the provisions apply “to dose response data and models underlying pivotal regulatory science that are used to justify significant regulatory decisions.” The commenter adds that, in the subsequent section, proposed §30.4, the Proposal references “all studies (or regulatory science) relied upon . . .” According to the commenter, the Proposal is arbitrarily vague and incoherent concerning whether “regulatory science” that is relied upon is the same as “pivotal regulatory science,” or whether it is a new category of science entirely. The commenter asks: (1) if this phrasing implies that the definition of “regulatory science” does not already include science that is “relied upon”? and, if so, (2) does EPA mean that the phrase, “provides the basis,” is not synonymous with “relied upon”? The commenter states that the Proposal provides no answers to these questions.

Commenter (6133) expresses concern that the Proposal makes no attempt to clarify how “pivotal regulatory science” is distinct from the separately defined, “regulatory science,” a term integral

to proposed §30.1, which states the Proposal's very purpose. The commenter provides that the definition of "regulatory science" is almost identical to that of pivotal regulatory science, with the exception that "regulatory science" encompasses information that "provide the basis for EPA final significant regulatory decisions," while "pivotal regulatory science" "drives the requirements." The commenter states that the phrase "provides the basis" in the proposed "regulatory science" (§30.2) definition could mean that science was one of many studies considered, that it was the bedrock study upon which regulation was grounded, that EPA relied on the study, or that the study was critical to EPA's determination. According to the commenter, the Proposal nowhere addresses or explains whether or how these possible meanings are distinct from the possible meanings of the "drive the requirements" phrase of the "pivotal" definition. The commenter concludes that it is entirely unclear from these definitions what makes science that "provides the basis" distinct from science that "drive the requirements," and that neither of these terms meaningfully distinguishes "pivotal" regulatory science from ordinary regulatory science.

Response: Through its 2020 supplemental notice of proposed rulemaking and this final rule, the EPA has sought to increase the clarity surrounding "science that serves as the basis for informing a significant regulatory action" (proposed as regulatory science) and "pivotal science" (proposed as pivotal regulatory science). The EPA clarifies that the two terms are distinct; while "pivotal science" is a subset of "science that serves as the basis for informing a significant regulatory action," the two sets are not identical. The EPA has further clarified the use of these two terms within the regulatory text, and is finalizing the rule so that "science that serves as the basis for informing a significant regulatory action" is only defined in 40 CFR 30.2 and used in 40 CFR 30.4.

The EPA disagrees that the proposed definition for regulatory science was without meaning, but in response to comments is altering the final definition to increase clarity. For example, the EPA notes that the proposed definition for "regulatory science" combined both general categories of scientific information, such as assessments and models, with specific examples of EPA scientific products, such as criteria documents and regulatory impact analyses. The EPA acknowledges that this may increase confusion and is therefore limiting the final definition to general categories. As such, the EPA is altering the definition of "science that serves as the basis for informing a significant regulatory action" in 40 CFR 30.2 to mean "studies, analyses, models, and assessments of a body of evidence that provide the basis for EPA significant regulatory actions." Examples of models include those used in regulatory impact analyses. Examples of assessments of a body of evidence include risk assessments, hazard identifications, IRIS assessments, and criteria documents.

Other commenters expressed confusion over the scope of what constitutes science that serves as the basis for informing a final significant regulatory action, as defined in the proposed rule. One commenter asserted that the phrase "provides the basis" means that science that serves as the basis for informing a final significant regulatory action could be all the science considered, relied upon, and included in the administrative record of a rulemaking by the EPA. The EPA agrees with this and clarifies in the final rule that the scope of science that serves as the basis for informing a significant regulatory action is equivalent to the science included in the public

docket as part of a rulemaking, but not all of that body of science would typically be considered “pivotal science.”

On the other hand, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. Future statute-specific rulemakings may interpret “pivotal science” more broadly.

6.2 SNPRM Pivotal Science

6.2.1 Need for Additional Clarity/Specificity

Comment: Commenters (10866, 10972, 11332, 11360, 11381, 11391, 11484, 11576, 11894, 12645, 12688, 12715, 12720, 12727, 14397) express that the proposed rule, and specifically the terms “pivotal regulatory science” and “pivotal science,” are unclear, as EPA did not detail a list of criteria or specific process that will be used to determine which studies fall under these categories. Commenters (11391, 12720, 12727) also note that this need for additional specificity was identified by the SAB. Specific areas pointed out by commenters as needing clarification include the following:

- How will EPA determine whether science is “pivotal” or “scientifically influential” and how this will be communicated to the public (9362, 11360, 11332, 12645, 12715, 12720, 12727). Commenter (12645) argues that this can only be accurately known in retrospect.
- Who determines whether a study is “pivotal” or “scientifically influential” and whether this is considered final or there will be opportunity to revisit the determination if underlying circumstances change (12720).
- How to interpret the word “underly,” as different studies and analyses may inform key scientific information “to differing degrees, depending on study quality, regulatory context, and EPA interpretation of scientific studies” (12720, 12727).

Response: EPA has described how it will identify pivotal science in the preamble in Section III.C of the final rule preamble. Specifically, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate points of departure (PODs)). EPA has finalized the definition of pivotal science using “drive” instead of “underly”. Pivotal science are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies

identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.

EPA will identify the pivotal science at the proposed rule stage for significant regulatory actions and for influential scientific information when it is submitted for peer review. In both instances, there will be opportunity for public comment on the designation of a study as pivotal science.

EPA will continue to identify influential scientific information consistent with the OMB Bulletin for Peer Review. To align this rule with the definition of influential scientific information in the OMB Bulletin for Peer Review, the requirements in 40 CFR Part 30 apply to influential scientific information, unless the influential scientific information is exempted from peer review requirements as described in Section IX of the OMB Bulletin for Peer Review.

Comment: Commenters suggest the following revisions to the rule in order to address perceived issues with clarity and/or interpretation of pivotal science:

1) Related to 40 CFR 30.3.

- Clarifying the language in § 30.3, as the comma after “data and models” could be interpreted to mean that the proposed rule would only apply to data and models, whereas commenter (12699) prefers the more expanded interpretation that includes all pivotal science and pivotal regulatory science.

2) Related to the definitions of pivotal science and pivotal regulatory science.

- Using the citation of research within an EPA document on which a regulatory decision is based as an indicator of “pivotal science” or “influential scientific information” (12645).
- Designating information as “pivotal” if it comes from a peer-reviewed scientific publication (9362).
- Defining “pivotal regulatory science” as “the study (or studies if necessary) on which the regulatory limit is based,” and requiring EPA to provide a transparent explanation of how and why the selected study or studies were chosen over others (12720).

3) Related to 40 CFR 30.5

- Giving more weight to publicly funded studies than to private studies which use proprietary data and giving peer-reviewed information the highest weighting to avoid favoring privately funded research (9362).
- Establishing criteria for selecting studies for decision-making based on (1) representativeness of the broader body of evidence; (2) usefulness; (3) past efforts to

reanalyze, reproduce, and confirm the findings, and (4) public availability of data and methods (11921)

- Deleting the phrase “other things equal” in § 30.5 due to its subjectivity (9362).
- Clearly stating in § 30.5 that the rule applies to EPA’s IRIS program (11499, 12397).
- Deleting the statement “nonparametric models that incorporate fewer assumptions” in § 30.6 on the grounds that parametric models may be more appropriate in many cases (9362).
- Adding language in § 30.6 “strengthening the concepts that EPA decisions should be evidence-based, pertinent to the issue being addressed and fully transparent, including disclosure of areas of uncertainty and potential confounding of the data” (12397).

Response: Responses to these comments follow.

1) Related to 40 CFR 30.3:

EPA has revised 40 CFR 30.3 to make it clear that the rule applies to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science .

2) Related to the definitions of pivotal science and pivotal regulatory science:

EPA disagrees that pivotal science should be defined simply based on whether a study has been peer-reviewed or whether it is cited in an EPA document used to support a significant regulatory action. Pivotal science is the subset of the science supporting a significant regulatory action or influential scientific information that drives the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.

See the description in Section III.E of the preamble of how EPA will identify studies as pivotal science.

3) Related to 40 CFR 30.5:

The EPA will use the following factors to assess the quality of studies identified in the systematic review: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. The EPA will rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence of a relationship between exposure and effect, the EPA will identify those studies based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both of an EPA significant regulatory action or influential scientific information will be identified as pivotal science.

In 40 CFR 30.5 EPA has identified the factors it will consider in determining the degree of consideration to afford pivotal science for which the dose-response data are not available for independent validation. EPA considered the comments and included factors based on usefulness and quality.

EPA has incorporated the language from proposed 40 CFR 30.6 into final 40 CFR 30.5. EPA notes that the language in 40 CFR 30.5 requires a consideration of both parametric and non-parametric models so that EPA can consider both in determining the consideration to give pivotal science for which the dose-response data are not available for independent validation. The commenter has not provided convincing rational on why non-parametric models should not be considered, particularly given that this factor is only one of several considerations in 40 CFR 30.5.

“Other things equal” has been deleted from 40 CFR 30.5.

All IRIS assessments are influential scientific information and thus subject to this rule. Adding a statement that IRIS assessments are subject to the rule would be superfluous.

6.2.2 Scope of Pivotal Science

6.2.2.1 Scope is Too Broad

Comment: Commenters (11390, 11576, 12435, 12546, 12688, 12702, 12727) note that because of the expanded scope of the rule, the lack of clear criteria contained in the proposed rule, and the fact that properly conducted science considers “the entire body of evidence,” nearly any study would meet the definition of “pivotal science” or “pivotal regulatory science.”

Response: EPA narrowed the scope of the rule from data and models to dose-response data. As EPA has explained in the preamble rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as “pivotal science,” the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect.

6.2.2.2 Support for Expanded Scope

Comment: Commenters (11499, 11500, 11915, 12399) support the expanded scope of the rule to include all “influential scientific information” and “pivotal science.”

Response: EPA notes the commenters support of EPA’s approach.

Comment: Commenter (11499) supports retroactive application in stating that existing data and models should be covered if they underlie “pivotal regulatory science” in a rulemaking or “pivotal science” in the development of influential scientific information.

Response: This rule applies to dose-response data, regardless of when the dose-response data were generated, that are considered to be pivotal science in a significant regulatory action proposed after the effective date of publication of this rule or in influential scientific information submitted for peer review after the effective date of this rule.

Chapter 7: Publicly Available

In the notice of proposed rulemaking (NPRM), the EPA used the term “publicly available” but did not define it at 40 Code of Federal Regulations (CFR) 30.2 or in the preamble to the 2018 NPRM. Given its use at 40 CFR 30.1, 30.5 and 30.9, the supplemental notice of proposed rulemaking (SNPRM) proposes a new definition of “publicly available.”

As noted in SNPRM preamble, the EPA received a large number of comments stating that the approach in the 2018 NPRM would likely preclude the use of valid data and models from consideration as pivotal regulatory science, because the proposed requirement to make data and models publicly available in a manner sufficient for independent validation would prevent the use of data and models that include confidential business information (CBI), proprietary data, personally identifiable information (PII) that cannot be sufficiently deidentified to protect the data subjects, as well as many older studies. Based on a consideration of these comments, the EPA is proposing a modified version of the 2018 NPRM regulatory text at 40 CFR 30.5 called Option 1. Option 1 would allow Agency consideration of studies where there is tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects.

The supplemental proposal also proposes an alternative approach to 40 CFR 30.5 called Option 2. Under Option 2, when promulgating significant regulatory decisions or finalizing influential scientific information, the Agency will, other things equal, give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because the information is publicly available or available through tiered access when the data include CBI, proprietary data, or PII; and appropriate techniques have been used to reduce the risk of re-identification.

Several comments were received that address Options 1 and 2 together as well as separately. Comments that encompass both Options 1 and 2 are covered under the topic of Broad Issues. Thus, these comments are organized under the following topics:

Section 7.1: Publicly Available, Tiered Access

- 40 CFR 30.2 Definition of Publicly Available
- 40 CFR 30.5: Broad Issues
- 40 CFR 30.5: Option 1
- 40 CFR 30.5: Option 2
- Ensure Over Time More Availability of Data

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized

in this Chapter. The responses provided in this Chapter adequately address these more general comments.

7.1 Publicly Available, Tiered Access

7.1.1 40 CFR 30.2 Definition of Publicly Available

The supplemental notice of proposed rulemaking (SNPRM, or supplemental proposal) rule adds the following definition to section 30.2:

Publicly available means “lawfully available to the general public from federal, state, or local government records; the internet; widely distributed media; or disclosures to the general public that are required to be made by federal, state, or local law. The public must be able to access the information on the date of publication of the proposed rule for the significant regulatory action or dissemination of the draft influential scientific information for public review and comment.”

7.1.1 Clarification

Comment: Commenter (11401) supports the clarity achieved by defining publicly available.

Conversely, commenters (9587, 11381, 12720) suggest the EPA clarify the definition of publicly available. Commenter (9587) notes that the EPA would be well-served by a systematic reform to provide clear definitions of all terms relevant to policymaking and suggests that the EPA, following government best practices in the Department of Defense,²⁸¹³ institute a formal ontology to establish terminological exactitude in all policymaking.²⁸¹⁴

Commenter (11381) states that the definition of publicly available in the supplemental notice of proposed rulemaking (SNPRM) is unclear. The commenter notes that it is different from the Information Quality Guidelines (IQG) term dissemination²⁸¹⁵ in potentially confusing ways, apparently because the Agency is trying to make the term perform dual purposes. The commenter states that, under the IQGs, dissemination is triggered only by agency action. Information an agency does not disseminate is not covered, and thus need not meet information quality standards. The commenter states that the term does not apply to what information an agency might consider, evaluate, or analyze. The commenter states that, in contrast, publicly available appears to act as both a substitute for dissemination and a filter governing what

²⁸¹³ 3 DM2, DoDAF Formal Ontology, DoD Architecture Framework Version 2.02, DoD Deputy Chief Information Officer, Department of Defense, https://dodcio.defense.gov/Library/DoDArchitecture-Framework/dodaf20_ontology1/.

²⁸¹⁴ Ontology for Government, National Center for Ontological Research, University at Buffalo, <https://ubwp.buffalo.edu/ncor/quick-start/ontology-for-government/>.

²⁸¹⁵ Office of Management and Budget (2002, p. 8460): “‘Dissemination’ means agency initiated or sponsored distribution of information to the public (see 5 CFR 1320.3(d) (definition of ‘Conduct or Sponsor’)). Dissemination does not include distribution limited to government employees or agency contractors or grantees; intra- or inter-agency use or sharing of government information; and responses to requests for agency records under the Freedom of Information Act, the Privacy Act, the Federal Advisory Committee Act or other similar law. This definition also does not include distribution limited to correspondence with individuals or persons, press releases, archival records, public filings, subpoenas or adjudicative processes.”

information the EPA will consider, evaluate, or analyze. The commenter states that the SNPRM uses the term publicly available in a manner resembling dissemination,²⁸¹⁶ but it also uses publicly available as a screen on what the Agency will consider to be pivotal regulatory science and/or pivotal science.²⁸¹⁷

Commenter (12720) states that the SNPRM's definition of "publicly available" data is vague in not making it clear whether the information itself would be actively made available to members of the public by data holders in government sources, media sources, or other online sources, or whether data subject to public distribution from government sources through legal approaches, including data requests submitted to EPA via the Freedom Of Information Act (FOIA) regardless of actual distribution, would also be subject to this definition.

Response: The term "publicly available" is not meant to convey that the EPA is responsible for disseminating dose-response data considered pivotal science under the final rule. Therefore, the definition of "disseminate" in the IQG is not relevant.

The final rule is limited to dose-response data and does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. The final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. EPA does not intend for the term "publicly available" to resemble "dissemination."

Comment: Commenter (11479) states that, in this definition [publicly available], the EPA wrongly applies a catch-all approach to transparency, as a recent paper in *Environmental Health Perspectives* points out:

"Strategies designed to serve some goals of the open science movement may be inadequate for achieving other goals. For example, efforts to provide access to all the data underlying a study may be helpful for enabling other scientists to reanalyze the results and identify weaknesses that could undermine its reproducibility. However, providing all that data may do little to help citizens or policymakers understand the overall significance of the study or the crucial limitations or weaknesses associated with it...Additional strategies—such as effective two-way communication between the scientists who designed the study and those using the information—might be needed to clarify the information needed by decision makers."²⁸¹⁸

²⁸¹⁶ U.S. Environmental Protection Agency (2020, p. 15405): § 30.5a ("Where the Agency is making data or models publicly available, it shall do so in a manner that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security.")

²⁸¹⁷ U.S. Environmental Protection Agency (2020, p. 15405): § 30.5a ("When promulgating significant regulatory decisions or finalizing influential scientific information, the Agency will only use pivotal regulatory science and/or pivotal science that includes studies with restricted data and models (*i.e.*, those that include confidential business information (CBI), proprietary data, or Personally Identifiable Information (PII) that cannot be sufficiently de-identified to protect the data subjects) if there is tiered access to these data and models in a manner sufficient for independent validation, and studies that do not include restricted data and models if the data and models are publicly available in a manner sufficient for independent validation.")

²⁸¹⁸ Elliott, Kevin C., and David B. Resnik. 2019. "Making open science work for science and society." *Environmental health perspectives* 127, no. 7: 075002. DOI:10.1289/EHP4808.

Response: The EPA agrees that subject matter experts are key to effectively determining if the results of a study can be produced when the study data are reanalyzed. For that reason, “independent validation” was defined in 40 CFR 30.2 as “the reanalysis of study dose-response data by *subject matter experts* who have not contributed to the development of the study to evaluate whether results similar to those reported in the study are produced” (emphasis added). However, the EPA maintains that underlying dose-response data should be available to a wide audience. Therefore, the EPA is also maintaining the definition of “publicly available.”

The final rule is limited to dose-response data and does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. The final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (12731) states that, in general scientific usage, “publicly available” means the data, methods, results and summary evaluation are available in a usual form (*e.g.*, a peer-reviewed scientific publication or a technical report). The commenter states that the definition proposed by EPA goes well beyond the generally accepted scientific definition and is likely to mislead the public into believing that the Agency’s definition is the scientific norm.

Response: As discussed in the preamble to the SNPRM, the EPA relied upon the definition of “publicly available” found in 16 CFR 313.3. There does not appear to be a published standard definition of “publicly available” in the scientific community so the definition from 16 CFR 313.3 was utilized.

Further, in this final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

Comment: Commenter (10020) states that the proposed definition is ambiguous, misleading and unworkable. The commenter asserts that the definition must incorporate contrasting definitions to clarify its meaning and make the proposed new definition workable. The commenter suggests the proposed new definition of “publicly available” should include a contrasting definition similar to the definition of “nonpublic personal information” found in 16 CFR section 313.3(n). The commenter states that, without a contrasting definition or definitions as are found in section 313.3, the proposed new definition is devoid of meaning.

Commenter (10020) does not agree with the proposal’s suggestion that its definition of “publicly available” is “similar” to the definition of “publicly available” at 16 CFR section 313.3. The commenter states that 16 CFR section 313.3 was carefully crafted to include a contrasting definition of “nonpublic personal information” which your new proposed definition does not. The commenter states that the contrasting definition gives clarity and meaning to the definition of “publicly available”.

Commenter (10020) states that the proposal's stated reason for 16 CFR section 313.3 as the basis for your new proposed definition is that "the meaning of information that is available to the general public should not vary." The commenter states that proposed new definition varies "the meaning of information that is available to the general public" contrary to your announced intention, which is quite correct, that the meaning in the Code of Federal Regulations "should not vary." The commenter states that the new proposed definition of "publicly available" ought to simply and expressly incorporate 16 CFR section 313.3(p) by reference. The commenter states that the proposed new rule defining "publicly available" would serve no purpose since there is already a perfectly workable definition of "publicly available" found in 16 CFR section 313.3(p).

Response: The EPA disagrees that a contrasting definition is needed or that incorporation of 16 CFR 313(p) by reference is needed. Section 30.2 of the final rule provides the following definition:

Publicly available means “lawfully available to the general public from federal, state, or local government records; the internet; widely distributed media; or disclosures to the general public that are required to be made by federal, state, or local law. The public must be able to access the information on the date of publication of the proposed rule (or, as appropriate, a supplemental notice of proposed rulemaking, or notice of availability) for the significant regulatory action or on the date of dissemination of the draft influential scientific information for public review and comment.”

The final rule is limited to dose-response data and does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. The final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

The EPA has finalized the approach that will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. Restricted or tiered access in this final rule means that the underlying dose-response data are be available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

7.1.1.2 FOIA

Comment: Commenters (11192, 11361, 12720, 12464, 12715) express concern that the proposal's definition of “publicly available” in the SNPRM includes information available through the FOIA, which means the studies and data may not be immediately or easily available to the public. The commenters assert that the FOIA is not a reasonable tool for making data publicly available because the use of such a data release mechanism cannot ensure equitable access, could involve significant costs, would complicate the existing system due to an

anticipated surge in FOIA requests for underlying data and models used in pivotal regulatory science, and/or would involve long processing times with comparatively short public comment periods for EPA regulatory proposals.

Commenters (11192, 11361) state that, while most government records are legally available through the FOIA, anyone who has filed a FOIA request knows that the actual availability of information can be extraordinarily laborious and expensive to obtain. Commenter (12720) states that the FOIA process could involve significant costs. Commenter (12715) states that, although the data may technically be “available,” it is likely to be difficult and costly to obtain.

Commenter (12720) states that the FOIA system at EPA and other federal agencies is widely known to be dysfunctional and slow, with thousands of pending requests in the backlog each year. Commenter (12464) states that once someone files a FOIA request, it may take months or years for an agency to provide all requested documents,²⁸¹⁹ and frequently, an agency will deny a request or miss statutory deadlines to respond, meaning that the requestor must resort to the courts to obtain the desired documents.

Commenters (12720, 12715) express concern that the FOIA process involves long processing times and comparatively short public comment periods for EPA regulatory proposals.

Commenter (12715) states that the data often may not be received by the requestor until after the comment period ends, if at all, in which case, it is unlikely that interested parties would be able to obtain the information in a manner timely enough to allow for their own review and comment within any timeframe designated by EPA.

Response: EPA agrees that FOIA mechanisms do not achieve the goals of this rule. Availability via FOIA mechanisms does not mean that these data are immediately or easily available to the public. Some commenters cited the EPA’s Freedom of Information Act Annual Report Fiscal Year 2019 (2020), which lists a median response time for “expedited processing” of FOIA requests by the EPA as 493 days (Ref. 42). Also, FOIA applies to federal agencies and cannot be used to compel other entities to release information.

The concern regarding the long processing time for FOIA requests has been addressed in the final rule by the addition of the following sentence to the definition of publicly available: “The public must be able to access the information on the date of publication of the proposed rule for the significant regulatory action or dissemination of the draft influential scientific information for public review and comment.”

Comment: Commenter (12720) states that the EPA has not explained how its SNPRM would affect the existing FOIA activities at the Agency, despite the potential for major disruption of the process if members of the public are expected to use FOIA requests in order to obtain “information legally available from government sources” as it pertains to this proposal. The commenter states that the EPA has not described any modification of the online FOIA request

²⁸¹⁹ See, e.g., EPA, Freedom of Information Act Annual Report Fiscal Year 2019, at 21 (2020) (listing median response time for “expedited processing” of FOIA requests by EPA as 493 days).

and response system to accommodate a significant volume of requests for all “data and models” underlying specific scientific studies.

Response: The final rule will not affect the Agency’s existing FOIA activities. The final rule does not require EPA to obtain, store or publish dose-response data. The rule merely provides that “[t]he public must be able to access the information on the date of publication of the proposed rule for the significant regulatory action or dissemination of the draft influential scientific information for public review and comment.” If the dose-response data underlying pivotal science is not available, those studies will receive lesser consideration under section 30.5 of the final rule.

Comment: Commenter (12720) asserts that there are major flaws which arise from EPA’s proposed definition of “publicly available” in the context of FOIA. The commenter states that it is not clear that the EPA would itself be the custodian of “data and models” subject to this rule, nor how the EPA would ensure sufficient data security, integrity, and sharing mechanisms. The commenter states that it is also not clear how members of the public could access “information legally available from government sources” given the volume and complexity of the underlying “data and models” that fall under the scope of this proposal. The commenter asks if members of the public will be expected to identify specific studies for release under FOIA and how would the EPA evaluate such requests. The commenter states that it is likely that, upon receipt of such a request, the EPA would need to contact and potentially negotiate a public data release with study researchers and actual study participants, in the case of research analyzing human exposures and health responses. The commenter states that it is far from clear that such a FOIA request could be fulfilled by EPA, given existing legal restrictions on data sharing that are characteristic of many studies involving human subjects. The commenter notes that the EPA’s own interpretation states that FOIA “does not require agencies responding to requests to conduct research or analyze data.”²⁸²⁰

Response: The final rule will not affect the Agency’s existing FOIA activities. The rule merely provides that “[t]he public must be able to access the information on the date of publication of the proposed rule (or, as appropriate, a supplemental notice of proposed rulemaking, or notice of availability) for the significant regulatory action or on the date of dissemination of the draft influential scientific information for public review and comment.” The final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. This is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information.

Section 30.4 of the final rule provides that the EPA “shall clearly identify all science that serves as the basis for informing a significant regulatory action. The EPA shall make all such science that serves as the basis for informing a significant regulatory action publicly available to the

²⁸²⁰ U.S. Environmental Protection Agency. 2013. “Learn about FOIA.” Reports and Assessments. US EPA. October 21, 2013. <https://www.epa.gov/foia/learn-about-foia>.

extent permitted by law.” Members of the public will not need to submit FOIA requests to gain access to the studies EPA relies on.

The EPA recognizes that researchers and other third parties may voluntarily consider the EPA’s position on data availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make data and models available. Researchers may choose to make more data and models available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate.

Comment: Commenters (11192, 11361) state that studies originating outside of the government would not be subject to FOIA, so there would need to be another system for creating public access. The commenters state that there is currently no central place for academics to publish their data, let alone to publish data with tiered access.

Response: The final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which data and models are available. This is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA’s position on data availability, as described in this rule, when making their own decisions about how to conduct research and the extent to which they make data and models available. Researchers may choose to make more dose-response data available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate. Further, the EPA recognizes that there are currently many options related to data sharing mechanisms and repositories for researchers. The rule does not prescribe a type of mechanism, but just requires the EPA to determine whether dose-response data is available in a manner sufficient for independent validation.

Comment: Commenters (12720, 12464, 12715) express concern that the proposal’s definition of “publicly available” in the SNPRM could systematically favor the EPA’s use of industry-submitted data.

Commenter (12720) states that, in 2019, the EPA finalized an update to its FOIA regulations. The commenter states that, under this rule, the Administrator and other officials are allowed to review all materials that fit a FOIA request criteria and can decide whether to release or withhold a record or a portion of a record on the basis of responsiveness or under one or more exemptions under the FOIA, and to issue no records responses. The commenter states that, given the vague language in this proposal and existing FOIA regulations at EPA, there is a significant potential for political interference and arbitrary determinations within EPA for public release of data and models.²⁸²¹

²⁸²¹ Green, Miranda. 2019. “New EPA Rule Could Expand Number of Trump Officials Weighing in on FOIA Requests.” Text. The Hill. June 25, 2019.

Commenter (12464) notes that the definition provides that “publicly available” means, among other things, “lawfully available to the general public from federal, state, or local government records.” The commenter states that this means that data submitted by industry when applying to state or federal agencies for a permit or approval will be treated as “publicly available” for purposes of the proposal, even if members of the public could obtain access to those data only by filing a FOIA or state public records law request.

Commenter (12715) states that the limitations on the actual ability for requestors to obtain data and documents upon which EPA relies increase the likelihood that when EPA adopts regulations or standards, it will consider studies or data that are not in any practical manner available to the public, while at the same time failing or refusing to consider peer-reviewed studies that have been published in the open literature but which have private underlying data.

Response: These comments are addressed in the preamble of the final rule:

Several commenters contended that the proposed definition of “publicly available” would introduce a bias favoring industry data submitted to the EPA. They asserted that industry-generated studies submitted to the EPA pursuant to FIFRA would be considered publicly available because they could be obtained by the public in response to a Freedom of Information Act (FOIA) request. However, this does not mean that these are immediately or easily available to the public. Some commenters cited the EPA’s *Freedom of Information Act Annual Report Fiscal Year 2019* (2020), which lists a median response time for “expedited processing” of FOIA requests by the EPA as 493 days (Ref. 42). The EPA finds that such comments have merit and is modifying the definition in the final rule to add the following at the end of the definition: “The public must be able to access the information on the date of publication of the proposed rule (or, as appropriate, a supplemental notice of proposed rulemaking, or notice of availability) for the significant regulatory action or on the date of dissemination of the draft influential scientific information for public review and comment.”

7.1.1.3 Other

Comment: Commenters (11576, 12720) share the concerns that the Science Advisory Board (SAB) outlined with respect to what “available” means in the context of the supplemental notice:

A question to be answered is whether making the scientific papers reporting these studies available without charge makes the studies “available,” or whether all data from every measurement taken as part of the study need to be available to anyone to analyze. At one end of this range of interpretation the requirement is easily implementable. On the other end of the spectrum, meeting the requirement would be enormously expensive and time consuming at best and could be expected to result in the exclusion of much of the

scientific literature from consideration (the machine data may no longer be available and/or the researchers may no longer be alive or in a position to assemble the data).²⁸²²

Response: In this final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

The EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. The final rule includes sufficient flexibility in terms of the allowance for restricted access, considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data to minimize potential unintended consequences

Comment: Commenter (12712) asserts that the default rule for all work funded by the EPA must be that relevant code and data are available online or on request. The commenter states that the EPA must be clear that making data available means that the actual final dataset used in statistical analysis is made available.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum "Increasing Access to the Results of Federally Funded Scientific Research" and the 2016 EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research." EPA researchers, grantees, and contractors are required to make peer-reviewed journal articles and the underlying data and models resulting from EPA-funded research accessible to the public.

The EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research" requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, the rule requires the EPA to evaluate the availability of the analyzable dataset, not the more limited dataset that accompanied the publication of the study or model. For this rulemaking EPA will not identify a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

Comment: Commenter (12406) states that the proposed definition regarding "publicly available" does not include any reference to the concept of tiered access to CBI and PII as a permissible and

²⁸²² SAB Comments at 2-4.

appropriate means by which information could be deemed within the definition of publicly available. The commenter suggests this definition should be revised as follows:

Publicly available means lawfully available to the general public from federal, state, or local government records; the internet; widely distributed media; in designated reading rooms; available through tiered access when the data includes CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects; or disclosures to the general public that are required to be made by federal, state, or local law.

Response: The EPA does not agree that restricted access should be a part of the definition of “publicly available” and therefore, EPA has not made the suggested edits to that definition. Restricted access is covered in other provisions of the rule. The EPA has finalized the approach that will give greater consideration to pivotal science whose for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. Restricted or tiered access in this final rule means that the underlying dose-response data or models are be available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (12720) notes that the SAB report²⁸²³ finds that requiring the identification of all studies and regulatory science supporting regulatory actions and making them available for reanalysis will be a complex process. The commenter contends that identifying and making “pivotal science data or studies” available could present challenges if some studies were considered in the regulatory decisions but were not used to determine the point of departure or reference dose or other regulatory/technical level. The commenter states that it is not clear how much information and which studies should be included in the requirement to identify and make studies available.

Response: In the final rule, pivotal science “includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.” The final rule does not require EPA or any other entity to conduct independent validation before EPA can use pivotal science. Nor does the final rule require EPA to obtain, store or publish dose-response data.

Comment: Commenter (12720) suggests that the rule could benefit from use of the term “analysis dataset” to define data that should be made publicly available. The commenter states that this term refers to data that have been collected and processed (e.g., cleaned and transformed) for analysis. The commenter states that, in this way, the public could understand which studies/data were considered and used without expending the resources to gather and disseminate all available data. The commenter states that the level of detail required to allow the

²⁸²³ SAB Comments.

public to transparently reach the same conclusion(s) as the Agency will differ among individuals who seek the data. The commenter states that some people may wish to verify that the EPA has selected the right “pivotal studies.” The commenter states that, however, a more expansive scope would increase the reporting burden in a way that may make the proposed rule untenable.

Response: In this final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

7.1.2 40 CFR 30.5: Broad Issues

7.1.2.1. Retroactive Application of the Rule

7.1.2.1.1 General

Comment: Commenters (11393, 11395, 11407, 11895, 12412, 12474, 13549) generally oppose the proposal that the rule would apply regardless of when the data and models were generated.

Commenters (11393, 11395, 12412, 12435, 12474, 13549) state that many environmental statutes require the EPA to promulgate standards and protections based on the best available science, and then reanalyze those decisions at set points in the future. The commenters state that the SNPRM, and its proposal to apply regardless of when the data and models were generated, suggests that as the EPA reexamines standards and protections, the Agency would potentially exclude from consideration studies that led it to enact those standards and protections in the first place. The commenters state that it would be nonsensical and unlawful for EPA to overturn or weaken a standard or protection not based on any new science, or on a concern that the results were invalid, but rather because that study has not publicly released all its underlying data.

Commenter (11401) states that, while it is reasonable not to apply the new standard to existing rules, it would be a mistake to perpetuate outdated, substandard scientific studies into the future. The commenter states that these standards should apply to any science that a new rulemaking is using, regardless of when the science was generated; perpetuating non-transparent, irreproducible studies potentially in perpetuity should not be the goal of this rulemaking.

Commenter (11894) states that the supplemental proposal attempts to have it both ways by maintaining that the rule would apply retroactively while requesting comments on whether this should apply only to data and models that are generated after the effective date of the rulemaking.

Response: The EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal

science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. One of the criteria the Administrator may use in his/her determination to grant a waiver is that the development of the dose-response data was completed or updated before the effective date of the rule. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as the potential skew toward newer, domestic, and/or industry-funded studies suggested by the commenters. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

7.1.2.1.2 Planning

Comment: Commenters (10339, 11890, 12430, 12720, 12715) express concern that the rule and SNPRM fail to explain how historical data, which may have been collected under different policies and procedures to ensure confidentiality, will be treated. Commenter (11890) states that older records may have lost underlying data due to record retention schedules.

Commenter (12430) states that the EPA is in the process of adopting, and has recently adopted, multiple rules that will have a significant negative impact on air quality and human health, and it supports these rulemakings with information that may not meet the proposed standards for public

availability. The commenter states that, for example, in the Safer Affordable Fuel-Efficient Vehicles Rule Part One: One National Program, the EPA notes that some information relied upon in the rulemaking is not publicly available, *e.g.*, CBI. The commenter states that the EPA has similarly relied upon information not publicly available in the “Safer Affordable Fuel-Efficient Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks.” The commenter states that the EPA does not explain the extent to which the SNPRM would prevent the Agency from relying upon non-public information in other concurrent or near-term rulemakings. The commenter states that it is an open question, then, whether the EPA would need to amend its open rulemakings to eliminate the non-public information that it is proposing to limit itself from considering if the SNPRM is finalized – or whether the EPA would simply find reasons to exempt its preferred studies from the SNPRM’s requirements under its arbitrary exemption provision. The commenter states that retroactive application is even more problematic than prospective-only application, but either approach would abrogate EPA’s duties to protect public health and the environment.

Commenter (12720) asserts that the retrospective application of data transparency standards is a monumental challenge. The commenter states that a large amount of work would be required to locate, curate and retrospectively make datasets available for public access. The commenter states that this requirement could adversely affect the ability to move this program forward in a meaningful capacity. The commenter states that, for example, the EPA could decide not to apply the proposed rule and its specific requirements retrospectively given the potential difficulty accessing, reviewing and making data available that were not originally intended to be disseminated in such a manner as defined in a future rule. The commenter states that the EPA could consider designating a “start date” and begin collecting and releasing pivotal study data at that time. The commenter states that, when the EPA updates an existing risk assessment after the start date, the EPA could collect and release pivotal data. The commenter states that it is true that a substantial amount of work would be required in order to make any data and models underlying studies available to the public, but the EPA has not identified a responsible party for this work, nor has it made clear the timelines, electronic data sharing mechanisms, or public reporting of such availability would be achieved, archived, and maintained over time. The commenter states that it is not clear how such a “start date” for future applicability of data requirements could be determined or fairly applied, and in many cases such as the national ambient air quality standards (NAAQS) science reviews, the assessments rely on a foundation of scientific evidence that stretches back many years, if not decades. The commenter states that, as a result, determination of any “starting date” would be arbitrary and deprive the EPA of the best available science.

Further, the commenter (12720) contends that EPA has not acknowledged that there are regular review cycles for different environmental rules, and that new requirements for all “data and models” to be considered by the Agency in development of “influential scientific information and/or pivotal regulatory science” will substantially complicate existing science review processes at the Agency. The commenter contends that the supplemental proposal makes no reference to the fact that EPA is constantly re-reviewing scientific evidence, and that the body of science remains relevant regardless of when it was generated. Additionally, the commenter states that EPA has not explained why retroactive application is warranted, even as the Agency proceeds with a number of influential science products that rely on studies that do not meet the requirements of the supplemental proposal.

Commenter (12715) states that the proposal at 15,399 and 15,403 is unclear whether studies with data and models generated before the effective date of this proposed rule would be subject to the 40 CFR 30.5 criteria.

Commenter (11392) asserts that the supplemental proposal's retroactive application could have radical consequences and that EPA must provide greater clarity on what the implications would be for past studies that underpin the Agency's regulatory standards.

Response: The EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. One of the criteria the Administrator may use in his/her determination to grant a waiver is that the development of the dose-response data was completed or updated before the effective date of the rule. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as the potential skew toward newer, domestic, and/or industry-funded studies suggested by the commenters. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data,

while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

7.1.2.1.3 Costs

Comment: Commenters (11890, 12731) express concern regarding the costs associated with any retrospective application of the rule.

Commenter (11890) states that scientists who volunteer to provide data would need funding to respond to requests from EPA. The commenter states that this rule should not apply retroactively. The commenter states that archived materials were likely collected under grants that have long expired or are funded by grants that can't be used to fund such activities.

Commenter (11892) states it is difficult to envision how the supplemental proposal could be applied retroactively to the science developed through long term experience in the implementation of various regulations and standards. The commenter asserts that the exclusion of research that was accepted as scientifically valid in the past could only result in the need to duplicate such research, adding needless cost and delay to the process of decision making. Furthermore, according to the commenter, there are already EPA mechanisms for revising regulations and standards based on new data and analyses.

Commenter (12731) refers to the SAB report which concluded, “the retrospective application of modern transparency standards is a challenge. A large amount of work would be required to locate, curate and retrospectively make datasets available for public access. This requirement could adversely affect the ability to move this program forward in a meaningful capacity.”²⁸²⁴

Response: The EPA has identified some incremental costs that the Agency may incur as a result of this final rule. As stated in Section III.A.2, the EPA will continue its current practice of conducting extensive review of scientific studies during the development of significant regulatory actions and influential scientific information. The additional procedures required by this rule only apply to pivotal science, which is a subset of the total number of studies that the EPA would evaluate. Given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small. The Agency may also incur other administrative costs to perform analyses and evaluations to support activities such as exemption decisions made by the Administrator, and documenting these or other decisions made pursuant to the requirements of the final rule. Again, the Agency anticipates that the incremental costs for these activities will be small relative to current administrative costs for developing significant regulatory actions or influential scientific information. Finally, this final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated

²⁸²⁴ Final SAB Report at 15.

with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

7.1.2.1.4 Consent Needed

Comment: Commenters (11361, 12430, 12720, 12731, 12727) express concern that it may not be possible to obtain consent from study authors and/or data owners of historical studies.

Commenter (11361) states that any study that includes primary collection of human health data would need to have obtained informed consent from subjects to participate in the study. The commenter states that consent agreements are created to be very specific, scope- and time-limited agreements. The commenter states that, for any study that did not originally make its data public--which describes the vast majority of studies conducted--participants haven't consented to their data being made public, even if a de-identification process has taken place. The commenter states that it could be an enormous undertaking to try to track down participants years after a study concludes to attempt to gain consent in order to comply with this rule. The commenter states that, since many consent agreements are time-limited, researchers may not have the consent of participants to even attempt to contact them after the conclusion of the study. The commenter states that the EPA is leading researchers into a legal, ethical, and financial quagmire by retroactively dismissing or devaluing existing studies that do not comply with these unrealistic requirements.

Commenter (12430) states that participation in epidemiological studies is often contingent on keeping subject data confidential, consequently, studies that have already been completed may contain data that was collected contingent on confidentiality. The commenter states that researchers cannot now make that data publicly available, in response to the SNPRM, without violating state and/or federal laws (*e.g.*, California Information Practices Act,²⁸²⁵ the Health Insurance Portability and Accountability Act) or locating research participants and requesting their consent to the release (an expensive and time-consuming process that may frequently result in participants declining to give their consent).

Commenter (12720) expresses concern that the proposal does not explain how permissions will be obtained from study authors and research participants. The commenter states that this shortcoming raises numerous questions, including the length of time that will be allowed for study participants to consider and respond to any requests for data release.

Commenters (12731, 12727) refer to Dr. Janice Chambers' comment in response to EPA's charge questions that even a "tiered access" approach to disclosing data would not be possible to apply retroactively to studies carried out in the past. The commenters state that, based on her personal experience, Dr. Chambers opined that "many of the older epidemiology studies would not have considered this Option in their Informed Consent Forms" and that the researchers who conducted those studies (assuming they are even available) would therefore not have consent to share the data for reanalysis.²⁸²⁶ The commenters note that participants in past health studies may either have died or be unable to provide consent due to age or illness—and that even participants

²⁸²⁵ California Civil Code §§ 1798-1798.78. [87] Pub.L. 104-191.

²⁸²⁶ SAB Consultation at B-10.

who are reachable may be unwilling to release subsets of their data even to “safe harbor data archives.”²⁸²⁷

Commenter (11900) states that a participant’s right to privacy is established during informed consent to participate in a study. The commenter states that informed consent is an ethical and legal requirement of human subject research. The commenter states that consent documents describe the nature of the research, the risks and benefits associated with participation, and how the researcher will protect the confidentiality of the research records. The commenter states that, up to the present, nearly all human environmental health studies have guaranteed in their informed consent not to share identifiable study data outside the research team. The commenter states that all human subjects data is potentially identifiable, even after overt identifiers are removed; thus, researchers will be put in the position of having to decide whether placing data in a restricted-access enclave—subject to access requirements that are not yet specified—violates their pre-existing pledge to participants.

Response: The final rule does not require EPA or any other entity to obtain, store or publish dose-response data. As provided in 30.5(f), “[w]here the Agency is making dose-response data publicly available, it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, CBICBI, and is sensitive to national security.” Dose-response data is considered “publicly available in a manner sufficient for independent validation” when it includes the information necessary for the public to understand, assess, and reanalyze findings and may include, for example:

- (1) Data (data would be made available subject to access and use restrictions);
- (2) Associated protocols necessary to understand, assess, and extend conclusions;
- (3) Computer codes and models involved in the creation and analysis of such information;
- (4) Recorded factual materials; and
- (5) Detailed descriptions of how to access and use such information.

The provisions of this section apply to dose-response data underlying studies that are pivotal science, regardless of who funded or conducted the studies. The Agency shall make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making such data available before it concludes that doing so in a manner consistent with law and protection of privacy, confidentiality, national security is not possible. Further, an exemption under 30.7 may be granted so that pivotal science where the underlying data are not available for independent validation may be used and granted greater consideration under 30.5.

Comment: Commenters (11890, 12418) argue that, to protect privacy, the rule should not be retroactive. Commenter (11890) states that new technology has enabled re-identification of study participants and studies considered de-identified 20 years ago would be vulnerable to breaches in privacy today.

Commenter (12418) agrees with the modification in the supplemental proposal that all studies completed before the effective date of this proposed rule are considered eligible for EPA rulemaking regardless of whether they contain data or models that are publicly available. The

²⁸²⁷ Id. at B-28.

commenter states that the EPA must acknowledge that protecting the privacy of human participants in studies which have been used to support regulations in the past is an essential justification for prohibiting application prior to the effective date of this rulemaking. The commenter states that confidentiality of participant information is a scientific imperative of human health research that this rule must address more directly.

Response: The EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. One of the criteria the Administrator may use in his/her determination to grant a waiver is that the development of the dose-response data was completed or updated before the effective date of the rule. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as the potential skew toward newer, domestic, and/or industry-funded studies suggested by the commenters. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

7.1.2.1.5 High Quality Research

Comment: Commenters (10973, 11361, 12617, 12731, 13788, 14397, 11900) object to the exclusion of older research simply because it does not have full data sets available. Commenter (11361) states that, by retroactively applying this rule, the EPA nearly guarantees that most existing public health studies would be stricken from consideration.

Commenter (12731) asserts that the Agency's proposed solutions do nothing to allow rigorous consideration of the vast body of historical studies that document the harm that pollutants cause to human health and welfare. The commenter states that, while the EPA acknowledges objections to the original proposal's exclusion of "many older studies" that include valid data and models (85 FR 15401-02), the SNPRM does not respond to these concerns. The commenter states that, as the EPA admits, there are compelling reasons why it may be impossible or infeasible to provide access to data and models underlying older studies.

Commenter (14397) states that this proposal could allow the EPA to retroactively dismiss studies that have been used for decades when setting or renewing NAAQS and related regulations. The commenter states that these studies could include seminal publications regarding lead and mercury, and particulate matter.^{2828,2829} The commenter states that it should be noted that the EPA is not suggesting that past studies are invalid or reached erroneous conclusions, and indeed many of these studies have been reviewed, replicated, and validated by further independent studies. The commenter states that the EPA simply wants these studies to be dismissed because properly confidential data cannot be released. The commenter states that this approach would force the EPA to arbitrarily make public health and environmental decisions based on incomplete or improperly weighted information.

Response: The EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. As described in 40 CFR 30.5 of the final rule, the EPA will rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies—based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. Further, because study quality factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) would have already been evaluated at an earlier stage in the assessment process, the studies evaluated with these additional factors are presumed to be of the highest quality available.

Comment: Commenter (12423) understands that the EPA interprets the proposed rule as not retroactive, but asserts that interpretation is misleading. The commenter states that any future

²⁸²⁸ Friedman, Lisa. (November 11, 2019). EPA to Limit Science Used to Write Public Health Rules. New York Times.

²⁸²⁹ Feldscher, Karen. (January 7, 2014). "Landmark air pollution study turns 20". News - Harvard T.H. Chan School of Public Health. Retrieved from <https://www.hsph.harvard.edu/news/features/six-cities-air-pollution-study-turns-20>.

regulations or policies would need to adhere to this proposed rule, including the review of existing regulations and policies. The commenter states that, without the effective ability to tier access these data under the proposed rule, an important study²⁸³⁰ would be either discounted or deprioritized, depending on whether the modified proposal (tiered access) or alternative proposal (weighted studies) for public data is applied. The commenter states that actions and decisions made by EPA then could not make use of this scientifically valid and critical study without an exemption by the Administrator.

Commenters (12403, 11900) express concern that retroactive application of the proposed rule would be detrimental to public health.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule and has no retrospective effect on existing significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data.

The EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies—based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. Further, because study quality factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) would have already been evaluated at an earlier stage in the assessment process, the studies evaluated with these additional factors are presumed to be of the highest quality available.

²⁸³⁰ CRITFC, 1994. A Fish Consumption Survey of the Umatilla, Nez Perce, Yakama, and Warm Springs of the Columbia River Basin. Columbia River Inter-Tribal Fish Commission, Portland, Oregon. Technical Report 94-3.

Comment: Commenter (12455) provides that the supplemental proposal needlessly complicates their use of pesticide reviews, which are traditionally based on CBI studies. According to the commenter, it is unclear whether older studies, when they come up for review, will be completely excluded from consideration as they would not qualify under the supplemental proposal. Commenter (12715) states that Option 1 is fatally flawed in that it continues to unlawfully and arbitrarily exclude from consideration valid scientific studies where the underlying data is unavailable, regardless of whether the studies have been peer reviewed or would be considered part of the “best available science” the Agency is commanded to consider.

Response: The EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. With this final rule, the EPA is maintaining language in 40 CFR 30.3 stating that the statutes that the EPA administers, or their implementing regulations, will control in the event of any conflicts with the requirements of this rule. The Agency will continue to comply with and abide by the requirements in those statutes and implementing regulations, including regulatory deadlines.

7.1.2.2 Best Available Science

7.1.2.2.1 Legal Concerns

Statutes

Comment: Commenters (11360, 11390, 11393, 11396, 11403, 11407, 11489, 11491, 11895, 11911, 12412, 12474, 12702, 12731, 13549, 13788, 12715) assert that the proposal violates statutes that require the EPA to base its decisions on the best available science.

Commenter (11360) states that the proposed rule and the SNPRM in effect bar the EPA from utilizing scientific information that rests on difficult-to-release information. The commenter states that the best available science must serve as the foundation for EPA's regulatory and policy actions. The commenter states that Congress intentionally and wisely embedded peer-reviewed research in the foundation of the Clean Air Act (CAA), including requiring regular reviews of the science, explicitly recognizing that the EPA needs the most current, peer-reviewed data to protect the public health. The commenter states that these expectations also are reflected in other public health laws that support the EPA's mission, including the Toxic Substances Control Act (TSCA).

Commenters (11393, 11407, 11895, 12412, 12474, 13549) assert that the EPA must base its decisions on the best available science and that anything less is nonsensical, arbitrary, and in violation of the environmental laws the EPA is charged with implementing.²⁸³¹ The commenters

²⁸³¹ See, e.g., 42 U.S.C. § 300g-1(b)(1)(B)(ii), (3)(A) (Safe Drinking Water Act provisions requiring regulation of contaminants based on best available science); 15 U.S.C. § 2625(h) (Toxic Substances Control Act provision

state that the SNPRM instead provides for ways the EPA would exclude and lessen consideration of the best available science.

Commenter (11390) asserts that weighting, discounting, or excluding relevant studies from consideration based not on the quality of the science but on the public availability of underlying data directly contradicts the EPA's statutory mandates²⁸³² and core mission. The commenter states that the EPA itself has defined "best available science" and similar statutory standards without reference to the public availability of data; for example, the EPA has explained that:

Use of best available science involves the use of supporting studies conducted in accordance with sound and objective scientific practices, including, when available, peer reviewed science and supporting studies and data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).²⁸³³

Commenter (11489) asserts that science does not depend on the public availability of underlying data to indicate quality and reliability of evidence and public availability of research data is not a proxy for the reproducibility of science. The commenter states that, if this rule is made final, the EPA will fail to meet a key component in its enabling legislation that requires the agency use the "best available science" in its regulatory decisions.

Commenter (11491) states that the EPA is often legally obligated to base its rules on the best available science, and the Agency does not have the authority to modify statutes requiring the Agency to use the best available science and health information.

Commenter (11911) asserts that ignoring valid and potentially valuable information in rulemaking with profound public health and economic consequences is a steep cost to pay – and it is at odds with the Agency's mandate to use the "best available" science.²⁸³⁴

Commenter (12731) asserts that, like the original proposal, the SNPRM lacks any demonstration that the public unavailability of a study's underlying data or models necessarily—or even likely—renders the study invalid or unreliable. The commenter notes that comments on the original proposal demonstrate that mechanisms are already in place to validate studies for which disclosure of underlying data and models is either illegal or impracticable.²⁸³⁵ The commenter contends that the EPA's automatic exclusion from consideration of (or, at least, diminished

requiring the use of best available science); see also 83 Fed. Reg. at 18,769 ("The best available science must serve as the foundation of EPA's regulatory actions.").

²⁸³² There are many other statutory requirements that require EPA to employ science that this proposed rule directly contravenes. For example, Clean Water Act § 104 requires EPA to undertake continuing comprehensive studies of the effects of pollution on estuaries and estuarine zones, considering "all pertinent information"—a mandate at odds with the proposed rule's push to exclude relevant peer-reviewed research from the regulatory process. 33 U.S.C. § 1254(a)(1).

²⁸³³ Environmental Protection Agency Office of Chemical Safety and Pollution Prevention, Guidance to Assist Interested Persons in Developing and Submitting Draft Risk Evaluations Under the Toxic Substances Control Act, EPA 740-R17-001 (June 2017).

²⁸³⁴ Michael J. Fox Foundation, Comment Letter on proposed rule for Strengthening Transparency in Regulatory Science 1 (Aug. 16, 2018), <https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-4878>.

²⁸³⁵ EDF 2018 Comments at 64-66, 70-74.

reliance upon) studies based solely on the public unavailability of underlying data or models would result in the Agency failing to consider all available science—and even the best available science in some cases—in direct contravention of statutory requirements. The commenter states that, under the differential weighting approach, the EPA would not be able to use the best available science and consider all available information, in violation of the EPA’s statutory obligations.²⁸³⁶

Commenter (13788) states that, unlike the 2018 proposal, the SNPRM does not include any acknowledgement that the EPA must use the “best available science” for regulatory actions—but it must.²⁸³⁷ The commenter notes that, under the Administrative Procedure Act (APA) and CAA, agency actions that are arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law are to be held unlawful and set aside. The commenter states that agencies are required to “articulate a satisfactory explanation for [the] action including a ‘rational connection between the facts found and the choice made.’”²⁸³⁸ The commenter states that, here however, the EPA is proposing to exclude or devalue scientific studies based on criteria that are unrelated to scientific value or merit, and that would eliminate the Agency’s ability to rely on research that may be the best available science.

Commenter (11576) expresses concern with respect to the practicability of requiring all information to be made available, given unequivocal statutory deadlines embedded within environmental statutes.²⁸³⁹

Response: The final rule provides that if implementing the rule results in any conflict between this rule and the environmental statutes that the EPA administers, and their implementing regulations, this rule will yield and the statutes and regulations will be controlling. The requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Case Law

Comment: Commenters (11390, 11403, 11479, 11495, 12720) refer to court cases and assert that the EPA must use the best available science regardless of whether the data are publicly available.

Commenter (11390) asserts that the “best available science” and similar standards set out in environmental statutes require the use of scientific information and analysis that follow standards accepted by the scientific community, not information and analysis based upon the public availability of data. The commenter states that the proposed requirements ignore well-established

²⁸³⁶ See EDF 2018 Comments at 13-94.

²⁸³⁷ 83 Fed. Reg. at 18,769 & n.1.

²⁸³⁸ *State Farm*, 463 U.S. 29, 42-44 (1983).

²⁸³⁹ See August 2018 Coalition Comments at 85-87 (discussing potential delays in the implementation of critical public-health protections).

indicia of reliable scientific research, such as peer review. The commenter states that proposal would force the EPA to ignore high quality science and that this controverts the EPA's statutory obligations and will impair the EPA's ability to protect public health and the environment. The commenter contends that public availability of data is a criterion often irrelevant to scientists' standards for determining whether research represents the best science.²⁸⁴⁰ The commenter asserts that the proposal's emphasis on public availability contradicts the EPA's own statutory mandates and is inappropriate, given the courts' agreement that publicizing the data underlying studies upon which EPA relies "would be impractical and unnecessary."²⁸⁴¹

Commenter (11403) states that the EPA has long relied on peer-reviewed studies in its rulemaking, even where the underlying data may not be publicly available. The commenter states that, as the proposed rule notes, the EPA has successfully defended that exact approach before the D.C. Circuit, which has recognized that "[i]f EPA and other governmental agencies could not rely on published studies without conducting an independent analysis on the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment...."²⁸⁴²

Commenter (11495) states that, in at least two instances, the D.C. Circuit Court of Appeals has recognized that studies for which the underlying data are not publicly available may constitute the "best available science."²⁸⁴³ The commenter states that, in *American Trucking Associations, Inc. v. EPA*, the Court held that the CAA did not require the EPA to make underlying data public where EPA relied on the study itself and not the raw underlying data.²⁸⁴⁴ The commenter states that the Court agreed with EPA's argument that requiring the Agency to obtain and publicize the relevant data "would be impractical and unnecessary."²⁸⁴⁵ The commenter states that in *Coalition of Battery Recyclers Association v. EPA*, the court again upheld the EPA's reliance on non-publicly available data, reasoning that the EPA relies on studies and their results rather than the raw data underlying those results.²⁸⁴⁶

Commenter (11479) states that records released through a FOIA request confirm that EPA staff are aware that the Agency does not need to have access to the underlying raw data, codes, etc. to promulgate regulations. The commenter states that during the development of this proposed rule, Dr. Nancy Beck, the Deputy Assistant Administrator for the Office of Chemical Safety and Pollution Prevention, emailed colleagues "for awareness" that in the 2002 court decision *American Trucking Association v. EPA*, it became evident that, if the EPA were required to have

²⁸⁴⁰ *American Trucking Ass'ns, Inc. v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002) (explaining that curtailing EPA's ability to rely on published studies would exclude "plainly relevant scientific information" from regulatory decision-making processes).

²⁸⁴¹ *American Trucking Ass'ns*, 283 F.3d at 372; see also *Coalition of Battery Recyclers Ass'n v. EPA*, 604 F.3d 613, 623 (D.C. Cir. 2010).

²⁸⁴⁴ *Am. Trucking Associations, Inc. v. EPA*, 283 F.3d at 372.

²⁸⁴⁵ *Id.* at 372 (quoting National Ambient Air Quality Standards for Particulate Matter, 62 Fed. Reg. 38,652, 38,689 (July 18, 1997)).

²⁸⁴⁶ *Coal. Of Battery Recyclers Ass'n v. EPA*, 604 F.3d 613, 623 (D.C. Cir. 2010).

access the raw data of peer-reviewed scientific studies, the Agency would not be able to use a significant amount of important scientific literature.²⁸⁴⁷ The commenter states that the courts, through that decision and through *Coalition of Battery Recyclers Association v. EPA*, have made it clear that the EPA is not required to obtain or analyze raw data in order to use independent scientific studies that are published in peer-reviewed journals to regulate.

Commenter (11495) states that the EPA has already established an array of rigorous review techniques that go beyond the typical scientific journal peer review process to ensure that the best available science is used.²⁸⁴⁸ The commenter states that imposing this new public availability of data obligation negates the purpose of these “rigorous reviews” and the already-strict review imposed by the scientific community.²⁸⁴⁹ The commenter states that courts have held that agencies “cannot ignore available...information.”²⁸⁵⁰ The commenter states that plaintiffs and petitioners can establish a violation of a statutory “best available science” requirement imposed on the Agency by “point[ing] to any scientific evidence that the agency failed to consider.”²⁸⁵¹ The commenter states that the Ninth Circuit Court of Appeals has also held that “the best available data requirement . . . prohibits [an agency] from disregarding available scientific evidence that is in some way better than the evidence [it] relies on.”²⁸⁵² The commenter states that, under the SNPRM, the EPA would not consider some scientific studies that are potentially more accurate and robust than the studies it does consider based upon the arbitrary criterion of the public availability of the study’s underlying data.

Commenter (12720) states that, in its SNPRM, the EPA proposed to categorically ignore and exclude all peer-reviewed research with non-public underlying data, without individually considering each study or offering specific reasons for not relying on that study. The commenter states that the SNPRM, by barring consideration of foundational scientific research premised upon non-public data, would result in EPA “fail[ing] to consider an important aspect of the problem.”²⁸⁵³ The commenter states that there is no evidence of a court supporting an agency’s decision to exclude entire categories of evidence, or studies or information based on categorical prohibitions like the ones in the SNPRM, without considering the source and offering specific reasons for not relying on the study. The commenter states that, both the EPA and the courts have indicated in *API* and *Coalition of Battery Recyclers*, that a rule like the one the EPA is currently proposing is not required by the CAA and would be both impractical and unnecessary. The commenter states that this SNPRM runs counter to the D.C. Circuit’s decision in *API* and would render the EPA’s regulatory actions based on the SNPRM arbitrary and capricious and an

abuse of EPA's discretion. The commenter states that SNPRM's blanket rule would represent a significant and unlawful departure from D.C. Circuit rulings on agencies' limited discretion to choose the sources it will consider and ignore.

Response: The EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

The final rule provides that if implementing the rule results in any conflict between this rule and the environmental statutes that the EPA administers, and their implementing regulations, this rule will yield and the statutes and regulations will be controlling. The requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information and do not interpret provisions of the statutes referenced by commenters. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information.

7.1.2.2.2 Informed Decision-Making

Comment: Commenters (11360, 11393, 11399, 11473, 11576, 11895, 12403, 12412, 12427, 12434, 12443, 12455, 12474, 12546, 12731, 13549) object to the SNPRM because the rules will lead the EPA to make decisions based on incomplete and/or improperly weighted information, rather than the best available information.

Commenters (11393, 11895, 12412, 12474, 13549) contend that the SNPRM does not address the fact that many past and ongoing public health studies simply cannot lawfully, ethically, or efficiently publicly release the underlying data. The commenters state that the SNPRM does not claim that such studies are invalid or reached incorrect conclusions. The commenters state that

some of these past studies have been reviewed, replicated, and validated by additional independent studies. The commenters state that, even if applied only to future research, the SNPRM would limit participation, limit the information that can be collected, and waste limited resources.

Commenter (11399) states that additional “independent validation” that goes above and beyond the peer review process and the EPA existing science advisory infrastructure is a new procedural hurdle that will limit the universe of scientific studies that the EPA may consider. The commenter states that creating such an impediment undermines the EPA’s legal obligation to use the best-available science to guide its decision-making processes and portends a weakening of the scientific underpinnings of health-based environmental regulations.

Commenter (11473) expresses concern that discounting evidence from the decision-making process on the basis that some data are confidential runs counter to the EPA stated mission to reduce environmental risks...based on the best available scientific information. The commenter states that the EPA 2016 document on transparency stated that “Classified or otherwise protected EPA-funded scientific research will not be made publicly available.”

Commenters (11576, 12405, 12427) refer to a joint statement by a group of scientists and editors-in-chief at leading scientific journals in response to the proposed rule: “It does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them; rather, it is paramount that the full suite of relevant science vetted through peer review, which includes ever more rigorous features, inform the landscape of decision making. Excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes.”²⁸⁵⁴

Commenter (12403) asserts the rule would compromise the EPA's decision-making by excluding from consideration or devaluing well-conducted peer reviewed studies that cannot comport with data availability requirements. The commenter states that it also runs the risk of regarding small, poorly designed studies while penalizing larger and more representative research studies.

Commenter (12434) states that the proposal would exclude validated and qualified science that has undergone rigorous peer review if the data were not publicly available. The commenter states that, consequently, the EPA would necessarily rely on scientific studies with publicly available data regardless of whether these studies were the most robust or best suited to inform decision making. The commenter states that decisions could be based on science that does not represent the latest scientific consensus, but by science arbitrarily selected by the Administrator, a political appointee.

Commenter (12443) asserts that, as written, this rule would result in excluding many well-designed studies that contain private medical information that cannot ethically be made publicly available, because to do so would jeopardize the privacy of study participants’ medical data and possibly other information. The commenter states that researchers should not be forced to choose whether to protect the privacy of participants’ data or to make their findings applicable to the

²⁸⁵⁴ Jeremy Berg, Philip Campbell, Veronique Kiermer, Natasha Raikhel, and Deborah Sweet, Joint Statement on EPA Proposed Rule and Public Availability of Data, *Nature*, Apr. 30, 2018.

EPA. The commenter states that, if the EPA were to ignore findings from studies with private data, many high-quality research findings could not be considered, which would weaken the basis of EPA decision-making. The commenter states that there is no scientific basis for discounting such findings, and valuable research would be suppressed, harming the public health.

Commenter (12455) states that the EPA's intent to have all decisions based on publicly available data as stated in the SNPRM could harm federal decision-making. The commenter states that there are many qualified research entities that conduct studies where the report may not be available to the public. The commenter states that, although the concept of having studies be publicly available so peer review can validate data has the veneer of transparency, it clearly subverts the ability of the researcher using the data to determine the validity of data, study, or methods used.

Commenter (12546) notes that the EPA is proposing to downgrade the consideration of studies that do not make underlying data and models publicly available. The commenter states that the EPA itself acknowledges that potential studies for downgrade or elimination are "high-quality" and that scientific findings and research are valid whether or not data are publicly available, a reiteration of the conclusion put forth in the EPA's 2016 Plan.²⁸⁵⁵ The commenter states that, if this model is pursued, the EPA can base new and renewed standards on lower-quality science, rather than the "best available science," and "adequate information."²⁸⁵⁶ The commenter states that the omission of high-quality studies because they do not have available the underlying data could greatly impact the strength of systematic reviews and meta-analyses needed to show the harms of an exposure on a health outcome, and this could lead to conclusions that the evidence-base lacked sufficient weight.

Commenter (12731) refers to the SAB report which noted that "[i]t is not clear: (1) how many of the studies the EPA currently relies upon to take important regulatory actions would meet the public disclosure standards stated in the proposed rule, and (2) whether EPA has assessed the feasibility of making underlying information from the studies publicly available, or what the impact of precluding those studies would be on EPA's decision making and its ability to protect public health/environment."²⁸⁵⁷ The commenter states that the EPA thus continues to disregard the likelihood that its rule would severely erode the best available science available to the agency, which it recognizes "must serve as the foundation of [its] regulatory actions."²⁸⁵⁸ The proposal remains arbitrary in ignoring this obvious—and now expanded—counterproductive effect.²⁸⁵⁹

²⁸⁵⁵ EPA (2016) Plan to increase access to results of EPA-funded scientific research. pg. 4-5 Available: <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransparencyplan.pdf>.

²⁸⁵⁶ 15 USC §2625 (h)-(i) and 15 USC §2601 (b)(1).

²⁸⁵⁷ SAB Final Report at 15.

²⁸⁵⁸ 83 FR 18769.

²⁸⁵⁹ See Physicians for Soc. Responsibility, 2020 U.S. App. LEXIS 12727, at *27 ("Even the Directive itself agrees that 'it is in the public interest to select the most qualified, knowledgeable, and experienced candidates.' Yet the Directive nowhere confronts the possibility that excluding grant recipients—that is, individuals who EPA has independently deemed qualified enough to receive competitive funding—from advisory committees might exclude those very candidates." (citations omitted)).

Response: The EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. The final rule does not require EPA or any other entity to conduct independent validation before EPA can use pivotal science. Nor does the final rule require EPA to obtain, store or publish dose-response data.

The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenters (10040, 11479, 11491, 11907, 11926, 12457, 12458, 12716, 12720, 12715) object to the rules because they would eliminate important health evidence collected under assurance of confidentiality and undermine the EPA regulatory decisions.

Commenter (10040) states that, by not allowing the use of science grounded in datasets that use confidential, protected health data from individuals who have consented on the condition that their data remain confidential, this proposal stands to severely undermine the scope of research available to inform the EPA as it works to make scientifically informed regulatory decisions.

Commenter (11479) notes that one Option offered in the new notice would allow the EPA, if considering a study whose underlying data are not made available, to place less weight on the results "to the point of entirely disregarding them," even if the research and results were strong and compelling, met the highest scientific standards, and had undergone extensive scientific peer review. The commenter states that, in other words, the EPA would give the most weight to studies with publicly available data rather than to studies that provide the strongest scientifically

supportable evidence. The commenter states that, because there are many environmental health studies relying on medical data and other private information, the rule's restrictions would mean that the best available science could be excluded.

Commenter (11491) states that neither of the Options provided in the SNPRM, regarding the need to both use and maintain the confidentiality of certain information relied upon by the Agency in its decision-making process, adequately addresses the constraints that the rule would put on EPA's ability to rely on the best available science. The commenter states that the rule would constrain the Agency's ability to use the best available science and thereby undermine the quality and defensibility of its final actions. The commenter refers to the EPA's SAB report which states:

There is minimal justification provided in the Proposed Rule for why existing procedures and norms utilized across the U.S. scientific community, including the federal government, are inadequate, and how the Proposed Rule will improve transparency and the scientific integrity of the regulatory outcomes in an effective and efficient manner. It is plausible that in some situations, the Proposed Rule will decrease efficiency and reduce scientific integrity, determining if in fact that will be the case requires a thorough and thoughtful examination that is currently absent in the Proposed Rule. Moving forward with altered transparency requirements beyond those already in use, in the absence of such a robust analysis, risks serious and perverse outcomes.²⁸⁶⁰

Commenter (11362) contends that the EPA must prioritize public health in its decision making, therefore data from public health and epidemiological studies must be taken into consideration for influential scientific information and regulatory actions and should be exempt from this rule if passed into law.

Commenter (11907) states that this rule will likely reduce or severely restrict the EPA's use of epidemiology studies that are based on anonymous or confidential PII that can contribute to identifying sources of air, water, or ground pollution that can lead to chronic human health conditions and terminal diseases, not only within Native American communities, but within all communities throughout the United States.

Commenter (11926) asserts that the proposal and SNPRM would seriously impact the EPA's ability to utilize the best available science in formulating new regulations or renewing existing ones. The commenter states that, by mainly considering studies with publicly available data or those posted to a special database that allowed public access to sensitive data by special arrangement, the rule would mean little weight would be given to studies with strictly confidential non-public data. The commenter states that this would eliminate important health evidence collected under assurance of confidentiality because publication of the data would be a breach of confidentiality. Ignoring the results of such studies, many in the most exposed and most affected populations, would mean that regulations and policies essential to protect public health would never come into existence.

²⁸⁶⁰ EPA Science Advisory Board, Consideration of the Scientific and Technical Basis of EPA's proposed rule Titled Strengthening Transparency in Regulatory Science, EPA-SAB-20-005, p. 18 (Apr. 24, 2020).

Commenter (12457) contends that the proposed revisions could result in the failure to properly consider important pivotal science and research findings during the policy making process. The commenter states that limiting information that is utilized for policy setting is not the most prudent course of action as policy makers often need to consider a range of information and data in order to set sound policy.

Commenter (12716) asserts that, to have access to the best available science, studies must protect the privacy of those affected by environmental risks. The commenter states that the EPA's proposal requires access to underlying data and, consequently, will limit the types of scientific studies that will be conducted and used to inform regulatory decision-making. The commenter notes that the EPA recognizes the need to balance the interests of making information available to the public and protecting other interests, like privacy.²⁸⁶¹

Commenter (12720) expresses concern that the EPA's proposal does not clarify how fundamental patient privacy and confidentiality issues can be overcome. The commenter notes that the SAB points out that such hurdles will prove insurmountable in some cases, depriving the EPA of the best available science to inform critical safeguards to limit pollution and protect public health.

Commenter (13788) asserts that the EPA's real intention in the SNPRM, as in the proposal, is to limit the Agency's access to public health science, not to ensure the quality of the studies the Agency relies on. The commenter states that it is made clear by the Agency's statement that if "multiple high-quality studies exist but only two studies have data and models that are available for independent validation and reanalysis, EPA would only include those two studies as pivotal regulatory science and/or pivotal science." The commenter states that, by acknowledging that the highest quality studies will be ignored if confidential data and models are not made available for validation and reanalysis, the EPA is admitting that this rule is not concerned with improving the quality of studies relied on by the Agency. The commenter states that the SNPRM is instead focused on information availability, even if it comes at the expense of the quality of scientific work. The commenter states that the best studies may not rely on available underlying data—precisely because they are human health studies that requires the maintenance of the privacy of the study participants—and in those situations this rule would clearly prioritize data availability over quality.

Commenter (12715) states that the issue of protecting confidentiality of data has been well recognized.²⁸⁶² The commenter states that this process demonstrates that, even after going through an arduous, time consuming process, the removal of personal identifying information would be difficult to achieve. The commenter states that, therefore, many valid, peer reviewed

²⁸⁶¹ Emphasis added, EPA, Plan to Increase Access to Results of EPA-funded Scientific Research, pp. 4-5, November 29, 2016, <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransparencyplan.pdf>.

²⁸⁶² National Research Council, Access to Research Data in the 21st Century: An Ongoing Dialogue Among Interested Parties: Report of a Workshop, National Academies Press (2002), <https://www.nap.edu/read/10302/chapter/1>.

epidemiological studies would be excluded from consideration, or arbitrarily given less weight, because the data would not be publicly available.

Commenter (12458) asserts that giving greater weight to studies where the underlying data and models are available or made available through tiered access would disproportionately exclude research that relies on personal health data, including research that draws crucial connections between environmental pollution and human health. The commenter states that such research could include the kind of critical work on the human health impacts of water and air pollution that has contributed to regulations that have saved thousands of lives and trillions of dollars.²⁸⁶³ The commenter states that giving greater weight to studies where the underlying data is available will increase the relative weight of industry-funded research and research using non-human subjects, which are less likely to foreground questions about human health. The commenter states that, for these reasons, the SNPRM and rule would actively interfere with EPA's mission to protect public health both in rulemaking and in other Agency activities.

Response: The final rule does not require EPA or any other entity to conduct independent validation before EPA can use pivotal science. Nor does the final rule require EPA to obtain, store or publish dose-response data. The EPA shall give greater consideration to pivotal science where the underlying dose-response data are publicly available in a manner sufficient for independent validation. The Agency shall also give greater consideration to pivotal science based on dose-response data that include CBI, proprietary information or PII if these data are available through restricted access in a manner sufficient for independent validation. For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.9. The Agency will identify the pivotal science that was given lesser consideration and provide a short description of why lesser consideration was given.

7.1.2.2.3 Public Health

Comment: Commenters (10040, 11377, 11378, 11390, 11491, 11926, 12443, 12458) object to the rule because it would undermine the Agency's ability to execute its mission to protect public health, and its obligation to use best available science. Commenter (10040) states that these regulatory decisions have profound implications for the lives, health and well-being of communities nationwide. Commenter (11377) asserts that systematically and arbitrarily favoring fully-public data for even more of the Agency's work only further imperils citizens whose health depends on the EPA's using the best science, not just the most public. Commenter (11926) asserts that ignoring the results of such studies, many in the most exposed and most affected populations, would mean that regulations and policies essential to protect public health would never come into existence. Commenter (12731) states that, in November 2019, the editors of the nation's leading science journals issued a statement underscoring that the notion of discounting

²⁸⁶³ The Benefits and Costs of the Clean Air Act from 1990 to 2020, U.S. Environmental Protection Agency Office of Air and Radiation, 5-24 and 7-3, April 2011 (The economic benefits of the Clean Air Act are estimated at \$2 trillion and the law is estimated to prevent 230,000 premature deaths in 2020 alone).

studies based on the availability of underlying data is contrary to good scientific practice and would be a “catastrophe” for public health.²⁸⁶⁴

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

7.1.2.3 Study Quality, Validity and Accepted Practices

7.1.2.3.1 Quality and Validity of Studies

Public Availability and Quality/Validity of Studies

Comment: Commenters (11392, 11399, 11408, 11473, 11480, 11487, 11489, 11576, 12455, 12457, 12546, 12720, 13788, 14397, 12715) do not agree with the rule’s premise that studies are “better” or more “valid” than others, depending on whether or the degree to which their underlying data and models are available to the public.

Commenter (11392) states that all studies go through a rigorous peer review process prior to publication, and as a result, the scientific community does not use the so-called potential for “independent validation” as a metric for quality of a study.

Commenter (11399) states that both rule Options rest on an incorrect premise that scientific studies should be “graded” by EPA based on the transparency of their underlying data and models, and that more “transparent” science is more worthy of EPA’s consideration than studies

²⁸⁶⁴ H. Holden Thorp et al., Joint Statement On EPA Proposed Rule and Public Availability of Data, SCIENCE, Dec. 6, 2019, <https://science.sciencemag.org/content/366/6470/eaba3197>.

based on confidential data that cannot be made publicly available. The commenter states that this assumption is fundamentally untrue and conflates two separate issues: transparency and scientific rigor. The commenter states that this issue is distinct and separate from EPA's obligation to consider the complete range of published, peer-reviewed scientific research that is relevant to its regulatory decisions.

Commenter (11408) states that the EPA's response to concerns regarding data availability is to weigh more heavily studies where the data is publicly available. The commenter states that this "compromise" runs counter to principles of transparency, as the Agency would rely more heavily on a study with publicly available data over one that meets the highest scientific standards and yields compelling results.

Commenters (11473, 12546, 13788) assert that the quality of the research is not dependent on data availability and refer to the EPA's 2016 Plan²⁸⁶⁵ to increase access to results of EPA-funded scientific research which states: "The validity of scientific conclusions drawn from research publications or their associated research data, or EPA's ability to consider those conclusions and data in its actions, does not depend on compliance with this Plan." Commenters (12546, 13788) point out that the EPA's 2016 Plan emphasizes that data availability does not affect the validity or usability of science: "Whether research data are fully available to the public or available to researchers through other means does not affect the validity of the scientific conclusions from peer-reviewed research publications."

Commenters (11487, 11479) assert that using non-scientific criteria to evaluate scientific studies is thoroughly inappropriate and at odds with established practices for evaluating study quality. The commenters state that, for instance, the Strengthening the Reporting of Observational Studies in Epidemiology (STROBE) checklist does not include public availability of data.²⁸⁶⁶ Commenter (11479) states that the STROBE initiative deems transparency crucial but does not include any criteria that would require the underlying data to be made publicly available.²⁸⁶⁷ The commenter states that, as external researchers conduct systematic reviews or meta-analyses on particular health outcomes, public availability of data is not among the criteria for study appraisal in the widely accepted Cochrane Systematic Review method. The commenter states that the five criteria used to appraise and down-weight studies are related to study quality, not the availability of data, and include "limitations in the design and implementation of available studies suggesting high risk of bias; indirectness of evidence; unexplained heterogeneity or inconsistency of results; imprecision of results; and high probability of publication bias."²⁸⁶⁸ The commenter states that imposing a requirement that is disconnected from the realities of the research world would put the quality of EPA's assessments and the Agency's reputation in the scientific community at risk.

Commenters (11480, 12464) assert that both approaches outlined in the proposal remove from consideration or significantly reduce the weight of studies when raw data is not publicly available for independent validation and reanalysis. Commenter (11480) states that public availability of data and models is not a criterion of best available science and should not be considered in determining whether to consider a study in an Agency decision. Commenter (12464) states that the rule relies on the flawed assumption that the scientific reliability of a study can be best determined by a reanalysis of the original data.

Commenter (11489) contends that the value or merit of peer-reviewed science is not determined by the public availability of the underlying research data. Commenter (12455) states that the lack of public availability does not automatically mean the research is flawed. Commenter (12457) states that, whether a study has data that is publicly available is not a factor that reflects the quality of the study, nor the relevance of the study's results to EPA policy decisions.

Commenter (11576) states that, throughout the proposed rulemaking, the EPA erroneously conflates the public availability of underlying data with the accuracy of a study. The commenter states that this conflation is contrary to well-established standards of scientific practice, in which the process of peer-review ensures that studies are vetted for accuracy. The commenter states that, while many scientific journals are starting to make more data publicly available, it is important to note that the availability of data underlying published studies has no bearing on evaluating the accuracy of the studies. The commenter states that access to unprocessed data at the stage described in the SNPRM is typically not a requirement even for peer-review, as scientists can evaluate the robustness and accuracy of findings based on the presentation of processed data and the articulation of the methods and analysis used.²⁸⁶⁹

Commenter (12546) states that the EPA is proposing to downgrade or exclude science that is not made publicly available or "cannot be sufficiently de-identified to protect the data subjects." The commenter states that this would codify that study quality is based on availability of underlying data, which is not the measure of study quality. The commenter states that this language is both vague and dangerous in implying that studies that do not make their data available are less informative or of less quality – both of which have no empirical basis. The commenter states that availability of underlying data is not a measure of study quality or validity; rather, study quality is dependent on the methods used in the study.

Commenter (12720) notes that the EPA in section 30.5 proposes to consider studies differently based on the availability of the study's data. The commenter states that this proposal has no scientific basis as availability of data has not been empirically shown to affect the quality or validity of a study. The commenter states that, as public availability of data or access to data have not been identified in the scientific literature as factors that have any bearing on the quality or validity of science, these criteria should not be used by EPA to give greater consideration to particular studies.

²⁸⁶⁹ Jeremy Berg, Philip Campbell, Veronique Kiermer, Natasha Raikhel, and Deborah Sweet, Joint Statement on EPA Proposed Rule and Public Availability of Data, *Nature* (Apr. 30, 2018) (attached to comment letter), available at <https://www.nature.com/articles/d41586-018-05026-y>.

Commenter (14397) states that this SNPRM approach improperly makes openness the primary factor, or one of the primary factors, in weighing which studies to use, when robust scientific analysis calls for priority being given to studies that fit the accepted hierarchy of evidence²⁸⁷⁰ and that follow basic scientific recommendations as to control, randomization, sample size, peer review, etc. The commenter states that studies should be considered or rejected based on their adherence to the appropriate scientific standards and the importance of their findings, not on their manner of dealing with CBI or PII, when presumably they have already been properly peer reviewed.

Commenter (12715) asserts that the use of Good Laboratory Practice protocols or other protocols where data are publicly available does not necessarily mean that the study is of higher quality or that it has evaluated the effects that are most relevant for decision-making, and there is no scientific reason that the data generated under the highly circumscribed regulatory requirements for product registration should receive greater weight than any other valid scientific data.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenters (11408, 11479) state that the demand for obtaining the raw data related to EPA rulemaking does not appear to be significant and would not justify the excessive burden it would place on the Agency. The commenter states that one study, which looked at the 79 requests made between 2002 and 2012 through the Information Quality Act to EPA that asked the Agency to correct or reconsider the data supporting its regulatory decisions, found only two

²⁸⁷⁰ Burns, P. B., Rohrich, R. J., & Chung, K. C. (2011). The levels of evidence and their role in evidence-based medicine. *Plastic and reconstructive surgery*, 128(1), 305-310. <https://doi.org/10.1097/PRS.0b013e318219c171>.

requests asking for the raw data.²⁸⁷¹ The commenter states that one possible explanation for this low number is that the public already has access to the science the EPA relies on and can fully access methods, summary data, results, and interpretations, as can all peer reviewers. The commenter states that in developing the NAAQS, for example, the EPA collects all relevant data and studies used to develop the Integrated Science Assessment and the merits of those scientific studies are publicly debated by the Clean Air Scientific Advisory Committee and pollutant review panel. The commenter states that the need for access to raw data is entirely unnecessary and arbitrarily precludes the use of critical studies.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenters (11403, 11498, 11576, 12718) object to the proposal package and assert that access to raw data is not determinative of the quality of the research.

Commenter (11403) asserts that public availability of raw data is not a rational metric for deciding whether a study is of high enough quality to be used for setting thresholds or enacting regulatory protections. The commenter states that the EPA must ensure that it uses high quality data to analyze environmental justice impacts vulnerable populations, regardless of the public availability of the raw data.

Commenter (11498) contends that there are credible procedures for testing results and verifying outcomes with methodologies that do not require access to raw data. The commenter states that

²⁸⁷¹ Goldman, L.R. and E.K. Silbergeld. 2013. Assuring Access to Data for Chemical Evaluations. *Environmental Health Perspectives*, 121:149-152, doi:10.1289/ehp.1206101. Online at <https://ehp.niehs.nih.gov/1206101/>. Accessed June 24, 2018.

the original proposed rule and now this SNPRM are de facto rejecting credible practices used by the scientific community and replacing them with a non-scientific metric in the evaluation of a study beyond its immediate quality. The commenter states that, as the EPA's own Scientific Advisory Board has stated, this decision risks politicizing science by using an unscientific standard to assess the validity of science.

Commenter (11576) states that there is no need to limit consideration of reliable science simply because the underlying data is not publicly available. The commenter states that less than 30 percent of scholarly literature is open-access, and only a small fraction of these include access to underlying raw data.²⁸⁷² The commenter states that journal-specific transition plans to increase access involve long timeframes to accommodate these changes, which are often voluntary options for participating researchers.²⁸⁷³ The commenter states that these open-access programs typically refer only to public access to the published studies themselves rather than to underlying raw data as required in the proposed rule, which is contrary to standard scientific practice.

Commenters (11576, 11920) refer to a joint statement by a group of scientists and editors-in-chief of leading scientific journals which states that "the merits of studies relying on data that cannot be made publicly available can still be judged." Commenters state that the group further noted that scientific studies typically contain all the information required to judge the accuracy and robustness of their findings without access to raw data as scientists are trained in assessing research publications by judging the articulation and logic of the research design, the clarity of the description of the methods used for data collection and analysis, and appropriate citation of previous results.²⁸⁷⁴

Commenter (12718) states that the Multi-Society comments on the SNPRM espouse a principle that must be given careful consideration: "access to raw data is not determinative of the quality of the research."²⁸⁷⁵ The commenter states that the EPA's proposed approach in the SNPRM presumes that access to data or information must be – as an absolute – accessible to EPA officials, even when that level of access might be inconsistent with Institutional Review Board (IRB) requirements, consent statements, or other ethical procedures that should be paramount in government's commitment to its citizens for protecting data and confidentiality.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific

information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Justification of How Availability Impacts Validity

Comment: Commenters (10048, 11408, 11576, 12430, 12727, 12731, 13788) express concern that the EPA has not provided any justification as to how or why the availability of confidential information or PII may impact the validity of data, studies, and models.

Commenter (11576) states that, while the EPA argues the proposed rule will strengthen the quality of the Agency's science, it points to no evidence to support that statement. The commenter states that, instead, the evidence shows that the rule's emphasis on data availability rather than accuracy will actually weaken the body of evidence available to the Agency. The commenter states that, while full consideration of the range of observations reported in peer-reviewed scientific literature provides a method for comprehensively estimating trends, means, and variances in data, arbitrarily omitting studies can result in skewed interpretations.²⁸⁷⁶

Commenter (12430) states that the EPA does not articulate, let alone provide, any basis for alleging that the scientific community's established practices are faulty or inadequate. The commenter states that, nonetheless, it would replace these practices with a single threshold requirement: public availability of the underlying data. The commenter states that the fact that the proposed rule is at odds with EPA's and the scientific community's established practices—as underscored by the many unique, substantive comments submitted in opposition to the rule

²⁸⁷⁶ See, e.g., Hans C. van Houwelingen, Lidia R. Arends, and Theo Stijnen, *Advanced Methods in Meta-analysis: Multivariate Approach and Meta-regression*, *Statistics in Medicine* (Feb. 28, 2002) (attached), available at <https://onlinelibrary.wiley.com/doi/abs/10.1002/sim.1040>; Matthias Egger, et al., *Meta-analysis: Principles and Procedures*, *BMJ* (1997), available at <https://www.bmj.com/content/315/7121/1533>; Koricheva, J., Gurevitch, J., and Mengersen, K., *Handbook of Meta-analysis in Ecology and Evolution*, Princeton University Press (2013).

by scientists, scientific organizations, and scientific journals—suggests that the EPA intends for the SNPRM to advance political priorities rather than the quality of science the Agency uses.

Commenter (12727) indicates that EPA has not demonstrated—and cannot demonstrate—that a study cannot be scientifically valid unless the underlying data and models are publicly disclosed. The commenter states that mechanisms are already in place to validate studies for which disclosure of underlying data and models is either illegal or impracticable.

Commenter (12731) states that researchers do not make data public to improve the strength or quality of their findings, and the EPA has offered no evidence to suggest that studies with publicly available underlying data are more likely to represent strong science than studies without such data availability.²⁸⁷⁷ The commenter asserts that, like the original proposal, the SNPRM lacks any demonstration that the public unavailability of a study’s underlying data or models necessarily—or even likely—renders the study invalid or unreliable. The commenter states that the proposal failed to identify an actual problem that needed to be addressed, or to point to even a single example of an EPA action or rulemaking that was later found to be defective because it rested on a study for which data was not publicly available.²⁸⁷⁸

Commenter (13788) contends that the basic premise of this rulemaking is that public health data—including human health data—has to be made publicly available to ensure the validity of scientific studies. The commenter states that this premise is completely unsupported and totally incorrect. The commenter states that the Agency’s long standing position is that “[w]hether research data are fully available to the public or available to researchers through other means does not affect the validity of the scientific conclusions from peer-reviewed research publications.”²⁸⁷⁹ The commenter states that the EPA fails to explain why it now believes the contrary—that study validity and public data availability are (or should be) connected.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality

²⁸⁷⁷ EDF 2018 Comments at 73.

²⁸⁷⁸ EDF, Comments on the Environmental Protection Agency’s Proposed Rule: Strengthening Transparency in Regulatory Science, Docket ID No. EPA-HQ-OA-2018-0259-9227, at 64 (Aug. 16, 2018) (“EDF 2018 Comments”).

²⁸⁷⁹ EPA, Plan to Increase Access to Results of EPA-Funded Scientific Research, at 4-5 (Nov. 29, 2016).

guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

7.1.2.3.2 Approaches to Validity Other Than Raw Data

Comment: Commenters (10866, 11377, 11400, 11489, 12403, 12731) note that the proposal package calls for underlying data and models to be “publicly available in a manner sufficient for independent validation.” These commenters object to the proposal package and generally assert that such independent validation is not the only means of determining credibility of studies.

Commenter (10866) states that the EPA fails in making its proposal to acknowledge that research studies can be both evaluated and replicated without the release of such individual data. Commenter (11377) asserts that transparency can be achieved in different ways that satisfy the demands of different kinds of science, while still maintaining respect for persons and intellectual property. Commenter (11489) states that, in cases where it is not appropriate for data to be made publicly available, there are other mechanisms intrinsic to the scientific process for substantiating the relevance and validity of research results. Commenter (12403) states that the proposed rule is not necessary to allow for independent validation of scientific studies and it would undermine existing successful science-based policy making. Commenter (12731) notes that comments on the original proposal demonstrate that mechanisms are already in place to validate studies for which disclosure of underlying data and models is either illegal or impracticable.²⁸⁸⁰

Response: The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Comment: Commenter (11378) contends that the integrity of much environmental and health research requires the tradeoff that certain business, proprietary, and PII remain confidential. The commenter states that making such information publicly available would potentially violate long-standing human subjects research protocols (i.e. the 1974 National Research Act), as well as legally binding proprietary data agreements.

Commenter (11926) asserts that the notion that the public release of raw data is a protection against fraud, or the generation of misleading results is also flawed. The commenter states that there are instances in which an unscrupulous researcher alters or even fabricates data to fit a

²⁸⁸⁰ EDF 2018 Comments at 64-66, 70-74.

preconceived hypothesis, however, there is no way to tell from the data itself that it is not accurate. The commenter states that this is why the weight of evidence, replication of findings from multiple sources, and peer review by scientific journals are so important—these factors, not the public availability of raw data, are the main safeguards against flawed or fraudulent science.

Commenter (13788) states that the EPA provides no explanation as to why those policies are not sufficient to allow validation of scientific studies and information relied on by the Agency. The commenter states that simply stating that “EPA shall conduct independent peer review on all pivotal regulatory science used to justify significant regulatory decisions and on all pivotal science underlying influential scientific information, consistent with the requirements of the Office of Management and Budget (OMB) Final Information Quality Bulletin for Peer Review,” fails to explain why this does not already occur under the Agency’s past and current practice. The commenter contends that, if validation is truly the aim of this rulemaking, the EPA must explain why existing practices for peer review are insufficient to validate scientific studies.

Response: As discussed in Section III.B of this preamble, based on a consideration of the public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. The EPA is also further clarifying how the Agency will determine the consideration to afford to pivotal science in either significant regulatory actions or influential scientific information for which the conclusions are driven by the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect.

Consistent with existing Agency practice, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information. The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information:

- Soundness – The extent to which the scientific and technical procedures, measures, methods or models employed to generate the information are reasonable for, and consistent with, the intended application.
- Applicability and Utility – The extent to which the information is relevant for the Agency’s intended use.
- Clarity and Completeness – The degree of clarity and completeness with which the data, assumptions, methods, quality assurance, sponsoring organizations and analyses employed to generate the information are documented.
- Uncertainty and Variability – The extent to which the variability and uncertainty (quantitative and qualitative) in the information or in the procedures, measures, methods or models are evaluated and characterized.
- Evaluation and Review – The extent of independent verification, validation and peer review of the information or of the procedures, measures, methods or models.

When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and

rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science (see Section III.E).

Comment: Commenters (10040, 10748, 11480) suggest the Agency rely, in part, on well-established principles for good science such as disclosure of conflicts of interest.

Commenter (10040) urges the EPA to withdraw its proposal to restrict scientific research and follow the current, effective measures in place to ensure the use of robust, uncensored scientific research to protect the health of our citizens and our communities. The commenter states that existing protections are in place to protect and assure the quality of the science used in the process of EPA's regulatory decision making.

Response: Consistent with existing Agency practice, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information. The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information:

- Soundness – The extent to which the scientific and technical procedures, measures, methods or models employed to generate the information are reasonable for, and consistent with, the intended application.
- Applicability and Utility – The extent to which the information is relevant for the Agency's intended use.
- Clarity and Completeness – The degree of clarity and completeness with which the data, assumptions, methods, quality assurance, sponsoring organizations and analyses employed to generate the information are documented.
- Uncertainty and Variability – The extent to which the variability and uncertainty (quantitative and qualitative) in the information or in the procedures, measures, methods or models are evaluated and characterized.
- Evaluation and Review – The extent of independent verification, validation and peer review of the information or of the procedures, measures, methods or models.

When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will

identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science (see Section III.E).

Comment: Commenter (11390) states that the SNPRM's approach would, in a wide range of circumstances, replace the EPA's existing, successful protocols—already in step with established scientific procedures—with a process driven by arbitrary, non-scientific gatekeeping.

Commenter (12702) states that the EPA has established existing protocols and statutory requirements for the rigorous scientific review for any rulemakings, and those requirements are not tied to whether the data are publicly available. The commenter states that, thus, robust peer review, can, and sometimes should, proceed without the publication of sensitive or confidential data. The commenter urges the EPA to ensure that any final rule is consistent with the scientific journal standards cited in the rule.

Response: As discussed in Section III.B of this preamble, based on a consideration of the public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. The EPA is also further clarifying how the Agency will determine the consideration to afford to pivotal science in either significant regulatory actions or influential scientific information for which the conclusions are driven by the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect.

Consistent with existing Agency practice, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information. The EPA is, therefore, finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and EPA's Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

Comment: Commenters (11387, 11395, 11890, 11926) suggest that there is no need for this rule as mechanisms exist for researchers to share data in order to confirm and validate studies.

Commenters (11387, 11890) suggest that researchers in one institution can transmit data in a confidential manner to researchers in one or multiple other institutions so the data can be evaluated and analyzed in a completely new and different analysis. The commenters assert that

this allows the study to be confirmed and validated, while still maintaining privacy protections of the people in the study.

Commenter (11395) states that, as discussed in comments on the proposed rule submitted by a large group of scientists²⁸⁸¹ in August 2018, representatives of academia, medical scientists, industry and publishers have developed protocols and guidelines specifically designed to improve reporting and evaluation of studies to improve the quality and transparency of the interpretation of findings. The commenter states that these protocols and guidelines are designed to improve the scientific basis of data evaluations without requiring public access to all study data. The commenter states that the EPA should utilize these existing tools to evaluate study quality and should build on the work already done by the scientific community.

Commenter (11890) states that, in order to honor study commitments to participants to guard their privacy and laws governing CBI and intellectual property, this could best be accomplished by a data sharing agreement with a trusted third party that agrees to uphold confidentiality of the study data. An example of this model is the Health Effects Institute reanalysis of Harvard's "Six Cities" Study and the American Cancer Society's "Study of Particulate Air Pollution and Mortality."

Commenter (11926) states that one approach is the establishment of data enclaves, in which an independent expert can access the raw data for statistical analysis, generate results to replicate the original findings and perform additional analyses, without taking possession of the data itself. The commenter states that the technology to create a secure data enclave is well-established, and many examples exist. The commenter states that this approach allows rigorous independent assessment of the raw data without compromising the sensitive information provided by human subjects.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (11489) expresses concern that the SNPRM does not address other mechanisms that could be used to give the EPA confidence that the findings should be considered in rulemaking. The commenter states that such mechanisms include comparing outcomes of several trials from different groups that reach the same conclusions and vetting the science through expert scientific panels convened for this purpose. The commenter states that

²⁸⁸¹ Comments from Academics, Scientists and Clinicians on the EPA Proposed Rule "Strengthening Transparency in Regulatory Science" (August 2018). Submitted online via Regulations.gov to docket EPA-HQ-OA-2018-0259 <https://prhe.ucsf.edu/sites/g/files/tkssra341/f/wysiwyg/2018%2008%2016%20Transparency%20in%20Science%20UCSF-PRHE%20comments%20EPA.pdf>.

these mechanisms are especially important for past studies where the underlying datasets may be unsuitable or unavailable for public review. The commenter also asserts that the public notice and comment period provide an opportunity for the Agency to communicate the scientific research that supports its proposal.

Response: When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science (see Section III.E).

Comment: Commenters (10040, 10339, 10973, 11378, 11395, 11399, 11480, 11489, 11498, 11926, 12404, 12430, 12617, 13788, 14397) suggest that peer review is an appropriate mechanism to determine the validity of studies.

Commenter (10040) asserts the use of peer-reviewed research is the foundation for EPA's decision making. Commenter (11378) encourages the EPA to utilize the most appropriate, scientifically peer-reviewed research to guide the development of environmental regulations and scientific information. Commenter (11399) states that additional "independent validation" that goes above and beyond the peer review process and the EPA existing science advisory infrastructure is not necessary to assure scientific validity and accuracy.

Commenter (10339) expresses concern that the Agency provides no evidence that the EPA decisions have been misled by the use of data published in the peer-review literature. The commenter suggests that the stated reason for this rule lacks scientific justification and credibility.

Commenter (10973) states that the EPA often appropriately publishes research through peer-reviewed journals. The commenter states that, ensuring that the Agency makes this information publicly available, whether through open access journals (or open access options within traditional journals), pre/post-prints, publicly available data, or some other method or combination of methods would help assure that all of EPA's processes can align to this policy and be of the greatest utility to all who may benefit.

Commenter (11395) asserts that risking re-identification by increasing access to study data is not necessary, given the availability of data to other scientists through National Institute of Health (NIH) repositories and peer-review journals, and the alternative techniques available to verify conclusions of scientific studies. The commenter states that, under the proposed rule, a peer reviewed study that has been replicated many times by different investigators using different data

may be excluded from consideration, while one that uses an inferior database that is publicly available would be included.

Commenter (11489) states that the incorporation of conclusions from peer-reviewed, quality science is critical to the integrity and effectiveness of the EPA's regulatory and rulemaking processes and its mission "to protect human health and the environment."

Commenter (11498) states that the model of down-weighting research maintains the major flaw in deeming data that cannot be made completely public – for legitimate and legal reasons to protect the privacy of health and CBI – less scientifically valid or valuable. The commenter states that it mischaracterizes the scientific process and the range of mechanisms for disclosing and protecting scientific research results for decision-making, implying that peer-reviewed scientific research data that are not available in its raw form is not rigorous enough for use in policy; this is simply not true. Commenter (11480) states that much of the proposal hinges on data availability, which the Agency appears to erroneously conflate with accuracy instead of relying on well-established principles for good science, such as peer review.

Commenter (11926) states that a key factor used in assessing research findings is publication in a peer-reviewed journal. Commenter (12617) states that peer review includes the evaluation of the authors' study design, research questions, methods, results, data presentation, interpretation, and conclusions. Commenter (12404) states that the proposed exclusion from consideration of any study for which underlying data are not made publicly available is not consistent with sound scientific practice because the scientific community uses other tools to validate studies without access to all underlying "raw data" including peer review. Commenter (13788) states that the EPA has long relied on peer review and already has extensive policies in place regarding influential scientific information to assess the quality of the scientific research.²⁸⁸²

Commenter (14397) asserts that the standard process of peer review already ensures that the underlying research data and models used in scientific decision making "are publicly available in a manner sufficient for independent validation" and ensures that these studies adhere to the appropriate standards of transparency, repeatability, accuracy, appropriateness of data, and explain all assumptions included in the research. The commenter states that the internationally accepted peer review system already includes mechanisms for excluding CBI and PII. The commenter states that, for these reasons, the EPA's proposal is unnecessary and purports to solve a problem that does not exist.

Commenters (11395, 12404, 12617) suggest there are several mechanisms available for validating studies, including reanalysis, replication, and reproduction of data, which do not require access to all underlying raw data. Commenters (11395, 12404) state that available tools include replication of a study using the same methodology but different data sources and/or reproduction of a study's conclusions using different methodologies and data. Commenter (11395) states that, under the proposed rule, a study that has been replicated many times by

²⁸⁸² EPA, Peer Review Handbook, (October 2015), https://www.epa.gov/sites/production/files/2016-03/documents/epa_peer_review_handbook_4th_edition.pdf.

different investigators using different data may be excluded from consideration, while one that uses an inferior database that is publicly available would be included.

Response: The EPA finds that comments received from the 2018 proposed rule and the 2020 SNPRM have merit, in part. In some cases, prior peer review or publication may be adequate, in which case initiating a new peer review may unnecessarily delay the EPA's development of a significant regulatory action or influential scientific information. However, as detailed in OMB's Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states, that "the intensity of peer review is highly variable across journals" and "prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary". Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule. The EPA also agrees with commenters that the scientific community and government agencies are making great strides in data transparency; however, improvements can still be made over existing policies and mechanisms. Many scientific publications, for example, require authors to make a data availability or data access statement, which discloses where and under what conditions the underlying study data are available. Yet the EPA cannot solely rely on data availability statements made in published research because initiatives toward greater data sharing and transparency amongst scientific journals and international organizations are still being implemented, are inconsistently enforced, and the true accessibility of data in a public repository is still limited.

Comment: Commenters (10748, 11926) support a weight of evidence approach. Commenter (10748) states that it is the replication of the science and weight of evidence of numerous – sometimes hundreds – of studies that actually influence scientific opinion.

Commenter (11926) states that, in addition to the weight of evidence from multiple domains, regulators have also examined consistency in findings from independently conducted studies. The commenter states that, in the case of humans, the finding that a chemical agent is harmful becomes more compelling as studies conducted by unrelated investigators, using different subject pools, all point to the same conclusion.

Commenter (11926) contends that the proposal ignores the history of science-based government regulation, which has always been based on the weight of evidence obtained from a variety of sources: laboratory-based chemical and biological (test-tube) analysis, laboratory-based testing on non-human animals, and observational research of human subjects. The commenter states that an example is the weight of compelling evidence from multiple sources that led to the regulation of tobacco marketing and distribution; as is well-known, research in all of the above domains established the fact that use of tobacco products caused cancer, a variety of other diseases, and early death.

Response: The EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. As further described in Section II.B, the EPA is

focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or more pollutants, contaminants, or substances are integral to the Agency's mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. In addition, the data underlying the dose-response assessment are more distinct than the broad range of data informing an entire risk assessment. Therefore, the EPA is concentrating its current efforts to increase transparency on a well-defined step in the quantitative assessment of risk supporting specific Agency actions. This final rule provides an important step in furthering the progress already being made toward maximizing transparency and will provide important insight for developing future statute-specific requirements.

Comment: Commenter (12617) states that scientific understanding progresses by researchers performing studies related to others in their field, by questioning one another's methods, by updating or expanding upon their own work or that of others. The commenter states that it also progresses by scientists performing systematic reviews and meta-analyses to understand large bodies of research. The commenter states that poorly designed studies and unsupported conclusions are called out by others without needing someone to recreate every step of data processing, analysis, and calculation for every study.

Response: The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the public's access to the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety.

The EPA's attention to data transparency is also responsive to the broader interest in greater data transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members of the public, scientific community, and Congress on the transparency of the scientific basis for EPA's decisions in previous influential scientific information assessments and regulatory actions (Refs. 19, 20, 21, 22, 23). The EPA's continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency's decisions.

Comment: Commenters (11915, 12454, 12596) see merit in both the Tiered Access Option and Consideration Option.

Commenters (12454, 12596) suggest the final rule should combine both approaches to establish a procedural transparency assessment framework robust enough to inform the Administrator of scientific transparency in the course of using policy-making authority. The commenters state that such a framework should be premised on the Consideration Option's reliance on policymaking consideration while also leveraging the Tiered Access Option's appreciation of different levels of transparency. The commenters state that general tiers of access – broadly speaking, full public access, restricted researcher access, and little outside access – can be used to establish a procedural transparency assessment framework that signals the extent to which a study's transparency supports its conclusions or, alternatively, introduces uncertainties into its

methodology. The commenters state that this framework would serve to highlight those studies that deserve greater consideration based on the transparency of their underlying data and models.

Commenter (12596) states that the procedural transparency assessment framework outlined in these comments would inherently mitigate concerns that transparency requirements could lead to the disclosure of sensitive information. The commenter states that, under the process described herein, the EPA would generally not be in the position of disclosing data and models. The commenter states that researchers would instead be incentivized to disclose this information in order to improve their studies' transparency assessments.

Commenter (12596) suggests that the final transparency rule can be effective without, as suggested by the Tiered Access Option, dictating when the Agency will consider a study in CAA rulemaking. The commenter states that the Final Transparency Rule can enhance transparency without, as suggested by the Consideration Option, directing how the Agency should consider science in CAA rulemakings. Instead, the Final Transparency Rule can combine both approaches to establish a procedural transparency assessment framework robust enough to inform the Administrator of scientific transparency in the course of using policy-making authority under the CAA. The commenter states that such a procedural transparency assessment framework, authorized only by the Federal Housekeeping Statute, would exist separate from the specific statutory and regulatory processes already established for reviewing science under the CAA. The commenter states that, as such, the EPA should implement the framework in a manner that complements, and does not interfere with, these processes, with the goal of better informing final policy outcomes. The commenter states that, at the same time, assessments resulting from the framework should be formatted in a manner that is readily accessible not only to the Administrator, but also the general public. The commenter suggests that the EPA can accomplish these objectives through a "Transparency Scoring System."

Commenter (12596) explains that, under this System, each study covered by the Final Transparency Rule would be given a score based on the ability of outside parties to assess the study's underlying data and models. The commenter states that the scoring parameters would be based largely on categorization as outlined by the Tiered Data Option. The commenter states that, borrowing from the Consideration Option, the Administrator would then have the ability to use this score when considering studies in the rulemaking process. The commenter states that the EPA could make this system simple or more complex, depending on how the Agency feels it would be best implemented. The commenter states that a simpler approach would assign basic "whole number" transparency scores to studies, for example:

- Transparency Score 3: Study's authors make all data and models publicly available.
- Transparency Score 2: Study's authors make a majority of data and models publicly available.
- Transparency Score 1: Study's authors make a majority of data and models only available for review by select outside researchers.
- Transparency Score 0: Study's authors make less than a majority of data and models available for review by select outside researchers.

Commenter (12596) states that the EPA could also choose to implement a slightly more complex Transparency Scoring System, to address more specific scenarios, by incorporating “interval scores.” The commenter states that, for example, if all of a study’s data and models were made public, but sufficient contextual information to fully replicate the study (such as underlying assumptions) was not made available, the score could be 2.75 (or some other appropriate interval). The commenter states that the final rule could provide for guidance to address the details of various intervals. The commenter states that, in assessing these specifics, the EPA’s guiding principle should be to implement a balanced and workable procedural transparency assessment framework. The commenter states that, on the one hand, the framework should reflect the variables implicating transparency, even if that tends towards a more complex system. The commenter states that, on the other hand, the framework should not be so burdensome that it inhibits rulemakings. The commenter states that, either way, the Final Transparency Rule needs to either address or provide for guidance on key underlying issues.

Response: As discussed in Section III.B of this preamble, based on a consideration of the public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. The EPA is also further clarifying how the Agency will determine the consideration to afford to pivotal science in either significant regulatory actions or influential scientific information.

Further, the EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

7.1.2.4 International Concerns

Comment: Commenters (11395, 11496, 11890, 11894, 12404, 12405, 12727, 12731) express concern that the EPA has not described how science from other countries would be incorporated.

Commenter (11890) states that researchers in other countries could not hand over private information to unauthorized people. The commenter states that data-sharing agreements do not allow sharing personal health data even with trusted friends.

Commenter (11894) states that seven recent North American studies were done using Canadian cohorts, for which access is extremely limited. The commenter states that access is also highly limited for all ten of the European studies under the EU General Data Protection Regulation. The commenter states that the EU requires that all PII data must be controlled by a data controller, who must show that any use of the data has been consented to by the individuals involved.

Commenter (11894) states that 30 of the 40 plus cohort studies of PM and mortality listed in the Integrated Science Assessment (ISA) for Particulate Matter (December 2019) could not be considered at all in the first version of 30.5. The commenter states that, under the alternative, 25 of them could not be given full consideration. The commenter states that this illustrates how arbitrary the SNPRM is, and indicates the proposal violates CAA section 108 (a)(2), which defines air quality criteria, among other things, as “the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such air pollutant in the ambient air.” The commenter states that it is possible to say with a straight face that the Medicare studies, which have a statistical power orders of magnitude greater than any previous PM epidemiologic study, are not “useful” in identifying the effects of PM_{2.5} in the ambient air; yet the SNPRM would either bar them from consideration or a priori downgrade their worth.

Commenter (12404) state the proposed rule and SNPRM place an undue burden on private companies that have invested in REACH (Registration, Evaluation and Authorization of Chemicals) registration. The commenter states that, in order to register a chemical under the European REACH program so that it can be used in commerce in Europe, private sector companies have to conduct studies of their chemicals (most of these are animal or in vitro studies) and submit them to the European Chemicals Agency (ECHA). The commenter states that these studies are expensive to conduct and are considered by the companies who do so to be an investment for the purpose of gaining access to the European market. The commenter states that robust summaries of these studies are available to the public, but data, associated protocols, computer codes and models, recorded factual materials and detailed descriptions of how to access and use such information are usually not made available to the public. The commenter states that one reason for this, is that companies spend a lot of money to develop these materials. The commenter states that requiring information developed at some cost to be made public in this way could give competitors access to the European market without having to make similar expenditures; thereby giving competitors an unfair advantage. The commenter states that the EPA relied on 20 ECHA Robust summaries for its risk evaluation of Pigment Violet 29 under TSCA and on five ECHA Robust summaries for its risk evaluation of 1-Bromopropane. The commenter states that the EPA would not be able to do so under this rule.

Commenter (12405) states that international studies raise additional challenges because participants are protected by European Union (EU) law. The commenter states that, going forward, an EU study’s compliance with the proposed rule will need to be reconciled with the new General Data Protection Regulation,²⁸⁸³ which is seen as more restrictive than the United States’ Health Insurance Portability and Accountability Act (HIPAA). The commenter states that it is clear that many studies involving people located in the European Union (EU) will have a difficult time both complying with the new directive and providing enough information to EPA to be considered. The commenter states that studies coming from other countries are vital to health determinations in the United States because people in other countries are exposed to chemicals at different rates than in the U.S. The commenter states that the inability to review and use international research in determinations will guarantee the EPA is missing major findings and important data.

²⁸⁸³ Council Directive 2016/679 2016 O.J. (L119) 1, 88 (EC).

Commenter (12731) refers to comments submitted by Bernard Goldstein of the Environmental Protection Network for the SAB's August 2019 consultation. The commenter states that Goldstein's comments pointed to the example of a 2010 study on the effects of formaldehyde exposure that had 34 co-authors from seven different institutions and three different countries.²⁸⁸⁴ The commenter states that Goldstein observed that sharing the underlying data from that study would potentially require the unanimous agreement of all 34 co-authors, many of which answer to different IRBs that must approve such sharing, and some of whom are subject to different privacy laws than those that apply in the United States.²⁸⁸⁵ The commenter states that, as Goldstein also observed, "international studies with or without significant U.S. collaboration are becoming an increasing percentage of total environmental health research. The commenter suggests that one of the inevitable outcomes of EPA's proposal is a cumbersome barrier to being able to put together a team of international investigators for studies of humans that are potentially relevant to EPA's environmental regulations"²⁸⁸⁶ The commenter states that neither the original proposal nor the SNPRM meaningfully considers this critical question and the implications that it poses for EPA's ability to consider regulatory science.

Commenter (12727) notes the possible limitation of use of international studies due to international barriers. The commenter references Bernard Goldstein's comments to the SAB, who pointed to the example of a 2010 study on the effects of formaldehyde exposure that had 34 co-authors from seven different institutions and three different countries.²⁸⁸⁷ According to the commenter, Goldstein observed that sharing the underlying data from that study would potentially require the unanimous agreement of all 34 co-authors, many of which answer to different IRBs that must approve such sharing, and some of whom are subject to different privacy laws than those that apply in the United States.²⁸⁸⁸ The commenter states, as Goldstein also observed, "international studies with or without significant U.S. collaboration are becoming an increasing percentage of total environmental health research. Isn't one of the inevitable outcomes of EPA's SNPRM a cumbersome barrier to being able to put together a team of international investigators for studies of humans that are potentially relevant to EPA's environmental regulations?"²⁸⁸⁹ To the commenter, neither the Proposal nor the SNPRM meaningfully considers this critical question and the implications that it poses for EPA's ability to consider regulatory science.

Commenter (11395) reiterates the International Society for Environmental Epidemiology's comments on the Proposal that the Canadian Community Health Survey Cohort and the Evaluation Study of Congestive Heart Failure and Pulmonary Artery Catheterization Effectiveness (ESCAPE) are unlikely to meet the requirements of the rule due to stringent

Canadian and European privacy laws and thus be excluded or devalued.²⁸⁹⁰ Failing to consider these and similar studies, according to the commenter, would limit the breadth and quality of information available to EPA for critical decisions.

Response: The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals and the emergence of organizations, such as the Center for Open Science, and international initiatives like Findable, Accessible, Interoperable, and Reusable (FAIR) data principles; Facilitate Open Science Training in European Research (FOSTER); and Guidelines for Transparency and Openness Promotion (TOP) in Journal Policies and Practices that incentivize greater transparency in research. The EPA supports these efforts and is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements.

Further, the EPA cannot solely rely on data availability statements made in published research because initiatives toward greater data sharing and transparency amongst scientific journals and international organizations are still being implemented, are inconsistently enforced, and the true accessibility of data in a public repository is still limited.

7.1.2.5 Implementation Issues

7.1.2.5.1 Breach of Contract

Comment: Commenter (11576) states that relationships with hospitals and other medical facilities rely on the confidentiality agreed upon by both researchers and the medical network. The commenter states that, in instances where the EPA is requiring private medical information to be disclosed in order for scientific studies to be used for decision-making purposes, the risk of breach of contract is not addressed in the SNPRM. The commenter states that such agreements cannot be easily renegotiated, especially for existing published studies and data.²⁸⁹³ The commenter states that the alternative proposal provided in the SNPRM does not address situations where researchers would be contractually precluded from releasing confidential information and does not offer a solution for data that cannot be contractually released. The commenter states that, even under a tiered-access approach, the EPA could effectively ignore

such data and the EPA fails to provide a solution for considering such studies and underlying data under the tiered-access scenario.

Response: When promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data, the Agency shall follow best practices to evaluate potential links between exposure to a pollutant, contaminant, or substance and the effect and the nature of the dose-response relationship.

The Agency shall also give greater consideration to pivotal science based on dose-response data that include CBI, proprietary information or PII if these data are available through restricted access in a manner sufficient for independent validation. For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.9. The Agency will identify the pivotal science that was given lesser consideration and provide a short description of why lesser consideration was given.

7.1.2.5.2 Description of the Structure for Implementing the Rule

Comment: Commenters (11192, 11361, 11890, 11919, 12617, 12720) express concern that the proposal does not identify a structure within which to implement the rule.

Commenters (11890, 12720) contend the proposal should not move forward until it is updated with supporting analysis and reposted for public review.

Commenter (11890) states that it appears that the EPA is still gathering ideas for how the goals of the rule might be achieved. The commenter states that it is unclear whether the rule intends to create a passive system where the data owner only provides data if requested or an active system that will require submission and storage data being considered in a science assessment or rule. The commenter states that the proposal does not specify how the EPA proposes to screen studies that would be subject to the new requirements, determine who owns the data for a given study, and request access to data from authors or institutions. The commenter states that there is no structure given for how this new rule would make data models publicly available that are protected by intellectual property and possibly patent laws. The commenter states that the rule is also silent on how and where data would be stored and protected, how the data would be shared, with whom, how much this would cost, and who would pay for it.

Commenter (12720) states that because the proposal does not include consideration of the questions listed below, it should be withdrawn. The commenter asks:

- How will the EPA ensure that studies are considered in perpetuity if it does not constantly verify and re-verify that underlying data and models remain publicly available (e.g., if journal open-access policies were to change)?
- Who at the EPA will certify that a study's underlying data and models have been made "available" so as to satisfy the requirements of the rule?
- When will such a determination be made, since weeks and months can elapse between when a paper is accepted to when it is formally published?

- What contingency has the EPA planned in the case that there arises a need to verify that all (rather than a portion) of a study's underlying data has been made, and who at EPA would be qualified to make that determination?
- If requests for data access are granted, would study data be provided only to the requestor, or made available to a broader group?
- How would the EPA ensure that anyone with access to the data make appropriate use of it, and not share it with other individuals or groups?

Commenter (12720) refers to the 2020 SAB Letter to the Administrator which suggests a mechanism for interested researchers to access datasets for reanalysis.²⁸⁹⁴ The commenter states that it is not clear who would staff such a committee and draft protocols. The commenter states that the protocols themselves are likely to conflict (or at the very least, intersect) with existing, signed agreements for many studies, including major cohort studies that involve large participation. The commenter states that, as a result, such a proposal for an added layer of federal scrutiny and approval over academic studies introduces unwieldy and impractical restrictions on already well-functioning systems. The commenter states that the proposal does not address these. Commenter (12720) states that the EPA has not indicated whether or not the Agency would provide the underlying data or simply link to it. The commenter states that the EPA has not made it clear whether any Agency-initiated cleaning or transformation of the data would be publicly available.

Commenter (10042) urges the EPA to:

- Define, clarify and specify the limitations of transparency when used by the EPA.
- Determine who outside the EPA in the rulemaking process will have access to human health information and data and when in the process those non-EPA personnel will contribute to human health risk assessments.
- Codify its approach for how, when and under what circumstances it will use human health data and information in and for rulemaking and setting standards.
- Adopt and develop SOPs for managing human health data and information which will likely have a strong anonymization component that can or will be used to make human health risk assessments.
- Establish the criteria for revisiting previously conducted human health risk assessments for which human clinical health information and data were collected.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data

²⁸⁹⁴ The letter notes that “Some of the major cohort studies, such as the Women’s Health Initiative (WHI) (National Heart, Lung, and Blood Institute, 2020) or the Atherosclerosis Risk in Communities (ARIC) Study (ARIC Investigators, 1989), require researchers to write a manuscript proposal, study design or protocol – in effect, a document describing the study they intend to conduct, including data that are required and the rationale behind the study (Prentice et al., 1998; ARIC Investigators, 1989). The proposal is reviewed by a committee and, in most cases, is either approved without modification or returned to the investigators to address specific issues. It is possible that the EPA could work with holders of private datasets to develop such study designs or protocols or a similar system of broader applicability. That approach would provide a mechanism for interested researchers to access datasets for reanalysis under appropriate controls where relevant for EPA regulations.”

that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

7.1.2.6 Consistent with the Law and Protects Privacy

Comment: Commenters (11387, 11480, 12457, 13788) express concern that the proposal's requirement to make data publicly available could be in violation of state and/or federal law.

Commenter (11387) contends that the proposed rule would require all studies used by EPA to have all their data publicly available on an internet website. The commenter states that putting study data on the internet could be in violation of the federal code that requires protection of confidentiality in human subjects research, as well as the HIPAA. Commenter states that, as highlighted in comments by the EPA Science Review Board, requiring public availability of data ignores legitimate confidentiality and privacy concerns.²⁸⁹⁵

Commenter (12457) states that the proposed revisions should include a detailed analysis of how this will impact patient privacy in health-related studies, what additional privacy safeguards will be implemented, and how the EPA will support transparency compliance for health data while also protecting privacy in accordance with HIPAA.

Commenter (13788) notes that the supporting private personal information that the EPA in the SNPRM proposes would have to be publicly released prior to EPA's reliance on public health studies is the kind of information that the EPA itself is generally prohibited from releasing, even when faced with a FOIA request. The commenter states that FOIA exempts "personnel and medical files and similar files the disclosure of which would constitute a clearly unwarranted

²⁸⁹⁵[https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebReportsLastMonthBOARD/2DB3986BB8390B308525855800630FCB/\\$File/EPA-SAB-20-005.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebReportsLastMonthBOARD/2DB3986BB8390B308525855800630FCB/$File/EPA-SAB-20-005.pdf).

invasion of personal privacy.”²⁸⁹⁶ The commenter states that, in the SNPRM, the EPA by contrast makes clear that the information subject to this rulemaking would include “[p]ersonnel and medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.” The commenter states that, not only is this information exempt from FOIA, but Congress passed the Privacy Act of 1974 in order to prohibit agencies from releasing precisely this kind of information. The commenter states that the Privacy Act concerns the release of records, and the definition of “record” explicitly includes medical history.²⁸⁹⁷ The commenter states that requiring public disclosure of information, where EPA itself is prohibited from disclosing it, as the threshold to allowing a study’s use in regulatory decision-making, is not only unjustified, it is absurd.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (11894) states that, in general under EPA practice, if a study is funded via any kind of assistance agreement, the recipient of the funding owns the data. The commenter states that the EPA lacks access to part or all of the data and models in many cases and does not have the authority to provide public access to part or all of the data and models. The commenter states that, if the EPA chooses to constrain its ability to the use of data and models only to those which are publicly available, the system will essentially shut down.

Response: This is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA’s position on data availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make the underlying dose-response data available. Researchers may choose to make more data available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate.

7.1.3 40 CFR 30.5: Option 1

7.1.3.1 Support/Oppose Option 1

7.1.3.1.1 Support Option 1

²⁸⁹⁶ 5 U.S.C. § 552(b)(6).

²⁸⁹⁷ 5 U.S.C. § 552a(a)(4).

Comment: Commenters (10973, 11397, 11401, 11499, 12397, 12410, 12612, 12692, 12712) express general support for the proposed Option 1.

Commenter (10973) states that the EPA's final rule should recognize evolving and historic open data access policies. The commenter states that open data access principles are increasingly, but not uniformly, an expected element of modern research. The commenter states that this is true especially when the research is sponsored by public sources or by prominent private foundations. The commenter states that there is likewise a growing expectation for open data access in the peer-review process and upon publication. The commenter states that, despite this trend, at present only a modest percentage scientific research articles are published in an open access format, and the publication of full data sets and models alongside articles is growing but small. The commenter states that different fields of study face different data constraints based upon privacy, logistical concerns, and other drivers. The commenter states that the "tiered access" model proposed in this version of the rule will help to alleviate some of these concerns.

Commenter (11397) agrees with the Option 1 approach because it provides clear direction to the Agency: do not use pivotal science unless the underlying data and models are available and allow for independent review and scrutiny. The commenter states that this is in keeping with Executive Orders 13777 and 13783, and it also eliminates gray areas and confusion that might exist if the EPA were merely directed by the rule to "give greater consideration" to publicly available data.

Commenter (11401) recommends that any study which has fully open public data can be considered the basis of a regulatory action, assuming of course, that the study supports the action that the EPA wishes to take. The commenter states that studies based on "CBI, proprietary data or PII with tiered access in a manner sufficient for independent validation" could likewise be considered foundational as a basis for regulatory action, but require more oversight and assurance that the system for allowing tiered access is robust.

Commenter (11499) supports the SNPRM's modified regulatory text that provides greater scope to consider studies in which underlying data can be reasonably available through tiered access so that CBI, proprietary data, or PII remains protected while still allowing sufficient opportunity for independent validation.

Commenter (12397) cites the Columbia River Inter-Tribal Fish Commission Consumption Survey (CRITFC 1994) that was conducted in 1991/1992. The commenter states that the calculated Feed Conversion Ratio (FCR) from this study has been the basis of FCR in the States of Washington and Oregon for a number of years. The commenter states that the data underlying the calculated FCR has never been made publicly available for the purposes trying to validate the "given" FCR. The commenter states that uncertainties associated with this study are significant. The commenter states that having this information publicly available would have enabled third parties (such as the regulated community) to understand how the FCR value was derived and to have done its own calculations as to an appropriate FCR, especially for specific tribes and states.

Commenter (12410) tiering access based on clearance levels seems like an appropriate measure to limit exposure of sensitive data. Commenter (12612) states that the tiered approach to data access will increase the functionality of the rule in increasing EPA transparency.

Commenter (12712) states that, with EPA regulations imposing such profound, significant harm to human health, their benefits must be verifiable by independent outside researchers. The commenter supports the modified transparency rule but only on the understanding that: no significant regulatory decision will be made on the basis of pivotal scientific studies that do not at the least ensure what the modified rule calls tiered access to the data, where such tiering is consistent with applicable privacy statutes; however, every attempt will be made to de-identify data to permit wider access to the data. The commenter states that, if tiered access to the data underlying a study cannot for whatever reason be granted to outside researchers, the EPA will not rely on the study for any significant regulatory decision.

Response: The EPA acknowledges and agrees with commenters that there may be pivotal science where the underlying data are not publicly available or available through restricted access. The final rule is limited to dose-response data and, as no studies are categorically excluded from consideration, the EPA will continue to rely on the full body of the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Consistent with the requirements of this rule, the EPA will identify a subset of those studies based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints that would inform a dose-response assessment, and will give greater consideration to pivotal science for which the underlying dose-response data are available.

7.1.3.1.2 Oppose Option 1

Comment: Commenter (9587) states that the EPA's proposed modification gives claims of privacy and/or confidentiality priority over transparency requirements. The commenter states that this modification practically will impose substantial limits on the effect of the rule since privacy, confidentiality, and tiered access are all concepts and practices that inhibit full transparency. The commenter endorses the previous, unmodified transparency requirements, and states that transparency should take priority over privacy and confidentiality in EPA policymaking.

Commenter (11182) asserts that Options 1 renders the SNPRM unfeasible, unethical, and possibly illegal.

Commenter (11500) urges the EPA to finalize the proposal under which unavailable data will not be used. The commenter states that public access to data and models is necessary not only for independent validation, but also for independent scrutiny of the data and methodologies. The commenter states that, if such materials are unavailable, the public is denied a meaningful opportunity for comment.

Commenters (10853, 11354, 11404, 12463) generally oppose proposed Option 1.

Commenter (10853) states that increasing transparency in science is an important goal that the EPA could more productively support by funding and creating data-sharing infrastructure that researchers from all sectors can use. The commenter states that the approaches in the proposed rule are too far downstream in the scientific process; unduly prescriptive; likely to increase costs and reduce supply of useful science; and likely to introduce bias and inefficiency in EPA's process of evaluating and developing regulatory science. Commenter (11404) states that the SNPRM's modified approach of tiered access is insufficient to address privacy concerns.

Response: The EPA disagrees with commenters that the requirements of this rule will result in any meaningful delay in promulgating regulations. While this final rule requires the Agency to evaluate the availability of dose-response data for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review the EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of the studies the EPA would review). Further, with this final rule, the EPA is maintaining language in 40 CFR 30.3 stating that the statutes that the EPA administers, or their implementing regulations, will control in the event of any conflicts with the requirements of this rule. The Agency will continue to comply with and abide by the requirements in those statutes and implementing regulations, including regulatory deadlines.

7.1.3.1.3 Revision of Option 1

Comment: Commenter (12471) suggests that, if the EPA finalizes Option 1, the following modification is offered:

When promulgating significant regulatory decisions or finalizing influential scientific information, the Agency will only use ~~pivotal regulatory science and/or pivotal science that includes~~ studies with restricted data and models (i.e., those that include confidential business information (CBI), proprietary data, or Personally Identifiable Information (PII) that cannot be sufficiently de-identified to protect the data subjects) if there is tiered access to these data and models in a manner sufficient for independent validation, and studies that do not include restricted data and models if the data and models are publicly available in a manner sufficient for independent validation.

Response: The EPA agrees with commenters that it is important to consider the totality of relevant, quality research. Therefore, the EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data and models be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is an important aspect of EPA's regulatory actions and assessments it should be an important consideration in how the Agency considers pivotal science. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In

order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Comment: Commenter (12692) states that it may be many years before a significant fraction of the studies on which EPA relies is independently validated. The commenter suggests that, until studies are independently validated, the EPA should follow Lutter and Zorn's recommendation to former House science chairman Lamar Smith, whose HONEST Act (H.R. 1430) is the legislative inspiration for the Transparency proposal:

The bill should also allow agencies to regulate in instances where they do not possess data. Specifically, agencies may rely on research published in peer-reviewed journals, even if there is not public access to such data and the agency cannot acquire it, provided that the agency states it has unsuccessfully sought the data under an agreement providing for privacy of human subjects and protecting trade secrets. In this case the agency, however, would have to state that it is using research based on non-public data and explain why it believes the research is nonetheless sufficiently reliable to be used for regulation.²⁸⁹⁸

Response: Since the purpose of 40 CFR 30.5 is to determine the consideration to afford to studies based on, among other factors, the availability of the underlying dose-response data that would support independent validation via reanalysis of the data underlying pivotal science, the appropriate stage of data would not be the processed data (data that have been computed and analyzed to extract relevant information) or the final clean data set that is provided with a publication. At these two stages of data, the analysis has already been conducted, and the results have already been determined. In order to determine if these results are valid, data that had not already been computed and analyzed are needed.

In this final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

²⁸⁹⁸ Text is available at <https://www.congress.gov/bill/115th-congress/house-bill/1430>.

7.1.3.2 Definitions

Comment: Commenter (11890) states that, in the SNPRM, new terms are introduced that require more explanation and transparency. The commenter states that the language "appropriate techniques for tiered access" is used, yet "appropriate techniques" are not defined.

Commenters (9587, 11576, 11890, 11894) express concern that "tiered access" is not defined.

Commenter (9587) asserts that the EPA should define tiered access precisely, to maximize transparency. The commenter states that the EPA should scrutinize its regulatory models carefully, and make sure that its own definition of tiered access defines all terms with absolute clarity, provides equally clear procedures designed to maximize transparency, and facilitates reproduction studies.

Response: Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

7.1.3.3 Data That Cannot Be Sufficiently De-identified

Comment: Commenters (9455, 10866, 11361, 11395, 11473, 11576, 11890, 12403, 12546, 12720) contend that the tiered structure presented in the SNPRM does not adequately address concerns about re-identification of study participants, disclosure of private health data, and/or negative effects on future study participation, as described below.

Commenter (9455) asserts the proposed rule's system of tiered access would violate medical confidentiality laws and standards because it only reduces the risk of re-identification and it allows, illegally and unethically, sharing of confidential data. The commenter states that posting into the system imposes risk in ways that have not been properly evaluated in the proposed rule. The commenter states that, as the tiered program could only "reduce the risk of reidentification and mitigate disclosure privacy risks," it would break laws on privacy and standards of medical confidentiality. The commenter states that it would make all the data sitting ducks for hackers.

Commenter (10866) asserts that the proposed tiered access strategy for consideration of protected health information does not adequately protect the identity and health information of participants included in research studies. Commenter (11890) states that the rule must recognize that the re-identification of study participants is possible even when stripped of the variables typically considered PII (e.g., under HIPAA).

Commenter (11395) is concerned about the potential for re-identification of study participants in the tiered access structure. The commenter states that, because environmental studies by necessity need to use location data to establish exposures, a very significant percentage of study

participants can be identified unless the data are masked to a degree that would not allow reanalysis. The commenter states that, recently, a peer reviewed study examined the identifiability of records from an environmental health study in northern California. The commenter states that, using data considered by the HIPAA to be sufficiently de-identified to be made public and which involved far fewer variables than would be required for the reanalysis proposed by EPA, the researchers were able to correctly identify over 25 percent of the study participants.²⁸⁹⁹ The commenter also refers to the 2002 National Academy of Sciences reports which states that:

In an experiment to discover whether confidentiality could be preserved while opening the data for public review, the study investigators attempted to disguise the identity of the study participants. They deleted as many features as possible from the questionnaires, such as the name, the state file number, the mother's maiden name, and the name of the person providing the information. However, they needed to retain a minimum set of features if other scientists were to be able to replicate the basic findings of the study... They found that even this minimum set of features could allow for identification of research participants.²⁹⁰⁰

Commenter (11473) asserts that the new “tiered” approach does not prevent loss of privacy. The commenter refers to an editorial published in the Lancet (Thorp et al., 2019) and signed by Editors of Science, Nature, PLOS, PNAS, Cell, and Lancet:

As leaders of peer-reviewed journals, we support open sharing of research data, but we also recognise the validity of scientific studies that, for confidentiality reasons, cannot indiscriminately share absolutely all data. Datasets featuring personal identifiers—including studies evaluating genomes of thousands of people to characterise medically relevant genetic variants—are but one example. Such data may be critical to developing new drugs or diagnostic tools but cannot be shared openly; even anonymised personal data can be subject to reidentification (*e.g.*, Sweeney, 2013; De Montjoye et al., 2015; Rocher et al., 2019) (attached), and it has been a longstanding practice for agencies and journals to acknowledge the value of data privacy adjustments. The principles of careful data management, as they inform medicine, are just as applicable to data regarding environmental influences on public health. Discounting evidence from the decision-making process on the basis that some data are confidential runs counter to the EPA stated mission ‘to reduce environmental risks...based on the best available scientific information’.”(USEPA, 2016).

Commenter (11576) states that the supplemental notice admits that under a tiered approach, the EPA will not fully protect confidential information. The commenter states that, while the EPA claims that its tiered-access approach will allow for a reduction in the risk of re-identification, it cannot guarantee that it can fully prevent all such data from being reidentified. The commenter

²⁸⁹⁹ Sweeney L, Yoo JS, Perovich L, Boronow KE, Brown P and JG B. Re-identification Risks in HIPAA Safe Harbor Data: A study of data from one environmental health study. Technology Science. 2017.

²⁹⁰⁰ National Research Council. 2002. Access to Research Data in the 21st Century: An Ongoing Dialogue Among Interested Parties: Report of a Workshop. Washington, DC: The National Academies Press. <https://doi.org/10.17226/10302>.

states that an analysis published in 2019 assessed the risks associated with the sharing of data within environmental-health studies, including genetic and medical records, and found an increased likelihood of re-identification.²⁹⁰¹ The commenter states that there is little discussion as to the criteria the EPA will rely upon to develop such an approach and even then, the EPA can only guarantee a reduction of risk—which means there would remain individuals whose private medical information is at risk of being disclosed.

Commenter (11926) states that there are substantial risks involved in sharing of individual level research data, especially if data are available to anyone in a public release. The commenter states that enormous technological advances have been made in data linkage techniques, and substantial resources have been devoted to data linkage as businesses, government agencies and sophisticated rogue hacking groups seek to find out as much as possible about as many people as possible.

Commenter (12546) states that researchers in 2015 were able to reidentify 90 percent of their study population as unique individuals and to uncover their records, knowing just four random pieces of information, due to the uniqueness of human behavior.²⁹⁰² The commenter states that a more recent study in 2019 modeled the likelihood of individual reidentification in a “heavily incomplete” anonymized dataset, and found “that 99.98% of Americans would be correctly re-identified in any dataset using 15 demographic attributes.”²⁹⁰³ The commenter states that this research shows how, with only a few pieces of information, current technology can already deidentify data that scientists currently consider sufficiently anonymized.

Commenter (12720) expresses concern that the EPA does not define a level to which study data can be “sufficiently” de-identified in the proposal, which leaves this determination open to arbitrary influence. The commenter states that this description of a tiered access system is vague in not defining a “sufficient” level of de-identification. The commenter states that the EPA has not submitted any specific plan for such a determination to be made, nor has any independent group evaluated such an approach.

Commenters (9455, 11361) express concern that the tiering approach may not be consistent with IRB requirements. Commenter (9455) states that the possibility that medical data, even if ostensibly de-identified, will be posted for review would never get past any good IRB. The commenter states that the requirements of various privacy protection laws and of medical ethics preclude such posting. The commenter states that IRBs enforce these requirements in their reviews of grant proposals. The commenter states that most federal agencies that fund health research, including EPA and National Institute of Environmental Health Sciences (NIEHS),

²⁹⁰¹ Katherine Boronow, et al., Privacy Risks of Sharing Data from Environmental Health Studies, Environmental Health Perspectives (Jan. 10, 2020) (attached), available at <https://ehp.niehs.nih.gov/doi/10.1289/EHP4817>.

²⁹⁰² Montjoye, Y.-A. D., Radaelli, L., Singh, V. K., & Pentland, A. S. (2015). Unique in the shopping mall: On the reidentifiability of credit card metadata. *Science*, 347(6221), 536–539. Available: <https://doi.org/10.1126/science.1256297>.

²⁹⁰³ Rocher, L., Hendrickx, J.M. & de Montjoye, Y. (2019). Estimating the success of re-identifications in incomplete datasets using generative models. *Nat Commun* 10, 3069. Available: <https://doi.org/10.1038/s41467-019-10933-3>.

require strict medical confidentiality, and IRBs make sure that all grant proposals ensure confidentiality.

Commenter (11186) states that, while the rule discusses risk reduction techniques and creating multiple versions of a single dataset with varying levels of specificity and protection, in fact, creating more datasets can involve more risk of reidentification and breaches of confidentiality.

Commenters (11387, 12404, 12423) assert that health studies of environmental exposures require sufficient location information to determine exposure, and that this location information makes it impossible to adequately de-identify health information. Commenter (12404) states that this is particularly true in some air pollution studies, in which participants' addresses are used to estimate exposure.

Commenter (11387) contends that the requirement that all study data be available on an internet website, means it would always be possible to use diagnosis and location information to figure out the identities of one or more people in the study. The commenter states that this violates the person's confidentiality rights, and means the study cannot be used (if it was completed in the past) or conducted (if it is a proposed future study).

Commenter (12423) asserts that the small populations of most tribes and tribal communities and their restricted geographic locations (i.e. specific reservations and villages) make it impossible to sufficiently de-identify raw data. The commenter states that tiered access does not alleviate this issue. The commenter states that, under the proposed rule, these studies would either be excluded or heavily discounted. The commenter states that this scenario would be played out hundreds to thousands of times throughout Indian Country. The commenter states that it should be noted that rural America in general shares some features with tribes, such as substandard housing, exposure to dust from unpaved roads, poor healthcare infrastructure, greater number of businesses that are below a range of federal statute threshold reporting levels and are more likely to rely on water systems and private wells unregulated by the Clean Water Act (CWA) and Safe Drinking Water Act (SDWA). The commenter states that, for example, there are 229 Alaska tribes living in remote and isolated villages averaging just 330 people. The commenter states that they are unconnected by road to any other populations, so that any community's geographic, hydrologic, and geological features relevant to participant selection criteria could unmask the tribe.

Commenters (9455, 11576, 12404, 12423, 12464) contend that certain studies show that it is difficult to make data public without also making participants identifiable.

Commenter (9455) contends that there is no way to completely ensure that re-identification will not happen. The commenter states that the references in Boronow²⁹⁰⁴ demonstrate that the environmental health research community has futilely grappled with this problem for many years.

²⁹⁰⁴ Boronow K, Perovich L, Sweeney L, Yoo J, Rudel R, Brown P, Brody J. 2020. Privacy risks of sharing data from environmental health studies. *Environmental Health Perspectives*. <https://doi.org/10.1289/EHP4817>. CID: 017008. CSIS. 2020.

Commenter (11576) refers to a study which discusses how even limited information made available from multiple studies involving the same dataset allowed researchers to successfully re-identify study participants.²⁹⁰⁵ The commenter states that researchers in the study were able to re-identify study participants despite the exclusion and redaction of information that could not be shared under the safe-harbor provision of HIPAA.²⁹⁰⁶ The commenter concludes that the EPA's proposal poses significant threats to personal privacy—threats the EPA has yet to acknowledge and address. The commenter states that, while the EPA claims that its tiered-access approach will allow for a reduction in the risk of re-identification, it cannot guarantee that it can fully prevent all such data from being reidentified. The commenter states that there is little discussion as to the criteria the EPA will rely upon to develop such an approach and even then, the EPA can only guarantee a reduction of risk—which means there would remain individuals whose private medical information is at risk of being disclosed.

Commenter (12404) states that it is difficult to make data public without also making participants identifiable. The commenter states that this is particularly true in some air pollution studies, in which participants' addresses are used to estimate exposure. The commenter states that this means, that in some cases, information about participants' exposures could be used to figure out their addresses.²⁹⁰⁷ The commenter states that a 2002 study by the National Research Council of the National Academy of Sciences found that, even after the deletion of some personal information from participants, if all the information necessary to reproduce a study's findings remained, it was possible to identify the participants.²⁹⁰⁸

Commenter (12423) asserts that the small populations of most tribes and tribal communities and their restricted geographic locations make it impossible to sufficiently de-identify raw data. The commenter states that, for example, a retrospective longitudinal cohort study was carried out in 2001 to examine whether there was a significant association between a range of short-term health risks and the surrogate inhalation exposures to solid waste in four Alaska Native villages. The commenter states that information was collected from 95 percent of residents, including education level, tobacco use, honey bucket use (plumbing), self-reported asthma, self-reported short-term health symptoms, and approximate total subsistence food consumption.²⁹⁰⁹ The commenter states that, in another study conducted in 2006, and published in the *American Journal of Epidemiology*, birth records were used to examine the association between hazardous waste content in Alaska Village landfills and a number of birth outcomes, including congenital anomalies.²⁹¹⁰ The commenter states that these two studies are seminal in that they are the first and only systematic studies carried out on impacts in rural Alaska Native villages. The commenter states that they have since informed EPA policy, as well as delegated state Resource Conservation and Recovery Act (RCRA) implementation and policy. The commenter states that

²⁹¹⁰ Gilbreath, S. and Kass, P. Adverse Birth Outcomes Associated with Open Dumpsites in Alaska Native Villages *American Journal of Epidemiology*, Volume 164, Issue 6, 15 September 2006, Pages 518– 528, 13 July 2006.

a substantial portion of results pertain as well to the rest of rural Alaska communities, representing in total about half of the state's population. The commenter states that, in the case of the retrospective cohort study, obtaining participant consent 19 years later is not possible. The commenter states that, in the case of the second study, the use of the Alaska Birth Record Registry was conditioned upon strict confidentiality and scrubbing procedures because of the medical records and sensitive information contained. The commenter states that, with communities as small as 50 people and just a single annual birth, it would be straightforward to identify individuals and individual medical records. The commenter states that permission from the State to modify the research agreement and release the data would not be granted.

Commenter (12464) states that recent research suggests that the risk of re-identification for environmental health data is greater than traditionally thought. The commenter states that a recent paper demonstrates that it is possible to successfully re-identify environmental health study participants using information that is publicly or commercially available.²⁹¹¹ The commenter states that, if data with geographic information about the study participants becomes public, that data can be combined with information that is readily available online such as voter lists, tax and real estate information, or information that is available from data brokers.²⁹¹² The commenter states that, in light of the risk of re-identification with environmental health data, researchers would have a strong interest in ensuring the data is restricted and not publicly available. The commenter asks if researchers are able to make this determination or will the EPA demand that certain studies be made public? The commenter asks if the EPA will decide, what process will be available if the researchers and the EPA disagree about the risk of re-identification?

Commenter (11576) states that, in the original notice, the EPA mentioned “[o]ther federal agencies [that] have developed tools and methods to de-identify private information for a variety of disciplines” as examples of approaches to de-identify and protect confidential medical information. The commenter states that, however, the Health and Human Services guidance referenced by the EPA acknowledges that de-identification does not fully protect patient information, stating that “[b]oth methods, even when properly applied, yield de identified data that retains some risk of identification. The commenter states that, although the risk is very small, it is not zero, and there is a possibility that de-identified data could be linked back to the identity of the patient to which it corresponds.”²⁹¹³ The commenter states that, as commenters noted in 2018, de-identifying personal information has thus far proven to be ineffective.²⁹¹⁴ The commenter states that the SNPRM does not offer a resolution that would fully prevent de-identified information from being re-identified.

Response: Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The EPA follows an objective, unbiased process for identifying and evaluating scientific studies and already identifies key or pivotal studies in some of its actions (e.g., Integrated Risk Information System (IRIS) assessments). The EPA intends to issue implementation guidelines and statute-specific rulemakings that will further describe these criteria and how the EPA will identify pivotal science in its assessments and rulemakings.

The EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data and models be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is an important aspect of EPA's regulatory actions and assessments it should be an important consideration in how the Agency considers pivotal science. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

7.1.3.4 Exclusion or Discounting of Data and Studies in Tiered System

Comment: Commenters (11391, 11479, 12404, 12688, 12731) express concern that, under Option 1, the EPA would not prevent important and relevant scientific information from being disregarded.

Commenter (11391) states that, as scientists discussing the feasibility and usefulness of a tiered or controlled-access approach have pointed out, "controlled access does not permit researchers to

curtail national legal and ethical policies on privacy and data protection.”²⁹¹⁵ The commenter states that, while the EPA seems to suggest that in many instances privacy issues can be sufficiently addressed through de-identification, the EPA’s own SAB has concluded that “even de-identified datasets present risks of re-identification.”²⁹¹⁶ The commenter states that, as such, there are some circumstances where scientists simply cannot share data, even if they promise only to share it with a select group of people through a tiered access regime. The commenter states that, even under Option 1, then, the EPA would still be forced to disregard large amounts of valuable scientific information where a tiered or controlled-access approach is not legally or ethically permitted.

Commenter (11479) states that the tiered-access approach fails to address a central concern—that it would require the release of private data for EPA to be able to use studies that rely on such data. The commenter states that, under a tiered-access approach, which would allow select researchers to gain access to sensitive data, the vast majority of studies that rely on nonpublic data – data such as personally identifying information, CBI, and intellectual property – would still be prohibited from use by EPA. The commenter states that this is because restrictions on disclosure of such data (as detailed in the next section) would still apply, even when such data are released to a select few researchers in a tiered-access system. The commenter states that, for example, the EPA relies on many studies that use personally identifying health data. The commenter states that, to use such data, researchers obtain ethics approval from IRBs and sign legal agreements with hospitals, health maintenance organizations, and other bodies that prevent them from sharing health data publicly. The commenter states that these legal and ethical obligations still apply, even if a tiered-access system exists. The commenter states that, thus, sharing health data in a tiered-access system would require researchers to breach legal and ethical agreements, as described in detail in the next section. The commenter states that researchers would be unlikely to participate in such a system if their research relies on sensitive data, consequently, the EPA will not be able to use much relevant research relying on nonpublic data, even if a tiered-access system is offered.

Commenter (11390) states that, while the EPA’s revised proposal contemplates that “tiered access,” such as restricted access to confidential data for independent validation by “authorized researchers,” would allow research institutions and researchers to authorize restricted access. The commenter states, however, this requirement is not consistent with many contractual agreements with research subjects, and will be infeasible or impossible to implement both retroactively and prospectively in a way that allows the Agency to rely on high-quality science.

Commenter (11498) states that this restricted access approach presupposes permission and participation from the scientists doing the research. The commenter states that, since the EPA does not have the authority to grant access to confidential and private research data, this approach would depend on the consent and approval of the scientists and institutions who

²⁹¹⁵ Yann Joly et al., Are Data Sharing and Privacy Protection Mutually Exclusive, 167 CELL 1150, 1151 (2016). See also SAB Review, *supra* note 10, at 10 (“If the participants [in a study] agreed to grant only a select group of researchers access to their personal information, then that consideration should be respected, and such information should not be supplied to additional people for validation. It would probably be impractical, to go back to the participants and request their approval to provide additional people access to personal information”).

²⁹¹⁶ SAB Review, *supra* note 10, at 9, n.11.

conducted the research. The commenter states that it is unclear if this is at all possible, as researchers and institutions, in the example of many groundbreaking epidemiological studies, enter into contracts with participants to keep their health and other sensitive information private. The commenter states that it is improbable the researchers would or could alter these legal contracts after studies are concluded to allow individuals selected by EPA to gain access to such protected information, even in a tiered scheme. The commenter states that, thus, this approach would likely exclude many credible and valuable studies, including ones containing private information that EPA has benefited from in the past. The commenter states that this reinforces our ongoing serious concern that this proposal threatens the use of the best available science in its decision-making.

Commenter (12404) states that the tiered approach would permit data that cannot be made broadly public to be shared with a limited number of scientists. The commenter states that, if this proposal were to become a final rule, it is possible to imagine that researchers might seek and obtain informed consent from study participants to do this kind of sharing of identifiable information. The commenter states that, if they did, it might be more difficult to find willing study participants, especially in communities of color, which have good historical reasons to distrust medical researchers and which are often the most heavily exposed to pollution. The commenter states that, even if researchers were able to seek and obtain consent for this kind of limited sharing in future studies, and even if doing so did not reduce study participation in communities of color or elsewhere, this rule would still exclude a tremendous amount of scientific research conducted before there was any reason to obtain such consent.

Commenter (12688) states that Option 1, which would require consent and approval from the researchers and institutions that collect data, ignores the realities of public health research involving human subjects, which often necessarily involve contractual arrangements with subjects to protect privacy and confidentiality. The commenter states that it is certain that many past studies would not be amenable to “tiered access” to data, and this requirement would inevitably impede the use of many future studies to inform Agency actions as well.

Commenter (12731) states that, in altering its proposed approach, the EPA purports to address objections to the Agency’s exclusion of valid data and models containing confidential, proprietary, or personal data that cannot be sufficiently de-identified to protect data subjects. The commenter states that the EPA’s tiered access approach is an inadequate response to these objections. The commenter states that, if tiered access does not exist, for whatever reason, the Agency will ignore all studies for which data and models are not publicly available. The commenter states that, thus, the tiered access modification to the original proposal fails to cure its essential defect: the Agency would continue to disregard valid studies without any rational grounding in its statutory authorities, and in plain violation of numerous statutory requirements.

Commenter (11500) states that, when excluding materials unavailable in a manner sufficient for independent validation, the Agency should clearly identify the materials that have been excluded and explain the precise bases for exclusion.

Response: Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the

originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The EPA follows an objective, unbiased process for identifying and evaluating scientific studies and already identifies key or pivotal studies in some of its actions (e.g., IRIS assessments). The EPA intends to issue implementation guidelines and statute-specific rulemakings that will further describe these criteria and how the EPA will identify pivotal science in its assessments and rulemakings.

The EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data and models be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is an important aspect of EPA's regulatory actions and assessments it should be an important consideration in how the Agency considers pivotal science. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

7.1.3.5 Research Data Centers

Comment: Commenter (11392) notes that the SNPRM references a pilot project with the Centers for Disease Control and Prevention (CDC) involving a secure data enclave for sensitive EPA datasets. The commenter asks if the CDC was involved in writing this rule, do they have the resources to host the EPA's data and models and moderate tiered access, will the CDC be making the decision as to who can access the data and at what level, and will CDC be reviewing applications for access? The commenter states that the SNPRM does not address any of these questions. The commenter states that, if the EPA intends to make its arrangement with the CDC permanent, and establish the CDC as the host of a secure data enclave for studies considered in Agency rulemaking, the EPA must clearly articulate its rationale for partnering with a separate

federal agency rather than performing the work internally. The commenter states that the EPA must also describe how such an unusual arrangement would be structured; it must be clear that the CDC is involved in this rulemaking.

Response: Proposed 40 CFR 30.2 in the 2018 proposed rule included a definition of “research data.” In the 2020 SNPRM, the EPA deleted the proposed definition of “research data.” The EPA is not including a definition of “research data” in this final rule given that it is finalizing the definition of “data.”

Comment: Commenters (11479, 12435, 12710, 12720, 12731) assert that the proposed model of tiered access for data involving and the precedents the SNPRM cites for it, are inappropriate to the work of the EPA.

Commenter (11479) states that the EPA’s SNPRM points to the CDC’s Research Data Center (RDC) as a model, and the EPA has referenced other practices by CDC and the U.S. Food and Drug Administration (FDA) as relevant models for the Agency to follow in implementing a tiered-access approach. The commenter states that there are significant reasons that these CDC and FDA systems will not work for EPA. The commenter states that, unlike CDC and FDA, the EPA is primarily focused on environmental threats, and deidentification of personal health data is challenging and sometimes impossible, as noted above. The commenter states that, by contrast, data from clinical drug trials used by FDA and medical data aggregated at the hospital or county level used by CDC can often more readily be disclosed publicly, because doing so will not reveal identities of study subjects.

Commenter (12435) states that the types of studies that inform the FDA are fundamentally different from those that inform the work of the EPA. The commenter states that the RDC of the CDC is not easily or affordably accessible and does not provide the raw data access that this rule demands.

Commenter (12710) asserts that the model for tiered access cited in the preamble (from the RDC within CDC), is relevant only to data owned by the federal government.²⁹¹⁷ The commenter states that no model exists, nor does the EPA propose one, for tiered access to studies generated outside the federal government (*e.g.*, states, universities, non-governmental organizations (NGOs)).

Commenter (12720) states that the EPA does not explain why the RDC approach would work in the EPA context and the wide scope of scientific data and models that would be subject to new public data release requirements under the proposed rule. Commenter (12731) asserts that the federal tiered-access models the EPA has pointed to are relevant only to “a small fraction of published epidemiology research” and that these platforms do not address access to datasets held by universities or by private organizations like the American Cancer Society.²⁹¹⁸

Commenter (12731) states that the closest the EPA comes to describing its envisioned tiered access approach is a brief reference to the RDC. The commenter states that the EPA’s reference

²⁹¹⁷ See <https://www.cdc.gov/rdc/b1datatype/dt100.htm> and <https://www.cdc.gov/rdc/leftbrch/frequest.htm>.

²⁹¹⁸ SAB Consultation at B-32.

to the RDC is wholly inappropriate, as the data features are entirely different from the scope of scientific information the EPA is capturing in the SNPRM. The commenter states that the data housed within the RDC are either developed directly by the federal government or collected through federal government- designed and managed programs. The commenter states that these data are highly standardized, and the platforms housing the data are developed and managed by the government. The commenter states that the RDC is a highly controlled, integrated, and coordinated data infrastructure. The commenter states that, in contrast, the EPA's proposal targets all potential "data and models" to be considered by the Agency that are developed by a wide breadth of entities inside and outside government and that are highly variable including in terms of how they are generated, collected, curated, and stored. The commenter states that any reference to the RDC as an analogous potential model for EPA's tiered access approach is highly inappropriate and disingenuous.

Commenter (12720) states that the EPA does not grapple with the fact that the RDC restricted-use data is not "publicly available" in that there are multiple barriers to data access.

Response: This rule is designed to build upon prior EPA actions in response to government-wide data access and sharing policies. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator (see Section III.G). See Section III.E for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available for independent validation.

Further, proposed 40 CFR 30.2 in the 2018 proposed rule included a definition of "research data." In the 2020 SNPRM, the EPA deleted the proposed definition of "research data." The EPA is not including a definition of "research data" in this final rule given that it is finalizing the definition of "data."

Comment: Commenters (10038, 11176) support the concept of tiered access to data in the current draft of the rule and for piloting the use of the RDC of the CDC National Center for Health Statistics (NCHS).

Commenter (11176) states that the NCHS RDC is one example for providing some level of tiered access. The commenter states that the NCHS also, along with more than a dozen other federal entities, provides data access through Federal Statistical Research Data Centers (FSRDCs). The commenter states that the EPA actually provides access to its Pollution

Abatement Costs and Expenditures (PACE) survey through the FSRDCs. The commenter states that one potential limitation of the FSRDC network is that work conducted therein must be for a statistical purpose and must be for research as well as the following stipulation: “An agency with regulatory or enforcement roles that also conducts or supports research may be able to house their data in RDCs if there is a clear delineation between enforcement and research in the agency. Further, the mission of RDCs is to facilitate research.” The commenter states that other existing access methods may provide additional flexibility and are actively being used by federal agencies. The commenter states that two such access examples are the NORC Data Enclave and the Inter-university Consortium for Political and Social Research (ICPSR) Virtual Data Enclave. The commenter states that the former is used by the two United States Department of Agriculture (USDA) statistical agencies, for example, and the latter by the Bureau of Justice Statistics. The commenter states that, if more restricted access is needed, programs such as the Bureau of Economic Analysis’ Special Sworn Researcher Program provides access to highly confidential firm data, under tight security. The commenter states that, while the EPA is actively working to provide more access to its data, its involvement in the sharing of its sensitive data through research data centers and data enclaves is minimal, limited to a single survey to our knowledge.

Response: Access to restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. given that transparency is an important aspect of EPA’s regulatory actions and assessments it should be an important consideration in how the Agency considers pivotal science. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation.

7.1.3.6 May Be Limited to Authorized Officials and Researchers

Comment: Commenters (11487, 11890) express concern that the rule does not define “authorized researchers.” Commenter (11890) states that, in the SNPRM, new terms are introduced that require more explanation and transparency.

Commenter (11487) states that the SNPRM language regarding tiered access is far too vague and limited to engender confidence among researchers or those who might consider participating in studies. The commenter states that, for instance, it does not define “authorized researchers” or mention the IRBs that govern human-subjects research in academia.

Response: Proposed 40 CFR 30.2 in the 2018 proposed rule included a definition of “research data.” In the 2020 SNPRM, the EPA deleted the proposed definition of “research data.” The EPA is not including a definition of “research data” in this final rule given that it is finalizing the definition of “data.”

This rule does not require any researcher or other outside entity to provide data to the EPA. Nor does the rule categorically exclude studies—even studies where the underlying dose-response data are not available for independent validation—and therefore any incidental impact on researchers who are developing science and deciding whether to make the underlying dose-response data available is negligible. Instead, it governs internal agency procedures for determining the consideration to afford various studies according to factors that include data availability.

Further, the EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (11391) expresses concern that there is no discussion regarding who at the EPA would make decisions about when access to data should be limited or how, or how the EPA would manage the potentially significant additional capacity necessary to make and execute such decisions. The commenter states that, even an unambiguous tiered access system would not address the fundamental underlying problem: there are situations in which researchers simply cannot make data available, even if they or the EPA agree only to share that data with a select group of people.

Commenter (11403) contends that, since the data would be PII, it would be available to the public only through tiered access, and the vast majority of the members of the public would not have more access to the data than it would under the current system. The commenter states that the proposed rule attempts to allow for the use of some CBI and PII by permitting use only if there is tiered access to the data or if the data can be sufficiently de-identified. The commenter states that, in a tiered access system, public transparency is restricted, not just access to the data. The commenter states that, while the EPA identifies the RDC as the model for its approach, why the EPA believes it is appropriate to create another database for confidential health information within the EPA is mystifying. The commenter states that this data, according to EPA, “may be limited to authorized officials and researchers and not provided to the general public.” The

commenter states that it would be at the EPA's discretion to determine if a member of the public was qualified to access scientific information. The commenter states that the EPA's proposed system is vastly more "secret" than the method it thinks needs fixing.

Response: The EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information for independent validation. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

7.1.3.7 Implementation of Tiered System

7.1.3.7.1 Costs and Burdens

Implementation Costs Not Fully Considered

Comment: Commenters (11176, 11391, 11890, 11894, 12430, 12731, 12464) express concern that administrative burdens associated with implementation of the rule are not fully considered in the proposal and SNPRM.

Commenter (11391) states that there is considerable resistance to tiered access in the scientific community, in no small part because of the additional administrative burdens imposed by the tiered-access agreements. The commenter states that there is no indication in the 2020 SNPRM that the EPA has considered those burdens or possible approaches for managing them. Commenter (12430) states that a requirement to provide multiple tiers of access would disproportionately burden academic, public, and even smaller corporate researchers. Commenter (12731) states that the tiered access approach would likely be difficult and costly to administer, but the EPA has not explained, even in general terms, how this approach would be implemented, the degree of burden it would impose, or who would bear the costs.

Commenter (12464) states that the SNPRM says nothing about the costs of the tiered access alternative nor who will bear those costs. The commenter states that, without any details, or cost analysis, it is not unreasonable to assume that the cost of the tiered access approach would fall on researchers, other federal agencies such as the CDC and other third parties.

Commenters (12430, 12617, 12731, 12464) express concern that the tiered access alternative will introduce additional costs for both the government and individual researchers. Commenter (12430) states that a requirement to provide multiple tiers of access would disproportionately burden academic, public, and even smaller corporate researchers.

Commenter (12617) states that researchers would have to dedicate time and resources to figuring out the logistics of sharing, especially with a tiered-access approach. The commenter states that researchers would have to determine how to safely protect medical and proprietary information while designing different levels of access. The commenter states that, while the SNPRM says researchers could create “multiple versions of a single dataset with varying levels of specificity and protection,” the extra time and expense seems unreasonable and without any clear benefit to EPA’s mission.

Commenter (12731) states that, in a recent briefing with staff on the House Committee on Science, Space, and Technology, EPA staff revealed that “key implementation responsibilities [for tiered access] will fall on the research community.”²⁹¹⁹ The commenter states that the EPA’s apparent expectation that it will impose massive new costs on the research community without acknowledging as much in the SNPRM is arbitrary and a violation of notice requirements. The commenter states that it would further privilege the EPA’s reliance on studies from wealthy organizations or those with a financial incentive to expend the necessary resources for EPA to consider their work.

Commenter (12464) states that the tiered access alternative will be even more costly to implement than a requirement that all data and models be made available to the public. The commenter states that, for example, some researchers will have to submit data to a secure data repository, the operator of the repository will have to maintain and operate the facility, and researchers who want to reanalyze the data will typically need to pay fees to access the data as well as pay to travel to the repository.

Commenters (12645, 12731) express concern the proposal and SNPRM do not address the burden of obtaining the consent of researchers. Commenter (12645) notes that there is an increasing number of co-authors in each published study and asks if each author would have to agree to share the data so that any one author would have veto power over sharing? The commenter states that the EPA could find out by sampling the scientific community represented in cited publications underlying its regulatory decisions, but like so many other aspects of the initial transparency rule and this SNPRM, it has not bothered to do any preliminary analyses or to have such analyses done by the National Academy of Sciences (NAS) or the SAB.

Commenter (12731) states that the EPA’s proposed “tiered access” approach fails to engage with or even acknowledge concerns that have been presented multiple times to the Agency regarding the cost and feasibility of establishing such arrangements on a routine basis. The commenter states that the Health Effects Institute (HEI) comments to SAB noted that tiered-access arrangements, such as proposed in the SNPRM, require the consent and collaboration of researchers and can be “challenging” to establish.²⁹²⁰

Response: The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs to the Agency. The EPA emphasizes that this is a rule of internal procedure promulgated under the EPA’s housekeeping authority. However, the EPA has identified some incremental costs that the Agency may incur as a result of this final rule. As

²⁹¹⁹ Memo to Chairwoman Johnson, *supra* note 120, at 3.

²⁹²⁰ Letter from Daniel Greenbaum, *supra* note 40.

stated in Section III.A.2, the EPA will continue its current practice of conducting extensive review of scientific studies during the development of significant regulatory actions and influential scientific information. The additional procedures required by this rule only apply to pivotal science, which is a subset of the total number of studies that the EPA would evaluate. Given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small. The Agency may also incur other administrative costs to perform analyses and evaluations to support activities such as exemption decisions made by the Administrator, and documenting these or other decisions made pursuant to the requirements of the final rule. Again, the Agency anticipates that the incremental costs for these activities will be small relative to current administrative costs for developing significant regulatory actions or influential scientific information.

Comment: Commenters (10038, 11392, 12464, 12715) express concern that the costs of data repositories such as the NCHS's RDC would exceed millions of dollars annually.

Commenter (10038) states that the annual operation of such data repositories costs several million dollars above and beyond the initial costs of establishing such centers. Commenter (12715) states that, given the expanded scope of the SNPRM, which now covers not just pivotal regulatory science but also pivotal science supporting influential scientific information, the costs of the proposal may well exceed the \$100 million annual threshold for Executive Order 12866.²⁹²¹

Commenter (11392) notes that the Secret Science Reform Act of 2014, a legislative precursor to this SNPRM, was estimated by the Congressional Budget Office to cost "\$250 million annually over the next few years" should it have passed into law and asks how much will this SNPRM cost, and what money will the EPA use to undertake a project of this magnitude that has not been authorized by Congress? Commenter (12464) states that the tiered access alternative will introduce additional costs for both the government and individual researchers. The commenter states that, as explained in our previous comment letter,²⁹²² the Congressional Budget Office ("CBO") estimated that a bill similar to the proposal would cost the EPA as much as \$250 million per year.²⁹²³ The commenter states that a tiered access approach will be even more costly to implement than a requirement that all data and models be made available to the public.

²⁹²¹ See, 2018 Comments at 17. In 2017, Congress proposed the Honest and Open New EPA Science Treatment Act, H.R. 1430, 115th Cong. (2017), which, like the proposed rule, provided that EPA could only rely on studies whose data were open and accessible. In assessing that legislation, the Congressional Budget Office estimated that costs to EPA associated with redacting confidential information to comply with this act would be at least \$100 million per year. Cong. Budget Office, Cost Estimate, Honest and Open New EPA Science Treatment (HONEST) Act of 2017, H.R. 1430 (as passed by the U.S. House of Representatives, Mar. 29, 2017), <https://www.cbo.gov/system/files/115th-congress-2017-2018/costestimate/hr1430.pdf>.

²⁹²² ELPC Multi-Clinic Comments, *supra* note 2, at 5.

²⁹²³ Congressional Budget Office, Cost Estimate: H.R. 1030, Secret Science Reform Act of 2015, at 2 (Mar. 11, 2015), <https://www.cbo.gov/sites/default/files/114th-congress-2015-2016/costestimate/hr1030.pdf> [hereinafter, "CBO Analysis"].

Commenters (11176, 11192, 11479, 11487, 11576, 12435, 11900) express concern that the SNPRM does not detail the significant costs of establishing and maintaining an RDC-type system. Commenter (11900) states that, before requiring such a system, the EPA must clearly explain how it will fund the staff and infrastructure required to collect, process, store, and mediate access to this immense trove of data.

Commenter (11192) states that the EPA fails to discuss the costs associated with building, maintaining, and providing access to that repository, nor the cost of reviewing and evaluating applications for access. Commenter (11487) states that the fact that RDC charges researchers \$3,000 to access a single year's data²⁹²⁴ hints at the substantial costs associated with the enterprise. The commenter states that the EPA also has not explained who would be in charge of making those determinations—a crucial issue given that communities disproportionately harmed by pollution might not trust the EPA to make them. Commenter (12435) states that the RDC is not affordably accessible and, from a financial standpoint, the construction of such a system could be very involved and should require an assessment of cost for review along with the proposed rule.

Commenter (11479) states that, even for the subset of EPA-relevant studies for which disclosure of data in a tiered-access system is feasible, such a system would be costly for the Agency to implement and maintain and impractical, if not impossible, for individual researchers to do so. The commenter states that, in turn, a system would likely be costly for those seeking to access the data. The commenter states that the CDC's RDC, for example, costs researchers thousands of dollars to access. The commenter states that it is unlikely that stakeholders such as the public and community groups would pay such high costs to access data that has already been vetted through peer-reviewed studies.

Commenter (11900) states that, in the case of the RDC, the data stored belongs to NCHS (or in some cases to other operating divisions of the Department of Health and Human Services [DHHS]). The commenter states that, however, the system employed by EPA will house extramural data produced by academic researchers in addition to data from their own scientists. The commenter states that the scope of data to be stored in the RDC—essentially all epidemiologic research on environmental exposure—is potentially massive and the EPA must explain how it will fund this system. The commenter states that the EPA must also define the burden to researchers of preparing data for entry into the repository, if such preparation is required.

Commenter (11900) states that, to ensure equitable use of the RDC, the EPA should not charge researchers to deposit or store their data in the RDC. The commenter is concerned that the costs of either depositing extramural data into an RDC or accessing data stored in an RDC will disproportionately impact certain types of research interests. The commenter states that, an alternative model, in which researchers are given unsupervised access to the raw restricted data, depends on the integrity of researchers and a system of penalties and enforcement for misuse; the commenter does not recommend this model.

²⁹²⁴ National Center for Health Statistics, Centers for Disease Control and Prevention. (no date). Fees and Invoicing. <https://www.cdc.gov/rdc/b5aproj/AP540.htm>.

Commenter (11900) states that a key feature of the RDC process is that researchers do not have access to the restricted data except while on site at the RDC, nor are researchers allowed to bring any external technology or datasets into the RDC. The commenter states that all computer code for running analyses at the RDC is reviewed in advance, activity inside the RDC is monitored, and the analysis output is reviewed again before being released back to the researcher. The commenter states that this process ensures that researchers never have access to the restricted data except under close supervision, which precludes any possibility of a linkage re-identification attack. The commenter states that this close oversight over the data comes at the cost of operating the RDC.

Commenter (12715) states that making the data underlying the studies used to generate all “influential scientific information” and “significant regulatory decisions” publicly available or ensuring that such data is publicly available in the future will require significant resources. The commenter states that the additional tiered access system the EPA now proposes is complicated and unclear and merely adds to the burden of evaluation and decision-making that the EPA must conduct in order to determine what data and studies to use when developing standards and health-based criteria. The commenter states that establishing tiered access to protect PII and other confidentiality protections involves creating multiple versions of a single dataset with varying levels of specificity and protection.²⁹²⁵ The commenter states that, as agencies add more tiers, they must build in sufficient controls to monitor who is accessing the data and allow only for authorized access. The commenter states that the SNPRM does not specify how confidential health information covered by the HIPAA Privacy Rule can be protected outside of HIPAA-covered entities but, again, designing and implementing such protections would be expensive and time consuming. The commenter states that, although setting up and maintaining tiered access levels involves significant additional time and cost, the SNPRM is silent on the “logistics, processes, and funding for such data sharing.”²⁹²⁶

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule. The analysis by CBO noted by the commenter is not applicable to this rule because the analyses were not for this rule and the requirements analyzed are not the same as those in this rule.

²⁹²⁶ See J. Samet and T. Burke, Deregulation and the Assault on Science and the Environment, *Annual Review of Public Health* 41:347, 355 (2020), <https://www.annualreviews.org/doi/pdf/10.1146/annurev-publhealth-040119-094056>.

Delay

Comment: Commenters (10038, 10853, 11890, 12731) contend that a tiered access program would delay Agency actions.

Commenters (10038, 10853) state that the rule will curtail the Agency's ability to respond to crises such as the current corona virus disease (COVID)-19 pandemic.

Commenters (11890, 12731) contend that the use of a tiered access program would further delay Agency assessments in critical programs that already struggle to meet their statutory or programmatic work plans. Commenter (12731) expresses concern that the EPA's SNPRM makes no mention of and gives no consideration to practical impediments to tiered access. Commenter (12731) refers to comments of Dr. Smith who highlighted that federal research centers allowing tiered access require researchers to visit in person and require a federal employee to approve all outputs taken from the research center; Center for Medicare and Medicaid Services (CMS) allows for remote use of data, but only after the researcher signs a contract with CMS that provides for the data to be maintained on a secure server—a process that in Dr. Smith's experience “took some months to set up and (as I understand) a considerable sum of money.”²⁹²⁷

Response: Some commenters on the 2018 proposed rule and 2020 SNPRM specifically asked why the EPA would need to peer review health and scientific studies and scientific literature that had already undergone independent peer review. The EPA disagrees with commenters that the requirements of this rule will result in any meaningful delay in promulgating regulations. While this final rule requires the Agency to evaluate the availability of dose-response data for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review the EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of the studies the EPA would review).

General

Comment: Commenter (11890) states that a tiered access program would be costly in critical programs that already struggle to meet their statutory or programmatic work plans.

Response: The EPA has identified some incremental costs that the Agency may incur as a result of this final rule. As stated in Section III.A.2, the EPA will continue its current practice of conducting extensive review of scientific studies during the development of significant regulatory actions and influential scientific information. The additional procedures required by this rule only apply to pivotal science, which is a subset of the total number of studies that the EPA would evaluate. Given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small. The Agency may also incur other administrative

²⁹²⁷ SAB Consultation at B-32.

costs to perform analyses and evaluations to support activities such as exemption decisions made by the Administrator, and documenting these or other decisions made pursuant to the requirements of the final rule. Again, the Agency anticipates that the incremental costs for these activities will be small relative to current administrative costs for developing significant regulatory actions or influential scientific information.

7.1.3.7.2 Timing and Planning for Implementation

Comment: Commenters (10038, 11176) assert that it is premature to enact this rule given the EPA's limited involvement with RDCs and data enclaves and no public plans for further involvement.

Commenter (10038) states that, based on the current status of available data repositories and these anticipated costs, the explicit inclusion of tiered access to data and models that have CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects in the proposed rule is premature.

Commenter (11176) asserts that the EPA should have an operations plan and an operational infrastructure for data sharing before implementing the requirements in the proposed rule as updated by the SNPRM. The commenter states that the operations plan should address financial support and logistics for placing research data into an enclave or RDC and carrying out the reanalysis and independent validation.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenters (11176, 12718) state that the EPA does not have an existing infrastructure in place to implement such tiering, therefore, it is premature to enact this proposed rule.

Commenter (11176) states that the data sharing infrastructure not in place and the mechanisms for data sharing are in the early stages of development and lacking proof of concept. The commenter states that making federally-funded research available for which the EPA does not own the data is a work in progress as the SNPRM's wording states: "Development of standard data repositories is still ongoing." The commenter states that the SNPRM also notes the White House Office of Science and Technology Policy recent call for comments on a "draft set of characteristics of data repositories used to locate, manage, share, and use data resulting from federally-funded research." The commenter states that, for a snapshot of the status of data repositories for federally funded research, consider the NIH, the federal government's likely leader in federally funded data sharing, an effort started more than a decade ago. The commenter states that, in its frequently asked questions (FAQ) page for data sharing, the NIH responds,

“maybe,” to question #20 on whether researchers should consider contributing their data to a data archive. The commenter states that the reply equivocates because of the many factors involved but also indicates how far the NIH is from achieving full data sharing for the research it funds. The commenter states that, for the next question of where to find guidance on preparing data for sharing and archiving, the NIH FAQ does not provide its own guidance but, except for molecular biology information, refers readers of the guidance to an outside entity, the ICPSR. The commenter states that the EPA is a relative newcomer to encouraging data sharing and, while it will benefit from the advances and experiences of other federal entities, is still likely to be years away from providing or encouraging the data access assumed in this rule. The commenter states that, unlike the NSF and NIH, the EPA does not seem to require a data management plan of its grantees, which it planned to do by 2018 in the 2016 EPA document, *Plan to Increase Access to Results of EPA-Funded Scientific Research*. The commenter states that NIH is seeking to expand its policy on data management and sharing (84 FR 60398), with the goal of making results more transparent to the public. The commenter states that such a requirement might be a first step towards the eventual goal of EPA funded research data being more widely accessible. The commenter states that data management plans and sharing strategies remain work in progress.

Commenter (12718) states that the EPA does not have an existing infrastructure in place to implement such tiering and has made not such efforts to satisfy capabilities that would be needed for appropriate tiered access structures in practice.²⁹²⁸ The commenter states that the proposed regulation offers no meaningful articulation of how the EPA would build this capacity or whether it would instead rely on existing infrastructure. The commenter states that, if the latter, the EPA does not address how such an approach would be operationalized given legal restrictions under title 13, title 42, and law for use of Federal Statistical Research Data Centers, including for managing the risks of re-identification that could violate confidentiality protections under federal law, even if EPA employees are the source of such violations. The commenter states that application and use of tiered access models within the federal government’s data architecture and infrastructure cannot be haphazardly applied. The commenter states that, if the EPA were to adopt such an approach, the Agency must clearly articulate appropriate safeguards beyond simply stating the Agency is “conducting a pilot study.” The commenter states that, even then, the peculiar requirements for nongovernment funded research to be included raise concern about the breadth, applicability, and utility of such an approach as proposed.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

²⁹²⁸ See explanation in U.S. Commission on Evidence-Based Policymaking (CEP). *The Promise of Evidence-Based Policymaking*. Washington, D.C.: GPO, 2017.

Comment: Commenter (11176) notes that the OMB has yet to release its expected guidance for tiered access. The commenter suggests the EPA should also consider the September 2019 workshop on tiered access hosted by the Council of Professional Associations on Federal Statistics, where the workshop's recommendations for OMB include encouragement of experimentation as well as further research and development.

Response: Thank you for the recommendation.

Comment: Commenter (12431) shares the concern, expressed by the Society of Toxicology in its comments on the SNPRM, that due to the high costs of establishing and operating data repositories with the capacity for anonymizing protected data sets, the inclusion of tiered access to restricted data and models is premature.

Commenters (10038, 12431) suggest the rule should exempt such data and models until the described data repositories have been established and are fully capable of providing tiered access to data.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

7.1.3.7.3 Tiering Plan

General

Comment: Commenters (10339, 10974, 11362, 11392, 11393, 11184, 11407, 11499, 12412, 12474, 12710, 13549, 13788, 14397) contend the proposal and SNPRM are unclear on several aspects of how the rule would be implemented, as described below.

Commenters (11393, 11184, 11407, 12412, 12474, 13549) state that saying a tiered approach to accessing data is possible, without providing details, is insufficient and unacceptable.

Commenter (10339) states that the practical details about the implementation of the rule remain unresolved, including many issues raised by the EPA's SAB draft report on the scientific and technical basis for the rule. The commenter states that it is not clear precisely if/how the EPA will pursue tiered access to data or make a final determination on whether the level of access is sufficient to be compliant with the rule.

Commenter (10974) states that the EPA does not sufficiently describe how the proposed rule would actively and effectively preserve individuals' privacy or CBI. The commenter states that this proposed rule weakens longstanding privacy protections afforded to U.S. citizens.

Commenter (11362) questions how the EPA will implement this system and determine how, when, and with whom it will share private information. Commenter (12710) states that criteria for tiered access have yet to be developed, and the EPA makes no attempt to define tiered access in the proposed regulatory language.

Commenters (11392, 11499, 13788, 14397) assert that the rule is vague in several respects. Commenter (11392) states that the SNPRM's description of tiered access as "creating multiple versions of a single dataset with varying levels of specificity and protection" is vague and impracticable. Commenter (11499) is concerned that the overall language on tiered access is vague and that clarification on who would have access to CBI and PII would be helpful, accompanied by clarification on how the tiered access would work. Commenter (13788) states that the EPA's discussion of tiered access is vague and neither the rule nor the preamble provides sufficient detail on how such a system would be actually be implemented. Commenter (14397) states that the EPA's proposed tiered approach remains vague and unworkable.

Commenter (11391) states that even where a tiered or controlled-access approach is theoretically possible, there may be valid practical reasons why such an approach cannot be adopted. The commenter states that there is an ongoing debate among scientists about the utility of tiered access models for human health data and how they can and should work.²⁹²⁹ The commenter states that some researchers and organizations have indeed begun to use this kind of approach.²⁹³⁰ The commenter states that there is still considerable resistance to tiered access in the scientific community and it has been far from universally adopted.

Commenter (9455) expresses concern that this proposed rule threatens the trust of the public in environmental health research. The commenter states that the ebbing of that trust has roots in reality and is not just a perception problem. The commenter states that medical data posted on a public website are open to sophisticated data and AI programs that could identify the individuals. The commenter states that medical literature includes large numbers of research papers on patients' need for medical confidentiality.²⁹³¹ The commenter states that medical confidentiality in research also has been found necessary, especially if the research involves parents giving consent for inclusion of children.²⁹³² The commenter states that even if no laws and ethical

PMID 18236934.

²⁹³² Andrews S, Raspa M, Edwards A, Moultrie R, Turner-Brown L, Wagner L, Alvarez R, Frisch M, Wheeler A. 2020. "Just tell me what's going on": the views of parents of children with genetic conditions regarding the research use of their child's electronic health record. *J. Am. Med. Inform. Assn.* doi: 10.1093/jamia/ocz208.e-pub. PMID 31913479.

standards were in place, environmental health research would be throttled if even a rumor of confidentiality breach should arise.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Administrative Capacity

Comment: Commenters (9455, 10974, 12731) contend that the EPA has not demonstrated that the Agency has the capacity to administer a system of tiered access. Commenter (10974) states that the EPA has not demonstrated sufficient programming resources to comply with the legal requirements afforded to individuals' privacy or CBI in the tiered approach outlined in the SNPRM.

Commenter (9455) asserts that the effort to de-identify or access-tier records of volunteers and of certificates is beyond EPA's budget and staffing. The commenter states that it cannot be left to an automated program with only spot checks for QA/QC. The commenter states that the number of individuals whose data underpin environmental standards may run into the millions. The commenter states that the number of volunteers whose medical data underpin existing standards may be as large as one half to one million. The commenter states that they are not the sole source of confidential medical data. The commenter states that many studies involve birth certificates and death certificates in the thousands for each study. The commenter states that these are privacy-protected documents. The commenter states that, even if the re-identification problem were solvable, the logistics of thorough de-identification or detailed tiering of the data would stymie the intent to post medical data.

Commenter (12731) asserts that the EPA has not demonstrated that the Agency has the capacity to administer a system of tiered access to the myriad studies that support all of its regulatory decisions and influential scientific information.²⁹³³ The commenter states that, as for CBI, the EPA points to its existing regulations on disclosure of CBI as a potential framework that would govern tiered access to such information. The commenter states that those regulations, however, provide a detailed process for applying the rules and adjudicating disputes as to confidentiality.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the

²⁹³³ See 40 C.F.R. §§ 2.204, 2.205.

originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Arbitrary System

Comment: Commenters (11396, 11576, 12430, 12731, 13788) contend the rule’s proposed tiering system is arbitrary in certain respects.

Commenter (11396) states that the Options in the SNPRM are vague and arbitrary. Commenter (12430) states that, rather than making the EPA’s proposals consistent with data privacy law, the SNPRM’s proposed tiering provision underscores the arbitrariness, unworkability, and unlawfulness of the proposal.

Commenter (11576) states that the proposed tiered-access approach is arbitrary and unexplained, as the EPA has failed to provide any analysis to justify the approach. The commenter adds that the EPA has not adequately responded to concerns previously raised in comments to substantiate how its tiered approach would remedy existing concerns.²⁹³⁴

Commenter (12731) asserts that the EPA’s preferred approach, which “would allow Agency consideration of studies where there is tiered access to data and models,” is arbitrarily vague and notional. The commenter states that nowhere does the Agency specify the types of data and models it envisions would be encompassed by each tier, or even how many tiers might exist. The commenter states that the EPA fails to provide sufficient description or necessary analysis of the Agency’s envisioned tiered access approach.

Commenter (12731) asserts that the EPA has arbitrarily offered no explanation of how and to what extent legal restrictions on the sharing of confidential information would impede its preferred “tiered access” approach.²⁹³⁵

Commenter (12731) asserts that the EPA failed to consider the likelihood that tiered access would not be practical or ethical if study participants did not consent to their personal information being examined by outside parties, even with restrictions. The commenter states that it would be arbitrary for EPA to ignore this important aspect of the problem,²⁹³⁶ especially in disregarding the comments of its own science advisers on these issues.²⁹³⁷ The commenter states

²⁹³⁴ See August 2018 Coalition Comments at 8.

²⁹³⁵ *Cf. Am. Pub. Power Ass’n v. Fed. Power Comm’n*, 522 F.2d 142, 146 (D.C. Cir. 1975) (upholding a rule for which the Commission explained how it would address antitrust implications).

²⁹³⁶ *State Farm*, 463 U.S. at 43.

²⁹³⁷ See, e.g., *NRDC v. EPA*, 808 F.3d 556, 570-71 (2d Cir. 2015).

that several members of the SAB expressed concerns along these lines.²⁹³⁸ The commenter states that the SAB expressed a similar concern in its majority report on the proposed rule:

It may not be feasible to identify and make available data in epidemiological studies that arise from small datasets or targeted geographic areas, especially if the Informed Consent Form indicated that only the particular researchers who conducted the study would have access to the information and data. If the participants agreed to grant only a select group of researchers access to their personal information, then that consideration should be respected, and such information should not be supplied to additional people for validation. It would probably be impractical, to go back to the participants and request their approval to provide additional people access to personal information.²⁹³⁹

Commenter (12731) states that the vagueness of the tiered access approach, if finalized, would render it arbitrary for another reason as well: researchers whose work is relevant to the regulatory process would no longer be able to pursue studies to ensure that the EPA could consider their findings. The commenter states that, by replacing its prior policy of considering peer reviewed studies with a prerequisite of indeterminate “tiered access” to data and models, the Agency has disregarded these stakeholders’ reliance interests in a predictable system for accepting and considering scientific information. The commenter states that the EPA has failed to provide the more detailed justification necessary for altering its policy in a way that would inject uncertainty into policy-oriented scientific inquiry.²⁹⁴⁰

Commenter (13788) asserts that the EPA’s failure to offer a reasoned explanation about how its proposed tiered access system would be implemented under this rule renders it unsupported and arbitrary. The commenter states that it is not enough for EPA in the SNPRM to introduce and vaguely discuss “tiered access.”

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science

²⁹³⁸ See SAB Consultation at B-10 (statement of Dr. Janice Chambers); *id.* at B-28 (statement of Dr. Kenneth M. Portier); see also *id.* (noting that owners of data may be unwilling to submit the data to a repository with tiered access).

²⁹³⁹ Final SAB Report at 10.

²⁹⁴⁰ *Cf. Nat’l Lifeline Ass’n v. FCC*, 921 F.3d 1102, 1114 (D.C. Cir. 2019) (noting that the agency had failed to take into account the reliance interests of certain telecommunications providers and their customers, who could lose access to service).

by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Establishment of the Data Repository

Comment: Commenters (10974, 11487, 11496, 11576, 11894, 12710, 12720, 12731, 13788, 11900, 12464) express concern that the EPA has not yet established a data repository nor established who or what entity will create and manage the tiered access approach.

Commenter (10974) states that, while the EPA described a model of private data treatment by the RDC, NCHS, CDC, there is no suggestion or reference in the SNPRM for how the EPA would establish this level of data stewardship, administration, and curation. Commenter (11900) asks how will researchers access data stored in a restricted-access enclave?

Commenter (11487) states that the EPA's proposal forces an untenable choice on researchers: know that their study will be inappropriately down weighted, or accept the problems that can accompany submission of their research into a repository that has not been satisfactorily described. The commenter states that, when environmental health researchers inform potential study participants that their data will be placed into such a repository, they will likely find it harder to recruit. The commenter states that the problem will be particularly acute in historically marginalized and disproportionately polluted communities whose involvement is essential.

Commenter (11487) states that the EPA's invocation of the NCHS's RDC acknowledges the necessity of establishing a way to provide carefully controlled access to identifiable data, but it fails to demonstrate that it has fully considered how such a model might be used for the many studies the Agency ought to be considering. The commenter states that the SNPRM language merely states that the RDC is a model, and that the EPA is conducting a pilot study on how RDC might host EPA datasets. The commenter states that this falls far short of the kind of detail necessary before finalizing a rule. The commenter states that, because the RDC contains data collected by CDC and other federal agencies, not by independent academic researchers, a great deal of additional work and infrastructure would be necessary before it could host the full range of data that should be informing EPA work.

Commenter (11576) notes that the EPA suggests that the RDC is a viable model for its tiered-access protocol. The commenter states that, as the protocol has yet to be fully developed, however, members of the public have no way of providing sufficient review or comment on the possible model. The commenter states that, at the time of publication of the SNPRM, there was no indication as to how long this evaluation will take and if it will be a successful model for implementation. The commenter states the EPA still has not provided a sufficient explanation as to how the Agency will consider all information available within a published study.

Commenter (11894) contends that the new proposal is opaque on the role the EPA intends to play in implementing a rule requiring studies and models to have public or restricted access to all data or code. The commenter states that the SAB conducted a consultation on mechanisms for

applying a tiered access approach for securing PII and confidential information in August 2019. The commenter states that no consensus was attempted but several SAB members were skeptical because the EPA had not provided any specifics of how to adapt such an approach for the rule.

Commenter (12720) states that the EPA highlights the RDC program as a model but does not explain how such an approach could be workable in the EPA context, nor does it explain the criteria that must be spelled out in a research proposal as a prerequisite for obtaining access to the data. The commenter states that the EPA apparently is planning to rely on CDC to fulfill major data management responsibilities made necessary in the SNPRM, but has not made that clear within the text of the SNPRM.

Commenters (12731, 12464) express concern that the EPA is entirely silent on who or what entity will create and manage the tiered access approach. Commenter (12464) states that, if the EPA intends to operate its own data enclave to administer the tiered access alternative, it should state that intention unambiguously, identify the source of its legal authority to do so, and address how it will pay for it. The commenter states that the SNPRM suggests that the EPA intends to address such issues in “implementation guidance,” (85 FR 15403), but they are far too fundamental to be left to guidance documents.

Commenter (13788) notes that the SNPRM references models in the RDC and CDC, mentioning that the EPA is currently conducting a pilot study using the RDC’s secure data enclave, but then the Agency also asserts that “[d]evelopment of standard data repositories is still ongoing.” The commenter states that, thus, even the EPA acknowledges that it is far from clear how this would actually work.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available.

Comment: Commenter (12710) asks if confidentiality agreements concerning PII in those studies can be overruled by whatever tiered access plan the EPA devises for such studies and, if so, at what risk to individuals and researchers?

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (12719) asserts that the EPA has not tested the proposed methods to ensure that private data would indeed remain secure. The commenter states that, without testing

their tiered approach, the EPA cannot be sure that it has protected individuals' privacy, which raises serious ethical and legal concerns about data privacy.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Detailed Descriptions of Tiering System

Comment: Several commenters (11391, 11392, 11396, 11399, 11894, 12464) contend the proposed revisions should include a more detailed description for implementation of the tiered system as described below. Commenters suggest the following implementation questions need to be addressed:

- How “tiered access” will be achieved? (12464)
- Who will determine which data and models count as “restricted”? (12464).
- To whom would the EPA release the otherwise restricted data and under what circumstances? (11396)
- Where data will be stored? (12464)
- Who will determine who has access to the stored data? (11396, 12464)
- Who will pay for the operation of such a system? (12464)
- How would the tiered access process be administered and funded? (11396)
- Where will such a system be housed within the Agency? (11392)
- The EPA is not a data management agency — does it have the capability to manage a large amount of sensitive data? (11392)
- Does the EPA have a robust cybersecurity strategy? (11392)
- Does the EPA have staff who are capable of running this system? (11392)
- How many people will the EPA need to hire? (11392)
- How will members of the public apply to access the sensitive data? (11392)
- Would the recipient(s) of the restricted information be a subset of the public with demonstrated scientific expertise? (11396)
- How will it evaluate the adequacy and integrity of any tiered access review that follows? (11396)
- Who at the EPA will determine external access to the data, and at what tier? (11392)
- Who at the EPA will determine what parts of the datasets belong in each tier of the system? (11392)
- How will this address restrictions put on PII protected by the Health Insurance Portability and Accountability Act, the NIH, and IRBs, which contain no applicable "tiered access" exemptions from privacy requirements? (11392)

- What framework or level of “tiered access” would be deemed acceptable to EPA? (11399)
- What is the difference between tiered and restricted access? Option 2 does not use the term “tiered access,” but nonetheless discusses (85 FR 15405) giving intermediate consideration to studies based upon data with “restricted access”? (11894, 12715)
- What standards will be used to determine what counts as “restricted data and models” subject to tiered access? (12464)
- Does the EPA mean to exclude restricted access in the first version and that tiered access is another term for publicly available? (11894)
- Is the EPA is proposing to consider studies where participants and researchers have agreed from the outset to a tiered access approach, or whether the Agency is proposing to itself provide tiered access to certain confidential data, even where researchers and study participants have not agreed to such sharing at the outset? (11391)

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenters (9455, 12457, 12731) contend that the EPA fails to provide sufficient description or necessary analysis of the Agency’s envisioned tiered access approach. The commenters suggest that the following information is necessary:

- Discussion of the process of allowing access to its tiered program other than noting that the highest tiers would be accessed only by “certified” researchers (9455).
- Description of “certified researchers” (9455).
- Description of how a demander of access would be judged to merit access (9455).
- Identification of the access fees, a potential barrier to the public but not to regulated industry (9455).
- Protocols for this tiered sharing approach (12457).
- Descriptions of who will be given access to the different data tiers (12457).
- Operational details associated with sharing data (12457).
- What data platforms will be used to publicly share data that will enable publicly shared tiered and non-tiered data (12457).
- What funding sources will be made available to cover the additional time and cost of data sharing (12457).
- Details relating to the determination of tiers (12731).
- Procedures for granting access to various tiers of data; operation, curation, management and oversight of data repositories; data repository ownership (12731).
- Whether, and if so, how repositories involving PII and CBI could be legal (12731).

- Safeguards to prevent hacking of web-based repositories (12731).
- Liability implications for researchers handling PII or CBI (12731).
- Considerations relating to the extent to which study authors would participate generally (12731).
- Costs (12731).
- How the Agency would ensure compliance with such statutory requirements or evaluate the extent of the restrictions they might place on its tiered access approach (12731).

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (11576) notes that the SNPRM states that “[u]nder a tiered approach to accessing data and models that include CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects, access is more restricted for more sensitive data and models. Thus, the amount of information available for analysis is dictated by the tier. The greatest amount of information is made available at the most restricted access tier.” The commenter states that this fails to describe what criteria must be met or what grounds any member of the public—including researchers or advocates—must have in order to access potentially sensitive information.

Commenter (11890) states that the alleged transparency sought by this SNPRM cannot be obtained for many public health studies if the EPA honors existing legal and ethical requirements for protecting participants' privacy. The commenter states that these study results would need to be restricted (tiered access) to researchers with legal data-sharing agreements and safeguards regarding protection of privacy.

Commenter (12720) contends that, even if access is restricted, the EPA needs to ensure that parties accessing the data (whether EPA staff, EPA consultants, or the public) are legally bound to protect the information, such as through a non-disclosure agreement, data use agreement or the like.

Commenter (12731) express concern that the proposed regulation should clearly address the issue of obtaining public access to datasets while maintaining the privacy of the participants and confidentiality of the data, because without such access, sensitive data and CBI could be excluded entirely from consideration as pivotal regulatory science."²⁹⁴¹

²⁹⁴¹ Final SAB Report at 3.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (11900) notes that the SNPRM described the restricted access tier as “limited to authorized researchers and not possible for the general public.” The commenter states that, however, the EPA does not define a process for vetting applicants or criteria for granting access. The commenter states that restricted access must be limited to researchers with a legitimate scientific interest in the data, otherwise restricted access is simply ‘accessible to the public by application.’ The commenter states that the RDC, identified as a possible model by the SNPRM, requires researchers “submit a research proposal outlining the need for restricted-use data.” The commenter states that a stated primary goal of the SNPRM in making data available is to support reanalysis of study data. The commenter states that it is unclear on what basis applications seeking to perform reanalysis would be judged, because reanalysis is not typically considered research. The commenter states that the EPA must clearly define how applications to access restricted-access data will be evaluated.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (11900) states that an established practice for evaluating applications for controlled data is to have a Data Access Committee, rather than leave decision-making in the hands of a single individual. The commenter states that, for example, large intramural research studies conducted by the National Institute of Environmental Health Sciences (NIEHS), including the Sister Study and Agricultural Health Study, have committees to review data requests.²⁹⁴² The commenter states that advises the EPA to establish a Data Access Committee that includes equal representation by academic scientists, industry scientists, public-interest researchers, and community members who are nonscientists. The commenter states that, similar

²⁹⁴² Freeman LB, Blair A, Hofmann J, Sandler DP, Parks CG, Thomas K. Agricultural Health Study Policy 2-4: Guidelines for Collaboration. 2017 [Available from: https://aghealth.nih.gov/collaboration/AHS%20Policy%202-4%20Guidelines%20for%20Collaboration_2017.1.pdf] Sister Study. The Sister Study Data Sharing Policy. [Available from: <https://www.sisterstudystars.org/Public/Sister/Documents/Data%20Access%20Policies%20and%20Procedures.pdf>].

to requirements for IRB membership (21 CFR section 56.107), the committee should have diversity of membership (including race, gender, and cultural background), and members must not have any conflict of interest with the applications they are evaluating.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Implementation of the final rule will consider existing best practices for data governance.

Comment: Commenter (12699) suggests the any limiting of the release of underlying information, if required, should be narrowly tailored to cover only the specific information that is unable to be disclosed. The commenter states that through a tiered approach, researchers signing non-disclosure requirements should be able to gain access to the restricted information. The commenter states that one exception would be if there was a genuine concern for access to be provided even to researchers signing non-disclosure agreements or who have been subject to other privacy and related requirements.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Opportunity to Comment on Tiered System

Comment: Commenters (11393, 11184, 11407, 11576, 12403, 12412, 12474, 12731, 13549, 12464) assert that, in the SNPRM, the EPA has failed to provide the requisite public notice.

Commenters (11393, 11184, 11407, 11576, 12412, 12474, 13549) state that this vague aspiration—saying a tiered approach to accessing data is possible, without details—is insufficient and before the EPA can finalize the rule, it must lay out and analyze those approaches for public review and comment. Commenter (12731) asserts that, without any specific proposals as to how it would implement its preferred tiered access approach, the EPA has failed to provide the requisite notice.²⁹⁴³

Commenter (11576) asserts that the tiered-access approach introduced in the SNPRM problematically and arbitrarily relies on an approach to be developed in the future without

²⁹⁴³ See *Small Refiner Lead Phase-Down Task Force*, 705 F.2d at 549 (“Agency notice must describe the range of alternatives being considered with reasonable specificity. Otherwise, interested parties will not know what to comment on, and notice will not lead to better-informed agency decision-making.”); see also *id.* (“This is doubly true under Clean Air Act § 307(d)(3), which requires EPA to issue a specific ‘proposed rule’ as a focus for comments.”).

providing commenters with the opportunity to comment on the exact tiered-access methodology it will use.

Commenter (12464) suggests that the EPA has not fully thought through the implications and legal challenges to a tiered access system. The commenter states that the public does not have enough information on such a program and therefore the EPA has not given the public a meaningful opportunity to comment on the proposal. The commenter states that it is not clear how the tiered access alternative would be implemented or who would be responsible for implementing it. The commenter states that the tiered-access alternative in the SNPRM contains multiple gaps and ambiguities.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. Implementation of the final rule will consider existing best practices for data governance.

Comment: Commenters (11392, 12720, 13788, 14397) assert that it is inappropriate for EPA to use the public comment period to illuminate issues that the Agency itself should have clarified within the original proposal and SNPRM.

Commenter (11392) asserts that the Agency's solicitation for public comments on this matter is insufficient given the paucity of details on this proposed solution to the publication limitations of sensitive data.

Commenter (12720) states that it is clear that the EPA has not adequately planned for the major complications to science activities imposed by the SNPRM, because the EPA is seeking the public to resolve fundamental implementation issues through the public comment period. The commenter states that, given these clear deficiencies, the SNPRM should be withdrawn.

Commenter (13788) states that the EPA's assertion that "[i]nformation received during this public comment period will, among other things, help inform improved guidance and best practices related to preserving and providing access to data," does not allow commenters access to sufficient information about the course the Agency's final rule will take to permit meaningful comment. The commenter states that the whole point of an SNPRM is to clear things up and to allow enough release of information to permit the public to evaluate fully what the Agency is proposing. The commenter states that the EPA has failed in that regard concerning its proposed tiered access approach.

Commenter (14397) states that, not only is the EPA proposing a major change to the way science is evaluated with regard to public health, but now the EPA doesn't even have a clear idea

of how this policy should be implemented. The commenter states that this proposed approach would incorporate suggestions from commenters on policy implementation without giving the public a chance to review and comment on them. The commenter states that this approach ignores the nation's system of public input and amounts to no more than wishful thinking that an acceptable approach will present itself. The commenter states that this tiered approach proposal would rank studies in a way that is, ironically, lacking in transparency.

Response: Implementation of the final rule will consider existing best practices for data governance.

Privacy Concerns

Comment: Commenters (11192, 11361) state the proposal does not describe how tiered access would effectively mitigate privacy concerns, especially as it provides no description regarding those who could gain access to different tiers of data.

Commenter (12731) states that the EPA fails to assess the legal and practical barriers to implementing tiered access.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. Implementation of the final rule will consider existing best practices for data governance.

Comment: Commenters (9455, 12715) express concern that the tiered process to gain access to CBI, proprietary information, or PII may lead to cybersecurity concerns.

Commenter (9455) states that, even if privacy protection could be accomplished satisfactorily, the EPA cannot guarantee that hackers could not enter the website and alter the data. The commenter states that protecting databases from intrusion is known to be an often-lost arms race. The commenter states that frequent news items about hacking of databases kept by large corporations and governmental agencies demonstrate this cybernetic problem. The commenter states that many parties have motivation to alter the data being proposed for EPA's public posting. The commenter states that the EPA proposes to post immense databases, analyses and models for all new standards and regulations spanning every aspect of environment and environmental health. The commenter states that the potential for massive disruption looms large. The commenter states that, while the EPA is testing tiered access by using the RDC program, most data in the RDC have nothing to do directly with industrially or commercially important standards and do not invite hacking except possibly by pranksters and ransomware blackmailers. The commenter states that they contrast with the data to be posted by EPA which

would underlie standard-setting. The commenter states that the EPA data would be a prime target for funded hackers to impose re-identification of medical data and to falsify the database by making changes designed to disprove effects of pollution.

Commenter (12715) states that this presents yet another reason that data are not made publicly available, which the SNPR does not address. The commenter states that, accordingly, cybersecurity issues need to be addressed to protect the identity of all participants in a study. The commenter notes that the National Academy of Sciences states that the identification of personal information is a cybersecurity concern:

In addition to cybersecurity concerns, computer scientists and cryptographers have demonstrated that statistical analyses of data sets that generate highly precise results—such as geographic specificity or other characteristics that identify respondents—may result in privacy breaches. This presents a new challenge that federal statistical agencies are just beginning to address.²⁹⁴⁴

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. Implementation of the final rule will consider existing best practices for data governance and protection.

Comment: Commenter (11492) asserts the tiered-access approach, by which data that cannot be made public can be shared with a few for independent validation, is unworkable because it is illegal to share personal health data with anyone, so sharing it with one or a handful of people is just as illegal as sharing it with the general public.

Commenter (11399) states that it is questionable whether a tiered approach is feasible or could be managed to the extent that confidentiality could be maintained.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting

²⁹⁴⁴ NAS Letter at 4.

sensitive information. Implementation of the final rule will consider existing best practices for data governance and protection.

Comment: Commenters (11192, 11361) contend that there are significant barriers to producing multiple datasets for different tiers of access, but perhaps the most obvious vulnerability in the proposal of a tiered access is that the EPA does not provide any criteria or suggested process regarding who would or could receive access to which tiers of data. Commenter (11361) states that, while the EPA mentions the potential creation of multiple versions of datasets that include privacy-related data transformations, the Agency fails to acknowledge that any data that needed to be transformed for any tier would need to be transformed for all tiers.

Commenter (11576) notes that the SNPRM states that “risk reduction techniques include creating multiple versions of a single dataset with varying levels of specificity and protection[,]” and that “[t]he benefit of tiered access is that data users who wish to conduct activities with a statistical purpose without first obtaining special authorization have access to the versions of the data in the least restricted tiers, allowing them to conduct research while protecting confidentiality.” The commenter states that, while the notice is unreasonably short on specifics, this suggests how the tiered-access approach might operate, with tiers that are less or more restricted than others. The commenter states that the EPA does not describe which users would be granted access to the vague “higher restricted tiers” and, importantly, what type of information would be made available at each tier. The commenter states that there is not any indication of who would be responsible for reviewing access requests and otherwise managing the large databases the revised proposal would require. The commenter states that, based on the Agency’s recent statements to the House Committee on Science, Space, and Technology, it appears the EPA intends for this burden to be shouldered by other agencies and private institutions.²⁹⁴⁵

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. Implementation of the final rule will consider existing best practices for data governance and protection.

Recommendations

Comment: Commenter (9587) suggests the EPA be required to provide clear and explicit reasons why a proposed replication study should not be permitted.

²⁹⁴⁵ Democratic Staff of the House Committee on Science, Space, and Technology, Summary of Staff-Level Briefings from the Environmental Protection Agency on the “Strengthening Transparency in Regulatory Science” Supplemental Proposed Rule (April 30, 2020) (attached), at 3.

Response: In this final rule, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as “pivotal science,” the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. Future statute-specific rulemakings may interpret “pivotal science” more broadly.

Comment: Commenter (11401) recommends that the EPA, in conjunction with this rulemaking, review its program for ensuring rigorous oversight of CBI, proprietary data or PII program. The commenter states that, for those studies that are not either fully transparent or transparent with tiered access, the EPA should determine that they cannot be used solely as the basis for a regulatory action or when finalizing influential scientific information. The commenter states that such studies may be considered, but alone cannot form the basis of a regulatory action without the inclusion of a fully transparent or transparent with tiered access study.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. Implementation of the final rule will consider existing best practices for data governance and protection.

Comment: Commenter (12720) suggests the EPA consider developing tiers of public access that may provide a base level of information (e.g., a robust summary or final study report which is devoid of confidential protected information) for the general user or member of the public and then restrict the availability of additional information to a smaller group when access to confidential or copyrighted information is warranted. The commenter states that, in matters of public health, it is common to require disclosure to a trusted third party. The commenter states that, in the case of environmental epidemiological studies, micro-aggregation of data can be used to protect personal identity.

Commenter (12720) notes that the SAB letter states that it may not be practical for EPA to make all studies or other regulatory science used in a final regulatory action available to the public. The commenter suggests the EPA consider producing a list of study data considered in an

evaluation and then strive to provide data for critical studies driving regulatory limits. The commenter states that the SAB notes that:

the requirement to make data available for public inspection will be more easily implemented for some datasets than others (*e.g.*, GLP [Good Laboratory Practices] studies include individual sample data as part of standard reporting). The expectation that data and methods will be available for all endpoints may be unrealistic. EPA could consider designating scores for information availability with the highest tier assigned to studies that define methods (*e.g.*, protocol) as well as raw (individual sample level) data. Additional scores could be driven by sharing data on other related endpoints in the pivotal study to facilitate data interpretation. Scores could subsequently be used to evaluate data utility, uncertainty, etc. Ultimately, there are some datasets where CBI and/or PII data will require more onerous steps to protect data confidentiality. Based on EPA responses to SAB questions, it appears that the Agency is seeking approaches to manage these data issues.²⁹⁴⁶

Commenter (12720) notes that any such scoring method has not been detailed by EPA in the SNPRM and could be biased given the unclear definitions and lack of evaluation criteria. The commenter states that, while the EPA may be “seeking approaches” to manage data issues, those issues should have been resolved by EPA before issuing the SNPRM. The commenter states that any such approaches determined by EPA itself in preparation of a proposed rule must be set forth for robust public inspection and comment because they are central to the ultimate impact of the SNPRM within the Agency and on stakeholders outside of the federal government. The commenter states that the SAB comment identifies “data utility, uncertainty, etc.” as potential components of a scoring tool, but this is a poor representation of the complexity and depth of information available in scientific studies that would require consideration.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (*e.g.*, Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. Implementation of the final rule will consider existing best practices for data governance and protection.

7.1.3.8 Researchers

7.1.3.8.1 Burden

Comment: Commenter (11377) states that the expansion of scope represented by the SNPRM increases the already substantial burden that this rule would place on researchers to ensure the privacy and confidentiality of research subjects. The commenter states that the rule fails to

²⁹⁴⁶ 2020 SAB Letter to the Administrator.

acknowledge the enormously burdensome and costly complexities involved in redacting individuals' information in a way that both protects individuals' privacy and ensures that the data is still useful for future analysis. The commenter states that the SNPRM would make this problem worse, as burdensome redaction would be required for influential information, rather than only regulatory decision-making information.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenter (11391) states that many of the studies the EPA has traditionally relied on in regulating environmental pollutants necessarily involve confidential human health data. The commenter states that researchers, and the institutions that employ them, have a legal and ethical obligation to protect the privacy of study participants. The commenter states that, if enacted, the rule—particularly as expanded in the 2020 SNPRM—would make it much more difficult for researchers to fulfill that obligation and credibly promise study participants that their patient information will remain confidential. The commenter states that this could have a serious chilling effect on the conduct of important public health research in the U.S. The commenter states that privacy concerns would almost certainly hamper such research.²⁹⁴⁷ The commenter states that critical lines of scientific inquiry that would have been pursued may not be and the quality of data that is obtained may be poorer than it otherwise would have been.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data

²⁹⁴⁷ See Will Thomas, Science Committee Renews Scrutiny of EPA Science Transparency Rule, American Institute of Physics Bulletin, Nov. 20, 2019 (citing a physician representing the American Thoracic Society who suggested the rule could have a chilling effect on individuals' willingness to participate in epidemiological studies).

enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenter (11392) states that, if the EPA expects researchers to implement this system, then the Agency is creating enormous new requirements for the research community. The commenter states that describing such requirements simply as "multiple versions of a single dataset with varying levels of specificity and protection" is excessively vague for such a monumental overhaul of how the Agency considers science in its rulemaking. The commenter states that, if the EPA intends for the scientific community to adopt — and potentially implement — these dataset and access requirements, it is not offering researchers a meaningful description of the parameters on which they can comment. The commenter asks the following questions:

- If the intent is for the researcher to determine the appropriate level of access, who would determine whether a researcher's determined access levels appropriately met the requirements of the rule?
- Would researchers be expected to review the applications for reanalysis in perpetuity?
- Has a cost analysis been done to assess the burden this rule would place on researchers and on the institutions hosting the data?
- What happens if a research team has since disbanded?
- Does the EPA expect researchers in other countries to work with the Agency to manage such a data access system so their studies can be used by the United States government?

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (11479) states that, even for the subset of research studies that could be shared within a tiered-accessed system, implementation of such a system would be onerous, costly, and infeasible for several reasons. The commenter states that de-identification of data would be an immense undertaking and is not feasible in many cases and for many study designs, particularly because the EPA is concerned with environmental threats. The commenter states

that, to understand environmental threats, researchers often must know the precise locations of parameters such as environmental exposure and health effect occurrences in a subject population. The commenter states that, in many studies, these locations are personally identifying. The commenter states that it is difficult and often impossible to release this data in a way that protects study subjects' identities,²⁹⁴⁸ and this exercise would be required under the tiered-access approach proposed in the EPA's SNPRM. The commenter states that, while the rule does not make this clear, researchers would bear the burden of deciding and implementing the tiered-access system for their data, according to EPA's conversations with Congress.²⁹⁴⁹ The commenter states that the rule may make researchers wary of participating in policy-relevant research. The commenter states that this potential effect is antithetical to the stated goals of the proposed rule.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (11495) states that, even before this new expansion of scope, it was already apparent that the Agency would be unable to handle the immense logistical and technical challenges this new rule would create. The commenter states that the EPA has previously not provided web-based or clearinghouse depots for the posting of data, assuring quality control, nor have they provided a system to ensure database integrity and maintenance. The commenter states that this has been the case even in more innocuous situations that don't involve personal privacy and proprietary issues. The commenter states that, even with this dramatic expansion in the scope of data sharing requirements, there has been no indication that the EPA is ready or willing to take the responsibility to develop such a clearinghouse website to house data and the associated information or metadata, including defining a structure with all protections and securities. The commenter states that such a data system is beyond the scope and complexity of any data system

²⁹⁴⁸ Schwartz, Joel. "Transparency" as mask? The EPA's proposed rule on scientific data." N Engl J Med 379, no. 16 (2018): 1496-1497.

²⁹⁴⁹ Johnson, E.B. 2020. Letter to the Democratic Members of the Committee on Science, Space and Technology, May 6. Online at <https://science.house.gov/imo/media/doc/Letter%20and%20Memo%20-%20EBJ%20to%20SST%20Dem%20Caucus%20re%20Transparency%20Rule.pdf>, Accessed May 14, 2020.

the EPA has previously developed for its internal use nor does it easily fit the existing models used by the Agency, such as the one used for its Air Quality System for monitoring data. The commenter states that this system is fully contracted, maintained and assessed outside the direct control of the Agency. The commenter states that, given that the EPA will be unable to handle all of these new responsibilities, it is clear that this SNPRM will instead impose tremendous burdens on researchers and scientists outside the Agency. The commenter states that scientists and researchers will have to take time-consuming steps to make the data underlying their studies publicly available in order to have their study considered by EPA.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

7.1.3.8.2 Funding

Comment: Commenters (10748, 12418, 12731) express concern that there is no financial support for researchers to redact data, host data, and/or provide tiered access infrastructure to the databases.

Commenter (10748) states that there is no financial or technical support for researchers, which would reduce the capacity of researchers to produce unbiased and credible research. The commenter states that the Agency would also need financial support to host data and provide tiered access infrastructure to the databases. The commenter states that this too would be expensive and burdensome to the Agency. The commenter states that, with the current effective review process and with leading scientific publications already encouraging data transparency, it does not make fiscal sense for the Agency to implement this rule. The commenter states that the proposed rule would, without doubt, impede the development and utilization of new science. The commenter states that the cost of doing research both in investigator time and required funding to develop regulated processes for broad access to data would be substantial, yet the SNPRM does not define any financial and technical support for researchers in this regard. The commenter states that, without defined financial and technical support, the result would be a crippling, if not an elimination of the strong, crucial science that has been the backbone of existent, validated regulatory reviews per the CAA mandate and found in other environmental statutes. Instead researchers may have to turn to other funding sources making their work biased and less credible.

Commenter (12418) states that the EPA has not specified the process for de-identifying data, ensuring study participant privacy, and covering associated costs, if the proposed rule is indeed adopted. The commenter states that the EPA has not indicated whether the researchers or the Agency will bear the cost of providing de-identified data and models upon request, and/or creating the additional versions of a dataset to support tiered access. The commenter states that, if the responsibility falls to researchers, this hurdle will likely further limit which studies will

become available for consideration given that costs to de-identify data and additional resources to comply with data and model sharing requirements are not typically requested in grant budgets. The commenter states that, if instead the EPA will cover the cost of deidentifying data and models to sufficiently comply with the proposed rule, the anticipated costs should be assessed along with other proposed merits and drawbacks. The commenter states that the costs of de-identifying data, appropriately managing those data, and ensuring that no PII is released for the foreseeable future may far outweigh any perceived benefits of this rule.

Commenter (12731) states that recent information has also underscored the EPA's failure to consider the costs to researchers of demanding that older data be made available for reanalysis (either to the public or through a tiered access mechanism), and the implications that cost would have on EPA's access to regulatory science. The commenter states that, for example, SAB member Robert W. Merritt commented in the SAB's September 2019 consultation that data from older studies may be located in obsolete storage media or data formats that are either impossible or very costly to convert to a shareable form.²⁹⁵⁰ The commenter states that, because the grants funding older studies have already lapsed, there would likely be little to no funding available for datasets owned by academic and non-profit institutions to be shared—meaning that much of this research would not be eligible for EPA's consideration, and that the EPA might be drawing from a biased pool of for-profit industry studies.²⁹⁵¹ The commenter states that, previously, the EPA had accepted some responsibility for making information publicly available in a “cost-effective” way.²⁹⁵² The commenter states that now, it has disclaimed this role and abandoned any pretense of contributing to the transparency and validity it supposedly seeks, opting simply to discard studies out of hand (85 FR 15402).

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public

²⁹⁵⁰ SAB Consultation at B-24 to -25.

²⁹⁵¹ *Id.*

²⁹⁵² 83 Fed. Reg. at 18,771 (“EPA should collaborate with other federal agencies to identify strategies to protect confidential and private information in any circumstance in which it is making information publicly available. These strategies should be cost-effective.”).

interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (12464) states that an industry representative who wants access to such data faces no costs or burdens. The commenter states that, instead, academic researchers and universities would assume the responsibility and the financial burden of managing the logistics of making the data and models publicly available. The commenter states that, even then, the EPA is under no obligation to consider or use the study to inform its regulatory or informational processes. The commenter states that, even research, such as the Six Cities Study,²⁹⁵³ that has been subject to a comprehensive reanalysis by the Health Effects Institute,²⁹⁵⁴ would apparently not be eligible for consideration under the SNPRM, because its data are not available for further reanalysis by other researchers.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

7.1.3.8.3 Other

Comment: Commenter (11495) states that the SNPRM imposes implicit obligations on parties outside the federal government, including on researchers and potential study participants. The commenter states that researchers are often obligated to protect the confidentiality of study participants, and the SNPRM would require researchers to either breach those confidentiality agreements or risk the loss of willing study participants.

Response: The underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (11497) asserts that the requirements for the public availability of data will not only undermine the inclusion and use of previously conducted epidemiological studies in the pool of “influential scientific information” and the science underlying “significant regulatory decisions”; they will also damage the ability of researchers to conduct future studies. The commenter states that researchers’ ability to recruit potential study participants will be severely undermined if participants fear that their personal information may be made available for public

²⁹⁵³ Douglas W. Dockery et al., An Association between Air Pollution and Mortality in Six U.S. Cities, 329 New England J. Med. 1753 (1993).

²⁹⁵⁴ Health Effects Institute, Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality (2000), <https://www.healtheffects.org/system/files/HEI-Reanalysis-2000.pdf>.

scrutiny. The commenter states that this is particularly true for communities of color that are both disproportionately exposed to hazardous chemicals and have historical reasons to distrust researchers; yet, it is the exposures to these communities, and the resulting health effects, that most need to be understood and addressed.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. The underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (12435) contends the SNPRM could increase the burdens facing science and health researchers. The commenter states that the proposal disadvantages scientists and clinical researchers whom this proposed rule would burden with reporting requirements, and study subjects whose participation and data would be prevented from informing public policy. The commenter states that the exclusion of many studies from informing policy has a direct impact on the scientific community whose work will be devalued under this proposal. The commenter states that pressure for underlying data to be public will induce participation bias in studies; people will be less likely to participate if their privacy is not assured. The commenter states that there is immeasurable harm done by politicization of the scientific basis of Agency rulemaking that Congress unquestionably intended to prevent when it mandated the role of scientific advisory boards under the CAA.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. The underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (12457) states that the proposed revisions should include a detailed analysis that examines how these proposed revisions would impact laboratories and study investigators.

Response: The EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information for independent validation. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating

author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

7.1.3.9 Potential Bias with Tiered System

Comment: Commenter (9455) states that the proposed rule fails to consider the probability of distorting studies because of minority distrust, privacy concerns, and allowing industrial access. The commenter states that the small amount of social science that analyzed the broad informed consent form indicates that members of traditionally discriminated against minority groups and people concerned about privacy shy away from giving broad consent. The commenter states that knowledge that for-profit companies will have access to the data also results in lower broad consent.²⁹⁵⁵ The commenter states that participants in studies to be used for EPA regulation under the proposed rule would have to be informed that the data would be posted and that regulated industries would have access to them before they are asked to sign the broad informed consent forms.

Commenter (12435) asserts that pressure for underlying data to be public will induce participation bias in studies; people will be less likely to participate if their privacy is not assured. The commenter states that there is immeasurable harm done by politicization of the scientific basis of Agency rulemaking that Congress unquestionably intended to prevent when it mandated the role of scientific advisory boards under the CAA.

Commenters (11192, 11361) contend that there are significant barriers to producing multiple datasets for different tiers of access, but perhaps the most obvious vulnerability in the proposal of a tiered access is that the EPA does not provide any criteria or suggested process regarding who would or could receive access to which tiers of data. The commenters state that, as written, the EPA could grant access to industry personnel eager to poke holes in public health studies and decline access to academic researchers interested in evaluating industry studies.

Commenter (11192) states that the proposal does not describe how tiered access would effectively mitigate privacy concerns, especially as it provides no description or metrics regarding those who could gain access to different tiers of data. The commenter states that this omission introduces an extraordinary potential vulnerability to political bias.

Response: The EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information for independent validation. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are

²⁹⁵⁵ Garrison N, Sathe N, Antommaria A, Holm I, Sanderson S, Smith M, McPheeters M, Clayton E. 2016. A systematic literature review of individuals' perspectives on broad consent and data sharing in the United States. *Genet. Med.* 18(7): 663-671.

available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (11479) states that it is unlikely that stakeholders such as the public and community groups would pay the necessary high costs to access data that has already been vetted through peer-reviewed studies. The commenter states that the exception is regulated industry, which is likely to be the only EPA stakeholder group interested and able to access data housed in a tiered-access system. The commenter states that the SNPRM makes clear that the rule’s intent is to allow stakeholders the opportunity to “reanalyze the data and models and explore the sensitivity of the conclusions to alternative assumptions...”²⁹⁵⁶

Response: This rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (12430) states that discouraging individuals or particular groups of people from participating in future studies would introduce bias into the studies, to the detriment of the public interest in protecting health and the environment. The commenter states that, to the extent that researchers require the public availability of data for future studies, this could have a chilling effect on people’s willingness to participate. The commenter states that the possibility of identification, with the specter of denial of future employment or benefits based on disclosure of medical information, may make some population groups less likely to participate in future studies. The commenter states that this chilling effect has important implications for environmental justice, as it may become more difficult to conduct studies in communities of concern.

Commenter (12702) asserts that the SNPRM allows arbitrary decisions to be made about what science can and can’t be used. The commenter states that environmental laws direct the EPA to use the “best available science” in countless situations. The commenter states that the SNPRM creates multiple confusing pathways for considering long standing public health studies, including the Option of “tiered access” or giving preference to some studies over others. The commenter states that the EPA’s purported goal of “transparency” means studies will be evaluated not on their quality but on non-scientific ill-defined metrics.

Commenter (12720) expresses concern that the proposal does not sufficiently explain how a tiered access system would avoid biased handling of data and models at EPA.

²⁹⁵⁶ Goldman, G. 2020. The Trump EPA Is Restricting EPA Science. It’s Somehow Worse than We Expected. Cambridge, MA: Union of Concerned Scientists.

Response: The EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information for independent validation. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (12731) states that, because the grants funding older studies have already lapsed, there would likely be little to no funding available for datasets owned by academic and non-profit institutions to be shared—meaning that much of this research would not be eligible for EPA’s consideration, and that the EPA might be drawing from a biased pool of for-profit industry studies.²⁹⁵⁷

Response: This rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (12731) asserts that the EPA has completely disregarded the potential for pro-industry bias by considering studies for which interested parties have arranged for tiered access. The commenter states that the EPA’s recent briefing to House Science, Space, and Technology Committee staff underscores how the tiered access approach would preference industry interests: researchers would be responsible for managing the logistics of making data and models publicly available and establishing levels of tiered access;²⁹⁵⁸ a time- consuming and labor-intensive process for investigators who have already concluded their work and published their findings, possibly having expended the full amount of funding available, unless specially interested third parties bankroll the process.²⁹⁵⁹ The commenter states that, once established, tiered access would also allow financially interested, repeat players such as regulated entities to test the findings of whatever studies they dislike. The commenter states that the EPA has thus proposed to establish a requirement that would favor industry interests by compelling disclosure of data and methods that regulated entities can more readily furnish and that only regulated entities will likely have the resources and motivation to scrutinize with any frequency. The commenter states that such favoritism in the Agency’s rule would be arbitrary unless somehow

²⁹⁵⁷ SAB Consultation at B-24 to -25.

²⁹⁵⁸ Memo to Chairwoman Johnson, *supra* note 120, at 2.

²⁹⁵⁹ See SAB Consultation at B-25 (comments of Robert W. Merritt).

grounded in its authorizing statutes.²⁹⁶⁰ The commenter states that the EPA would need to assess, consider, and balance the substantial unfair advantage industry would receive against any theoretical, marginal increase in the reliability of scientific information that could result from a tiered access approach.

Response: The EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information for independent validation. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. This rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (12720) states that the claim that publicly available dose response data and models would allow for independent validation stands in direct contradiction to the legal privacy protections that apply to key data necessary for re-analysis. The commenter states that the proposed partial redaction of sensitive information poses a cascading set of problems, because the statistical models characteristic of epidemiologic investigations rely on the inclusion of potentially confounding variables (e.g., age, sex, home address, health status, diet and alcohol consumption, smoking history) in order to properly isolate the pollution-health relationship with precision.²⁹⁶¹ The commenter states that, to understand the dose-response connection, these studies analyze detailed health, demographic, spatial, and behavioral information from thousands of people. The commenter states that this information is extremely sensitive and collected at the individual level. The commenter states that, as such, our nation's health privacy laws and IRB protocols require researchers to keep the data secure and confidential to prevent misuse. The commenter states that, collectively, these data points help researchers understand and isolate the cause-effect relationship between exposure to air pollution and risks for various health problems. The commenter states that it would be extremely difficult if not impossible for anyone using

²⁹⁶⁰ See *Cent. Fla. Enters., Inc. v. FCC*, 598 F.2d 37, 41 (D.C. Cir. 1978); cf. *Action for Children's Television v. FCC*, 564 F.2d 458, 480 (D.C. Cir. 1977) (upholding a rule against a claim of pro-industry bias); see also *Am. Trucking Ass'ns, Inc. v. EPA*, 175 F.3d 1027, 1052-53 (D.C. Cir. 1999), rev'd on other grounds sub nom. *Whitman v. Am. Trucking Ass'ns*, 531 U.S. 457 (2001) (concluding it was arbitrary for EPA to disregard study based on informational criteria not applied to other such studies).

²⁹⁶¹ For example, see confounding variable adjustment in Pope III, C. A., Burnett, R. T., Thun, M. J., Calle, E. E., Krewski, D., Ito, K., & Thurston, G. D. (2002). Lung cancer, cardiopulmonary mortality, and long-term exposure to fine particulate air pollution. *JAMA*, 287(9), 1132-41.

partially-redacted data sets derived from epidemiologic cohort studies to “validate” the results of the original studies, because such investigators would not be working with complete data sets.

Commenter (12720) states that, as further demonstration, the 2009 Integrated Science Assessment for PM_{2.5} notes that “[a]ppropriate statistical adjustment for confounders requires identifying and measuring all reasonably expected confounders.”²⁹⁶² The commenter states that, therefore, exclusion of some potentially sensitive confounding variables from an underlying dataset likely would lead a different team of investigators to a different result. The commenter states that causing this wrongheaded and indefensible outcome results from the core approach and conceit in the proposal, revealing it to be yet again, arbitrary and capricious and an abuse of EPA discretion. The commenter states that the quantitative findings of dose-response relationships would almost certainly differ, not as a result of any true difference in the quantitative exposure-effect relationship, but because the original work relied on complete data sets and the new analyses would not—due to the proposal. The commenter states that the resulting discrepancies in quantitative findings could serve as motivation to call the original study results into question due to faulty and incomplete re-analyses.

Response: The EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information for independent validation. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

7.1.4 40 CFR 30.5: Option 2

7.1.4.1 Support/Oppose Option 2

7.1.4.1.1 Support Option 2

Comment: Commenters (9362, 10973, 11358, 11388, 11395, 12395, 12397 12406, 12453, 12471) support Option 2.

Commenter (9362) asserts their preference for Option 2 of section 30.5 but notes the phrase “other things equal” should be deleted. The commenter questions who makes the determination that “other things are equal” and states that each study should stand on its own merits and those studies in the public domain should be given greater consideration. Additionally, the commenter approves of the statement “Furthermore, the Agency will identify those studies that are given

²⁹⁶² U.S. EPA, Integrated Science Assessment (ISA) for Particulate Matter (Final Report, Dec 2009), 1–16, Washington, DC, EPA/600/R-08/139F, 2009.

greater consideration and provide a short description of why greater consideration was given,” as long as all relevant scientific information has been considered and is documented in any EPA decision-making.

Commenter (10973) states that the EPA’s alternative approach giving priority for publicly available studies is commendable. The commenter states that this is more of an “opt out” scenario where all appropriate scientific information is considered unless there is a specific reason to exclude it. The commenter states that, at the same time, this approach will continue to encourage open access to data and models. The commenter states that this approach is reasonable in that it furthers the goals of transparent rulemaking and open access to scientific data while recognizing that some relevant scientific information may not be fully publicly available. The commenter states that the EPA’s attention to detail in this rulemaking is essential to assure the appropriate balance of transparency with inclusion of all relevant scientific information, while addressing necessary privacy and confidentiality concerns.

Commenter (11358) states that this alternative approach will give the Agency appropriate flexibility when implementing this new policy. The commenter states that the EPA should refrain from banning all studies from being utilized within the regulatory process solely due to data availability. The commenter states that, for data that is not produced by EPA, such as data used for studies, which have been published in scientific journals, the process of peer reviewing may often be sufficient. The commenter states that, as the EPA notes in the SNPRM, raw data may not be available for a variety of reasons including privacy, age of the data, etc. The commenter states that this proposed alternative will ensure that the EPA is in a position to use all available data to inform the Agency’s decision-making process.

Commenter (11395) states that, of these two alternatives, Option 2 is preferable because it does not automatically eliminate a wide range of well-conducted studies that cannot comport with the data availability specifications.

Commenter (12406) states that Option 2 is consistent with their 2018 comments, specifically that scientifically relevant and reliable studies should not be eliminated from consideration, but rather, accorded less weight when integrating evidence from multiple studies and across different lines of evidence and that any guidance and other relevant documents developed to assist EPA staff to comply with this rule should include specific examples and/or case studies, perhaps drawing from recent EPA rulemakings, to demonstrate what constitutes regulatory science that is material to EPA’s significant regulatory decisions. The commenter recommends EPA revise the regulatory text in Option 2 to omit the word “short” to characterize the narrative that EPA will provide to describe the studies that are provided greater consideration along with its explanation why the studies received greater consideration. The commenter asserts that the Agency should provide sufficient information and explanation as may be necessary in any given circumstance.

Commenter (12471) states that, while the most robust standards for science transparency are clearly desired, the tools to achieve this worthwhile objective may not yet be in place. The commenter states that agencies and research institutions may need time to develop the tools and protocols to allow greater public access at the appropriate tiered access level considering the need to protect privacy and other confidential information. The commenter states that the EPA

should note in this rulemaking that it will be revisiting this issue as the appropriate tools are developed, with the objective of increasing transparency and public access as expeditiously as possible consistent with federal law.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public.

Comment: Commenters (11922, 12471, 12612, 12699) support Option 2 but encourage limited use of data and models that cannot be independently validated.

Commenter (11922) supports the SNPRM's proposed modifications to 40 CFR 30.5 that at the very least give extremely strong preference for data and models that can be independently validated. The commenter supports the use of information that cannot be validated only in rare circumstances. The commenter states that studies and data that cannot be validated under Option 2 should be utilized only if adequate studies that can be validated are not available to develop the necessary underlying influential or pivotal information. The commenter states that, in the rare circumstance described above, when information that cannot be validated is used in the decision-making process, the data that cannot be validated should always be afforded less consideration, if any consideration at all, than data that can be validated.

Commenter (12471) recommends the EPA give preference to studies that are fully available to the public if they are of equal (generally commensurate with) or better quality than the non-available studies. The commenter states that the EPA could note that transparency, in and of itself, is a study criterion that enhances study quality by allowing greater independent review and reanalysis. The commenter states that, if the only studies available provide limited or no access to the underlying data or models, the EPA could still consider the data and models in the rulemaking if they are otherwise of sufficient quality, but note the weakness and additional uncertainties inherent in relying on studies that are not available at any protected tiered level.

Commenter (12612) states that, if data and models are not made public, then the study should not be ignored but should be considered secondary to other comparable studies where data and models are made public.

Commenter (12699) states that, when there are genuine privacy, confidentiality, and CBI concerns, the EPA should not exclude studies, but give lesser weight to the studies when underlying information is unavailable. The commenter states that, when the EPA provides a legal justification to not disclose underlying information, there should be clear documentation provided to the public in support of the legal justification. The commenter states that, when there are subjective privacy or confidentiality concerns unrelated to law, this can be tricky to ensure the authors or agency are stating a genuine concern. The commenter states that the EPA should view and treat such assertions with skepticism, and deem the concern to be genuine only when disclosure would violate widely accepted practices or norms. The commenter states that, if the concerns are deemed genuine, then the study should not be excluded,²⁹⁶³ however, it still should be provided less weight than comparable studies. The commenter states that it should be rare for the EPA to solely rely upon studies without underlying data, and the EPA should clarify in the rule that the Agency shall take all reasonable steps to avoid such an outcome. The commenter states that the EPA should certify in the administrative record of a rulemaking that it did a full literature review and no legitimate studies without such problems exist that could have been used in their place.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will

²⁹⁶³ There may be instances when a study author has passed away or the underlying information is no longer available. The EPA should take reasonable steps to secure whatever information can be obtained. If such steps are taken, then the study should not be excluded but given less weight than comparable studies.

subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information.

7.1.4.1.2 Oppose Option 2

Comment: Commenter (9587) endorses the previous, unmodified transparency requirements, and states that transparency should take priority over privacy and confidentiality in EPA policymaking. The commenter states that the EPA's proposed modification gives claims of privacy and/or confidentiality priority over transparency requirements. The commenter states that this modification practically will impose substantial limits on the effect of the rule since privacy, confidentiality, and tiered access are all concepts and practices that inhibit full transparency.

Commenter (12712) states that the SNPRM's "consideration" to studies based on data that is neither publicly available nor available through tiered access is too vague. The commenter states that no such study, by definition unavailable for reanalysis by independent researchers, should even be a factor in an EPA decision to regulate.

Response: The EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information for independent validation. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenters (11182, 11362, 11390, 11393, 11396, 11407, 11489, 11576, 11890, 11895, 12404, 12412, 12442, 12463, 12474, 12715, 13549) oppose Option 2.

Commenters (11362, 11890) oppose the weighting of publicly available data and down-valuing of confidential data. The commenters contend that the EPA must prioritize public health in its decision making, therefore data from public health and epidemiological studies must be taken into consideration for influential scientific information and regulatory actions.

Commenter (11390) suggests that Option 2 is designed to create the appearance of flexibility but flouts the EPA's mission and settled scientific principles. Commenter (11890) states that giving less consideration to epidemiological studies conducted in the U.S. and other countries that protect private health data solely because those data aren't publicly available is unscientific. Commenter (12442) states that this rule shifts the Agency's approach by injecting a non-scientific metric that credits a study for disclosing private individual information used.

Commenter (11489) asserts that the value or merit of peer-reviewed science is not determined by the public availability of the underlying research data, and there is no scientific justification for a rule that directs the Agency to selectively weight certain studies over others based on this factor alone. Commenter (12463) does not believe that public availability and independent validation are qualities sufficient to mean research should be weighted more heavily than research where data must remain confidential.

Commenter (11396) states that the alternative to tiered access is equally arbitrary as no standards or criteria are provided to guide the Agency's discretion under this provision and to ensure that the best available science drives EPA's decision-making. The commenter questions how much less consideration would be given to research that relies on confidential patient information and who would make these decisions? The commenter contends that placing a higher value on certain scientific studies over others without clear criteria risks politicizing EPA's decision-making process.

Commenter (11576) asserts that EPA must use the best available science and it cannot exclude or down-weight a study that has undergone rigorous peer review that sufficiently analyzed the quality of the study. The commenter notes that in their joint statement regarding the proposed rule, the editors-in-chief of six highly regarded journals voiced disagreement with the EPA's Proposal by noting that "[d]iscounting evidence from the decision-making process on the basis that some data are confidential runs counter to the EPA stated mission 'to reduce environmental risks ... based on the best available scientific information.'"²⁹⁶⁴ Additionally, the commenter states that the Agency has failed to articulate a rational connection between the availability of underlying data and the quality, significance, and scientific soundness of a study, nor could it. Therefore, the commenter asserts that by reducing the weight given to studies on the basis of data availability, the EPA would wrongly downgrade the importance of study findings, which would ultimately affect the EPA's ability to address well-documented health harms.²⁹⁶⁵

Commenter (12404) states that while Option 2 would not totally eliminate a study from consideration for failure to share identifying information, it would downgrade its weight in a rulemaking or as "influential science." The commenter maintains that this could easily lead to a scientifically perverse result of putting greater weight on a methodologically inferior study just because the researchers shared personally identifying information from their subjects. According to the commenter the rule would incentivize not the best science, but that which most violates privacy. Additionally, the commenter provides privacy protections are in place to prevent a repetition of Nazi experiments and of cruel, racist research conducted on African American citizens of the United States. As such, the commenter asserts it is the regulatory process itself and the American people who will suffer by being denied regulations based on the best available science if violating human subject protections is made a condition of giving a study full weight in rulemaking or "influential science."

²⁹⁶⁴ H. Thorp, et al., Joint Statement on EPA Proposed Rule and Public Availability of Data, Science (Dec. 6, 2019) (attached), available at <https://science.sciencemag.org/content/366/6470/eaba3197>.

²⁹⁶⁵ See August 2018 Coalition Comments at 14-17.

Commenter (12463) provides that the qualities of public availability and independent validation are not sufficient to mean research should be weighted more heavily than research where data must remain confidential.

Commenter (12715) states that Option 2 is flawed not only because it weighs the value of scientific studies using a non-scientific and largely irrelevant criterion—the public availability of data for independent validation—but also because it identifies no criteria for when or how EPA would exercise the vast discretion the Agency creates for itself. Quite the opposite, the commenter provides, the EPA has instead requested comment on “how much consideration should be given to studies where there is limited or no access to the underlying data and models.” Thus, according to the commenter, Option 2 does nothing to ensure that important and valid scientific studies for which the data may be unavailable receive any consideration at all.

Response: The EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information for independent validation. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

7.1.4.2 Definition of Greater Consideration

Comment: Commenters (9587, 10748, 10339, 11397, 11176, 11492, 12720) express concern that, while the SNPRM states that “the Agency will give greater consideration to studies where the underlying data and models are publicly available in a manner sufficient for independent validation,” “greater consideration” is not defined.

Commenter (10748) states that the level of difference in “consideration” is not defined. The commenter states that this could mean that a study that provides its data but is poorly designed would be held in higher consideration than a study that is well-designed but is unable to provide all its data. The commenter states that this is disconcerting and could lead to serious health consequences by implementing rulemaking based on poor science solely because higher-quality studies were unable to provide all their data.

Commenter (11176) notes that for the term, “greater consideration,” the supplement does require “a short description of why greater consideration was given” when a study is given greater consideration. However, the commenter points out there is no (i) guidance for what “greater consideration” means when weighting the results of one study with that of another; and (ii) direction that EPA must explain the weighting given to various relevant studies. The commenter

contends that such transparency here and in the previous paragraph is critical to rigorous scientific consideration of the relevant evidence.

Commenter (12720) states that the EPA has not defined what “greater consideration” means in different contexts.

Commenter (9587) suggests the EPA define greater consideration by definitions for all relevant policymaking subcategories.

Commenter (9587) suggests the EPA distinguish between publicly available research and research available only via tiered access, and give greater consideration to studies whose underlying data and models are publicly available than to studies whose underlying data and models are only available via tiered access.

Commenter (11401) suggests that “give greater consideration to” should be clearly defined to mean whether the studies can or cannot be used primarily as the basis of a regulatory action, based on their level of transparency.

Response: If researchers want to increase the likelihood that their studies receive greater consideration by the EPA, they may take steps to ensure that the underlying dose-response data are available to the greatest extent possible. But any such response to this final rule would be purely voluntary. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

7.1.4.3 Other Things Equal

Comment: Commenter (10972) asks how the weighting of studies will be determined. Commenters (9362, 10972, 11484, 12715) question who is responsible for determining that “other things are equal” when deciding which studies should be given greater consideration.

Commenter (11176) states that scientific reasoning would not support the following aspect of the SNPRM: “other things being equal, the Agency will give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because they are publicly available or because they are available through tiered access when the data includes CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects.” The commenter states that the EPA has not scientifically justified that greater consideration should be given to such studies.

Commenter (11390) notes that the SNPRM suggests that “other things being equal,” a “high-quality” study based on publicly available data would receive more weight than a study supported by non-publicly available data. The commenter states that that explanation leaves much undefined. The commenter states that, for example, the EPA does not explain what it would consider to be a “high-quality” study, or how it would determine whether “other things” are equal in any given circumstance. The commenter states that, in the likely event that the Agency is presented with multiple studies that could be considered “high-quality” but that are based on varying amounts of data and whose conclusions are supported with varying robustness, there are no criteria for the Agency to apply in determining which studies to consider, or how heavily to weigh them.

Commenter (11392) states that “other things being equal” is a nonsensical and arbitrary standard. Commenter (11894) states that the EPA’s use of “other things equal” (85 FR 15405, section 30.5(a)) is unhelpful.

Commenter (12699) suggests that, instead of “other things equal” when comparing studies, a better measure would be to studies that are “comparable,” which to this author, means something slightly less than “other things equal.”

Response: The EPA clarified its intent and the process by which it would identify and determine the consideration to afford pivotal science in the final rule and preamble. The term “other things equal” is no longer used.

7.1.4.4 No Access or Access is Limited

The SNPRM states “Where there is no access to data and models, or access is limited, the Agency may still consider these studies, depending on the other attributes of the studies.”

Comment: Commenter (9362) expresses concern that the EPA may still consider studies where there is no access to data and models, or access is limited. The commenter states that using “dark data” from third party sources does nothing to promote science and good policy-making decisions. The commenter states that the EPA should be promoting the acquisition of scientific evidence and this can only happen if the EPA uses publicly available information and data in their decision-making. The commenter states that, if third parties are unwilling to share their data, their data should not be used to make public policy decisions.

Commenter (11892) notes that the SNPRM requests comment on how much consideration should be given to studies when there is limited or no access to underlying data or models. The commenter suggests that the EPA accept approved theses/dissertations from accredited colleges/universities; published peer reviewed articles; other studies conducted according to federal/state/local QA/QC, as well as citizen science if data were collected with approved QA/QC. The commenter states that all these sources of information follow established quality review processes, which impacts credibility to results.

Commenter (11186) suggests that studies with limited or no access to underlying data should be given equal consideration as studies with publicly available data.

Commenters (11399, 12456, 12715, 12715) express concern that the SNPRM does not include criteria regarding the EPA's consideration of "other attributes" and studies where there is no access or limited access to underlying data and models.

Commenter (11399) asks what "other attributes" will the EPA consider, and how much weight will it place on such attributes? The commenter states that, with no criteria to make these determinations, it would be extremely difficult to apply this provision uniformly or objectively.

Commenters (12456, 12715) express concern that, in the alternative proposal, the EPA would have broad discretion to use, or exclude, potentially relevant, high-quality studies where there is no access or limited access to underlying data and models.

Commenter (12715) asserts the proposal is flawed because it identifies no criteria for when or how the EPA would exercise the vast discretion the Agency creates for itself. The commenter states that the EPA has instead requested comment on "how much consideration should be given to studies where there is limited or no access to the underlying data and models." The commenter states that, thus, Option 2 does nothing to ensure that important and valid scientific studies for which the data may be unavailable receive any consideration at all.

Commenter (12731) states that, while the Agency suggests that it "may still consider studies where there is no access or limited access to underlying data and models" the Agency's consideration of relevant, valid studies is not optional.²⁹⁶⁶

Response: Though not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

- (1) the quality of the study relative to other studies for which the dose-response data are available;
- (2) the extent to which there are other studies for which the dose-response data are available;
- (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- (4) the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
- (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- (6) the extent to which the study is supported by other scientific evidence;
- (7) the extent to which the study accounts for unique scientific considerations;
- (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- (9) the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables,

²⁹⁶⁶ *Genuine Parts Co. v. EPA*, 890 F.3d 304, 312 (D.C. Cir. 2018).

nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

7.1.4.5 Short Description of Why Greater Consideration

Comment: Commenter (11358) supports the EPA's suggestion that the Agency would provide a short description of why greater consideration was given to a particular study or data set. The commenter states that this will help to ensure the greater transparency that this proposal aims to promote.

Commenters (11392, 11922, 11401, 12720) contend that a "short description of why greater consideration was given" to some studies over others is not sufficient.

Commenter (11922) suggests that the utilization of studies that cannot be validated under Option 2 should be accompanied with a comprehensive explanation detailing why the information was given consideration as pivotal or influential and its relative weight in the decision-making process.

Commenter (11392) states that the text of the SNPRM is vague when it comes to the proposal that the Agency will provide a "short description" of weighting decisions. The commenter asks the following questions:

- Who will write this description?
- Will it be qualitative or quantitative?
- Will it be based on a standardized rubric or case-by-case?
- Where will the description be published?
- Will there be an appeals process?

Commenter (12720) states that, given the potential for such a decision on a single study to affect its application across a range of different Agency activities, a "short description" is not nearly sufficient transparency from the Agency in describing such a significant decision with potentially far reaching and long lasting consequences. Rather than a short description, the commenter suggests the EPA address the following questions:

- What information could be included in such a short description?
- How would the Agency assess and confirm public availability or verify that data and models underlying pivotal science studies remained "publicly available" into the future?
- When would such a description be drafted or finalized by the Agency within the context of its rulemaking responsibilities?
- Would such a description be included in a central science data clearinghouse and potentially revisited and revised over time, or would it necessarily be included in individual science products published by EPA and potentially remain static.
- How would the EPA explain and document its deliberations and decision-making around the waiver process in a way that accounts for the complexity of any endeavor to make all "data and models" underlying key scientific information publicly available?

Response: Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Though not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

- (1) the quality of the study relative to other studies for which the dose-response data are available;
- (2) the extent to which there are other studies for which the dose-response data are available;
- (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- (4) the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
- (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- (6) the extent to which the study is supported by other scientific evidence;
- (7) the extent to which the study accounts for unique scientific considerations;
- (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- (9) the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

7.1.4.6 Arbitrary Decision Making

Comment: Commenter (10752) contends the proposal's inherent ambiguity makes it unacceptable as a legal regulation. The commenter states that the EPA proposes to arbitrarily pick and choose which data to rely upon.

Response: The EPA disagrees that the selection of pivotal science is arbitrary. Title 40 CFR 30.5 provides sufficient guidance for EPA to use in the selection of pivotal science.

Comment: Commenter (11176) notes that the supplemental proposal does not reference the well-known and valued scientific practice of meta-analysis, which EPA staff regularly uses, in its discussion of weighting evidence. According to the commenter, how to weigh the consideration of studies is at the heart of meta-analysis and its exclusion from the supplemental proposal reinforces the point that EPA has much work to do in laying the foundation for accomplishing the stated goal of the proposed rule. Additionally, the commenter asserts that “a short description of why greater consideration was given” is required whenever a study is given greater consideration.

Commenter (11349) asserts that the “greater consideration” criterion is arbitrary as it does not judge a study by standard scientific evaluation, such as the strength of its design or methods which are current acceptable metrics used to evaluate the merit of a scientific study.

Commenter (11391) states that, under Option 2, the EPA has not explained why certain studies are inherently unreliable, and thus should be given less weight. The commenter states that, to unfairly downgrade some valid and relevant studies without any apparent rationale or specified procedure is arbitrary and capricious in violation of the APA.

Commenter (11399) asserts that Option 2 would impose a wholly subjective framework by which EPA would determine the weight that should be afforded to scientific studies based on their transparency. The commenter asks what “other attributes” will the EPA consider, and how much weight will it place on such attributes? The commenter states that, with no criteria to make these determinations, it would be extremely difficult to apply this provision uniformly or objectively. The commenter states that this provision is an invitation for arbitrary decision-making. The commenter states that the EPA should not serve as an “arbiter” of scientific studies in this manner.

Commenter (13788) states that, while the details of EPA’s alternative approach are unclear, assigning preferential treatment to certain studies based on criteria that are unrelated to the studies’ scientific merit and quality would be arbitrary and capricious. The commenter states that the SNPRM states that “[w]hen promulgating significant regulatory decisions or finalizing influential scientific information, the Agency will, other things equal, give greater consideration to studies where the underlying data and models are publicly available.” The commenter states that, however, the Agency does not explain what it means by “other things equal” such that one study would be given greater weight, nor is the fact that data can be made publicly available tied in any way to the actual scientific merit or quality of the study results. The commenter states that the SNPRM places great importance on having publicly available data for reanalysis of peer-reviewed studies, but the Agency provides minimal detail regarding how it will determine whether researchers have actually fulfilled this reanalysis requirement. The commenter states that giving the Administrator or staff leeway to “consider” one study more valuable than another based on criteria unrelated to quality clearly provides opportunity to inject politics into public health and environmental decision-making. The commenter states that, while no two studies are likely to be identical, this vague approach would actually force the Agency to rely on one more

than another (whether or not the study receiving the greater weight is actually more accurate or up to date), and is arbitrary and capricious.

Commenter (11492) states that the Option 2 approach arbitrarily devalues scientific work that relies on health data containing personal identification. The commenter states that the EPA is charged with protecting public health and the environment, and as such, studies that involve health data are critical. The commenter states that, giving less consideration, or no consideration, to studies where underlying data are not publicly available is a political decision that has nothing to do with science. The commenter states that this is contrary to EPA's mission to protect human health and the environment based on best-available science.

Response: Though not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

- (1) the quality of the study relative to other studies for which the dose-response data are available;
- (2) the extent to which there are other studies for which the dose-response data are available;
- (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- (4) the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
- (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- (6) the extent to which the study is supported by other scientific evidence;
- (7) the extent to which the study accounts for unique scientific considerations;
- (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- (9) the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

Comment: Commenter (11495) states that weighing studies based on their ability to comply with EPA Federal Housekeeping internal requirements is unscientific, arbitrary, burdensome and capricious.

Response: The EPA disagrees with the commenter. As discussed more fully in the preamble to the final rule, the EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. This rule builds on the work that is already being done to increase the availability

of underlying data in the scientific community and in the federal government. The EPA also disagrees with the commenter that the requirements of this rule will result in any meaningful delay in promulgating regulations. While this final rule requires the Agency to evaluate the availability of dose-response data for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review the EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of the studies the EPA would review).

Comment: Commenter (11576) asserts the EPA cannot arbitrarily give greater or lesser weight to studies solely because of the public availability of underlying data. The commenter states that the Agency has failed to articulate a rational connection between the availability of underlying data and the quality, significance, and scientific soundness of a study. The commenter states that, by reducing the weight given to studies on the basis of data availability, the EPA would wrongly downgrade the importance of study findings, which would ultimately affect the EPA's ability to address well-documented health harms.

Commenter (12430) states that there is simply no appropriate and non-arbitrary method for U.S. EPA to deprioritize studies or models relying on non-public data. Commenter (12688) expresses concern that Option 2 is based on arbitrary criteria.

Commenter (12731) states that, while the EPA indicates the Agency could downgrade its consideration of many valid studies and seeks input on how much to diminish their weight,²⁹⁶⁷ discarding or discounting otherwise valid studies, for no reason other than an *a priori* judgment made without regard to study quality, is arbitrary and illegal, for the same reason that disregarding such studies altogether is illegal.

Commenter (13788) states that there are critically important questions that neither the proposal nor the SNPRM answers or explains. The commenter states that the limited information provided about the alternative approach suggests that it would be arbitrary because, like the original approach, it would force the Agency to distinguish between studies and treat them differently based on arbitrary criteria. The commenter states that data availability has no connection to the validity and quality of science.

Commenter (12715) asserts that the EPA's "alternate approach" to 40 CFR 30.5 fails to address concerns regarding the arbitrary down-weighting of relevant scientific studies. The commenter states that, under Option 2, the EPA could consider studies for which the data is not available or where access is limited. The commenter states that, however, the proposal identifies no criteria for when or how the EPA would exercise the vast discretion the Agency creates for itself.

Response: Though not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

²⁹⁶⁷ See 85 Fed. Reg. at 15,403 ("EPA is also requesting comment on how much consideration should be given to studies when there is limited or no access to the underlying data and models.").

- (1) the quality of the study relative to other studies for which the dose-response data are available;
- (2) the extent to which there are other studies for which the dose-response data are available;
- (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- (4) the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
- (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- (6) the extent to which the study is supported by other scientific evidence;
- (7) the extent to which the study accounts for unique scientific considerations;
- (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- (9) the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

7.1.4.7 Implementation of Option 2

7.1.4.7.1 Criteria

Comment: Commenters (11192, 11361, 11390, 11391, 11399, 11911, 12720, 12731, 13788) express concern that, while the SNPRM states that “the Agency will give greater consideration to studies where the underlying data and models are publicly available in a manner sufficient for independent validation,” the EPA provides no information about potential weighting criteria or calculations.

Commenter (11390) expresses concern that, in the likely event that the Agency is presented with multiple studies that could be considered “high-quality” but that are based on varying amounts of data and whose conclusions are supported with varying robustness, there are no criteria for the Agency to apply in determining which studies to consider, or how heavily to weigh them. The commenter states that, at best, the lack of clear guidance on how studies should be weighted would lead to inconsistent and unclear application of the proposed rule.

Commenter (12731) states that the EPA provides no details as to how the differential weighting alternative approach would work in practice. The commenter states that this description is entirely ambiguous, lacking sufficient detail not only as to how the EPA would intend to apply this alternative approach in practice (including how much weight it would give to the availability of data and models in assessing studies), but also under what circumstances the Agency would or would not decide to apply this alternative approach as the EPA maintains it may consider studies

where underlying data is not available or only available on a limited basis.²⁹⁶⁸ The commenter states that, in the EPA’s briefing to House Science, Space, and Technology Committee staff, the Agency “was unable to expand on how this potential weighted system would operate. The Agency has not identified implementation details for the weighting approach, including any concrete ideas about how the scale of a weighted system would be structured.”²⁹⁶⁹

Commenter (12731) states that the fact that the EPA itself does not understand how the alternative would work confirms that the Agency has not provided adequate notice for public comment,²⁹⁷⁰ and it cannot finalize any such alternative without first examining the details of its implementation.²⁹⁷¹

Response: Though not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

- (1) the quality of the study relative to other studies for which the dose-response data are available;
- (2) the extent to which there are other studies for which the dose-response data are available;
- (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- (4) the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
- (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- (6) the extent to which the study is supported by other scientific evidence;
- (7) the extent to which the study accounts for unique scientific considerations;
- (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- (9) the study’s consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

7.1.4.7.2 Detailed Description of Option 2

²⁹⁶⁸ EPA’s suggestion that there will be instances where studies will be “equal” with the exception of the availability of underlying data is entirely disingenuous. In reality, underpinning influential scientific information and significant regulation, will be a diverse body of evidence of different methodological design and no two studies will be exactly alike with exception of data availability. EPA’s suggestion that this will be the case may be convenient, but in no way reflects the realities of research and science.

²⁹⁶⁹ Memo to Chairwoman Johnson, *supra* note 120, at 4.

²⁹⁷¹ *State Farm*, 463 U.S. at 43.

Comment: Commenters (9587, 11390, 11391, 11392, 11495, 11576, 11894, 12464, 12720, 13788) contend the proposed revisions should include a more detailed description for implementation of Option 2 as described below. The commenters suggest the following implementation questions need to be addressed:

- Are 10 studies that do not meet the data sharing requirements, but reach a similar finding, outweighed by 1 study that does meet the data sharing requirement, but has a contrary finding? (11495)
- Could the EPA explain away ignoring a pivotal public health study by simply saying it was given "less consideration," implying that it did in fact inform a problematic new pollution standard? (11392)
- How the EPA would apply such weighting? (11390, 12464)
- How would the EPA determine whether "other things" are equal in any given circumstance? (11390)
- How will the EPA create the necessary infrastructure or capacity to handle such decisions in a timely manner? (11391)
- How much greater consideration will the EPA give to studies where the underlying data and models are available for independent validation? (9587)
- How much additional weight will certain studies receive? How will that be determined? (13788)
- How would the weighting system impact existing weighting metrics used, such as the greater consideration given to human health studies over animal studies in NAAQS reviews? (11392)
- When the EPA would apply such weighting? (11390)
- What would the EPA consider to be a "high-quality" study? (11390)
- What are the parameters for making these decisions? (11391)
- While human health studies with the most medical information are currently given the most weight, animal studies will have no data-sharing complications — will the science-based metrics be overturned with a system based entirely on transparency of data? (11392)
- Who will have access to the information and what type of information they will have access to? (11576)
- Who will determine whether underlying data and models are available in a "sufficient" manner when, as EPA itself has pointed out, data are sometimes available in a graduated or tiered manner (*i.e.*, data availability exists on a spectrum)? (11391)
- Will the EPA publish a regularly updated database indicating its determination about how much weight each study is given? If so, how will the public be able to access this information? (12720)
- Will the decisions made by other federal agencies using the same studies be necessarily affected by the determinations that the EPA makes? (12720)
- Will these determinations be final, or changeable? If final, will there be opportunities for the study authors or researchers to dispute the determination? If changeable, what is the process by which such a determination could be changed, and who within the EPA would have that authority? (12720)

- Would the EPA develop objective metrics to determine when and how "greater consideration" would be given to certain studies, or would decisions be made on a case-by-case basis without any established procedures? (11392)
- Would giving less "consideration" in assessments devolve into giving no weight? (11894)

Commenters (11392, 12431, 12720) contend that the EPA fails to provide sufficient description or necessary analysis of the Agency's Option 2 approach. The commenters suggest that the following information is necessary:

- The EPA must provide greater clarity on how such a weighted system would operate in practice, where decision making authority would reside, and what the implications would be for past studies that underpin the Agency's regulatory standards. (11392)
- The EPA needs to clarify whether a determination on degree of consideration would apply consistently across all the EPA staff, science advisors, and subject matter areas relevant to the EPA work. (12720)
- The EPA needs to clarify whether making data "available" for independent validation is sufficient for such increased consideration, or whether such independent validation must have actually occurred prior to the EPA making such a decision. (12720)
- Because the Agency relies on scientific studies across a range of disciplines and for a range of activities, the EPA needs to clarify how variations in weight given to specific studies would actually be implemented. (12720)
- The EPA needs to clarify what this greater consideration would entail. (12431)

Commenters (10752, 11192, 11361, 11399, 11911) contend that, as the EPA has proposed no criteria or oversight mechanisms, Option 2 is open to manipulation and, thus, is unacceptable.

Commenter (10752) states that the proposal's inherent ambiguity makes it unacceptable as a legal regulation. The commenter states that the EPA proposes to arbitrarily pick and choose which data to rely on with the presumption that the nonconfidential information is given more weight. The commenter states that it is safe to assume that, in the current regulatory climate, the EPA will always choose the industry data and models.

Commenters (11192, 11361) state that the Agency provides no example weighting criteria or maximum weighting ratios that might inform the public about what could be expected from this weighting proposal. The commenter states that, as a result, this generalized suggestion could be used to mollify those that oppose dismissal of public health studies that couldn't make their data public, but in essence, still dismiss them by assigning them a very small weighting factor.

Commenter (11399) asserts that Option 2 would impose a wholly subjective framework by which the EPA would determine the weight that should be afforded to scientific studies based on their transparency. Commenter (11911) asserts that the SNPRM's Option 2 is open to manipulation without transparent criteria informed by independent scientific expertise.

Response: Though not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data

availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

- (1) the quality of the study relative to other studies for which the dose-response data are available;
- (2) the extent to which there are other studies for which the dose-response data are available;
- (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- (4) the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
- (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- (6) the extent to which the study is supported by other scientific evidence;
- (7) the extent to which the study accounts for unique scientific considerations;
- (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- (9) the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

7.1.4.7.3 Other

Comment: Commenter (10339) maintains that publicly funded, peer-reviewed studies should not be disadvantaged during Agency scientific reviews.

Response: The EPA disagrees that publicly funded, peer-reviewed studies would be disadvantaged in any way. The final rule includes sufficient flexibility in terms of the allowance for restricted access, considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data to minimize such potential unintended consequences.

Comment: Commenters (11176, 11390, 11492, 11495, 12688, 12727) assert there is no scientific basis for employing the Option 2 weighting system.

Commenter (11176) states that the category of "non-federally funded and non-the EPA data" likely makes up the largest category informing the EPA's many actions. The commenter states that it is also the category that poses the most challenges for making data available. The commenter states that such studies generally provide important scientific contributions and should not be discounted because their data are not readily available. The commenter states that, in our 2018 comments, we included two examples of research that might be excluded: private-sector studies and meta-analyses. The commenter states that, while such work will not necessarily be excluded through the proposed rule with the SNPRM, it is likely to be de-

emphasized to the detriment of evidence-based policymaking at the EPA. The commenter states that scientific reasoning would not support the following aspect of the SNPRM: “other things being equal, the Agency will give greater consideration to studies where the underlying data and models are available in a manner sufficient for independent validation either because they are publicly available or because they are available through tiered access when the data includes CBI, proprietary data, or PII that cannot be sufficiently de-identified to protect the data subjects.” The commenter states that the EPA has not scientifically justified that greater consideration should be given to such studies.

Commenter (11492) states that the use of meta-analysis (when results from pertinent, multiple studies are combined) is becoming increasingly common, and they are crucial to understanding epidemiology and public health issues. The commenter states that the Supplemental Rule requires a brief description of why one study is given “greater consideration” over another, but does not give any direction as to how to weigh these different studies. The commenter states that failure of the Supplemental Rule to address basic questions such as these is indicative that the authors have no understanding of scientific analysis.

Commenter (11495) states that federal agencies should have the ability to individually evaluate and weight scientific studies based on the strength of the science using criteria such as participant selection, disclosure of methods and authentication of reagents, quality of exposure assessment, strength of association, consistency, specificity, temporality, evidence of dose-response, biological plausibility, and assessment of potential bias or confounding. The commenter states that weighing studies based on their ability to comply with the EPA Federal Housekeeping internal requirements is unscientific. The commenter states that it hinders the EPA by depriving the Agency of some of the best science on which it might make its decisions.

Commenter (12688) contends that Option 2 has no basis in scientific practice. The commenter states that it will hamper the Agency’s ability to use high-quality science produced by researchers at institutions like UCLA. The commenter states that regulatory agencies should do what scientists do: consider studies in accordance with the robustness of their methodology and conclusions, and not based on arbitrary criteria.

Commenter (12727) states that the EPA proposes to “give greater consideration” when reviewing studies based on data’s public availability, but this is not a science-based approach. The commenter states that the proposal to “downgrade” studies due to their public accessibility does not appear to improve any aspect of science-based decision making. The commenter states that public accessibility for the purpose of “independent validation” does not mean that the data are high quality, or even useful from a scientific perspective. The commenter states that, for example, epidemiological data on real-life human exposures are valuable for science-based decisions on chemical exposures, and yet much these data are rightfully protected as PII.

Response: Though not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

- (1) the quality of the study relative to other studies for which the dose-response data are available;
- (2) the extent to which there are other studies for which the dose-response data are available;
- (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- (4) the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
- (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- (6) the extent to which the study is supported by other scientific evidence;
- (7) the extent to which the study accounts for unique scientific considerations;
- (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- (9) the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

Comment: Commenter (11176) states that research that uses CBI, proprietary data, or PII is likely to provide greater insights into health effects pertinent to the EPA's work precisely because of these data. The commenter states that, because such data will not be "publicly available or available through tiered access," the potentially more insightful research that relies on these data is likely to be discounted by this proposed rule to the detriment of the EPA's important work. The commenter states that, for CBI, for example, the EPA uses such data to identify best available technologies (BAT) upon which many water regulations are based. The commenter states that companies only provide the data upon which BAT can be determined with the proviso that the data remain CBI. The commenter states that, without accurate data on the BAT currently in use, such regulations would be based on weaker science. The commenter states that the proposed rule poses three risks for this example: (i) businesses may have less confidence their CBI will be protected and may be reluctant to share their information; (ii) the EPA may discount research based on CBI weakening the scientific underpinning of a regulation; and (iii) water quality may suffer.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (11391) states that implementing Option 2 would require so much additional complex review before important Agency rulemakings and other actions could be accomplished that a significant and deeply problematic regulatory bottleneck is easily foreseeable. The commenter states that the EPA has offered no indication that it has considered these problems nor how it plans to develop the necessary internal infrastructure or capacity to deal with them. The commenter states that the SAB raised concerns in its report on the proposed rule, noting that the requirement to make data available is unclear, “mak[ing] it difficult to understand the implications of the requirement.”²⁹⁷² The commenter states that, according to the SAB, depending on how the requirement is interpreted, compliance with it could “be enormously expensive and time consuming.”²⁹⁷³ The commenter states that the SAB goes so far as to suggest that the EPA may have to establish an office on data sharing, or peer review panel or working group to implement the requirement.²⁹⁷⁴ The commenter shares this view.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (11395) does not agree that data accessibility should be the primary factor used to determine how a study is weighted relative to other studies.

Response: Though not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

- (1) the quality of the study relative to other studies for which the dose-response data are available;
- (2) the extent to which there are other studies for which the dose-response data are available;
- (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- (4) the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
- (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- (6) the extent to which the study is supported by other scientific evidence;
- (7) the extent to which the study accounts for unique scientific considerations;

²⁹⁷² SAB Review, *supra* note 10, at 8.

²⁹⁷³ *Id.*

²⁹⁷⁴ *Id.*

- (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- (9) the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

Comment: Commenter (11495) states that, without detailed, consistent guidelines delineating exactly how studies will be weighted, as well as how missing data will be accounted for, the quality of this new document in no way approaches the quality of the EPA's existing documents that define inclusion and exclusion criteria, currently based on publication quality judged by rigorous scientific standards. The commenter states the SNPRM brings forward a new and complex process without any consideration to ensure that information is "accurate, clear, unbiased and complete", as mandated by the federal government, let alone how the policy will be practically implemented.

Commenter (12731) states that the EPA has failed to explain how differential weighting of studies based on data availability adds to, modifies, or is needed in light of existing, relevant frameworks at the Agency including, for example, frameworks developed for the EPA IRIS toxicological reviews,²⁹⁷⁵ the development of Integrated Science Assessments,²⁹⁷⁶ and ecological assessments.²⁹⁷⁷

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Though not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

²⁹⁷⁵ See, e.g., EPA, IRIS Systematic Review Protocol for Polychlorinated Biphenyls (PCBs), https://cfpub.epa.gov/ncea/iris_drafts/recordisplay.cfm?deid=237359.

²⁹⁷⁶ EPA, Preamble To The Integrated Science Assessments (ISA), EPA/600/R-15/067 (2015), <https://cfpub.epa.gov/ncea/isa/recordisplay.cfm?deid=310244>.

²⁹⁷⁷ EPA, Risk Assessment Forum, Weight of Evidence in Ecological Assessment, EPA/100/R-16/001 (2016), https://hero.epa.gov/hero/index.cfm/reference/details/reference_id/3839851.

- (1) the quality of the study relative to other studies for which the dose-response data are available;
- (2) the extent to which there are other studies for which the dose-response data are available;
- (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- (4) the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
- (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- (6) the extent to which the study is supported by other scientific evidence;
- (7) the extent to which the study accounts for unique scientific considerations;
- (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- (9) the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

The flexibility provided in the rule in terms of the allowance for restricted access, considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data will minimize any potential unintended consequences.

7.1.5 Ensure Over Time More Availability of Data

Comment: Commenter (11176) suggests that, by working together with other agencies to develop common standards and provide resources to researchers and research sponsors to create data governance systems that support tiered data access, the EPA can ensure that over time more of the data and models underlying the science that informs significant regulatory decisions are available publicly or via restricted access.

Response: The final rule does not regulate or impose requirements on any party outside of the EPA but rather exclusively governs the EPA's internal process for handling pivotal science. This rule does not require any researcher or other outside entity to provide dose-response data to the EPA. It also does not direct or require any outside entity or EPA to establish data sharing mechanisms. Further, the rulemaking does not require the EPA to collect, store, or publicly disseminate dose-response data and models underlying pivotal science. Instead, it governs internal agency procedures for weighing its consideration of various studies according to factors that include data and model availability.

Comment: Commenter (11576) states that seeking to require or promote greater public accessibility to models and data underlying studies is not the EPA's role; the Agency was established to protect public health and the environment using the best available science, not to

attempt to tell scientists how to do their jobs. The commenter states that there is no way to ensure that the EPA's approach would honor "legal and ethical obligations to reduce the risks of unauthorized disclosure and re-identification[.]" nor does the EPA offer any explanation as to how it would address these issues. Commenter (11576) notes that the SNPRM states that:

the EPA is requesting comment on how to ensure that, over time, more of the data and models underlying the science that informs significant regulatory decisions and influential scientific information are available to the public for independent validation in a manner that honors legal and ethical obligations to reduce the risks of unauthorized disclosure and re-identification". ... [And] the EPA is interested in comments about how to provide sufficient incentives and support to researchers to increase access to the data that may be used as pivotal regulatory science or pivotal science.

Response: The rule does not impose requirements on any entity outside of EPA. This is a rule of internal procedures and does not direct or require any outside entity or EPA to establish data sharing mechanisms. Further, the rulemaking does not require the EPA to collect, store, or publicly disseminate dose-response data for underlying pivotal science.

The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (11892) suggests that, because access to information can be limited by for-profit publications requiring payment to view full peer-reviewed articles, all work funded in part by the federal government should allow free full access to published articles.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum "Increasing Access to the Results of Federally Funded Scientific Research" and the 2016 EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research." EPA researchers, grantees and contractors are required to make peer-reviewed journal articles and the underlying data and models resulting from EPA-funded research accessible to the public.

The EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research" requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, the rule requires the EPA to evaluate the availability of the analyzable dataset, not the more limited dataset that accompanied the publication of the study or model. For this rulemaking EPA will not identify a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be

generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

Comment: Commenter (9587) suggests the EPA should provide a time limit for its willingness to accept privacy, confidentiality, and tiered access. The commenter states that scientific research can meet full transparency standards in time, even if it cannot meet it immediately. The commenter states that a time limit will provide the EPA researchers and independent scientists an incentive to change their practices. The commenter suggests a time limit of no more than 20 years—say, 31 December 2040. The commenter states that this time limit might be subdivided, so that fields that require substantial longitudinal studies have longer time limits than fields that do not.

Response: The EPA clarified in the final rule that the public must be able to access the information on the date of publication of the proposed rule (or, as appropriate, a supplemental notice of proposed rulemaking, or notice of availability) for the significant regulatory action or on the date of dissemination of the draft influential scientific information for public review and comment.

Comment: Commenter (10974) states that, if the EPA were to spend their time and direct their resources towards ensuring that their own data is easily accessible in updated and user-friendly tools, they would model the way for, and incentivize and support, other researchers as they work to become more creative and thorough with data transparency. The commenter states that, rather than promulgating this new rule, the EPA should be taking immediate action to demonstrate data leadership – doing so would be a much more progressive and useful approach, and would model good governance and public service. Furthermore, the commenter provides that EPA would be better served supporting state efforts to make existing data easier to understand, to help better communicate research results and conclusions, and to help states develop third-party partnerships.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum “Increasing Access to the Results of Federally Funded Scientific Research” and the 2016 EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research.” EPA researchers, grantees and contractors are required to make peer-reviewed journal articles and the underlying data and models resulting from EPA-funded research accessible to the public.

The EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research” requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, the rule requires the EPA to evaluate the availability of the analyzable dataset, not the more limited dataset that accompanied the publication of the study or model. For this rulemaking EPA will not identify a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a

separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

Comment: Commenter (11401) states that, applying the new standard to existing studies would encourage researchers to make their underlying data more transparent in accordance with the tiered approach, thereby benefiting not just the EPA rulemakings, but scientific knowledge to the broader society. The commenter states that encouraging researchers to release data for existing studies also addresses the EPA's question in the SNPRM on "how to provide sufficient incentive...to researchers to increase access to the data that may be used as pivotal regulatory science or pivotal science." The commenter states that allowing their existing, nontransparent studies to be used in the future would discourage greater openness and hinder the contribution to better science.

Response: The EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. One of the criteria the Administrator may use in his/her determination to grant a waiver is that the development of the dose-response data was completed or updated before the effective date of the rule. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as the potential skew toward newer, domestic, and/or industry-funded studies suggested by the commenters. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions

implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Comment: Commenter (12596) states that a Transparency Scoring System would provide incentives and support to researchers to increase access to the data that may be used as pivotal regulatory science or pivotal science. The commenter states that it would inform the public as to the methodologies underlying important pivotal regulatory science or pivotal science. The commenter states that those signals would be bi-directional, encouraging researchers to adopt transparency protocols with the incentive of having their studies receive greater consideration in the EPA rulemakings. The commenter states that such a framework would encourage researchers to fundamentally incorporate “transparency by design” into their studies.

Commenter (11386) contends the EPA should not incentivize researchers to provide public access to their data. The commenter states that consideration for rulemaking should not be used by the EPA as an incentive for researchers, nor should grant money be allocated on the basis of the feasibility of making data publicly available. The commenter states that both of these incentives potentially conflict with the primary purpose of the EPA and the EPA-funded research, which is to protect public health and the environment. The commenter states that it is admirable to make data public when possible, but the EPA should not pressure scientists to do so when it is not, for instance, in the best interests of the subjects in the study. The commenter states that the mission of the EPA is to protect human health and the environment, and providing regulatory incentives that influence the direction of scientific research does not fall within that mission. The commenter states that, while it would be inappropriate to base public health decisions on data transparency, it is appropriate and beneficial for the EPA to provide support and resources for increasing the access to scientific data. The commenter states that examples of ways in which the EPA can give this support include providing those carrying out the research with space on servers on which relevant data can be stored and made publicly accessible, providing access to computing power for running reanalysis, or providing a data-management team. The commenter states that these resources would lead to an increase in availability of the data and models underlying the science that informs significant regulatory decisions and influential scientific information. The commenter states that such support structures from the EPA would enable relevant data to be publicly accessible independent of the resources of the research team. The inherent value and validity of the data and of the conclusions drawn from its analyses would be unchanged by these methods of increasing transparency.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions. Where underlying dose-response data in

pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

The EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Commenter (12464) states that, while academic researchers have no incentive to revisit their old research and make the raw data and models publicly available, industry scientists have a strong monetary incentive to do so if their research supports the industry's goals.

Commenter (11103) suggests that lowering barriers associated with making data available is a better mechanism for change than the supplemental proposal. The commenter references the 2019 NASEM report, which provides that the lack of a supportive framework for adequate recordkeeping disincentivizes researchers to create the conditions for reproducibility.²⁹⁷⁸ The commenter states EPA can address this by fostering the development of new software tools, but by providing adequate training on how to use such tools and education in the importance of transparency in scientific studies. To accomplish this, the commenter recommends partnering with educational institutions and leveraging the working relationships EPA's Office of Public Engagement and Environmental Education (OPEEE) already has, such as the U.S. Department of Education, to create programs that promote a culture of openness in the scientific community.²⁹⁷⁹ The commenter provides the "Reproducible Research" course at John Hopkins University as such a program.²⁹⁸⁰

Response: The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does

²⁹⁷⁸ National Academies of Sciences, Engineering, and Medicine (NASEM), Reproducibility and Replicability in Science, (Washington, DC: The National Academies Press 2019). <https://doi.org/10.17226/25303>.

²⁹⁷⁹ "About the Office of Public Engagement and Environmental Education (OPEEE)," last modified March 24, 2020, <https://www.epa.gov/aboutepa/about-office-public-engagement-and-environmental-education-opeee>.

not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (12465) expresses concern that the treatment of existing data or models may disincentivize the generation of new data under the new transparency requirements while reducing the importance of considering existing data, regardless of the scientific validity or merit of that data. Additionally, the commenter notes there are similar considerations between statutes and regulations that are outside of the scope of the supplemental proposal and recommends that these provisions be revisited in an effort to resolve the inherent conflict.

Conversely, Commenter (11401) notes that applying the new standard to existing studies would encourage researchers to make their underlying data more transparent in accordance with the tiered approach, thereby benefitting not just EPA rulemakings, but scientific knowledge to the broader society.

Response: The EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. One of the criteria the Administrator may use in his/her determination to grant a waiver is that the development of the dose-response data was completed or updated before the effective date of the rule. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as the potential skew toward newer, domestic, and/or industry-funded studies suggested by the commenters. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential

scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Chapter 8: Research Data

Title 40, Code of Federal Regulations part 30.10 (40 CFR 30.10) of the notice of proposed rulemaking (NPRM) proposes to require the Environmental Protection Agency (EPA) to implement the rule consistent with the definition of research data in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, exemptions in Public Law 89–487, and other applicable federal laws. From the Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards:

Research data means the recorded factual material commonly accepted in the scientific community as necessary to validate research findings, but not any of the following: preliminary analyses, drafts of scientific papers, plans for future research, peer reviews, or communications with colleagues. This “recorded” material excludes physical objects (e.g., laboratory samples). Research data also do not include: (i) Trade secrets, commercial information, materials necessary to be held confidential by a researcher until they are published, or similar information which is protected under law; and (ii) Personnel and medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study.

Several comments were received regarding the NPRM with regards to research data as defined under the Uniform Administrative Requirements. In this section these comments are organized as follows:

- Uniform Administrative Requirements
- Applicability of the Rule to Research Laboratory Samples

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

8.1 Uniform Administrative Requirements

Comment: Commenters (6111, 6126, 6880, 6924) assert that the proposed requirements in §30.10 are inconsistent with aspects of the other proposed requirements. The commenters assert that, while proposed §30.10 requires EPA to implement the rule consistent with the definition of research data in the Uniform Administrative Requirements, the proposed rule appears to require all information be made publicly available, despite exclusions in the Uniform Administrative Requirements regarding medical information. The commenters refer to the Uniform Administrative Guidance which exempts from its definition of “research data” subject to

disclosure any “medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study.”²⁹⁸¹

Commenter (6126) suggests that, to be consistent with the definition of “research data” in Office of Management and Budget (OMB) Circular A-110 and with EPA’s existing guidance, the rule appears to preclude collection of identifiable information. The commenter states that, however, such information could be necessary to conduct replication and validation of studies. The commenter states that this would reflect the type of data available through the Federal Statistical Research Data Centers and referred to by the U.S. Commission on Evidence-Based Policymaking, which are cited in the preamble text. The commenter states that, if EPA’s intent is to only consider replicable studies those with identifiable data but to preclude such information from the definitions, the rule’s organizing logic must be deemed tautological. The commenter states that clarification is needed regarding whether EPA intends for identifiable data to be available to fulfill the regulatory requirements or if the intent is to rely exclusively on de-identified data.

Commenter (6880) states that the preamble and proposal are contradictory as to what data are subject to the proposed rule. The commenter states that, in the preamble, EPA makes the following statement that is unsupported by the text of the proposal: “Implementation of this rule will be consistent with the definition of ‘research data’ in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards.” The commenter states that, in the cited regulation, the OMB defines “research data” within the context of identifying what information a federal agency must release to satisfy a Freedom of Information Act (FOIA) request for data generated by research funded through that agency. The commenter states that the definition specifically excludes certain confidential information from the definition of “research data” (§200.315(e)(3), (3)(i), and (3)(ii)).

Commenter (6924) asserts that the rule’s requirement to make all information publicly available that would be needed to complete a reanalysis conflicts with the exclusions in the definition of “research data.”

Response: Proposed 40 CFR 30.2 in the 2018 proposed rule included a definition of research data. In the 2020 SNPRM, the EPA deleted the proposed definition of research data. While one commenter on the 2020 SNPRM noted that the exclusions in the definition of research data of trade secrets and personal and medical information were not incorporated into the definition of data, commenters did not request that the EPA maintain a definition of research data. The EPA is not including a definition of “research data” in this final rule because it includes the definition of “data” in section 30.2 as follows:

Data means the set of recorded factual material commonly accepted in the scientific community as necessary to validate research findings in which obvious errors, such as keystroke or coding errors, have been removed and that is capable of being analyzed by either the original researcher or an independent party.

²⁹⁸¹ OMB, Uniform Guidance, 2 C.F.R. § 200.315(e)(3)(ii).

In addition, the EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. The rule allows the EPA Administrator to grant an exemption to the transparency requirements if the Administrator determines that greater consideration is warranted when:

- Technological or other barriers render sharing of the dose-response data infeasible;
- The development of the dose-response data was completed or updated before the effective date of this final rule;
- Making the dose-response data would conflict with laws and regulations governing privacy, confidentiality, confidential business information (CBI), or national security;
- Third-party independent validation of the study's underlying dose-response data through reanalysis has been conducted; or
- The factors in 40 CFR 30.5 used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

8.2 Applicability of the Rule to Research Laboratory Samples.

Comment: Commenter (6143) suggests that the Agency apply the proposed requirements to a limited and special class of laboratory samples, the analytical results of which (from non-destructive testing) may become an essential element of the research that underpins a given regulation. The commenter states that, not only can different laboratory analysts reach different conclusions by analyzing the same sample, it is common for analytical methods to improve over time. The commenter notes that improved analytical methods provide researchers with the opportunity to re-analyze properly archived samples, potentially yielding more accurate and even different results. According to the commenter, it should become part of the researchers' protocol to retain and properly archive this special class of samples when the analytical results are likely to inform or inspire the regulatory process. The commenter asserts that it is particularly true for research conducted by or for EPA and its contractors; and by any party conducting research with the intent to inform or inspire a specific regulatory action. (While it is true that certain types of samples cannot be retained because they are inherently unstable chemically and/or physically, other types of samples can remain stable for decades when properly archived.)

Response: EPA disagrees with the commenter's suggestion to extend the scope of the rule to laboratory samples. As stated in 40 CFR 30.3, the provisions of this part do not apply to physical objects (like laboratory samples). Physical samples are not needed to independently validate pivotal science in the context of this rule.

Chapter 9: Science That Serves as the Basis for Informing a Final Significant Regulatory Actions

Section 30.1 of the proposed rule requires the Environmental Protection Agency (EPA) to ensure that the regulatory science underlying its actions be publicly available in a manner sufficient for independent validation. Section 30.2 of the proposed rule includes a definition of regulatory science as scientific information, including assessments, models, criteria documents, and regulatory impact analyses, that provide the basis for EPA final significant regulatory decisions. Several comments were received regarding “regulatory science”. In this section these comments are organized as follows:

Section 9.1: NPRM Regulatory Science (section 30.2)

- Ensure that the Regulatory Science is Publicly Available in a Manner Sufficient for Independent Validation (§30.1)
- Regulatory Science Means Scientific Information that Provides the Basis for EPA Final Significant Regulatory Decisions (§30.2)
- EPA’s Regulatory Science Should Be Consistent with the OMB’s Final Information Quality Bulletin for Peer Review (83 FR 18770)
- EPA’s Proposed Regulatory Science Requirements Consistency with OMB’s Guidelines for Ensuring and Maximizing Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies (OMB Guidelines)
- Regulatory Science that Cannot Meet the Requirements of §§30.5 and 30.6
- How Should EPA Address a Circumstance in which EPA Has a Statutory Requirement to Make a Determination for Which Scientific Information Publicly Available Sufficient for Independent Validation Does Not Exist? (83 FR 18772)
- How Does What this Rule Would Require Compare to Requirements of Environmental Statutes? (Relates to Chapter 1)

Comments that seek to clarify how the definition of “pivotal regulatory science” is distinct from the separately defined, “regulatory science” are primarily contained in the chapter of this response to comments (RTC) concerning “pivotal regulatory science” (Chapter 6).

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

Note on Terminology

In the final rule, the EPA has replaced the term “regulatory science” with the term “science that serves as the basis for informing a significant regulatory action.” The EPA made this change in response to comments that the term “regulatory science” may be confusing because it suggests either the term refers to a scientific discipline of regulatory decision-making, or that some science the EPA considers is inherently regulatory. Neither of these interpretations reflects the Agency’s intent in defining this term. The EPA considers the breadth of scientific evidence in its rulemakings; while this scientific evidence informs policy decisions, the EPA’s consideration of the science does not make it “regulatory science.” To reflect this fact, in the final rule the EPA is changing the proposed term “regulatory science” to “science that serves as the basis for informing a significant regulatory action.” While commenters on the 2018 proposed rule used the term “regulatory science,” the EPA is responding to comments with the term “science that serves as the basis for informing a significant regulatory action” to reflect the contents of the final rule.

9.1 NPRM Regulatory Science (Section 30.2)

9.1.1 Ensure that the Regulatory Science is Publicly Available in a Manner Sufficient for Independent Validation (§30.1)

9.1.1.1 General Opposition to Regulatory Science Being Required to be Publicly Available

Comment: Commenters (0044, 0671, 0732, 1943, 2687, 2909, 4591, 4595, 4848, 4894, 5181, 6111, 6125, 6147, 6158, 6897, 6904, 6907, 6924, 6940, 8281-PH5, 8281-PH29, 8281-PH46, 8281-PH84) generally oppose regulatory science underlying its actions being required to be publicly available in a manner sufficient for independent validation. Commenters generally express that, it is unnecessary and would limit the ability to use scientific data that is necessary for the EPA to meet its mission. Commenter (6105) asserts that not all scientific findings that are important are publishable, nor do scientific journals generally have sufficient space to include all data. Example comments include:

- Commenter (0732) states that there is a need to consider ALL scientifically well-planned, documented and reported studies about potential adverse health effects of chemicals. The commenter asserts that this serves to increase the likelihood that any regulatory standards developed will be based on the full and complete "weight of evidence" of data and helps reduce the uncertainty inherent in those numbers. According to the commenter, the ability of the EPA to protect health is directly connected to the quality and quantity of studies that underpin its standards.
- Commenter (4595) asserts that the EPA's Proposal risks rejecting valid scientific evidence and fundamentally mischaracterizes the way science is conducted and made available for decision-making. According to the commenter, by limiting the science EPA can use in policies and regulations, EPA will ultimately constrain itself to smaller groups of studies and risk biased outcomes. The commenter asserts that, if the pool of research is smaller - which is what this proposed rule will lead to - that smaller pool utilized creates an inherent bias and thus the rulemaking process will yield distorted results.

- Commenter (4848) contends that it is imperative that EPA allow consideration of all available scientific data pertinent to a proposed environmental rule or regulation – including randomly controlled human health trials and other epidemiological studies.
- Commenter (6924) In general, when assessing the body of evidence, EPA should consider both individual study quality and the overall quality of the body of evidence which requires consideration of all the relevant scientific literature. To not do so could potentially bias the assessment, as stated by the National Academies of Sciences (NAS).
- Commenter (0671) states that EPA does not need publicly available information to allow independent validation. The commenter states that any researcher who wishes to validate a study is already free to perform her or his own study asking the same scientific question. According to the commenter, this sort of replication is already performed hundreds of times a year across many areas of environmental science and is far more meaningful than the narrow and misguided notion of validation the EPA is implicitly using.
- Commenters (1943, 6940) assert that EPA needs to have access to data generated from modern, sensitive, and novel models and methodologies to protect the American public. Commenter (1943) states that any attempt to limit the applicability of scientific data will stifle innovation and progress toward a cleaner, healthier future for all Americans.
- Commenters (2687, 6147, 6158) express concern that this rule would greatly limit the data and models upon which EPA would rely when setting public health and environmental standards. Commenter (6158) also refers to the concerns expressed by Singla et al (2018) in their detailed comments to EPA submitted May 30, 2018.²⁹⁸²
- Commenters (2909, 5181, 8281-PH5, 8281-PH29) express concern that the proposed rule would limit the scientific research available to EPA policy makers to an extent that would undermine EPA’s mission to protect public health and the environment.
- Commenter (6904) states that, if EPA excludes studies because the data cannot be made public, people may be exposed to real harm. The commenter states that the result would be decisions affecting millions based on inadequate information that fails to include well-supported studies by expert scientists.
- Commenter (4894) states that the proposed rule is based on a faulty premise, namely, that only studies whose underlying data are publicly available, sufficient to support replication, should be considered by the EPA as it develops regulations governing clean air, clean water, and exposure to toxic substances and pesticides.
- Commenter (4591) states that the goals of open science are not advanced through this proposal, which does not provide incentives, funding, or infrastructure for increasing access to data, but simply allows the Agency to disregard important, ethical, well-designed and executed studies.
- Commenter (6907) is concerned that the proposed rule on transparency would reduce the number of valid scientific studies utilized by EPA in conducting risk assessments and therefore, jeopardize the safety of pesticides and impact rulemaking under Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).
- Commenter (6125) asserts that, while it is not flatly untrue that the proposal “does not compel” EPA to make the information available, it is worse than disingenuous not to

²⁹⁸² Singla, Veena et al. “Comments from academics, scientists and clinicians on the EPA proposed rule “strengthening transparency in regulatory science,” May 30, 2018. 16 pp.

mention also that unless the information is publicly available it cannot be used as a basis for the rulemaking decision unless EPA grants an exemption.

- Commenter (8281-PH84) expresses concern that, under this proposal, studies without a guarantee of full public access will be considered unreliable and will play no role in assessing a chemical's health effects on human health. The commenter states that this ignores the many ways in which the scientific community, regulators and the public have traditionally determined the quality and relevance of study results.

Response: In this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. The EPA has removed the term “science that serves as the basis for informing a significant regulatory action” from 40 CFR 30.1, and will not require that science that serves as the basis for informing a significant regulatory action is publicly available in a manner sufficient for independent validation. Instead, in the final rule, 40 CFR 30.4 requires that the EPA clearly identify all science that serves as the basis for informing a significant regulatory action, and make all such science that serves as the basis for informing a significant regulatory action publicly available to the extent permitted by law. The EPA clarifies that this requirement is consistent with the EPA's existing practice of making science that serves as the basis for informing a significant regulatory action available in the public docket as part of the rulemaking.

Comment: Commenter (4831) references several NAS reports²⁹⁸³ and states that these reports encourage EPA to consider all available science in the rule-making process and provide guidance about how the agency could be more transparent in describing how evidence is gathered and evaluated.

Response: Consistent with existing Agency guidelines, the EPA will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Comment: Commenters (4591, 6191) concur with the Association of American Medical Colleges, Association of American Universities, Association of Public and Land-grant Universities, and Council on Governmental Relations in their July 11, 2018 statement “Re: Docket Number EPA-HQ-OA-2018-0259-0025, Strengthening Transparency in Regulatory Science,” which states that “[e]ven the strongest and most sincere supporters of the open science movement have recognized that there is value in research for which underlying data are not made

²⁹⁸³ Application of Systematic Review Methods in an Overall Strategy for Evaluating Low-Dose Toxicity from Endocrine Active Chemicals (NASEM, 2017a), Review of EPA's Integrated Risk Information System (IRIS) Process (NRC, 2014), Critical Aspects of EPA's IRIS Assessment of Inorganic Arsenic: Interim Report (NRC, 2013), Review of the Environmental Protection Agency's Draft IRIS Assessment of Formaldehyde (NRC, 2011), Finding What Works in Health Care: Standards for Systematic Reviews (IOM, 2011), Science and Decisions: Advancing Risk Assessment (NRC, 2009), and Models in Environmental Regulatory Decision Making (NRC, 2007).

publicly available and acknowledge an imperative to leverage all science to develop policies and regulations.”²⁹⁸⁴

Response: EPA agrees with the commenter that there is value in research for which the underlying data and models cannot be made available. In consideration of this concern, in this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Comment: Commenter (6135) opposes any effort by EPA, under the guise of transparency, to disregard the findings of scientific studies assessing the health impacts of air pollution when making regulatory decisions. The commenter states that, since there is no way to provide de-identified data in the public domain that would allow for secondary reanalysis of both the exposure assessment and health analysis in studies assessing the health impacts of air pollution, the EPA should instead continue to focus on assessing results across multiple studies to evaluate the veracity and general applicability of scientific findings.

Response: The EPA disagrees that this rule will cause the Agency to disregard the findings of scientific studies assessing the health impacts of air pollution when making regulatory decisions. The EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Comment: Commenter (6907) states that, while the proposed rule suggests that fraud is prevalent in studies where data are not published, this is not the case. The commenter states that, in many instances, these unpublished data protect the humans who are part of studies. The commenter states that the scientific process ensures that studies remain reproducible even when data cannot be made publicly available.

²⁹⁸⁴ Ioannidis, J.P.A. (2018). All science should inform policy and regulation. PLOS Medicine. 15 (5): e1002576. <https://doi.org/10.1371/journal.pmed.1002576>.

Response: The EPA is committed to protecting the privacy of study participants and will ensure that the implementation of this rule is consistent with law; protects privacy, confidentiality, and confidential business information (CBI); and is sensitive to national security interests. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety.

Comment: Commenter (6915) states that, going forward, many academic scientists whose research is relevant to EPA regulations may not conduct and report their studies in a way that satisfies the requirements of the proposed rule. The commenter asserts that the proposed rule’s provisions would require significant additional resources and could impose unreasonable and impractical requirements beyond those included in current protocols. The commenter states that academic researchers may not be concerned about or even consider whether their studies would qualify for use in establishing EPA regulations, and/or may not have the resources to reshape their approach to maintaining data. The commenter notes that, for those researchers who do attempt to comply with the proposed rule’s requirements, the extent and nature of the data that must be maintained and made publicly available is vague and unclear, making compliance virtually impossible.

Response: EPA disagrees with the commenter that this rule would impose a burden of unreasonable or impractical requirements on researchers or other members of the public. Instead, this is an internal rule of agency procedure and thus puts no burden on any entity other than EPA. This rule is consistent with advances by the scientific community, which has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals²⁹⁸⁵ and the emergence of organizations, such as the Center for Open Science, and international initiatives like Findable, Accessible, Interoperable, and Reusable (FAIR) data principles; Facilitate Open Science Training in European Research (FOSTER); and Guidelines for Transparency and Openness Promotion (TOP) in Journal Policies and Practices that incentivize greater transparency in research^{2986,2987}.

9.1.1.2 Generally Support Requirement to Make Regulatory Science Publicly Available

Comment: Commenters (0555, 0563) generally support regulatory science underlying its actions being required to be publicly available in a manner sufficient for independent validation. The commenters generally express that often analyses underpinning regulations reflect policy

²⁹⁸⁵ McNutt, M. (2016). Taking up TOP. *Science* 352, 1147. Available at <https://doi.org/10.1126/science.aag2359>.

²⁹⁸⁶ NAS (National Academies of Sciences, Engineering, and Medicine). (2019). *Reproducibility and replicability in science*. Washington, DC: The National Academies Press. Available at <https://www.nationalacademies.org/our-work/reproducibility-and-replicability-in-science>.

²⁹⁸⁷ Nosek, B. A. et al. (2015). Promoting an open research culture. *Science* 348, 1422-1425. Available at <https://doi.org/10.1126/science.aab2374>.

preferences or are grounded on false information and that EPA's proposal to strengthen the transparency of its regulatory science would lead to better regulatory outcomes.

Commenter (0555) provides that regulatory impact analyses often hinge on assessments of risk that necessarily involve assumptions and judgments but often generate precise-sounding predictions that hide not only considerable uncertainty about the actual risk, but hidden policy judgements.²⁹⁸⁸ The commenter states that too often scientific information presented to the public and decision-makers is infused with hidden policy preferences. The commenter asserts that EPA's proposal to strengthen the transparency of its regulatory science includes reasonable steps that could improve the evidential basis for its regulatory policies, and thus improve regulatory outcomes by targeting resources to where they can achieve the largest benefits. The commenter states that, as President Obama's science advisor observed, "open communication among scientists and engineers, and between these experts and the public, accelerates scientific and technological advancement, strengthens the economy, educates the Nation, and enhances democracy."²⁹⁸⁹

Commenter (0563) does not agree with the claim that peer review alone is sufficient quality control. The commenter asserts that using scientific research that is non-transparent and non-replicable increases the likelihood that policy will be grounded on false information. The commenter does not agree with the argument that EPA should be able to use all available scientific research and that excluding some may cripple its ability to protect us.

Commenter (0563) states that studies may rely on funding from sources that restrict disclosure of underlying data, and the rule would prohibit the EPA's use of those. The commenter states that is precisely why the rule is needed. The commenter adds that the funders should change their policies; and argues that their refusal suggests they have something to hide.

Commenter (0844) asserts that many of the arguments opposing the EPA's transparency rules are surreal. The commenter did not explain this position.

Response: The EPA disagrees with the commenter that its analyses are often political or grounded in false information. The EPA performs objective, high-quality analyses using the best available science. Through this rule, and consistent with existing Agency practice,²⁹⁹⁰ the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information. The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions

²⁹⁸⁸ Susan Dudley and Marcus Peacock. "Improving Regulatory Science: A Case Study of the National Ambient Air Quality Standards," with Marcus Peacock. *Supreme Court Economic Review*. ²⁹⁹⁰ U.S. EPA. (2002). Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency. (EPA/260R-02-008). Washington, DC: U.S. Environmental Protection Agency. Available at https://www.epa.gov/sites/production/files/2020-02/documents/epa-info-quality-guidelines_pdf_version.pdf.

and influential scientific information: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review.^{2991,2992} When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science (see Section III.E of the final rule preamble).

EPA agrees that relying on measures beyond peer review can increase transparency. However, EPA notes that peer review is still a valuable process. As noted in EPA's Peer Review Handbook (4th Edition): "Peer review is conducted to ensure that activities are technically defensible, competently performed, properly documented and consistent with established quality criteria. Peer review is an in-depth assessment of the assumptions, calculations, extrapolations, alternate interpretations, methodology, acceptance criteria and conclusions pertaining to the scientific or technical work product, and of the documentation that supports them."²⁹⁹³ Peer review does serve to increase the credibility of a work product. This is why the final rule at 40 CFR 30.6 requires the EPA to conduct independent peer review consistent with the requirements of the Office of Management and Budget (OMB) Final Information Quality Bulletin for Peer Review and the exemptions described therein, and authorizes the EPA to evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review.

Finally, EPA disagrees with the commenter that this rule is needed to convince funders of scientific studies to change policies restricting data disclosure that are consistent with laws governing privacy and intellectual property. Furthermore, this is an internal rule of agency procedure and not intended to impose requirements or burdens upon the public.

9.1.1.3 Are Studies More Valid If Data Publicly Available?

Comment: Commenters (6133, 9227) assert that EPA provides no basis for its assumption that science or studies for which data are publicly available yield more valid or reliable results than

²⁹⁹¹ U.S. EPA. (2014). Framework for Human Health Risk Assessment to Inform Decision Making. (EPA/100/R-14/001). Washington, DC: U.S. Environmental Protection Agency, Office of the Science Advisor, Risk Assessment Forum. Available at <https://www.epa.gov/sites/production/files/2014-12/documents/hhra-framework-final-2014.pdf>.

²⁹⁹² U.S. EPA. (2003). A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information. (EPA 100/B-03/001). Washington, DC: U.S. Environmental Protection Agency. Available at <https://www.epa.gov/sites/production/files/2015-01/documents/assess2.pdf>.

²⁹⁹³ U.S. EPA. (2015). Peer Review Handbook, 4th Edition. (EPA/100/B-15/001). Washington, DC: U.S. Environmental Protection Agency. Available at https://www.epa.gov/sites/production/files/2020-08/documents/epa_peer_review_handbook_4th_edition.pdf.

the best available, peer-reviewed, independent, credible science, for which the underlying data are not publicly available. Commenter (6133) states that neither the Proposal nor docket contains any factual, scientific, technical, logical, or legal support for the suggestion that science and data that are “publicly available in a manner sufficient for independent validation” are necessary elements for the “validity,” “reliability,” or “transparency” of scientific information.

Commenter (9227) states that the EPA irrationally conflates scientific “validity” and “transparency” with data availability, incorrectly assuming that eliminating the use of studies without publicly available data will improve scientific validity and transparency. The commenter states that, in the preamble to the proposed rule, EPA states that the intent of the regulation is “to strengthen the transparency of EPA regulatory science.” The commenter states that, later in the preamble, EPA states: “[e]nhancing the transparency and validity of the scientific information relied upon by EPA strengthens the integrity of EPA’s regulatory actions and its obligation to ensure the Agency is not arbitrary in its conclusions.” The commenter states that EPA then leaps to the unexplained conclusion that barring the use of studies without publicly available data will enhance transparency and validity. The commenter states that EPA’s assumption that data availability (or “transparency” in the form of data availability) ensures the use of valid science or its equivalent to using the best available science is manifestly incorrect, and hence provides an irrational basis for the proposed rule. The commenter states that neither data availability in particular, nor transparency in general, is equivalent to or a guarantee of “validity” in scientific studies.

Commenter (6133) states that the Proposal arbitrarily fails to address, much less explain, why prior EPA regulatory actions that relied upon studies, data, or other information did not reflect the “best available science” or why they were otherwise unreliable, despite failing to meet the Proposal’s standards.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to national ambient air quality standards (NAAQS), risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines (IQG) or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to

more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

9.1.1.4 The Proposal is not an Exclusionary Rule

Comment: Commenter (6179) states that some have mischaracterized the Proposal as an exclusionary rule that would bar EPA from considering studies where underlying information cannot be made public. The commenter states that a plain reading of the Proposal's specific regulatory language shows no such requirement. The commenter asserts that the Proposal states that: (1) EPA should generally release regulatory science where practicable; (2) EPA shall ensure certain information underlying studies cited in significant rulemaking is made publicly available; and, (3) the Administrator has authority to exempt studies cited in significant rulemakings containing certain information, including that which is private, sensitive, or confidential, from these requirements. The commenter states that these are reasonable steps to improve the evidentiary basis for EPA's regulatory policies and improve regulatory outcomes by targeting resources to where they can achieve the largest benefits.²⁹⁹⁴ The commenter states that it would be unsound policy for EPA to summarily exclude science from regulatory consideration – and the Proposal does not do so. The commenter states that the proposal presumes proactive management of private, sensitive, or confidential information and only requires disclosure of dose response data and models in appropriate circumstances. The commenter states that, rather than rigidly excluding important studies, the Proposal provides a flexible, case-by-case exemption process.

Commenter (6179) states that the Proposal is not, and does not need to be, an exclusionary rule in order to accomplish its underlying goal of informing public discourse on significant regulations. The commenter asserts that the rule can be implemented to protect private, sensitive, or confidential information while still seeking maximum possible transparency. According to the commenter, the presence of private, sensitive, or confidential information does not necessarily make disclosure of dose response data and models impossible.

Commenter (1302) states that many have objected that this transparency ruling would undermine the ability to collect relevant data. The commenter notes that the ruling specifically allows the Agency to make data or models available in a manner that is consistent with law, protects privacy, confidentiality, CBICBI, and is sensitive to national and homeland security. The commenter adds that the data made publicly available are only those required to enable "independent validation," that is that the data provided is sufficient "for the public to understand, assess, and replicate findings." According to the commenter, since such information does not (except perhaps in extraordinary circumstances) include the identity of subjects, it is difficult to imagine how confidentiality agreements would be violated by disclosing information regarding anonymous subjects.

Commenter (0563) suggests that §30.5 assures that the Agency, in making data or models publicly available, would do so in a fashion that is consistent with law, protects privacy,

²⁹⁹⁴ Susan E. Dudley, Public Interest Comment on the Environmental Protection Agency's Proposed Rule Strengthening Transparency in Regulatory Science, GEO. Wash. U. Regulatory Studies Ctr., Docket No. EPA-HQ-OA-2018-0259-0555, May 18, 2018.

confidentiality, CBICBI, and is sensitive to national and homeland security. The commenter adds that §30.9 allows the Administrator to grant exemptions on a case-by-case basis if compliance is impracticable. The commenter concludes that the rule would not prevent the EPA from using studies that involved confidential information, such as personal health data or corporate proprietary information.

Response: The EPA agrees that this final rule is not an exclusionary rule. The final rule is limited to dose-response data and, as no studies are categorically excluded from consideration, the EPA will continue to rely on the full body of the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Consistent with the requirements of this rule, the EPA will identify a subset of those studies based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints that would inform a dose-response assessment, and will give greater consideration to pivotal science for which the underlying dose-response data are available.

Comment: Commenter (6376) suggests that EPA should establish guidelines to ensure transparency does not come at the cost of widespread exclusion due to inadequate protections for the variety of sensitive data included in different pertinent studies. The commenter states that scientific studies involving or including sensitive health data should not be at risk of exclusion over concerns related to personal information being exposed.

Response: The EPA agrees that it is important not to categorically exclude any study because the data underlying a study at the stage required by this rulemaking may not be available for independent validation. Therefore, the EPA is not finalizing the primary proposal in the 2020 SNPRM that would have categorically required that for studies to be considered pivotal science the underlying data would need to be available for independent validation. However, given that transparency is an important aspect of EPA's regulatory actions and assessments, it should be an important consideration in how the Agency considers pivotal science. As described in 40 CFR 30.5 of the final rule, the EPA will rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies—based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science.

Further, the EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject

matter expert access to enough data to support independent validation while still protecting sensitive information.

9.1.1.5 EPA Would Exclude Studies and Other Valid Data from Regulatory Decision-Making

9.1.1.5.1 EPA Should Identify Studies that Would Be Barred

Comment: Commenter (6125) expresses concern that the proposal says nothing about what studies it will exclude, aside from those identified but not mentioned by name in footnote 3 of the preamble. The commenter requests that EPA should identify the key studies that its proposal would bar that have been used to support regulations in the past and evaluate the impact of their loss on those regulations and thereby on human health and the environment.

Response: Under this final rule, the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

9.1.1.5.2 Best Available Science

Comment: Commenters (1012, 1433, 1796, 1945, 1973, 1994, 2170, 2180, 2182, 2190, 2249, 2335, 2425, 2746, 2911, 3135, 4595, 4827, 4828, 4845, 4877, 5115, 5131, 5176, 5178, 5180, 5981, 6116, 6122, 6125, 6128, 6133, 6134, 6137, 6153, 6157, 6181, 6194, 6195, 6355, 6368, 6373, 6873, 6882, 6895, 6906, 6909, 6932, 6942, 8272, 8282-PH10, 8281-PH38, 9225, 9227) oppose this proposed rule since it could undermine EPA's ability to use studies that represent high-quality studies/best-available science and thereby potentially leading to weakening protections for public health and the environment. Comments include:

- Commenter (6373) asserts that EPA must consider the “best available science” to guide policies and practices and should avoid eliminating existing data and standards until such time as new and better information is available, regardless of the source of the existing data.
- Commenter (6932) states that risk assessment processes can be improved and recommendations have been issued in reports like the 2014 NAS report,²⁹⁹⁵ but limiting the types of studies that can be used is not the way to improve them. The commenter notes that the best available science means that EPA should use all scientific studies –

²⁹⁹⁵ National Research Council (U.S.), ed. Science and Decisions: Advancing Risk Assessment. Washington, D.C: National Academies Press, 2009.

especially independent science from peer-reviewed journals-- available in order to inform its decisions.

- Commenter (6125) What justification is there to impose such an absolute ban on EPA studies? Would the ban extend to using research developed and relied on by other agencies?
- Commenter (6116) states that EPA does not explain how its proposed approach will ensure that it relies on the “best available science” which is an oft-repeated standard in various environmental laws. The commenter states that it is possible that EPA’s proposed regulation will actually result in a failure to rely on the “best available science” as EPA will arbitrarily disqualify important scientific studies if the underlying data cannot be disclosed to the public and/or cannot be independently validated.
- Commenter (6137) states that EPA has provided no scientific justification for ignoring an entire class of health science simply because the underlying data has not been disclosed. The commenter adds that EPA has not demonstrated that it is consistent with scientific principles to categorically exclude peer-reviewed scientific information from all consideration in a rulemaking, as EPA proposes to do. The commenter states that, if EPA has any doubts or concerns regarding the merits of a particular study, it must address those doubts or concerns for that particular study in the context of a given rulemaking, where agency staff, internal scientific experts, scientific advisory committees, or commenters contend that study is relevant. The commenter notes that, whether underlying data on which a study relies is made public or not simply has no bearing on whether a scientific study is good science, is accurate, is reliable, and is relevant to a scientific question (such as the health effects of air pollution).
- Commenter (2911) states that the only criterion that should be used in deciding whether to use the information from a scientific study is whether the study is valid or not. Commenters (6873, 6906) expand on this idea by noting that the proposal, as written, could provide the EPA Administrator and offices with an incentive to exclude studies with useful information either inadvertently or intentionally because underlying dose response information and information about models are not available. Commenter (6906) suggests that EPA close this potential loophole by amending proposed 40 CFR §30.4 to include instructions that this rule shall not be used to exclude a study from EPA’s review and consideration of conclusions drawn therein, where EPA determines the study is compatible with the “best available science.” Commenter (6873) recommends that EPA close this loophole by any number of minor adjustments—for instance, holding public hearings for each study to be questioned by the EPA might allow scientific findings to be vetted without ruling them out entirely.
- Commenter (1012) asserts that EPA must use the best available science as the foundation of its regulatory actions. Commenter (1945) states that regulatory decisions should be based on the best science, and that there is often much to be gained by allowing data to be scrutinized.
- Commenter (1012) asserts that oftentimes the best available science (or the only available science) may include data of a sensitive nature like personal health information or CBI. Commenter (5131) states that peer-reviewed studies assessing the effects of pollution

exposure on humans, based on actual personal health data, which by law must be kept confidential, are among the best science available to the Agency.

- Commenter (3135) states that, for years, both Congress and successive administrations have required the EPA to use the best science for its decisions. The commenter states that it is a major departure for this proposal to direct EPA scientists to exclude key studies merely because they cannot meet the proposed disclosure requirement.
- Commenter (2170) states that the best available science can include research vetted through means other than the publishing of all data used. The commenter states that the protection of human health and the environment, as well as the legal, ethical, and moral prohibitions on publishing certain kinds of data, require that the best available science be inclusive of such research. The commenter states that it is unclear from a reading of the Proposed Rule whether scientific research not relying on published data sources would be (1) required to publish the data before the research could be used, even where publishing would be in clear violation of legal, ethical and/or moral standards, (2) simply ignored by EPA as if it were nonexistent, or (3) some combination of 1 and 2. The commenter states that the practical effect would be the same: a whole segment of research critical to the protection of human health, representing the best available science, would be eliminated from regulatory use.
- Commenter (4595) asserts that it has been recognized since 2002 by the D.C. Circuit Court that it would be "impractical and unnecessary" for the EPA to require that all underlying data be made public.²⁹⁹⁶ The commenter notes that the court recognized the importance of EPA to have access to as much scientific information as possible to protect public health and the environment. The commenter adds that there remain cases when the transparent and proper use of the best available science requires that some of the underlying data cannot be made publicly available for legitimate reasons.

Response: The EPA disagrees with the commenters because this final rule does not require the EPA to categorically exclude any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Further, this rulemaking is not intended to modify the Agency's interpretations of "best available science." The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. The EPA will then identify and consider "pivotal science in accordance with the provisions of this rule," unless the implementation of the rule conflicts with statutory requirements and associated implementing regulations.

Some commenters interpreted 40 CFR 30.4 as requiring the EPA to make publicly available all science relied upon in final agency actions. The EPA clarifies that in the final rule, the requirements of 40 CFR 30.4 are consistent with the EPA's existing practice of making science

²⁹⁹⁶ <https://law.justia.com/cases/federal/appellate-courts/F3/283/355/484491/>

that serves as the basis for informing a significant regulatory action available in the public docket as part of the rulemaking.

9.1.1.5.3 Epidemiologic Studies

Comment: Commenters (1012, 2180, 4844, 5981, 6103, 6114, 6116, 6119, 6130, 6131, 6170, 6450, 6884, 6915, 6932, 8272) express concern that this proposal would likely prevent the EPA from using any studies that could not be independently reproduced and would therefore disallow many extremely beneficial types of studies, such as those examining the results of natural disasters or industrial/occupational accidents/exposures. The commenters assert that such incidents could not be replicated from practical, safety, or ethical points of view, yet the information they provide on real world exposure and dose-response interactions is invaluable. These studies include the following:

- Exposure to high levels of smoke from wildfires or to high levels of chemicals resulting from industrial accidents or exposures. (6114, 6116, 6131)
- Unique events such as the 2010 Deepwater Horizon oil spill. (1012, 4844, 6103, 6450)
- The Flint water crisis and the 1979 Three Mile Island accident. (6450)
- Health impacts resulting from asbestos exposure, exposure to Dichlorodiphenyltrichloroethane (DDT), and birth defects caused by thalidomide. (6450)
- The effects of radiation from atomic bomb survivors. (6915)
- Data on wildlife toxicity from the Exxon Valdez oil spill. (6915)
- Data on the human health impacts of the September 11, 2001 World Trade Center disaster. (6915, 8913)
- Impacts of neurotoxins from mercury contaminated Minamata Bay.²⁹⁹⁷ (8272)
- The BP Transworld oil spill, the Katrina pollutant disaster, the Hurricane Harvey-related toxic chemical discharges, and the Church Rock uranium mill spill. (8913)

Commenter (6915) states that, for older epidemiology data, such as data from studies on occupational exposures to workers in factories before the advent of strict Institutional Review Board (IRB) requirements, raw data are seldom if ever still available. The commenter states that such data, including high quality data generated by major corporations in conjunction with academic institutions, would not be available to EPA under the proposed rule. The commenter states that, effectively, the proposed rule would restrict the epidemiology data available for use by EPA, even where the weight of the evidence clearly supports a finding of causality and risk.

Response: The EPA disagrees with the commenters that this rule would likely prevent the EPA from using any studies that could not be independently reproduced and would therefore disallow many extremely beneficial types of studies, such as those examining the results of natural disasters or industrial/occupational accidents/exposures. In this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will

²⁹⁹⁷ Grandjean P, Satoh H, Murata K, & Eto K. (2010). Adverse Effects of Methylmercury: Environmental Health Research Implications. *Environmental Health Perspectives*, 118(8):1137-45. [Copy of study included with comment.]

continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Further, the rule does not require EPA or any other entity to reproduce or conduct independent validation of pivotal science used in significant regulatory actions and influential scientific information.

Comment: Commenters (2171, 2336, 4591, 4595, 5019, 5115, 5165, 6133, 6916, 6919, 8275, 8281-PH16, 8281-PH26, 8281-PH38) express concern that EPA's Proposal would exclude, including published supporting studies for the NAAQS, that the Agency uses to make informed policy decisions regarding major public health and environmental laws.

Commenters (1311, 1883, 1973, 1995, 2002, 2064, 2107, 2151, 2171, 2180, 2190, 2241, 2336, 4410, 4591, 4595, 4828, 5019, 5115, 5165, 5981, 5186, 6117, 6119, 6120, 6125, 6130, 6132, 6133, 6137, 6170, 6181, 6188, 6373, 6696, 6868, 6872, 6882, 6884, 6895, 6915, 6916, 6919, 6920, 6922, 6943, 6925, 6932, 6941, 8272, 8275, 8281-PH16, 8281-PH26, 8281-PH38) also express concern that EPA is proposing to establish a policy that could preclude it from using many of the best available peer-reviewed and scrutinized longitudinal medical and epidemiological and other studies from consideration in regulatory actions because these studies' underlying data includes confidential information. Commenter (6920) states that, by disqualifying high quality longitudinal epidemiological and clinical studies - often the most direct and relevant evidence of chemical impacts on humans - the proposed rule would diminish not strengthen the science underlying regulations. Commenter (4848) contends that longitudinal medical and epidemiological studies are often conducted over years, if not decades and is concerned that, under the Proposed Rule, they would be eliminated from consideration unless all underlying data is made public.²⁹⁹⁸ Commenter (4595) asserts that requiring all raw data to be made publicly available before a study can be utilized in EPA decision-making will cut off EPA from foundational research that has informed EPA's work since the inception of the agency and may violate Federal laws and directives already in place. The commenters generally indicate that epidemiological studies are essential to effective environmental regulation. Comments include:

- Commenters (2171, 4410) state that laboratory work, toxicological research, and epidemiological studies are complementary, and each facet is necessary when it comes to understanding and quantifying the effects of a pollutant on human health. The commenters state that eliminating evidence from one of these three essential disciplines threatens the scientific basis for regulatory decisions and actions.
- Commenter (1973) thinks that the proposed rule would deprive policy makers of the real-world epidemiologic evidence, based on real exposures of real people, that has been and will continue to be vital for future revisions of the NAAQS, drinking water standard,

²⁹⁹⁸ David Fouse. Public health, medical, academic and scientific groups oppose EPA transparency rule (July 16, 2018), <https://www.apha.org/news-and-media/news-releases/apha-news-releases/2018/epa-transparency> ("If EPA excludes studies because the data cannot be made public, people may be exposed to real harm. The result would be decisions affecting millions based on inadequate information that fails to include well-supported studies by expert scientists. These efforts are misguided and will not improve the quality of science used by EPA nor allow the agency to fulfill its mandate of protecting human health and the environment").

pesticide standards, and other health based standards based on a false understanding of transparency and replication in science.

- Commenter (4828) notes that many of EPA's drinking water standards rely on epidemiological studies.²⁹⁹⁹ The commenter states that often these studies last decades and follow hundreds, if not thousands, of patients, collecting confidential health data as well as other personal data, like the people's addresses, ages, and genders. Commenters (4828, 6872) add that, for most of these studies, the underlying data cannot be made public – even in redacted form – without sacrificing the participants' privacy or jeopardizing data confidentiality. The commenter states that studies like these established the original limits on lead, and this research continues to be essential today. Commenter (6872) states that, thus, the proposed rule could prevent EPA from considering some of the best, most up-to-date research, including some of the largest collections of epidemiological data developed over long periods of time, in assessing toxic pollutants in drinking water and the air and/or compromise data confidentiality.

Commenter (2064) states that, through peer-reviewed and validated research, paraquat is very strongly associated with an increased risk of Parkinson's disease. The commenter states that much of the research relies on large, population-based studies, which is the type of research most impacted by this rule. The commenter states that, without the ability to consider this research, the EPA will miss vital information needed to protect public health, thus placing Americans at risk. Commenter expresses concern that many of the most important studies involving environmental exposures and Parkinson's disease would be excluded from future determinations for one or more of the following reasons:

- The authors did not previously obtain the needed consents to release the data and would thus be subject to criminal penalty if they did so.
- The data cannot be deidentified appropriately while complying with federal privacy protection laws.
- The cost to deidentify would be very high and many research institutions do not have people on staff who can perform the work needed to do so.

Commenter (6884) asserts that, in proposing this rule, EPA is essentially discounting the scientific expertise, knowledge, experience, and integrity of tens of thousands of researchers around the country that engage in epidemiological research. The commenter states that the "transparency" that is the basis for this rule would virtually undermine any studies that look at real world environmental health impacts to the people we work with every day.

Commenter (2151) states that, while environmental regulation will never be perfect and the goal should not be over-regulation, the potential costs to public health of any rule which would disallow long-term epidemiological studies is not an acceptable risk. The commenter states that there is no product or corporate bottom line so valuable that could legitimize excluding medical

²⁹⁹⁹ For example, the National Primary Drinking Water Regulation for arsenic under the Safe Water Drinking Act, <https://www.gpo.gov/fdsys/pkg/FR-2001-01-22/pdf/01-1668.pdf>; National Primary Drinking Water Regulations for radionuclides under the Safe Water Drinking Act, <https://www.gpo.gov/fdsys/pkg/FR-2000-12-07/pdf/00-30421.pdf>; Lead and Copper Rule Revisions White Paper, https://www.epa.gov/sites/production/files/2016-10/documents/508_lcr_revisions_white_paper_final_10.26.16.pdf.

studies relating to a child's developing brain or the sickness of any human's body. The commenter states that no particular scientific method or study should be sacrosanct, but whatever methodology the EPA adopts it should be one in which all of the available science is considered in decision-making.

Commenter (5118) believes epidemiological reports are valuable but more critical initial review is needed. The commenter states that there is no way to verify the procedures or results presented and the EPA reviewers are not identified.

Response: In this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

9.1.1.5.4 Reliance on Animal Toxicity Studies Over Epidemiological Studies

Comment: Commenters (1973, 2171, 4410, 6915, 6941, 8281-PH63) express concern that the proposed rule would exclude many human studies and, as a result, force EPA to increase its reliance on information from less relevant animal toxicity studies. Comments include:

- Commenter (1973) states that the major scientific issue challenging EPA's regulations is not the use of human studies that have been replicated multiple times, it is that EPA has to base many of its regulations on extrapolation from animal studies because human studies, particularly at relevant doses, have not been available. The commenter states that this proposal, by announcing that human studies, when done, will likely be ignored, will only exacerbate this problem.
- Commenters (2171, 4410, 8281-PH63) assert the proposed rule would put regulators tasked with protecting human health in an impossible situation of relying primarily on animal models or in-vivo models that cannot be directly extrapolated to human dose-response estimates.
- Commenter (6915) notes that, in general, and specifically in EPA's 2005 Guidelines for Carcinogen Risk Assessment, human (i.e., epidemiology) data are preferred to animal data as the basis for risk assessment toxicity factors when they are of sufficient quality and are amenable to dose response modeling. The commenter states that this is because animal data always carry inherent uncertainties in regard to their relevance to humans. The commenter states that epidemiology data collected over the last 40 years, however, have been generated under the auspices of IRBs working to protect the patient or participant information obtained by academic institutions, government entities, hospitals, and other organizations, and thus disclosure of that data would be difficult, if not impossible.
- Commenter (6941) asserts that the proposed rule could force EPA to exclude from its consideration epidemiologic studies that use confidential health data. The commenter notes that such studies are frequently the most relevant to protecting public health as they assess outcomes in humans following real world exposures. The commenter states that,

without access to the information provided by such studies, EPA may instead increase its reliance on information from less relevant animal toxicity studies.

Response: The EPA disagrees with the commenters that this rule will necessarily lead the EPA to disregard human subject research in favor of animal studies. In this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. See 40 CFR 30.5 for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available for independent validation. The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Comment: Commenter (6446) states that the proposed regulation would preclude EPA from considering a large number of important, peer-reviewed animal studies — studies that should serve as a foundation for regulatory action -- merely because of the unavailability of the raw data underlying the studies or the time and expense that would be required to obtain the raw data and provide it to the public. The commenter adds that a large amount of toxicological literature is based on animal studies that has accrued over the past 60 years that underlies the establishment of advisory levels and standards for hundreds of chemicals. The commenter notes that, in the scientific studies relied on for establishing these levels, data are generally provided in aggregated form due to journal page count limitations. According to the commenter, certain raw study data are available at an individual animal level (e.g., pathology data) online and from animal study reports performed by the National Toxicology Program (NTP), but such data are not included in study reports published by academic and industry researchers in peer-reviewed journals.

Commenter (6446) contends that a requirement to obtain an ad hoc exception to the proposed rule's requirements for large numbers of animal studies would be wholly unworkable.

Response: The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. See 40 CFR 30.5 for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available for independent validation. The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

The EPA disagrees that the process of the Administrator granting exemptions to the rule per 40 CFR 30.7 will be unworkable. The Agency may incur administrative costs to perform analyses and evaluations to support activities such as exemption decisions made by the Administrator, and documenting these or other decisions made pursuant to the requirements of the final rule. The Agency anticipates that the incremental costs for these activities will be small relative to current administrative costs for developing significant regulatory actions or influential scientific information.

9.1.1.5.5 Limitation of Use of Studies in Future Rulemakings

Comment: Commenters (0559, 6103, 6111, 6125, 6188, 6903, 6934, 8276) express concern that the proposed rule would shrink the universe of scientific information EPA can rely upon in support of rules in the future. Commenters provide the following examples:

- Commenter (6103) states that, in the upcoming review of soot standards, the proposed Transparency rule makes it unlikely that the EPA would be able to consider much of the scientific research that links soot pollution to adverse health effects, as it relies on medical records. The commenter adds that EPA will be forced to make decisions based on less information, making it more difficult for the agency to make science-based decisions that protect public health, as its mission requires.
- Commenter (6111) states that late in 2017 EPA issued a draft report identifying potential approaches to deriving a maximum contaminant level goal for perchlorate.³⁰⁰⁰ The commenter states that, to develop these approaches, EPA focused on five epidemiological studies.³⁰⁰¹ The commenter provides that all five studies relied on confidential patient

³⁰⁰⁰ EPA, Draft Report: Proposed Approaches to Inform the Derivation of a Maximum Contaminant Level Goal for Perchlorate in Drinking Water (2017), <https://www.regulations.gov/document?D=EPA-HQ-OW-2016-0438-0019>.

³⁰⁰¹ Id. at 6-1 to 6-19 (citing Tim I. M. Korevaar et al., Association of Maternal Thyroid Function during Early Pregnancy with Offspring IQ and Brain Morphology in Childhood: A Population-based Prospective Cohort Study, 4

data and all five studies were carried out in Europe, where scientists may be subject to different data confidentiality requirements than in the United States. The commenter states that the proposed rule would also prohibit EPA from continuing to rely on Needleman's critically important study³⁰⁰² in future reconsiderations of the lead NAAQS and revisions to the Lead and Copper Rule. The commenter states that, as a result, the proposed rule risks undermining the scientific basis for these EPA actions.

- Commenter (6125) states that EPA must propose an updated rule on lead in soil, dust and paint this year and EPA will propose an updated lead and copper rule for drinking water by 2020. The commenter states that, because many of the foundational lead studies analyzed children with higher exposure and blood lead levels than are commonly seen today, it would be unethical to run the same tests today, exposing children to levels of lead that we know are unhealthy. The commenter notes that, due to numerous factors related to their age, it may well not be possible to recover the original data. The commenter states that, if use of those older studies were successfully challenged because they do not meet the data requirement policy, they could not be used. The commenter asserts that their exclusion would weaken the scientific support for EPA regulations that have clearly proved their worth in the dramatic declines in blood lead levels in American children.
- Commenter (6125) suggests that the standards for arsenic and nitrate standards will most likely be affected by the proposed rule. The commenter states that both drinking water standards rely on epidemiological data including confidential patient information, as well as on older studies. The commenter adds that data from such studies may have been discarded or lost or be in an unreadable form. The commenter contends that none of these studies could realistically or ethically be reproduced since they derive from a unique cohort, and it would be unethical to expose people to ingested pollutants.
- Commenter (6903) states that one study published in 2017 indicates that particulate matter (PM_{2.5}) and ozone exposure at levels below current NAAQS is associated with increased mortality. The commenter notes that the Proposed Rule would make it near impossible for the Agency to consider the study.
- Commenter (6934) expresses that the rule would eliminate the use of studies like the one they hope to one day attain that rely on confidential health guidelines, discredit already peer-reviewed science, and make it impossible for citizens within their group and the countless other groups out there like theirs and individuals to gather preliminary health information for fear that this confidential information might become public once it is

The Lancet Diabetes & Endocrinology 35 (2016); Martijn J. J. Finken et al. accepted into your review system and most of all create a double standard that allows polluting companies and industries to keep their data confidential.

Response: The EPA disagrees with the commenters that this rule will shrink the universe science the EPA can rely upon in significant regulatory actions or influential scientific information. In this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. See 40 CFR 30.5 for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available for independent validation. The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

9.1.1.5.6 Important Studies that Could Be Excluded from Regulatory Decision-Making

Cancer Classifications and Reference Values

Comment: Commenter (6125) states that, if the proposed rule were to apply retroactively with few or no exceptions/exemptions, most of the EPA cancer classifications and reference values would be vacated, aside from those values that are based upon accessible National Institute for Occupational Safety and Health (NIOSH) epidemiology data, National Toxicology Program (NTP) bioassay data or pesticide-related CBI data, if an exemption were made for the latter. The commenter provides a detailed analysis which focuses on two chemical categories³⁰⁰³ for which a cancer classification has been assigned and/or a non-cancer Reference Dose (RfD) and/or

³⁰⁰³ 1) Currently registered Pesticide Active Ingredients and 2) Chemicals currently on IRIS. At this time, roughly 700-800 conventional chemical pesticides are registered for use in the U.S. and, perhaps, double that number if the antimicrobials (N ~ 400) and biopesticides (N~ 400) are included. As of mid-May 2018, there were 511 individual records on the IRIS.

Reference Concentration (RfC) has/have been calculated.³⁰⁰⁴ The commenter provides the following observations/conclusions:

1. Office of Pesticide Program (OPP) “Known” carcinogens all were assessed in collaboration with Office of Research and Development (ORD)-National Center for Environmental Assessment (NCEA) as those substances also have non-pesticidal uses and/or are an issue for other program offices. So access to their raw data would be a problem for OPP as well as everyone else, since they were not generated by registrants in response to FIFRA regulatory requirements.
2. OPP has the raw data for chemicals on the 2013 and the RfD/RfC lists, but, of course, they cannot share them with the public because of FIFRA section 3(c)(1)(F) which provides for both “exclusive-use” and compensation rights for data submitted to EPA to support registration actions. In other words, they are CBI and one can be fined and/or jailed for releasing them without approval by their rightful owner.
3. OPP’s regulatory decisions rarely rise to the \$100 million cost threshold and most are not considered “rules” in the traditional sense. And, of those that might meet the dollar threshold, most of them are not chemical-specific. Rules such as the Worker Protection Standard or the Container rule may have met that threshold. Actions on individual requests for approval or revocation of uses do not qualify. On rare occasions, the cancellation/revocation of the entire spectrum of uses could meet the threshold if the number of uses was large enough. The 2015 proposed revocation of all of the chlorpyrifos tolerances (~80) might qualify by virtue of numbers of uses although EPA concluded that “revoking all tolerances for chlorpyrifos will not have a significant economic impact on a substantial number of small entities,” so maybe it didn’t.
4. Under the conditions of a final rule in which CBI data were exempted, OPP might be able to go forward with decision-making for chemicals based upon those data alone but would be hard-pressed to conduct scientifically-sound risk assessments for those chemicals for which the registration package is mixed. Even assessments for many of the conventional chemicals often are informed by studies from the open literature that were not funded by registrants and declared CBI. Important details in their toxicity or exposure profiles might have to be discarded leading to an underestimation of the actual risk.
5. The Integrated Risk Information System (IRIS) assessments, for the most part, have significant age on them (late 1980’s into the 1990’s). This indicates that the studies used to generate those assessments are even older than that. Access to their raw data would be very much a challenge, unless the studies were conducted by NIOSH (epidemiology), the

³⁰⁰⁴ P.F. Crisp, Potential Impacts of the Loss of EPA’s Ability to Use Key Study Data or Risk Assessment and Decision Making, see Attachment to Appendix C.

National Toxicology Program (animal studies) or the EPA, itself (human volunteer laboratory studies).

6. If the proposed rule were to apply to both human and animal studies, then everything on IRIS could become compromised and many of the pesticides may be at risk, too, depending upon the nature of any exemption for them and the degree to which they depended upon non-CBI data.

7. If a chemical exhibits suggestive to known human carcinogenic potential, and the cancer risk is estimated quantitatively, then this endpoint usually drives the risk assessment and the human data and/or the long-term animal bioassays become the key studies. Data from non-government-conducted epidemiology studies are likely difficult or impossible to acquire and share. Unless the animal data are CBI data from manufacturers or from NTP bioassays, gaining access to them also is likely to be very difficult. Most all of the cancer bioassay data on pesticides are from the manufacturers. Some number of the key studies for the non-pesticide IRIS chemicals are NTP bioassays. In these two cases, EPA will have access to the raw data but will be able to share only the NTP information.

8. For chemicals for which cancer is not the driving endpoint, the RfDs and RfCs become the important factors in quantitative assessments. Again, for conventional pesticides and biopesticides, most of the key data are from the manufacturers. In the case of the antimicrobials, some submitted studies may come from alternative non-CBI sources, presenting a challenge to access the raw data for them. For the IRIS chemicals, a small number are calculated from NTP data. Most key studies are from the peer-reviewed literature, primarily academic research. Given the age of most of the IRIS assessments, these data would be difficult, if not impossible, to acquire.

9. If the rule means to define reproducibility/replication as applying to the data/results of the key studies used rather than EPA's assessment of them, then the pesticide and commodity chemical manufacturers might have to submit TWO of every key study used in developing a regulatory decision, each being conducted in accordance with FIFRA Part 158 data requirements and data call-ins or Toxic Substances Control Act (TSCA) Section 4 or 5 test rules.

10. An inability to acquire and share the raw data for the substances in both of these case examples would seriously compromise EPA's risk assessments and thwart its mission to protect public health.

Commenter (6920) notes that IRIS uses a rational weight-of-evidence method to assess available research and to provide access to a comprehensive source of toxicity data. The commenter adds that it increases the capacity to evaluate chemical hazards, and to quantify risk magnitudes and uncertainties, but it does not tell us how to manage risks. The commenter contends that the proposed exclusion of research lacking all underlying data from IRIS would be an unnecessary

waste of information. Commenter (6133) notes that IRIS the Proposal would undermine decades of expert work to advance successful data evaluation methods described in the systematic review approach now underway in the EPA IRIS program.

Response: There are several important clarifications in response to the commenters' concerns. First, the final rule applies prospectively to significant regulatory actions and influential scientific information, not retrospectively. Second, this rule only applies to significant regulatory actions and influential scientific information. Many of the actions performed by the EPA Office of Pesticide Programs (OPP) are not significant regulatory actions, and therefore would not be subject to this rule. Finally, in this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. The EPA acknowledges that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. See 40 CFR 30.5 for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available for independent validation.

Six Cities Study and American Cancer Society Cancer Prevention Study Would be Excluded in Regulatory Decision-Making

Comment: Commenters (0567, 2429, 2746, 2787, 4591, 4894, 5012, 5165, 5176, 5180, 6103, 6111, 6125, 6133, 6351, 6915, 6916, 6925, 8281-PH38, 9227) express concern that the proposed rule could exclude studies that utilize confidential data, such as the Harvard Six Cities ("Six Cities") (1993)³⁰⁰⁵ and American Cancer Society (ACS) Cancer Prevention Study II (1995) studies, each of which tracked the medical histories of thousands of people and which are the two major epidemiological studies referenced in the particulate matter (PM) NAAQS.

Commenters (2787, 6925) state that the "Six Cities" study, which followed more than 8,000 participants for nearly twenty years was key in establishing a link between chronic air pollution exposure and increased mortality. Commenter (6925) provides that this epidemiological study relied on health data that is protected under confidentiality agreements, so these data cannot be publicly released without violating privacy.

³⁰⁰⁵ Dockery, D.W., Pope, C.A., Xu, X., Spengler, J.D., Ware, J.H., Fay, M.E., Ferris, Jr., B.G., Speizer, F.E. An Association between Air Pollution and Mortality in Six U.S. Cities. *N Engl J Med.* 1993 329:1753-1759. <https://www.nejm.org/doi/full/10.1056/NEJM199312093292401>.

Commenter (9227) states that the original findings of the Harvard Six Cities Study have been validated many times over, and they have been used to inform countless EPA rule makings that address particulate matter pollution. The commenter adds, however, that the Proposal would appear to preclude EPA from using them because—while the Study has been reanalyzed and reproduced—the underlying data is not publicly available because of patient confidentiality protections bound by individual contractual agreements between the scientists and the research participants and by the Health Insurance Portability and Accountability Act (HIPPA). The commenter states that these reasons are unrelated to the validity, integrity or quality of the Harvard Six Cities Study. The commenter asserts that the provisions of the proposed rule that would preclude the use of the study are inconsistent with OMB’s data quality guidelines, which specifically point to the Harvard Six Cities Study as an example of how data may be validated or corroborated without public release of the underlying raw data.³⁰⁰⁶

Commenters (5165, 6925) suggest that EPA publicly confirm that it would continue to use existing literature such as the Six Cities Study in future rulemakings, should the proposed rule be enacted.

Commenters (2429, 2787, 6125, 6915) express concern that the proposed rule could exclude studies that utilize confidential data such as the ACS Cancer Prevention Study.³⁰⁰⁷ Commenter (2429) states that, while results from the study have been subjected to independent reanalysis and sensitivity analyses,³⁰⁰⁸ public access of these data will be difficult given that they were collected decades ago with assurances of confidentiality for research participants.

Commenter (4894) states that there are valid, peer reviewed studies that should be included in EPA’s regulatory work, even though their underlying data sets cannot be released to the public, including the ACS’s Cancer Prevention Study II.³⁰⁰⁹ Commenter (2907) states that the ACS Cancer Prevention Study II tracked air pollution exposure and personal medical histories of nearly 670,000 people for more than two decades to understand the exact risk of air pollution on death and the results of this study underpin critical components of decision making with respect to national air quality standards.

Commenters (2787, 4827, 4894, 6925, 8272) state that the results of the Harvard Six Cities Study and the ACS Cancer Prevention Study II studies have stood up to extensive subsequent analysis, including the “Reanalysis of the Harvard Six Cities Study and the ACS Study of Particulate Air Pollution and Mortality,”³⁰¹⁰ which highlights the strength of such research.

³⁰⁰⁶ OMB’s Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information, 67 Fed. Reg. 8,452, 8,456 (Feb. 22, 2002).

³⁰⁰⁷ Pope, C.A., III; Thun, M.J.; Namboodiri, M.M.; Dockery, D.W.; Evans, J.S.; Speizer, F.E.; Heath, C.W. (1995). Particulate Air Pollution as a Predictor of Mortality in a Prospective Study of U.S. Adults; *Am. J. Respir. Crit. Care Med.* 151, 669-674

³⁰⁰⁸ Krewski, D., et al. "Reanalysis of the Harvard Six Cities Study, part I: validation and replication." *Inhalation toxicology* 17.7-8 (2005): 335-342.

³⁰⁰⁹ Cancer Prevention Study II, Am. Cancer Soc’y, <https://www.cancer.org/research/we-conduct-cancer-research/epidemiology/cancer-prevention-study-2.html>.

³⁰¹⁰ Krewski, D., Burnett, R. T., Goldberg, M. S., Hoover, K., Siemiatycki, J., Abrahamowicz, M., & White, W. H., Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality,” A Special Report of the Health Effects Institute’s Particle Epidemiology Reanalysis Project, Cambridge, MA, Health Effects Institute (2000).

Commenter (8272) states that since publication of these two landmark studies, dozens of additional peer-reviewed studies, as well as follow-up research involving the Six Cities and ACS cohorts, have replicated and expanded upon their findings and provided insights into specific effects of particulate pollution on certain groups.^{3011,3012}

Commenter (6915) states that under the proposed rule, EPA could ignore these two foundational studies and other peer-reviewed studies built upon them in setting health-based air quality standards for particulate matter and other pollutants. The commenter states that the effect could be devastating and deadly, as EPA estimates that reductions in ambient particulate matter under the 1990 Clean Air Act (CAA) Amendments will prevent 230,000 adult deaths by 2020.³⁰¹³

Commenter (6925) states that the fact that patient personal information is held confidential in no way undermines or casts doubt on its findings. The commenter states that this study is one of the most critical studies that has been used to establish air pollution standards. Commenter (4894) states that the studies remain valuable today.^{3014, 3015}

Response: The EPA clarifies that in this final rule the Agency is neither specifically nor categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. This includes the Harvard Six Cities (“Six Cities”) (1993)³⁰¹⁶ and ACS Cancer Prevention Study II (1995) studies. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of personally identifiable information (PII), CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. See 40 CFR 30.5 for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available for independent validation. The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Other Important Studies that Would be Excluded from Regulatory Decision-Making

Comment: Commenters (2336, 4827, 6920) state that, if adopted, the proposed rule will deprive EPA policymakers from real-world evidence and studies that are vital to EPA's review of the NAAQS into the future, such as "Air Pollution and Mortality in the Medicare Population."³⁰¹⁷ Commenter (6920) states that the NAAQS review process is a model of scientific transparency. The commenter notes that its reviews are renowned for their high quality. In regard to the studies on which they are based, the commenter states that the costs of publication as well as requirements for the privacy of study subjects have prohibited making all the data obtained publicly available. The commenter strongly disagrees that this diminishes the value of such epidemiology and toxicology studies to regulatory science. The commenter contends that the exclusion of such studies would significantly reduce the amount of scientific data available to establish appropriate standards to protect public health and the environment.

Similarly, commenter (6125) states that one of the most recent fine particle mortality studies created a cohort of 60 million subjects from the Medicare database.³⁰¹⁸ The commenter states that this study found even larger effects of fine particles at levels well below EPA's current standards. The commenter states that the Medicare database is available to any research group that pays a fee and can guarantee confidentiality of the personal data. The commenter states that, because these data are not fully available to the public, under the proposed rule, the Administrator could choose to bar consideration of even this powerful study.

Commenter (2336) provides that the history of the NAAQS standards for PM_{2.5}, and the dose-response models which underpin them, demonstrates that a blanket public disclosure rule such as the Proposal would have been counterproductive if it had been in effect during the 1990s when

³⁰¹⁷ Qian Di, Yan Wang, Antonella Zanobetti, Yun Wang, Petros Koutrakis, Christine Choirat, Francesca Dominici, Joel D. Schwartz. Air Pollution and Mortality in the Medicare Population. *New England Journal of Medicine*, 2017; 376(26): 2513 DOI: 10.1056/NEJMoa1702747

³⁰¹⁸ *Id.*

the new NAAQS standard for PM_{2.5} was being evaluated and the underlying dose response models were being vetted. The commenter states that the rule proposed would have required that the health-outcomes dataset be made public, or the results would have been thrown out. The commenter adds that, had the rule proposed been in effect in the 1990s, it would have created a Hobson's choice for the EPA. The commenter states that it would have had to discard a pair of robust groundbreaking studies demonstrating that there is an intense dose-response function between PM_{2.5} and mortality rates, or it would have had to violate the privacy interests of the studies' participants and jeopardize the prospect of performing similar studies in the future.

Commenter (8272) references two recent studies and states that they add to knowledge on susceptible populations.^{3019,3020} The commenter states that both of these studies involve data that can be obtained by investigators who apply to use it and are approved by the relevant IRB or Privacy Board, but their data sets are not publicly available.

Response: The EPA clarifies that in this final rule the Agency is neither specifically nor categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. This includes the "Air Pollution and Mortality in the Medicare Population" study.³⁰²¹ Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. See 40 CFR 30.5 for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available for independent validation. The EPA expects to

identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Comment: Commenter (2429) states that a recent example of an important study that could be excluded under the Proposal is the *Multi-Ethnic Study of Atherosclerosis and Air Pollution* (MESA-Air), a 10-year prospective cohort study of more than 6,000 participants. Using these data, the commenter notes that the MESA-Air researchers have produced over 100 scientific publications examining the cardiovascular impacts of long-term exposure to air pollution,³⁰²² all of which could be excluded from consideration in the regulatory process.

Commenter (2977) expresses concern that the proposed rule would restrict the scientific evidence that can inform essential environmental regulations; regulations that have reduced emissions, protected our drinking water, reduced lead exposure, and saved lives. Commenter states that the studies listed below, which EPA has used to help establish acceptable levels of exposure to pollutants, would not be considered if rigid standards like the ones proposed in this transparency rule were in effect.

Commenter (2977) provided a sample list of population-based studies (included in an Appendix to their comment letter) from the National Institute of Environmental Health Sciences/Environmental Protection Agency's Children's Environmental Health and Disease Prevention Research Centers that were considered or included in EPA regulations:

Commenter (4844) states that, by requiring reproducibility, this rule may also exclude many landmark public health studies that were so scientifically rigorous and resource intensive that they could not be reproduced, such as the Framingham Heart Study, a 70-year long cardiovascular epidemiologic study, the Diabetes Control and Complications Trial, a 10-year study of the effects of intensive diabetes control on long-term complications, or the Nurses' Health Study, a decades-long study into the risk factors for major chronic diseases in women.

Commenter (5012) expresses concern that the Children's Health Study conducted in southern California³⁰²³ would also be eliminated.

Commenter (5177) submitted four attachments and a summary of each as examples of important studies that may be excluded in regulatory decision-making:

1. As part of a large cohort study of cancer and hematotoxicity among approximately 75,000 workers exposed to benzene sponsored by The Chinese Academy of Preventive Medicine and the U.S. National Cancer Institute, a cross-sectional study was performed of currently exposed workers in order to gain insight into early biologic effects associated with benzene exposure. The report³⁰²⁴ presents the findings of the association between benzene exposure, benzene metabolite formation, and hematotoxicity.
2. A study was conducted to determine the relation between the consumption of contaminated local fish and concentrations of total polychlorinated biphenyls (PCBs) and 68 PCB congeners in the milk of nursing Mohawk women residing near three hazardous waste sites³⁰²⁵. Estimated cumulative lifetime exposure from local fish consumption was significantly related to milk total PCB and to three congeners only among those Mohawks who gave birth from 1986 to 1989.
3. This report summarizes the health implications associated with exposure to PCBs, primarily through fish consumption.³⁰²⁶ The weight of evidence clearly indicates that populations continue to eat fish containing PCBs and that significant health consequences are associated with consumption of large amounts of some fish.
4. The EPA has been performing its second Six-Year Review of the drinking water contaminants regulated under the Safe Drinking Water Act (SDWA). The primary

purpose of this document³⁰²⁷ is to provide a screening-level review of the health effects component of the Six-Year Review 2 effort.

Commenter (5419) states that complete exclusion of an entire study could limit access to scientifically defensible information to regulators and other stakeholders to achieve desired regulatory aims. The commenter provides three examples of research that the Electric Power Research Institute (EPRI) believes are important for consideration in regulatory activities with an explanation of the potential issues associated with making data required to understand human health effects and dose-response relationships publicly available. These are summarized below:

1. Occupational Epidemiology Study of Hexavalent Chromium Cancer Risk: EPRI funded a study to update the mortality, exposure reconstruction and dose-response modeling for a cohort of workers from the Painesville, Ohio Chromate Production Plant who were exposed to hexavalent chromium, resulting in elevated rates of lung cancer (Proctor et al., 2017). This cohort is associated with significant regulatory precedent as it updated a study used by the Occupational Safety and Health Administration for risk assessment when the hexavalent chromium Permissible Exposure Limit was lowered in 2006. The current EPA inhalation cancer slope factor, originally set in 1984, was also based on an earlier study of workers from the Painesville plant, but the EPRI study uses more robust data and included short-term workers, thus allowing examination of the dose-response relationship in the low exposure range. Clearly this study is of interest for risk assessment (in particular, the EPA's IRIS program); however, the original data are not publicly available as they are owned by the company that employed the workers, and EPRI's research was subject to a strict confidentiality agreement. Complete study validation, as expressed in the proposed rule (i.e., data to be publicly available in a manner sufficient for independent validation), would not be possible.

2. Children's Air Pollution Asthma Study (CAPAS): EPRI funded a panel study of asthmatic children involving residential exposure assessment and collection of pulmonary function and symptom data. Several papers resulted from the research related to the associations between indoor and outdoor PM_{2.5} and its individual components and asthma exacerbation (Habre et al., 2014a, 2014b; Rohr et al., 2014; Schachter et al., 2015; additional paper forthcoming). Additionally, CAPAS provided important information on the role of PM components in the health effects, which is a topic of interest to EPA and others, given that it is unlikely that all PM components are equally toxic. The consent form utilized in the study stated that indoor exposure data as well all questionnaire data would be kept strictly confidential.

3. Low Dose Radiation Exposure Health Effects: EPRI has for nearly 10 years worked to increase the understanding of effects from low doses of ionizing radiation. Observational studies have been well-utilized and form the basis for radiation protection standards around the world (Ozasa et al., 2012; Richardson et al., 2015). Since many of the data from human radiation studies are managed by other research organizations that have highly restrictive data access policies, it is unclear that special arrangements can be made

³⁰²⁷ Six-Year Review 2 Health Effects Assessment. Environmental Protection Agency, Office of Water (4304T) EPA 822-R-09-006. October 2009 (EPA Docket ID: EPA-HQ-OA-2018-0259-5177-A4) .

with these entities to release the data for public access. EPRI is concerned that these seminal studies may be eliminated from future consideration as a result of this proposed rule.

Commenter (6111) states that studies that would be excluded from EPA consideration under the proposal form the basis for multiple regulatory actions that EPA and other agencies have taken over the course of many years. The commenter provides the following examples:

- *Lead*: Early studies on the neurological effects of low-dose exposure to lead such as Herbert Needleman's 1979 paper finding a negative relationship between the level of lead in children's teeth and IQ scores.³⁰²⁸ EPA relied on this study in its 1986 Air Quality Criteria document for lead.³⁰²⁹ EPA's Lead and Copper Rule, which established the federal regulations for lead under the SDWA, in turn relied on that Air Quality Criteria document to identify blood lead levels of concern.³⁰³⁰ EPA relied on both the 1986 Air Quality Criteria and on Needleman's research directly in establishing standards for lead-based paint hazards under the TSCA.³⁰³¹ Needleman's work, and subsequent studies building upon it, also supported EPA's decision to revise the NAAQS for lead in 2008.³⁰³² After 40 years, and with the principal investigator no longer alive, it is not clear that the raw data from the Needleman study is available. Even if the data were, they could not be made publicly available without invading the privacy of the study participants. Importantly, it would not be possible to conduct that same study at this time, because children no longer have blood or dental lead levels as high as they did in the 1970s as a result of EPA's implementation of the statutes.
- *Arsenic*: EPA's drinking water standard for arsenic under the SDWA is dependent on studies that the agency would now be compelled to ignore under the proposed rule. EPA established a drinking water standard of 10 ppb for arsenic in 2001.³⁰³³ The Food and Drug Administration ("FDA") then relied on EPA's determination.³⁰³⁴ In setting this standard, EPA relied on a National Research Council review of the scientific evidence, which "concluded that [certain epidemiological] studies from Taiwan provided the current best available data for the risk assessment of inorganic arsenic-induced

³⁰³⁰ Maximum Contaminant Level Goals and National Primary Drinking Water Regulations for Lead and Copper, 56 Fed. Reg. 26,460, 26,468–26,469 (June 7, 1991).

³⁰³¹ Lead; Identification of Dangerous Levels of Lead, 63 Fed. Reg. 30,302, 30,316–30,317 (proposed June 3, 1998). The final rule was published at 66 Fed. Reg. 1,206 (Jan. 5, 2001).

³⁰³² National Ambient Air Quality Standards for Lead, 73 Fed. Reg. 66,964 (Nov. 12, 2008).

³⁰³³ National Primary Drinking Water Regulations; Arsenic and Clarifications to Compliance and New Source Contaminants Monitoring, 66 Fed. Reg. 6,976, 7,036 (Jan. 22, 2001).

³⁰³⁴ The FDA subsequently relied on EPA's drinking water standard, as well as the research underlying it, when it proposed an action level for arsenic for apple juice in 2013. See Draft Guidance for Industry on Arsenic in Apple Juice: Action Level; Supporting Document for Action Level for Arsenic in Apple Juice; A Quantitative Assessment of Inorganic Arsenic in Apple Juice; Availability, 78 Fed. Reg. 42,086 (July 15, 2013); see also Clark D. Carrington et al., FDA, A Quantitative Assessment of Inorganic Arsenic in Apple Juice (2013), <https://www.fda.gov/downloads/Food/FoodScienceResearch/RiskSafetyAssessment/UCM360016.pdf>.

cancer.”³⁰³⁵ The Taiwanese papers looked at rates of skin cancer and blackfoot disease in villagers from southwestern Taiwan who were exposed to high levels of arsenic in their drinking water.³⁰³⁶ These studies were based on data from clinical examinations of the research subjects and therefore included confidential patient data that likely cannot be released to the public. In addition, given that the first data were collected more than 50 years ago, the studies are based on data that may no longer be available.

- **PCBs:** EPA’s regulations establishing water quality standards for PCBs under the CWA were based in part on long-term epidemiological studies of cancer rates in workers exposed to PCBs.³⁰³⁷
- **Radionuclides:** EPA’s S regulation for radionuclides relied on epidemiological studies of survivors from the Hiroshima and Nagasaki atomic bomb attacks.³⁰³⁸
- **Methylmercury:** EPA’s reference dose for methylmercury in fish that will be consumed by humans relied on data from human exposures in the Faroe Islands.³⁰³⁹ Precluding reliance on these and other studies for the sole reason that the underlying raw data has not been or cannot be released to the public is arbitrary, capricious, contrary to professional best practices, and antithetical to protection of public health and safety as required by the Statutes. The proposed rule will prevent EPA from relying on the “best available science.”

Commenter (6373) provides four examples of research and studies the City (NYC) has conducted to evaluate the impact of environmental exposures on populations within its borders. The commenter states that all these studies have informed or currently inform EPA decision-making and are considered regulatory science to which the Rule would apply. The commenter states that, if the Rule is finalized, the valuable findings that these studies offer may be discounted by EPA, to the detriment of New Yorkers and the country.

- The Department of Health and Mental Hygiene (DOHMH) used study designs to identify individual-level risk factors for the elevated risks of dying on extreme heat event days (e.g., ethnicity, age, and location at time of death). DOHMH used the analysis to develop the Heat Vulnerability Index.³⁰⁴⁰ If DOHMH had to make the raw data available to public, the agency wouldn’t be able to use these study designs while protecting individual privacy.

- In collaboration with Brown University, DOHMH conducted a series of analyses to examine the health impacts of air pollution on several birth outcomes, including birth weights, pre-term births, and hypertensive disorders of pregnancy.³⁰⁴¹
- The World Trade Center Health Registry (WTCHR) is the largest registry in the United States that tracks the health effects of a disaster. The WTCHR collects personal identifiable information as well as protected health information, with permission from each enrollee.
- New York City Health & Nutrition Examination Survey (NYC HANES) is a community-based health survey first conducted in 2004 by DOHMH and then most recently in 2013-14 by City University of New York School of Public Health and DOHMH.³⁰⁴² The data collected enables DOHMH to learn how many New Yorkers suffer from basic conditions such as diabetes, high blood pressure, high cholesterol, and depression.

Response: The EPA clarifies that in this final rule the Agency is neither specifically nor categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. See 40 CFR 30.5 for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available in a manner sufficient for independent validation. The EPA expects to identify pivotal science, and the consideration afforded to pivotal

³⁰⁴¹ See Sarah Johnson et al., Ambient Fine Particulate Matter, Nitrogen Dioxide, and Preterm Birth in New York City, *Environmental Health Perspectives*, 124(8), 1283–1290 (Aug. 2016), <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4977049/>.

³⁰⁴² See DOHMH, New York City Health and Nutrition Examination Survey (last visited August 13, 2018), <https://www1.nyc.gov/site/doh/data/data-sets/new-york-city-health-and-nutrition-examination-survey-2004-nyc-hanes.page>

science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

9.1.1.5.7 Multi-Study Issues

Comment: Commenter (6125) states that the proposal has failed to consider the effect of the rule on consolidated models. The commenter states that the Integrated Exposure Uptake Biokinetic (IEUBK) model,³⁰⁴³ a crucial tool to assess lead body burden in regulatory and other settings, is based on many individual studies to support various individual relationships. The commenter asks: given the number of studies needed to support what is clearly a highly influential tool in regulation, how would EPA determine which supporting studies needed to provide data and which would not? The commenter states that EPA has not fully considered these kinds of multi-study issues, and the potential effect on the model as a whole. The commenter notes that the contributing researchers may have little motivation to prepare and make available data to satisfy this new and unique policy.

Response: The EPA is finalizing the scope of the rule to apply to dose-response data, and not models. Specifically, where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies— based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. The EPA acknowledges that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Comment: Commenter (6125) states that EPA has not considered the potentially significant implications of this policy for researchers doing meta-analyses, which have been crucially important in understanding lead, and which consider many studies by many researchers, who may have varying views on releasing their individual data for public review. The commenter provides that one example of a possible regulatory issue would be the 2006-2008 lead air

³⁰⁴³ Technical Support document: Parameters and Equations used in the Integrated Exposure Uptake Biokinetic Model for Lead in Children (v 0.99d) (older version), <https://semspub.epa.gov/work/HQ/176287.pdf>.

standards, which were based in part on a pooled analysis, for which two of the seven primary investigators declined to provide the raw data to the public.

Commenter (6895) asserts that the rule would exclude high quality, peer-reviewed science. The commenter states that loss of information would be particularly egregious in an area called out in the notice, the "point-of-departure from which a reference value is calculated." The commenter states that reference value determinations all too often suffer from a paucity of data and will be further hindered by excluding sound science that does not meet the proposed availability requirement.

Response: The EPA clarifies that in this final rule the Agency is neither specifically nor categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

The EPA is finalizing the scope of the rule to apply to dose-response data. Specifically, where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies— based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. The EPA acknowledges that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Furthermore, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. Future statute-specific rulemakings may interpret “pivotal science” more broadly.

9.1.1.5.8 Non-US Studies and International Studies

Comment: Commenters (1973, 6188, 6906, 8913) express concern that the proposed rule could limit recognition of analysis conducted and information available in foreign jurisdictions. Comments include:

- Commenter (1973) states that essentially all non-U.S. studies would be legally unable to meet EPA’s requirements, including the Canadian Community Health Study data, the ESCAPE study, the UK national cohort study, the Netherlands National Cohort study, the Danish National Birth Cohort and the Norwegian Birth Cohort (both funded by National Institutes of Health (NIH)). The commenter states that EPA will achieve no greater “transparency”, they will only deny themselves the ability to set standards based on the studies that the rest of the world relies on.
- Commenter (6188) states that the ESCAPE study relied upon data protected by European privacy laws to combine multiple cohorts across Europe and examine the association of air pollution with mortality in study participants.³⁰⁴⁴ The commenter notes that the findings of that study are consistent with multiple other studies that examine the effects of particulate matter exposure using different methodologies.
- Commenter (6906) states that consideration of hazard and risk assessments from other jurisdictions for Risk Evaluations under TSCA promotes a uniform international market by coming to a common understanding of risk. The commenter notes that recognition of internationally available data also reduces EPA’s burden in performing evaluations, assuming EPA can verify the quality of information meets the standard of “best available science.” The commenter states that it also reduces industry’s burden by allowing industry to rely on and/or provide data across countries.
- Commenter (8913) states that many studies span decades, involve multiple collaborations, and use pooled international data. The commenter adds that a prime example is a recent Lancet study by an international team which included scientists from the Radiation Epidemiology Branch of the National Cancer Institute (NCI).³⁰⁴⁵

Response: The EPA clarifies that in this final rule the Agency is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. This includes studies from foreign jurisdictions. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological

³⁰⁴⁴ See id. (citing Beelen R, et al. Effects of long-term exposure to air pollution on natural-cause mortality: an analysis of 22 European cohorts within the multicenter ESCAPE project. *Lancet*. 2014; 383:785-95.)

³⁰⁴⁵ <https://www.ncbi.nlm.nih.gov/pubmed/30026010>.

feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. See 40 CFR 30.5 for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available for independent validation.

9.1.1.5.9 Older Studies

Comment: Commenters express concern that many older studies could not be used under this rule for the following reasons:

- Older studies where the authors or data sources may not be accessible. (1006, 9225)
- Open data requirements would be a new qualification for the field not in line with prior publication standards; as a result, many quality studies would be disregarded due to the old societal standards under which they were published. (1481)
- Most existing environmental health studies were completed before the movement toward public access in science, and such existing studies cannot reasonably be expected to retroactively release their data to be eligible for consideration in future regulatory decisions. (1994)
- Public access to data from older studies might not be feasible. (2472)
- Older studies that have data stored on older technology that can't be recovered. (8281-PH38)

Commenter (6125) states that, even for controlled human and animal studies, where subject data might ethically be released, the underlying data may no longer be accessible years after publication.

Commenter (6907) is concerned that, under the proposed rule, older studies on pesticides may not be considered. The commenter states that this is of particular concern for older pesticides which have now been unregistered but for which we have older studies that indicate that these pesticides pose harm to humans or the environment. The commenter asserts, for example, that there is no sound reason to redo the studies related to DDT.

Commenter (6915) expresses concern that many of the standards that are developed or updated by EPA are for chemicals that have an extensive, older body of scientific literature on their effects, but that are not currently being actively researched. The commenter states that the vast majority of studies considered for standard-setting are not new and were not conducted, designed, or published with the goal of ensuring data availability. The commenter states that, accordingly, their data are likely unavailable and, even if data were kept, the formats in which older data are stored may not be accessible from currently available computers, potentially invalidating the use of those studies as the basis for future regulatory standards.

Response: The EPA clarifies that in this final rule the Agency is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing

influential scientific information. This includes older studies. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. See 40 CFR 30.5 for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available for independent validation.

Comment: Commenter (6125) expresses concern that EPA has not considered or examined the number of potentially significant studies for which EPA cannot obtain raw data or methodology due to age. The commenter includes a review of EPA's IRIS and pesticide data bases to show the age of many of the studies that underlie risk assessments for carcinogens and reference doses and concentrations (Rfd, Rfc) for a number of substances that are regulated under legislation that addresses hazardous wastes, toxic chemicals, clean water, drinking water, clean air and pesticides.³⁰⁴⁶ The commenter notes that perhaps the most revealing and stark finding of this review comes from the examination of the IRIS data base used to determine cancer classifications, RfDs and RfCs for IRIS chemicals. The commenter provides that most of the entries are over 20 years old, and some over 30 years old. The commenter states that this guarantees that the studies used to develop the findings are at least that old, and, perhaps, decades older still. The commenter asserts that, without examining the support document for each entry, one cannot rule out that the age of the key studies may far exceed that of the entry. The commenter notes that, if a regulatory action that relied on one or more of these assessments was challenged due to the lack of the original data, under the requirements of the proposed rule, most of the cancer classifications and reference values could be vacated, aside from those values that are based upon certain NIOSH epidemiology data, NTP bioassay data or pesticide-related CBI data, and then, only if an exemption were made for the latter.

³⁰⁴⁶ P.F. Crisp, Potential Impacts of the Loss of EPA's Ability to Use Key Study Data or Risk Assessment and Decision Making, see Attachment to Appendix C.

Response: The EPA is finalizing the scope of the rule to apply to dose-response data. Specifically, where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies— based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. The EPA acknowledges that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis for various reasons, including the age of the pivotal science or its underlying dose-response data. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. See 40 CFR 30.5 for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available for independent validation.

Furthermore, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. Future statute-specific rulemakings may interpret “pivotal science” more broadly.

9.1.1.5.10 Studies Used to Support Other Agency Standards

Comment: Commenter (0671) states that no other federal agency has such a broad standard as the one envisioned here. The commenter states that EPA knows that IRBs will not allow such studies’ data to be made public, so to require public data from these studies will make them invisible to the rulemaking process.

Commenter (1973) thinks that the proposed rule would put EPA in direct opposition to other agencies’ standards for considering evidence:

- Health effects of smoking, high cholesterol, etc. by the Centers for Disease Control and Prevention (CDC).
- The studies considered for issuing guidelines generated by the NIH.
- The FDA reliance on non-publicly available studies to approve drugs for use by people.

Commenter (5022) provides that some of EPA's greatest public health accomplishments, such as eliminating lead in gasoline and classifying secondhand smoke as a cause of cancer (which led to banning smoking from indoor public places), were based on the kinds of data that would be

discarded under the proposal. The commenter states that such data are widely used in rulemaking proceedings by other U.S. government agencies and around the world.

Commenter (6117) references the following policies of other agencies and asserts that none of these policies require that all individual-level underlying data and models be made available to the public:

- NIH requires that researchers conducting agency-funded research pre-register clinical trials, pre-specify study endpoints and statistical plans, and report research results.
- All NIH applications for \$500,000 or more in direct funding in any given year must contain a data sharing plan, and some institutes of the NIH share data with researchers via a secure website.³⁰⁴⁷
- Many federal agencies, including the EPA, require that any published articles based on federally funded research be made available via the PubMed Central website.³⁰⁴⁸
- The International Committee of Medical Journal Editors has adopted a policy requiring pre-registration of clinical trials, and publication of a data sharing statement.³⁰⁴⁹
- The Institute of Medicine published a report recommending that trials be registered prospectively, that summary-level results be shared with the public after trial completion, and that the metadata and patient-level data be responsibly shared with researchers 6 months after scientific publication, or 30 days after regulatory approval.³⁰⁵⁰

Commenter (6125) states that the CDC and other Federal Agencies involved in reducing lead risk, would not be subject to the restrictions on use of science imposed by the proposal, and thus would continue to use the older studies as evidence, creating an unwarranted science practice and policy schism in the federal government. The commenter provides the following examples:

- The CDC has acknowledged that no safe level of lead in blood has been identified and has identified a “reference level” to define especially high-risk populations and geographic areas most in need of primary prevention. Even some of the studies that the Federal government’s most respected lead advisory group (CDC’s Advisory Committee on Childhood Lead Poisoning Prevention, or ACCLPP) used to develop background justification for the reference level could be precluded from EPA use under this policy. If some of those 92 plus references and studies fail to meet this policy, EPA could not rely on them in developing regulations, and thus could issue regulations that fail adequately to address CDC’s high-risk exposures. Moreover, EPA cost-benefit analyses could not use the CDC health effects work in calculating regulatory benefits. Further, the additional requirements in the proposal could require that EPA re-evaluate the appropriateness of

³⁰⁴⁷ U.S. Department of Health and Human Services, National Institutes of Health. NIH Data Sharing Policy and Implementation Guidance (Updated: March 5, 2003).

https://grants.nih.gov/grants/policy/data_sharing/data_sharing_guidance.htm. (Last accessed August 13, 2018).

³⁰⁴⁸ U.S. National Library of Medicine, Funders and PMC. <https://www.ncbi.nlm.nih.gov/pmc/about/public-access>. (Last accessed August 13, 2018).

the CDC dose-response relationship and give “explicit consideration” to other dose-response models even if, as in this case, they have been vetted and rejected by CDC and its advisory committee.

- Both EPA and the U.S. Department of Housing and Urban Development (HUD) regulate similar residential sources of lead (paint, soil, and dust) - EPA in private housing, and HUD in Federally supported housing, including Federally supported units in private buildings. This policy shift increases the potential for disparate treatment and public confusion stemming from those situations. The identical risks addressed by the two programs should be analyzed consistently. HUD has already acted to incorporate CDC’s statement into its programs by making its policy on dust-lead clearance levels more stringent;³⁰⁵¹ is still considering its response. But under this proposal, EPA might not be able to rely on as wide a range of studies as would be available to the rest of the federal family, which could result in different risk assessments and regulatory outcomes for similar, and possibly even adjacent, dwellings.

Response: The EPA clarifies that in this final rule the Agency is neither specifically nor categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency’s goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. For example, in 2002 OMB released its Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies, which includes discussion of the importance of the reproducibility of analyses underlying influential information³⁰⁵². The EPA’s 2016 Plan to Increase Access to Results of EPA-Funded Scientific Research noted that “transparency is a core EPA value” and that increased availability of research data would accelerate scientific breakthroughs that support the Agency’s mission and policymaking efforts³⁰⁵³. The EPA’s Open Government Plan 5.0³⁰⁵⁴ also details the EPA’s

³⁰⁵¹ HUD Policy Guidance Number: 2017-01, Revised Dust-Lead Action Levels for Risk Assessment and Clearance; Clearance of Porch Floors, January 31, 2017, <https://www.hud.gov/sites/documents/leaddustclearance.pdf>

progress in implementing the tenets of the numerous data transparency initiatives in the federal government prior to 2018, including OMB M-10-06³⁰⁵⁵, the Office of Science and Technology Policy Memorandum of February 22, 2013³⁰⁵⁶, and OMB M-13-13³⁰⁵⁷. In 2019, Congress passed the Foundations for Evidence-Based Policymaking Act of 2018 (or OPEN Government Data Act, Pub. L. 115-435) into law, which included requirements for federal agencies to prioritize making their data available to the public, and OMB has released additional guidance for implementing the act^{3058,3059}.

9.1.1.5.11 Privacy Data

Confidential Business Information (CBI)

Comment: Commenters (1006, 2787, 4877, 6114, 6116, 6128, 6131, 6707, 8281-PH38, 9225) express concern that this proposal would likely prevent the EPA from using many studies performed using data that contains CBI. Comments include:

- Commenter (2787) states that confidential industry data are vital to understanding the nature of chemical pollutants, the impacts of pollution, and the most effective ways to protect the environment and public health.
- Commenter (4877) states that many studies contain CBI and this data should be exempt from blanket data sharing requirements. The commenter states, however, that studies based on this data should not be automatically excluded from the EPA's policy-making progress, which is what proposed rule is designed to do.
- Commenters (6114, 6116, 6131) express concern that this proposal would likely prevent the EPA from using many studies performed using data from industrial sources because they contain CBI, such as product formulations. The commenters state that federal law imposes criminal penalties for disclosing CBI, which could result in liability for the EPA, if they follow down the path of making research data publicly available.
- Commenter (6707) states that some data that are not ready for public release (such as proprietary or temporarily embargoed data) could not be used since they simply cannot be made public. The commenter notes, for example, that there is a famous case involving the study of the health effects of living near a major hog farming operation. The commenter provides that, because this work included the study of the effects on children,

³⁰⁵⁵ Office of Mgmt. & Budget, Exec. Office of the President, OMB M-10-06, Open Government Directive (Dec. 8, 2009), available at <https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/memoranda/2010/m10-06.pdf>.

³⁰⁵⁶ Office of Science and Technology Policy. (2013). Memorandum for the Heads of Executive Departments and Agencies: Increasing Access to the Results of Federally Funded Scientific Research. Available at https://www.epa.gov/sites/production/files/2015-01/documents/ostp_memo_increasing_public_access.pdf.

³⁰⁵⁷ Office of Mgmt. & Budget, Exec. Office of the President, Open Data Policy—Managing Information as an Asset, OMB M-13-13 (May 9, 2013), available at <https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/memoranda/2013/m-13-13.pdf>.

³⁰⁵⁸ Office of Mgmt. & Budget, Exec. Office of the President, OMB M-19-23, Phase 1 Implementation of the Foundations for Evidence-Based Policymaking Act of 2018 - Learning Agendas, Personnel, and Planning Guidance (July 10, 2019), available at <https://www.whitehouse.gov/wp-content/uploads/2019/07/M-19-23.pdf>.

³⁰⁵⁹ Office of Mgmt. & Budget, Exec. Office of the President, OMB M-20-12, Phase 4 Implementation of the Foundations for Evidence-Based Policymaking Act of 2018 - Program Evaluation Standards and Practices (Mar. 10, 2020), available at <https://www.whitehouse.gov/wp-content/uploads/2020/03/M-20-12.pdf>.

this data could not be fully released under this law, and thus this major, relevant study would not be considered when the EPA makes a decision on the environmental impacts of that hog farm.

Response: In this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. This includes studies that use data containing CBI. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information, and will continue to handle studies and underlying data in accordance with existing CBI requirements and procedures. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Confidential Health Data

Comment: Commenters (2425, 4838, 4843, 4844, 6130, 6868) express concern that this rule would create procedural barriers to the use of studies that rely on confidential health information, thereby restricting the EPA's ability to consider significant amounts of relevant scientific evidence bearing directly on its core mission. Commenter (4838) states that EPA should not provide blanket limits on the use of studies that cannot be made public because they contain confidential health or business information.

Commenters (1170, 1536, 1973, 4933, 5981, 6788) assert that since most medical research uses patient data that is subject to stringent privacy requirements, the proposed rule automatically eliminates from consideration a majority of medical research. Commenter (1536) states that the proposed rule dismisses virtually all medical research because the research protects the privacy of the patients that volunteered even though these legal obligations are a routine part of HIPAA.

Commenter (6896) states that it is vital to have accurate information about the most pressing health and safety issues to prevent work-related injuries, illnesses, and fatalities and to protect the confidentiality of personal identifying data. The commenter asserts that quality science protects the confidentiality of construction workers personal identifying data.

Commenter (8281-PH63) states that important studies by Minnesota's Department of Health help Minnesota derive health protected values under state law and help the state of Minnesota in litigation. These studies are only possible because we provided absolute guarantees to the participants that their data would be protected and that we would assure its confidentiality. The proposed rule will make it unlikely that public health data such as these would be available for states to use, but even more so for the EPA to use in its decision-making.

Commenters (2429, 2907, 2908, 4884, 5013, 6188, 6696, 6882, 6915, 6943, 8281-PH26) express concern that the proposed rule would limit access to many important and valid peer-reviewed studies that have relied on confidential health data, undermining EPA's mission to protect public health. Comments include:

- Commenter (4884) states that peer-reviewed studies have ensured the sound basis of EPA rules. The commenter states that valid health effect studies are often non-public because they rely upon confidential medical records. The commenter states that, as long as the analysis of the raw data is available and correct, such studies must be used to achieve the legislative intent of the environmental laws.
- Commenter (6943) asserts the EPA should continue its current system in basing its rulemaking decisions on peer-reviewed scientific studies while protecting the privacy of citizens in the human database.
- Commenter (6882) states that peer-reviewed studies assessing the effects of pollution exposure on humans, based on actual personal health data—which by law must be kept confidential—are among the best science available to the Agency. The commenter states that the proposal would allow EPA to ignore this data unless that confidential personal health data were made publicly available. The commenter states that we must take these studies into account when creating our policies in order to protect the public's health.

Response: In this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. This includes studies that use confidential health data. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no

longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Comment: Commenters (1006, 1518, 1981, 4933, 5013, 5178, 6450, 6195, 6877, 6882, 6896, 8272, 8281-PH63) express concern that many important studies that rely on confidential health data could not be used. Comments include:

- Commenter (1006) states that Google’s AI study release would not be able to function with this proposal due to confidential data. The commenter states that they both have hidden the public data and the means of which the AI is coded. The commenter states that, if they wanted to do anything with the EPA in relation to a hospital it would be impossible for them.
- Commenters (1518, 4933, 5013, 6882) express concern that, if the transparency regulation were in place, all health studies on fracking would be simply not considered because the research could not be conducted due to non-disclosure agreements. Commenter (1518) states that, if the EPA were unable to consider such studies due to a requirement to release patient information, the Agency would be ill-equipped to weigh benefits vs. costs. Commenter (5013) references three studies:
 - One study found that drilling and fracking activity was associated with increased rates of hospitalization in Pennsylvania. In communities with the most wells, the rate of cardiology hospitalizations was 27 percent higher than in control communities with no fracking.³⁰⁶⁰
 - Another study found that living near fracking operations significantly increases asthma attacks.³⁰⁶¹
 - Another study found that pregnant women who lived near active fracking operations in Pennsylvania were at a 40 percent increased risk of giving birth prematurely.³⁰⁶²
- Commenter (1981) does not agree with the purposed rule’s claims that it “will help ensure that EPA is pursuing its mission of protecting public health and the environment in a manner that the public can trust and understand.” The commenter states that, where the rule would cause data affecting tribal members to be excluded as a matter of cause, we refute this claim of trust and understanding. The commenter states that fish surveys demonstrate that the proposed rule results in inequitable data representation.
- Commenter (1981) states that, under the proposed rule, fish surveys would be excluded. The commenter states that almost no activity on the reservation has more potential for significantly affecting the economic and political integrity and the health and welfare of

³⁰⁶⁰ Jemielita T., Gerton G. L., Neidell, M., Chillrud S., Yan B., Stute, M., ... Panettieri, Jr., R. A. (2015), Unconventional gas and oil drilling is associated with increased hospital utilization rates. PLoS ONE 10(7), e0131093. doi: 10.1371/journal.pone.0131093

Association between unconventional natural gas development in the Marcellus Shale and asthma exacerbations. JAMA Internal Medicine. Advance online publication. doi: 10.1001/jamainternmed.2016.2436

³⁰⁶² Casey, J. A., Savitz, D. A., Rasmussen, S. G., Ogburn, E. L., Pollak, J., Mercer, D. G., & Schwartz, B.S. (2016). Unconventional natural gas development and birth outcomes in Pennsylvania, USA. Epidemiology 27(2), 163-172. doi: 10.1097/EDE.0000000000000387

all reservation citizens than water use, quality, and regulation. The commenter states that the proposed rule threatens to silence tribal interests where it potentially prevents the use of the fish surveys. The commenter states that, in our view, this seems contrary to “openness, clarity, [and] unobstructed access.”³⁰⁶³

- Commenter (1981) states that the fish surveys are scientifically rigorous while also protecting the fiduciary interest between the researcher and the research subject. The commenter states that one fish survey provided by the Columbia River Inter-Tribal Fish Commission included a confidentiality agreement for instance—barring the release private information about tribal member participants—but also included limitations, peer review, procedural information, and quality control.³⁰⁶⁴ The commenter states that the fish surveys demonstrate the distinctive relationship between Tribes and the health of our Nation’s waterways, and in so doing highlights the need for diverse representation in EPA data collection. While the general population eats 19-56 grams of fish and shellfish on average per day, tribal members in the Pacific Northwest can eat up to 797 grams (1.75 pounds) every day.³⁰⁶⁵ Tribal populations are exposed to toxins that bioaccumulate in aquatic life due to factory effluent, urban wastewater, and runoff from agriculture and cities.³⁰⁶⁶
- Commenters (5178, 8272) state that a recent example of important non-public data on a neurotoxicant is research on the pesticide chlorpyrifos. The commenters report that researchers followed a cohort of children exposed to this pesticide before the current ban on residential use and found lower IQ and working memory to be associated with higher levels of prenatal chlorpyrifos exposure.³⁰⁶⁷ The commenters state that, in a rulemaking process regarding agricultural use of chlorpyrifos, EPA requested the underlying data from the Columbia Center for Children’s Environmental Health (CCEH). The commenters state that the response from CCEH explained that because of the detailed sociodemographic and health-related elements their data set contains, they did not believe they could submit extensive individual-level data to EPA in a way that would ensure participants’ confidentiality.³⁰⁶⁸ The commenters state that such concerns are not uncommon with the kinds of longitudinal data sets that allow identification of long-term consequences of environmental exposures. Commenter (8272) states that a recent analysis of the annual costs to the U.S. economy of a set of endocrine-disrupting

³⁰⁶³ Transparency, Blacks Law Dizctionary (10th ed. 2014).

chemicals is \$340 billion, with the majority of that due to IQ point loss and intellectual disability from in-utero exposure to polybrominated diphenyl ethers (PBDEs).³⁰⁶⁹

- Commenter (6195) states that the past EPA administration's decision to ban chlorpyrifos was based in part on studies showing neurological problems for kids exposed to the pesticide. The commenter states that the EPA abruptly decided to reverse this proposed ban because the study authors were unable to make their "raw data" publicly available. The commenter states that the proposed rule would codify this requirement for all pollutants the EPA regulates.
- Commenter (6450) states that studies that analyze the health impacts resulting from asbestos exposure, exposure to DDT, and birth defects caused by thalidomide would also be excluded under the proposed rule because the data contain confidential patient information protected by HIPAA.

Response: In this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. This includes studies that use confidential health data. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Intellectual Property

Comment: Commenters (1006, 4877, 6128, 9225) express concern that many studies that include intellectual property would be excluded. Commenters (4877, 6128) state that many studies contain data that is sensitive in terms of intellectual property and this data should be exempt from blanket data sharing requirements. Commenter (9225) asserts that the proposal would restrict the

³⁰⁶⁹ Attina TM, Hauser R, Sathyanarayana S, Hunt PA, Bourguignon JP, Myers JP, DiGangi J, Zoeller RT, & Trasande L. (2016). Exposure to Endocrine-disrupting Chemicals in the USA: a Population-based Disease Burden and Cost Analysis. *Lancet Diabetes & Endocrinology*, 4(12):996-1003.

types of science the Agency may use in regulatory decision making, including studies that rely on intellectual property.

Response: In this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. This includes studies contain data that are intellectual property. The EPA further clarifies that this rule does not impose blanket data sharing requirements; this rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

9.1.1.5.12 Studies Controlled by Third Parties

Comment: Commenter (6125) states that, while the proposal acknowledges that data may be “controlled by third parties,” the explanation of what this may mean is a vague promise that “EPA shall work with those parties to endeavor to make the data available in a manner that complies with this section.” The commenter adds that the ambiguous wording never specifies what actually might qualify, nor what interactions would be required before third party studies such as the Medicare study might be given an exemption from the requirement of public availability.³⁰⁷⁰ The commenter states that this language does not begin to address the variety of complexities involved with data controlled by a wide variety of third parties each with different policies of access, making it nearly impossible for commenters to know whether third party studies can ever be used without some type of interactive process between the study authors and

³⁰⁷⁰ See also FR 18772/2-3 which states “it does not compel the agency to make that information available where it concludes after all such reasonable efforts that doing so in way [sic] that complies with the law and appropriate protections is (sic) not possible”. According to the commenter, although opaque and ungrammatical, this sentence seems to imply some prior agency determination before a third-party study with confidential data is considered to be usable under the proposal.

EPA. The commenter contends that, even if EPA does not intend to apply this provision to categorically bar the use of third-party studies, its failure to point this out, or otherwise explain this provision makes the rule too vague to implement.

Response: This language has been removed from the final rule. 40 CFR 30.5(g) now reads: “The provisions of this section apply to dose-response data underlying studies that are pivotal science, regardless of who funded or conducted the studies. The Agency shall make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making such data available before it concludes that doing so in a manner consistent with law and protection of privacy, confidentiality, national security is not possible.”

Comment: Commenter (6191) expresses concern that data resulting from research funded through sources other than EPA may be “best available” science and per EPA’s current directives, should form the basis of new regulations. The commenter states that this research would not be subject to federal data access and sharing requirements and it is unreasonable to expect that anyone doing research that may one day be important for regulatory science would anticipate the importance for this future use. The commenter states that these researchers would not be subject to current public access plans and may be unable to prepare their data in a way that it could be made publicly available, whether because their agreements with human subjects do not permit this or because a lack of funding would prevent them from taking the steps necessary to enable the data to be made public.

Response: This is a rule of internal procedure that does not impose requirements on any party other than the EPA. It therefore does not establish any requirements or expectations for third party researchers to make the dose-response data underlying their research publicly available, or accessible through a secure data enclave. Furthermore, under this rule the EPA will continue to consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information. EPA further notes that this internal procedural rule does not interpret or apply any statutory requirement to use “best available science” or any variation thereof. The EPA will undertake such efforts in forthcoming statute-specific transparency or programmatic regulations.

9.2 Regulatory Science Means Scientific Information that Provides the Basis for EPA Final Significant Regulatory Decisions (§30.2)

Comment: Commenters (0567, 4932, 6180, 6356) express concerns regarding the proposed definition of “regulatory science” and provided several suggested changes to the definition for the EPA to consider.

Commenter (0567) recommends a slight revision of EPA’s definition by deleting the words “significant” and “final”. The commenter states that a generalized definition as recommended by the Institute for Regulatory Science is:

Regulatory science consists of applied versions of various scientific disciplines used in different regulatory processes.

Commenter (0567) adds that a simplified, generally applicable definition is:

Regulatory science consists of the scientific segment of the regulatory process.

Commenter (0567) also notes that other federal agencies have also promoted definitions of regulatory science:

- FDA: *Regulatory science* is the science of developing new tools, standards, and approaches to assess the safety, efficacy, quality and performance of all FDA-regulated products.³⁰⁷¹
- NIH: *Regulatory science* fosters the development, evaluation and availability of new or improved tools, methods, standards, and applied science that support a better understanding and improved evaluation of product safety, quality, effectiveness, and manufacturing throughout the product life cycle.³⁰⁷²

Commenter (4932) suggests that EPA alter the definition of “regulatory science” by striking the word “final” from the proposed definition to make the Proposal fully consistent with Executive Order 12866. The commenter states that implication of including the word “final” in those definitions is that the transparency objective (i.e., the disclosure of pivotal regulatory science) does not apply to advanced notices of proposed rulemaking or proposed rulemaking. The commenter states that the public must have access to pivotal regulatory science at these earlier steps in the rulemaking process in order to assess effectively the merit of the Agency’s regulatory science.

Commenter (6356) suggests EPA remove the word “significant” from the proposed definition of “Regulatory Science”.

Commenter (6180) suggests “regulatory science” means scientific information, including assessments, models, criteria documents (including narrative criteria translators), and regulatory impact analyses, that provide the basis for EPA final significant regulatory decisions.

Response: The EPA agrees with commenters that the term “regulatory science” may be confusing because it suggests either the term refers to a scientific discipline of regulatory decision-making (akin to FDA), or that some science the EPA considers is inherently regulatory. Neither of these interpretations reflects the Agency’s intent in defining this term. The EPA considers the breadth of scientific evidence in its rulemakings; while this scientific evidence informs policy decisions, the EPA’s consideration of the science does not make it “regulatory science.” To reflect this fact, in the final rule the EPA is changing the proposed term “regulatory science” to “science that serves as the basis for informing a significant regulatory action.”

In the 2018 proposed rule the EPA combined both general categories of scientific information, such as assessments and models, with specific examples of EPA scientific products, such as criteria documents and regulatory impact analyses in the proposed definition for “regulatory

³⁰⁷¹ <https://www.fda.gov/ScienceResearch/SpecialTopics/RegulatoryScience/default.htm>

³⁰⁷² <https://prevention.nih.gov/research-priorities/dissemination-implementation>

science.” The EPA acknowledges that this may increase confusion and is therefore limiting the final definition to general categories. As such, the EPA is altering the definition of “science that serves as the basis for informing a significant regulatory action” in 40 CFR 30.2 to mean “studies, analyses, models, and assessments of a body of evidence that provide the basis for EPA significant regulatory actions.” Examples of models include those used in regulatory impact analyses. Examples of assessments of a body of evidence include risk assessments, hazard identifications, IRIS assessments, and criteria documents.

Comment: Commenter (6143) suggests that the definition of regulatory science should include the study protocol. The commenter states that, when a study is conducted, the most important step is the careful production of a protocol which addresses all aspects of the study. The commenter states that these should at a minimum include objectives, study design, methods for collection of data, methods for handling the data, methods of analysis, and how results will be interpreted and reported. The commenter states that all the basic parameters should be documented, and include, sensitivity, specificity, variability, reproducibility, bias etc. The commenter states that the a priori definition of how results will be interpreted avoids the temptation to look at the data and perform analyses which have the potential to be biased. The commenter states that studies that are hypothesis generating should not be used as hypothesis testing studies. The commenter states that making protocols available to the public for research funded by EPA could go a long way towards improving the underlying science. The commenter states that all too often research is carried out and variables that should have been identified at the outset are considered after the study results are examined and the data reanalyzed or interpreted differently in the light of information obtained after completion of the research.

Response: The EPA disagrees with the commenter that the definition of science that serves as the basis for informing a final significant regulatory action should specifically include the study protocol. Protocols are often provided with the studies, analyses, models, and assessments of a body of evidence that constitute the definition of the term. Further, this rule does not govern how individuals outside of EPA conduct science, but rather is a rule of internal procedure.

Comment: Commenter (6133) states that the phrase “provides the basis” does nothing to illustrate the meaning of regulatory science, or to limit or particularize its scope, because it is equally vague and unexplained. The commenter adds that all science, data, and information considered by EPA, and relied upon by EPA, “provides the basis” for final EPA regulatory decisions, insofar as EPA includes those materials in its administrative record, certifies that record for judicial review, and may cite and rely upon that information in explaining and defending its final regulatory decisions. The commenter states that, accordingly, the proposed “regulatory science” definition is capacious and unbounded. The commenter states that, alternatively, the phrase “provides the basis” in the proposed “regulatory science” (§30.2) definition could mean that science was one of many studies considered, that it was the bedrock study upon which regulation was grounded, that EPA relied on the study, or that the study was critical to EPA’s determination. The commenter asserts that the term “regulatory science” lacks statutory authority, is vague, inconsistent, unexplained, and otherwise arbitrary and capricious.

Commenter (6137) states that EPA’s Proposed Rule lacks the requisite standards and principles that are the hallmark of lawful agency decision-making. The commenter states that the vague

definitions proposed in §30.2 invite limitless agency discretion to decide when the Rule's requirements apply. The commenter states that the Proposed Rule's definition of "regulatory science" lacks any discernible meaning. The commenter states that there is no standard or definition for determining when scientific information does or does not "provide the basis" for a regulatory decision, nor are there any standards or definitions for what subset of "regulatory decisions" should be deemed "significant."

Response: The EPA agrees with the commenters that the use of "provides the basis" in the definition indicates an expansive scope, and clarifies in the final rule that the scope of science that serves as the basis for informing a significant regulatory action is equivalent to the science included in the public docket as part of a rulemaking, but not all of that body of science would typically be considered "pivotal science." The EPA disagrees that the definition lacks any discernible meaning, as the Agency's procedure for making available science that provides the basis for a regulation in the administrative record is a well-established practice.

9.3 EPA's Regulatory Science Should Be Consistent with the OMB's Final Information Quality Bulletin for Peer Review (83 FR 18770)

Comment: Commenter (6125) states that, while the proposed rule cross-references the OMB Information Quality Bulletin for Peer Review, it is not clear what the proposed rule is intended to add to the Information Quality Bulletin with which EPA already complies or how in fact it would operate. The commenter adds that, while the Bulletin recognizes that an agency need not conduct peer review of studies which already have been adequately peer reviewed (70 FR at 2671), it is not clear if EPA is aware of this. Lastly, the commenter notes that problems may be raised by cross-referencing a document (Information Quality Bulletin for Peer Review) that can be amended.

Response: The EPA finds merit in this comment, in part. However, in this rule, the EPA is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that "the intensity of peer review is highly variable across journals" and "prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary."³⁰⁷³ Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule.

9.4 EPA's Proposed Regulatory Science Requirements Consistency with OMB's Guidelines for Ensuring and Maximizing Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies (OMB Guidelines)

³⁰⁷³ Office of Mgmt. & Budget, Exec. Office of the President, Final Information Quality Bulletin for Peer Review, 70 FR 2,664 (Jan. 14, 2005), available at <https://www.federalregister.gov/documents/2005/01/14/05-769/final-information-quality-bulletin-for-peer-review>.

Comment: Commenter (0555) contends that the proposed requirements are not a radical departure from existing guidelines, including 2004 OMB guidance³⁰⁷⁴ and the 2011 Executive Order 13563.³⁰⁷⁵

Conversely, commenters (6137, 6916, 9227) state that the Proposed Rule contravenes the OMB requirements, as it will prevent EPA from considering all relevant information by precluding consideration of certain data.

Commenter (6137) states that, according to EPA's IQG, EPA uses a "weight-of-evidence" approach that "considers all relevant information and its quality, consistent with the level of effort and complexity of detail appropriate to a particular risk assessment." The commenter notes that, pursuant to EPA's guidelines, EPA must ensure that the information it disseminates "is accurate, reliable and unbiased." The commenter states that, to do so, it uses the best available science and supporting studies conducted in accordance with sound and objective scientific practices, including, when available, peer reviewed science and supporting studies; and data collected by accepted methods or best available methods.

Commenter (6916) asserts that the provisions in the proposed rule that would preclude the use of proprietary or confidential data in regulatory actions are inconsistent with OMB Guidelines that indicate that transparency "does not override other compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections,"³⁰⁷⁶ that direct agencies to conduct robustness checks when data cannot be released,³⁰⁷⁷ or that encourage agencies "to address ethical, feasibility, and confidentiality issues with care."³⁰⁷⁸ The EPA does not explain either (a) why it considers the proposed rule to be consistent with the OMB Guidelines, or if it is, why (b) the regulations it now proposes are necessary in light of the OMB Guidelines' directives.

Commenter (9227) asserts that the discussion in the proposed rule relating data availability to data quality are inconsistent with provisions in the OMB Guidelines that indicate high quality science can be judged by many factors and that controls be implemented "flexibly, and in a manner appropriate to the nature . . . of the information to be disseminated."³⁰⁷⁹ The commenter also asserts that provisions in the rule requiring public availability of data are inconsistent with provisions in the OMB Guidelines that provide for differential treatment of data due to privacy and confidentiality concerns,³⁰⁸⁰ that indicate that not all data should be held to a reproducibility

³⁰⁷⁷ Id. at 8,459-60, OMB Guidelines at § V(3)(a), V(3)(b)(ii)(A), (B)(ii).

³⁰⁷⁸ 83 Fed. Reg. at 18,769 n.3.

³⁰⁷⁹ OMB's Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information, 67 Fed. Reg. 8,452, 8,453 (Feb. 22, 2002).

³⁰⁸⁰ OMB's Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information, 67 Fed. Reg. 8, 452, 8,460 (Feb. 22, 2002) (interest in making data publicly available "does not override other compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections").

requirement,³⁰⁸¹ that “the objectivity standard does not override other compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections,”³⁰⁸² and that direct agencies to apply robustness checks where public access to data and methods cannot occur.³⁰⁸³

Commenter (9227) asserts that, by outright prohibiting EPA from relying on a study to support a significant rulemaking if that study’s underlying data and models are not publicly available, EPA’s proposed rule departs from OMB’s unambiguous language instructing agencies that they “shall not” require that all data and models be subject to the reproducibility requirement, and that “the objectivity standard does not override other compelling interests.”³⁰⁸⁴ The commenter adds that the fact that EPA’s proposed rule includes a discretionary “exemption” provision does not correct this problem, as that provision would not require the Administrator even to consider whether an exemption is warranted, let alone grant such an exemption under appropriate circumstances.

Commenter (6916) states that the OMB Guidelines also establish and reflect a presumption of objectivity and favored status for peer-reviewed science, which the EPA Proposal flips on its head.³⁰⁸⁵ The commenter states that this presumption of objectivity and favor for externally peer-reviewed studies is also an element of the EPA Data Quality Act Guidelines, which also reflect the overall principle that “[a]gencies should adopt a common sense approach that build on existing processes and procedures[, and] ... do not impose unnecessary administrative burdens or inhibit agencies from disseminating quality information to the public.”³⁰⁸⁶ The commenter states that adding a mandatory agency-conducted ‘independent’ peer review process (as this Proposal does) for all “pivotal regulatory science” used in making “regulatory decisions”³⁰⁸⁷ does not comport at all with the EPA or OMB Guidelines implementing the Data Quality Act, EPA’s statements in the Proposal notwithstanding.

Response: This final rule makes incremental steps towards increasing data transparency by codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation and thereby improving the public’s access to the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety. This rule is designed

³⁰⁸⁵ Compare *id.* at 8,454 (quoting OMB Guidelines at § V.3.b.i. “technical information that has been subjected to formal, independent, external peer review [i]s presumptively objective”) with 83 Fed. Reg. 18,774, proposed 40 C.F.R. § 30.7 (stating “EPA shall conduct independent peer review on all ‘pivotal regulatory science’ used to justify ‘regulatory decisions’,” whether or not that science has been subject to formal external peer review).

³⁰⁸⁶ EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency, at 9, 19 (2002, updated May 2005), available at: <https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf>.

³⁰⁸⁷ 83 Fed. Reg. 18,774 (proposed 40 C.F.R. § 30.7 requires EPA to “conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions” - two phrases that are defined in the Proposal but not found in, or supported by, the statutes EPA claims authorize its action, or in the rules and guidelines the Agency references).

to build upon OMB M-19-15,³⁰⁸⁸ which highlights the need to characterize the sensitivity of an agency's conclusions to analytic assumptions, as well as other federal guidance documents that require greater data transparency. The EPA's attention to data transparency is also responsive to the broader interest in greater data and model transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members of the public, scientific community, and Congress on the transparency of the scientific basis for EPA's decisions in previous influential scientific information assessments and regulatory actions.^{3089,3090,3091,3092,3093} The EPA's continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency's decisions.

The EPA further clarifies that in this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available or not available in a manner sufficient for independent validation. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it

lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Finally, the EPA disagrees with the commenter that this final rule undervalues the role of peer review. 40 CFR 30.6 states: “The EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review. Because transparency in pivotal science includes addressing issues associated with assumptions used in analyzing dose-response data, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied and the implications of those assumptions for the results.” Adequate peer review remains an essential factor to pivotal science in the EPA’s final regulatory actions and influential scientific information.

9.5 Regulatory Science that Cannot Meet the Requirements of §§30.5 and 30.6

Comment: Commenter (6924) states that the rule’s requirements for specific types of defaults, test methods, dose-response models and/ or analyses are not supported by current science. The commenter refers to the proposed rule which states that “EPA will use peer-reviewed information, standardized test methods, consistent data evaluation procedures, and good laboratory practices to ensure transparent, understandable, and reproducible scientific assessments.” The commenter states that it is not appropriate to require use of standardized test methods (guideline studies) and good laboratory practices (GLP) studies, as described below.

Guideline and GLP studies – mostly sponsored by industry to meet regulatory requirements - don’t necessarily use modern methods for evaluating chemicals and are not designed to address issues with evaluated health effects from low-dose exposures, complex and systemic endocrine effects, behavioral or learning effects, metabolic perturbations, or upstream effects like reduced sperm count or reduced anogenital distance which are predictors of infertility. Furthermore, GLP and Guideline studies are not consistently associated with higher quality research, proper study design or correct statistical analysis.^{3094,3095} Much of the research available in the scientific literature is hypothesis driven-- for example, exploring mechanisms to explain how a detrimental health impact occurs. These experimental protocols are tailored to address the question being asked and generally there are no standardized test methods that could be followed. Yet, these experimental findings are critically important contributions to the body of scientific evidence. For the highest quality scientific assessment, a systematic review approach which considers all relevant scientific evidence and evaluates study quality

³⁰⁹⁴ Myers, J. P., F. S. vom Saal, et al. (2009). "Why public health agencies cannot depend on good laboratory practices as a criterion for selecting data: the case of bisphenol A." *Environ Health Perspect* 117 (3): 309-15.

³⁰⁹⁵ Vandenberg LN, Ågerstrand M, Beronius A, Beausoleil C, Bergman Å, Bero LA, Bornehag CG, Boyer CS, Cooper GS, Cotgreave I, Gee D, Grandjean P, Guyton KZ, Hass U, Heindel JJ, Jobling S, Kidd KA, Kortenkamp A, Macleod MR, Martin OV, Norinder U, Scherlinger M, Thayer KA, Toppari J, Whaley P, Woodruff TJ, Rudén C. A proposed framework for the systematic review and integrated assessment (SYRINA) of endocrine disrupting chemicals. *Environ Health*. 2016 Jul 14;15(1):74.

according to established criteria should be used, as recommended by the NAS.³⁰⁹⁶ Inappropriately using GLP as a measure of study quality would lower the overall quality of the assessment because other studies which are higher quality and/ or more directly relevant to the study question would be downgraded or excluded.

Commenter (6872) states that it is important that EPA have the ability to consider data that do not precisely fulfill the proposed rule's criteria if the data are informative and of high quality. The commenter states that, for example, requiring GLP sounds "good" but, in practice, many academic research laboratories conduct stellar research but may not meet all GLP criteria. The commenter states that data from such laboratories should be considered and weighed on its merits and should not be excluded from EPA consideration by rule. The commenter states that data from new and improved, but non-standard test methods, should be available for EPA to evaluate on their merits and use as appropriate.

Response: The EPA clarifies that in this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. In addition, this rule does not apply to dose-response models. Further, this final rule does not establish requirements that the EPA only consider standardized test methods (guideline studies) and GLP studies. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available or not available in a manner sufficient for independent validation. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Comment: Commenter (6935) states that a final rule should not disqualify a study from consideration as pivotal regulatory science if it addresses most key factors in §§30.5 and 30.6 and can be independently assessed and verified. The commenter states that the Proposed

³⁰⁹⁶ National Research Council. Review of EPA's Integrated Risk Information System (IRIS) Process. Washington, D.C.; 2014. The National Academies of Sciences. Application of Systematic Review Methods in an Overall Strategy for Evaluating Low-Dose Toxicity from Endocrine Active Chemicals. Washington, D.C.: National Academies Press; 2017. National Academies of Sciences, Engineering, and Medicine. 2018. Progress Toward Transforming the Integrated Risk Information System (IRIS) Program: A 2018 Evaluation. Washington, DC: The National Academies Press. <https://doi.org/10.17226/25086>.

Regulation generally would increase transparency with respect to dose response data and models. The commenter states that, in a final rule, EPA also should balance strict adherence to new transparency requirements against the need for regulatory certainty and efficiency. The commenter states that EPA should consider that only the rare past study, from inside or outside the Agency, has addressed all these factors. The commenter states that it is a worthwhile goal that future studies, especially those within the Agency, should meet as many of the requirements as possible from proposed provisions 30.5 and 30.6.

Response: The EPA clarifies that in this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. See 40 CFR 30.5 for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available in a manner sufficient for independent validation. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available or not available in a manner sufficient for independent validation. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

9.6 How Should EPA Address a Circumstance in which EPA Has a Statutory Requirement to Make a Determination for Which Scientific Information Publicly Available Sufficient for Independent Validation Does Not Exist?

Comment: Commenters (6120, 6895) notes that in the proposed rule, the EPA requested comments on how to address circumstances in which the EPA has a statutory requirement to make a determination when scientific information publicly available in a manner sufficient for independent validation does not exist.

Commenter (6120) states that this situation highlights the importance of using all available data, including studies of accidental exposures to chemicals that do not follow standardized test methods and cannot be reproduced or validated, academic studies on mechanisms such as endocrine disruption, and environmental sampling. The commenter states that all new compelling peer-reviewed research published in the scientific literature should be considered in

regulatory decisions. The commenter states that this also underscores the importance of a panel of independent scientists to peer review the information and consider all the evidence. The commenter also states that, in the absence of data, the EPA should make conservative assumptions protective of vulnerable populations such as children and women of childbearing age.

Commenter (6895) notes that it is likely that in such circumstances such data does exist. The commenter states that, in the very odd circumstance that such data does not exist, it behooves EPA to develop the data. The commenter states that, since EPA regulations and other actions are applicable to all of the country, the data used to make these decisions should be collected at the community and larger aggregate level.

Commenter (6375) suggests the following approach where EPA has a statutory requirement to make a determination for which scientific information publicly available in a manner sufficient for independent validation does not exist.

EPA should solicit input from EPA Offices (such as the Office of Pesticide Programs) and other federal agencies (such as FDA) that rely heavily on proprietary studies, many of which are not published in the peer-reviewed scientific literature and for which the data have historically not been available to the public for independent validations to make a determination as required by statute. As described above, EPA's Office of Pesticide Programs relies heavily on proprietary studies/CBI and apparently has devised mechanisms that balance protection with transparency of pivotal regulatory science and the public's right to know. One mechanism is Data Evaluation Records (DERs) that summarize proprietary studies.³⁰⁹⁷ The other is human health risk assessments that integrate findings in DERs such that stakeholders can assess the impact of a particular endpoint (e.g. health effect) in a particular study ("pivotal regulatory science") on the overall risk assessment. Both DERs and risk assessments have been made available on the docket or by other means. While this is not as transparent as making the underlying studies fully available, sufficiently detailed DERs and risk assessments are arguably as detailed and transparent as many health studies and risk assessments published in the peer-reviewed scientific literature.

Response: The EPA clarifies that in this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or

³⁰⁹⁷ <https://www.epa.gov/pesticide-registration/oecd-data-evaluation-record-templates>

proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available or not available in a manner sufficient for independent validation. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Further, with this final rule, the EPA is maintaining language in 40 CFR 30.3 stating that the statutes that the EPA administers, or their implementing regulations, will control in the event of any conflicts with the requirements of this rule. The Agency will continue to comply with and abide by the requirements in those statutes and implementing regulations, including regulatory deadlines.

Comment: Commenter (6362) suggests that the regulatory text in §30.4 be clarified. The commenter states that §30.4 appears to apply to EPA's use of studies (or other regulatory science) relied upon when EPA takes any final agency action. The commenter states that, in those instances, EPA should make all such studies available to the public to the "extent practicable." The commenter states that EPA should provide greater clarity regarding what it intends to do in circumstances where raw data cannot be made publicly available.

Response: The EPA has altered the final rule to increase clarity and address the commenter's concern. The EPA has removed the term "science that serves as the basis for informing a significant regulatory action" from 40 CFR 30.1, and will not require that science that serves as the basis for informing a significant regulatory action is publicly available in a manner sufficient for independent validation. Instead, in the final rule, 40 CFR 30.4 requires that the EPA clearly identify all science that serves as the basis for informing a significant regulatory action, and make all such science that serves as the basis for informing a significant regulatory action publicly available to the extent permitted by law. The EPA clarifies that this requirement is consistent with the EPA's existing practice of making science that serves as the basis for informing a significant regulatory action available in the public docket as part of the rulemaking.

9.7 How Does What this Rule Would Require Compare to Requirements of Environmental Statutes? (Relates to Chapter 1)

9.7.1 Best Available Science

Comment: Commenters (0671, 2249, 4827, 6188, 6922, 9227) assert that the Proposal would violate EPA's statutory requirement to consider the best available science. Commenter (6188) states that the rule does not explain how the EPA will be able to fulfill its statutory duties without the ability to consider the best available science, which includes robust, peer-reviewed, and

cutting-edge studies that rely upon protected data that cannot legally be made publicly available.³⁰⁹⁸

Commenter (6922) states that numerous statutes that EPA is charged with implementing require that EPA rely on the best available science and health information. The commenter states that any final rule must ensure that EPA is able to conduct its decision-making in a manner consistent with these and similar statutory directives. The commenter states that Congress did not mention transparency or any other reason why EPA should exclude consideration of the best available science. The commenter states that, in the Proposal, EPA did not provide any reason to exclude consideration of epidemiological studies based on the quality of science or reliability of results. The commenter states that transparency concerns or any other goal declared by the Agency cannot override EPA's statutory obligation to consider the full range of peer-reviewed, sound scientific research that is available and relevant to its regulatory decisions. The commenter states that these concerns cannot interfere with the Agency's general obligations to conduct informed, reasoned decision-making. The commenter provides the following statutory citations as examples of this obligation: 33 U.S.C. § 1314(a)(1); 42 U.S.C. § 7408(a)(2); 15 U.S.C. § 2625(h); and 42 U.S.C. § 300g-1(b)(3)(A).

Commenters (2249, 4827) suggest that, if EPA does not use the best available science, it would not be carrying out the mission given to it by Congress to protect Americans and the environment. Commenter (4827) states that the proposal directly contravenes the comprehensive federal and state regulatory programs Congress envisioned when drafting the CAA of 1970.³⁰⁹⁹ Commenter (4827) asserts that it reduces our public health legislation to mere declarations, as EPA would be severely delayed, if not rendered entirely unable, to establish future Standards using the "best available science."

Commenter (9227) asserts that EPA's statutory authorities generally require the agency to consider all available data when undertaking significant rulemakings. The commenter states that EPA's statutory authorities mandate a variety of requirements for what scientific information EPA must consider in rulemaking. The commenter states that, to take one example that appears in numerous statutes, including TSCA, CAA, SDWA, and the Endangered Species Act, Congress has often required agencies to act on the "best available science." The commenter states that, for an agency to comply with this obligation, the agency must at least consider all available scientific information. The commenter states that "best" means "of the most excellent, effective, or desirable type or quality."³¹⁰⁰ The commenter states that "available" means "able to be used or obtained."³¹⁰¹ The commenter states that "science" means "the intellectual and practical activity encompassing the systematic study of the structure and behavior of the physical

³⁰⁹⁸ For example, the commenter notes that the ESCAPE study relied upon data protected by European privacy laws to combine multiple cohorts across Europe and examine the association of air pollution with mortality in study participants. See *id.* (citing Beelen R, et al. Effects of long-term exposure to air pollution on natural-cause mortality: an analysis of 22 European cohorts within the multicenter ESCAPE project. *Lancet*. 2014; 383:785-95.) The findings of that study are consistent with multiple other studies that examine the effects of particulate matter exposure using different methodologies.

³⁰⁹⁹ Clean Air Act of 1970, 42 U.S.C.A. § 7401 (Congressional findings and declaration of purpose).

³¹⁰¹ *Id.* at 111.

and natural world through observation and experiment.”³¹⁰² The commenter states that assessing which science is “best” requires consideration of the overall quality of the science, and the public availability of underlying data is, at best, one of many aspects that should inform that assessment of overall quality. The commenter states that EPA cannot reasonably elevate the interest in public availability of all underlying information above all other factors in assessing the “best available science.” The commenter states that, textually, EPA’s approach is unlawful.

Commenter (9227) asserts that an agency “cannot ignore available. . . information.”³¹⁰³ The commenter states that numerous courts have indicated that a plaintiff or petitioner can establish a violation of the “best available science” requirement by “point[ing] to any scientific evidence that the agency failed to consider.”³¹⁰⁴ The commenter states that “the best available data requirement. . . prohibits [an agency] from disregarding available scientific evidence that is in some way better than the evidence [it] relies on.”³¹⁰⁵ The commenter states that “An agency does. . . have an obligation to deal with newly acquired evidence in some reasonable fashion.”³¹⁰⁶ The commenter states that EPA’s proposal will result in EPA precluding itself from considering certain studies that are “available,” thus violating the requirement that EPA rely on the best available science.

Commenter (9227) further asserts that the requirement that agencies use “best available” science or information often means that the agency must act even if the available science or information is imperfect. The commenter states that “even if the available scientific and commercial data were quite inconclusive, [the agency] may—indeed must—still rely on it” when the agency has a duty to act.³¹⁰⁷ The commenter states that “where the information is not readily available, we cannot insist on perfection.”³¹⁰⁸ The commenter states that, just as the Courts have recognized that they cannot expect perfection, agencies cannot choose to ignore certain studies or sources of information based solely on whether the data is publicly available—especially where the validity of those studies has been established using techniques that do not rely on public availability of underlying data.

Commenter (9227) states that, in direct violation of statutory requirements to consider, for example, “any other information available” or “the latest scientific knowledge [that is] useful” or “best available science,” the Proposal would prohibit EPA from considering relevant and high quality science whenever the underlying data for a study is not publicly available. The commenter states that, through the Proposal, EPA unlawfully tries to engraft an additional statutory requirement onto each of these statutes, requiring that to be considered a study’s

³¹⁰⁷ *Southwest Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000) (quoting *City of Las Vegas v. Lujan*, 891 F.2d 927, 933 (D.C. Cir. 1989)).

³¹⁰⁸ *San Luis*, 747 F.3d at 602.

underlying data must be publicly available.³¹⁰⁹ The commenter states that, for EPA’s Proposal to succeed, EPA must demonstrate that a study cannot be “other information available to the Administrator” or the “latest scientific knowledge useful in indicating” health or welfare effects or the “best available science,” or any of a number of other statutory formulations if the underlying data is not publicly available. The commenter states that EPA’s Proposal fails to do so, and it could not do so.

Commenter (9227) states that there are many reasons that underlying study data may not be available that have no bearing on the quality or validity of the study. The commenter states that these include legal restrictions or concerns about privacy (especially with respect to studies involving human subjects), confidentiality, CBICBI, or national security. The commenter states that, if this requirement were applied retroactively to existing studies, it may no longer be possible to make underlying data and models publicly available. The commenter states that EPA acknowledges these impediments in proposed section 30.9, which provides the Administrator with discretion—but not an obligation—to allow the agency to consider a study for which underlying data or models are not publicly available if he determines that public disclosure is infeasible. The commenter states that, where the Administrator fails to exercise his discretion to grant an exemption pursuant to proposed section 30.9, or where data or models are unavailable for reasons that do not satisfy the infeasibility standard, proposed section 30.5 would prohibit EPA from considering such studies, regardless of whether they meet the statutory criteria for consideration.

Commenter (9227) states that the only way that this prohibition could comport with EPA’s statutory obligations is if a study for which underlying data is not available cannot be, for example, “other information available” or “the latest scientific knowledge [that is] useful” or “best available science”—i.e., if the public unavailability of a study’s underlying dose response data and models makes the study ineligible to meet these criteria, regardless of whether the study has been peer reviewed, is based on rigorous methodologies, or has been published in a leading journal, and regardless of the reason for the public unavailability. The commenter states that EPA makes no such demonstration—nor could it. The commenter states that there is simply no support for such a proposition; to the contrary, all the evidence shows that studies may be “best available science,” and certainly “other information available” regardless of whether the data underlying them is publicly available.

Response: The EPA clarifies that in this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly

³¹⁰⁹ See *Nat’l Ass’n of Homebuilders v. Defenders of Wildlife*, 551 U.S. 644, 663-64 (2007).

available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available or not available in a manner sufficient for independent validation. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Furthermore, this final rule does not interpret or apply the provisions of any environmental statutes, nor does it modify the Agency's interpretations of "best available science." The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. The EPA will then identify and consider "pivotal science in accordance with the provisions of this rule," unless the implementation of the rule conflicts with statutory requirements and associated implementing regulations. As this rule makes clear, if implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

9.7.2 Data Quality Act

Comment: Commenter (6137) asserts that EPA's Proposed Rule ignores requirements set forth in the Data Quality Act. The commenter states that, given that the Proposed Rule eliminates from consideration any scientific study where the underlying data cannot be made publicly available, it undoubtedly precludes the use of the best available science in certain situations and, thus, the Proposed Rule is inconsistent with EPA's implementation of the Data Quality Act.

Commenter (6168) states that EPA should provide an analysis of how this rule differs from the Data Quality Act³¹¹⁰ and related policies and then offer a justification for this rule considering that analysis. The commenter states that it is unclear why the proposed rule is necessary given these policies or how the proposed rule would relate to them, especially given that the Data Quality Act and its associated guidelines cover much of the same ground. The commenter states that it is unclear if, or why, this proposed regulation is meant to supersede existing legislation and policies. The commenter states that EPA should provide an analysis of how this rule differs from the Data Quality Act and related policies and then offer a justification for this rule considering that analysis. The commenter states that, without clarity on these issues, the proposed rule appears to not only be an attempt to regulate where legislation has failed (i.e. the HONEST Act), but to use a regulation to supersede legislation that is already on the books.

Commenter (9227) states that, because Congress expressly granted OMB the authority to set guidelines for data quality and instructed agencies like EPA to follow OMB's lead, EPA lacks statutory authority to adopt a regulation that is contrary to OMB's guidelines. The commenter states that, accordingly, EPA's proposed regulation violates the Information Quality Act (IQA)

³¹¹⁰ Section 515 of Treasury and General Government Appropriations Act for Fiscal Year 2001 (Public Law 106-554). Also not addressed in the proposed rule are the Data Access Act and the 2009 "Scientific Integrity" memo.

and must be withdrawn.³¹¹¹ The commenter adds that EPA's proposed rule is unlawful because it exceeds EPA's authority under Section 515(a) of the IQA.³¹¹² The commenter states that the IQA requires EPA promulgate data quality guidelines that are consistent with those promulgated by OMB. The commenter states that, contrary to EPA's assertion in the preamble to the proposal, the Proposed Rule is not consistent with OMB's data quality regulations.

Response: The EPA clarifies that in this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available or not available in a manner sufficient for independent validation. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

This final rule makes incremental steps towards increasing data transparency by codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation and thereby improving the public's access to the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. Therefore, this rule is consistent with the focus on transparency in OMB Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal

³¹¹¹ *Prime Time Int'l Co. v. Vilsack*, 599 F.3d 678, 685 (D.C. Cir. 2010) (“[B]ecause Congress delegated to OMB authority to develop binding guidelines implementing the IQA, we defer to OMB's reasonable construction of the statute.”)

³¹¹² Codified at 44 U.S.C. 3504(d)(1) and 3516.

Agencies³¹¹³ and OMB M-13-13.³¹¹⁴ It is also consistent with OMB M-19-15,³¹¹⁵ which highlights the need to characterize the sensitivity of an agency's conclusions to analytic assumptions, as well as other federal guidance documents that require greater data transparency.

Furthermore, this final rule does not interpret or apply the provisions of any environmental statutes, nor does it modify the Agency's interpretations of "best available science." It therefore cannot conflict with the Data Quality Act. The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. The EPA will then identify and consider "pivotal science in accordance with the provisions of this rule," unless the implementation of the rule conflicts with statutory requirements and associated implementing regulations. As this rule makes clear, if implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

9.7.3 Other

Comment: Commenters (5165, 6125, 6925) assert that EPA suggests in footnote 3 of the proposal that it would exercise its discretionary authority to establish a policy that would exclude studies from consideration, such as the Harvard School of Public Health "Six Cities" epidemiological study. Commenters (5165, 6925) express concern that EPA would discard rigorously vetted scientific literature such as the Six Cities Study, withdrawing from its legal obligation and stated intention to rely on the best available science. Commenter (8272) states that failure to consider the Harvard Six Cities Study³¹¹⁶ and the ACS study.³¹¹⁷ and others like them in setting NAAQS because their data are not publicly available would conflict with the requirement that EPA set standards that protect susceptible subgroups.

Commenter (6125) states that none of the statutes cited in the proposal provide EPA with the discretionary authority to disregard such data. The commenter adds that the cases cited in the footnote involved two of the most consequential EPA regulations, namely the NAAQS for lead and for fine particles. The commenter states that the studies at issue were the Lanphear study for lead and the Harvard Six-City and ACS studies for fine particles. The commenter states that EPA is surely aware of the extensive history involving industry challenges to those studies. The

³¹¹⁶ Dockery DW, Pope CA 3rd, Xu X, Spengler JD, Ware JH, Fay ME, Ferris BG Jr, & Speizer FE. (1993). An Association between Air Pollution and Mortality in Six U.S. Cities. *New England Journal of Medicine*, 329(24):1753-9.

³¹¹⁷ Pope CA 3rd, Thun MJ, Namboodiri MM, Dockery DW, Evans JS, Speizer FE, & Heath CW Jr. (1995). Particulate Air Pollution as a Predictor of Mortality in a Prospective Study of U.S. Adults. *American Journal of Respiratory and Critical Care Medicine*, 151(3):669-74.

commenter states that in the two cited cases, industry had challenged EPA's reliance on those studies, arguing in each case that the underlying data should have been disclosed. The commenter states that, in each case, EPA addressed the comments on their merits, finding, with support in the record, that the studies were reliable as they stood despite the criticisms. The commenter states that both courts agreed that there was no need for disclosure. The commenter states that the current proposal claims discretionary authority--for which it identifies no basis--to ignore those considered responses in favor of categorically disregarding such repeatedly examined studies.

Response: The EPA clarifies that in this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available or not available in a manner sufficient for independent validation. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Comment: Commenter (6133) states that the Proposal would broadly prohibit EPA from considering studies, models, and analyses that are integral to the functioning of EPA regulatory programs, implementation of statutes like the CAA, and protection of public health and the environment. The commenter states that it is unlawful for EPA to refuse or fail to consider these additional studies, models, and analyses.

Response: The EPA clarifies that in this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA intends to issue implementation guidance and statute-specific rulemakings that will further describe these criteria and how the EPA will identify pivotal science in its assessments and rulemakings. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available or not available in a manner sufficient for independent validation. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Chapter 10: Applicability of the Rule

The proposed rule includes 40 CFR 30.3 which states:

The provisions of this subpart apply to *dose response data and models* underlying *pivotal regulatory science* that are used to justify significant *regulatory decisions* regardless of the source of funding or identity of the party conducting the regulatory science. The provisions of this section do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses. Except where explicitly stated otherwise, the provisions of this subpart do not apply to any other type of agency action, including individual party adjudications, enforcement activities, or permit proceedings.

As described in the preamble, the proposal solicits comment on (1) whether and to what extent the 40 CFR 30.3 requirements should apply to other stages of the rulemaking process, including proposed rules and guidance; (2) whether a narrower scope of coverage would be appropriate and whether certain categories of regulations should be excluded from coverage, such as individual party adjudications, enforcement activities, or permit proceedings; (3) whether the Agency should apply the provisions of the proposed rule to these actions or to specific types of actions within these categories; and (4) whether other agency actions, beyond significant final regulatory actions under Executive Order 12866, should be included, such as site-specific permitting actions or nonbinding regulatory determinations.

Several comments were received regarding the extent to which the 40 CFR 30.3 requirements should apply. In this section these comments are organized according to the following topics:

- Limiting Requirements to “Significant Regulatory Actions”
- Expanding the Scope of the Applicability of the Rule
- Narrowing the Scope of the Applicability of the Rule
- Changes in the Scope of the Science Subject to the Rule
- Scope - Phase-in
- Scope - Effects on Individual EPA Programs and Exceptions
- 40 CFR 30.3 – How do the provisions of this subpart apply?
- “Regulatory Decisions” Definition at 40 CFR 30.2

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

10.1 Limiting Requirements to “Significant Regulatory Actions”

Comment: Commenters (4882, 6102, 6141, 6149, 6175, 6179, 6362, 6363, 6373) support the proposed rule being limited to “significant regulatory actions.”

Commenter (6141) states that, by limiting the application of scientific transparency to this smaller subset of EPA regulatory actions, the Proposal ensures that the enhanced requirements for science transparency will apply in cases where EPA regulatory actions having the greatest impacts on the U.S. economy and regulated industry sectors. The commenter states that enhancing public access to underlying scientific data in the case of the most important and impactful EPA rulemakings will lead to increases in the true net benefits of these EPA regulatory actions by helping to ensure that the policies and requirements established by EPA in those regulatory actions are based on valid science and not on published studies with irreproducible results.

Response: The EPA agrees that the Agency’s significant regulatory actions can potentially impact American lives and livelihoods. Because of this, the American people deserve environmental decisions and policies that are based on the best information, and only through continuous improvement to its procedures, especially those focused on transparency, can the EPA truly demonstrate its commitment to the Agency’s mission of protecting public health and the environment through sound policy decisions that are informed by robust scientific and technical research.

In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include final influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments.

Comment: Commenter (6102) suggests that, over time, EPA can consider expanding the scope of the types of actions covered by this rulemaking through an amendment to the rule once stronger data sharing mechanisms are in place and operational.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. By finalizing the applicability of this rulemaking to influential scientific information, the Agency has expanded the scope not only to an important category of scientific assessments but also to a wider range of EPA regulatory actions.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (6149) requests that the category of radiation protection be exempted from the proposed rule, or the proposed definition of “pivotal regulatory science” should be limited solely to regulatory actions that are used as a basis for “significant regulatory action” as defined by Executive Order 12866 or for implementing/modifying a “major rule” as defined by 5 U.S.C. 804, Congressional Review of Agency Rulemaking.

Commenter (6149) states that various federal and state agencies implement radiation protection standards within an interconnected regulatory framework from a common scientific basis. In addition to the EPA, federal authority for radiation protection resides with the U.S. Nuclear Regulatory Commission (USNRC), the U.S. Department of Energy (DOE), the U.S. Department of Defense (DOD), the Occupational Safety and Health Administration (OSHA), and the U.S. Food and Drug Administration (FDA). State radiation control programs exercise regulatory authority for protection from ionizing radiation as defined in the Atomic Energy Act (AEA) through federal and state statutes. Recognizing that the EPA is not the sole regulatory authority for radiation protection, the commenter contends that it is critical that any significant changes in the associated integrated regulatory framework be coordinated and harmonized to ensure regulatory certainty and consistency. The commenter states that this is supported by the guidance in Executive Order 12866 which states, “Each agency shall avoid regulations that are inconsistent, incompatible, or duplicative with its other regulations or those of other Federal agencies.”

The commenter (6149) notes that the linear no-threshold (LNT) radiation dose-response relationship is the foundation for the system of radiation protection, as well as federal and state laws and regulations. According to the commenter, any changes in its application would significantly impact radiation protection guidance, medical practice, compensation programs, environmental contamination issues, advances in technology, and communication of risk with profound corresponding safety, compliance, and financial impacts to both the private and public sectors. The commenter asserts that the National Academies, National Research Council, and National Council on Radiation Protection and Measurements (NCRP) have provided effective methods for a rigorous, holistic, and consensus review of the science behind radiation protection from all stakeholders. Thus, based upon these existing processes, the commenter recommends that the category of radiation protection be exempted from the proposed rule. At a minimum, the commenter recommends that the definition of “pivotal regulatory science” be limited to regulatory actions that are used as a basis for “significant regulatory action” as defined by Executive Order 12866 or for implementing/modifying a “major rule” as defined by 5 U.S.C. 804, Congressional Review of Agency Rulemaking.

In summary, the commenter (6149) believes the radiation protection category of regulations should be exempted from the Proposed Rule on Strengthening Transparency in Regulatory Science based upon the unique nature of the extensive - interconnected radiation protection system, the limited availability of radiation epidemiological and scientific expertise, and the demonstrated ability of the Congressionally chartered scientific advisory organizations (the National Academies, National Research Council, and NCRP) to effectively develop and review the scientific bases for radiation protection regulatory actions in an open and transparent manner.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. “Significant regulatory actions” means final regulations determined to be “significant regulatory actions” by the Office of Management and Budget (OMB) pursuant to Executive Order 12866. *Influential scientific information* means scientific information the Agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions. This action establishes how the Environmental Protection Agency (EPA) will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. The provisions of this part do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses, and influential scientific information or pivotal science that meet one or more of the exemptions identified in Section IX of the OMB Final Information Quality Bulletin for Peer Review. In the event the procedures outlined in this part conflict with statutes the EPA administers, or their implementing regulations, the statutes and regulations will control. Except where explicitly stated otherwise, the provisions of this part do not apply to any other type of Agency action, including individual party adjudications, enforcement activities, site-specific actions, or permit proceedings. Unless specifically exempt, this final rule will apply regardless of the scientific issue considered.

10.2 Expanding the Scope of Applicability of the Rule

Comment: Commenters (4882, 5181, 6112, 6115, 6133, 6141, 6143, 6148, 6161, 6360, 6362, 6366, 6375, 6867, 6875, 6891, 6906, 6921, 6935, 9227) support applying the proposed rule requirements more broadly and offer suggestions on expanding the scope of the rule. Commenter (6891) states that limiting transparency obligations only to significant regulatory actions ignores that EPA’s actions outside of the rulemaking context can often have significant impacts on those other regulatory decisions.

Commenters (6133, 9227) argue that limiting the proposal to “significant regulatory actions” would result in treating a study differently depending on whether it supports regulation or non-regulation in a particular context. Commenter (6133) asserts that it is a hallmark of the Proposal’s inherent arbitrariness and capriciousness that the Proposal prohibits EPA from considering the identical regulatory science, studies, and information in some regulatory situations, while allowing EPA to consider the identical regulatory science, studies, and information in other regulatory situations—based merely upon the type of situation, rather than any differences in availability, replicability, verifiability, or validation concerning the information.

Specific suggestions provided by commenters for expanding the scope of the rule are summarized in sections 7.2.1 through 7.2.7 of this Chapter and include: other regulatory actions; guidance; proposed rulemaking/advanced notice of proposed rulemaking; individual party adjudications, enforcement activities, permit proceedings; actions relying on records from

previous reviews; specific EPA programs, and application of the rule to a limited and special class of laboratory samples.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. By finalizing the applicability of this rulemaking to influential scientific information, the Agency has expanded the scope not only to an important category of scientific assessments but also to a wider range of EPA regulatory actions.

The EPA is committed to its mission of protecting human health and the environment through sound policy decisions that are informed by robust scientific and technical research. Because of the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best scientific information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA fully demonstrate that commitment.

The provisions of final rule do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses, and influential scientific information and/or pivotal science that meet one or more of the exemptions identified in Section IX of the OMB Final Information Quality Bulletin for Peer Review. In the event the procedures outlined in this part conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control. Except where explicitly stated otherwise, the provisions of this final rule do not apply to any other type of agency action, including individual party adjudications, enforcement activities, site-specific actions or permit proceedings.

Finally, because of the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods, this rule focuses on these important Agency actions. The EPA disagrees with commenters who believe that this rule requires the Agency to treat science differently based on the situation. Rather this rule does not categorically exclude any pivotal science, but because of the potentially significant societal impact of significant regulatory actions and influential scientific information requires the Agency to consider the availability of the underlying dose-response data to better ensure the validity of the science.

10.2.1 Application of the Rule to Other Regulatory Actions

Comment: Commenters (1972, 4882, 6141, 6148, 6362, 6375) support expansion of the rule requirements beyond "significant regulatory actions" to all EPA programs and stages of rule development; scientifically or technically novel actions (2426, 6161, 6375); interpretive rules (6141); regulatory and other key agency decision-making support assessments/studies (4882, 6112, 6115, 6125, 6141, 6143, 6148, 6161, 6360, 6369, 6375, 6867, 6891, 6906, 6911); pre-

rulemaking planning activities (6375); Agency policy documents (6366); and models used in studies supporting regulations/policies (4882, 6112, 6115, 6143, 6360, 6375, 6867, 6875, 6891, 6935). In general, these commenters assert that there is no reason that there should be a distinction made between the application of the proposed rules provisions to major rules and other regulatory actions regarding the consideration of the science and modeling done in the development of such actions.

Commenter (6125) contends that allowing a distinction between using studies when they confer a benefit on industry but disallowing them when used to influence public health protection would be arbitrary and invidious.

Commenter (6360) argues that, since EPA's application of science always involves judgement and since this judgement is an exercise of government authority, all EPA applications of science should have minimum transparency standards. The commenter contends that there is no objective principle to separate permits, cleanup decisions, regulations, or other uses of EPA authority to arrive at the conclusion that one community deserves the ability to understand the government's judgement and reasoning and another does not. The commenter states that EPA commonly employs fate-and-transport models, route of exposure models, cost estimation models, statistical techniques to project analytic data beyond method detection limits, and numerous other specific applications of science that involve judgement by EPA and by the application developers, and that there is no logical principle to require transparency for one application and not another. As an example, the commenter asserts that a fate and transport model could have as much economic impact as a dose-response model.

Commenter (6360) states that, when EPA introduces a new applied science tool, the requirements of this rulemaking should apply, no matter the significance level or impact of the decision. The commenter asserts that EPA generally has discretion – judgement – as to when it introduces a new scientific application. According to the commenter, if the applicability is limited only to economically significant regulatory actions or some other impact threshold, this tiering approach creates a perverse incentive to introduce new, non-transparent tools in minor regulatory actions, permits, or product approvals. The commenter suggests that, once scientific applications are established in this manner, these applications may be granted deference as EPA policy and its precedent.

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, to expand the scope of the 2018 proposed rulemaking in two ways: (1) expanding “dose-response data and models” to “data and models,” and (2) including influential scientific information. As EPA noted in the 2020 SNPRM, transparency of EPA's science should not be limited to dose-response data and dose-response models, because other types of data and models can also drive the requirements and/or quantitative analysis of EPA significant regulatory actions and influential scientific information.

Based on the comments on the 2018 proposed rule and the 2020 SNPRM, including that the number of studies that would be subject to the rule might hinder rulemaking, the EPA determined that the Agency should pursue an incremental approach to maximizing transparency in the science that it relies upon by focusing the final rule requirements on dose-response data

and, in particular, only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs).

The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The provisions of the final rule apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.

The provisions of final rule do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses, and influential scientific information and/or pivotal science that meet one or more of the exemptions identified in Section IX of the OMB Final Information Quality Bulletin for Peer Review. In the event the procedures outlined in this part conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control. Except where explicitly stated otherwise, the provisions of this final rule do not apply to any other type of agency action, including individual party adjudications, enforcement activities, site-specific actions or permit proceedings.

Further, the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

10.2.2 Application of the Rule to Agency Guidance

Comment: Commenters (2426, 6141, 6148, 6161, 6366, 6375, 6906, 6911, 6913) urge the Agency to apply the requirements to EPA guidance.

Commenters (2426, 6366, 6913) assert that guidance documents can have as much impact on the regulated community as the “significant regulatory actions” discussed in the proposal. Commenters (2426, 6913) state that allowing this opportunity for public involvement safeguards the larger goal of regulatory transparency, as operational guidelines and guidance documents can often be just as impactful as official regulatory actions or rules.

Commenter (6161) states that transparency principles should be applied to all science used in developing guidance. Commenter (2426) states that the proposed data transparency rule should also apply to scientifically or technically novel guidance, and the resulting guidance document should be made available for public comment.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. Except where explicitly stated otherwise, the provisions of the final rule part do not apply to any other type of agency action. By finalizing the scope to include influential scientific

information, the Agency is applying the applicability of the rule to an important category of scientific assessments that influence a wide range of EPA actions.

Comment: Commenter (6906) states that, due to the vast range of Guidance that EPA produces and utilizes, it would not be practical to require the Agency to enforce that these Guidelines be met for all Guidance Documents.

Response: EPA agrees with the commenter and is not expanding the scope of the rule to cover guidance documents. The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. Except where explicitly stated otherwise, the provisions of the final rule part do not apply to any other type of agency action. By finalizing the scope rule to include influential scientific information, the Agency is applying the applicability of the rule to an important category of scientific assessments that influence a wide range of EPA actions. Except in those instances where this rule yields to an existing environmental statute, all future influential scientific information will be subject to the requirements of this rule. Though this final rule does not apply directly to guidance documents, all new guidance will benefit from this rule if those documents rely on new influential scientific information.

Comment: Commenter (5181) expresses opposition to applying the requirements of the proposed rule to promulgation of guidance. The commenter states that applying such strenuous requirements for data early in the development of a rule would restrict initial consultation with other agencies, with stakeholders, and with the public. According to the commenter, in environmental programs, guidance often supports implementation of a rule in a practical manner at the field level. The commenter states that practical, accurate, and efficient application of regulations in the field typically depends upon guidance based not only on published science, but also on professional experience and results of field testing. The commenter asserts that it would be highly impractical to make such information available to the public in the format described by the proposed rule. According to the commenter, failure to develop guidance because of lack of extensive published data would cripple implementation of necessary regulatory programs.

Response: This final rule does not apply to guidance documents. The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. Except where explicitly stated otherwise, the provisions of the final rule part do not apply to any other type of agency action. By finalizing the scope rule to include influential scientific information, the Agency is applying the applicability of the rule to an important category of scientific assessments that influence a wide range of EPA actions.

10.2.3 Application of the Rule to Proposed Rules, Advanced Notice of Proposed Rulemaking and All Aspects of the Rulemaking Process

Comment: Commenters (4932, 6143, 6148, 6151, 6177, 6360, 6366, 6375, 6867, 6906, 6913, 6921) urge the Agency to apply the requirements of the proposed rule to proposed rulemakings.

Commenter (6360) states that transparency at the proposal stage benefits EPA by helping build a robust administrative record to support its policy decisions.

Commenter (6143) recommends that requirements apply first to proposed regulations for which rulemaking is already in progress, then prospectively to proposed and final rules alike.

Commenters (4932, 6151, 6177, 6366, 6913, 6921) assert that deferring access to the science until the final rulemaking is issued will be too late for active public engagement. Commenters (6913, 6360, 6921) state that policy decisions and scientific interpretations need to be thoroughly explained in the proposed rule stage, so that the public can understand and provide an informed opinion on them, which allows EPA to benefit from transparent stakeholder input before rendering a final agency action.

Commenter (6366) states that, when impacted stakeholders and the public are provided an opportunity to comment on federal proposals, they should have all relevant data, including cost benefit data, available to ensure they fully understand the justification for the rule and that their comments are clearly in response to the selected regulatory option(s) being proposed.

Commenters (6177, 6360, 6921) suggest that additional information may become available as a result of broadening the scope to the proposed rule stage. Commenter (6177) states that broadening the scope to the proposed rule stage would allow third parties to review the scientific underpinnings early in the process and possibly provide additional data sets and studies generated that the Agency may not currently possess. Alternatively, according to the commenter, if EPA only allows access to data sets once the rule is final, interested third parties would be more limited in their options to seek redress if a substantial issue is found.

Commenter (6906) states that it would be useful for the Agency to include language that regulators “strongly consider,” rather than mandate, the use of these transparency guidelines during other moments of the regulatory process (*i.e.* the creation of guidance). The commenter asserts that, by requesting consideration of the guidelines at earlier stages in the proposed rule process, enforcement of these provisions for Final Rulemakings should be smoother.

Response: The EPA sees no need to include the proposed rule stage of significant regulatory actions in the final regulatory text for this rulemaking because, as a practical matter, these proposed rules must comply with this final rule in order to be finalized. The EPA does not introduce the studies and analyses it relies on for a rulemaking at the final rule stage. The basis for a rulemaking is provided for public review and comment in the public docket when the proposed rule is issued or if subsequently added to the docket through a separate opportunity for public comment. The EPA expects to identify pivotal science in proposed significant regulatory

actions or external review drafts of influential scientific information, which will allow the public, if they so choose, to independently validate the pivotal science and provide comment to the EPA.

Comment: Commenters (4932, 6867, 6375, 6906) recommend revisions to the regulatory text in support of their positions that the proposed rule apply to both advanced notice of proposed rulemakings and proposed rules.

Commenter (4932) recommends that EPA revise the definitions of “regulatory decisions,” “pivotal regulatory science,” and “regulatory science” by striking the word “final” from the proposed definitions so that the transparency objectives (*i.e.*, the disclosure of pivotal regulatory science) apply to advanced notices of proposed rulemaking and proposed rulemakings.

Commenter (6867) states the EPA should identify all studies (or other regulatory science) it will rely upon at the time it proposes any regulation in order for the public to meaningfully comment on the proposed action. The commenter suggests that Proposed 40 CFR 30.4 be amended to state that:

EPA shall clearly identify all studies (or other regulatory science) relied upon to support any agency action. When EPA proposes any agency action, EPA shall make all such studies (or other regulatory science) available to the public to the extent practicable.

Commenter (6906) recommends that the EPA amend 40 CFR §§ 30.4 (identification of studies), 30.5 (disclosure of data and models), 30.6 (documentation and evaluation of studies) and 30.7 (peer review) to require these steps at an interim phase prior to issuance of the final rule.

Response: The EPA sees no need to include the proposed rule stage of significant regulatory actions in the final regulatory text for this rulemaking because, as a practical matter, these proposed rules must comply with this final rule in order to be finalized. The EPA does not introduce the studies and analyses it relies on for a rulemaking at the final rule stage. The basis for a rulemaking is provided for public review and comment in the public docket when the proposed rule is issued or if subsequently added to the docket through a separate opportunity for public comment. The EPA expects to identify pivotal science in proposed significant regulatory actions or external review drafts of influential scientific information, which will allow the public, if they so choose, to independently validate the pivotal science and provide comment to the EPA.

The EPA also sees no need to include advance notices of proposed rulemakings in this final rule because advance notices of proposed rulemakings are preliminary in nature and frequently focus on soliciting initial comment on a regulatory issue or approach. Therefore, an expansion to advance notices of proposed rulemaking would be inconsistent with the purpose of this final rule.

Finally, based on a consideration of the public comments on both the 2018 proposed rule and the 2020 SNPRM, the EPA has revised many of the rules definitions (at 40 CFR 30.2), including the definitions of “regulatory decisions,” “pivotal regulatory science,” and “regulatory science.”

Comment: As background, the commenter (5181) explains that the proposed rule language indicates that it is generally applicable prospectively to final agency actions. However, the

commenter states that the proposed rule requests comments on applicability to other stages of rulemaking. The commenter states that the EPA is currently engaged in a very extended proposed modification to the definition of waters of the United States (WOTUS) and it is unclear how the proposed rule might affect current rulemaking efforts. According to the commenter, although the definition of “dose response data and models” may not apply directly to the WOTUS rule, the *Federal Register* notice indicates that EPA is considering expansion of the rule “to cover other types of data and information, such as for example economic and environmental impact data and models that are designed to predict the costs, benefits, market impacts and/or environmental effects of specific regulation interventions on complex economic or environmental systems.” The commenter recommends that, given the in-depth scientific analysis undertaken to support development of the 2015 rule regarding WOTUS – based heavily on a publicly available analysis of the pertinent peer-reviewed literature, they recommend that the WOTUS rule be exempt from any application of the proposed rule regarding transparency in science and that completion of the WOTUS rule be allowed using the existing scientific analysis. The commenter asserts that applying the proposed rule to the information gathered to support a WOTUS rule is unnecessary given currently availability of the underlying science to the public.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; therefore, the rule does not apply to the WOTUS rule. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

Comment: Commenters (6112, 6143, 6375) contend that these requirements should apply to all aspects and steps in the pre-rulemaking and rulemaking process. Commenter (6112, 6143) specifically suggests that the proposed rule requirements should apply to assessments (including certain retrospective assessments), models, criteria documents, and regulatory impact analyses that provide the basis for EPA’s policies, procedures, guidance, and proposed and final regulatory decisions. Commenter (6375) requests that the scope be expanded to cover, at a minimum, pre-rulemaking activities (e.g., during the planning and/or assessment stages of a National Ambient Air Quality Standard (NAAQS) cycle, EPA should indicate on which studies it plans to rely).

Commenter (1972) requests that the EPA follow the proposed requirements to the fullest extent practicable for all rulemaking decisions that rely on scientific or economic information as a basis for EPA’s decision.

Commenter (4882) asserts that transparency is just as important in all aspects of rule-making as it is in regulatory science.

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, to expand the scope of the 2018 proposed rulemaking in two ways: (1) expanding “dose-response data and models” to “data and models,” and (2) including influential scientific information. The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond

significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities. Based on the comments on the 2018 proposed rule and the 2020 SNPRM, including that the number of studies that would be subject to the rule might hinder rulemaking, the EPA determined that the Agency should pursue an incremental approach to maximizing transparency in the science that it relies upon by focusing the final rule requirements on dose-response data and, in particular, only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs).

10.2.4 Individual Party Adjudications, Enforcement Activities, or Permit Proceedings

Comment: Commenters (6112, 6115, 6143, 6375) provide arguments that support application of the proposed requirements to individual party adjudications, enforcement activities, and permit proceedings. Commenter (6143) recommends that the proposed requirements apply on a case-by-case basis to individual party adjudications, enforcement activities, and permit proceedings, to the extent that such actions are based or depend on research information.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

Comment: Commenter (6935) supports proposed provision 40 CFR 30.3 which indicates that the regulation does not apply to Agency action involving individual party adjudications, enforcement activities, or permit proceedings. The commenter states that it is not clear that the proposed new regulations should be applicable to individual party adjudications, enforcement activities, or permit proceedings, unless reliance on a particular study is a central issue. The commenter explains that adjudications and enforcement activities tend to turn on questions of fact and current processes can uncover necessary details without adding a new layer of requirements, which they assert would slow down such actions, while creating uncertainty and adding unnecessary costs for both regulated parties and regulators. The commenter suggests that even if reliance on a particular study is central to a more individualized proceeding, it would be more appropriate for the Agency to conduct a more generic regulatory action to address potential deficiencies in a study—and the resulting regulatory requirements—than require a private party to expend its own resources to assess and validate the underlying science.

Commenter (6137) asserts that, to the extent EPA decides to apply this Proposed Rule in the context of enforcement, adjudicatory, and permit actions – which it should not – it must first issue a proposal setting out its basis for such a rule and provide opportunity for comment, separate from the April 30, 2018 proposal, under the Administrative Procedure Act (APA) and Clean Air Act (CAA) § 307(d).

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and

assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

Comment: Commenter (6191) requests that EPA define what they would consider “practical” with respect to application of the rule to individual party adjudications, enforcement activities, or permit proceedings

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

10.2.4.1 Individual Party Adjudications

Comment: Commenter (6133) states that the Proposal arbitrarily and capriciously allows EPA to continue to rely on highly relevant regulatory science and other information supplied to the agency by industry during individual party adjudications, even when that information is not “publicly available in a manner sufficient for independent validation.” According to the commenter, the EPA could consider non-peer reviewed, non-transparent industry science to conclude that formaldehyde or asbestos are not carcinogens, or that fine particles (PM_{2.5}) or lead have safe exposure levels, or that carbon dioxide (CO₂) does not endanger public health or welfare. The commenter states that, under the proposed 40 CFR 30.3, EPA could conclude, after considering the non-transparent, unavailable information, that the regulations should not apply in ways that would affect an entire industrial sector favorably, while harming the public meant to be protected by those regulations.

Response: The final rule does not prohibit EPA from relying on studies when the underlying dose-response data is not available for independent validation. Implementation of this rule will not undermine EPA’s efforts in protecting human health and the environment. The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

Comment: Commenter (6137) states that EPA does not explain how or where its Proposed Rule could be relevant in individual party adjudications. The commenter asserts that, though the administrative penalty provisions of the CAA provide for individual party adjudications, EPA’s proposed procedures bear no relevance or applicability to such adjudications.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

Comment: Commenter (6935) states that, to the extent that an individual adjudication, whether in the context of permitting or enforcement, relies on EPA's own models or those provided by intervenors, the Agency should provide complete and transparent access to these models to the private party so that it can assess and critique any outcomes.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

10.2.4.2 Enforcement Activities

Comment: Commenter (6133) asserts that the proposal arbitrarily and capriciously allows EPA to continue to rely on highly relevant regulatory science and other information supplied to the agency by industry during enforcement proceedings, even when that information is not "publicly available in a manner sufficient for independent validation." The commenter provides for consideration an example where a company that receives a notice of violation from EPA meets with the agency to make the case that EPA and the Department of Justice should not file a complaint. The commenter states that a company may submit regulatory science, confidential business information (CBI) (CBI), or other non-confidential information that is not "publicly available in a manner sufficient for independent validation." The commenter asserts that the EPA could consider non-peer reviewed, non-transparent, erroneous industry science to conclude that formaldehyde or asbestos are not carcinogens, or that PM_{2.5} or lead have safe exposure levels, or that CO₂ does not endanger public health or welfare. According to the commenter, considering this and other non-transparent information, EPA could conclude that prosecution is not warranted, or that the information represents mitigating factors for penalties or injunctive relief, notwithstanding that the non-transparent, unavailable information is scientifically erroneous and even absurd.

Response: The final rule does not prohibit EPA from relying on studies when the underlying dose-response data is not available for independent validation. The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

Comment: Commenter (6137) states that, with respect to enforcement actions, EPA has no authority to bar the courts or administrative adjudicators from considering relevant evidence merely because that evidence has not passed an arbitrary test for transparency and peer review. The commenter contends that, whether a scientific study is sufficiently transparent or has been peer reviewed provides no bearing on administrative enforcement of statutes and is wholly irrelevant to determining administrative civil penalties. The commenter provides that the CAA, for example, vests authority over judicial enforcement actions to the courts, not EPA, and EPA has no authority to dictate to the courts what evidence they can and cannot consider, or what weight to give such evidence. See *Nat. Res. Def. Council v. EPA*, 749 F.3d 1055, 1063-64 (D.C. Cir. 2014). The commenter asserts that courts and administrative law judges are equipped with tools to separate out credible and non-credible scientific evidence, see, e.g., Fed. R. Evid. 702; Daubert, 509 U.S. 579. According to the commenter, whether a scientific study is sufficiently transparent or has been peer reviewed provides no bearing on administrative enforcement of these statutes, which provide enforcement authority over whether there has been a violation of specified requirements and prohibitions, see, e.g., 42 U.S.C. § 7413(a)(1)-(5). The commenter argues that it is also wholly irrelevant to determining administrative civil penalties. See, e.g., *id.* § 7413(e). Though the CAA does allow consideration of “such other factors as justice may require” in setting civil penalties, the commenter asserts that the EPA does not and cannot explain how its transparency and peer review tests could possibly be relevant to whether “justice” requires a different penalty for violation of a prohibition or requirement. The commenter asserts that, if a defendant feels that a standard is unjust because of a lack of data transparency or peer review in supporting studies, the defendant can seek review in the Court of Appeals within 60 days of the standard’s publication and that the validity of standards cannot be questioned in an enforcement proceeding. See, e.g., 42 U.S.C. § 7607(b)(2).

Response: Nothing in the final rule bars courts or administrative adjudicators from considering relevant evidence. With this final rule, the EPA is including regulatory text in 40 CFR 30.3 stating that the statutes and regulations will control in the event of any conflicts, and clarifying that the requirements in this final rule set the overarching structure and principles for science transparency in the EPA’s significant regulatory actions and influential scientific information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes that the EPA administers.

The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

Comment: Commenter (6356) recommends that the rule not apply to litigation and settlement/consent or to EPA enforcement actions, consent decrees, or administrative settlements because of the prosecutorial and confidentiality of discussions in the context of litigation and settlement agreements.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA agrees with the commenter and will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

Comment: Commenter (6362) supports the application of the rule to enforcement action. The commenter states that in civil judicial enforcement programs, EPA routinely makes discretionary decisions targeting cases to pursue on the basis of scientific data on exposure of humans and ecological resources to pollutants and that the scientific data used in such cases should be publicly available to be verified and replicated.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

10.2.4.3 Permit Proceedings

Comment: Commenters (6180, 6362) state that the requirements should apply to permit proceedings. Commenter (6180) states that permit proceedings (and related water quality standards and total maximum daily loads (TMDLs)) have potentially long-lasting, widespread, and costly implications for permittees and therefore should not be excluded from this rule as they meet the requirements of pivotal regulatory science. Commenter (6362) contends that it should apply to permit proceedings because, in administrative programs, EPA routinely makes discretionary decisions targeting cases to pursue on the basis of scientific data on exposure of humans and ecological resources to pollutants and that the scientific data used in such cases should be publicly available to be verified and replicated.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

Comment: Commenters (5181, 6356) oppose application of the proposed requirements to individual permit actions.

Commenter (5181) asserts that such requirements would be inconsistent with sound and timely authorizations under the section 404 dredge and fill permit program. The commenter states that regulations that subject all data to identical requirements regarding data collection, evaluation, and release would interfere with the permitting process in an unacceptable manner. According to

the commenter, the exclusion of non-peer reviewed data - which is typically collected at the time of a permit application for the purpose of clarifying both the extent and limitations of adverse impacts – would undermine the accuracy of individual permit decisions.

Commenter (6356) recommends that the rule, if adopted, should not apply to information that forms the basis of permits under any of the statutes such as the CAA, the Clean Water Act (CWA), or the Safe Drinking Water Act (SDWA) because separate public participation requirements provide under each of the respective statutes that the permit itself, including its requirements and conditions and their respective bases, already are subject to public comment and review. The commenter states that, while it is not clear what this rule would apply to other than these provisions, it seems possible that the applicability of this transparency regulation to other information underlying an environmental permit could open the door to confidential information about manufacturing processes and other business information and also third-party technology, which would be irrelevant to the permit's requirements and conditions and otherwise not required to be in the public's purview.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

10.2.5 Application of the Rule to Actions Relying on Records from Previous Reviews

10.2.5.1 Support Expanding the Scope to Prior Studies

Comment: Commenters (0555, 4882, 6143, 6362, 6375, 6867) support an expansion of the scope of the Proposal to prior studies.

Commenter (0555) states that, when possible, EPA should apply the proposed new guidelines to existing regulations and the regulatory science that supports them. The commenter recognizes that this may not always be feasible, especially for regulatory science that was developed under conditions that would limit disclosure, and EPA should develop clear criteria for the types of research that would be eligible for exemptions to its transparency policy. The commenter states that EPA has an opportunity, when conducting retrospective evaluation of regulatory impacts (as required by Executive Orders 13563 and 13771), to reexamine the studies, data, models and assumptions that generated ex-ante estimates of regulatory benefits and costs in order to ensure transparency and opportunities for independent analysis.

Commenter (6143) also recommends that the proposed requirements apply on a case-by-case basis to retrospective assessment of research information.

Commenter (6362) suggests that, in cases where EPA has developed analytical tools and models in the past that incorporate dose response data, it may be valuable to apply this rule retrospectively.

Commenter (6375) requests that a standard based on pivotal regulatory science that was not made publicly available, which has ongoing or upcoming economically significant costs, be subject to this rule. The commenter states that it would be inappropriate to reaffirm an existing standard without first reaffirming the underlying science. According to the commenter, if the underlying science was based on pivotal regulatory studies which have not been made publicly available, there would be no way to know if the standard was set correctly.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

10.2.5.2 Oppose Expanding the Scope to Prior Studies

Commenters (1008, 1011, 1012, 1281, 2006, 2426, 2477, 2876, 3971, 4595, 4838, 4931, 5165, 5170, 5172, 5181, 6109, 6114, 6116, 6120, 6126, 6133, 6361, 6362, 6373, 6447, 6449, 6868, 6875, 6895, 6905, 6925, 6935, 9224) oppose expanding the scope of the proposal with respect to prior studies and recommend that the rule only apply prospectively. Detailed comments supporting their positions are provided below.

10.2.5.2.1 Retrospective Implementation Would Lead to Significant Delays and Costs

Comment: Commenters (1008, 5181, 6895, 6935) assert that retrospective implementation could lead to delays and significant new costs that would lead to the EPA diverting substantial resources from its mission and a delay to the process of decision making. Commenter (6935) adds that, if previously implemented regulatory determinations were invalidated by a retrospective evaluation of the transparency in underlying scientific studies, then the investments made based on those regulatory decisions would be undermined. The commenter asserts that companies and their customers already will have made the investment to comply with a regulation and may have made corollary investments (e.g., if a regulation caused plant retirements and replacement generation is needed) that cannot be undone.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

10.2.5.2.2 Retroactive Application of the Proposed Rule is Not Practical

Comment: Commenters (1011, 2426, 4595, 6126, 6447, 6895) assert that retroactive application of this proposed rule to existing rules is not practical. Commenter (2426) states that the Proposal is infeasible considering the volume of significant environmental rules already in place and the

time and expertise it would take to reanalyze the technical and legal aspects of these rules while maintaining oversight of ongoing agency business. Commenter (6895) states that applying the proposed rule retroactively to health studies, potentially initiated decades ago, may be impossible.

Commenter (6126) states that EPA will not likely have the resources or capability to assess the entire suite of regulations and the evidence-base retrospectively. The commenter states that, for example, EPA is technically required to evaluate every regulation promulgated under the Resource Conservation and Recovery Act (RCRA) on a triennial basis; and recent research suggests that statutory requirement has been largely unfulfilled due to a lack of resources to comply with the decades-old mandate. The commenter asserts that, in the absence of a major influx of new resources, EPA would be unlikely to engage in such meaningful and transparent reviews while also complying with statutory obligations.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

10.2.5.2.3 Application of the Proposal to Prior Studies Would Dismiss Important Studies

Comment: Commenters (1011, 1281, 2477, 4838, 4931, 5172, 6109, 6114, 6126, 6868, 6895) recommend against applying the rule retrospectively because the outcome of such action would be to dismiss scientific studies and weaken the arguments that lay the foundation for public health protections.

Commenter (1011) states that it may not be possible for EPA to acquire and release, in a manner consistent with the proposed rule, the data generated from studies previously incorporated into the administrative record. The commenter asserts that omitting these data from the administrative record would unnecessarily weaken the body of evidence EPA can consider in its regulatory actions.

Commenter (2477) states that retroactively trying to apply even a reasonable open-science standard to research done before that was the norm and before funding agencies were providing funds to do the work to make data publicly accessible, is not sound science; retroactively applying the proposed requirements comes across as defining an ad hoc metric to allow people to ignore prior work with which they disagree. The commenter recommends using the best previous scientific studies we have while at the same time increasing funding so future studies can be more open, including funding replication studies of any past work that is in question and is critical to current policy.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific

information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. The final rule does not require EPA to obtain, store or publish the dose-response data underlying pivotal science.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science where the underlying dose-response data are not available in a manner sufficient for independent validation. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use these studies in significant regulatory actions and influential scientific information after either giving lesser consideration to the study or studies or if the Administrator grants an exemption under 40 CFR 30.7.

Comment: Commenters (4838, 4931, 5172, 6114, 6868) express concern that, if the proposed rule is applied retroactively, the EPA Administrator could reconsider regulations already in place, thereby allowing existing health protections to be revoked if the studies they were based upon are no longer allowed to be used by the EPA. Commenter (4931) states that, while significant progress in improving air quality has resulted from a number of federal, state, and local rules that were adopted over the years, the proposed rule runs the very real risk of reversing these gains, resulting in worse air and significant negative health effects.

Commenter (6868) expresses concern that EPA plans to apply the proposed requirements to rulemakings that are already in progress or recurring policy review – such as the periodic review of the NAAQS, potentially applying the proposed new data policy to current standards retroactively.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

10.2.5.2.4 Grandfathering of Prior Studies/Regulatory Actions

Comment: Commenters (1012, 2006, 4595, 5170, 6449, 6875, 9224) oppose applying the proposed requirements to prior studies and, instead, suggest exempting or grandfathering certain past studies and data. Commenter (2006) asserts that it is not fair or wise to disregard studies with important results by holding them to a standard that the scientists producing the studies could have no knowledge of at the time. Commenter (4595) states that all prior studies should be exempt from this rule, as many foundational studies regarding air quality and asthma and exposure to mercury and lead were conducted decades ago and many of these studies have been reanalyzed, reassessed and/or reproduced by other institutions and countries. Commenter (5170) states that grandfathering certain past studies and data would be similar to what EPA did for pesticides that EPA approved for use in the past that were approved under less current research

protocols and have continued to be “grandfathered in” for use. Commenter (6449) suggests that EPA grandfather existing analyses, unless being updated or challenged.

Commenters (6875, 9224) state that trying to apply this proposal to models, rules, and research that has already begun or has concluded would only serve to set current work back and complicate work already done. The commenters state that it makes sense to “grandfather” what has already been completed and to implement this rule in stages in order to not compromise or delay EPA’s work. Commenter (1012) states that regulatory actions that are based on administrative records from previous reviews should be excepted from the proposed rule to prevent introducing needless procedural hurdles into the EPA’s regulatory review process.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science where the underlying dose-response data are not available in a manner sufficient for independent validation. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use these studies in significant regulatory actions and influential scientific information after either giving lesser consideration to the study or studies or if the Administrator grants an exemption under 40 CFR 30.7.

10.2.5.2.5 Applying the Proposed Rule Retrospectively Could Lead to Regulatory Uncertainty/Litigation Risks/Legal Challenges

Comment: Commenters (4931, 5165, 5170, 6905, 6935) express concern that retrospective implementation could lead to significant regulatory uncertainty, litigation risks, and legal challenges. Commenters (4931, 5165) contend that retrospective implementation would call into question existing regulatory standards as well as the permits, state implementation plans and other decisions that are based on those standards. Commenter (6905) states that retrospective implementation presents increased litigation risk for states who rely on existing rules and standards set by the EPA. Commenter (5170) states that retroactive application of this proposed rule would make the Agency vulnerable to an onslaught of legal challenges.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

Comment: Commenters (6116, 6133, 6361) assert that retrospective application of the Proposal is not legally supportable.

Commenters (6116, 6361) state that it would be improper and contrary to the APA for EPA to reopen prior regulations for review due to alleged lack of transparency in past scientific studies.

Commenter (6133) states that the Proposal does not identify a single provision in a single statute that EPA administers, or any other federal law, that requires or even authorizes any final rule based on the Proposal to have retroactive effect. The commenter states that there has been no power conveyed by Congress in express terms to promulgate retroactive rules related to any element of the Proposal.

Commenter (6133) further states the Proposal ignores an entire body of case law that has considered and roundly rejected both retroactivity in rulemakings and limiting data that underlies rulemakings to “publicly available data.” The commenter states that the Supreme Court strongly disfavors retroactive application of rules:

"Retroactivity is not favored in the law. Thus, congressional enactments and administrative rules will not be construed to have retroactive effect unless their language requires this result. [] By the same principle, a statutory grant of legislative rulemaking authority will not, as a general matter, be understood to encompass the power to promulgate retroactive rules unless that power is conveyed by Congress in express terms. [] Even where some substantial justification for retroactive rulemaking is presented, courts should be reluctant to find such authority absent an express statutory grant." *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208–09 (1988) (internal citations omitted).

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

10.2.5.2.6 Conditional Support for Application of Proposed Rule to Retroactive Studies/Actions

Comment: Commenters (1011, 6141, 6151), while generally supporting a forward-looking approach for the rule, suggest that there may be circumstances in which EPA needs to re-address past regulatory decisions or rely on data previously submitted for a new decision-making activity.

Commenter (1011) states that EPA should avoid reviewing data previously incorporated into the administrative record unless new scientific data necessitates the review or EPA is periodically required to do so by law.

Commenter (6141) recommends that, instead of imposing an absolute ban on the use of past studies, EPA develop reasonable rules and guidelines on when EPA may consider these past studies in future rulemakings. The commenter states that one such situation where Agency guidance will be needed is for health-based standards (*e.g.*, NAAQS) that EPA set based on restricted data in past rulemakings but must review those standards in the future on a periodic basis.

Commenter (6151) states that, whether or how to implement the transparency rule should be considered on a case-by-case basis, recognizing the considerable challenges that will be faced.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science where the underlying dose-response data are not available in a manner sufficient for independent validation. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use these studies in significant regulatory actions and influential scientific information after either giving lesser consideration to the study or studies or if the Administrator grants an exemption under 40 CFR 30.7.

Comment: Commenters (2426, 6375) state that, for the most part, retroactive application is likely unnecessary. Commenters state that many of the EPA's significant rules have already been implemented and are on a statutorily mandated review cycle. Commenter (2426) states that, once the EPA solidifies the requirements of this proposed data transparency rule, they should commit to applying the new transparency standards to pivotal scientific studies, both old and new, that justify agency actions on rules as they are formally reviewed on their existing cycle. Commenter (2426) states that, in a separate analysis, the EPA should evaluate whether any rules that are not on a review cycle should be re-evaluated through the lens of this data transparency rule and the EPA should receive feedback on their determinations from the public and any applicable review boards or entities.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

Comment: Commenter (6356) states that, to the extent that future regulations rely on old data and/or dose-response relationships, then the proposed regulation should be transparent on both sets of information--the data and/or dose-response models must be available for review and

independent validation in the context of the new rulemaking. Commenter states that the information could not form the basis for a challenge of a standard or pollutant limitation that EPA promulgated prior to adoption of this final agency action.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science where the underlying dose-response data are not available in a manner sufficient for independent validation. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use these studies in significant regulatory actions and influential scientific information after either giving lesser consideration to the study or studies or if the Administrator grants an exemption under 40 CFR 30.7.

Comment: Commenter (3971) states that “looking backward” to rehash regulations that are already in place would be disruptive to the environmental sciences and would generate significant push-back from many stakeholders. The commenter suggests that, as EPA reviews the appropriateness and protectiveness of past regulations during their required re-evaluation process, EPA should do so under the guidelines of this “transparency” regulation.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information.

10.2.6 Application of the Rule to Specific EPA Programs

10.2.6.1 Application to Prior Reviews Under the NAAQS Program

Comment: Commenters (0555, 4882, 6102, 6857, 6921, 9243) support expanding the scope of the rule to include application to prior reviews under the NAAQS program.

Commenter (0555) states that for regulatory programs like the NAAQS that periodically review and update standards based on a record that has been built over decades, application of the proposed transparency and integrity procedures to that record, when feasible, could allow a broader group of experts access to pivotal regulatory science, including data, models, and assumptions. The commenter states that such review would be consistent with EPA’s statutory mandate for review under the CAA and allow EPA to make future decisions on better data.

Commenter (4882) states that NAAQS reviews need to use the most current, and rigorous standards, not carry forward less rigorous standards used in prior reviews. The commenter states

that, if no scientific information is publicly available in a manner suitable for independent validation, the last standard that did use scientific information meeting the requirements of this rule should be used until such time new information becomes available. According to the commenter, past poor decisions in setting standards should not be carried forward in new standards.

Commenter (6185) suggests that without clearly articulated and appropriate bounds, the Proposed Rule can restrict the scientific literature that is the basis for reviews of the NAAQS. The commenter adds that, along with the changes to the NAAQS review process outlined in EPA's May 9, 2018 "Back to Basics" memo³¹¹⁸ and the recent requirement that members of the CAA Science Advisory Committee and related panel members not receive any current EPA funding,³¹¹⁹ the Proposed Rule would constrain both the range of expertise and body of scientific literature that is available to be considered in these reviews, undermining the NAAQS.

Commenters (6102, 6857, 6921, 9243) assert that increased transparency is critically important in NAAQS rulemakings due to the magnitude of the potential impact of the rulemakings on public health and the economy.

Commenters (6857, 9243) state that transportation conformity review is an example of the need for transparency in regulatory science. The commenters state that, where appropriate, the EPA should consider science demonstrating the consequences of proposed NAAQS changes on other federal activities that promote public health and economic stability. The commenters state that a complete analysis of potential NAAQS revisions should include the effects of the potential for increased unemployment, reduced congestion relief and weakened public safety.

Response: The EPA agrees that the Agency's significant regulatory actions can potentially impact American lives and livelihoods. Because of this, the American people deserve environmental decisions and policies that are based on the best information, and only through transparency can the EPA truly demonstrate its commitment to the Agency's mission of protecting public health and the environment through sound policy decisions that are informed by robust scientific and technical research.

The EPA clarified in the final rule that this rulemaking is not intended to remedy a particular instance in which the EPA may have relied on a poor-quality study or a study for which the conclusions could not be independently validated. Rather, the rulemaking is intended to meet a broader, compelling public need for increased transparency in the EPA's decision-making.

³¹¹⁸ Memorandum from E. Scott Pruitt, EPA Administrator, to [EPA] Assistant Administrators, Subject: Back-to-Basics Process for Reviewing National Ambient Air Quality Standards (May 9, 2018). Available at <https://www.epa.gov/sites/production/files/2018-05/documents/image2018-05-09-173219.pdf> (accessed May 21, 2018).

³¹¹⁹ U.S. EPA, "Strengthening and Improving Membership on EPA Federal Advisory Committees," (Oct. 31, 2017). Available at [Memo October 31, 2017 from EPA Administrator Scott Pruitt, Strengthening and Improving Membership on EPA Federal Advisory Committees](#). [Link cited no longer worked and was replaced with a link to the cited source that works as of December 2020].

The final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science where the underlying dose-response data are not available in a manner sufficient for independent validation. In these cases, the EPA may still use these studies in significant regulatory actions and influential scientific information after either giving lesser consideration to the study or studies or if the Administrator grants an exemption under 40 CFR 30.7.

With this final rule, the EPA is including regulatory text in 40 CFR 30.3 stating that the statutes and regulations will control in the event of any conflicts and clarifying that the requirements in this final rule set the overarching structure and principles for science transparency in the EPA's significant regulatory actions and influential scientific information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes that the EPA administers.

Comment: Commenters (1012, 6116, 6133, 6356, 6362, 6379, 6868, 6925) oppose retroactive application of the rule to the NAAQS program.

Commenters (1012, 6925) assert that retroactive application of this proposed rule would open up a process that could undermine existing public health protections. Commenter (6925) disagrees with any retroactive application of this proposed rule that would result in a revisionist and scientifically invalid assessment of the NAAQS. Commenter (6925) states that epidemiological studies form an essential basis of our understanding of how air pollution impacts human health; stripping these studies from consideration would undermine EPA's ability to establish NAAQS that remain sufficiently protective of public health.

Commenters (1012, 6362) argue that retroactive application of this proposed rule would cause needless delays in the already beleaguered NAAQS review process. Commenter (6362) states that, because each NAAQS review under the CAA is based on a substantial amount of scientific and policy information used to inform EPA's determinations of appropriate levels for each standard, the retroactive application of this proposal to those administrative records would only serve to confuse, distress, and impede a NAAQS review process that is already severely

overburdened. Commenter (6362) states that, while it is unclear which administrative NAAQS records would be covered by the proposal, the proposal could potentially cover more than a decades' worth of NAAQS administrative records and scientific analyses.

Commenter (6356) states that prior regulations should not be affected by this rulemaking, even if EPA has not made their basis available for independent validation. The commenter states that EPA should explain, in the context of this rulemaking, that many environmental statutes, including but not limited to the CAA, contain anti-backsliding provisions regarding the relaxation of standards. The commenter states that courts have interpreted this CAA provision to mean that while EPA can revoke a NAAQS for a criteria pollutant, the non-backsliding provisions of the CAA prohibit the Agency from revoking regulatory requirements that were required for implementation of a prior standard.

Response: The final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

Comment: Commenters (6116, 6133) identify legal issues with retrospective application of the Proposal to the NAAQS program. Commenter (6133) states that the suggestion in the Proposal that EPA may invoke the Proposal's approach to review all prior health and scientific studies underlying the NAAQS is illegitimate, arbitrary and capricious, and contrary to caselaw. Commenter (6133) states that Bowen and its progeny do not permit agency rules to have retroactive effect to disallow health studies and regulatory science generated prior to, or relied upon by EPA prior to, adoption of any final rule based on the Proposal.

Response: The final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

Comment: Commenter (6379) urges EPA to avoid taking actions that would result in stranded costs of compliance with existing NAAQS and reduce ongoing regulatory certainty. The commenter states that companies have made and will continue to make investments in physical and operational changes in response to the existing NAAQS. The commenter states that any implementation of the Proposed Rule should ensure the certainty of these existing standards for states and businesses by applying only to future rules, if at all.

Response: The final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the

final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

Comment: Commenters (5165, 6362) suggest the rule be applied prospectively to the NAAQS program. Commenter (5165) states that the rule should not be applied to data and models underlying studies that have already been completed or are currently underway. Commenter (6362) recommends the final rule be applied prospectively in a manner that integrates its application within the periodic review schedule established for each criteria air pollutant.

Response: The final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule ; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. The provisions of this final rule apply to significant regulatory actions for which a proposed rule was published in the *Federal Register* after the effective date of the rule and influential scientific information submitted for peer review after the effective date of the rule.

10.2.6.2 Integrated Risk Information System (IRIS)

Comment: Commenters (4932, 6143, 6148, 6151, 6362, 6364, 6369, 6375, 6891, 6911) urge EPA to clearly apply the proposed requirements to risk evaluations performed in the Agency's IRIS program.

Commenters (6362, 6364, 6891) suggest EPA incorporate the requirements of the Transparency rule during the development of the IRIS process for a chemical rather than wait until the IRIS assessment is used to support a rulemaking. Commenter (6362) strongly recommends that the Agency apply the proposed rule to any IRIS assessment that could be used as the basis for significant regulation.

Commenter (6362) states that the IRIS Program has been plagued for years by its slow pace generating IRIS assessments and lack of scientific transparency and reproducibility and provides several examples where they contend that IRIS assessments failed to reflect best available science (see APPENDIX C of their comment letter for examples). The commenter suggests that in cases such as IRIS assessments, where the Agency has yet to articulate a periodic review schedule for updating scientific assessments dating back 10-20 years or longer, EPA should develop appropriate mechanisms for application of the rule.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. IRIS assessments are normally designated as influential scientific information.

This final rule applies prospectively to final significant regulatory actions and influential scientific information developed after the effective date of the final rule ; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

Comment: Commenter (6362) recommends that the Agency apply this rule to any IRIS assessment that could be used as the basis for significant regulation, including ethylene oxide. The commenter asserts that the final IRIS assessment for ethylene oxide, posted in December 2016, uses unsupportable and un-reviewed conservative risk assessment modeling.

Commenter (6362) provides that the IRIS assessment concludes that the one-in-a-million lifetime cancer risk value associated with exposure to ethylene oxide is less than 1 part per trillion (ppt). The commenter states that this value is far below both ethylene oxide background levels in the environment and ethylene oxide levels naturally converted from ethylene in humans through breathing. According to the commenter, this conclusion is not plausible and not scientifically supportable. The commenter contends that it is based on an inadequate evaluation of a body of evidence from human studies that include historical exposure levels to ethylene oxide that are far higher than current occupational exposure limits. The commenter states that other, more accurate data sources are available, and alternative scientific risk assessment modeling approaches could have been used, but the IRIS Program did not systematically integrate all the evidence. The commenter notes that public comments on the ethylene oxide IRIS assessment can be found in Docket No. EPA-HQ-ORD-2006-0756.

Commenter (6362) states that EPA's Scientific Advisory Board (SAB) 2007 review concluded that substantial revisions were needed to the draft IRIS assessment including:

- Acquiring and using individual data for modeling rather than grouping populations, which results in overly conservative estimated cancer risks.
- Considering using both linear and non-linear approaches to estimate cancer risk due to the distribution of and questionable association with certain cancer types; and
- Providing more transparency and correcting flaws associated with inappropriately grouping lymphohematopoietic cancers and combining genders for the dose-response analysis.

Commenter (6362) provides that meeting materials, including public comments, can be found at <https://yosemite.epa.gov/sab/sabproduct.nsf/MeetingCal/7E3E313F627541D78525711400470D01>.

Commenter (6362) asserts that they did not believe that the 2015 Science Advisory Board (SAB) Committee that reviewed the revised 2013 ethylene oxide draft IRIS assessment conducted an independent, unbiased review. Problems identified by the commenter included:

- Several SAB members made inaccurate public statements indicating industry produced scientific studies should be not be considered due to potential industry influence, although no evidence of biased data sponsored by industry was ever presented.
- SAB members did not understand new evidence-based medicine concepts regarding mutagenicity of cancer cells and the contribution of naturally occurring ethylene oxide in DeoxyriboNucleic Acid (DNA) repair mechanisms.
- The SAB recommended using epidemiology data sets with questionable or scientifically unsound characteristics to estimate cancer risk and rejected alternative data sets that are as or more robust than those selected.

Commenter (6362) notes that the EPA still did not use individual data for modeling as recommended by the SAB in 2007 and did not adequately explore alternatives to the linear low dose modeling approach. The commenter provides that meeting materials, including public comments, can be found at <https://yosemite.epa.gov/sab/sabproduct.nsf/MeetingCal/17F305EC43EB1A6585257E2D0050255F>.

Commenter (6362) states that the IRIS Program used a spline approach (piecewise linear model that was not presented during either SAB review) for exposure-response analyses for each of the lymphoid and breast cancer endpoints and ultimately combined the results. According to the commenter, this approach results in higher risk at lower exposure levels and leads to proposed regulatory levels that are orders of magnitude lower than what the epidemiologic and genotoxicity scientific evidence would support.

Further, commenter (6362) asserts that the IRIS Program did not fully consider all available evidence in finalizing the ethylene oxide assessment. According to the commenter, scientific evidence clearly indicates that ethylene oxide is a weak mutagen and a unit risk factor of less than 1 ppt is not realistic or reliably measurable and is orders of magnitude lower than levels of ethylene oxide in ambient air and the normal, endogenous levels of ethylene oxide present in human bodies. Moreover, the commenter contends that the assessment fails to consider the difference between exposures to ethylene oxide produced outside the human body and exposure to ethylene oxide produced within the human body as a normal metabolic product.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. IRIS assessments are normally designated as influential scientific information.

This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

The EPA would like to emphasize that the final rule is not intended to remedy a particular instance in which the EPA may have relied on a poor-quality study or a study for which the conclusions could not be independently validated. Rather, the rulemaking is intended to meet a broader, compelling public need for increased transparency in the EPA's decision-making.

Comment: Commenter (6362) recommends that the Agency apply this rule to any IRIS assessment that could be used as the basis for significant regulation, including 1,2,3-Trimethylbenzene (TMBs). The commenter asserts that, in its review of TMBs, the EPA fell far short in meeting its obligations to improve its IRIS processes and assessment reports. The commenter adds that EPA failed to respond to public comments on the draft TMBs assessment, even though the IRIS process for developing assessments explicitly includes a response to comments element and that EPA failed to rely on available guideline studies on commercial complex C9 aromatic mixtures that industry conducted under EPA's TSCA program. According to the commenter, guideline studies on the commercial complex of aromatic mixtures are highly relevant to assessing the toxicology of TMBs. The commenter provides that EPA's Office of Pesticide Programs (OPP) has also reviewed the toxicology of TMBs and determined that the health effects of TMBs can be efficiently assessed by relying on C9 aromatic mixture studies. The commenter notes that OPP reached different scientific conclusions, including different quantitative health effect numbers, than that of EPA's IRIS Program. The commenter states that EPA, however, did not resolve these differences during the IRIS assessment of TMBs.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. IRIS assessments are normally designated as influential scientific information.

This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

The EPA would like to emphasize that the final rule is not intended to remedy a particular instance in which the EPA may have relied on a poor-quality study or a study for which the conclusions could not be independently validated. Rather, the rulemaking is intended to meet a broader, compelling public need for increased transparency in the EPA's decision-making.

Comment: Commenter (6364) urges EPA to apply the Transparency Rule to the IRIS program from the time any public announcement is made concerning development of a compound-specific assessment through the publication of a final assessment. The commenter states that significant regulatory decisions that incorporate an IRIS analysis can take place at any time, and those proceedings may or may not provide adequate opportunities to evaluate the quality of the IRIS assessment itself. According to the commenter, applying the Transparency Rule throughout

the development process will help ensure that IRIS documents are scientifically sound and balanced, because IRIS assessments “provide a critical part of the scientific foundation” for EPA decision-making.

Commenter (6891) states that supplying the underlying data/models during the IRIS process and providing sufficient opportunity to the public to comment and participate in the process is far preferable to waiting until those reference doses are employed in a later significant rulemaking, which could occur years or decades later.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. IRIS assessments are normally designated as influential scientific information.

This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created.

Comment: Commenters (6151, 6364) note that EPA views IRIS assessments as “the preferred source of toxicity information used by [the agency],” and are used in “set[ting] national standards and clean[ing] up hazardous sites.” Commenter (6364) states that, because the development of risk assessments through the IRIS Program is a vital component of the rulemaking process, EPA should expressly include in the final Transparency Rule the publication of the underlying IRIS assessment data as a regular and early step in the development of IRIS assessments. Commenter (6891) states that, in the IRIS assessment process, EPA may develop reference concentrations or reference doses that will be critical for later rulemakings regarding those chemicals.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. IRIS assessments are normally designated as influential scientific information.

This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information.

Comment: Commenters (6151, 6364) express concern over a lack of transparency in the IRIS program. Commenter (6151) states that, despite recent agency efforts, the lack of full

transparency in the IRIS program's development of toxicity values, as well as the inability to independently reproduce some of those values, continue to present obstacles to ensuring sound and balanced scientific decisions.

Commenter (6364) states that extending the Transparency Rule to IRIS assessments is particularly appropriate in light of the long history of criticism of the IRIS program from the U.S. Government Accountability Office (GAO), the National Academy of Sciences (NAS) and other expert bodies. The commenter states that the IRIS Program's most recent Report to Congress touts the benefits of making information pertaining to assessments available for public comment "earlier in the assessment development process" and advances the goal of developing systematic review methods that ensure reproducibility.³¹²⁰ The commenter asserts that providing public access to the science and methods relied upon in IRIS assessments meaningfully advances this agenda.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. IRIS assessments are normally designated as influential scientific information.

This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information.

Comment: Commenters (6369, 6911) state that EPA's formaldehyde assessment illustrates why application of appropriate scientifically based exposure-response modelling and transparency in the use of science by the Agency is so important. Commenter (6369) states that, using data obtained from the National Cancer Institute (NCI)^{3121,3122,3123}, in combination with data provided in the draft 2010 IRIS assessment for formaldehyde,³¹²⁴ further detailed analyses were conducted to validate pivotal scientific findings used by EPA's IRIS program to draw

conclusions. Commenter (6369) states that the results have been found to disagree with the original study findings and/or the findings cannot be replicated due to methodological issues.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. IRIS assessments are normally designated as influential scientific information.

This final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule; the final rule has no retrospective effect on either final significant regulatory actions or influential scientific information.

The EPA would like to emphasize that the final rule is not intended to remedy a particular instance in which the EPA may have relied on a poor-quality study or a study for which the conclusions could not be independently validated. Rather, the rulemaking is intended to meet a broader, compelling public need for increased transparency in the EPA's decision-making.

Comment: Commenter (4932) recommends that EPA alter the definition of "regulatory decisions" to include Agency "rules," in addition to regulations, to make the Transparency Proposal fully consistent with Executive Order 12866. The commenter asserts that the adoption of this proposed change would ensure that the Transparency Proposal applies to the derivation of all inhalation reference concentrations, reference doses, oral slope factors, and inhalation unit risk values as part of EPA's IRIS program. The commenter states that EPA's IRIS values are not typically thought of as regulations and better fit the definition of a rule. According to the commenter, as the Transparency Proposal appears to have been intended to apply to derivation of reference values by virtue of the definition of "dose response data and models," EPA should eliminate any potential confusion about the application of the Transparency Proposal to derivation of IRIS values by making such applicability explicit.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. IRIS assessments are normally designated as influential scientific information.

10.2.6.3 Toxic Substances Control Act (TSCA)

Comment: Commenters (6112, 6115, 6143, 9227) recommend that the Proposal's requirements apply to risk evaluations performed under section 6(b) of TSCA.

Commenter (9227) objects to the Proposal in part because, as drafted, it will not apply to EPA's New Chemicals Review Program under TSCA. The commenter states that EPA has effectively exempted the TSCA new chemicals program where industry seeks expeditious actions allowing

market access and EPA regularly fails to disclose its own analyses and the studies and materials supporting those decisions, much less any underlying data. The commenter states that, in these proceedings industry seeks affirmative authorization from EPA to commercialize chemicals, so industry has a vested interest in expeditious government action. The commenter asserts that EPA's exclusion of the new chemicals program clearly favors industry, allowing industry to conceal information and evade regulation. According to the commenter, the EPA cannot rationally impose stringent new disclosure requirements that exclude extensive peer-reviewed, high-quality studies in some contexts while simultaneously authorizing the commercial distribution of new chemicals with almost no disclosure and no peer-review.

Moreover, commenter (9227) states that the New Chemicals Program is more opaque than the rulemakings EPA is currently targeting with its Proposal, often in direct violation of law. The commenter provides that the EPA does not make the public files for new chemicals electronically available, and when a person does obtain a copy of the public file from EPA, the files generally reveal almost none of EPA's analyses supporting its decisions or the information submitted to support those decisions, with massive amounts of data redacted or concealed as CBI. The commenter asserts that, if EPA extended the rule articulated in proposed §30.5 to the new chemicals program, it would seem that EPA would either have to make much of the information in the public files available or EPA would be precluded from using this information. Without this information, EPA generally would not be able to find that the new chemical "is not likely to present an unreasonable risk of injury to health or the environment," the finding that allows unregulated manufacture of the chemical. Thus, excluding the information would require EPA to regulate the new chemicals before they could enter the market.

Commenter (6143) specifically urges the EPA to clarify that the proposed requirements will also apply to risk evaluations performed under section 6(b) of TSCA, and to assessments performed by the Agency's IRIS Program.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the rulemaking to include influential scientific information. Based on a consideration of public comments on the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. *Influential scientific information* means scientific information the Agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions.

As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation.

With this final rule, the EPA is including regulatory text in 40 CFR 30.3 stating that the statutes and regulations will control in the event of any conflicts, and clarifying that the requirements in this final rule set the overarching structure and principles for science transparency in the EPA's

significant regulatory actions and influential scientific information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes that the EPA administers.

10.2.6.4 Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and Resource Conservation and Recovery Act (RCRA)

Comment: Commenter (6365) states that the language in the regulatory proposal should be read to apply EPA's proposed scientific transparency policy to CERCLA remedial action levels and RCRA corrective actions. According to the commenter, however, for clarity, in the final rule EPA should expressly state that its scientific transparency policy applies to the process of setting CERCLA remedial action levels and in establishing RCRA corrective actions. The commenter asserts that this clarification will provide certainty to potentially responsible parties and agency officials as they undertake these processes, including assessing risk and considering remedial alternatives.

Response: With this final rule, the EPA is including regulatory text in 40 CFR 30.3 stating that the statutes and regulations will control in the event of any conflicts, and clarifying that the requirements in this final rule set the overarching structure and principles for science transparency in the EPA's significant regulatory actions and influential scientific information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

10.2.6.5 Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and Federal Food, Drug, and Cosmetic Act (FFDCA)

Comment: Commenters (6363, 6374) argue that the proposed rule requirements should not apply to pesticide registration decisions under FIFRA, and tolerance setting under FFDCA. These commenters assert that EPA pesticide product registration actions are not "significant regulatory actions" that meet the definition of "significant regulatory action" as set forth in Executive Order 12866/OMB).

Commenters (6263, 6374) state that EPA needs to ensure compliance with the statutory framework established by Congress to carefully balance the requirements of public notice and transparency (which are accomplished through several statutory provisions under FIFRA and FFDCA) with the need to incentivize pesticide product innovation through the protection of proprietary data rights (also accomplished through specific provisions of FIFRA and FFDCA).

Response: With this final rule, the EPA is maintaining language in 40 CFR 30.3 stating that the statutes and regulations will control in the event of any conflicts, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for science transparency in the EPA's final significant regulatory actions and influential scientific

information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

10.2.6.6 CWA

Comment: Commenter (5181) states that application of the proposed requirements to individual permit actions under the CWA would be inconsistent with sound and timely authorizations under the §404 dredge and fill permit program. The commenter states that proposed requirements that would subject all data to identical requirements regarding data collection, evaluation, and release would interfere with the permitting process and would undermine the accuracy of individual permit decisions that rely on non-peer reviewed information.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are focused on individual regulated entities.

Comment: Commenters (6180, 6362, 6891) favor application of the transparency requirements in specific CWA programs. Commenter (6180) states that National Pollutant Discharge Elimination System (NPDES) permit proceedings (and related water quality standards TMDL decisions have potentially long-lasting, widespread, and costly implications for permittees and therefore should not be excluded from this rule as they meet the requirements of pivotal regulatory science. Commenter (6362) states that each of those decisions requires analyzing complex environmental/engineering data on a case-specific basis.

Commenter (6180) supports application of the Proposed Rule to technical CWA criteria development and related NPDES permitting activities, including the derivation and imposition of NPDES permit limits, TMDLs, and water quality standards (WQS). The commenter provides that these legally binding NPDES permits, often driven by WQS and TMDLs, include effluent limits for wastewater treatment facilities for pollutants such as lead, mercury, or phosphorus. According to the commenter, slight alterations in these permit limits can cost a single wastewater facility tens of millions of dollars, the cost of which is eventually passed on to individual local rate payers. The commenter notes that these permit limits are supposed to be derived in a manner similar to dose-response relationships, as mentioned in the Proposed Rule, where, for example, a lower level of a pollutant in the discharge will result in a measurable improvement in receiving water quality or human health. As such, the commenter asserts that these criteria development and permitting activities fall under the Proposed Rule's scope and definition of "pivotal regulatory science." The commenter expresses that they are aware of numerous instances throughout the country where environmental agencies have (1) based regulations on outdated science, or (2) refused to consider available data or studies which indicate stringent permit limits imposed by these agencies are not anticipated to result in any quantifiable environmental or

human health benefit despite disproportionately high costs. (The commenter refers to Attachment 1 of their comment letter – March 20, 2013 House Letter³¹²⁵). The commenter suggests that expanding the Proposed Rule to CWA criteria development would remedy shortcomings by applying, at a minimum, to the following:

- Water quality criteria derivation and interpretation, particularly for narrative nutrient criteria
- Impairment listing determinations
- NPDES permit limit derivations
- Statistical methods used to claim ecological significance

Commenter (6891) states that, under the Proposed Rule, they are concerned that the EPA's water quality criteria would not be covered as they are not considered "regulations." The commenter asserts that the federal water quality criteria are important because they initiate a chain of actions that ultimately result in water quality-based effluent limits (WQBELs). The commenter provides that EPA requires states and tribes to consider the federal water quality criteria during triennial review of their own water quality standards and they often form the basis of those standard and that these state and tribe standards, in turn, are incorporated into the wastewater discharge permits. The commenter expresses concern that they have not been able to adequately comment on EPA's draft water quality criteria because some of the key data or models justifying them were not provided. The commenter provides several recent examples of draft water quality criteria where some of the necessary underlying data and models were not provided for review (e.g., Draft Aquatic Life Ambient Water Quality Criteria for Aluminum, Draft Aquatic Life Ambient Estuarine/Marine Water Quality Criteria for Copper, Draft Updated National Recommended Water Quality Criteria for the Protection of Human Health (Notice of Availability)).

Response: With this final rule, the EPA is including regulatory text in 40 CFR 30.3 stating that the statutes and regulations will control in the event of any conflicts, and clarifying that the requirements in this final rule set the overarching structure and principles for science transparency in the EPA's significant regulatory actions and influential scientific information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

10.2.6.7 Endangerment Finding

Comment: Commenter (6137) states that the proposed procedures cannot lawfully or rationally be required in the context of EPA decisions to abate "imminent and substantial endangerments" ("ISEs") to human health and the environment. See, e.g., 42 U.S.C. §§ 300(i)(a) (SDWA § 1431(a)), 6973(a) (RCRA § 7003(a)), 7603 (CAA § 303), and 9606(a) (CERCLA § 106(a)). The commenter states that none of these provisions set or authorize limitations on the studies that can

³¹²⁵ Letter to U.S. House Representatives from John C. Hall & Associates. Re: EPA's Use of Scientifically Flawed Methods for Imposing Nutrient Reduction Requirements Is Poised to Waste Billions in State, Municipal and Agricultural Resources Throughout the Country. March 20, 2013.

be relied upon in identifying ISEs. The commenter states that, to the contrary, both courts and the EPA have interpreted these statutes as precautionary in nature, allowing abatement action where there is only a risk of harm. *See, e.g.,* EPA, Guidance On the Use of Section 303 of the CAA, EPA-R08-OAR-2013-0556-0015, at 2-4 (1991) (“Section 303 Guidance”); *see also United States v. Vertac Chemical Corp.*, 453 F.3d 1031, 1045 (8th Cir. 2006) (describing § 9606(a)’s ISE standard as “cautionary” in sanctioning EPA’s decision to issue a unilateral administrative order requiring cleanup of former manufacturing site).

Response: As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation.

With this final rule, the EPA is including regulatory text in 40 CFR 30.3 stating that the statutes and regulations will control in the event of any conflicts, and clarifying that the requirements in this final rule set the overarching structure and principles for science transparency in the EPA’s significant regulatory actions and influential scientific information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

10.2.7 Application of the Rule to a Limited and Special Class of Laboratory Samples

Comment: Commenter (6143) suggests that the EPA apply the proposed requirements to a limited and special class of laboratory samples, the analytical results of which (from non-destructive testing) may become an essential element of the research that underpins a given regulation. The commenter states that, not only can different laboratory analysts reach different conclusions by analyzing the same sample, it is common for analytical methods to improve over time. The commenter notes that improved analytical methods provide researchers with the opportunity to re-analyze properly archived samples, potentially yielding more accurate and even different results. The commenter notes that it should become part of the researchers’ protocol to retain and properly archive this special class of samples when the analytical results are likely to inform or inspire the regulatory process. The commenter states that is particularly true for research conducted by or for EPA and its contractors; and by any party conducting research with the intent to inform or inspire a specific regulatory action. (While it is true that certain types of samples cannot be retained because they are inherently unstable chemically and/or physically, other types of samples can remain stable for decades when properly archived.)

Response: The EPA does not agree that this rulemaking should apply to physical objects, and the provisions of final rule do not apply to physical objects (like laboratory samples). Physical objects like lab samples often have a shelf-life, are not permanent nor is it practical to retain physical objects for a lengthy period of time, which then makes it unreasonable for the

provisions of this rule to apply. The provisions of the final rule also do not apply to drafts, and preliminary analyses, and influential scientific information and/or pivotal science that meet one or more of the exemptions identified in Section IX of the OMB Final Information Quality Bulletin for Peer Review.

10.3 Narrowing the Scope of Applicability of the Rule

10.3.1 Narrowing the Scope of the Applicability of the Rule

Comment: Commenters (5181, 6099, 6449, 6155) express support for narrowing the scope of the applicability of the rule.

Commenter (5181) requests that, in their support for narrowing the applicability of the rule, EPA define a more specific category of decisions that would demand the level of public access to data defined by this rule, and more fully explain how the benefit of greater public access to raw data justifies the cost of implementation.

Commenter (6155) supports limiting the scope of the proposed rule to "dose response data and models" as defined in §30.2 of the proposed rule.

Commenter (6449) recommends that, since the "significant regulatory action" threshold of \$100M was established by Congress in 1996, the threshold that would apply to this regulation should be adjusted to current and/or future year dollars, as appropriate.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the 2018 proposed rulemaking in two ways: (1) expanding "dose-response data and models" to "data and models," and (2) including influential scientific information. As EPA noted in the 2020 SNPRM, transparency of EPA's science should not be limited to dose-response data and dose-response models, because other types of data and models can also drive the requirements and/or quantitative analysis of EPA final significant regulatory actions and influential scientific information. Based on the comments on the 2018 proposed rule and the 2020 SNPRM, including that the number of studies that would be subject to the rule might hinder rulemaking, the EPA determined that the Agency should pursue an incremental approach to maximizing transparency in the science that it relies upon by focusing the final rule requirements on dose-response data and, in particular, only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs).

The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The provisions of the final rule apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science. *Significant regulatory actions* means final regulations determined to be "significant regulatory actions" by the OMB pursuant to Executive Order 12866. The Agency will continue to follow the \$100M economic impact consideration found in the Executive Order.

Finally, as defined in Part 30.2 of the final rule, the Agency has narrowed the definition of data. *Data* means the set of recorded factual material commonly accepted in the scientific community as necessary to validate research findings in which obvious errors, such as keystroke or coding errors, have been removed and that is capable of being analyzed by either the original researcher or an independent party. This stage of data is not raw data. In addition, this is a rule of internal procedure that does not impose requirements (such as the provision of data) on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information.

10.3.2 Limiting to “Major” Issues Under the Congressional Review Act or “Economically Signification” Actions Under Executive Order 12866

Comment: Commenters (2426, 6099, 6149, 6449) support limiting coverage of this regulation to “major” issues under the Congressional Review Act (CRA) or “economically significant” under Executive Order 12866. Commenter (2426) contends that this will better ensure timely regulatory action, as well as balance the need for confidentiality with regulatory transparency. The commenter states that regulatory actions outside of this scope (e.g., site-specific permitting actions) may still impact the public, though the impact is much less than that of major or economically significant rules.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. For this rule, “significant regulatory actions” means final regulations determined to be “significant regulatory actions” under Executive Order. 12866.

The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

Comment: Commenters (6102, 6362) state that narrowing the definition to only “major” issues under the CRA or “economically significant” under Executive Order 12866 would omit rulemakings that could significantly impact specific sectors or industries, or that could have significant precedential impact. Commenter (6362) asserts that either of these approaches would lose the efficiency and predictability benefits of using the Executive Order 12866 definition—and would increase work for both EPA and Office of Information and Regulatory Affairs (OIRA).

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. For this rule, “significant regulatory actions” means final regulations determined to be “significant regulatory actions” under E.O. 12866.

Comment: Commenters (5181, 6144) request clarification of, and distinction between, “major” issues under the CRA, and “economically significant” under Executive Order 12866.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. For this rule, “significant regulatory actions” means final regulations determined to be “significant regulatory actions” under E.O. 12866. The Agency believes the scope of the final rule is appropriate as the Agency makes incremental progress towards its transparency goals.

10.3.3 CAA

Comment: Commenters (6155, 6179) suggest that EPA more narrowly focus the final rulemaking on improving transparency in the use of dose-response studies that establish regulations under the CAA. Commenter (6155) states that two important uses of dose response studies are to help determine NAAQS levels and which hazardous air pollutants to regulate under the CAA. Commenter (6179) states that air regulations are the most likely to incur substantial costs and benefits and are therefore most appropriate for the Proposal’s high standard of robustness.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The provisions of the final rule apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science.

With this final rule, the EPA is including regulatory text in 40 CFR 30.3 stating that the statutes and regulations will control in the event of any conflicts, and clarifying that the requirements in this final rule set the overarching structure and principles for science transparency in the EPA’s significant regulatory actions and influential scientific information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

10.3.4 Other Comments on Narrowing the Scope of Applicability of the Rule

Comment: Commenter (6924) states that EPA should not implement this proposal for any Agency decision, whether major or minor. The commenter asserts that doing so would hinder scientific inquiry and lead to inaccurate results.

Response: As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation. The EPA does not believe that this final approach will hinder scientific inquiry or lead to inaccurate results.

Comment: Commenter (6955) asserts that, if the rule were narrowed to apply only to studies funded by the US government and to studies funded by stakeholders participating in regulation, it would be an improvement, but, then, the public access part of the proposed rule would be largely moot, given current Freedom of Information Act (FOIA) access.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The provisions of the final rule apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

Finally, as stated in the preamble to the final rule, in part, the purpose of this final rule is to consider the availability of the underlying dose-response data in pivotal science. When this information is available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Making underlying dose-response data available is not a waste of time. Besides, for pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.9.

10.4 Changes in the Scope of the Science Subject to the Rule

Comment: Commenter (6867) states that the replication crisis and public confidence rationales that underlie the Proposed Rule suggest that data, methodology, and computational code should be disclosed for all science relied upon to support agency actions. The commenter suggests, as a first step, the phrase “dose response data and models” should be replaced with “data and models, including dose response data and models” throughout the Proposed Rule. Commenter (6891) suggests that data and models provided should include all supporting quality assurance/quality control data and be accompanied with adequate explanatory materials so that the public can readily understand all models and all inputs and formulas to the models.

Commenter (4882) requests that the disclosure requirements in this rule should be applied to information from environmental impact studies, models used to predict cost/benefit analysis, and environmental effects.

Response: Based on a consideration of these and other similar comments, the EPA proposed, through a 2020 SNPRM, to expand the scope of the 2018 proposed rulemaking in two ways: (1) expanding “dose-response data and models” to “data and models,” and (2) including influential

scientific information. As EPA noted in the 2020 SNPRM, transparency of EPA's science should not be limited to dose-response data and dose-response models, because other types of data and models can also drive the requirements and/or quantitative analysis of EPA significant regulatory actions and influential scientific information.

Based on the comments on the 2018 proposed rule and the 2020 SNPRM, including that the number of studies that would be subject to the rule might hinder rulemaking, the EPA determined that the Agency should pursue an incremental approach to maximizing transparency in the science that it relies upon by focusing the final rule requirements on dose-response data and, in particular, only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs).

The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The provisions of the final rule apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.

And as defined in Part 30.2 of the final rule, *Data* means the set of recorded factual material commonly accepted in the scientific community as necessary to validate research findings in which obvious errors, such as keystroke or coding errors, have been removed and that is capable of being analyzed by either the original researcher or an independent party. Depending on the data in question, this may or may not include QA/QC information as well as other explanatory information.

The EPA would also like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

10.5 Scope – Phase-In

10.5.1 Proposed Rule Does Not Provide for Any Phase-In Time

Comment: Commenter (6188) provides that the Proposed Rule would be effective immediately upon adoption, rather than including any sort of implementation schedule that recognizes the significant practical challenges of applying the rule. According to the commenter, putting the Proposed Rule into practice would mean that EPA would need to gather and make available enormous amounts of data, requiring the Agency not only to acquire that data, but also to devise a system to manage it; secure its storage; appropriately redact data; ensure data subject to Health Insurance Portability and Accountability Act (HIPAA) and other privacy laws or otherwise considered to be confidential is not disclosed; and implement “feasibility” exemptions to the rule. The commenter complains that the Proposed Rule does not provide for any phase-in time to establish the complicated procedures that will be necessary, meaning that any ongoing or planned rulemaking processes will be stalled or thwarted upon the rule's adoption as EPA

struggles to take practical steps towards rule implementation. The commenter contends that this would not only stymie necessary regulation, but would also, as discussed above, leave the scientific community in the dark as it attempts to design and carry out studies to provide high quality information EPA can use to make informed decisions.

Response: The EPA does not find that a phase-in approach for implementing the final rule is necessary because of the limited application of this rule to pivotal science underlying significant regulatory actions and influential scientific information. The EPA would also like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

The EPA disagrees with commenters that requirements of the final rule will result in any meaningful delay in promulgating regulations.

10.5.2 Support Phasing-In of Transparency Requirements

Comment: Commenters (6875, 9224) support EPA seeking to phase-in transparency requirements, regardless of the strategy used. The commenters provide that the scientific community has just recently begun data access requirements. The commenters assert that, while the scientific community has been moving towards the idea of “open science”, the policies are still new and phasing in requirements would give the scientific community sufficient time to respond and prepare for the implications of this rule. The commenters recommend that EPA ensure that there are explicit and clear milestones to be achieved throughout the process.

Commenter (6955) suggests that if the rulemaking goes forward, EPA should limit the first introduction to a single regulatory proceeding, as an experiment.

Commenter (6126) suggests that in lieu of a regulatory approach to changing scientific transparency practices at EPA, the Agency could begin with a targeted voluntary pilot effort that aims to address open scientific activities in a thoughtful, intentional manner. The commenter states that such a pilot could also enable the agency to better assess implications for individual programs, costs of implementation, and whether the anticipated benefits are realized relative to the activities described in the proposed rule.

Commenter (6448) recommends that the effective date of this regulation reflect significant phase-in times commensurate with the timeframes of the impacted regulatory actions.

Response: The EPA does not find that a phase-in approach for implementing the final rule is necessary because of the limited application of this rule to pivotal science underlying significant regulatory actions and influential scientific information. The EPA would also like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

10.5.3 Conditional Phase-In Implementation Recommendations

Comment: Commenter (0068) notes that if the Agency decides to impose a requirement that dose-response and similar data on which regulatory science is based be made “publicly available in a manner sufficient for independent validation,” this requirement should apply only to new data developed after some future date, and only after the Agency has clearly demonstrated that safe and effective methods exist to anonymize sensitive personal data in epidemiological and other studies. According to the commenter, failing to impose such limitations would have the effect of discarding decades of excellent (and expensive) peer-reviewed science on which the agency has depended for years to protect the health and welfare of all Americans. For example, the commenter states that meta-analyses such as those used to determine the odds ratios for the effect of maternal smoking on lower respiratory illnesses during infancy can rely on scores of studies that cover decades.

Commenter (2171) recommends that, given that the proposed rule offers no instruction on how “independent validation” would be conducted, existing EPA programs evaluating human health studies should continue under current practices until such time as implementation elements are completed, including providing sufficient funding for developing open access to databases, establishing guidance as to how and when EPA is to assess or use unsupervised validation studies submitted by the public, as well as determining and resolving public and nonpublic data issues (securing permissions if necessary).

Commenter (2426) suggests that, once the EPA solidifies the requirements of the data transparency rule, EPA should commit to applying the new transparency standards to pivotal scientific studies, both old and new, that justify agency actions on rules as they are formally reviewed on their existing cycle. In a separate analysis, the commenter recommends that the EPA evaluate whether any rules that are not on a review cycle should be re-evaluated through the lens of this data transparency rule and receive feedback on their determinations from the public and any applicable review boards or entities. The commenter suggests that EPA consider using an upcoming major or significant rule-making as a test case to help solidify how the intent of the data transparency rule could be thoughtfully implemented before phasing in the final data transparency rule. According to the commenter, because the proposed data transparency rule offers limited implementation details, it is difficult to provide meaningful comment on the potential intentional and unintentional consequences of its enactment. The commenter provides that, rather than promulgate an untested final rule that could potentially impact all agency actions, the EPA should consider choosing a major upcoming rule-making as a test case. According to the commenter, ideally, the test case would help sketch out more specific guidelines for data transparency rule implementation that could then be vetted with an external, cross-disciplinary work group and provided for public review and comment.

Commenter (6360) believes that that requirements of this rule can be implemented immediately if the scope and applicability are defined appropriately. However, the commenter acknowledges that there could be practical considerations that could make this infeasible. The commenter recommends that criteria be employed during the transition period to full EPA compliance to address past instances of non-transparency consistent with existing law and policy.

Commenter (6375) states that the proposed rule should apply to all significant regulatory actions promulgated after the effective date of the rule. According to the commenter, if a phase-in is desired, another approach would be to prioritize implementation of this rule for any significant regulatory actions related to establishment, review, and/or revision of NAAQS. Subsequently, the commenter states that the Agency could then apply this to other programs on a set schedule laid out in the final rule.

Commenter (6356) notes that, if this proposed rule is adopted, a less acceptable alternative would be to phase the rule's requirements in over the next ten years. The commenter provides, however, that the phase-in cannot be based on a rule's regulatory impact assessment because a rule's cost is generally not known until a final rule is adopted based on cost-benefit studies done after the basis for a regulation has been generated.

Response: The final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule. The provisions of the final rule apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science where the underlying dose-response data are not available in a manner sufficient for independent validation. In these cases, the EPA may still use these studies in significant regulatory actions and influential scientific information after either giving lesser consideration to the study or studies or if the Administrator grants an exemption under 40 CFR 30.7.

The EPA does not find that a phase-in approach for implementing the final rule is necessary because of the limited application of this rule to pivotal science underlying significant regulatory actions and influential scientific information. The EPA would also like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

10.5.4 Implement Existing Guidance More Fully Before Considering Phasing-In of Rule

Comment: Commenter (6126) recommends that EPA seek to implement its existing guidance more fully to encourage open data and data availability using administrative means and policy guidance as a logical first step before considering phasing-in of the rule. The commenter suggests that EPA could pilot an opportunity for a targeted statutory area at the Agency to develop the practices and protocols for voluntary submission of relevant de-identified data that fulfill the stated intent of the rule. The commenter provides that, importantly, this would include

developing the protocols, practices, and infrastructure needed to fulfill the expectations for privacy and confidentiality protections. The commenter states that the EPA should first identify how to implement these aspects of the proposed rule before specifically connecting the use of those data or availability of data to the decision-making process.

Response: The EPA does not find that a phase-in approach for implementing the final rule is necessary because of the limited application of this rule to pivotal science underlying significant regulatory actions and influential scientific information. The EPA would also like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

The EPA also disagrees that existing guidance needs to be implemented before proceeding with the final rule. The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. For example, in 2002 the Office of Management and Budget (OMB) released its *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies*, which includes discussion of the importance of the reproducibility of analyses underlying influential information. The EPA's 2016 *Plan to Increase Access to Results of EPA-Funded Scientific Research* noted that "transparency is a core EPA value" and that increased availability of research data would accelerate scientific breakthroughs that support the Agency's mission and policymaking efforts. The EPA's *Open Government Plan 5.0* also details the EPA's progress in implementing the tenets of the numerous data transparency initiatives in the federal government prior to 2018, including the OMB M-10-06, the Office of Science and Technology Policy Memorandum of February 22, 2013, and OMB M-13-13. In 2019, Congress passed the Foundations for Evidence-Based Policymaking Act of 2018 (or OPEN Government Data Act, Pub. L. 115-435) into law, which included requirements for federal agencies to prioritize making their data available to the public, and OMB has released additional guidance for implementing the act.

10.5.5 Phase-In for Use of Past Studies Lacking in Sufficient Transparency

Comment: Commenter (6141) requests that, instead of imposing an absolute ban on the use of past studies that are lacking in sufficient transparency in all cases, EPA develop reasonable rules and guidelines on when EPA may consider these past studies in future rulemakings. The commenter states that one such situation where such careful Agency guidance will be needed is those health-based standards (*e.g.*, NAAQS) that EPA set based on restricted data in past rulemakings but must review those standards in the future on a periodic basis. In the case of such requirements, the commenter suggests that it may be appropriate for EPA to apply a phase-in of the transparency rules or establish a future effective date that would not require the transparency rules to apply until after the completion of the current five-year review cycle of the NAAQS for each criteria pollutant.

Response: As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation. The EPA acknowledges that there may be pivotal science where the underlying dose-response data are not available in a manner sufficient for independent validation. In these cases, the EPA may still use these studies in significant regulatory actions and influential scientific information after either giving lesser consideration to the study or studies or if the Administrator grants an exemption under 40 CFR 30.7.

With this final rule, the EPA is clarifying that the requirements in this final rule set the overarching structure and principles for science transparency in the EPA's significant regulatory actions and influential scientific information. The EPA intends develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

10.5.6 States Involvement in Identifying Priorities

Comment: Commenter (6104) asks whether states will have any role in helping EPA identify priorities if EPA decides to phase in the requirements or prioritize certain specific actions.

Response: The EPA does not find that a phase-in approach for implementing the final rule is necessary because of the limited application of this rule to pivotal science underlying significant regulatory actions and influential scientific information. The EPA would also like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

10.5.7 Transparency Rule Should Never Be Implemented

Comment: Commenter (0671) states that the Agency should not implement the proposed rule or any of its components at any time, now or ever.

Response: The EPA disagrees with the commenter. Because the EPA's significant regulatory actions can potentially impact American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best information, and only through transparency can the EPA truly demonstrate its commitment to the Agency's mission of protecting public health and the environment through sound policy decisions that are informed by robust scientific and technical research.

10.6 Scope – Effects on Individual EPA Programs and Exceptions

10.6.1 Proposed Rule Would Have Effects on All/Several EPA Programs

Comment: Commenter (1012) states that if this rule is implemented as currently written, many relevant studies that rely on personal health information or CBI, may be excluded from the Agency's decision-making process. According to the commenter, this would reduce the total number of studies that utilize the best available science being used in the EPA's regulatory process. The commenter (1012) notes that restricting the number and type of scientific studies used would lower the overall quality of regulatory review at the Agency and would also impact the scientific integrity of the regulatory work conducted by the Agency. The commenter provides that, a non-comprehensive list of EPA programs that may be negatively impacted by the proposed rule include: the IRIS; the Integrated Science Assessment (ISA) for the NAAQS; Provisional Peer Reviewed Toxicity Values (PPRTV); the TSCA; pesticide reviews under FIFRA; other chemical review programs; and programs under the jurisdiction of the SDWA and CWA.

Commenter (4878) states that the proposed rule stands to affect every program and statute that the EPA administers.

Response: In response to this comment, and other similar comments, the EPA clarified the relationship between this rulemaking and the environmental statutes, and their implementing regulations, in a 2020 SNPRM by adding language to proposed 40 CFR 30.3, stating that the statutes and regulations would control in the event of any conflicts.

With this final rule, the EPA is maintaining language in 40 CFR 30.3 stating that the statutes and regulations will control in the event of any conflicts, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for science transparency in the EPA's significant regulatory actions and influential scientific information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science where the underlying dose-response data are not available in a manner sufficient for independent validation. In these cases, the EPA may still use these studies in significant regulatory actions and influential scientific information after either giving lesser consideration to the study or studies or if the Administrator grants an exemption under 40 CFR 30.7.

10.6.2 Evaluating Effects of Proposal on Environmental Programs and their Implementation is Unnecessary

Comment: Commenter (6356) states that it is unnecessary for EPA to evaluate the effects of this rulemaking on individual environmental programs and their implementation. According to the commenter, this rulemaking addresses whether the data, model, or causal relationship (such as a dose and a response), is available to the public and whether the information on which a final agency action is based is replicable. The commenter notes that neither requires or warrants a particularized analysis of each statutory program that EPA administers, and such review would delay unnecessarily a much-needed reform of EPA's overall regulatory agenda. The commenter asserts that while each environmental statute has a distinctive basis for regulatory actions and some delineate what facts may or may not be considered, the proposed rule only attempts to ensure that facts and means of obtaining them, which establish the foundation for implementation of a particular statutory authority, are available to stakeholders and the public for review and comment.

Response: As described in the final rule, the EPA is including regulatory text in 40 CFR 30.3 stating that the environmental statutes and regulations will control in the event of any conflicts. The EPA also clarified in the preamble of the final rule that the requirements in the final rule set the overarching structure and principles for science transparency in the EPA's significant regulatory actions and influential scientific information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

10.7 40 CFR 30.3 - How Do the Provisions of this Subpart Apply?

10.7.1 Unlimited Discretion and Authority to Decide What “Any Other Type of Agency Action” is or is Not

Comment: Commenter (6133) asserts that 40 CFR 30.3 is unlawfully vague, open-ended and arbitrary due to the capacious and unlimited way that EPA has drafted the exclusion from the Proposal's prohibitions. The commenter states that 40 CFR 30.3 indicates that “the provisions of this subpart do not apply to any other type of agency action.” According to the commenter, this grants EPA capacious and effectively unlimited discretion and authority to decide what “any other type of agency action” is and is not, without providing the public or regulated entities any criteria, understanding or advance notice as to how EPA will exercise that discretion and authority. The commenter contends that is the essence of arbitrary and capricious agency action. Indeed, according to the commenter, the Proposal is structured in such a way that EPA will be exercising that discretion and authority—to decide what “any other type of agency action” does and does not cover—in secret, with no public input and no public awareness, concerning the situations in which EPA will and will not consider non-transparent, unavailable information. In addition to this being perversely ironic, the commenter believes that considering the “transparency” title of the Proposal, this fact renders the Proposal even more arbitrary and capricious and unlawful.

Response: The Agency took comment on the applicability of this rule and the EPA does not agree with the commenter and finds that 40 CFR 30.3, as finalized, clearly identifies the applicability of the final rule. As stated in 40 CFR 30.3, the provisions of 40 CFR part 30 apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to data and models underlying pivotal science regardless of the source of funding or identity of the party conducting the science. Significant regulatory action and influential scientific information are both clearly defined in Part 30.2 of the final rule.

10.7.2 Applicability Covers Studies, Models and Analyses Integral to the Functioning of EPA Regulatory Programs

Comment: Commenter (6133) provides that the Proposal states that “[t]he provisions of this subpart apply to dose response data and models underlying pivotal regulatory science that are used to justify significant regulatory decisions regardless of the source of funding or identity of the party conducting the regulatory science.” 83 Fed. Reg. at 18,773/3 (proposed 40 CFR 30.3). The commenter then states that the proposal defines “dose response data and models” and “pivotal regulatory science” and “regulatory science” in such a way that it appears to cover studies, models, and analyses that are integral to the functioning of EPA regulatory programs, implementation of statutes like the CAA, and protection of public health and the environment. The commenter lists and describes the following studies, models and analyses and their use in the support of existing regulations (pages 105 – 110 of their comment letter):

- Integrated Planning Model (IPM)
- National Electric Energy Data System (NEEDS)
- Co-Benefits Risk Assessment (COBRA)
- Avoided Emissions and Generation Tool (AVERT)
- Community Multi-scale Air Quality (CMAQ) Modeling System
- EPA U.S. Nine-Region MARKet ALlocation (MARKAL) Database
- Emissions & Generation Resource Integrated Database (eGRID)
- National Emissions Inventory (NEI)

The commenter contends that it would be harmful, unlawful, arbitrary and capricious, and an abuse of EPA’s discretion to include these materials within the sweep of the Proposal’s prohibitions. Alternatively, the commenter states that if EPA disagrees that the listed examples are covered by the Proposal, then continuing to consider these materials that have the same hallmarks as the prohibited materials, and that raise the same issues and concerns that cause EPA to prohibit their consideration, demonstrates that the Proposal is arbitrary and capricious, biased, and internally inconsistent and contradictory. Moreover, the commenter provides that in this case, the Proposal would suffer from fatal failures to explain why EPA may consider these materials, while the Proposal would prohibit EPA from considering other materials.

Response: In 2020, the EPA issued an SNPRM and proposed to expand the scope of the 2018 proposed rulemaking in two ways: (1) expanding “dose-response data and models” to “data and models,” and (2) including influential scientific information. As EPA noted in the 2020 SNPRM, transparency of EPA’s science should not be limited to dose-response data and dose-response

models, because other types of data and models can also drive the requirements and/or quantitative analysis of EPA significant regulatory actions and influential scientific information.

Based on the comments on the 2018 proposed rule and the 2020 SNPRM, including that the number of studies that would be subject to the rule might hinder rulemaking, the EPA determined that the Agency should pursue an incremental approach to maximizing transparency in the science that it relies upon by focusing the final rule requirements on dose-response data and, in particular, only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs).

The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The provisions of the final rule apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.

The 2018 proposed rule included proposed definitions for “dose-response data and models,” “pivotal regulatory science,” “regulatory decisions,” “regulatory science,” and “research data.” Some commenters stated that several of the proposed definitions were unclear, including some that seemed to overlap (e.g., “pivotal regulatory science” and “regulatory science”). Some commenters also stated that certain terms used in the proposed regulatory requirements were not clear and should be defined. In response to these comments on the 2018 proposed rule, the EPA proposed in the 2020 SNPRM definitions for “capable of being substantially reproduced,” “data,” “independent evaluation,” “models,” “publicly available,” and “reanalyze.” In the 2020 SNPRM, the EPA also proposed a definition of “influential scientific information” to comport with the proposed expansion of the applicability of the rulemaking to influential scientific information. Based on a consideration of the public comments on both the 2018 proposed rule and the 2020 SNPRM, the EPA is finalizing the definitions at 40 CFR 30.2.

The final rule covers only dose-response data underlying pivotal science used for significant regulatory actions and influential scientific information and thus the scope of this final rule does not cover the models noted in the comments.

10.7.3 Drafted Exclusions from Proposal’s Prohibitions

Comment: Commenter (6133) provides that §30.3 states that:

Except where explicitly stated otherwise, the provisions of this subpart do not apply to any other type of agency action, including individual party adjudications, enforcement activities, or permit proceedings.

83 Fed. Reg. at 18,773.

Response: The Agency took comment on the applicability of this rule and the EPA does not agree with the commenter and finds that 40 CFR 30.3, as finalized, clearly identifies the applicability of the final rule. As stated in 40 CFR 30.3, the provisions of 40 CFR part 30 apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data and models underlying pivotal science regardless of the source of funding or identity of the party conducting the science. Significant regulatory action and influential scientific information are both clearly defined in Part 30.2 of the final rule.

The final rule does not prohibit EPA from relying on studies when the underlying dose-response data is not available for independent validation. Implementation of this rule will not undermine EPA's efforts in protecting human health and the environment. The scope of the rule is clear and EPA has articulated that its provisions will not apply to other agency actions. The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

Finally, as described in the preamble to the final rule, the requirements in this final rule set the overarching structure and principles for science transparency in the EPA's significant regulatory actions and influential scientific information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

10.7.4 Applicability to Government-Funded and/or Beyond Government-Funded Scientific Research

Comment: Commenter (6362) provides that the EPA is proposing to add this rule to 40 CFR Part 30, contained in Chapter 1, Subchapter B, dedicated to "Grants and Other Federal Assistance," without explaining how or why this rule fits within this subchapter, thereby creating potential confusion regarding its applicability. According to the commenter, the potential for confusion was enhanced by the fact that EPA's public website currently contains information regarding the content that was formerly within 40 CFR Part 30 but was repealed on December 19, 2014, i.e., general terms and conditions applicable to grant recipient and sub-recipients. In addition, the commenter asserts that several questions on which EPA seeks comment relate solely to EPA cooperative agreements and grants or access to EPA-funded data.

In contrast, the commenter (6362) provides that 40 CFR 30.3 of the proposed regulatory text states that "the provisions of this section apply to dose-response data and models underlying pivotal regulatory science regardless of who funded or conducted the underlying data, models, or other regulatory science." The commenter asserts that stakeholders would benefit greatly from EPA providing clarification regarding the applicability of Subchapter B and whether and to what

extent this rule applies to government-funded and/or beyond government-funded scientific research. The commenter believes the broader approach is warranted.

Commenter (1972) also strongly supports proposed 40 CFR. 30.3, stating that EPA's transparency requirements will apply "regardless of the source of funding or identity of the party conducting the regulatory science." Too often, according to the commenter, studies funded in whole or in part by industry are dismissed or given diminished credibility solely due to the source of the funding. Although the commenter recognizes the common presumption that the funding source may influence a study's results, these presumptions are rarely applied to studies performed or funded by nongovernmental organizations, academic institutions, or government agencies even though each of them may exert a significant influence over study results as well. Further, the commenter contends that industry may be the only party interested in funding the study of certain aspects of environmental or public health issues, allowing for a more robust scientific review of these issues than if the matter were left solely to the decision of others. Of course, the commenter states that the quality of scientific studies stand or fall on their underlying data, methodologies, and assumptions. The commenter provides that a transparent and open process that allows for outside validation or criticism of studies will reveal the quality of those studies regardless of the funding source.

Response: The EPA would like to clarify that 40 CFR part 30 is contained in Chapter 1, Subchapter A, which is titled, "General." The EPA finds this to be the appropriate subchapter for the requirements in the final rule.

The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The provisions of the final rule apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.

Comment: Commenter (2911) states that the federal government already has rules requiring that data be made publicly available for studies funded by the federal government. The commenter states that, if a need were to be demonstrated that additional regulation is needed to promote more transparency in scientific studies, then such regulation should apply to the studies themselves, not to the users of the studies.

Response: The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. The EPA also agrees with commenters that government agencies are making great strides in data transparency; however, improvements can still be made over existing policies and mechanisms.

The rule will allow for greater scientific scrutiny as EPA decision makers are developing significant regulatory actions and influential scientific information and increases the likelihood that any errors in pivotal science can be identified and corrected through independent validation. Greater transparency is also inherently valuable as a principle of good government and provides benefits to the public at large, including reducing the risk of errors in EPA analyses and in the science such analyses rely upon. The ability for independent subject matter experts to validate pivotal science will facilitate more effective comment and engagement with the public during development of future significant regulatory actions and influential scientific information.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

10.7.5 Data Pivotal to the Basis of a Regulatory Decision

Comment: Commenter (6356) states that proposed 40 CFR 30.3 and 30.4 appear to be inconsistent. The commenter states that proposed §30.3 would require EPA to identify all studies or other regulatory science that it relied upon when taking any final agency action and that such studies be available to the public for review. The commenter then provides that 40 CFR30.4 appears to presume that only dose response models and data are pivotal regulatory science. The commenter asserts that other research or data may be pivotal to the basis of a regulatory decision. The commenter states that this inconsistency appears to be at cross-purposes with the regulation and unnecessarily imbues the rule with a political purpose that detracts from its primary purpose.

Response: In the final rule, the EPA has revised the requirements of 40 CFR 30.4 such that they are consistent with the EPA's existing practice of making science that serves as the basis for informing a significant regulatory action available in the public docket as part of the rulemaking. As a result, the final regulatory text at 40 CFR 30.4 reads, "The EPA shall clearly identify all science that serves as the basis for informing a significant regulatory action. The EPA shall make all such science that serves as the basis for informing a significant regulatory action publicly available to the extent permitted by law."

In the final rule, the EPA has also revised the requirements of 40 CFR 30.3 to clarify how the provisions of the 40 CFR part 30 apply to EPA activities. As stated in 40 CFR 30.3, "The provisions of this part apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science."

10.7.6 No Clear Information on How the Rule will Apply

Comment: Commenter (2169) states that the question “[h]ow do the provisions of this subpart apply” is not answered by the regulatory proposal. That is, according to the commenter, no clear information is stated in the Notice as to HOW the provisions of the subpart will be applied.

Response: In response to this comment, and other similar comments, the EPA has clarified how the provisions in the final rule will be applied. As described in the final rule, specifically Part 30.3, the provisions of this part apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science. The provisions of this part apply to significant regulatory actions for which a proposed rule was published in the *Federal Register* after the publication date of the final rule and influential scientific information submitted for peer review after the publication date of the final rule.

In addition, the provisions of this part do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses, and influential scientific information or pivotal science that meet one or more of the exemptions identified in Section IX of the OMB Final Information Quality Bulletin for Peer Review. In the event the procedures outlined in this part conflict with statutes the EPA administers, or their implementing regulations, the statutes and regulations will control. Except where explicitly stated otherwise, the provisions of this part do not apply to any other type of Agency action, including individual party adjudications, enforcement activities, site-specific actions, or permit proceedings.

Finally, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation. There may be pivotal science where the underlying dose-response data are not available in a manner sufficient for independent validation. In these cases, the EPA may still use these studies in significant regulatory actions and influential scientific information after either giving lesser consideration to the study or studies or if the Administrator grants an exemption under 40 CFR 30.7.

The EPA intends for the final rule to be implemented in a transparent manner. The final rule requires the EPA to document the rationale for exemptions granted by the Administrator to the requirements included in the final rule in the significant regulatory action or influential scientific information. Additionally, the EPA expects to identify pivotal science in proposed significant regulatory actions or external review drafts of influential scientific information, which will allow the public, if they so choose, to independently validate the pivotal science and provide comment to the EPA.

10.7.7 Physical Objects, Drafts and Preliminary Analyses Exclusion

Comment: Commenter (6880) states that, in describing the data to which the proposal applies, EPA states in 40 CFR 30.3 “[t]he provisions of this section do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses.” According to the commenter, as these are already excluded from the definition of “research data,” it would be redundant for EPA to exclude them if they were using said definition. Also, the commenter asserts that, by mentioning these exclusions while remaining silent on trade secrets and privacy information that are excluded from the definition of “research data,” EPA clearly signals that those data are not excluded from the “data” to which EPA refers in the proposal. The commenter contends that the proposal is clear that it applies to a much broader range of data than that included in the cited definition of “research data.” The commenter states that this would allow EPA to ignore research findings if it were not possible to make public all the underlying data, including data that is excluded from the definition of “research data.”

Response: Based on a consideration of this and other similar comments, the EPA issued a SNPRM in 2020, which included clarifications, modifications and additions to certain provisions proposed in the 2018 NPRM. In the 2020 SNPRM, the EPA deleted the 2018 proposed 40 CFR 30.2 definition of “research data,” because, as noted by the commenter, this definition excludes “trade secrets, commercial information, materials necessary to be held confidential by a researcher until they are published, or similar information which is protected under law” and “[p]ersonnel and medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study.” The EPA clarified in the 2020 SNPRM that these types of data would not be disclosed in violation of any statutory prohibitions.

In the final rule, the EPA has defined “data” to mean “the set of recorded factual material commonly accepted in the scientific community as necessary to validate research findings in which obvious errors, such as keystroke or coding errors, have been removed and that is capable of being analyzed by either the original researcher or an independent party.”

In the final rule, the EPA has also revised the requirements of 40 CFR 30.3 to clarify how the provisions of the 40 CFR part 30 apply to EPA activities. As stated in 40 CFR 30.3, “The provisions of this part apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.” Because the provisions of 40 CFR part 30 apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, the EPA finds it appropriate to further clarify that this science does not include physical objects (like laboratory samples), drafts, and preliminary analyses, and influential scientific information and/or pivotal science that meet one or more of the exemptions identified in Section IX of the OMB Final Information Quality Bulletin for Peer Review.

10.8 “Regulatory Decisions” Definition at 40 CFR 30.2

10.8.1 Amend Definition to Remove Limitation of Applicability to Only Final Regulations

Comment: Commenter (4932) recommends that EPA alter the “regulatory decisions” definition by striking the word “final” to make the Transparency Proposal fully consistent with Executive Order 12866. The commenter states that the necessary (and seemingly unintended) implication of including the word “final” in the definition is that the transparency objective (i.e., the disclosure of pivotal regulatory science) does not apply to advanced notices of proposed rulemaking or proposed rulemakings. The commenter asserts that the public must have access to pivotal regulatory science at these earlier steps in the rulemaking process in order to assess effectively the merit of the Agency’s regulatory science. The commenter concludes that EPA’s adoption of their recommendation would address this timing issue.

Response: The 2018 proposed rule included proposed definitions for “dose-response data and models,” “pivotal regulatory science,” “regulatory decisions,” “regulatory science,” and “research data.” Some commenters stated that several of the proposed definitions were unclear, including some that seemed to overlap (e.g., “pivotal regulatory science” and “regulatory science”). Some commenters also stated that certain terms used in the proposed regulatory requirements were not clear and should be defined. The final rule no longer uses the term “regulatory decisions” and thus the term is not defined.

The preamble to the final rule also notes that EPA sees no need to include the proposed rule stage of significant regulatory actions in the final regulatory text for this rulemaking because, as a practical matter, these proposed rules must comply with this final rule in order to be finalized. The EPA does not introduce the studies and analyses it relies on for a rulemaking at the final rule stage. The basis for a rulemaking is provided for public review and comment in the public docket when the proposed rule is issued or if subsequently added to the docket through a separate opportunity for public comment. The EPA expects to identify pivotal science in proposed significant regulatory actions or external review drafts of influential scientific information, which will allow the public, if they so choose, to independently validate the pivotal science and provide comment to the EPA.

The EPA also sees no need to include advance notices of proposed rulemakings in this final rule because advance notices of proposed rulemakings are preliminary in nature and frequently focus on soliciting initial comment on a regulatory issue or approach. Therefore, advance notices of proposed rulemaking are not consistent with the purpose of this final rule.

10.8.2 Proposal is Inconsistent with Regards to What Types of Regulatory Actions Would be Covered

Comment: Commenter (6133) states that in some places the Proposal suggests that the rule would apply only to final rulemakings (e.g., “regulatory decisions” definition). See 83 Fed. Reg. at 18771 (“EPA solicits comment on whether and to what extent these requirements, or other provisions and policies, should apply to other stages of the rulemaking process . . .”). The commenter asserts that applicability of the rule to only final rulemakings is inconsistent with OMB guidance on Executive Order 12866 that states that the definition is intended to cover “any policy document of general applicability and future effect, which the agency intends to have the

force and effect of law, such as guidance, funding notices, manuals, implementation strategies, or other public announcements, designed to implement, interpret, or prescribe law or policy or to describe the procedure or practice requirements of an agency.” OMB, Memorandum for Heads of Executive Departments and Agencies, and Independent Regulatory Agencies, at 5 n.3 (Oct. 12, 1993). Therefore, according to the commenter, there is an inconsistency between what EPA says it is doing, and what it is really proposing. The commenter states that without knowing what types of agency actions would be covered, the public cannot understand the Proposal’s true impact.

Response: The EPA agrees that the use of “regulatory decisions” is confusing, given that the term was only intended to apply to a subset of regulations. To clarify the definition, the EPA has changed the term from “regulatory decisions” to “significant regulatory actions” in the final rule. The EPA finds that the definition of “significant regulatory actions” used in the final rule (i.e., “final regulations determined to be ‘significant regulatory actions’ by the Office of Management and Budget pursuant to Executive Order 12866”) sufficiently identifies the applicability of the final rule.

10.8.3 Regulatory Decisions Should Also Apply to Permitting Activities

Comment: Commenter (6180) recommends that the definition for “regulatory decisions” be revised to apply to permitting activities.

Response: The EPA does not agree with this comment and will not expand the applicability of this rulemaking beyond significant regulatory actions and influential scientific assessments to individual party adjudications, permit proceedings, site-specific actions, and enforcement actions because these actions are typically focused on individual regulated entities.

10.8.4 Recommends that the Regulatory Decisions Definition Include EPA-Focused Criteria

Comment: Commenter (6906) provides that, throughout the proposed rule, EPA establishes that the guidelines for strengthening the transparency in regulatory science would only apply to “significant regulatory actions” as described by Executive Order 12866. The commenter understands why the Agency uses Executive Order 12866 as the basis for determining whether a regulatory action is significant; as its’ four criteria have long been the standard to which the “significance” of a regulatory action is judged. The commenter states that they do not want to discount the decades-long use of this Executive Order with nearly every regulatory action but recommend that it would be useful for the Agency to develop more specific EPA-focused criteria. The commenter states that the EPA-focused criteria could take into account the range of regulatory and policy activities that the Agency conducts. According to the commenter, one possible way to meet this suggestion is by having each Program Office establish a list of rulemaking categories that would not be deemed significant, and thus minimizing any potential confusion. The commenter contends that using this approach could aid future regulators and stakeholders in future determinations as to when these transparency guidelines need to be accounted for. Furthermore, the commenter states that this could be one potential method of

“narrowing the scope” of this proposed rulemaking without sacrificing the integrity of what the rule intends to do.

Response: The EPA is finalizing the applicability of this final rule to significant regulatory actions as defined in Executive Order 12866, and influential scientific information because of the broad impact of these actions and assessments. *Influential scientific information* means scientific information the Agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions. Following the Agency’s Peer Review Guidance, each Program determines what science produced will be designated as influential scientific information. Also, as described in the preamble to the final rule, the requirements in this final rule set the overarching structure and principles for science transparency in the EPA’s significant regulatory actions and influential scientific information. The EPA intends to develop internal implementation guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

10.8.5 Basis for Regulatory Decisions

Comment: Commenter (0039) recommends that EPA require all *regulatory decisions*, meaning “significant regulatory actions,” as defined by the OMB pursuant to Executive Order 12866, be based on:

- Scientific research that meets the “best available reproducible science” standard;
- At least one study on the effect of publication bias on this scientific research;
- At least one meta-analysis of this scientific research; and
- Explicit consideration of whether the corpus of scientific research has accounted for different aspects of the irreproducibility crisis, including flawed statistics, arbitrary research methods, publication bias, and disciplinary and/or political groupthink.

Response: As described in the preamble to the final rule, consistent with existing Agency practice (Ref. 35), the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information. The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review.

When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will

be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science (see Section III.E of the final rule preamble). Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of personally identifiable information (PII), CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator (see Section III.G). See Section III.E for a description of the factors the EPA will consider when determining the consideration to afford to pivotal science when the underlying dose-response data are not available for independent validation.

The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

The specific request found in these comments regarding the scientific basis for or other concerns associated with a significant regulatory action will be in part addressed through the availability of dose-response data underlying pivotal science.

Chapter 11: Availability of Data and Models

The proposal *Federal Register* preamble states that the proposed rule is intended to strengthen the integrity, transparency, and validity of the scientific information relied upon by EPA (83 FR 18769). The proposal notes that, in applying the best available science to its regulatory decision-making, EPA must comply with federal transparency and data integrity laws (83 FR 18769). Several comments were received regarding the integrity and transparency of regulatory decision making. In this section these comments are organized as follows:

Section 11.1: NPRM Transparency and Integrity of Regulatory Decision Making vs. Availability of Raw Data

- Basis for EPA Decision Making Regarding Use/Non-Use of Studies Not Required to be Transparent; and
- EPA Actions in Other Areas.

Section 11.2: SNPRM Data Availability-Related Comments

- Confidential Business Information, Proprietary Data, or Personally Identifiable Information

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

11.1. NPRM Transparency and Integrity of Regulatory Decision Making vs. Availability of Raw Data

11.1.1 Basis for EPA Decision-Making Regarding Use/Non-Use of Studies Not Required to be Transparent

Comment: Commenter (5176) states that the proposed rule does not enhance transparency in science. The commenter states that the proposed rule undermines its claim of promoting transparency within the EPA regarding environmental policymaking. According to the commenter, the proposed rule does not say that a scientist has to make her study data publicly available, if the EPA is to consider using that study to inform policy; rather, it says that her study will not be considered as a basis for EPA decision-making. The commenter adds that the proposed rule requires no transparency regarding when and under what circumstances the EPA might decide unilaterally that a rigorous, independently validated, peer-reviewed study cannot be used as a basis for regulatory policymaking, solely on the grounds that its underlying data are not

publicly available. Under the proposed rule, the commenter notes that the public would never know that a decision not to use a particular study had been made. The commenter contends that, in that sense, the proposed rule will foster a lack of transparency about EPA decisions and the science that serves as the basis for its regulatory policy.

Commenter (9224) asserts that, in order to increase transparency, it would be important to have the agency give a thorough explanation as to why certain studies and data sets were chosen and not others, rather than relying on public access to the individual data. The commenter states that the public does not need the individual data in order to determine if there are inherent issues within the study itself. The commenter states that the analysis of the data is already done multiple times throughout the publication process, via peer review. The commenter states that, while it is useful to have the data EPA uses, it is perhaps more important to understand the methodology and reasoning behind why EPA chooses the data it does.

Response: The EPA disagrees that this rule will foster decreased transparency in regulatory decision-making. In this final rule, the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. When characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, the EPA will identify pivotal science and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation. As stated in 40 CFR 30.5(c), the Agency will identify the pivotal science that was given lesser consideration and provide a short description of why lesser consideration was given.

As codified in this rule in 40 CFR 30.4, EPA will continue its practice of making public the science that serves as the basis for informing a significant regulatory action available in the public docket. The EPA has established various guidelines for how it assesses scientific evidence in its regulatory actions and influential scientific information, such as the *Framework for Human Health Risk Assessment to Inform Decision Making*³¹²⁶. The Agency will continue to follow this and other guidelines under this rule. Consistent with the intent of this rulemaking, the EPA also intends to clearly identify the studies considered pivotal in the documentation at the proposed rule stage for significant regulatory actions and when influential scientific information is disseminated for peer review.

Comment: Commenter (6134) asserts that the proposed rule puts EPA in the position of defining “transparent” and allows them to decide if particular studies should be included in their rule making process. The commenter states that it is not designed to make an already robust review process better.

³¹²⁶ U.S. EPA. (2014). Framework for Human Health Risk Assessment to Inform Decision Making. (EPA/100/R-14/001). Washington, DC: U.S. Environmental Protection Agency, Office of the Science Advisor, Risk Assessment Forum. Available at <https://www.epa.gov/sites/production/files/2014-12/documents/hhra-framework-final-2014.pdf>.

Response: The EPA disagrees with the commenter that this rule allows the Agency to decide if particular studies should be included in the rulemaking process. Under this final rule, no studies are categorically excluded from consideration. Rather, the purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. Also see the response to the preceding comment.

11.1.2 EPA Actions in Other Areas

Comment: Commenter (6168) states that the litany of ways the EPA under the current administration has been secretive and has sought to limit information and evidence of chemical harms suggests that the idea of “transparency” grows not out of commitment to openness and public participation. The commenter states that, rather, it is being used here strategically, in bad faith, to limit the evidence used in regulatory decision-making and to undermine moves toward protective regulations. The commenter lists the following examples:

- EPA has made less accessible or removed extensive information about climate change that had been available on EPA’s website.³¹²⁷
- EPA has failed to provide the information necessary for independent evaluation of its decisions under Toxic Substances Control Act (TSCA), e.g. EPA’s recent decision to green light a new fragrance chemical despite a range of health concerns.³¹²⁸
- EPA has pushed to delay releasing reports documenting harms of chemicals, e.g. formaldehyde³¹²⁹ and Per- and Polyfluoroalkyl Substances (PFAS).³¹³⁰
- EPA has reduced opportunities for public participation by creating short comment periods and trying to circumvent public comment entirely.³¹³¹
- EPA’s procedure for implementing TSCA is designed to limit the range of information included in regulatory decisions by limiting the sorts of uses/exposures that will be analyzed.³¹³²
- EPA has drastically shifted influence away from the broader public and toward business interests, for example in private meetings and in appointments to science advisory boards.
- Especially under Scott Pruitt -- who was Administrator when this proposed rule was written and published -- EPA has been secretive, for example denying Freedom of

³¹²⁷ See for example the following reports produced by EDGI: Missing Environmental Protection Agency Endangerment Finding Web Resources (July 2017); Assessment of Removals and Changes in Access to Resources on the EPA’s “Climate and Energy Resources for State, Local, and Tribal Government” Website (October 2017); Change in Access to the EPA’s “A Student’s Guide to Global Climate Change” Website (May 2017); Removal from the Greening EPA Website of a Climate Change Adaptation Web Resource, Links to Resources, and Mentions of EPA’s Own Greening Performance Goals (Dec 2017)

³¹²⁸ The commenter provides that the lack of transparency on these decisions is laid out in detail in EDF’s three-part analysis: “EPA rams through its reckless review scheme for new chemicals under TSCA, your health be damned” (EDF, August 2018): Part 1, Part 2, Part 3

³¹²⁹ Sources: EPA blocks warnings on cancer-causing chemical (Politico, July 2018)

³¹³⁰ Suppressed Study: The EPA Underestimated Dangers of Widespread Chemicals (ProPublica, June 2018)

³¹³¹ Heinzerling, Lisa, The Legal Problems (So Far) of Trump’s Deregulatory Binge (October 6, 2017). Harvard Law & Policy Review, Forthcoming.

³¹³² The Chemical Industry Scores a Big Win at the E.P.A. (New York Times, June 2018)

Information Act (FOIA) requests until required to release documents by courts. Pruitt's secrecy was famous: not telling reporters where he was speaking, not letting the press into events, hiding, and even changing his calendars, etc.³¹³³

Response: The EPA disagrees that this final rule is meant to limit the evidence used in regulatory decision-making and to undermine moves toward protective regulations. Rather, the purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. Under this final rule, no studies are categorically excluded from consideration. Where the underlying data is available, EPA will give greater consideration to the pivotal science. Where the underlying data is unavailable, EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator under 40 CFR 30.7.

Comment: Commenter (6868) suggests several discrete actions the Agency could take to increase transparency and public trust in how EPA develops policy other than the proposed rule:

- Making the schedule of the EPA Administrator/Acting Administrator available to the public,
- Granting media representatives full access to public meetings,
- Ensuring public access to factual information on the environmental and public health effects of climate change,
- Minimizing the role regulated industry representatives play on EPA advisory committees, and
- Meeting court ordered deadlines for promulgation of major regulatory actions and providing full cooperation with any pending federal investigations of agency staff misuse of office.

Response: These suggestions are outside the scope of this rule. The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

³¹³³ For example, the commenter notes "Anti-secrecy lawsuits soaring against Pruitt's EPA" (Politico, February 2018); "Pruitt rules EPA under a cloak of secrecy" (EDF, September 2017)

11.2 SNPRM Data Availability-Related Comments

11.2.1 Confidential Business Information, Proprietary Data, or Personally Identifiable Information

11.2.1.1 40 CFR 30.5 Requirements

11.2.1.1.1 Deletion of Research Data Definition

The supplemental proposal states the EPA is deleting the 2018 proposed 40 CFR 30.2 definition of research data because this definition excludes trade secrets, commercial information, materials necessary to be held confidential by a researcher until they are published, or similar information which is protected under law and personnel and medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study. The EPA proposes that these types of data are intended to be subject to this rulemaking.

Comment: Commenters (10038, 10740, 11361, 12710) oppose the proposal and express concern over the deletion of the definition of “research data.”

Commenter (10740) suggests that it is the intent of this proposed rule to preclude scientific evidence based on data and models informed by raw data, including medical records, that is required to be held confidential and concludes that this is not transparency, nor is it science.

Commenter (11361) asserts that the effect of the proposed deletion is readily apparent: it will dramatically shift the balance of the kinds of studies that will be utilized in Agency decision-making, reducing the proportion of public health studies and increasing the proportion of assay-based and computational modeling studies. The commenter states that this is likely to make the link between regulations and health protections less clear, not more.

Commenter (11361) asserts it is an ill-conceived move by the EPA to put current researchers in the position of either complying with privacy laws or allowing their research to have real-world impacts by informing regulations. The commenter notes that in this supplemental notice of proposed rulemaking (SNPRM or supplemental proposal), the EPA explicitly bucks the use of the term “research data” in the 2018 proposed rule because “research data” excluded data that was protected under various privacy laws, such as confidential business information (CBI) and personally identifiable information (PII), and the EPA is requiring that that protected information be made public or be disregarded.

Commenter (12710) states that “research data” excludes the “physical objects (like laboratory samples), drafts, and preliminary analyses” that proposed § 30.3 will exclude. The commenter states that research data also excludes trade secrets and personal and medical information that if disclosed would constitute an invasion of privacy. The commenter states that this is not excluded from EPA’s new definition of data; instead, throughout the proposal studies that allow “tiered access” to PII are mentioned and yet offer very little detail in the preamble (no sources) and none in the proposed regulation as to what constitutes acceptable “tiered access.”

Response: While the EPA maintains the approach of the 2020 supplemental proposed rule, that the types of data included in the proposed definition for “research data” should be subject to this final rule, the EPA emphasizes that this final rule does not require that data be made publicly available. Rather, this final rule of internal agency procedure requires that the EPA give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

The EPA acknowledges, and agrees with commenters, that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. This may include studies containing protected information from the proposed definition of “research data.” In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

11.2.1.1.2 Protected Data

Comment: Commenter (12472) states that the data access requirements described in the supplemental proposal may pose difficulties for emissions inventories used in modeling. The commenter states that, when developing emissions inventories for modeling, there are instances where CBI, PII, or proprietary data is used but cannot be shared in raw form due to access agreements with originators of that data. The commenter states that, for instance, on-road mobile, commercial marine vessels, rail, area, or oil and gas inventories are often constructed with PII, CBI, or proprietary data. The commenter states that the economic growth factors used in forecasting emissions may be constructed with code or models that are considered CBI or proprietary data. The commenter states that the Texas Commission on Environmental Quality is legally prohibited from releasing some of these datasets, but it is necessary to collect such information in order to prepare emissions inventories for air quality modeling. The commenter states that, in these instances, as allowed in the supplemental proposal, the EPA should consider studies and other data even if the underlying data and models are not publicly available.

Response: The EPA acknowledges that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. This may include modeling studies that rely on underlying CBI, PII, or proprietary dose-response data. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Comment: Commenter (12718) expresses concern that the supplemental proposal offers no meaningful articulation of privacy and confidentiality safeguards for the American people. The commenter states that the Agency has no established statistical Agency or unit designated under the Confidential Information Protection and Statistical Efficiency Act of 2018 (Title 3 of PL 115-435) to apply civil and criminal penalties for violations of protection. The commenter states that this is disappointing in that these protections were unanimously upheld by the Republican and

Democratic appointees to the U.S. Commission on Evidence-Based Policymaking as a model for federal agencies, including EPA, then reauthorized with strong bipartisanship in Congress.

Response: The EPA clarifies that this rule is not intended to establish enforcement of civil and criminal penalties for violations of data protections. Rather, this internal rule establishes procedures for the EPA to give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

11.2.1.2 Confidential Business Information (CBI)

11.2.1.2.1 Transparency Standards for CBI and Public Health Data

Comment: Commenters (10339, 11403, 11479, 12403, 12442, 12455, 12702) express concern that, under the proposed rule, CBI may not be held to the same standards of transparency as public health information. Commenter (12442) states that the rule is arbitrary and capricious because this rule creates a double standard by allowing specific industry data to be kept confidential while exposing sensitive data underlying health-based studies.

Commenter (10339) states that the rule and supplemental proposal still fail to explain whether the Agency will ensure that CBI will also be held to the same standards of transparency, disclosure, and access. Commenter (12403) asserts the proposal's approach to CBI favors private sector research over independent institutions.

Commenter (11403) asserts that the proposal would result in EPA policy being based on secret industry CBI that has been protected under this proposed rule. The commenter notes that the proposed rule restricts the use of the exemption to circumstances where “compliance is impracticable because technological barriers render sharing of data or models infeasible.” The commenter asserts that, in practice, this exemption would result in EPA policy being based exclusively on secret industry CBI that has been protected under this proposed rule and potentially outdated studies that have been exempted by the Administrator under this section 30.9. The commenter states that, under this exemption, data that is not publicly available because of a technological barrier would arbitrarily be considered prioritized over health data that would be blocked from consideration by this proposed rule.

Commenter (11479) suggests the EPA appears to be more concerned with protecting industry data and CBI than with protecting public health information. The commenter states that this disparity is exemplified by the fact that the Agency requests commenters to provide feedback on how to balance protections for copyrighted and CBI but does not seek similar advice on how to protect patient health data. The commenter states that emails show that top EPA officials responsible for drafting the proposed rule struggled with how to incorporate exemptions and limit the rule’s impact on industry data.³¹³⁴ The commenter states that Dr. Beck’s comments on

³¹³⁴ Kothari, Y. 2018. Internal EPA Emails Confirm that Scott Pruitt’s Secret Science Proposal Is Entirely Driven By Politics, April 19. Online at <https://blog.ucsusa.org/yogin-kothari/internal-epa-emails-confirm-that-scott-pruittssecretpruitts-secret-science-proposal-is-entirely-driven-by-politics>, Accessed August 10, 2018.

protecting CBI also resemble her testimony in front of a Senate Homeland Security and Government Affairs subcommittee, where she represented her former employer, the American Chemistry Council, whose members have a significant financial interest in EPA regulatory matters.³¹³⁵ The commenter states that the proposed rule and supplemental proposal's focus on protecting industry over protecting the public health research community illustrates the Agency's disinterest in seeking actual transparency in decision making; instead, the EPA is seeking an opportunity to protect data for the industries it is supposed to regulate, at the expense of science-based public health safeguards. The commenter adds that this bias is affirmed by Dr. Yamada's response to an email from Dr. Beck, in which he writes that he "didn't know about the intricacies of [confidential business information]" and that the Agency would have to "thread this one real tight!"³¹³⁶

Commenter (12442) contends that, while the proposed rule would subject studies to additional scrutiny by exposing the privacy of participants and raise the standards by which they can be considered, the rule would allow for the continued confidentiality of equally critical and often much more opaque business information such as economic cost modeling or industry labeled proprietary data, which is rarely subject to verification at all, let alone rigorous peer review. The commenter states that this approach would only serve to eliminate the strong and well-founded basis for health and environmental regulations millions of Americans depend on while keeping information deemed confidential by for profit industry interests out of the public eye. The commenter states that the dividing line drawn by this proposal creates two camps: the privileged, industry data kept out of the public eye and often used to avoid protections like pollution controls for heavily emitting sources such as coal-fired power plants and oil refineries; and the epidemiological data prejudiced by EPA's proposed transparency rule that is used to support protections for the benefit of public health and welfare. The commenter states that this is a textbook example of an arbitrary and capricious rulemaking.

Commenter (12442) states that, in the prevention of significant deterioration (PSD) air permitting process, permitting decisions often rely on CBI. The commenter states that, as a result, the public is barred from commenting on, let alone knowing, the information on which an effective emission control may be bypassed in favor of a lax permit that would result in negative air quality impacts that could otherwise be avoided. The commenter states that a rule truly designed to increase transparency should require the data of source operators and owners to be released to the public.

Commenter (12455) contends the supplemental proposal allows companies to manipulate which studies would be considered by declaring them CBI, or by seeking to publish the study in a journal that prohibits sharing data pre-publication. The commenter is also concerned that studies published in subscription journals vs. open source may be treated differently.

³¹³⁵ Beck, N. 2017. Written Statement before the U.S. Senate Committee on Homeland Security and Governmental Affairs, Subcommittee on Regulatory Affairs and Federal Management, Regarding a Hearing on the Agency Use of Science in the Rulemaking Process: Proposals for Improving Transparency and Accountability, March 9. Online at <https://www.hsgac.senate.gov/imo/media/doc/BECK%20TESTIMONY.pdf>, Accessed August 10, 2018.

³¹³⁶ Waldman, S. and N. Heikkinen. 2018. Trump's EPA wants to stamp out 'secret science.' Internal emails show it is harder than expected. E&E News, April 20. Online at <http://www.sciencemag.org/news/2018/04/trump-s-epa-wantsstampwants-stamp-out-secret-science-internal-emails-show-it-harder-expected>, Accessed August 10, 2018.

Commenter (12702) states that, under the proposed rule and supplemental proposal, the EPA would be required to establish an exemption process to utilize CBI or alternative process to give higher weight to data that did not include CBI. The commenter is concerned that either approach could decrease the consistency with which data are treated and increase the discretion of EPA in making such determinations. The commenter states that CBI from regulated or effected entities is in some cases critical to determine the most appropriate standard, control technology, and regulatory requirements. The commenter states the EPA should not finalize a rule, such as this one, that decreases transparency of the rulemaking process by obscuring the basis of and process for taking regulatory actions.

Response: To take into consideration studies that involve PII, CBI or proprietary data, the EPA is finalizing an approach that takes gives greater consideration to pivotal science whose underlying dose-response data involve PII, CBI or proprietary data are available through restricted or tiered access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

11.2.1.2.2 Plan for CBI

Comment: Commenters (10974, 11378, 11491, 11496, 11894, 12455, 12465) contend that the EPA does not sufficiently describe how the proposed rule would cover CBI. Commenter (11378) contends the criteria for evaluation and plans for long-term management regarding research utilizing confidential and proprietary data remain unclear in the supplemental proposal. Commenter (11496) states the EPA has not described how pivotal peer-reviewed science from other countries would be incorporated, including CBI.

Commenter (11491) asserts that, under the proposal as supplemented, there would be uncertainty about how CBI submissions would be treated. The commenter states that understanding the costs and practicability of compliance the EPA often relies upon regulated industry to submit CBI. The commenter notes that, where CBI is excluded, compliance costs are based on outdated numbers or technology. The commenter states that CBI might be at increased risk of public release, creating a disincentive for companies to voluntarily submit information, and Agency use of legally protected CBI might be disfavored, depriving the rulemaking process of important information.

Commenter (11894) states that, much, if not most, of the information used to determine if a chemical may present an unreasonable risk to human health or the environment or would result in substantial human exposure or release to the environment is claimed as CBI and, thus, it could not comply with the transparency rule. The commenter states that how the EPA will deal with this remains to be seen as the proposed rule merely states that it is an issue to be worked out. The commenter states that, under the 2016 TSCA amendments, the EPA must make an affirmative

finding on the safety of a new chemical or significant new use of an existing chemical before it is allowed into the marketplace.

Commenter (12455) states that the supplemental proposal needlessly complicates the use of pesticide reviews, which are traditionally based on CBI studies. The commenter states that it is unclear whether older studies, when they come up for review, will be completely excluded from consideration as they would not qualify under the supplemental proposal.

Commenter (12465) is concerned with the lack of details around appropriate access to CBI. The commenter notes that there will be situations in which CBI cannot be shared publicly, but this should not preclude the inclusion of the CBI in regulatory decisions. The commenter states that, while noting that "[n]othing in the proposed rule compels the disclosure of any confidential or private information in a manner that violates applicable legal and ethical protections," the lack of specificity and applicability is found wanting and the Agency should expand this guidance at great length should the rule go forward.

Response: Under this rule there is no categorical exclusion of pivotal science if the underlying dose-response data are not available for independent validation. Thus, dose-response data involving PII or CBI that cannot be made legally or ethically available or proprietary information that cannot be made available through either law or contractual agreement could still be considered as pivotal science. Availability of dose-response data would be done in accordance with existing laws and contractual agreements.

To take into consideration studies that involve PII, CBI or proprietary data, the EPA is finalizing an approach that takes gives greater consideration to pivotal science whose underlying dose-response data involve PII, CBI or proprietary data are available through restricted or tiered access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Even if the underlying dose-response data are not available for independent validation, the pivotal science including these dose-response data may still be considered as pivotal science, although it would be given lesser consideration than pivotal science where the underlying dose-response data are available, including through restricted or tiered access, for independent validation.

Comment: Commenter (12453) appreciates that the EPA has continued in the supplemental proposal to confirm that it will apply the rule consistent with statutory requirements to protect proprietary data and CBI.

Response: EPA thanks the commenter.

11.2.1.3 Proprietary Data

11.2.1.3.1 General

Comment: Commenter (12430) expresses concern that the term “proprietary data” in 40 CFR 30.5 is not defined.

Response: EPA is not providing a definition of proprietary data because this rule does not regulate such data or treat such data categorically. This rule describes the extent to which EPA will give consideration to pivotal science in which the underlying dose-response data are available or are not available for independent validation.

Comment: Commenter (11378) asserts that the proposal to make information publicly available would potentially violate legally binding proprietary data agreements. The commenter states that deemphasizing geospatial research in which proprietary data agreements necessitate restrictions to public data access would severely limit the EPA’s mission to protect human health and the environment, with consequent deleterious effects on environmental and health policy among state and local government agencies.

Commenter (12430) expresses concern that restricting models to those that are publicly available, or that meet the vaguely described exceptions in proposed 40 CFR 30.5, would severely limit the science that the EPA may consider or reference. The commenter states that, while models are critical to help humans assess and analyze large quantities of data, they are nearly always proprietary. The commenter adds that most scientists and agencies purchase access to and use these models for data.

Response: This rule does not require any dose-response data be made publicly available. Thus, there is no categorical exclusion for dose-response data that includes proprietary data. Availability of dose-response data would be done in accordance with existing laws and contractual agreements.

To take into consideration studies that involve PII, CBI or proprietary data, the EPA is finalizing an approach that takes gives greater consideration to pivotal science whose underlying dose-response data involve PII, CBI or proprietary data are available through restricted or tiered access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Even if the underlying dose-response data are not available for independent validation, the pivotal science including these dose-response data may still be considered as pivotal science, although it would be given lesser consideration than pivotal science where the underlying dose-

response data are available, including through restricted or tiered access, for independent validation.

11.2.1.3.2 Plan for Proprietary Data

Comment: Commenter (11378) expresses concern that the criteria for evaluation and plans for long-term management regarding research utilizing proprietary data remain unclear in the supplementary proposal.

Response: The rule imposes no requirements on the criteria for evaluation and plans for long-term management regarding research utilizing proprietary data.

Comment: Commenter (12453) appreciates that the EPA has continued in the supplemental proposal to confirm that it will apply the rule consistent with statutory requirements to protect proprietary data, including the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and Federal Food, Drug, and Cosmetic Act (FFDCA) provisions. Commenter (12465) recommends that the EPA ensure that any new guidelines comply with applicable laws and encourages the use of all relevant scientific information, regardless of whether the underlying data can be publicly disclosed, especially with respect to data and information developed individually or via consortia under the requirements of FIFRA or TSCA.

Response: EPA will comply with all applicable laws. It will continue to consider all relevant pivotal science in its significant regulatory actions and influential scientific information.

11.2.1.3.3 Tribes

Comment: Commenter (12423) states that, while the proposed rule addresses public health studies, for tribal peoples many of these studies are intertwined with proprietary lifeways including subsistence activities, ceremonies, and spiritual beliefs. The commenter notes that, for example, consumption patterns might reveal locations or numbers of wildlife and plant harvest areas that tribes wish to keep private or might reveal information about how and what a tribe eats. The commenter states that, in the case of the retrospective cohort study for waste disposal practices, self-reported daily subsistence food consumption was included to determine whether these foods provided a protective benefit for the surrogate exposures studied.

Commenter (12423) states that fish consumption is a primary pathway of exposure for multiple chemicals that are released to aquatic systems from a multitude of source and, for many tribes, fish is consumed in far greater quantities than the general population. The commenter notes that it is therefore critical to document the extent of fish consumption in tribes when setting water quality standards and developing water quality policies, either at a national level, state level, or project-specific level in the case of contaminated site cleanups. The commenter further notes that because the fish consumed is not from the grocery store but obtained through traditional practices on tribal lands, community level studies must be carried out. The commenter states that in doing so, not only is the small-scale population problem tripped, but the reluctance of tribal members to share their practices is substantial. The commenter states that tribal members have specific locations in which they harvest fish and some tribes have had conflicts with local and

state officials on their treaty rights to harvest the fish or other species. The commenter provides that some tribal members are reluctant to reveal that they may eat less fish than they could or fear that they may have violated some ordinance through subsistence and ceremonial fishing. The commenter states that subsistence is intricately tied to tribal values, beliefs, and lifeways, and is often a spiritual exercise.

Commenter (12423) asserts that, while the EPA is not in the business of collecting and reviewing data on the religious practices and beliefs of American citizens, the proposed rule essentially asks just that of tribes. The commenter states that, by placing tribes in the position of either revealing aspects of their spiritual lifeways that are not relevant to the study purpose or not being protected by the nation's environmental laws, the proposed rule may have implications for the American Indian Religious Freedom Act of 1978 (AIRFA) (42 U.S.C. § 1996.).

Response: This final rule does not require data revealing proprietary lifeways or personal religious practices be made publicly available. In this final rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. This may be the case for exposure studies evaluating tribal fish consumption patterns. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. Where the Agency is making dose-response data publicly available, it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, CBI, and is sensitive to national security.

11.2.1.4 Personally Identifiable Information (PII)

11.2.1.4.1 Publicly Available Consistent with Law

Legal Protections Could Result in Exclusion of Studies

Comment: Commenters (9372, 10040, 10865, 10866, 10975, 11359, 11361, 11378, 11184, 11396, 11492, 11576, 12715) express concern that studies will be excluded from consideration by the EPA because legally mandated privacy protections prohibit the proposed requirement to make data publicly available.

Commenter (9372) states that pollution can affect cognitive outcomes, like academic test scores and cognitive disabilities, in children.³¹³⁷ The commenter states that the Family Educational Rights and Privacy Act requires that any educational records be kept private on secure servers

³¹³⁷ Heissel, J., Persico, C. and Simon, D. 2020. "Does Pollution Drive Achievement? The Effect of Traffic Pollution on Academic Performance." *The Journal of Human Resources*, forthcoming. Persico, Claudia, David Figlio, and Jeffrey Roth. 2020. "The Developmental Consequences of Superfund Sites." *The Journal of Labor Economics*, forthcoming. Persico, C. and Venator, J. 2020. "The Effects of Local Industrial Pollution on Students and Schools." *The Journal of Human Resources*, forthcoming.

because the release of such information could harm students. The commenter states that this is a ridiculous request that's designed to remove research from policymaking with no benefit. The commenter states that most of the best papers use restricted data because almost no individual data are publicly available anymore. The commenter states that only aggregated data can be released publicly, and aggregated data is often not as good as individual-level data, particularly if there is heterogeneity in the outcomes.

Commenter (10040) asserts data privacy laws largely prevent information from studies involving humans from being made public in the manner being considered by the EPA. The commenter states that, by limiting EPA's ability to use rigorously conducted peer reviewed literature simply because they do not meet transparency standards stands to block consideration of research that is critical to decision making to protect the public's health.

Commenter (10865) states that there are many credible scientific studies where the exposure of raw data to the public is infeasible or would reveal confidential patient information.

Commenter (10866) notes that many studies are conducted on large datasets such as those that draw on hospital records. The commenter states that the proposal, by requiring that the entire dataset be made available, would expose to public scrutiny data that would allow the identification of individual persons included in the study. The commenter notes that, because this would violate legally mandated privacy protections, this step would result in the de facto exclusion from EPA consideration of valuable and significant research studies.

Commenter (11378) notes that after reviewing the supplementary proposal associated with Strengthening Transparency in Regulatory Science Proposed Rulemaking (EPA-HQ-OA-2018-0259-9322), they are concerned that by giving primacy to research in which data and models are made publicly available the proposed rule will limit the use of valid scientific research for promulgating environmental regulations and finalizing scientific information. The commenter contends that the integrity of much environmental and health research requires the tradeoff that certain business, proprietary, and PII remain confidential. The commenter adds that making such information publicly available would potentially violate long-standing human subjects research protocols (*i.e.* the 1974 National Research Act), as well as legally binding proprietary data agreements.

Commenter (11184) asserts that the supplemental proposal does not address the fact that many past and ongoing public health studies simply cannot lawfully, ethically, or efficiently publicly release the underlying data. The commenter states that, even if applied only to future research, the supplemental proposal would limit participation, limit the information that can be collected, and waste limited resources. The commenter states that proposed 40 CFR 30.5 remains a poorly formed scheme in search of a problem that would ultimately force the EPA to arbitrarily make public health and environmental decisions based on incomplete or improperly weighted information.

Commenter (11396) asserts that the EPA's proposal would, despite any clarifications and modifications made in the supplemental proposal, block the use of studies that rely on confidential patient information from being used in policymaking. The commenter states that

many studies, including older studies, depend on or have historically used such data that legally cannot be made public. The commenter states that the fact that this information must be kept confidential to protect patients does not make the data any less valid.

Commenter (11360) states that it is understandable that when issuing regulations, scientific information helps to provide the rationale for decisions; however, not being able to publicly disclose all sensitive data does not justify the EPA dismissing the use of important scientific work that could very well inform regulatory and policy decisions.

Response: In this final rule the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

In this final rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. This may be the case, for example, for studies that rely on health records containing PII. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. Where the Agency is making dose-response data publicly available, it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, CBI, and is sensitive to national security.

Comment: Commenter (12596) suggests the EPA must balance the rule's sound policy goals with the Agency's legal obligation to be a good steward of private, sensitive, and confidential information. The commenter states that statements in the supplemental proposal "clarifying" that the EPA does not intend to make data and models public for which the Agency lacks access or does not have the authority to provide access. The commenter appreciates reassurances in the supplemental proposal concerning sensitive information and anticipates that the Final Transparency Rule can be implemented in a manner that moots disclosure concerns. For the sake of clarity, the commenter reiterates the request from their proposal comments that the EPA explicitly state that the rule does not assert authorization under the law to disclose protected sensitive or confidential information, and that any such claim must be independently based on a statutory grant of authority from Congress.

Response: The EPA confirms that this final rule does not assert authorization under the law to disclose protected, sensitive, or confidential information. This is a rule of internal agency procedure and does not require the EPA or any entity outside the federal government to make data available. Where the Agency is making dose-response data publicly available, it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, CBI, and is sensitive to

national security. Finally, as this rule makes clear, if implementing this procedural rule would result in conflicts with existing statutes, and their implementing regulations, this rule will yield to the statutes and regulations.

Comment: Commenter (11496) asserts the EPA does not provide the tools necessary for this rule to function without causing a conflict with established Federal data privacy rules.

Commenter (12403) contends the proposal undermines privacy protections for participants in human subject research. Commenter (12458) states that confidentiality of health data in research is often ethically, if not legally required.

Response: The EPA disagrees with the commenters that this rule would conflict with either Federal data privacy laws or regulations, or the ethics of patient confidentiality. This is a rule of internal agency procedure and does not require the EPA or any entity outside the federal government to make data available. Where the Agency is making dose-response data publicly available, it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, CBI, and is sensitive to national security. Finally, as this rule makes clear, if implementing this procedural rule would result in conflicts with existing statutes, and their implementing regulations, this rule will yield to the statutes and regulations.

Common Rule

Comment: Commenters (9372, 11182, 12422) express concern that the supplemental proposal may not be consistent with the Common Rule.

Commenter (9372) asserts that the requirement that researchers post data publicly violates the Common Rule guidelines for Human Subjects research.

Commenter (11182) states that a key duty in the American College of Epidemiology's ethical guidelines is the protection of confidentiality and privacy.^{3138,3139} The commenter states that this duty echoes the obligation to maintain patient confidentiality in Occupational and Environmental Medicine (ACOEM) Code of Ethics,³¹⁴⁰ as it does for all professional medical and scientific

Accessed April 22, 2020: https://www.ecfr.gov/cgi-bin/textidx?m=10&d=22&y=2018&cd=20181018&submit=GO&SID=83cd09e1c0f5c6937cd9d7513160fc3f&node=pt45.1.46&pd=20180719#se45.1.46_1102.

organizations. The commenter states that the 1979 Belmont report laid the groundwork for privacy and confidentiality in human research. The commenter states that the ethical principles guiding the report and underlying the ethical practice of science and medicine are autonomy (respect for persons), beneficence (do no harm), and distributive justice (equitable risks and benefits). The commenter states that the Belmont report led directly to the 1991 Common Rule, which set the regulations for the ethical conduct of human-subjects research.^{3141,3142} The commenter states that in the 2018 updated Common Rule, confidentiality protections for people who volunteer to participate in research were strengthened. The commenter states that the public must feel confident that their private information is protected, and researchers must be able to assure their research subjects that confidentiality is maintained. The commenter states that the supplemental proposal rejects this basic ethical tenet. The commenter states that even with the unexplained and untested “tiered access” proposition, researchers will be unable to provide that reassurance.

Commenter (12422) states that, depending on how it is implemented and interpreted by the Administrator, under this regulation, human studies could only be used by EPA if the investigators surrender confidential data that the investigators had promised the study subjects and institutional review boards (IRBs) would never be released. The commenter states that, while the EPA might agree to redact these data before public posting, they could be given to anyone who signed a confidentiality agreement designed by the agency. The commenter states that implications for the protections of human subjects and informed consent under the Common Rule (the Federal Policy for the Protection of Human Subjects)³¹⁴³ have yet to be evaluated.

Response: The EPA disagrees with the commenters that this final rule would either require the release of human subject research data in conflict with the Common Rule, or cause the EPA to categorically exclude human health data from consideration in EPA significant regulatory actions or influential scientific information. The EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

In this final rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA acknowledges that there may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure

³¹⁴³ <https://www.hhs.gov/ohrp/regulations-and-policy/regulations/common-rule/index.html>

environment that still allows for independent analysis. This may be the case, for example, for studies that rely on human subject research data. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. Where the Agency is making dose-response data publicly available, it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, CBI, and is sensitive to national security.

Health Insurance Portability and Accountability Act (HIPAA) and Institutional Review Boards (IRBs)

The HIPAA Privacy Rule establishes national standards to protect individuals' medical records and other personal health information and applies to health plans, health care clearinghouses, and those health care providers that conduct certain health care transactions electronically. The Rule requires appropriate safeguards to protect the privacy of personal health information, and sets limits and conditions on the uses and disclosures that may be made of such information without patient authorization. The Rule also gives patients control and rights over their health information, including rights to examine and obtain a copy of their health records, and to request corrections.

Comment: Commenters (9372, 11183, 11190, 11404, 11479, 11496, 12718, 12715, 12720) express concern that the supplemental proposal may not be consistent with HIPAA and/or IRB requirements. Commenter (11404) states that HIPAA protections must be honored. Commenter (11183) asserts that the proposed rule violates HIPAA standards.

Commenter (9372) states that researchers cannot make their data publicly available because there are laws against that type of thing to protect the privacy of health and education information such as HIPAA.

Commenter (11190) contends the proposed rule is impractical to implement, because there are good and justifiable regulations protecting private health information, described by HIPAA. The commenter states that human subjects in medical studies participate in these studies with the assurance that their private medical information will never be revealed.

Commenter (11479) states that, while we can assume that the agency believes that a simple anonymization process is enough to fully and completely protect people's confidential data, a simple anonymization process is at odds with the legal and ethical frameworks developed to protect human participants in scientific studies. The commenter states that HIPAA requires that medical information be protected by a set of administrative, physical, and technical safeguards,³¹⁴⁴ and a scientist who releases raw anonymized data to the public could be in violation of their IRB approval,³¹⁴⁵ which governs a study's informed consent process. The

³¹⁴⁴ Office for Civil Rights (OCR). 2019. Security Rule Guidance Material. Washington, DC: US Department of Health and Human Services. Online at <https://www.hhs.gov/hipaa/for-professionals/security/guidance/index.html>, Accessed May 14, 2020.

³¹⁴⁵ University of California, Irvine Office of Research. 2019. Privacy and Confidentiality. Online at <https://www.research.uci.edu/compliance/human-research-protections/researchers/privacy-and-confidentiality.html>, Accessed May 14, 2020.

commenter states that the release of underlying human health data may include participants who cannot consent to such a process, like participants who have died. In a rare joint statement on the proposed rule, the editors of six prominent scientific journals³¹⁴⁶ wrote that some data “cannot be shared openly; even anonymized personal data can be subject to re-identification, and it has been a longstanding practice for agencies and journals to acknowledge the value of data privacy adjustments.”

Commenter (11496) states that the EPA has not described how future studies could comply with the proposed data access requirements while maintaining compliance with other applicable statutes, such as HIPAA, while assuring participants they will continue to prevent disclosure of personal health information to unknown third parties in the future.

Commenter (12718) states that the EPA’s proposed approach in the supplemental proposal presumes that access to data or information must be – as an absolute – accessible to EPA officials, even when that level of access might be inconsistent with IRB requirements, consent statements, or other ethical procedures that should be paramount in government’s commitment to its citizens for protecting data and confidentiality. The commenter states that the EPA’s supplemental proposal offers no meaningful articulation of privacy and confidentiality safeguards for the American people. The commenter states that the Agency has no established statistical agency or unit designated under the Confidential Information Protection and Statistical Efficiency Act of 2018 (Title 3 of PL 115-435) to apply civil and criminal penalties for violations of protection. The commenter states that this is disappointing in that these protections were unanimously upheld by the Republican and Democratic appointees to the U.S. Commission on Evidence-Based Policymaking as a model for federal agencies, including the EPA, then reauthorized with strong bipartisanship in Congress.

Commenter (12715) notes that the SNPRM does not specify how confidential health information covered by the HIPAA Privacy Rule can be protected outside of HIPAA-covered entities but, again, designing and implementing such protections would be expensive and time consuming.

Commenter (12720) asserts that the proposal’s requirement for the public sharing of underlying data of these studies contradicts HIPAA’s legal protections for private medical data and requirements researchers adhere to under IRBs, which typically require investigators to ensure participant confidentiality and data security. The commenter states that underlying sensitive health data cannot be released without obtaining individual patient consent, or consent from the next responsible party for study participants who have died.

Response: The final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. The purpose of the final rule is to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. If dose-response data underlying pivotal science contains PII, the EPA will evaluate whether these data are available in a manner sufficient for independent validation (potentially through restricted access). For pivotal science where there is no access to

³¹⁴⁶ Thorp, H.H. et al. 2019. "Joint statement on EPA proposed rule and public availability of data (2019)." *Science*, vol. 366, issue 6470: 25368-25368. DOI: 10.1126/science.aba3197.

dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.7.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to establish data sharing mechanisms.

Comment: Commenter (11496) states that the EPA has not explained how GLP2 studies will be addressed by this rule, particularly those that are conducted through a process that follows HIPAA rules. The commenter provides that King County is concerned that pivotal regulatory decisions will increasingly be made based on rodent and other guideline studies rather than peer-reviewed science that describes the direct impacts of chemical exposures on people's lives.

Response: The purpose of the final rule is to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. Under the final rule, the EPA is not categorically excluding any studies from consideration with promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule under 40 CFR 30.7.

11.2.1.4.2 Deidentification

General

Comment: Commenter (11900) states that a primary concern about data transparency is that study participants will be re-identified when identifiable information sufficient to contact a person (such as name or address) is matched to "de-identified" data. The commenter states that the supplemental proposal defines PII by reference to the "requirements of the Common Rule, the HIPPA [sic], the 21st Century Cures Act, the Privacy Act, and other relevant laws and regulations, and EPA privacy policies." The commenter states that this definition of PII does not capture all of the data types that can contribute to re-identification risk.

Response: The final rule does not require the de-identification of PII. The purpose of the final rule is to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory

actions and develop influential scientific information. If dose-response data underlying pivotal science contains PII, the EPA will evaluate whether these data are available in a manner sufficient for independent validation (potentially through restricted access). For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.7.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Adverse Consequences of Deidentification

Comment: Commenter (9372) contends that, if employers, colleges or others found out about people's health, it could cause them to get fired or suffer in other ways. Commenter (11576) asserts that the potential consequences of reidentification are severe.

Commenter (11479) re-identifying people from an anonymized database could prove particularly damaging for research on issues like child abuse, sexual assault, and mental illness. And data that include genetic information could reveal sensitive information about the relatives of the research participants, including those not yet been born.

Commenter (11480) states that the release of private health data that could be used to identify individual workers serving as subjects in a study puts those workers at risk of discrimination or retaliation by their employers, insurers, and others.

Commenter (11576) refers to a study³¹⁴⁷ which identifies a number of adverse consequences due to re-identification and expresses concern that these consequences have not been addressed by the EPA. The commenter identifies the following adverse consequences:

Loss of privacy from re-ID could result in stigma for individuals and communities; affect property values, insurance, employability, and legal obligations; or reveal embarrassing or illegal activity.... It could damage trust in research, harming the study and research more generally. Because ... [environmental health] studies often focus on groups with the highest exposures, privacy risks potentially compound harms faced by the most vulnerable communities. Entities that might be motivated to re-identify ... [environmental-health] data include, for example, employers or insurance companies (who may wish to discriminate against individuals or properties on the basis of environmental exposures) and corporations affected by environmental regulations (who may wish to discredit litigants or studies demonstrating ... [environmental-health] harms, or to discourage participation in ... [environmental-health research]). Other parties might

³¹⁴⁷ Katherine Boronow, et al., Privacy Risks of Sharing Data from Environmental Health Studies, Environmental Health Perspectives (Jan. 10, 2020) (attached), available at <https://ehp.niehs.nih.gov/doi/10.1289/EHP4817>.

leverage the environmental variables to gain access to other parts of the data set, such as sensitive health information.³¹⁴⁸

Commenter (11920) states that, because public disclosure of sensitive biological data can cause irreparable harm to imperiled species populations, there are established norms for the application and use of such data without full disclosure. The commenter states that applying the proposed rule regarding public disclosure of data would severely limit the ability of the agency to properly address endangered species and wildlife issues in its work, including pesticide labeling and use restrictions under FIFRA, and Section 7 consultations under the Endangered Species Act. The commenter states that access to raw data at the stage described in the supplemental proposal is typically not a requirement even for peer-review, as scientists can evaluate the robustness and accuracy of findings based on the presentation of processed data and description of the methods and analysis used.

Commenter (11926) states that the uses of sensitive personal data in the wrong hands can range from personal embarrassment through release of identified information on social media, to impacts on an individual's employment and insurance when health data are involved.

Response: The final rule does not require the de-identification of PII. The purpose of the final rule is to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. If dose-response data underlying pivotal science contains PII, the EPA will evaluate whether these data are available in a manner sufficient for independent validation (potentially through restricted access). For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.7.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Deidentifying and Reidentifying Data

Comment: Several commenters (9372, 11360, 11396, 11186, 11192, 11361, 11395, 11473, 11479, 11576, 11900, 11921, 12405, 12464, 12546, 12715, 12720, 12727) express concern that the deidentification of PII required by the proposed rule is infeasible due to issues of cost, the type of data essential to health studies, identification technology, and/or the risk of identification. Other commenters (10042, 11381, 11899) contend the anonymization process maintains the privacy of the individual.

³¹⁴⁸ Id.

Response: The final rule does not require the de-identification of PII. The purpose of the final rule is to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. If dose-response data underlying pivotal science contains PII, the EPA will evaluate whether these data are available in a manner sufficient for independent validation (potentially through restricted access). For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.7.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenters (11192, 11361) state that the EPA fails to acknowledge the substantial costs of data de-identification. Commenter (11192) states that thorough data de-identification is not trivial, and if it was not included in an original project scope and budget, it is highly unlikely any academic researcher would have the capacity to undertake the de-identification process. The commenter states that, for existing studies, it is likely to be financially impracticable to de-identify data to make any sort of public access possible, thus excluding them or devaluing them in Agency consideration, except through the sole discretion of the Administrator.

Response: The EPA disagrees that this rule would impose costs on third-party researchers. This is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information. If dose-response data underlying pivotal science contains PII or CBI, the EPA will evaluate whether these data are available through restricted access in a manner sufficient for independent validation. For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.7.

Comment: Commenter (11921) asserts that it is not possible to conduct a high-quality air pollution and health study without knowing the locations of those being studied, *i.e.* where they live, the sources and levels of their air pollution exposure, as well as their specific covariates, and specific health outcomes. The commenter states that, should such information be made available at smaller spatial scale, it is possible to disclose extensive personal and medical information for individual study subjects, raising privacy and ethical concerns. The commenter states that taken together, these characteristics – which have in general enhanced the quality and the sensitivity of the studies – increase the difficulty of providing a fully “de-identified” data set while also enabling a different investigator to conduct a full replication and sensitivity analysis of the original study results. The commenter states that analyses using more limited data sets may well therefore result in incomplete and misleading results. The commenter states that, since the goal should be to find ways to share data that enables full replication and sensitivity analysis

of original studies, it is valuable to consider several aspects of large population air pollution studies that have moved them towards utilizing data at smaller spatial scales:

First, in response to valid criticisms that earlier air pollution studies relied only on central air quality monitoring data to estimate exposure, investigators have increasingly sought to improve exposure estimates by employing land use regression and other methods that can account for the distance of a subject's home from roadways, industrial facilities, and other sources of air pollution. They have also applied increasingly finer-grained community-level covariates (*e.g.* at the zip code level). While in the largest locations the application of these finer-grained data may not allow for identification of individuals, the national analyses in some of these studies include subjects from a range of community sizes, including smaller communities where identification could be possible.

Second, as these types of studies have been reviewed intensively by the HEI Review Committee, the Committee has identified two potentially significant sources of uncertainty in their results: the so-called “ecological confounding”³¹⁴⁹ and “spatial autocorrelation.”³¹⁵⁰ To address both of these issues, one of the first steps that investigators have taken has been to use data at smaller scales which, while enhancing their ability to address these two sources of uncertainties, also poses the potential in smaller communities for individuals and their personal information to be identified.

Response: The final rule does not require the release of PII or sensitive information. The purpose of the final rule is to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. If dose-response data underlying pivotal science contains PII, the EPA will evaluate whether these data are available in a manner sufficient for independent validation (potentially through restricted access). For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.7.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenters (9372, 10040, 11360, 11396, 11186, 11395, 11473, 11479, 11576, 11900, 12405, 12464, 12715, 12720, 12727) assert that, although “publicly available data” would be anonymized, it is now possible to re-identify people in these datasets. Commenter

³¹⁴⁹ The commenter provides that ecological confounding arises when some community-level variables (such as socio-economic status), which are themselves and independent risk factors for mortality, are also associated with air pollution levels.

³¹⁵⁰ According to the commenter, spatial autocorrelation is the tendency for variables to have similar values for people or areas that are geographically close, which violates a common assumption in statistical analyses that measured outcomes are independent of each other. Appropriately addressing spatial autocorrelation and accounting, for example, for other mortality causes or exposures in a given locale leads to more robust and precise results.

(9372) states that with new machine learning techniques it is easier and easier to identify people in data even when the data is anonymized.

Commenter (11186) states that newer and more advanced technological methods are being developed to re-identify participants from small and large studies which were once thought “fully de-identifiable”. Commenter (11473) states that even anonymized personal data can be subject to reidentification. Commenter (11479) contends that a simple anonymization process is inadequate to protect personal data. Commenter (12727) states that advances in computing have made it possible to identify participants in studies and details about their personal and medical histories, even where researchers have taken steps to mask that information or otherwise “de-identify” the data before disclosing it.³¹⁵¹ As described below, these commenters cite various studies that have documented that de-identification techniques to render data anonymous is not “simple,” despite what the Proposal suggests, and can lead to the publication of protected confidential or private data.

Commenters (11360, 11396) state that stripping out personal identifiers does not solve the problem as the identity of individuals often can be inferred by using data sets from multiple sources.³¹⁵²

Commenters (11576, 11479, 11900, 12464) refer to the Boronow et al. study³¹⁵³ that discusses how even limited information made available from multiple studies involving the same dataset allowed researchers to successfully re-identify study participants. Commenter (11576) states that researchers in the study were able to re-identify study participants despite the exclusion and redaction of information that could not be shared under the safe-harbor provision of the HIPAA. Commenter (12464) states that the study demonstrates that it is possible to successfully re-identify environmental health study participants using information that is publicly or commercially available such as voter lists, tax and real estate information, or information that is available from data brokers.

Commenter (11900) states that the Boronow et al. study shows that linkage re-identification can occur when de-identified data is matched to externally available, identifiable data using data fields that overlap between both datasets. The commenter states that examples of external public or commercial datasets that can be used in linkage re-identification include tax assessor data, registries of licensed professionals, hospital discharge records, or advertising lists. The commenter states that because environmental health studies often link protected health information and non-protected fields, seemingly non-sensitive data can compromise the security of the entire dataset and lead to breaches of sensitive personal information. The commenter states that the study also demonstrated how chemical exposure measurements, a distinguishing data type of environmental health studies, could pose an unanticipated privacy risk. The commenter

³¹⁵³ Katherine Boronow, et al., Privacy Risks of Sharing Data from Environmental Health Studies, Environmental Health Perspectives (Jan. 10, 2020) (attached), available at <https://ehp.niehs.nih.gov/doi/10.1289/EHP4817>.

states that this analysis demonstrated that chemical data could be used to infer a characteristic of people in a study, even if that characteristic is excluded when the study data are shared.

Commenters (11395, 12715) assert that the issue of protecting confidentiality of data has been well recognized. Commenters refer to NAS report which states that, “[i]n an experiment to discover whether confidentiality could be preserved while opening the data for public review, the study investigators attempted to disguise the identity of the study participants. They deleted as many features as possible from the questionnaires, such as the name, the state file number, the mother’s maiden name, and the name of the person providing the information. However, the investigators needed to retain a minimum set of features if other scientists were to be able to replicate the basic findings of the study... and found that even this minimum set of features could allow for identification of research participants.”³¹⁵⁴ Commenter (12715) contends this demonstrates that, even after going through an arduous, time consuming process, the removal of personal identifying information would be difficult to achieve.

Commenters (11473, 11479, 12727) refer to the Rocher et al., study³¹⁵⁵ in which 99.98% of Americans could be correctly re-identified using a combination of just 15 demographic attributes. The commenters assert that the study demonstrates that anonymized personal data can be subject to reidentification. Commenter (12727) notes that the authors state, their results “reject the claims that, first, re-identification is not a practical risk and, second, sampling or releasing partial datasets provide plausible deniability.”

Commenters (12464, 12727) refer to the Science Advisory Board (SAB) report³¹⁵⁶ on the risk of re-identification and state that “[a]lthough the Proposed Rule suggests that privacy and confidentiality issues can be addressed through anonymization or de-identification, this is not always the case;” anonymization is not always effective because “even de-identified datasets present significant risks of reidentification given modern techniques for combining these datasets with other sources of individual information (also known as a ‘mosaic effect’).” Commenter (12464) asserts that, in general, the supplemental proposal expresses too much confidence that de-identification can adequately address privacy and confidentiality concerns.

Commenters (11186, 11395, 11900) refer to the 2017 Sweeney et al., study³¹⁵⁷ which tested the ability to re-identify participants from a small de-identified environmental health study on air pollution. The commenters state that in the study, using data considered by the HIPAA to be sufficiently de-identified to be made public and which involved far fewer variables than would

be required for the reanalysis proposed by EPA, the researchers were able to correctly identify over 25% of the study participants.³¹⁵⁸

Commenter (11473) refers to three studies³¹⁵⁹ and states that even anonymized personal data can be subject to reidentification, and it has been a longstanding practice for agencies and journals to acknowledge the value of data privacy adjustments.
