The National Academies recognize the current limitations of producing restricted data that sufficiently limits identifiability to allow it to be made publicly available in a useful form. They note that “well-informed policy making” requires “[r]esearch using detailed confidential data” that cannot be made public—which the Proposal fails to acknowledge to the detriment of the quality of EPA’s policy decisions.¹⁵¹⁵ Just because certain information cannot be made public for legitimate reasons does not mean the government should refuse to use it to inform policy. And much of the data useful for environmental and health research is particularly sensitive—the report notes there is increased vulnerability in “[d]ata with geographic detail, such as census block data” and longitudinal data obtained in panel surveys, which is often salient in environmental research.¹⁵¹⁶ In the meantime, the National Academies state that more work is needed to allow “[h]igh-quality public-use files” that still assure “the inferential validity of the data while safeguarding their confidentiality.”¹⁵¹⁷

They also point to broader implications of not implementing sufficient privacy protections that EPA does not consider at all may result from the Proposal. The quality of data collected is likely to suffer as “[i]t is essential that respondents believe they can provide accurate, complete information without any fear that the information will be disclosed inappropriately.”¹⁵¹⁸ Essentially, the report leaves as an open question “decisions about how much disclosure risk is acceptable in order to achieve the benefits of greater access to research data involve weighing the potential harm posed by disclosure against the benefits potentially foregone.”¹⁵¹⁹ Thus, EPA wrongfully points to this report as supporting the notion that simple techniques exist to address privacy concerns. The report recommends only more research to reduce risks and increase data

utility along with consultation with data users and providers about these issues—which the Proposal does not implement and thus the report does not support the Proposal.¹⁵²⁰

Response: See Section III.A of the final rule preamble and Chapter 2 of this document

Comment [8750-1919]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 19 of the proposal:

<https://www.cep.gov/content/dam/cep/report/cep-final-report.pdf>;
<https://www.nap.edu/catalog/24652/innovations-in-federal-statistics-combining-datasources-while-protecting-privacy>; <https://www.nap.edu/catalog/24893/federal-statisticsmultipliedata-sources-and-privacy-protection-next-steps>.

The commenter states that the EPA claims that “the National Academies and the Bipartisan Commission on Evidence Based Policy have discussed the challenges and opportunities for facilitating to secure access to confidential data for non-government analysts.”¹⁵²¹ The proposal does not explain how these examples are relevant, as there is no indication that secure access to underlying data would meet the requirements of making underlying data “publicly available.” Further, even if it were relevant, a review of the sources cited reveal that they do discuss many challenges in this space—which the Proposal does not at all address—and provide no support for the Proposal. The commenter specific comments follow:

I. Commission on Evidence-Based Policymaking, The Promise of Evidence-Based Policymaking (2017)

This report centers on how to enhance infrastructure to increase the access and use of data between federal agencies to support government policy-making, rather than increase public access to data to non-governmental analysts for purposes of independently validating regulatory science.¹⁵²² Further, its focus is to help efforts to make more data available for government purposes to better inform policies. The Proposal on the other hand seeks to make data available to validate individual studies while ultimately making less data available for EPA to consider as it creates policies.

To the extent the report does speak to making more data publicly available, it envisions an entirely new framework to provide adequate privacy protections. Chapter Three of the report discusses increasing threats to privacy as “the amount of information about individuals that is publicly available has grown and the technology that can permit unauthorized re-identification has improved.”¹⁵²³ It notes that forming solutions to this problem while preserving the quality of

¹⁵²⁰ Id.

¹⁵²¹ 83 Fed. Reg. at 18,771.

¹⁵²³ Id. at 54-55.

data is difficult, and that a challenge is “ensuring that enhanced statistical disclosure methods do not change the data in ways that increase the difficulty of reproducing research results.” It thus specifically notes that protecting confidentiality can be in tension with allowing data to be used for reproducibility purposes.

The report recommends: (1) amending federal statutes to require Federal departments to conduct a comprehensive risk assessment on de-identified confidential data intended for public release and release de-identified confidential data subject to the Privacy Act and Confidential Information Protection and Statistical Efficiency Act (CIPSEA) only after a disclosure review board approves the release and publicly provides the risk assessment and a description of steps taken to mitigate risk; (2) federal departments to adopt state-of-the-art database, cryptography, privacy-preserving, and privacy-enhancing technologies for confidential data used for evidence building; (3) federal departments assign a senior official the responsibility for coordinating access to and stewardship of the department’s data resources; (4) new legislation ensuring that data acquired under a pledge of confidentiality are kept confidential and used exclusively for statistical purposes.¹⁵²⁴ The Proposal does not discuss or contribute to any of these efforts.

Chapter Four recognizes that some data cannot be made publicly available without sacrificing the utility of the evidence and thus sets forth recommendations for creating a new National Secure Database Service to allow researchers to access “detailed data that cannot be made publicly available, and only for exclusively statistical purposes.”¹⁵²⁵ This report thus implicitly recognizes the value of using confidential data to “securely generate evidence about government policies and programs.”¹⁵²⁶ While transparency is a crucial goal, using data that cannot be made publicly available can help inform government policies in important ways.

The Report details the many obstacles to making data publicly available, and ultimately concludes that much more work is needed in this area, none of which is being furthered by EPA’s Proposal.

II. NAS, Innovations in Federal Statistics: Combining Data Sources While Protecting Privacy (2017)

This report provides recommendations to increase sharing and use of data by the federal government and between agencies.¹⁵²⁷ It places maintaining privacy and confidentiality at the forefront. The report provides a discussion of the benefits and challenges to allowing external researchers to access data held by government agencies. This assumes that agency has access to data in the first place—which may not be the case with the studies EPA wishes to rely on that would be barred by its Proposal.

The report notes multiple risks to privacy and confidentiality from data breaches, identity theft, and the threat from the ability to combine multiple data sources to re-identify anonymized data

¹⁵²⁴ Id. at 47.

¹⁵²⁵ Id. at 66.

¹⁵²⁶ Id. at 68.

¹⁵²⁷ NAS, *Innovations in Federal Statistics: Combining Data Sources While Protecting Privacy*, National Academies Press (2017).

as more and more data is made publicly available.¹⁵²⁸ The solutions that the report proposes to minimize these risks include: data minimization, restricted data, restricted access (including licensing agreements, FSRDCs, nongovernment data enclaves).¹⁵²⁹ The Proposal does not allow for data minimization since it is aimed at making public complete underlying data that is likely to involve salient personally identifiable information for an unlimited amount of time.¹⁵³⁰ Data restriction involves “removing explicit identifiers and applying a variety of statistical disclosure limitation methods to the dataset to reduce the risk of disclosure.”¹⁵³¹ However, because these techniques “decrease the precision of the variables in the dataset and. . . introduce errors” it is unclear that they would preserve data for independent validation while also sufficiently protecting privacy.¹⁵³² Restricted access involves using “administrative procedures and technology to restrict who can access the dataset and what kinds of analyses can be done with the data to reduce the risk of disclosure.”¹⁵³³ This specifically limits access to data from the general public, which seemingly would not meet the requirements of EPA’s proposal. Thus, EPA has not addressed how it would meet any of the challenges raised in this document.

III. NAS, Federal Statistics, Multiple Data Sources, and Privacy Protection: Next Steps (2017)

This report is not directly relevant as it discusses ways to combine diverse data sources from government and private sector sources and the privacy issues that arise from combining multiple data sets.¹⁵³⁴ The purpose of the report is to help “federal statistical agencies examine and evaluate data from alternative sources and then combine them as appropriate to provide the country with more timely, actionable, and useful information for policy makers, businesses, and individuals.”¹⁵³⁵ EPA’s proposal will in fact restrict the information that EPA can use.

The report notes that the “privacy status of data is dynamic over time, that datasets that are not individually identifiable today may in the future become individually identifiable” with the availability of new techniques and auxiliary data.¹⁵³⁶ It notes that as data sets are linked, these privacy threats increase.¹⁵³⁷ The Proposal does not discuss or address threats to privacy from data linkages.

The panel highlighted a number of threats to privacy and data security, including from security threats and inferential disclosure, and concluded “there is awareness of weaknesses of current statistical disclosure limitation methods, but the feasibility for federal statistical agencies of

¹⁵³⁵ Id. at 2.

¹⁵³⁶ Id. at 71.

¹⁵³⁷ Id. at 72.

implementing new technologies, such as differential privacy, has not been clearly demonstrated.”¹⁵³⁸ Finally, they state:

Overall, much work, interaction, and collaboration will be needed across the various disciplines and stakeholders as agencies seek to move forward to provide stronger privacy protection for the data they either collect from respondents or acquire access to from other administrative and private-sector sources for statistical purposes. It will be critical for there to be robust discussions of the implications of this approach for all stakeholders and these discussions will need to be informed by concrete examples to help everyone understand how use of these technologies will affect them.¹⁵³⁹

The report notes that in order to provide greater access to data much more research and resources are needed. The Proposal identifies no such resources or processes needed to develop needed methods and techniques to allow for greater data disclosure.

Response: See Section III.A of the final rule preamble and Chapter 2 of this document. EPA notes that this final rule does not require EPA to categorically exclude any studies. See response to Comment 4829-2022.

Comment [8750-1920]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 20 of the proposal:

For example, see policies or recommendations of publishers Taylor & Francis, Elsevier, PLOS, and Springer Nature.

The commenter states that the EPA cites to “policies or recommendation” of several journals that require data be deposited in public data repositories as an example of the Proposal’s requirement of data availability.¹⁵⁴⁰ EPA provided only a list of journals with no reference to any specific policies making it difficult to respond fully to this statement.

Each of these journals, however, has exceptions to its data availability requirements when there are valid reasons preventing authors from making their data publicly available via a public data repository. Further, the editors of these journals released a joint statement that explains why their policies with regards to data availability should not be used to support a policy by a federal agency that would in fact restrict the scientific studies it could rely on.¹⁵⁴¹ Given the vastly different contexts and aims of federal agencies and scientific journals when it comes to making data publicly available, journal policies should not inform EPA’s direction. None of these

¹⁵³⁸ Id. at 105.

¹⁵³⁹ Id. at 106.

¹⁵⁴⁰ 83 Fed. Reg. at 18,771.

¹⁵⁴¹ Jeremy Berg et. al., Joint statement on EPA proposed rule and public availability of data, Science (Apr. 30, 2018), <http://science.sciencemag.org/content/early/2018/04/30/science.aau0116>.

journals claims that lack of data availability in itself calls into question the validity of a scientific conclusion based on that data—and thus these policies do not support the Proposal.

Response: See Section III.A of the final rule preamble and Chapter 2 of this document.

Comment [8750-1921]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 21 of the proposal:

For example: <https://osp.od.nih.gov/scientific-sharing/requesting-access-tocontrolled-access-data-maintained-in-nih-designated-data-repositories-e-g-dbgap/>;
<https://www.census.gov/fsrdc>.

The commenter states that as examples of controlled access to data in federal research data centers, EPA cites to the NIH’s policy for requesting access to controlled-access data maintained in NIH-designated data repositories and the U.S. Census Bureau’s website on FSRDC, secure facilities providing authorized access to restricted-use microdata for statistical purposes only. NIH requires researches to be a tenure-track professor, senior scientist, or equivalent and go through required procedures prior to gaining access.¹⁵⁴² The U.S. Census Bureau requires researchers to obtain Census Bureau Special Sworn Status, which requires passing a moderate risk background check and swearing to protect respondent confidentiality for life, with significant financial and legal penalties under Title 13 and Title 26 for failure to do so.¹⁵⁴³

It is unclear how these policies are informing EPA’s proposal. EPA’s proposal would require data to be made “publicly available,” and these forms of restricted access specifically do not make data publicly available. They require significant resources and infrastructure and careful thought about who will be permitted to access such data and under what conditions— none of which EPA has provided any discussion of in the Proposal.

Response: See Section III.A of the final rule preamble and Chapter 2 of this document.

Comment [8750-1922]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 22 of the proposal:

¹⁵⁴² NIH, Requesting Access to Controlled-Access Data Maintained in NIH-Designated Data Repositories (e.g., dbGaP), <https://osp.od.nih.gov/scientific-sharing/requesting-access-to-controlled-access-data-maintained-in-nihdesignated-data-repositories-e-g-dbgap/> (last accessed Aug. 10, 2018).

¹⁵⁴³ U.S. Census Bureau, Secure Research Environment, https://www.census.gov/about/adrm/fsrdc/about/secure_rdc.html (last accessed Aug. 10, 2018).

These recommendations are consistent with those of Lutter and Zorn (2016). <https://www.mercatus.org/system/files/Mercatus-Lutter-Public-Access-Data-v3.pdf>. we re.

The commenter states that the EPA cites to a working paper by Randall Lutter and David Zorn as supporting the proposition that “EPA should collaborate with other federal agencies to identify strategies to protect confidential and private information in any circumstance in which it is making information publicly available. These strategies should be cost-effective and may also include: Requiring applications for access; restricting access to data for the purposes of replication, validation, and sensitivity evaluation; establishing physical controls on data storage; online training for researchers; and nondisclosure agreements.”¹⁵⁴⁴

Lutter and Zorn reference these strategies as ones agencies could use to minimize the risks to personally identifiable information when agencies make data publicly available.¹⁵⁴⁵ However, EPA’s proposed regulations do not discuss or propose implementation of any of these strategies. The Proposal would result in a rule that mandates only that data be made “publicly available” without any possibility for more restricted release. As the comments discuss, EPA has further not consulted with other federal agencies on this Proposal.

Lutter and Zorn additionally do not argue that agencies should immediately disregard studies where data cannot be made publicly available, and provide alternative procedures agencies should utilize in those cases when still relying on studies.¹⁵⁴⁶ In a separate statement on the HONEST Act, which contains similar requirements as the Proposal, Lutter and Zorn stated that the legislation “should also allow agencies to regulate in instances where they do not possess data.”¹⁵⁴⁷ While these additional procedures they recommend agencies follow could still be overly burdensome and barriers to EPA promulgating important safeguards, it is important to note that even they see the dangers in a rule that would force the agency to disregard studies when underlying data could not be made public.

Response: The final rule does not require EPA or any entity outside of the agency to make data publicly available. EPA notes that the supplemental proposal underwent interagency review.

Comment [8750-1923]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 23 of the proposal:

¹⁵⁴⁴ 83 Fed. Reg. at 18,771.

¹⁵⁴⁵ Randall Lutter & David Zorn, On the Benefits and Costs of Public Access to Data Used to Support Federal Policy Making, Mercatus Working Paper 31 (Sept. 2016).

¹⁵⁴⁶ Id. at 32-33.

¹⁵⁴⁷ Randall Lutter and David Zorn, The Data That Our Government Uses Must be Transparent, SmartRegs (Mar. 13, 2017), <https://smartregs.org/the-data-that-our-government-uses-must-be-transparent-caa16b3dc19d>.

<https://www.nap.edu/catalog/11434/expanding-access-to-research-data-reconciling-risks-and-opportunities>.

The commenter states that the Proposal claims “[t]he benefits EPA ensuring that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation are that it will improve the data and scientific quality of the Agency’s actions and facilitate expanded data sharing and exploration of key data sets.”¹⁵⁴⁸ EPA cites to a National Academies report. This report does speak to many benefits of making data available to researchers, including helping to maintain and improve data quality;¹⁵⁴⁹ promoting new research and exploration of new questions using existing data;¹⁵⁵⁰ and allowing for verification, refutation, or refinement of original results.¹⁵⁵¹

However, the report simply considers the benefits of making data publicly available in a broad sense, it does not consider the issue in the Proposal—which is that new data is not necessarily being made publicly available that was not before, and at the same time EPA’s consideration of scientific research is being limited. Thus, it does not consider the costs to government policy-making that come from EPA’s refusing to consider scientific research where underlying data is not publicly available. Since it is questionable whether the Proposal will result in any new data being made available to the public, and certain that it will result in EPA’s ignoring valid scientific findings, it is unlikely that this Proposal will “improve the data and scientific quality of the Agency’s actions” as EPA claims.

Response: See Section III.A of the final rule preamble and Chapter 2 of this document. EPA notes that the final rule does not require EPA or any entity outside of the agency to make data publicly available.

Comment [8750-1924]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 24 of the proposal:

<https://www.mercatus.org/system/files/Mercatus-Lutter-Public-Access-Datav3.pdf>.

The commenter states that the EPA cites to a paper by Randall Lutter and David Zorn for its analysis that “an increase in existing net benefits from greater reproducibility, which, if it occurred, would cover the costs of obtaining the data and making the data available.”¹⁵⁵²

¹⁵⁴⁸ 83 Fed. Reg. at 18,772.

¹⁵⁴⁹ The National Academies, *Expanding Access to Research Data: Reconciling Risks and Opportunities*, National Academies Press 48 (2005).

¹⁵⁵⁰ *Id.* at 38.

¹⁵⁵¹ *Id.* at 39.

¹⁵⁵² Randall Lutter & David Zorn, *On the Benefits and Costs of Public Access to Data Used to Support Federal Policy Making*, Mercatus Working Paper (Sept. 2016).

However, there are important limitation to this analysis that seriously call this conclusion into question.

First, the statement that EPA cites to is taken out of context. The entire sentence is: “More specifically, we can calculate an increase in existing net benefits from greater reproducibility, which, if it occurred, would cover the costs of obtaining the data and making the data available.”¹⁵⁵³ This statement is not a conclusion that the benefits of making publicly available data underlying research that federal agencies use to promulgate significant public policies would outweigh the costs. It is describing the figure that Lutter and Zorn go on to calculate—the threshold level of increase in net benefits required by this policy to equal the costs of implementation. They find that “an improvement in net benefits of 0.02 to 2.08 percent would imply that the net benefits of requiring data access are positive.”¹⁵⁵⁴ They themselves note that this estimate “fall[s] short of proving that the benefits outweigh the associated costs.”¹⁵⁵⁵

Their analysis itself is suspect because it differs greatly from the cost estimate provided by the CBO for H.R. 1430, Honest and Open New EPA Science Treatment Act of 2017. The CBO estimated that, if the agency were to choose to rely only on studies that met the Act’s requirements from the outset, implementing this legislation would cost about \$5 million from 2018-2022.¹⁵⁵⁶ They assumed it would cost \$10,000 per study to make data available to enable use of studies.¹⁵⁵⁷ They estimated costs of at least \$100 million per year if EPA were to continue to rely on as many studies to support its actions as it has done in recent years.¹⁵⁵⁸ An older cost estimate from CBO on a prior version of the HONEST Act estimated that it would cost “about \$250 million a year for the next few years.”¹⁵⁵⁹ This assumed that EPA would spend from \$10,000 to \$30,000 per study to make the data available and that EPA would reduce the number of studies it relies on by about one-half.¹⁵⁶⁰

Zutter and Lorn calculated an alternative amount for the costs to EPA of this legislation. They find that “the total cost to the EPA for data collection and public accessibility would be \$2,558 per study, or about 26 percent of the \$10,000 per study cost estimated by CBO.”¹⁵⁶¹ They used estimates that EPA reported under the Paperwork Reduction Act for time that entities in the chemical industry would need to spend to comply with EPA’s Health and Safety Data Reporting Rule (40 C.F.R. 716).¹⁵⁶² While they purport that the requirements of that rule are similar to the activities that EPA would undertake to comply with the HONEST Act and similar legislation,

¹⁵⁶² Id. at 21.

they provide no further basis for this.¹⁵⁶³ Given the great discrepancy between their and CBO's estimates, it is unclear that their estimate sufficiently accounts for the numerous costs associated with EPA locating underlying research data not currently in its possession and upgrading it to enable it to be made publicly available.

They also rely on questionable assumptions in their calculation. They assume that “given modern technology, by the time research has been published, almost all relevant underlying data and computer code and models will be in electronic format” so time spent photocopying studies will be reduced.¹⁵⁶⁴ This does not consider that EPA may want to rely on older studies where all relevant information is not available in electronic, easily accessible formats. They provide unsupported estimates for activities that EPA would need to undertake to comply with HONEST Act-like legislation that has no corresponding requirement in EPA's Health and Safety Data Reporting Rule—such as estimating 10 hours for EPA to format unformatted data for public access.¹⁵⁶⁵

They additionally produce their own estimate for the number of studies that EPA relies on each year, looking at materials posted in dockets on regulations.gov and coming to a total of 18,000 pieces of scientific research per year.¹⁵⁶⁶ CBO estimated 50,000 scientific studies per year.¹⁵⁶⁷ Assuming that EPA continued to rely on all 18,000 studies per year, Zutter and Lorn came to total implementation costs of about \$46 million per year, far below the estimate by CBO assuming EPA still relied on at least half of the studies it does currently. Thus, one should view this cost estimate with suspicion, and there is no reason it should be relied on over CBO's cost estimates and does not suffice for EPA providing its own cost benefit analysis.

Response: See Section III.J of the final rule preamble.

Comment [8750-1926]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 10 of the proposal:

Specific comments provided include the following:

I. Health Effects Institute

The EPA provides a link to the HEI Policy on The Provision of Access to Data Underlying HEI funded Studies. This policy is “to provide access expeditiously to data for studies that it has funded and to provide that data in a manner that facilitates review and verification of the work but also protects the confidentiality of any volunteers who may have participated in the study and respects the intellectual interests of the original investigator of the work.”¹⁵⁶⁸ It is written to be consistent with OMB Circular A-110, which requires agencies to respond to FOIA requests for data underlying federally supported research used to develop federal agency actions with the force and effect of law. EPA already has policies in place to make public the data underlying research that it funds, and already must comply with OMB Circular A-110, thus, it is unclear how this Proposal builds upon this policy.

Furthermore, the policy specifically excludes “personal and medical information and similar information that is personally identifiable, and the disclosure of which would constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study” and requires the requestor to pay reasonable costs. In this manner, it further deviates from the Proposal.¹⁵⁶⁹

¹⁵⁶⁸ HEI, APPENDIX D: HEI POLICY ON THE PROVISION OF ACCESS TO DATA UNDERLYING HEI FUNDED STUDIES, https://www.healtheffects.org/system/files/AppendixD-data-access_3.pdf (last accessed Aug. 10, 2018).

¹⁵⁶⁹ *Id.*

II. Center for Open Science

The EPA links to the COS's 2017-2020 Strategic Plan.¹⁵⁷⁰ While the strategic plan outlines COS's own mission to "increase openness, integrity, and reproducibility of scholarly research" and to meet its goal of creating "a future scholarly community in which the process, content, and outcomes of research are openly accessible by default" nothing in this strategic plan suggests anything like EPA's Proposal.¹⁵⁷¹ It does not discuss barring use of studies or ensuring access to underlying data—and thus is completely irrelevant to the Proposal.

III. Members of the Risk Assessment Specialty Section of the Society of Toxicology, the Dose Response Section of the Society for Risk Analysis, and the International Society for Regulatory Toxicology and Pharmacology

EPA links to a survey conducted by the Center for Media and Public Affairs and Center for Health and Risk Communication at George Mason University.¹⁵⁷² They surveyed members of the Risk Assessment Specialty Section of the SOT, the Dose Response Section of the SRA, and the ISRTP. However, the survey thus does not represent any official recommendation or policy position from these professional organizations and represent only the views of the members who chose to participate in the survey.

Thus, while the survey found 69 % of those surveyed "regard it as "very important" for assessors to have access to underlying raw data for the most critical studies in order to independently analyze their results," this should be viewed in the rightful context.¹⁵⁷³ The survey did not ask whether agencies should continue to rely on scientific studies where the underlying data cannot be made public or independently analyzed. The survey question further appears to have only asked whether researchers assessing studies should have access to underlying data to independently analyze results, not whether underlying data should be made publicly available.

Further, the Dose Response Section of the SRA has since submitted a comment to EPA that states this footnote and the claim that EPA makes that the Proposal took into consideration these recommendations and policies is "inaccurate" and that "the 'Dose-Response Section [sic] of the Society for Risk Analysis' has never adopted any 'policies or recommendations' on this or any other topic."¹⁵⁷⁴ They have asked that EPA remove all references to the organization and make clear in the comment response for this rule that "'third party Organizations' whose policies and recommendations were considered do not include the Society for Risk Analysis or the Dose-Response Specialty Section."

The SOT similarly have said this survey does not constitute support from the Specialty Section or the SOT as a whole, and requesting "that any and all references to "members of the Risk

¹⁵⁷⁴ Comment from Weihsueh A. Chiu, Chair, Dose-Response Specialty Group, Society for Risk Analysis, Docket ID No. EPA-HQ-OA-2018-0259 (May 24, 2018).

Assessment Specialty Section of the Society of Toxicology” be removed from the Final Rule.”¹⁵⁷⁵ They also specifically comment that “invalidating data solely on the basis of public availability is inappropriate.”¹⁵⁷⁶

IV. Bipartisan Policy Center’s Science for Policy Project

The EPA provides a hyperlink to the Final Report of the Science for Policy Project Improving the Use of Science in Regulatory Policy.¹⁵⁷⁷ This report makes a number of recommendations, none of which endorse the Proposal. In relevant part, Recommendation Three suggests “Agencies and their scientific advisory committees should cast a wide net in reviewing studies relevant to regulatory policy, and should make their methods for filtering and evaluating those studies more transparent.”¹⁵⁷⁸ They urge agencies to increase availability of data and information on research studies and subject all studies relied on in the formulation of regulation to be subject to the requirements of the Shelby Amendment and OMB Circular A-110 regardless of who funded the study.¹⁵⁷⁹ Importantly, those requirements contain important exception for confidentiality and privacy concerns—and thus do not support the Proposal. This recommendation is also aimed at increasing use of science in regulatory policy and does not suggest that agencies not rely on studies where those data access requirements cannot be met because of other concerns. It also highlights that the use of CBI to prevent access to data appears to be overused and urges agencies to make procedures more stringent to allow only for legitimate claims of CBI—which EPA does not address in its Proposal.¹⁵⁸⁰ Recommendation Four states: “The federal government, universities, scientific journals and scientists themselves can help improve the use of science in the regulatory process by strengthening peer review, expanding the information available about scientific studies, and setting and enforcing clear standards governing conflict of interest.”¹⁵⁸¹ As part of this recommendation, the report “Federal agencies, universities and journals should encourage or require on-line publication of the methods and data underlying published scientific studies.”(citation omitted) However, it once again does not say that agencies should not consider research studies where this is not possible due to privacy or other compelling reasons.

Wendy Wagner, who served on the panel that produced the recommendations has stated: “They don’t adopt any of our recommendations, and they go in a direction that’s completely opposite, completely different. . . . They don’t adopt any of the recommendations of any of the sources they cite. I’m not sure why they cited them.”¹⁵⁸²

Response: See Section III.A of the final rule preamble and Chapter 2 of this document.

Comment [8750-1927]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 11 of the proposal:

- Proceedings of the National Academy of Sciences: <http://www.pnas.org/page/authors/journal-policies#xi>
- PLOS ONE: <http://journals.plos.org/plosone/s/data-availability>
- Science: <http://www.sciencemag.org/authors/science-journals-editorial-policies>
- Nature: <http://www.nature.com/authors/policies/data/data-availability-statementsdata-citations.pdf>

The commenter states that while EPA links to journal policies that encourage or require, in some instances, sharing data, they contain exceptions when privacy would be compromised.¹⁵⁸³ The editors of these journals issued a joint statement opposing the Proposal. They note that some data sets cannot be shared publicly, and that there are still other methods available to verify scientific findings. The statement also strongly condemns the notion of excluding scientific information from consideration when underlying data cannot be made publicly available:

It does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them; rather, it is paramount that the full suite of relevant science vetted through peer review, which includes ever more rigorous features, inform the landscape of decision making. Excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes.¹⁵⁸⁴

Thus, journal policies encouraging the sharing of underlying data do not support a proposal by a regulatory agency to exclude from consideration studies when the underlying data is not publicly available.

Response: See Section III.A of the final rule preamble and Chapter 2 of this document. EPA notes that this final rule does not require EPA to categorically exclude any studies. See response to Comment 4829-2022.

Comment [8750-1931]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 16 of the proposal:

¹⁵⁸³ See discussion below on footnote 20.

¹⁵⁸⁴ Jeremy Berg et. al., Joint statement on EPA proposed rule and public availability of data, Science (Apr. 30, 2018), <http://science.sciencemag.org/content/early/2018/04/30/science.aau0116>.

- U.S. Department of Health and Human Services:
<https://www.hhs.gov/hipaa/forprofessionals/privacy/special-topics/de-identification/index.html>
- National Institute of Standards and Technology:
<https://nvlpubs.nist.gov/nistpubs/ir/2015/NIST.IR.8053.pdf>
- U.S. Department of Education:
https://studentprivacy.ed.gov/sites/default/files/resource_document/file/data_deidentification_terms.pdf
- U.S. Census Bureau:
<https://www.census.gov/about/adrm/linkage/technicaldocumentation/processing-de-identification.html>

The commenter states that the EPA suggests the examples linked to could address concerns about privacy and confidentiality arising from the Proposal. However, the cited sources provide no assurance that the Proposal could be implemented to expand disclosure of personal data without serious risks to privacy. The commenter provides the following specific comments:

I. U.S. Department of Health and Human Services

EPA first points to guidance on de-identification requirements under HIPAA. This guidance provides two methods for de-identifying data: (1) expert determination method, where an expert determines that, after application of statistical and scientific principals and methods, the risk is very small that the information alone or with other available information could be used to identify the subject; and (2) the safe harbor method, requiring that a number of identifiers are removed. The first method requires case-by-case work and EPA has provided no information regarding how EPA could implement it or how much it might cost and thus the feasibility of requiring researchers or EPA to de-identify data this way is questionable. The second method requires removal of much information useful for research that may be necessary to be able to independently validate the research, so it is unclear that it would satisfy the Proposal's demands. Furthermore, the safe harbor method has been shown to provide potentially insufficient privacy protections.¹⁵⁸⁵

II. NIST

EPA links to a NIST document entitled De-Identification of Personal Information as a potential solution to address concerns about confidentiality and privacy.¹⁵⁸⁶ This document discusses different techniques and issues with de-identification of personal information. However, the document does not discuss de-identification of personal information specifically for the purposes of making research data publicly available for independently validating scientific studies. The document instead notes that:

¹⁵⁸⁵ Latanya Sweeney, Ji Su Yon, Laura Perovich, Katherine E Boronow, Phil Brown, and Julia Green Brody, *Reidentification Risks in HIPAA Safe Harbor Data: A Study of Data From One Environmental Health Study*, Technology Science (August 28, 2017).

¹⁵⁸⁶ Simson L. Garfinkel, *De-Identification of Personal Information* (NISTIR 8053), NIST (Oct. 2015), <https://nvlpubs.nist.gov/nistpubs/ir/2015/NIST.IR.8053.pdf>.

The purpose of de-identifying data is to allow some uses of the de-identified data while providing for some privacy protection by shielding the identity of the data subjects. These two goals are antagonistic, in that there is a trade-off between the amount of de-identification and the utility of the resulting data. However, de-identification opens up new uses for the data that were previously prohibited due to privacy concerns. It is thus the role of the data controller, standards bodies, regulators, lawmakers, and courts to determine the appropriate level of security, and thereby the acceptable trade-off between de-identification and utility.¹⁵⁸⁷

EPA completely fails to note this obstacle, that as data is stripped of identifiable material it also loses utility to researchers. EPA cites to broad privacy protection techniques without explaining whether they could be applied to protect privacy while still allowing enough utility in the data set to allow for independent validation as required by the Proposal.

The document notes many of the challenges to protecting privacy including that: “de-identification approaches based on suppressing or generalizing specific fields in a database cannot provide absolute privacy guarantees, because there is always a chance that the remaining data can be re-identified using an auxiliary dataset.”¹⁵⁸⁸ The harms of data linkages and increasing difficulty to preserve privacy as more and more information about individuals is made available is another challenge that EPA has not addressed.

III. U.S. ED

EPA links to a document of the Privacy Technical Assistance Center, Data Deidentification: An Overview of Basic Terms, which provides a high-level overview of key terms and practices to help educational agencies and institutions comply with the FERPA.¹⁵⁸⁹ EPA has not explained why the requirements of FERPA are applicable here. This document is concerned with data disclosure that occurs “when schools, districts, or states publish reports on student achievement or share students’ data with external researchers” not to make information publicly available for independent validation.¹⁵⁹⁰ Thus it’s unclear that methods used to de-identify but preserve data for those purposes would be adequate in this context.

For example, one of the methods that the U.S. ED uses for disclosure avoidance for tabular data is to not release information for any cell that has a size below some minimum, which essentially means not disclosing information where there are small numbers in a certain cell.¹⁵⁹¹ This could obviously lead to a loss of information that would prevent a deidentified data set from being used to independently validate research findings.

¹⁵⁸⁷ Id. at 11-12.

¹⁵⁸⁸ Id. at 5.

¹⁵⁸⁹ U.S. Department of Education, Privacy Technical Assistance Center, Data De-identification: An Overview of Basic Terms (Oct. 2012), https://studentprivacy.ed.gov/sites/default/files/resource_document/file/data_deidentification_terms.pdf.

¹⁵⁹⁰ Id.

¹⁵⁹¹ Id. at 4.

IV. U.S. Census Bureau

EPA provides a link to a website titled Data Ingest and Linkage that details the U.S. Census Bureau's approach to linking data across many records held by the Bureau, permitting more detailed information to be linked back to one individual to allow for analysis and research. The website links to a working paper that describes the method by which the Bureau assigns a unique person identifier to records it holds that enables it to link records together to create the final file.¹⁵⁹² It is totally unclear how this process on linking together records is a solution that EPA could implement to protect privacy of individuals when disclosing data as it concerns how to identify data to specific people—not how to make data available while protecting their privacy.

Response: See Section III.A of the final rule preamble and Chapter 2 of this document.

Comment [8750-1936]: Commenter (9227) states that the EPA has provided no sources or authorities that support or provide a reasoned basis for the proposed rule and that many of the sources raise key implementation concerns that EPA fails at all to address—rendering the proposal arbitrary and capricious.

As an example, the commenter cites footnote 20 of the proposal:

- Taylor & Francis: <https://authorservices.taylorandfrancis.com/data-repositories/>
- Elsevier: <https://www.elsevier.com/authors/author-services/research-data>
- PLOS: <http://journals.plos.org/plosone/s/data-availability>
- Springer Nature: <https://www.springernature.com/gp/authors/research-datapolicy/repositories>

The commenter states that the EPA cites to “policies or recommendation” of several journals that require data be deposited in public data repositories as an example of the Proposal's requirement of data availability.¹⁵⁹³ While these journals have policies that encourage authors to deposit data in public data repositories, they all have important exceptions in cases where this is not feasible or ethical.

The hyperlink for Taylor & Francis links to a page that provides information about how to find public data repositories to submit data to in order to comply with journal sharing policies. However, Taylor & Francis' basic data sharing policy “which applies across many of [their] journals” does not require data be submitted to a public data repository, but “encourages authors to share and make data open where this does not violate protection of human subjects or other valid subject privacy concerns.”¹⁵⁹⁴ Thus, this policy is flexible and allows exceptions for when privacy concerns are at stake.

¹⁵⁹² Deborah Wagner & Mary Layne, The Person Identification Validation System (PVS): Applying the Center for Administrative Records Research and Applications' (CARRA) Record Linkage Software, CARRA Working Paper Series, Working Paper # 2014-01, U.S. Census Bureau (July 1, 2014).

¹⁵⁹³ 83 Fed. Reg. at 18,771.

¹⁵⁹⁴ Taylor & Francis Author Services, Understanding our data sharing policies, <https://authorservices.taylorandfrancis.com/understanding-our-data-sharing-policies/> (last accessed Aug. 10, 2018).

The hyperlink for Elsevier links to a page providing general information about data sharing. While the web page notes that researchers “are increasingly encouraged, or even mandated, to make. . . research data available, accessible, discoverable and usable,” it also provides important qualifications.¹⁵⁹⁵ It notes, “there are times when the data is simply not available to post or there are good reasons why it shouldn’t be shared.”¹⁵⁹⁶ In these cases, authors are encouraged to provide a data statement explaining why the data cannot be shared.

The hyperlink for PLOS links to a page describing PLOS’s data availability policies. It explains, “PLOS journals require authors to make all data underlying the findings described in their manuscript fully available without restriction, with rare exception.”¹⁵⁹⁷ The policy recommends deposition of the data into a public repository, however, it recognizes that there are instances when this may not be ethical or legal, for instance because the “underlying data pose privacy or legal concerns e.g., where data might reveal the identity or location of participants.”¹⁵⁹⁸ In these instances, it allows an exception to this policy.

The hyperlink for Springer Nature links to a page listing recommended repositories. While Springer Nature’s data policies support data sharing via public data repositories, it notes, “reasonable restrictions on data availability are permitted to protect human privacy, biosafety or respect reasonable terms of use for data obtained under license from third parties.”¹⁵⁹⁹

Response: See Section III.A of the final rule preamble and Chapter 2 of this document.

Comment [8750-2620]: Commenter (9227) states that the EPA has failed to explain why it has singled out dose response studies to be excluded if their underlying data and models are not publicly available but has not similarly targeted any other types of studies commonly used by EPA.

EPA also has proposed to target the requirements for public availability specifically to the data and modeling underlying one specific subset of scientific research—dose response studies. EPA has provided no explanation or justification for targeting dose response studies in particular or for not including other types of studies or scientific information. EPA has not suggested that these studies are inherently less reliable than other studies, that they more commonly fail to publicly disclose data and modeling information, that replication is more necessary for these studies than others, or any other conceivable reason. Absent any explanation from the agency, it is impossible to comment on the factual predicates for EPA’s proposed decision, or the reasonableness of EPA’s justification, except to state that it appears completely arbitrary in the absence of any rationale. See, e.g., *Transactive Corp., v. United States*, 91 F.3d 232, 237 (D.C. Cir. 1996) (“A long line of precedent has established that an agency action is arbitrary when the agency offered insufficient reasons for treating similar situations differently.”).

Response: See Sections III.A, III.B and III.E of the final rule preamble. EPA notes that this final rule does not require EPA to categorically exclude any studies. See response to Comment 4829-2022.

Comment [8750-2896]: Commenter (8227) states that the EPA has failed to explain why it has singled out dose response studies to be excluded if their underlying data and models are not publicly available, but has not similarly targeted any other types of studies commonly used by EPA.

EPA also has proposed to target the requirements for public availability specifically to the data and modeling underlying one specific subset of scientific research—dose response studies. EPA has provided no explanation or justification for targeting dose response studies in particular or for not including other types of studies or scientific information. EPA has not suggested that these studies are inherently less reliable than other studies, that they more commonly fail to publicly disclose data and modeling information, that replication is more necessary for these studies than others, or any other conceivable reason. Absent any explanation from the agency, it is impossible to comment on the factual predicates for EPA’s proposed decision, or the reasonableness of EPA’s justification, except to state that it appears completely arbitrary in the absence of any rationale. See, e.g., *Transactive Corp., v. United States*, 91 F.3d 232, 237 (D.C. Cir. 1996) (“A long line of precedent has established that an agency action is arbitrary when the agency offered insufficient reasons for treating similar situations differently.”).

Response: EPA notes that this final rule does not require EPA to categorically exclude any studies. See response to Comment 4829-2022.

Comment [8750-3567]: Commenter (9227) asserts that the EPA arbitrarily fails to offer a reasoned explanation for its departure from existing policies that broadly require the agency to consider all available scientific information when undertaking rulemakings.

In addition to the statutes that require EPA to use the best available science when making regulatory decisions, a number of EPA’s own policies embed this requirement as well. By arbitrarily limiting the science EPA considers when making regulatory decisions, the Proposal contravenes these policies, injuring the scientific integrity of EPA’s actions. As discussed in more detail in Section II.E [of the commenter’s letter] because EPA is changing course from established policy, EPA must fully acknowledge and justify its decision, which it has failed to do in the Proposal.

EPA’s own existing Scientific Integrity Policy states:

To support a culture of scientific integrity within the Agency, this policy. . . [r]ecognizes . . . policy makers within the Agency weigh the best available science, along with additional factors such as practicality, economics, and societal impact, when making policy decisions.¹⁶⁰⁰

¹⁶⁰⁰ EPA, Scientific Integrity Policy 3-4.

The Proposal conflicts with this policy by restricting what may be the best available science on a given topic from EPA’s consideration solely because the underlying data cannot be made public. As described above, public availability of data is neither necessary nor sufficient to ensure that studies constitute “best available science.” The Proposal does not acknowledge this departure from the agency’s Scientific Integrity Policy, much less explain why such a departure is reasonable.

Likewise, the Proposal is in tension with *EPA’s Information Quality Guidelines*, developed in response to OMB guidelines issued under Section 515(a) of the Treasury and General Government Appropriations Act for Fiscal Year 2001, which require EPA to ensure the objectivity of influential scientific information it disseminates by using “the best available science and supporting studies conducted in accordance with sound and objective scientific practices.”¹⁶⁰¹ EPA considers information to be disseminated when EPA prepares and distributes information to support an Agency decision or regulation or when EPA distributes information in a way that suggests EPA agrees with it, that it supports EPA’s viewpoint, or if in the distribution EPA proposes to use it to support or formulate a regulation or agency decision.¹⁶⁰² Thus, the Proposal conflicts with the Guidelines by restricting scientific studies that EPA may use to support regulations, which may cause it to disseminate other information to support its regulations that is not based on the best available science.

EPA’s *Peer Review Handbook* similarly acknowledges that “EPA strives to ensure that the scientific and technical bases of its decisions meet two important criteria: (1) they are based upon the best current knowledge from science, engineering, and other domains of technical expertise; and (2) they are credible.”¹⁶⁰³ EPA’s Science Policy Council Handbook on Risk Characterization also requires reasonableness in the agency’s risk assessments, which is achieved when “the characterization is based on the best available scientific information.”¹⁶⁰⁴ These policies clearly impact EPA’s regulatory actions, and thus will be impacted by the Proposal. Yet EPA completely fails to analyze the impact the Proposal will have on its ability to comply with these policies and fails to explain why it is changing course or justify its decision to do so. Indeed, the Proposal fails to even acknowledge that the agency is changing positions.

Response: See Section III.A of the final preamble and Chapter 2 of this document. EPA notes that this final rule does not require EPA to categorically exclude any studies. See response to Comment 4829-2022.

Comment [9066-1950]: Commenter (6188) asserts that the Proposed Rule is arbitrary and capricious, as written and as it would be applied. See 5 U.S.C. § 706(2)(A) (an agency’s action can be set aside if it is “arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law”). For example, the Proposed Rule applies only to EPA regulatory actions,

¹⁶⁰¹ EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency 21-22 (2002), <https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf>.

¹⁶⁰² Id. at 15-16.

¹⁶⁰³ EPA, EPA Peer Review Handbook 4th Edition A-4 (Oct. 2015), https://www.epa.gov/sites/production/files/2016-03/documents/epa_peer_review_handbook_4th_edition.pdf.

¹⁶⁰⁴ EPA, Sci. Policy Council, Risk Characterization Handbook 18 (2000), https://www.epa.gov/sites/production/files/2015-10/documents/osp_risk_characterization_handbook_2000.pdf

which often regulate industry to protect human health and the environment, and omits from its ambit Agency adjudications, which often involve private companies seeking regulatory exemptions or permissions from EPA and are more likely to implicate industry-provided studies that are specific to the particular adjudication in question. The NPRM offers no explanation for this distinction, but documents obtained through the FOIA suggest that EPA introduced the distinction mid-way through the rulemaking process, when the Agency realized the implications of its Proposed Rule for pesticide registration proceedings, many of which rely on industry-generated and proprietary data, which cannot be publicly disclosed.¹⁶⁰⁵ Similarly, while the Proposed Rule suggests that EPA “should be guided by this policy to the maximum extent practicable during ongoing regulatory action,” it also provides that the Administrator—and the Administrator alone—would be empowered to offer case-by-case exemptions in myriad instances. See 83 Fed. Reg. 18771. As discussed further in their comment letter, they suggest that this would likely lead to inconsistent application of the Proposed Rule, suggesting its implementation would be arbitrary at best.

Implementation of the Proposed Rule could also impair future Agency rulemaking actions by forcing EPA to ignore key comments and regulatory record evidence in violation of the APA. See *Motor Vehicle Mfrs. Ass’n of the United States, Inc. v. State Farm Mut. Automobile Ins. Co.*, 463 U.S. 29, 43 (1983) (an agency must “examine the relevant data” and acts arbitrarily and capriciously when it “entirely fail[s] to consider an important aspect of the problem”). For example, if a commenter were to cite studies that are based upon data that is not entirely publicly available, the Agency would not be able to consider those studies—or fully evaluate the comment—as part of the rulemaking action, regardless of the scientific validity of the comment. In other words, the Proposed Rule would expose the Agency to challenges not only to arbitrary and capricious application of the rule itself, but also to the arbitrariness of future rules.

Simply put, the commenter contends that the Proposed Rule fails to satisfy the basic requirements of the APA and denies the public a meaningful opportunity to engage in this rulemaking process and in future rulemaking processes.

Response: See Section III.A of the final rule preamble and Chapter 2 of this document. Also, see general response regarding compliance with the APA. Regarding the Administrator exemption, see response to comment 6112-3062.

As discussed in the final rule preamble at Section III.A, EPA will issue statute-specific regulations following this procedural rule, some of which will be substantive and therefore subject to public notice and comment. Any implementation issues will be addressed as appropriate in subsequent rulemakings.

Comment [9217-3571]: Commenter (9225) states that substantively, the rule violates numerous public health and environmental provisions contained in these laws, as well as requirements to

¹⁶⁰⁵ See Science Magazine, Trump’s EPA wants to stamp out ‘secret science.’ Internal emails show it is harder than expected (April 20, 2018), available at <http://www.sciencemag.org/news/2018/04/trump-s-epa-wants-stamp-out-secret-science-internal-emails-show-it-harder-expected>; The Hill, Internal emails show EPA working to limit agency’s use of science (April 19, 2018), available at <http://thehill.com/policy/energy-environment/384039-internal-emails-show-epa-working-to-limit-agencys-use-of-science>

use the best available science or to consider all available information, while procedurally, it violates the APA and a number of other laws that set forth specific procedures EPA must follow during its rulemaking process.

Response: See response to Comment 4829-2022.

Comment [9298-4772]: Commenter (8771) argues that the proposal is arbitrary and capricious for the three reasons stated above: (1) failing to interpret one's data via a model EPA likes is in no way a reason to ignore the data themselves—so this part of the proposal must be stricken; (2) requirements for transparency must be applied to cost and valuation studies as well as risk ones, or else the proposal is arbitrary; and (3) “reducing reliance on defaults” is tantamount to “ignoring good science,” which would be contrary to law.

Response: See Section III.D of the final rule preamble. EPA notes that this final rule does not require EPA to categorically exclude any studies. See response to Comment 4829-2022.

Comment [6891-1526]: Commenter (6912) states that the proposed rule is illegal because it is arbitrary and capricious, and it is arbitrary and capricious in at least three ways. First, the proposed rule grants the Administrator broad discretion to determine whether its terms apply, effectively making it a rule establishing the whim of the Administrator. Particularly in an agency so captured by industry, this cannot be tolerable in a nation of laws. Second, the proposed rule is not supported by any independent authority. Third, the proposed rule is not the product of reasoned decision-making; it is a deliverable, pre-ordained by interested parties laden with bias.

Separately, and in addition, the proposed rule is illegal because it is the result of an effective delegation of rulemaking authority to private interests.¹⁶⁰⁶

The commenter provides that the APA¹⁶⁰⁷ permits courts to set aside agency actions found to be "arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with the law."¹⁶⁰⁸ In determining whether an agency action was "arbitrary and capricious, the courts look to several factors, whether: "(1) the agency 'relied on factors which Congress has not intended it to consider,' (2) the agency 'failed to consider an important aspect of the problem,' (3) the agency explained its decision in a way 'that runs counter to the evidence,' or (4) the action 'is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.'"¹⁶⁰⁹

¹⁶⁰⁶ In a previous comment on EPA's proposal to rescind the Clean Power Plan, some of the authors of this comment argued that that proposal should be seen by the courts as a product of former Administrator Pruitt's "unalterably closed mind." We note that when the political leadership of an agency has been as thoroughly captured by industry as has EPA's, rule makers' minds will often be unalterably closed to any proposals other than those championed by the industries to which they are beholden. See, Comment submitted by Senators Sheldon Whitehouse, Jeffrey A. Merkley, Brian Schatz, and Edward J. Markey, Feb. 6, 2018, available at <https://www.regulations.gov/document?D=EPA-HQ-OAR-2017-0355-17190> (viewed on August 14, 2018)

¹⁶⁰⁷ 5 USC §500 et seq.

¹⁶⁰⁸ 5 USC §706(2)(a)

¹⁶⁰⁹ *Mendoza v. Secretary, Department of Homeland Security*, 851 F.3d 1348, 1353 (11th Cir. 2017) (quoting *Miccosee Tribe of Indians of Fla. v. United States*, 566 F.3d 1257, 1264 (11th Cir. 2009))

Courts have also held that a rule is arbitrary and capricious if the promulgating agency did not "genuinely engage in reasoned decision making"¹⁶¹⁰ or if it did not "articulate a satisfactory explanation for its action including a 'rational connection between the facts found and the choice made.'"¹⁶¹¹

Response: See response to Comments 2157-149, 4829-2022, 6112-3062, and 6163-1114.

Comment [6168-4100]: Commenter (6178) provides the NPRM proposes to establish a new EPA regulation that will 'ensure the data and models underlying the science pivotal to what the Agency deems 'significant regulatory actions' is publicly available in a manner sufficient for validation and analysis', hereinafter referred to as the 'Transparency Rule' or 'Rule'. Specifically, the commenter raises the following concerns with the Transparency Rule proposed by the NPRM:

1. The Agency cites specific sections of statutes it administers as the basis of the Agency's authority to adopt the Transparency Rule; specifically: the CAA sections 103, 301(a), 42 U.S.C. 7403, 7601(a); CWA sections 104, 501, 33 U.S.C. 1254, 1361; SDWA sections 1442, 1450(a)(1), 42 U.S.C. 300j-1, 300j-9(a)(1); RCRA sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; CERCLA (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; EPCRA section 328, 42 U.S.C. 11048; FIFRA sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; and the TSCA, as amended, section 10, 15 U.S.C. 2609 (collectively the 'Acts'). The Agency rightly cites acts of Congress in an attempt to support the NPRM as such authority is necessary for the Agency to adopt regulations pursuant to the above listed Acts.

2. However, Congress, in each of the Acts' sections cited, never instructs the Agency to consider transparency to the public of supporting data and/or models of the scientific research when deciding to rely on such research as support for regulations passed pursuant to any of the Acts. Consequently, the Transparency Rule requires the EPA to rely on factors which Congress has not intended it to consider when promulgating regulations pursuant to the Acts, rendering the Transparency Rule arbitrary and capricious under the APA.

3. Further, not only does the Transparency Rule lack sufficient Congressional intent to avoid being deemed arbitrary and capricious, implementing the Rule would actually contradict Congressional instruction to conduct scientific research with a focus on 'promotion' and 'coordination' among itself and other institutions that produce scientific research material to the objectives of the Acts Congress requires the EPA to enforce. This provides additional cause for finding the Transparency Rule arbitrary and capricious under the APA.

Response: See response to Comments 4829-2022 and 6163-1114.

¹⁶¹¹ *Motor Vehicle Manufacturers Association v. State Farm Mutual Automobile Insurance Co.*, 463 US 29, 43 (1983), quoting *Burlington Truck Lines, Inc. v. United States*, 371 U.S. 156, 168 (1962)

Comment [4837-3057]: Commenter (4848) states that the Administrative procedure requires that EPA consider data submitted by the public in evaluating regulations.¹⁶¹² Let's be clear. Scientific studies submitted have always been of uneven quality.¹⁶¹³ EPA has processes in place (including use of a SAB, testimony and written and oral public notice and comment) using both internal and external peer review to evaluate data. Depending on context, some studies are given greater weight than others. Some studies are disregarded entirely.

It is inappropriate, and likely unlawful under the APA¹⁶¹⁴ and the express language of numerous environmental statutes including the SDWA¹⁶¹⁵ and the TSCA,¹⁶¹⁶ for EPA to categorically eliminate certain types of studies, and hence certain types of data, without considering context.¹⁶¹⁷

Response: The final rule does not require EPA to categorically exclude any studies. See response to Comment 4829-2022.

Comment [1929-3901]: Commenter (1943) states that for the reasons stated below, The Minerals, Metals, and Materials Society (TMS) finds the proposal to be arbitrary and limiting, both of which are antithetical to the principles of scientific exploration. We strongly believe that our federal government's regulatory rulemaking process is better served by consideration of all available data and information, especially that which has been carefully reviewed and objectively approved by the scientific community. On behalf of all TMS members, we urge the EPA to reconsider its proposal and cease any development of a final rule to limit the science that underlies the Agency's regulatory process.

Response: The final rule does not require EPA to categorically exclude any studies. See response to Comment 4829-2022.

Comment [6852-2780; 6128-2235]: Commenters (6874, 6153) state that the EPA's process for promulgating this rule represents a gross deviation from the agency's typical action development process. EPA failed to perform an appropriate regulatory impact analysis, despite indications that

¹⁶¹⁷ *Ecology Ctr., Inc. v. U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006) ("best available science" requires agencies "seek out and consider all existing scientific evidence relevant to the decision" and "cannot ignore existing data."); *Chlorine Chemistry Council v. EPA*, 206 F.3d 1286 (D.C. Cir. 2000) ("When EPA relies in any way on scientific information to set SDWA standards, the agency is required to use 'the best available, peer reviewed science and supporting studies conducted in accordance with sound and objective scientific practices...'").

implementation costs could be substantial.¹⁶¹⁸ EPA has not received sufficient input from the OIRA, which conducted a highly truncated review¹⁶¹⁹ and does not appear to have met with outside groups during that process, or from its SAB, which states that the rule “deals with a myriad of scientific issues for which the Agency should seek expert advice from the Science Advisory Board.”¹⁶²⁰ Taken together, these deviations from typical process leave EPA unable to consider its proposal accurately, and constitute an arbitrary and capricious approach to rulemaking.

Response: See response to Comment 2157-149. EPA’s Action Development Process is not legally binding and is a purely internal, collaborative process. In any event, the supplemental proposal underwent OMB and interagency review and was thoroughly reviewed by the SAB. The final rule discusses the SAB’s findings and the SAB’s report is available in the rulemaking docket.

Comment [6163-1155]: Commenter (6133) notes that their comments discuss the failure of statutory authorities cited by EPA to provide any legal support or authorization whatsoever for the Proposal and its approaches. The commenter notes that the Proposal also cites various executive orders, memoranda, reports, guidelines and the like with the suggestion or implication that these materials somehow provide support for the Proposal. They do not, and thus the Proposal violates the law. See, e.g., *Public Citizen Health Research Group v. Tyson*, 796 F.2d 1479 (D.C. Cir. 1986) (reversing and remanding agency decision to carry out last-minute directive by White House OMB without any apparent justification in the administrative record). First, of course, EPA’s proposed rulemakings must be authorized by federal statutes. Executive orders provide no legal authority for agency rulemakings. Nor may executive orders contradict or alter legal responsibilities an agency has under federal statutes or justify arbitrary and capricious agency action. Equally obvious, memoranda, reports, guidelines, and the like provide no legal authority for agency rulemakings, nor may they justify arbitrary and capricious agency action. See, e.g., *Medellin v. Texas*, 552 U.S. 491, 524 (2008) (“The President’s authority to act, as with the exercise of any governmental power, ‘must stem either from an act of Congress or from the Constitution itself.’” (citation omitted)); *Chrysler Corp. v. Brown*, 441 U.S. 281, 302 (1979) (“The legislative power of the United States is vested in the Congress, and the exercise of quasi-legislative authority by governmental departments and agencies must be rooted in a grant of such power by the Congress and subject to limitations which that body imposes.”). Second, an agency’s proposed rulemaking may not be at odds with federal statutes, may not be creatures of

the agency's imagination or policy preferences, and may not be otherwise arbitrary, capricious, or inconsistent with law. The Proposal fails on all of these scores.

Response: See response to Comment 6163-1114.

Comment [6163-2477]: Commenter (6133) states that when an agency reverses course, it must "provide reasoned explanation for its action." *FCC v. Fox Television Stations, Inc.*, 556 U.S. 502, 515 (2009); *Motor Vehicle Mfrs. Ass'n of U.S. v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983). And when that reversal "rests upon factual findings that contradict those which underlay [the agency's] prior policy," a "more detailed justification" is needed. *Fox*, 556 U.S. at 515. Indeed, "an agency's decision to change course may be arbitrary and capricious if the agency ignores or countermands its earlier factual findings without reasoned explanation for doing so." *Id.* at 537 (Kennedy, J., concurring).

As the Supreme Court explained in its 2016 *Encino Motorcars* decision, an agency must supply "good reasons" for a policy revision, cannot leave "unexplained inconsistency," and must address "serious reliance interests." *Encino Motorcars, LLC v. Navarro*, 136 S. Ct. 2117, 2126 (2016). In *Encino*, the DOL reversed its decades-long practice of treating service advisors at automobile dealerships as exempt from the Fair Labor Standards Act's overtime provisions, offering minimal explanation for the policy change. *Id.* at 2123. The Court overturned the rule, holding that the Department had not met its obligation to offer a "reasoned explanation," especially given the decades of reliance on the policy. *Id.* at 2126. It was not enough that the Department included conclusory statements declaring its new policy to be a reasonable interpretation of the statute because the Department failed to provide any good reasons for the new policy. *Id.* at 2127. As explained by the Court, "[t]his lack of reasoned explication for a regulation that is inconsistent with the Department's longstanding earlier position results in a rule that cannot carry the force of law." *Id.*

In *Organized Village of Kake v. United States Department of Agriculture*, the USDA, relying on a detailed factual record, decided not to exempt the Tongass National Forest from a rule that would limit road construction and timber harvesting in national forests, explaining that the benefits would outweigh the potential economic loss. 795 F.3d 956, 959–61, 967–68 (9th Cir. 2015) (en banc). Just two years later, on "precisely the same record," the agency issued a new decision reversing course. *Id.* at 968. The court concluded that the "absence of a reasoned explanation for disregarding previous factual findings violate[d] the APA." *Id.* at 969. The court also recognized that "[e]lections have policy consequences," but even when reversing a policy after an election, "an agency may not simply discard prior factual findings without a reasoned explanation." *Id.* at 968.

EPA previously routinely used and considered science and studies for which the underlying data was not publicly available in regulatory actions. As explained above, EPA has not identified even one example in which EPA has observed the policies underlying the Proposal, and our research has likewise uncovered no such instance. The Proposal essentially admits as much, stating:

Historically, EPA has not consistently observed the policies underlying this Proposal, and courts have at times upheld EPA's use non-public data in support of its regulatory actions. See *Coalition of Battery Recyclers Ass'n v. EPA*, 604 F.3d 613, 623 (D.C. Cir. 2010); *American Trucking Ass'ns v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002).

83 Fed. Reg. at 18,769, n.3. The Proposal then goes on to say that "EPA is proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions." Id. The Proposal's categorical exclusion of non-publicly available "dose response data" is also departure from EPA's previous practice, as described in the 2002 EPA Guidelines, of weighing all relevant information.

In short, according to the commenter, EPA provide no basis for changing course on this issue, especially when EPA has enshrined the previous policy in agency guidelines and litigation. EPA's failure to explain this change in course violates the law.

Response: See Section III.A of the final rule preamble and Chapter 2 of this document.

1.6.1.1.2 Was the Proposed Rule Issued in Compliance with the APA?

Comment [6099-566]: Commenter (6109) notes that the EPA states that the proposed rule is "consistent with requirements in the APA to ensure public participation in the rulemaking process." However, this proposed rule lacks justification or a practical explanation of how EPA will implement the rule and thereby fails to meet the legal threshold of seriousness defined by the APA, § 307 of the CAA, and court decisions that require an agency to give public notice about the who, what, when, where, why and how of its plans when it wants to create or change a regulation.

Response: See response to Comment 2157-149.

As discussed in the final rule preamble at Section III.A, EPA will issue statute-specific regulations following this procedural rule. Forthcoming substantive rulemakings will be subject to public notice and comment and judicially reviewable, and any implementation issues will be addressed as appropriate.

Comment [6112-1622]: Commenter (6137) provides that the APA establishes rulemaking procedures and judicial review requirements for agency rules that EPA has failed to follow here. 5 U.S.C. §§ 553, 706. These requirements – which EPA entirely and unlawfully ignores – are central both to ensure an opportunity for the affected public to comment, and to ensure an adequate record for judicial review. This includes:

- Providing a meaningful opportunity for notice-and-comment;
- Ensuring that the docket contains all documents on which EPA relies;
- Providing additional information regarding what the public is being asked to comment on, and
- Adding details that are missing from the proposal, before taking further comment.

According to the commenter, the EPA has failed to comply with these mandates, rendering this rulemaking unlawful under the APA, for several reasons.

First, in issuing this Proposed Rule, EPA violated the APA by failing to place in the administrative record all of the documents on which it purports to rely. The preamble to the Proposed Rule cites more than thirty specific documents on which EPA purportedly relies. See, e.g., 83 Fed. Reg. at 18,769-72 & nn.1-2, 4-24. Of the specifically cited and relied upon documents, only about 12 are included in the docket, available at www.regulations.gov, Docket ID: EPA-HQ-OA-2018-0259, as of the date of publication of the Proposed Rule. In addition, EPA provides no support for its proposed conclusion that “EPA believes the benefits of this proposed rule justify the costs.” 83 Fed. Reg. at 18,772. Nothing in the record demonstrates what costs or benefits EPA considered to reach this determination, or whether it evaluated at all the harm to public health and to privacy that this Proposed Rule would cause.

Absent the ability to review such documents, the public is deprived of adequate notice or an ability to provide informed comments regarding the Proposal and EPA’s rationale for issuing the Proposed Rule. EPA’s failure to put the documents on which it relies into the record violates notice-and-comment under the APA and other statutes that supplement such notice requirements. See, e.g., *Am. Radio Relay League v. FCC*, 524 F.3d 227 (D.C. Cir. 2008) (agency may not cherry-pick documents on which it relies for public review; it is a violation of public notice and comment to refuse to put the documents in full on which the agency relied into the record).

Second, failing to place all of the documents on which EPA relies into the record also violates the judicial review provision of the APA by making it impossible for commenters to provide adequate comments or a complete record for judicial review of any final action EPA takes. 5 U.S.C. § 706 (“In making the foregoing determinations, the court shall review the whole record or those parts of it cited by a party, and due account shall be taken of the rule of prejudicial error.” (emphasis added)); *Am. Radio Relay League*, 524 F.3d at 242-43 (Tatel, J., concurring) (reiterating importance of the requirement for agency to place unredacted studies into the docket because not doing so “undermines this court’s ability to perform the review function APA section 706 demands”); see also *Walter O. Boswell Mem’l Hosp. v. Heckler*, 749 F.2d 788, 792 (D.C. Cir. 1984) (citing *Citizens to Preserve Overton Park, Inc. v. Volpe*, 401 U.S. 402, 420 (1971)) (“[R]eview is to be based on the full administrative record that was before the Secretary at the time he made his decision.” (emphasis in original)).

Not only is EPA’s failure to include in the regulatory docket all of the documents upon which it relies a violation of the APA, but it likewise contravenes procedural requirements in Title 28 of the U.S. Code that govern judicial review of agency action. See, e.g., 28 U.S.C. § 2112(b) (“The record to be filed in the court of appeals . . . shall consist of the order sought to be reviewed or enforced, the findings or report upon which it is based, and the pleadings, evidence, and proceedings before the agency . . . concerned.” (emphasis added)); Fed. R. App. P. 16 (“The record on review or enforcement of an agency order consists of . . . any findings or report on which it is based.” (emphasis added)); see also 28 U.S.C. §§ 2071-77 (providing federal courts with authority to establish binding rules of procedure and evidence). Thus, EPA’s slipshod creation of the regulatory docket for the Proposed Rule cannot withstand scrutiny under either the APA or the judicial review provisions for Title 28.

Third, EPA has violated the APA (and all statutes that track its notice-and-comment requirements) by failing to provide sufficient specificity regarding the Proposed Rule. Under the APA, notice is only sufficient “if it affords interested parties a reasonable opportunity to participate in the rulemaking process,” and if the parties have not been “deprived of the opportunity to present relevant information by lack of notice that the issue was there.” *WJG Tel. Co., Inc. v. FCC*, 675 F.2d 386, 389 (D.C. Cir. 1982) (citations omitted); see *Fla. Power & Light Co. v. Nuclear Regulatory Comm’n*, 846 F.2d 765, 771 (D.C. Cir. 1988). The Proposed Rule is plagued by a lack of detail as to how EPA will interpret the broad and vague terms it creates, how it will use the Rule in connection with particular rulemakings, and how it will implement the new “independent peer review” and “exemption” provisions, and these shortcomings undermine the sufficiency of the notice provided by the Proposal. For example:

- The new definitions of “dose response data and models,” “pivotal regulatory science,” “regulatory decisions,” “regulatory science,” and “research data,” in § 30.2 are extremely broad and impermissibly vague. EPA provides no specific examples of what these terms mean or how they will actually be implemented under the long list of statutes implicated by this rule.
 - Sections 30.1, 30.2, 30.3 – discussing the purpose of the Proposed Rule, the applicable definitions, and how the Proposed Rule will apply – provide broad requirements for EPA without giving any information regarding how or when EPA will implement them in connection with any given proposed or final rule.
- EPA states in § 30.5 that the Proposal will require EPA to “ensure that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation . . .” Yet EPA provides no indication of what this means, how it will so “ensure,” or what it will do if it is not possible to ensure this, among other shortcomings.
- Section 30.6 addresses the “additional requirements” related to the use of dose response data and models underlying “pivotal regulatory science,” but it is devoid of details necessary to assure meaningful public review and comment on how, when, or in what way EPA will implement this. It also cites no specific science and gives no indication of how or why EPA is attempting to redefine scientific information on dose response differently than it has done in the past to allow for informed consideration of why EPA is even attempting to address this issue.
- Sections 30.7 and 30.9 describe the “role” of “independent peer review” in the Proposal and permissible “exemptions” under the Rule, yet these descriptions fail to provide the process that will be used to inform the public of when a given document or study impacted by this rule does or does not qualify for an exemption. There is no indication of whether EPA will provide notice or comment, or any steps allowing for public participation, when deciding whether or not to exclude a given study from consideration.
- The preamble to the Proposed Rule is replete with broad (and unsubstantiated) statements regarding limits on EPA’s ability to consider and use science in rulemakings, as well as environmental issues EPA envisions being impacted by the Proposed Rule – for example, the NAAQs – but EPA fails to provide any specific information to inform public notice and comment on the purported impact of Proposed Rule. Commenters have done their best in view of this to provide comment on all of the likely harm that EPA’s vague and general statements would cause if fully implemented in regulatory language, but they are

severely prejudiced due to EPA's refusal to provide specific notice as required by the APA.

In sum, the commenter contends that the EPA has failed to satisfy the requirements for specific public notice that can assure meaningful comment, falling far short of the fundamental threshold requirements for notice and comment. This shortcoming is fatal to its ability to finalize this Proposed Rule.

In addition, the commenter notes that it is especially problematic that EPA's Proposal states that EPA will apply the Proposed Rule to "regulatory decisions" which it defines as "final regulations determined to be 'significant regulatory actions' by [OMB]." 83 Fed. Reg. at 18,773 (proposed § 30.2). Under this definition, EPA can exclude and ignore science in future rulemakings without specifying where or how it will do so and without providing any public notice or comment in a future rulemaking that would be impacted by this Rule. EPA's attempt to limit the rulemaking process for undefined other rules in this manner is a violation of the APA for all of the reasons described above.

Finally, the commenter states that the EPA's APA violations would cause significant harm to Commenters and the public if the Rule were finalized without correcting these problems. The inability to review and attempt to understand the documents on which EPA relies and thus to comment meaningfully and receive effective judicial review cause severe prejudice to the affected public. See 5 U.S.C. § 706(2). Even if EPA were to add documents to the docket at a later date, that would not cure this fatal flaw. Given the sweeping scope of this Proposed Rule – which would restrict the consideration and use of important health science in rulemakings which, in turn, would likely lead to a weakening of air, water, waste, chemical, pesticide and other protections – the failure to publish the documents for review for an adequate time period has undermined the public's ability to comment meaningfully, and impermissibly prevented the affected public from being able to seek and receive effective judicial review based on the record.

Response: See response to Comment 2157-149. As discussed in the final rule preamble at Section III.A, EPA will issue statute-specific regulations following this procedural rule. Forthcoming substantive rulemakings will be subject to public notice and comment and judicially reviewable, and any implementation issues will be addressed as appropriate.

Comment [6163-1115]: Commenter (6133) states that, as EPA is aware, when an agency drafts a proposed rule pursuant to congressionally delegated authority, the exercise of that authority is governed by the informal rulemaking procedures outlined in the APA, 5 U.S.C. § 553.5. EPA is required to provide the public with adequate notice of a proposed rule, followed by a meaningful opportunity to comment on the rule's content. 5 U.S.C. § 553 (b)-(c).

The requirement under § 553 to provide the public with adequate notice of a proposed rule is generally achieved through the publication of a notice of proposed rulemaking in the *Federal Register*, and the APA requires that the notice of proposed rulemaking include "(1) the time, place, and nature of public rulemaking proceedings; (2) reference to the legal authority under which the rule is proposed; and (3) either the terms or substance of the proposed rule or a description of the subjects and issues involved." 5 U.S.C. § 553(b)1-3. Generally speaking, the notice requirement of § 553 is satisfied when the agency "affords interested persons a reasonable

and meaningful opportunity to participate in the rulemaking process.” *Forester v. Consumer Prod. Safety Comm’n*, 559 F.2d 774, 787 (D.C. Cir. 1977).

The commenter adds that they believe that the Proposal fails to reference any other legal authority to support its adoption. The agency claims its Proposal is “consistent with” Administrative Procedure Act provisions to ensure public participation in the rulemaking process, 83 Fed. Reg. at 18,769/2, but this faint “consistent with” falls far short of any legal authority for the Proposal, or even any claim of such authority. The APA provides no authority for the Proposal and, tellingly, EPA does not and cannot identify any authority therein. Even were this “consistent with” claim an attempt by EPA to claim any legal authority for the Proposal, the throw-away statement fails to provide sufficient notice for the public to comment on the proposed rule or any asserted legal authority in the APA.

Finally, the commenter states that the Proposal’s solicitation of comment—“on whether additional or alternative sources of authority are appropriate bases for this proposed regulation”—does not and cannot itself provide any justification for EPA finalizing a rule based on additional or alternative sources of legal authority. This fails to provide sufficient notice for the public to comment on the proposed rule or any other possible legal authorities. For all these reasons, the commenter contends that the EPA lacks any basis to finalize a rule invoking any other legal authorities to support its adoption.

Response: See response to Comment 6163-1114.

Comment [6163-1215]: Comment (6133) states that the proposed rule’s definitions are vague, arbitrary, and capricious, and fail to provide fair notice to the public of how EPA would implement any final rule.

The APA requires notices of proposed rulemakings to include “the terms or substance of the proposed rule or a description of the subjects and issues involved.” 5 U.S.C. § 553(b)(3). Proposals must “provide sufficient factual detail and rationale for the rule to permit interested parties to comment meaningfully.” *Honeywell International, Inc. v. EPA*, 372 F.3d 441, 445 (D.C. Cir. 2004).

The instant Proposal lacks any statutory authority for regulatory terms and text, concepts, and other inventions that make up its foundation. Moreover, many of these regulatory terms and text are vague, unexplained, internally inconsistent, and otherwise arbitrary and capricious.

Response: See response to Comment 2157-149.

Comment [6351-3238]: Commenter (6373) suggests that the Rule includes several definitions and requirements that are vague or appear to contradict standard scientific practice, which will make it difficult if not impossible for the scientific community to comply with its mandates. According to the commenter, this is impermissible under the APA, which requires that “general notice of proposed rulemaking shall be published in the *Federal Register*,” including the “terms or substance of the proposed rule.”¹⁶²¹ As currently drafted, the Rule’s ambiguity about what

¹⁶²¹ See APA § 4(a)-(b); 5 U.S.C. § 553(a)-(b).

constitutes “independent validation” prevents clear direction to researchers.¹⁶²² While this Rule governs EPA actions, the commenter notes that third party researchers must rely on its direction in order to design studies that the agency may use to inform regulations.

Additionally, the commenter states that the Executive Orders cited as providing the Rule’s authority require that regulations must be “simple and easy to understand, with the goal of minimizing uncertainty and litigation,”¹⁶²³ and must specify regulations’ effect “in clear language.”¹⁶²⁴ The commenter contends that the Rule is inconsistent with these mandates.

Response: See response to Comment 2157-149. The final rule does not cite to any Executive Orders as authority.

Comment [6895-3299]: Commenter (6916) states that the rulemaking process set forth in the APA, and in more detail in the CAA, provide a Congressionally-directed framework to assure that the Agency’s rulemaking decisions are not arbitrary – that they are made transparently and based on an adequate record that is subject to public scrutiny. Similarly, the commenter notes that the ERDDAA requirement to submit CAA regulatory proposals to SAB review serves as a check to ensure that the scientific basis underlying the rule is robust.

The commenter contends that the EPA failed to submit the rule to its SAB, and additionally did not prepare a regulatory impacts analysis of the Proposal as required by Executive Order 12,866. Nor did the Administrator provide sufficient time for a meaningful OMB OIRA review, having signed the rule on April 24, 2018 after having submitted the Proposal to OIRA on April 19, 2018 – despite the requirement to provide OIRA with at least 10 working days to decide whether to waive review.¹⁶²⁵

According to the commenter, nor did the Agency comply with other Executive Orders requiring analyses of other potential aspects of rulemaking proposals, despite their relevance to this proposed action. For example, the Agency did not satisfy the requirements of Executive Order No. 13,045, “Protection of Children from Environmental Health Risks and Safety Risks,” 62 Fed. Reg. 19,885 (Apr. 21, 1997), which requires federal agencies to “make it a high priority to identify and assess environmental health risks and safety risks that may disproportionately affect children,” in proposing regulatory actions.¹⁶²⁶ Instead, despite the fact that among the “dose response data and studies” the Agency is questioning are those analyzing the disproportionate

¹⁶²² See, e.g., *Walker Stone Co. v. Sec’y of Labor*, 156 F.3d 1076, 1083-84 (10th Cir. 1998) (“regulations must be sufficiently specific to give regulated parties adequate notice of the conduct they require or prohibit”); *United States v. Alcan Aluminum Corp.*, 755 F. Supp. 531, 540 (N.D.N.Y. 1991) (“To withstand a void for vagueness challenge, it is sufficient if the meaning of the statutory or regulatory language is discoverable from its context.”).

¹⁶²³ See E.O. 12866 § 1, Par. (b)(12)).

¹⁶²⁴ See E.O. 12988 § 3, Par. (b)(2). See also E.O. 13563, (requiring that regulations are accessible, consistent, written in plain language, and easy to understand).

¹⁶²⁵ Exec. Order No. 12,866 § 6(b)(2)(A) requires that the Agency give OIRA ten working days to determine whether to waive review; id. at § 8 forbids an Agency from publishing “or otherwise issu[ing] to the public,” a Proposal until either OIRA waives review or completes it. In this instance, OIRA did not complete its review until one day after the Administrator signed the Proposal, which was published only six days later on April 30, 2018, seven working days after the rule was submitted to OIRA. See also *supra* note 30 (press account).

¹⁶²⁶ Exec. Order No. 13,045 § 1(a).

health effects of air pollution on children's health,¹⁶²⁷ and the fact that as Executive Order 13,045 itself notes, children "breathe more air in proportion to their body weight than adults,"¹⁶²⁸ EPA simply states that the Proposal "does not concern an environmental health risk or safety risk."¹⁶²⁹ Similarly, EPA dismisses Executive Orders 12,898 "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations," and 13,175, "Consultation and Coordination with Indian Tribal Governments," single sentence stating for each that they do not apply.¹⁶³⁰ EPA's failure to subject the Proposal to these required analyses denies the public "transparency" – because information is withheld on which the affected public might base meaningful comments – as well as denying OMB the information it needs to complete its reviews.

EPA's Proposal claims to be "consistent with" Executive Order 13,777, which ordered a Regulatory Reform Task Force to identify regulations that "rely in whole or in part on data, information, or methods that are not publicly available or are insufficiently transparent to meet the standard for reproducibility," and 13,783, which required a focus on energy independence, but also the "achieve[ment of] environmental improvements for the American people."¹⁶³¹ But the Executive Order 13,777 Task Force report does not identify any regulations that rely on insufficiently transparent data,¹⁶³² nor is this Proposal - which would deny access to scientific studies - consistent with the goal of advancing environmental improvements for the American public.

Response: See responses to Comments 2157-149 and 6112-4452.

Comment [9069-3312]: Commenter (6185) states that the Proposal is too vague as written to provide the public with a meaningful opportunity to comment. According to the commenter, the Proposed Rule, as written, lacks credible specificity and is overly vague in its terms and scope. Under the APA, a federal regulatory agency must publish notice of either the substance of a proposed rule or a "description of the subjects and issues" covered by a proposed rule (5 U.S.C. § 553(b)(3)). In *Fertilizer Institute v. EPA*, 935 F.2d 1303 (D.C.Cir. 1991), the court observed that it "has consistently interpreted that requirement to mean that an agency's notice must 'provide sufficient detail and rationale for the rule to permit interested parties to comment meaningfully'" [citing *Florida Power & Light Co. v. United States*, 846 F.2d 765, 771 (D.C. Cir. 1988), cert. denied, 490 U.S. 1045 (1989)]. As such, the commenter notes that the EPA is required to articulate the specifics of its proposed rulemakings in a manner that provides a valid opportunity for public comment.

¹⁶²⁷ See e.g. Dockery, et al., *Change in Pulmonary Function in Children Associated with Air Pollution Episodes*, 32 *J. AIR POLLUTION CONTROL ASS'N* 937 (1982).

¹⁶²⁸ Exec. Order No. 13,045 at §1 1-101 ("Policy").

¹⁶²⁹ 83 Fed. Reg. at 18,773.

¹⁶³⁰ Id.

¹⁶³¹ Id. at 18,769, citing Exec. Orders Nos. 13,777, 82 Fed. Reg. (Mar. 1, 2017) & 13,783, 82 Fed. Reg. 16,093 (Mar. 31, 2017)).

¹⁶³² EPA, Final Report on Review of Agency Actions that Potentially Burden the Safe, Efficient Development of Domestic Energy Resources Under Executive Order 13,783, (Oct. 25, 2017) ("noting that EPA has coordinated its review with other Administration initiatives, such as ... E.O. 13,777").

In this proposal, the commenter provides that the EPA solicits comment across a long list of topic areas, but fails to provide the Agency’s own “sufficient detail and rationale” on the solicited comment areas, in contravention to APA § 553(b)(3). Commenters are left in the position of speculating on EPA’s views and on those of other commenters that would presumably shape EPA’s final rule. It is well settled law that this approach fails to provide adequate notice for informed public comment. In *Fertilizer Institute v. EPA*, the court held “Commenting parties cannot be expected to monitor all other comments submitted to an agency.” In commenters’ trying to anticipate potential rule revisions in response to comments from others, the court has also stated, “the EPA must itself provide notice of a regulatory proposal. Having failed to do so, the commenter argues that it cannot bootstrap notice from a comment” [*Fertilizer Institute v. EPA*, at 1312, quoting *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 547 (D.C.Cir. 1983) (emphasis in original)].

Response: See response to Comment 2157-149.

Comment [9078-3457]: Commenter (6194) provides that the statutory requirements that Congress established for the process by which agencies develop regulations—while often described as “procedural” in nature—assure that agencies reach substantively valid and informed outcomes. These statutory and other rulemaking procedures were put in place for a reason; failing to follow them suggests a lack of informed analysis and, without an authorized basis for foregoing the process, an agency decision cannot be upheld. Thus, the commenter states that while lack of compliance with required procedures is itself a fatal flaw in the Proposal, it also undermines the basis of and credibility for the substance of the Proposal.¹⁶³³ Here, the contends that the proposal violates multiple procedural requirements, including but not necessarily limited to: compliance with the APA and Paperwork Reduction Act (PRA); consultation with the OMB, other federal agencies, and EPA’s own SAB; and application of Executive Orders regarding the Protection of Children from Environmental Health Risks and Safety Risks, and Environmental Justice in Minority Populations and Low-Income Populations.¹⁶³⁴

The commenter states that under the APA, notices of proposed rulemakings must reference the legal authority under which the rule is proposed. 5 U.S.C. § 553(b)(2). The *Federal Register* notice of the Proposal fails to meet this requirement. The Proposal cites provisions from several statutes, but does not explain how any of those provisions provide authority for the Proposal. Even if relevant authority could be found somewhere in the statutes, the APA does not countenance placing the burden on the public to search for it.¹⁶³⁵

The commenter adds that notices of proposed rulemakings must also include “the terms or substance of the proposed rule or a description of the subjects and issues involved.” 5 U.S.C. §

¹⁶³³ See e.g., *Horsehead Res. Dev. Co., Inc. v. Browner*, 16 F.3d 1246, 1268 (D.C. Cir. 1994) (describing the purpose of the Administrative Procedure Act notice and comment requirements as “better-informed agency decision-making” because “[n]otice improves the quality of agency rulemaking by ensuring that agency regulations will be tested by exposure to diverse public comment”) (internal citations omitted).

¹⁶³⁴ But for many requests from members of the public and organizations, EPA would have also violated statutory requirements for a public hearing and federal norms for reasonable public comment periods.

¹⁶³⁵ See U.S. Dep’t of Justice, Attorney General’s Manual on the Administrative Procedure Act 29 (1947) (“[T]he reference [to legal authority] must be sufficiently precise to apprise interested persons of the agency’s legal authority to issue the proposed rule.”).

553(b)(3). The purpose of this requirement is to “provide sufficient factual detail and rationale for the rule to permit interested parties to comment meaningfully.” *Honeywell International, Inc. v. EPA*, 372 F.3d 441, 445 (D.C. Cir. 2004). The *Federal Register* notice of the Proposal fails to meet this requirement. It is too vague to allow for fully meaningful and targeted comments. For example, the purported need and objective of the Proposal is couched in references to “transparency” and “validation” but these terms are not defined in the Proposal, nor do they have a single definition amongst professionals in the fields impacted by the Proposal.¹⁶³⁶ According to the commenter, the Proposal also improperly uses distinct concepts, such as “reproducibility” and “replicability,” as though they are interchangeable.

The commenter states that the notice similarly presents key issues beyond definitions at only broad stroke levels, raising issues in such a general manner that it fails to provide the public with adequate notice of what EPA intends. For instance:

- The Proposal requires that certain data and models be made “publicly available in a manner sufficient for independent validation,” and indicates that information will satisfy this standard when “it includes the information necessary for the public to understand, assess, and replicate findings.” 83 Fed. Reg. at 18,773-74. But it is not clear what degree of availability or explanation would satisfy the Proposal. For example, the “public” referenced in the Proposal could be scientists trained in the relevant field or members of the general public.
- The Proposal provides that, “where necessary, data would be made available subject to access and use restrictions.” *Id.* What this process would look like is not addressed in the Proposal or discussed at all in the preamble. This leaves significant open questions, such as who will pay for and implement these restrictions and who will decide which people are allowed to access the data and under what standards.
- The Proposal appears to require EPA to conduct independent peer review of all “pivotal regulatory science,” but provides no detail as to what this means or how it will be implemented. *Id.* For example, it is unclear who within the agency would perform this peer review, when it would occur, and whether (and when) prior peer review in the journal publication process would serve as a substitute for EPA peer review.
- The Proposal includes an exemption mechanism but does not provide information about the process or conditions under which exemptions shall or can be sought and granted.

Given these and other ambiguities, the public cannot adequately assess what EPA thinks the Proposal means or how it will implement it. Nevertheless, for purposes of these comments, we assume EPA intends a broad interpretation that would preclude a swath of scientific studies and information from use and consideration in regulatory proceedings.

¹⁶³⁶ For a detailed explanation of this point, see the separate comment letter submitted by the Emmett Environmental Law & Policy Clinic on August 7, 2018 on behalf of the President of Harvard University, the Presidents and a number of Department Chairs and Chiefs of four of the world’s foremost research and teaching hospitals (Beth Israel Deaconess Medical Center, Brigham and Women’s Hospital, Massachusetts Eye and Ear, and Massachusetts General Hospital), the Deans of Harvard’s T.H. Chan School of Public Health and Harvard Medical School, preeminent faculty at the Harvard T.H. Chan School of Public Health, the Harvard Medical School, and the Harvard School of Engineering and Applied Sciences, and numerous esteemed research and clinical doctors affiliated with Harvard and its research hospitals [“the Harvard Letter”].

Moreover, the commenter states that many of the sources cited in the Proposal either do not support the text of the proposed regulation, do not support the proposition for which they are cited, or are so broad that the public does not have fair notice of, and therefore cannot evaluate, EPA's rationale for the Proposal. For example, EPA asserts that it considered policies or recommendations of third-party organizations that advocate for open science. The Proposal, however, does not cite specific policies or recommendations, instead merely listing the names of institutions. 83 Fed. Reg. at 18,770 & n.9. Even when a specific report is referenced, such as the National Academies' reports on Improving Access to and Confidentiality of Research Data, Expanding Access to Research Data, and Access to Research Data in the 21st Century, the Proposal fails to cite the specific sections EPA purportedly considered or relied upon or the specific policies embodied in these reports that are allegedly advanced by the Proposal. *Id.* at 18,770 n.10. Other references are similarly vague.

The overall lack of clarity is illustrated by EPA's own solicitation of feedback; it covers so wide a range of issues—posing over two dozen questions—that it makes clear EPA has not identified a proposed path forward on which the public can comment.¹⁶³⁷ The Proposal would be more appropriately posited as an Advanced Notice of Proposed Rulemaking; it does not meet the APA's standards for proposed rules.

Response: See response to Comment 2157-149.

Comment [6112-3191]: Commenter (6137) states that, to the extent EPA decides to apply this Proposed Rule in the context of enforcement, adjudicatory, and permit actions – which it should not – it must first issue a proposal setting out its basis for such a rule and provide opportunity for comment under the APA and CAA § 307(d). EPA cannot rely on the comment opportunity provided by its April 30, 2018 Proposal, as the Proposal provides no notice whatsoever of the substance of what EPA might or might not include in a rule applying to enforcement and other actions excluded from the regulatory text of the proposal. See 83 Fed. Reg. at 18,773 (proposed 40 C.F.R. § 30.3).

Response: As discussed in the final rule preamble at Section III.A, EPA will issue statute-specific regulations following this procedural rule. Any substantive regulations will be issued via notice and comment rulemaking.

Comment [6141-2555]: Commenter (6166) suggests that procedurally, the Proposal violates the APA and a number of other laws that set forth specific procedures EPA must follow during its rulemaking process.

Response: See response to Comment 2157-149.

Comment [6133-2161]: Commenter (6158) states that a lack of analysis is unfair to the public and may also itself constitute a violation of the APA and Executive Order requirements for

¹⁶³⁷ See e.g., *Prometheus Radio Project v. F.C.C.*, 652 F.3d 431, 449 (3d Cir. 2011) (“[A]n agency proposing informal rulemaking has an obligation to make its views known to the public in a concrete and focused form so as to make criticism or formulation of alternatives possible.”) (internal citations omitted).

promulgation of agency rules.¹⁶³⁸ The lack of analysis and rationale is further evidence that this proposed rule is unnecessary and burdensome and should be withdrawn.

Response: See response to Comment 2157-149.

Comment [9066-1949]: Commenter (6188) contends that, in addition to the substantive deficiencies, EPA has failed to satisfy the appropriate procedural requirements for the Proposed Rule's promulgation.

First, the NPRM does not meet the federal APA requirement to cite adequate authority providing a basis for EPA's promulgation of the rule. See 5 U.S.C. § 553(b)(2) (requiring that an agency make reference to the authority under which the rule is proposed in a NPRM). As discussed, none of the statutory authority identified by EPA authorizes it to support the proposed rule, and further, EPA has solicited comment on this basic question, asking the public to supply the basis for EPA's rulemaking authority. This is not permissible under the APA.

The NPRM, by soliciting comment on the very nature of the rule itself, also suggests that EPA could adopt a Final Rule that deviates significantly from the Proposed Rule, an outcome which would violate the APA's notice provisions were the rule not first subjected to another round of notice and comment. 5 U.S.C. § 553(b)(3); see *National Black Media Coalition v. FCC*, 791 F.2d 1016 (2d Cir. 1986) (final rule that deviated significantly from NPRM did not provide the public with adequate opportunity to engage in the rulemaking process as required by the APA). Given the Proposed Rule's potential to affect scores of significant regulatory decisions, its brevity and ambiguity are breathtaking. Indeed, the Proposed Rule is more akin to a brainstorming document than a precisely noticed regulatory action. Without a clear statement of the Proposed Rule's reach and implications, members of the public cannot engage as informed participants in the rulemaking process, the very purpose of the APA. As the Third Circuit recognized in *Prometheus Radio Project v. FCC*, 652 F.3d 431, 450 (3d Cir. 2011):

...there must be an exchange of views, information, and criticism between interested persons and the agency...Consequently, the notice required by the APA...must disclose in detail the thinking that has animated the form of a proposed rule and the data upon which that rule is based...[A]n agency proposing informal rulemaking has an obligation to make its views known to the public in a concrete and focused form so as to make criticism or formulation of alternatives possible." (quoting *Home Box Office, Inc. v. FCC*, 567 F.2d 9, 35-36 (D.C. Cir. 1977) (internal citations and footnotes omitted))

Here, according to the commenter, despite EPA's purported commitment to transparency, the Proposed Rule contains no "concrete and focused" explanation of its impacts upon which the public can rely to formulate opinions regarding the rule's potential adoption. For example, nowhere does the Proposed Rule assess possible impacts on environmental quality and public

¹⁶³⁸ 5 U.S.C. § 553; Executive Order 12866: Regulatory Planning and Review (E.O. 12866) (1993) (as amended by E.Os. 13258 (2002) and 13422 (2007)); Executive Order 13563: Improving Regulation and Regulatory Review (2011); Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-income Populations (1994); Executive Order 13045: Protection of Children from Environmental Health Risks and Safety Risks (1997).

health from implementation of this rule, including the likelihood that EPA would be unable to consider important scientific research in its rulemakings and other activities; discuss how issues associated with patient privacy and CBI will be resolved; or identify any authority or data supporting the rule's promulgation.

Instead, the Proposed Rule creates a confused and muddled picture, soliciting comments on “additional or alternative sources of authority” for the rulemaking and “whether other alternative or additional regulatory or other policy vehicles on a programmatic or statutory level would be appropriate as alternative or additional steps.” 83 Fed. Reg. 18769, 18771. Far from satisfying the APA's requirements, the Proposed Rule entirely fails to “describe the range of alternatives being considered with reasonable specificity.” *Horsehead Res. Dev. Co. v. Browner*, 16 F.3d 1246, 1268 (D.C. Cir. 1994) (citing *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 549 (D.C. Cir. 1983)). In other words, the Proposed Rule, on its face, provides the public with no opportunity to understand the authority for its implementation or precisely how its mandates would apply to future regulatory decision-making, and leaves the door open to adoption of a Final Rule that looks very different from EPA's proposal. Given the vagueness of the Proposed Rule and the broad request for comments, the commenter asserts that the EPA must engage in another round of notice and comment before finalizing the rule if it intends to follow any substantive suggestions offered by commenters.

Response: See response to Comment 2157-149.

Comment [8750-1820]: Commenter (9227) notes that EDF has two FOIAs directly related to the substance of this rulemaking pending at EPA, for which we have received no responsive documents thus far, despite the passage of the statutory deadlines for a response. The first request (No. EPA-HQ-2018-005636) was submitted on March 20, with a determination from EPA statutorily due by April 19—which has not been provided. EDF submitted a second request (No. EPA-HQ-2018-007397) on May 4. According to the commenter, given the lack of transparency and information around the basis for this rule, its impacts, and its true motivations, EDF and the public cannot provide informed comment on this rule without the public records that have been requested. The commenter suggests that, for EPA to close the public comment period on this Proposal before all relevant records are released to the public is arbitrary and prevents our ability to meaningfully comment.

Response: Both FOIA requests EPA-HQ-2018-005636 and EPA-HQ-2018-007397 have been addressed and closed. The EPA disagrees that there was insufficient opportunity for informed comment at the proposed rule stage because the rulemaking docket contains the materials relevant to the public's review.

Comment [8750-1806]: Commenter (9227) provides that Section 553 of the APA, 5 U.S.C. § 553(b)(3), requires that an agency proposing a rule “provide sufficient factual detail and rationale for the rule to permit interested parties to comment meaningfully.”¹⁶³⁹ The CAA requires even more, that the *Federal Register* notice be accompanied by a statement of basis and purpose that includes a summary of the factual data on which the proposed rule is based, the methodology

¹⁶³⁹ *United States Telecom Assn. v. FCC*, 825 F.3d 674, 700 (D.C. Cir. 2016) (quoting *Honeywell Intl., Inc. v. EPA*, 372 F.3d 441, 445 (D.C. Cir. 2004) (internal quotation marks omitted).

used in obtaining the data and in analyzing the data; and the major legal interpretations and policy considerations underlying the proposed rule.¹⁶⁴⁰ The commenter notes that all data, information, and documents on which the proposed rule relies must be included in the docket on the date of publication of the proposed rule.¹⁶⁴¹

These core requirements are “designed (1) to ensure that agency regulations are tested via exposure to diverse public comment, (2) to ensure fairness to affected parties, and (3) to give affected parties an opportunity to develop evidence in the record to support their objections to the rule and thereby enhance the quality of judicial review.”¹⁶⁴² In addition, “a chance to comment ... [enables] the agency [to] maintain[] a flexible and open-minded attitude towards its own rules,”¹⁶⁴³ and “avoid[s] the inherently arbitrary nature of unpublished ad hoc determinations.”¹⁶⁴⁴ The “notice required by the APA ... must disclose in detail the thinking that has animated the form of a proposed rule and the data upon which that rule is based [A]n agency proposing informal rulemaking has an obligation to make its views known to the public in a concrete and focused form so as to make criticism or formulation of alternatives possible.” *Home Box Office, Inc. v. FCC*, 567 F.2d 9, 35-36 (D.C. Cir. 1977); see also *Horsehead Res. Dev. Co., Inc. v. Browner*, 16 F.3d 1246, 1268 (D.C. Cir. 1994) (“[A]n agency must describe the range of alternatives being considered with reasonable specificity. Otherwise, interested parties will not know what to comment on, and notice will not lead to better-informed agency decisionmaking.”) (internal citations and quotation marks omitted).

According to the commenter, the failure to include critical documents relevant to the proposed rule in the docket, as required by the CAA, itself constitutes a notice violation because “absence of those documents, or of comparable materials. . . makes impossible any meaningful comment on the merits of EPA’s assertions.”¹⁶⁴⁵ By failing to provide a more developed docket, EPA is frustrating the terms and purposes of these statute’s notice requirements. These procedures are in place to form a “specific” proposal that can serve as a “focus for comments,” *Small Refiner Lead Phase Down Task Force v. EPA*, 705 F.2d 506, 548-49 (D.C. Cir. 1983); see *Home Box Office, Inc. v. FCC*, 567 F.2d 9, 36 (D.C. Cir. 1977) (agency must “make its views known . . . in a concrete and focused form so as to make criticism or formulation of alternatives possible”). Because EPA has not provided supporting evidence, has not included key items it points to as major considerations underlying the Proposal, and has generally presented a vague and unspecified proposed rule and docket, EDF [the commenter] and the public are hindered in our ability to provide specific comment focused on the underpinnings of the Proposal, because we do not know and can only guess as to what they are.¹⁶⁴⁶

¹⁶⁴⁰ 42 U.S.C. § 7607(d)(3).

¹⁶⁴¹ 42 U.S.C. § 7607(d)(3).

¹⁶⁴² *Int’l Union, United Mine Workers of Am. v. Mine Safety and Health Admin.*, 407 F.3d 1250, 1259 (D.C. Cir. 2005).

¹⁶⁴³ *McLouth Steel Prods. Corp. v. Thomas*, 838 F.2d 1317, 1325 (D.C. Cir. 1988) (internal citation and quotation marks omitted).

¹⁶⁴⁴ *United States v. Reynolds*, 710 F.3d 498, 519-20 (3d Cir. 2013).

¹⁶⁴⁵ *Kennecott Corp. v. EPA*, 684 F.2d 1007, 1018 (D.C. Cir. 1982).

¹⁶⁴⁶ “Without a readily accessible statement of the agency’s rationale, interested parties [could not] comment meaningfully during the rulemaking process.” *Ne. Md. Waste Disposal Auth. v. EPA*, 358 F.3d 936, 949 (D.C. Cir. 2004).

The commenter adds that even the text of EPA's proposed rule and the statement of basis and purpose fails to provide the requisite notice to allow meaningful comment. At the most fundamental level, the commenter contends that it contains vague and contradictory statements about the actual effect of the Proposal. The Proposal generally appears to make its requirements mandatory—i.e., failure to make information publicly available will preclude the agency from relying on the study at all. See 83 Fed. Reg. at 18,769 n. 3 (“EPA is proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions.”); *id.* at 18,771 (“the regulatory text would impose requirements”); see also *id.* at 18,769 (“EPA will ensure that the data and models underlying the science is publicly available...”)(emphasis added) and proposed section 30.5 (“When promulgating significant regulatory actions, the Agency shall ensure that does response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation”). In a few places, however, the Proposal makes it sound as if its aims are more aspirational. See *id.* at 18,770 (“Where available and appropriate, EPA will use peer-reviewed information, standardized test methods, consistent data evaluation procedures, and good laboratory practices to ensure transparent, understandable, and reproducible scientific assessments.”)(emphasis added); *id.* at 18,772 (“The proposed rule directs EPA to make all reasonable efforts to” make data publicly available, but “does not compel the Agency to make that information available where it concludes after all such reasonable efforts that doing so in way [sic] that complies with the law and appropriate protections is not possible.”)(emphasis added); see also *id.* at 18,768 (“EPA should ensure that the data underlying those are publicly available...”)(emphasis added). The commenter states that the difference between a requirement precluding use of science and making all best efforts to make data publicly available is enormous.

To the extent EPA intends to propose a rule that would preclude use of science, as it appears the Proposal would do, the commenter contends that the proposed rule is further flawed because it contains no analysis of how that would affect regulations. How many studies does EPA typically rely on in promulgating regulations? What percentage of these would meet EPA's new requirements? For those that do not, how many could not meet these requirements for patient privacy, CBI, or other reasons? How would EPA set standards if it must rely on many fewer studies? Would EPA be precautionary in the face of less evidence? Would EPA delay promulgating regulations in order to comply with this new mandate? How does this mandate interact with statutory deadlines or statutory requirements that EPA look at a wide range of science? None of these very basic questions are addressed in the proposed rule and without answering them, it is impossible for the public to assess the import and likely consequences of the Proposal. Even more basically, the agency gives no notice as to the Proposal's impacts, its costs, its benefits, why it applies only to regulatory requirements but not to any regulatory actions (like licensing or permitting) that confer a benefit, substantive and procedural criteria for adjudicating waivers, or even the legal theory under which the Proposal issues—the plaintive solicitation for comment as to “additional or alternative sources” of authority, 83 Fed. Reg. at 18771, does not suffice.

The commenter states that to the extent the Proposal is intended to solicit comment on how EPA may make reasonable efforts to make data publicly available it is also unlawfully vague. The proposed rule includes numerous footnotes referencing entire websites or even Departments of

the Executive Branch. For example, the Proposal claims that “EPA believes that concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions commonly used across some parts of the Federal government.”¹⁶⁴⁷ To support this proposition, EPA remarkably cites (without any further elaboration or explanation in the proposal itself) to “examples from the U.S. Department of Health and Human Services, National Institute of Standards and Technology, U.S. Department of Education, and the U.S. Census Bureau.”¹⁶⁴⁸ See *Small Lead Refiner Phase Down*, 705 F. 2d at 548 (requirement that comments are to raise issues with “reasonable specificity” applies equally to the agency giving notice). For example, it is not possible to identify whether the sources referenced support EPA’s claim that there are approaches available to address the serious privacy issues raised by the Proposal— without providing the specific policies and recommendations, a public commenter has no way of knowing whether they are consistent or why EPA believes them to be consistent. It is impossible to respond in a meaningful way without significant guesswork.

Similarly, in footnote 10, where EPA lists a number of organizations whose “policies and recommendations” the Proposal allegedly took under consideration—no explanation is provided.¹⁶⁴⁹ In addition, in the proposed rule EPA fails to adequately define key terms like “validation”, “independence”, “reproducibility,” “replication,” and “uncertainty,” while also citing a “replication crisis” in science. The commenter states that it is important that these terms are defined clearly as these terms are not defined consistently across the scientific community nor governments—which has implications for the scope and purview of the proposed rule.

The commenter asserts that this amount of information is wholly insufficient to allow a public commenter to provide meaningful comments about these issues. Courts have been reluctant to find that important information appearing solely in the footnote of a rulemaking document satisfied the notice requirement of the APA, holding that “an agency may not turn the provision of notice into a bureaucratic game of hide and seek.”¹⁶⁵⁰ Referencing a key document without further discussion in the rulemaking document itself, and without incorporating it by reference or publishing it in the *Federal Register*, also does not satisfy the notice requirements of the APA.¹⁶⁵¹ Subsequent publication of the document may not be enough to cure a defect of notice where an important issue is “belied by the obscurity of the footnote intended to give notice” and further agency procedure is required to provide the public with “the opportunity to comment on a significant part of the agency’s decisionmaking process as required by section 553.”¹⁶⁵² Thus, the

¹⁶⁴⁷ Proposed Rule, 83 Fed. Reg. at 18,770.

¹⁶⁴⁸ Id. at 18,770 n. 16.

¹⁶⁴⁹ 83 Fed. Reg. at 18,770. n. 10 (“These include policies and recommendations from: The Administrative Conference of the United States’ Science in the Administrative process Project; National Academies’ reports on Improving Access to and Confidentiality of Research Data, Expanding Access to Research Data, and Access to Research Data in the 21st Century; the Health Effects Institute; Center for Open Science; members of the Risk Assessment Specialty Section of the Society of Toxicology, the Dose Response Section of the Society for Risk Analysis, and the International Society for Regulatory Toxicology and Pharmacology; and the Bipartisan Policy Center’s Science for Policy Project.”)

undifferentiated citations in the footnotes of the Proposal do not give adequate notice for public comment.¹⁶⁵³

Response: See response to Comment 2157-149. The rulemaking docket contains the materials relevant to the public's review.

Comment [8750-1779]: Commenter (9227) asserts that the EPA has failed to provide a properly developed record in support of the proposed rule. EPA has not identified sufficient supporting evidence in the Proposal or in its docket and has failed to provide adequate notice of the supporting evidence for the public to respond to meaningfully, as the APA, the CAA and other substantive statutes require.

Under the APA, agencies must base their actions on examination of the facts, “the agency must examine the relevant data and articulate a satisfactory explanation for its action including a ‘rational connection between the facts found and the choice made.’”¹⁶⁵⁴ The factual determination underlying the agency decision must be based on substantial evidence and will be set aside “if the agency ‘relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.’”¹⁶⁵⁵

Rulemaking under the CAA is subject to the same general requirements of statutory conformity and reasoned decision-making derived from the APA and basic principles of administrative law. CAA rules cannot be “arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law,” “in excess of statutory jurisdiction, authority, or limitations, or short of statutory right,” or “without observance of procedure required by law.”

As noted in Appendix A (of their comment letter) and in Section VIII.D (in their comment letter), the commenter states that the EPA's citations for support in the Proposal are vague and uninformative, and even where the particular citation can be identified and located, it is often not clear how EPA thinks the citation supports the Proposal. The commenter asserts that this does not meet the standards of the APA and CAA.

Additionally, the commenter contends that the EPA has failed to meet the docket requirements of the CAA. CAA section 307(d)(3) requires that publication of the proposed rule in the *Federal Register* include a summary of the factual data on which the proposed rule is based, the methodology used in obtaining the data and in analyzing the data, and the major legal

interpretations and policy consideration underlying the proposed rule. It also requires the agency to place “[a]ll data, information, and documents. . . on which the proposed rule relies” in the rulemaking docket on the date of publication of the proposed rule.¹⁶⁵⁶ The undifferentiated citation of articles and policies, most of which contradict the Proposal or otherwise offer no support for it, fails abjectly to satisfy these requirements.¹⁶⁵⁷ Any document that becomes available after the proposed rule has been published and that is of central relevance to the rulemaking must also be placed in the docket as soon as possible after its availability.¹⁶⁵⁸ The agency must allow enough time for participants in the rulemaking to respond to those documents with comments.¹⁶⁵⁹

As of the date of the publication of the Proposal, the commenter states that the docket at regulations.gov contained only the following 12 documents: (1) OIRA Review Start Document (Apr. 17, 2018); (2) OIRA Review Conclusion Document (Apr. 23, 2018); (3) White House Memorandum on Scientific Integrity (Mar. 9, 2009); (4) Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies; Republication, 67 Fed. Reg. 8,452 (Feb. 22, 2002); (5) Exec. Order 13,777, Enforcing the Regulatory Reform Agenda, 82 Fed. Reg. 12,285 (Feb. 24, 2017); (6) EPA, Plan to Increase Access to Results of EPA-Funded Scientific Research (Nov. 29, 2016); (7) OMB Memorandum M-05-03 on Issuance of OMB’s “Final Information Quality Bulletin for Peer Review” (Dec. 16, 2018); (8) EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency (Oct. 2002); (9) Exec. Order 13,563, Improving Regulation and Regulatory Review, 76 Fed. Reg. 3,821 (Jan. 18, 2011); (10) Exec. Order 16, 093, Promoting Energy Independence and Economic Growth, 82 Fed. Reg. 16,093 (Mar. 28, 2017); (11) OMB Memorandum M-13-13: Open Data Policy-Managing Information as an Asset (May 9, 2013); (12) Commission on Evidence-Based Policymaking, The Promise of Evidence-Based Policymaking (Sep. 2017).

According to the commenter, this clearly is not enough to meet the APA’s or CAA’s requirements. Aside from the drafts of the proposed rule submitted to OIRA, each of these documents was a pre-existing memorandum, policy document, or executive order that contains

¹⁶⁵⁶ CAA Section 307(d)(3).

¹⁶⁵⁷ See *Kenecott v. EPA*, 684 F.2d 1007, 1018 (D.C. Cir. 1982) (“Section 307(d)(3) requires that notice of proposed . . . regulations be accompanied by a statement of their basis and purpose, including the factual data on which the proposed regulations are based, the methodology used in obtaining and analyzing the data, and the major legal interpretations and policy considerations underlying the proposed regulations. . . . Though EPA states in its preamble to the final regulations that its current eligibility test is based upon a closure policy adopted by EPA before 1977, and that it has used financial tests similar to the present closure test under the agency’s existing policy, no documents embodying those tests or demonstrating the methodology used before 1977 were ever placed in the docket. The only document in the docket purporting to explain that a closure test was ever employed by EPA was a memorandum in which EPA economist Hale sets forth his recollection that such a test had been used before 1977 to determine whether smelters would be permitted to rely upon dispersion techniques to meet the ambient standards. That memo, dated August 17, 1979, was placed in the docket on March 12, 1980, approximately eleven months after the close of the public comment period, and reveals neither the actual tests nor the methodology used by EPA. The failure of EPA to observe the procedures mandated by §§ 307(d)(3) and 307(d)(6) was thus arbitrary and capricious.”)

¹⁶⁵⁸ CAA Section 307(d)(4).

¹⁶⁵⁹ *Sierra Club v. Costle*, 657 F.2d 298, 352 (D.C. Cir. 1981); *Union Oil Co. v. EPA*, 821 F.2d 678, 683 (D.C. Cir. 1987).

no specific analysis—factual, legal, policy or otherwise—that pertains to the impacts of or at all justifies this proposed rule. While EPA in the proposed rule cites to some of these documents as purportedly being consistent with these prior policies, see, e.g., 83 Fed. Reg. at 18,769-70, as is discussed in Section II and in Appendix A (of their comment letter), these policies do not in fact provide any basis for the Proposal. The record that EPA provides clearly fails to support its proposed action. Some of the factual data, legal interpretations, and policy considerations that EPA has not sufficiently provided evidence for include: the number of scientific studies that would be precluded from consideration under the Proposal; whether there are fields of research where the Proposal would result in insufficient scientific information available for EPA to meet its statutory duties; how EPA will address the substantial privacy concerns implicated by the Proposal; how application of this Proposal will impact substantive agency actions; what the costs of implementing this Proposal are if EPA intends to not just exclude studies from consideration where too costly to provide access, etc.

The commenter notes that the EPA, for instance, includes Executive Order 13,563 in the docket to support its statement that “[t]he best available science must serve as the foundation of EPA’s regulatory actions.”¹⁶⁶⁰ While Executive Order 13,563 makes that statement, it does not support EPA’s Proposal, which as explained above, hinders EPA’s use of the best available science. EPA provides no evidence or explanation in the docket or Proposal for why EPA believes this policy would further that goal. The executive order only states that agencies should make available to the public the scientific or technological findings or conclusions on which rules rely, as opposed to underlying raw data that EPA has targeted with this Proposal. Meanwhile, EPA blatantly violates the executive order’s provisions requiring agencies to weigh costs and benefits; to write regulations that are easy to understand; and to provide the scientific and technical findings underlying the rule for the public to comment on.

Section 307(d)(3) of the CAA requires that “[a]ll data, information, and documents ... on which the proposed rule relies shall be included in the docket on the date of publication of the proposed rule.” Many items that EPA cites to in the Proposal as providing a basis for the proposed rule do not appear in the docket. For example, EPA states: “The proposed rule takes into consideration the policies or recommendations of third party organizations who advocated for open science.”¹⁶⁶¹ In a footnote, EPA provides: “These include policies and recommendations from: The Administrative Conference of the United States’ Science in the Administrative Process Project; National Academies’ reports on Improving Access to and Confidentiality of Research Data, Expanding Access to Research Data, and Access to Research Data in the 21st Century; the Health Effects Institute; Center for Open Science; members of the Risk Assessment Specialty Section of the Society of Toxicology, the Dose Response Section of the Society for Risk Analysis, and the International Society for Regulatory Toxicology and Pharmacology; and the Bipartisan Policy Center’s Science for Policy Project.”¹⁶⁶² Many of these policies and recommendations did not appear in the docket on the date of publication of the Proposal and still do not appear in the docket—a clear violation of the CAA—nor are the specific documents or reports even identified or properly cited so that they may be tracked down. This is evidently

¹⁶⁶⁰ 83 Fed. Reg. at 18,769 n. 1.

¹⁶⁶¹ 83 Fed. Reg. at 18,770.

¹⁶⁶² 83 Fed. Reg. at 18,770 n. 10.

prejudicial to commenters—it undermines commenters ability to submit meaningful feedback when the agency is hiding the ball in this manner.

These policies and recommendations are not easily identifiable on their own either, even after significant internet research. This is also true of footnote 16, where EPA lists a number of agencies to support its claim that the federal government is already implementing solutions to data disclosure.¹⁶⁶³ EPA cites, for example, the National Institute of Standards of Technology. NIST has numerous policy documents on protecting privacy concerns and keeping data secure as well as its own internal policies on releasing data. It is hard to see how any are relevant here, but without a particular cite the public is denied even a chance to respond to whatever EPA is trying to use as support—or must respond to everything that might be being referenced, creating a burdensome task. Throughout these comments, as we attempt to respond to EPA’s Proposal, we have been very practically limited by our inability, even after much research and consideration, to be fully certain we have identified the appropriate policies to respond to. This presents a situation that the CAA’s docket requirement was exactly formulated to prevent.

On May 25, 2018, EPA added a memorandum to the docket for this rulemaking.¹⁶⁶⁴ This memorandum contains hyperlinks apparently intended to accompany various citations in the footnotes of the Proposal. This document does not cure the former procedural defect, as the CAA requires information the proposed rule relies on to be placed in the docket on the day the proposed rule is published.¹⁶⁶⁵ Further, these hyperlinks still link ambiguously to various documents and agency websites without providing any information about what specifically EPA intends to cite or how the cited information is being used or considered by EPA. Additionally, simply adding such a document to the docket does not provide adequate notice to the public. Someone who had access only to the proposed rule and was not carefully monitoring the docket would have no indication or notice of this new document. Either EPA is failing to comply with the CAA’s requirements by failing to include in the docket factual data, legal interpretations, and policy considerations that support the Proposal, or these supporting items do not exist, deeming this rulemaking completely arbitrary—in either case the Proposal fails to meet the standards of the APA and CAA. Under the CAA the rulemaking docket “must provide the entire basis for the final rule and the exclusive record for judicial review,” this docket clearly cannot support a final rule.¹⁶⁶⁶

Response: See response to Comment 2157-149. The rulemaking docket contains the materials relevant to the public’s review. EPA notes that this is an internal procedural rule and is not subject to CAA § 307(d). As discussed in the final rule preamble at Section III.A., EPA will issue statute-specific transparency regulations or programmatic regulations after this procedural rule.

Comment [8750-1776]: Commenter (9227) provides that the APA, the CAA, and other federal statutes proscribe procedures that must be followed in agency rulemaking, and which EPA has

¹⁶⁶³ 83 Fed. Reg. at 18,770 n. 16.

failed to meet in its Proposal. This proposed rule does not fit into any of the exceptions the APA provides for the procedural requirements of rulemaking—it is neither an interpretive rule, general statement of policy, or a rule of agency organization, procedure or practice.¹⁶⁶⁷

The commenter states that the proposed rule does not purport to clarify or explain an already existing statute or rule, and thus is not an interpretive rule.¹⁶⁶⁸ The proposed rule is not a general statement of policy, because it establishes a standard of conduct, which has the force of law. It uses mandatory language indicating a requirement: “When promulgating significant regulatory actions, the Agency shall ensure that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation.”¹⁶⁶⁹ Unlike a general statement of policy, which “does not establish a ‘binding norm,’ . . . [and] is not finally determinative of the issues or rights to which it is addressed,” EPA here makes no qualifications that it has any leeway to not follow the Proposal’s new requirements in all future regulatory actions.¹⁶⁷⁰ The provision allowing the EPA Administrator to grant exceptions in a limited number of cases does not turn this rule into a general statement of policy because it also binds the Administrator’s discretion, allowing deviation from the policy only when they make specific findings.¹⁶⁷¹ EPA has not indicated that “in subsequent proceedings it will thoroughly consider not only the policy’s applicability to the facts of a given case but also the underlying validity of the policy itself,” but seems poised to apply the policy in all instances—granting exceptions only in limited circumstances where compliance is deemed impracticable.¹⁶⁷² It nowhere indicates that EPA may reassess in each case whether following this rule is the best means to achieve scientific integrity as it undertakes regulatory action. The Proposal has other indications of a binding rule, including that EPA intends to codify it in the CFR, and EPA has itself characterized the Proposal as a binding rule.¹⁶⁷³

The commenter adds that this rule is also not a rule of agency organization, procedure or practice, for purposes of the APA. Agency actions in this category are those “that do not themselves alter the rights or interests of parties, although it may alter the manner in which the parties present themselves or their viewpoints to the agency.”¹⁶⁷⁴ An agency action that “trenches on substantial private rights and interests” does not fall under this exemption.¹⁶⁷⁵ By restricting the scientific studies on which EPA may base final significant regulatory actions, EPA severely limits parties from relying on excluded studies in advocating for particular safeguards. In the preamble, EPA makes clear that the rule is about “EPA’s regulatory actions” and underlying conclusions.¹⁶⁷⁶ Because the rule substantively impacts agency conclusions and regulations, it

¹⁶⁷⁶ 83 Fed. Reg. 18,769.

impacts private rights and interests. The rule does not allow private individuals to submit for consideration (or renders such submittal a nullity) studies that they would have been permitted to prior to the proposed rule, thus impacting the substantive standards that EPA is able to justify setting—which has implications for the regulated community as well as for public health. The Proposal “encodes a substantive value judgment or puts a stamp of approval or disapproval on a given type of behavior” by requiring regulatory actions to be supported only by certain scientific information deemed acceptable by the proposed rule.¹⁶⁷⁷

In *CropLife Am. v. E.P.A.*, the commenter provides that the Court held that a similar rule promulgated by EPA, barring third-party human studies from agency consideration during pesticide registrations was a binding regulation because it used “clear and unequivocal language” reflecting “an obvious change in established agency practice” that created a “binding norm.”¹⁶⁷⁸ The Court stated: “EPA’s stated rule is binding on petitioners, who are now barred from relying on third-party human studies (even in cases where such studies formerly were approved), and is binding on the agency because EPA has made it clear that it simply ‘will not consider’ human studies.”¹⁶⁷⁹ Similarly, the Proposal appears to bind EPA to not consider scientific information it could consider before, unless it falls under certain narrow, ambiguously defined exceptions, and binds the public and organizations such as EDF who can no longer submit studies to EPA that EPA would previously have been required to consider as part of the rulemaking process.

Response: See response to Comments 84-1403 and 4829-2022.

Comment [6894-3628]: Commenter (6915) argues that the EPA’s skeletal outline falls far short of the APA’s notice requirements and fails entirely to “examine the relevant data and articulate a satisfactory explanation for its action including a rational connection between the facts found and the choice made.” *Natural Res. Defense Council, Inc. v. U.S. Env’tl. Prot. Agency*, 859 F.2d 156, 209 (D.C. Cir. 1988). The commenter states that the EPA should withdraw the proposal on these grounds alone.

Response: See response to Comment 2157-149.

1.6.1.2 APA (SNPRM Comments)

Comment [25-96]: Commenter (10972) writes that Section 553(c) gives interested persons a right to participate and a right to consideration of their submissions.

Interested persons have a right to participate in a rulemaking through submission of written data, views, or arguments. The EPA here fails to comply with the APA’s participation requirements in

¹⁶⁷⁷ *Am. Hosp. Asso. v. Bowen*, 834 F.2d 1037, 1047 (D.C. Cir. 1987). See also *Pharm. Mfrs. Asso. v. Finch*, 307 F. Supp. 858, 865 (D. Del. 1970) (finding that a regulation promulgating new criteria for clinical investigations that will meet the standards of evidence necessary to demonstrate the effectiveness of drug products, and excluding certain kinds of clinical investigations, was not merely a procedural rule, because they “did effect a material narrowing of the range of evidence which previously had been considered relevant in evaluating a drug’s efficacy. Because of the important clarification of acceptable testing standards effected by the September regulations and because of the substantial impact of these regulations on the drug industry. . . ”)

¹⁶⁷⁸ 329 F.3d 876, 881 (D.C. Cir. 2003).

¹⁶⁷⁹ *Id.*

three ways. First, the scheme suggested in section 30.5 of the proposed regulation, particularly the option 1, channels the work of interested persons from the submission desk into the dustbin on a bright-line basis which has nothing to do with the substance of the data, views or arguments expressed therein. This serves to guillotine interested persons' right to participate, in contravention of the APA.

Second, the SNPRM itself is non-compliant with section 553(b)(3) of the APA as read with the participation requirement in section 553(c) in that it negates realistic participation by providing no clarity on the nature and scope of the problem sought to be regulated. The SNPRM fails to meaningfully discuss the fundamental expansion it works on the NPRM. It provides no justification for jumping from a rule applicable to dose-response models to a rule that applies to essentially any research the EPA may use; as noted above, there seems to be no real basis for this. An explanation of the problem that necessitates this expansion is necessary. This is not least because the EPA has dealt with such data for a long time and it must – if this proposed rule is in any way supportable – undoubtedly be able to point to incidents where regulatory error arose (especially beyond the dose-response context) due to apparent transparency failings. Realistic participation of the public is seriously compromised when the agency fails to provide clarity on the nature and scope of the problem to be regulated. How is the public supposed to participate in determining the size of the bridge to be built when the size of river underneath is concealed by a vast tarp? The inconsistencies of this SNPRM with substantive laws that the EPA itself points to – together with the vast scale of application introduced by this SNPRM – suggest that Executive Order 12866 ought to apply. Under Executive Order 12866, regulation should only occur when law or compelling public need requires it. Yet the expansion of the NPRM to the SNPRM was carried out with nary a word on what compelling public need required it; that is improper.

Third, the very fact that this is an SNPRM attaches it to the NPRM to which it is supplementary. The NPRM was about dose-response models and data – a feature of a very limited set of sciences; the SNPRM is about all models and data across all sciences – including the social sciences. To make that type of vast expansion as a “supplement” to the very narrow initial concept raises the probability – well-nigh certainty – of restricting participation. The SNPRM then points out that there will be no consideration of anything that relates to the NPRM. Further, the EPA has limited comments to 60 days in the middle of a national emergency. All this highlights the procedural invalidity of the SNPRM.

Section 553(c) gives a right to consideration of such relevant matter as is presented by interested persons. The determination of relevance is surely a matter of substance. The EPA cannot purport to turn it into a non-substantive procedural fiat as it seeks to under section 30.5 of the proposed rule. Section 30.5 of the proposed rule is therefore unlawful.

Given the rights to participate and to consideration of their submissions, an interested person would expect that exclusion of their submission would occur in terms of a clear-cut procedure with appropriate safeguards of their rights. Yet the proposed rule makes no such provision. Exclusion of an interested person's study from consideration is also a substantial repudiation of that person; it is a restrictive action or limitation that can be classified as a sanction as defined under section 551 of the APA, with all the legal consequences which that entails. The proposed

regulation is also silent as to whether a reanalysis will be sent to an initial author for comment and response and how this will be administered.

Response: As explained in Section III.E of the final rule preamble, the final rule adopts a weighting approach to considering data availability and not the categorical exclusion presented as an option in the NPRM. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. That means that the agency will consider all relevant studies when taking covered actions.

EPA disagrees that this rulemaking does not comply with the APA. EPA explains the expanded scope and the basis for that expansion in Section I.B of the SNPRM preamble (85 FR 15396) and Sections II.B and III.B of the final rule preamble. EPA notes that this rule is purely procedural in nature and therefore is not subject to APA notice and comment. Nevertheless, EPA initiated two rounds of notice and comment of 60 days each and made changes to both the SNPRM and the final rule in response to those comments. While EPA was not required to take comment on this procedural rule, the 60-day comment period meets the recommendation of Executive Order 12866 pertaining to the recommended length of comment periods for significant rulemakings.

Comment [34-154]: Commenter (11192) writes that this SNPRM demonstrates a disingenuous request for public input from the EPA. The EPA is obligated through the APA to notify the public and invite public comment on proposed regulations.¹⁶⁸⁰ While fulfilling the procedural requirements of the APA through this SNPRM, the EPA downplays the public interest of this sweeping proposed regulation, repeatedly asserts that this proposed rule is an affair internal to the agency, and sets up a path for the agency to dismiss public input regarding the STRS rule.

In the first paragraph of the Executive Summary, the EPA appears to dissuade public comment by understating the interest of members of the general public in a proposed rule designed to significantly alter regulations protecting public health. First, the EPA frames the proposed rule as internal to the agency, stating “This SNPRM does not regulate any entity outside the Federal Government. Rather, the proposed requirements would modify the EPA's internal procedures regarding the transparency of science underlying regulatory decisions.”¹⁶⁸¹ The EPA then concedes that “any entity interested in EPA's regulations may be interested in this proposal,” providing an example of “entities that conduct research or another scientific activity that is likely to be relevant to EPA's regulatory activity.”¹⁶⁸²

Response: Please see the response to comment 25-96.

Comment [34-156]: Commenter (11192) writes that in addition to asserting that the EPA can introduce these changes under its housekeeping authority, the EPA also lays the groundwork in this SNPRM to subvert public comment in the future. The EPA states that it is “considering how to proceed, apart from this supplemental proposal, to establish regulations interpreting provisions

¹⁶⁸⁰ Administrative Procedure Act, 5 U.S.C. § 552.

¹⁶⁸¹ EPA, “Strengthening Transparency in Regulatory Science” SNPRM, 15397.

¹⁶⁸² *Id.*

of, and/or exercising substantive rulemaking authority delegated to it by programmatic statutes.”¹⁶⁸³ Creating regulations specifically about how the EPA interprets or carries out its statutes could result in a process whereby many, perhaps all, new environmental regulations pursuant to the EPA’s statutes, including the CAA and CWA, would be considered internal procedures and thus give the EPA leeway to circumvent the APA’s required notice-and-comment rulemaking. The EPA has been acting with an aggressive deregulatory agenda for the last three years.¹⁶⁸⁴ This action not only shuts the public out of federal environmental decisions but could lay the groundwork for discarding all of the EPA’s regulatory accountability. We firmly oppose the establishment of regulations that could allow the EPA to circumvent notice-and-comment rulemaking.

Response: This action underwent two rounds of public notice and comment despite being a procedural rule and therefore not subject to those requirements. Furthermore, and as mentioned in Section III.D of the final rule preamble, any substantive actions implementing this procedural rule will be subject to public notice and comment.

Comment [48-502]: Commenter (12727) writes that the Supplemental Notice would violate the APA and EPA’s authorizing statutes by depriving the public of an adequate opportunity to comment on future rulemakings.

The SNPRM would prevent the public from commenting meaningfully on future rulemakings by withholding information on the studies the agency is considering or will consider. In order to comment in an informed way, it is essential for the public to understand the agency’s rationale for ignoring otherwise relevant information. If the agency fails to explain why it has excluded a study in issuing a proposal, or will not consider it when submitted by commenters, the public cannot object to its exclusion and has no indication whether the agency has rejected it because of the requirements of this rule or because the agency deemed the study irrelevant to its regulation. The latter, if true, would be crucial to an understanding of the agency’s view of the scope and purpose of its regulation. Yet the Supplemental Notice suggests that EPA will only provide an explanation for disregarding or discounting a study under its alternative “weighting” option.¹⁶⁸⁵ It has not indicated that it will identify the studies it has entirely ruled out under the preferred “tiered access” approach.¹⁶⁸⁶ Without an understanding of how this rule is operating to suppress scientific information in future rulemakings, commenters cannot understand the basis of the agency’s proposals and may develop and submit information that the agency will discard out of hand. They would also be unable to oppose EPA’s disregard of otherwise relevant information, which it may be required to consider under the controlling statute. This ‘black box’ precludes fully informed comment on future rulemakings and therefore violates the APA and EPA’s authorizing statutes.¹⁶⁸⁷

¹⁶⁸⁶ See id. at 15,402-03.

¹⁶⁸⁷ See, e.g., *Am. Radio Relay League, Inc. v. FCC*, 524 F.3d 227, 239-40 (D.C. Cir. 2008) (“It is [acceptable] for the Commission to give notice and make available for comment the studies on which it relied in formulating the rule

Response: As mentioned in Section III.D of the final rule preamble, any substantive actions implementing this procedural rule will be subject to public notice and comment. EPA will make available to the public all information necessary to ensure meaningful comment on those actions upon their proposal.

Comment [48-1481]: Commenter (12727) writes that EPA’s failure to consider how its proposed rule could interfere with its ability to discharge its statutory duties and fulfill its mission of protecting public health and the environment renders its proposed action arbitrary and capricious under the APA.¹⁶⁸⁸

Response: EPA disagrees that it failed to consider this issue, as evidenced by its specific request for comments on the appropriateness of relying on the substantive statutes that EPA administers as authority for the rule. See NRPM and SNPRM at Section I. C. of preamble (83 FR 18768) and Section I. B. of preamble (85 FR 15396), respectively.

Comment [54-2034]: Commenter (11361) writes that in addition to asserting that the EPA can introduce these changes under its housekeeping authority, the EPA also lays the groundwork in this SNPRM to subvert public comment in the future. The EPA states that it is “considering how to proceed, apart from this supplemental proposal, to establish regulations interpreting provisions of, and/or exercising substantive rulemaking authority delegated to it by programmatic statutes.”¹⁶⁸⁹ Creating regulations specifically about how the EPA interprets or carries out its statutes could result in a process whereby many, perhaps all, new environmental regulations pursuant to the EPA’s statutes, including the CAA and CWA, would be considered internal procedures and thus give the EPA leeway to circumvent the APA’s required notice-and-comment rulemaking. The EPA has been acting with an aggressive deregulatory agenda for the last three years.¹⁶⁹⁰ This action not only shuts the public out of federal environmental decisions but could lay the groundwork for discarding all of the EPA’s regulatory accountability. We firmly oppose the establishment of regulations that could allow the EPA to circumvent notice-and-comment rulemaking.

Response: Please see response to comment 48-502.

Comment [81-590]: Commenter (12715) writes that the supplemental proposal is arbitrary, and too vague to allow for meaningful public participation.

The APA requires that “general notice of proposed rulemaking shall be published in the *Federal Register*,” including the “terms or substance of the proposed rule.” 5 U.S.C. § 553(b). The straightforward purpose of this requirement is to give the affected public an opportunity to

while explaining its non-reliance on certain parts.” (emphasis added)); cf. *Appalachian Power Co. v. EPA*, 249 F.3d 1032, 1060 (D.C. Cir. 2001) (upholding EPA’s fully explained determination that a report did not need to be included in the docket because it was not of central relevance to the rulemaking).

¹⁶⁸⁸ See *Physicians for Soc. Responsibility*, 2020 U.S. App. LEXIS 12727, at *27 (“[I]n failing to grapple with how EPA’s policy affected its statutory scientific mandates, the Directive ‘failed to consider an important aspect of the problem.’ *State Farm*, 463 U.S. at 42.”).

provide meaningfully informed comment on an agency's proposal. See *Home Box Office, Inc.*, supra, 567 F.2d at 35-36. Further, an agency's regulations cannot be arbitrary, capricious, or contrary to the agency's statutory authority. 5 U.S.C. § 706. Courts will not hesitate to strike down final rules based on proposals lacking in specificity. See, e.g. *Horsehead Res. Dev. Co. v. Browner*, 16 F.3d 1246, 1268 (D.C. Cir. 1994) ("general notice that a new standard will be adopted affords the parties scant opportunity for comment"). Here, however, in the words of EPA's own SAB, "[g]iven the relatively skeletal nature of the Proposed Rule, it is not possible to define the implications of the rule with confidence." SAB Report, at 2. In particular, it is unclear which definitions are included in the proposed rule, EPA fails to define key features of the two "options" proposed for determining which data and models may be used, and the proposed rule's exemptions provision contains insufficient standards to guide the Administrator's discretion. The supplemental proposal thus runs afoul of the APA's substantive and procedural requirements due to its vagueness as well as its arbitrariness, thus depriving the public of a meaningful opportunity to comment. Accordingly, if EPA does not abandon the proposal altogether, it should reclassify the proposal as, at most, an Advance Notice of Proposed Rulemaking.

Response: EPA clarifies the relevant definitions in the final rule preamble at Section III.C elaborates on key features for determining which data and models may be used at Section III.E, and outlines the standards the Administrator will be required to apply in determining whether to grant an exemption at Section III.G.

Comment [81-593]: Commenter (12715) writes that the supplemental proposal's definitions section is contradictory and unclear.

The supplemental proposal's contradictory and confusing discussion and presentation of the definitions section of the proposed rule violates the APA's requirement that a proposal must allow for meaningfully informed comment. Specifically, the narrative section of the supplemental proposal states that EPA is "modifying, deleting and proposing new regulatory text" in the definitions section, including "deleting the first paragraph of the 2018 proposed rulemaking regulatory text" and the definition of research data. 85 Fed. Reg. at 15,398. But in the proposed rule section, EPA states that it is "[r]evis[ing] § 30.2 by *adding* the [listed] definitions . . . to read as follows." *Id.* at 15,404 (emphasis added). Unlike other sections of the supplemental proposal where EPA appears to have included the full revised provision, the proposed rule text for section 30.2 appears to include only the added definitions. It is thus unclear which, if any, portions of the original proposed rule text are being "modif[ied]" or "delet[ed]" as the narrative description indicates. EPA's unclear presentation of the changes it is making to this section of the supplemental proposal deprives the public of the opportunity to provide meaningful feedback on this portion of the rule.

The definitions are also problematic because the proposed rule repeatedly refers to "significant regulatory decisions," *id.* at 15,405-06, but the proposal fails to provide any definition of the terms "significant regulatory decisions" or "significant." Even more confusingly, "regulatory decisions" are defined in the original proposal as "final regulations determined to be 'significant regulatory actions' by the Office of Management and Budget." 83 Fed. Reg. 18,768, 18,773 (Apr. 30, 2018). Moreover, numerous other definitions in the proposed rule are also fatally flawed as described in our Technical Comments below.

The confusion throughout the definitions section infects the entire proposal because understanding whether and how EPA has defined key terms is critical to understanding how the other substantive provisions of the rule would operate. The supplemental proposal, like the original proposal, is therefore unlawfully vague and arbitrary.

Response: EPA made several changes to the definitions section to address these concerns. Please see the final rule preamble at Section III.C and final regulatory text at §30.2.

Comment [82-711]: Commenter (12464) writes that multiple aspects of the supplemental notice are incomplete, ambiguous, or otherwise fail to provide adequate notice of the contents of the proposal.

Under the APA, a notice of proposed rulemaking must include “the terms or substance of the proposed rule or a description of the subjects and issues involved.” 5 U.S.C. § 553(b)(3). The purpose of this requirement is to “provide sufficient factual detail and rationale for the rule to permit interested parties to comment meaningfully.”¹⁶⁹¹ The Supplemental Notice fails to meet this requirement. Several aspects of the Proposal remain too incomplete or vague to allow for meaningful and targeted comments.

While we identify multiple topics on which the Supplemental Notice has not provided sufficient detail throughout this comment letter, some of the most important issues are highlighted below.

Response: Both the SNPRM and final rule contain a description of the subjects and issues involved. See 85 FR 15396 and final rule *Federal Register* notice for this action, respectively.

Comment [97-901]: Commenter (11479) writes that while EPA does not cite the APA as a source of its authority, this proposal would be violating the law because the agency would be arbitrarily and capriciously selecting which information to use in decision-making. This is especially true given section 30.9 of the rule, which would allow the administrator to exclude certain studies from the rule’s requirements on a case-by-case basis. Furthermore, under the APA, agencies are required to consider and respond to all information presented in the docket. If EPA chooses to ignore a portion of this evidence because it cannot access or publicize the underlying data, models, and codes, such action would be arbitrary and capricious.

Response: Per section 30.9 of the final rule, the Administrator may grant an exemption, but in so doing, the Administrator must apply specifically enumerated standards and provide a justification for the Administrator’s decision. EPA has articulated the standards to be applied and imposed a process for documenting an exemption decision which demonstrates that this rule will not be applied in an arbitrary or capricious manner. Furthermore, the rule does not require EPA to “ignore” underlying data and models. Rather, in lieu of a categorical exclusion, EPA has finalized a weighting approach to considering such information. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration

¹⁶⁹¹ *Honeywell International, Inc. v. EPA*, 372 F.3d 441, 445 (D.C. Cir. 2004).

to those studies where the underlying data and models are available for independent validation. That means that the agency will consider all relevant studies when taking covered actions.

Comment [157-1480]: Commenter (12422) writes that under the provisions of the APA, the EPA administrator does not have the authority to refuse to consider any comment submitted to the agency. If she or he thinks it is not valid, inaccurate, or inapplicable, she or he must explain why. Under the APA, submissions, including scientific studies, cannot arbitrarily or capriciously be discarded because the underlying data are not provided. When I was OSHA Administrator, we wanted to protect the integrity of the science used in setting regulations, so we explored asking for conflict-of-interest disclosures, similar to those requested by every leading scientific journal. Our legal experts determined that we could request this disclosure, but we could not reject submissions that failed to include them. This is a comparable situation – rejecting submitted studies because the underlying data are not available is prohibited under the APA.

Response: EPA has finalized a weighted approach to considering underlying data and models, not a categorical exclusion. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. That means that the agency will consider all relevant studies when taking covered actions.

Comment [159-1415]: Commenter (12430) writes that Agency action violates the APA, 5 U.S.C. section 706, if it is “arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law.”¹⁶⁹² Agency action is arbitrary and capricious when the agency “has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise[.]”¹⁶⁹³ or otherwise fails to “examine the relevant data and articulate a satisfactory explanation for its action ‘including a rational connection between the facts found and the choice made.’”¹⁶⁹⁴

If finalized, the SNPRM would be arbitrary and capricious, and not in accordance with law. Congress has directed U.S. EPA to use the “best available science”¹⁶⁹⁵ or the “latest scientific knowledge”¹⁶⁹⁶ in a multitude of programs. Congress has never directed U.S. EPA to consider the public availability of underlying data and models as the sole or even predominant factor in evaluating the soundness of science.¹⁶⁹⁷ Nevertheless, U.S. EPA is proposing to codify public

¹⁶⁹² 5 U.S.C. § 706(2)(A).

¹⁶⁹³ *Motor Vehicle Mfrs. Ass’n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983).

¹⁶⁹⁴ *Ibid.* (citing *Burlington Truck Lines v. United States*, 371 U.S. 156, 168 (1962)).

¹⁶⁹⁵ E.g., Safe Drinking Water Act, 42 U.S.C. § 300g-1; Toxic Substances Control Act, 15 U.S.C. §§ 2617(f), 2625(h), Clean Water Act, 33 U.S.C. § 1321(a)(27).

¹⁶⁹⁶ E.g., Clean Air Act, 42 U.S.C. § 7408(a)(2).

¹⁶⁹⁷ Moreover, recent legislation prescribes priorities and processes for data use in agency rulemakings and requires federal agencies to make their own data publicly available (consistent with existing legal restrictions), yet does not authorize agencies to exclude or deprioritize non-federal data based on public non-availability. Foundations for Evidence-Based Policymaking Act of 2018, PL 115-435, January 14, 2019, 132 Stat 552. Title II of this Act is the “Open, Public, Electronic, and Necessary (OPEN) Government Data Act.”

availability as a threshold requirement for agency consideration or publication of or reference to a scientific study.¹⁶⁹⁸ Codifying this requirement, when public availability is not a factor that Congress intended U.S. EPA to prioritize, would itself be arbitrary and capricious in violation of the APA. U.S. EPA has also manifestly failed to consider important aspects of the ostensible problem, offered explanations for its proposed decision that run counter to the evidence, and failed to articulate any rational explanation for the proposal, as discussed below under, “The SNPRM Fails to State a Reasoned Basis for the Proposed Regulation.”

Finalizing the SNPRM would render subsequent U.S. EPA actions arbitrary and capricious as well. The SNPRM would prohibit or restrict U.S. EPA’s consideration of relevant and high-quality data, studies, and models that do not meet U.S. EPA’s arbitrary and outcome-seeking proposed requirements for public availability. In excluding relevant science from expert consideration, based on a factor that Congress did not intend for the agency to prioritize, U.S. EPA would inevitably fail to consider important aspects of the problems under consideration, issue decisions counter to the evidence before the agency, and commit other basic APA violations with every affected action. Indeed, the D.C. Circuit Court of Appeals rejected the proposed approach decades ago, agreeing that, “[i]f EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much *plainly relevant scientific information* would become unavailable to EPA for use in setting standards to protect public health and the environment.”¹⁶⁹⁹ This instability would also create significant liabilities, and hence reliance risks, for States, regulated entities, and the public.

In addition to its substantive prohibition on arbitrary and capricious actions, the APA establishes general procedural requirements for agency rulemakings, including a requirement for agencies to consider the relevant information presented via public comment on proposed rulemakings.¹⁷⁰⁰ By precluding agency experts from considering relevant studies and models raised in public comments on proposed agency actions, the SNPRM would also cause future U.S. EPA actions to violate the APA’s procedural requirements.

Response: Regarding notice and comment on subsequent agency actions, please see response to comment 48-502. The SNRPM is not being finalized as is. As discussed in great detail in the final rule preamble, the final rule makes a number of important changes to the SNPRM. Notably, EPA is finalizing a weighting approach to considering underlying data and models that are not

¹⁶⁹⁸ U.S. EPA’s preamble to the SNPRM claims: “Under this regulation EPA would continue to use standard processes for identifying, evaluating, and reviewing available data, models, and studies. When the Agency has potentially identified multiple key studies or models of similar quality that could drive its subsequent decisions, the Agency will investigate the availability of the underlying data.” 85 Fed. Reg. at 15399. This portrayal of the SNPRM, as merely establishing public data availability as a tiebreaker among key studies or models of similar quality, is belied by the SNPRM’s proposed regulatory text. Under the SNPRM’s proposed section 30.5, “[w]hen promulgating significant regulatory decisions or finalizing influential scientific information, the Agency will use only pivotal regulatory science and/or pivotal science that includes studies” that meet the proposed public availability requirements. As proposed, this inquiry into public availability takes place before consideration of quality and excludes science that does not meet the public availability test regardless of whether other studies or models are “of similar quality,” or exist at all.

¹⁶⁹⁹ *American Trucking Ass’n., Inc. v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002) (emphasis added) (quoting National Ambient Air Quality Standards for Particulate Matter: Final Rule, 62 Fed. Reg. 38,652, 38,689 (July 18, 1997)).

¹⁷⁰⁰ 5 U.S.C. § 553(c).

publicly available, not a categorical exclusion. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. That means that the agency will consider all relevant studies when taking covered actions.

Comment [159-1417]: Commenter (12430) writes that under the APA, changes in agency policy positions are permissible only when the agency provides a reasoned justification for the change.¹⁷⁰¹ Further, “[t]he requirement that an agency provide reasoned explanation for its action would ordinarily demand that it display awareness that it is changing position.”¹⁷⁰² U.S. EPA fails to acknowledge that the SNPRM and NPRM comprise a profound change in agency policy position, let alone provide a justification. Instead, the agency struggles to situate the proposals within existing federal policies and guidance on public data availability and peer review. This includes referencing a variety of U.S. EPA and OMB guidance documents dating back to 2002 that, as discussed above, bear little relationship to the current proposals.¹⁷⁰³ The SNPRM represents a wholesale departure from past and current U.S. EPA policy with powerful and far-reaching impacts for U.S. public health and the environment. U.S. EPA’s failure to justify or even acknowledge its proposed policy change falls far short of the APA’s requirements.¹⁷⁰⁴

Response: EPA disagrees that it has failed to acknowledge a change in agency position or to provide a reasoned explanation for that change. Please see the preamble to the final rule at Section III.A.1 for further discussion of these issues.

Comment [159-1451]: Commenter (12430) writes that the NPRM and SNPRM conflict with many of the statutes that U.S. EPA administers, which include requirements to use, for example, the “best available science,”¹⁷⁰⁵ the “best available public health information,”¹⁷⁰⁶ the “latest scientific knowledge,”¹⁷⁰⁷ or “generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies,”¹⁷⁰⁸ among others. U.S. EPA tacitly acknowledges these conflicts in the SNPRM by adding proposed section 30.3, providing, “In the event the procedures outlined in this part conflict with statutes that EPA administers, or their implementing regulations, the statutes and regulations will control.”¹⁷⁰⁹ Yet

¹⁷⁰¹ *F.C.C. v. Fox Television Stations, Inc.*, 556 U.S. 502, 515-516 (2009).

¹⁷⁰² *Ibid.*

¹⁷⁰³ 85 Fed. Reg. at 15403-04.

¹⁷⁰⁴ See 85 Fed. Reg. at 15398. Though U.S. EPA desperately avows its authority under the Federal Housekeeping Statute, 5 U.S.C. § 301, for this ostensible “rule[] of agency organization, procedure, or practice,” as described in the APA, U.S. EPA does not invoke the APA’s procedural exemptions for such rules. See 85 Fed. Reg. at 15397 (“As the Supreme Court further notes, section 301 authorizes ‘what the [Administrative Procedure Act] terms ‘rules of agency organization, procedure, or practice’ as opposed to substantive rules.”) (citing *Chrysler Corp. v. Brown*, 441 U.S. 281, 310 (1979)). The APA exempts “rules of agency organization, procedure, or practice” from the requirement to publish a notice of proposed rulemaking, 5 U.S.C. § 553(b)(A), which U.S. EPA has now done twice for this proposed action.

¹⁷⁰⁵ Safe Drinking Water Act, 42 U.S.C. § 300g-1; Toxic Substances Control Act, 15 U.S.C. §§ 2617(f), 2625(h)); Clean Water Act, 33 U.S.C. § 1321(a)(27).

¹⁷⁰⁶ Safe Drinking Water Act, 42 U.S.C. § 300g-1.

¹⁷⁰⁷ Clean Air Act, 42 U.S.C. § 7408(a)(2)); Clean Water Act, 33 U.S.C. § 1314(a)(1).

¹⁷⁰⁸ Emergency Planning and Community Right-to-Know Act, 42 U.S.C. § 11023(d)(2).

¹⁷⁰⁹ Proposed section 30.3.

neither this proposed provision nor the SNPRM preamble identify statutory or regulatory provisions with which U.S. EPA believes a conflict could emerge. Moreover, the proposed regulatory text does not provide any parameters for determining whether there is a conflict. Rather than improving the legality and workability of the SNPRM, this provision is impermissibly vague, in violation of the APA, and likely to mire the agency in additional litigation.

Response: Conflict analyses will be conducted and discussed as appropriate when EPA develops subsequent substantive rulemakings implementing this final procedural rule. See the final rule preamble discussion at Section I.A.3. If implementing this procedural rule will result in a conflict with an environmental statute that EPA administers, then this procedural rule will yield.

Comment [179-1609]: Commenter (12688) writes that this proposed policy change would lead the EPA away from its mandate—in its mission and under various environmental statutes—to use the best scientific evidence in assessing environmental risks, and its obligation under the APA to refrain from arbitrary decision making. The practical effect of this rule would be to limit EPA’s ability to protect public health and meet both its statutory obligations and its overall mission.

Response: Please see response to comment 159-1451.

Comment [179-1790]: Commenter (12688) writes that this proposed policy change would lead the EPA away from its mandate—in its mission and under various environmental statutes—to use the best scientific evidence in assessing environmental risks, and its obligation under the APA to refrain from arbitrary decision making. The practical effect of this rule would be to limit EPA’s ability to protect public health and meet both its statutory obligations and its overall mission.

Response: Please see response to comment 159-1451.

Comment [205-2125]: Commenter (13788) writes that this rule is not procedural. If finalized, it will have substantial effects on EPA decisions that impact regulated entities. For example, under the CAA’s NAAQS program, EPA is required to issue air quality criteria for pollutants that “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air.”¹⁷¹⁰ If EPA were to ignore or diminish the value of the latest scientific studies because they involve human health data that cannot be made publicly available, that would significantly impact the health-protectiveness of the resulting ambient air quality standards, which would have a substantial effect on both regulatory beneficiaries and regulated industries.

In addition to the *Chrysler* Court’s decision,¹⁷¹¹ the D.C. Circuit held in *Pickus v. United States Bd. Of Parole*, that rules of practice or procedure “should not be deemed to include any action which goes beyond formality and substantially affects the rights of those over whom the agency

¹⁷¹⁰ 42 U.S.C. 7408(a)(2).

¹⁷¹¹ *Chrysler v. Brown*, 441 U.S. 281 (1979).

exercises authority,” and that “adherence to congressional purpose counsels a construction of this exemption [for procedural rules] that excludes from its operation action which is likely to have considerable impact on ultimate agency decisions.”¹⁷¹² By restricting EPA’s consideration of science in regulatory decision-making based only on the public availability of underlying data, this rule would have a clear and substantial effect on ultimate agency decisions, including decisions that affect the rights of regulated entities, and therefore it is not a procedural rule.

Nor is this a proposed “internal rule of agency procedure” that “exclusively pertains to the internal practices of the EPA.”¹⁷¹³ According to details provided to staff of the House Committee on Science, Space, and Technology,¹⁷¹⁴ EPA’s proposed tiered access system would not be implemented internally at EPA, but rather the Agency expects that the bulk of the burden of implementing such a system would fall on the researchers who conduct (or conducted, as this relates to retroactive application of this new policy) the study. According to information shared with committee staff, EPA anticipates that researchers would be responsible for managing the logistics of making data and models publicly available in compliance with the rule, for judging the sensitivity of study data and models and what information can or cannot be made publicly available through tiered access, and what tier of access should be designated for different types of information.¹⁷¹⁵ It is unclear how EPA would ensure compliance with this rule, or whether after this rule is finalized, it will in effect ban all studies based on confidential human health data. However, what is clear is that this rule would have significant impacts beyond the Agency’s internal practices and procedures.

Response: As discussed in the final rule preamble at Section II.C, this is a procedural rule governing EPA’s internal affairs. It does not regulate or affect the legal rights and obligations of parties outside of the agency, and therefore is not a substantive rule. An internal rule of agency procedure is not substantive merely because it may indirectly affect the voluntary behavior of parties outside of the agency. *See American Hosp. Ass’n v. Bowen*, 834 F.2d 1037, 1051 (D.C. Cir. 1987) (“[A]gency rules that impose ‘derivative,’ ‘incidental,’ or ‘mechanical’ burdens upon regulated individuals are considered procedural, rather than substantive.”).

This procedural rule does not impose requirements on external scientists. In fact, it exclusively regulates EPA employees. While it is entirely possible that this procedural rule may influence how scientists choose to conduct their studies or present their research to EPA, that potential incidental effect does not render the rule substantive.

Comment [205-2128]: Commenter (13788) writes that under the APA and CAA, agency actions that are “arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law” are to be held unlawful and set aside.¹⁷¹⁶ Agencies are required to “articulate a satisfactory explanation for [the] action including a ‘rational connection between the facts found and the

¹⁷¹² *Pickus v. United States Bd. of Parole*, 507 F.2d 1107, 1114 (D.C. Cir. 1974).

¹⁷¹³ 85 Fed. Reg. at 15,398.

¹⁷¹⁴ Democratic Staff, Committee on Science, Space, and Technology, Summary of Staff-Level Briefings from the Environmental Protection Agency on the “Strengthening Transparency in Regulatory Science” Supplemental Proposed Rule (Apr. 30, 2020), <https://science.house.gov/imo/media/doc/Letter%20and%20Memo%20-%20EJB%20to%20SST%20Dem%20Caucus%20re%20Transparency%20Rule.pdf>.

¹⁷¹⁵ *Id.*

¹⁷¹⁶ APA 706; CAA 307.

choice made.”¹⁷¹⁷ Here, however, EPA is proposing to exclude or devalue scientific studies based on criteria that are unrelated to scientific value or merit, and that would eliminate the Agency’s ability to rely on research that may be the best available science.

The Agency’s newly claimed statutory authority under the housekeeping statute does not save this rule, and actually undermines any transparency justification for the rule. Many of the studies EPA relies on are done outside of the Agency, and therefore must be beyond the reach of the housekeeping statute. The Agency’s conflation of transparency in EPA’s processes with data availability in scientific research outside the Agency cannot be used to provide satisfactory justification for this rule.

EPA seems to believe that by wielding the terms “validation” and “reanalysis” it shows concern about the quality of studies relied on by the Agency. But EPA’s real intention in the SNPRM, as in the Proposal, is to limit the Agency’s access to public health science, not to ensure the quality of the studies the Agency relies on. That is made abundantly clear by the Agency’s statement that if “multiple high-quality studies exist but only two studies have data and models that are available for independent validation and reanalysis, EPA would only include those two studies as pivotal regulatory science and/or pivotal science.”¹⁷¹⁸ By acknowledging that the highest quality studies will be ignored if confidential data and models are not made available for validation and reanalysis, EPA is admitting that this rule is not concerned with improving the quality of studies relied on by the Agency. The SNPRM is instead laser-focused on information availability, even if it comes at the expense of the quality of scientific work. The best studies may not rely on available underlying data—precisely because they are human health studies that requires the maintenance of the privacy of the study participants—and in those situations this rule would clearly prioritize data availability over quality.

Unlike the 2018 Proposal, the SNPRM does not include any acknowledgement that EPA must use the “best available science” for regulatory actions—but it must.¹⁷¹⁹ This lack of concern for quality is evident throughout the SNPRM and is particularly alarming in an agency that relies heavily on science—as it must, given its statutory mandates. Additionally, the suggestion that the rule could apply to studies retroactively if the Administrator does not grant an exemption further illustrates the intention to undermine longstanding reliance on the human health studies that have done the most to advance air quality and public health. The SNPRM states that the “proposal would apply to reviews of data, models, and studies at the time a rule is developed or influential scientific information is finalized, regardless of when the data and models were generated.”¹⁷²⁰ EPA has provided no reasoning to explain how retroactive application to past studies—including the Harvard Six Cities and American Cancer Society particulate matter health studies and subsequent work that links exposures to air pollution with declines and damages to human health—is justified. It certainly has not provided any information to suggest that this rule would encourage the release of more data from those studies. This proposal’s focus is clearly on

¹⁷¹⁷ *State Farm*, 463 U.S. 29, 42-44 (1983).

¹⁷¹⁸ 85 Fed. Reg. at 15399 (emphasis added).

¹⁷¹⁹ 83 Fed. Reg. at 18,769 & n.1.

¹⁷²⁰ 85 Fed. Reg. at 15,399.

arbitrarily excluding or diminishing the value of quality scientific research rather than any real commitment to transparency.

Response: EPA disagrees that the true intent of this rulemaking is to diminish the value of quality scientific research. As discussed in the final rule preamble at Section I.A, EPA is taking this action to help strengthen the transparency of the data and models underlying EPA's significant regulatory actions and ISI.

Regarding the scientific standards that EPA is required to apply, this purely procedural rule does not interpret or apply the provisions of any environmental statutes that EPA administers, and such efforts will occur in the subsequent rulemakings under the relevant statutes. If implementing this procedural rule will result in a conflict with an environmental statute that EPA administers, then this procedural rule will yield. See the final rule preamble at Section I.C.

Comment [205-2164]: Commenter (13788) writes that EPA has failed to provide a meaningful opportunity to review and comment on the proposed rule as required by the APA,¹⁷²¹ because many of the provisions in the SNPRM are described only in vague terms, with very little detail provided about the proposed policies and how they would be implemented. This continued failure to address critical details ignores significant problems that will arise on implementation of a final rule. For example, EPA in the SNPRM proposes to apply its data release requirements across the board, without distinguishing between types of studies and the data they rely on, which may or may not include confidential information. Additionally, while the 2018 Proposal was limited to dose-response data and models, the SNPRM expands that to all data and models broadly and without justification. The SAB's report on the 2018 Proposal stated that:

the requirement to make data available for public inspection will be more easily implemented for some datasets than others (e.g., [certain] studies include individual sample data as part of standard reporting). The expectation that data and methods will be available for all endpoints may be unrealistic.¹⁷²²

The SAB was clearly concerned that the rule's requirements could not even be put into practice, never mind whether they are lawful or rational or adequately justified. And, although the SNPRM allows the Administrator to grant an exception to the requirements, the SNPRM provides no reason to believe that provision will sufficiently address the concern identified by the SAB. Nor is there any safeguard included to ensure that the EPA Administrator, in exercising his discretion, will not bring extra-statutory political considerations into the decision-making process.

Response: Please see response to comment 25-96. The SNPRM and final rule address these and many other concerns articulated by public commenters. See 85 FR 15396 and final rule *Federal Register* notice for this action, respectively.

¹⁷²¹ 5 U.S.C. § 553.

¹⁷²² SAB Report at 19.

1.7 Other Authorities (NPRM Comments)

Comment [6835-2704]: Commenter (6857) writes that increased scientific transparency can improve the application of the Endangered Species Act (ESA), specifically in the determination of "critical habitat." Proper determination of critical habitat is a very important issue for state and local governments, as well as businesses located in areas impacted by ESA activity. A determination of critical habitat can literally remove hundreds of miles from the possibility of any type of development. Currently, regulatory agencies can even make this designation based on the "historical" presence of a species, years in the past. In the transportation arena, the critical habitat designation is especially relevant as states promulgate transportation plans years, if not decades, in advance. If a regulatory agency summarily declares an area "off limits" through an overly broad critical habitat designation, then it can unnecessarily jeopardize carefully designed plans for economic development. At a minimum, all economic and scientific analysis necessary for a critical habitat determination should be based on the best data available and incorporate an area's planned transportation improvements.

Response: EPA appreciates your comment but critical habitat determinations under the ESA would be made by other agencies and not EPA. See ESA section 4. 16 U.S.C. § 1533

Comment [6427-1069]: Commenter (6449) writes that the Final Information Quality Bulletin implements the IQA (Pub L. No. 106-554, § 515, Dec. 21, 2000) This rule should reference the IQA along with the bulletin.

Response: We cite OMB's bulletin because it interprets terminology in the IQA that Congress left undefined. The IQA directed OMB to issue guidelines for use by federal agencies in developing their own information quality guidelines, which EPA did in 2002.

Comment [4921-366]: Commenter (4932) recommends that EPA should clarify that nothing in the Transparency Proposal is intended to diminish the Agency's existing legal authority to enhance the transparency of EPA's regulatory science.

The Transparency Proposal omits discussion of EPA's ample existing legal authority to enhance the transparency of the Agency's regulatory science, at least as it relates to public health research sponsored by the federal government. As set forth in the Office of Management and Budget's guidance for financial assistance to non-Federal entities (2 C.F.R. § 200.315), federal agencies have unfettered legal authority to "[o]btain, reproduce, publish, or otherwise use the data produced under a Federal award," or to "[a]uthorize others to receive, reproduce, publish, or otherwise use such data for federal purposes."¹⁷²³ In addition, any public health research data (a) produced under a Federal award, and (b) used by the Federal Government in developing agency action that has the force and effect of law, must be released to the public if a request for the data is made pursuant to the FOIA.¹⁷²⁴

Because the federal government has sponsored a substantial majority of the public health research conducted in the United States over the past 50 years, the federal government is well

¹⁷²³ 2 C.F.R. § 200.315(d)(1) and (d)(2).

¹⁷²⁴ Id., § 200.315(e).

positioned, using existing legal authority, to facilitate release of public health research data if it is inclined to do so as a matter of policy. MIG recommends that EPA clarify in the final regulation that the Transparency Proposal's omission of these existing authorities was not intended, nor should it be interpreted in any fashion, to diminish the Agency's existing legal authority to enhance the transparency of EPA's regulatory science. Further, the scope of EPA's authority noted above should be identified in the Transparency Policy as an additional source of support.

Response: EPA agrees that there are existing regulations that govern the ownership and use of data generated with federal funding. Because the final rule is one of internal agency procedure, it does not impact or diminish those authorities. Rather, as EPA states in the preamble, "[t]his rule builds upon prior EPA actions in response to government-wide data access and sharing policies" such as the regulations cited by the commenter. The focus of § 30.5 is how the Agency will handle pivotal science based on the availability for independent validation of the underlying dose-response data. Where the data is available, the pivotal science will be given greater consideration. Where it is not available for reasons that may include confidentiality and privacy protections, the pivotal science will be given lesser consideration unless an Administrator's exemption is granted under § 30.7.

Comment [6169-2818]: Commenter (6179) states that EPA is authorized by Congress to promulgate internal housekeeping regulations like the transparency proposal.

The Transparency Proposal relies upon authority under various environmental statutes, including Clean Air Act sections 103 and 301(a).¹⁷²⁵ EPA solicits comment on whether additional or alternative sources of authority are an appropriate basis for the Transparency Proposal.¹⁷²⁶

In addition to those statutes cited in the Transparency Proposal, we note EPA's authority under 5 U.S.C. § 301. More commonly known as the "Federal Housekeeping Statute," this provision authorizes the "head of an Executive department"¹⁷²⁷ to "prescribe regulations for the government of his department, the conduct of its employees, the distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property."¹⁷²⁸

The Federal Housekeeping Statute authorizes the Transparency Proposal – a regulation for the government of EPA and the performance of its business – on a general basis, similar to how the environmental statutes cited by EPA do so specifically. As seen in the Federal Housekeeping Statute, Congress expected that regulations like the Transparency Proposal would be so commonplace within agencies that it provided a general federal government-wide authorization

¹⁷²⁵ Id. at 18,769.

¹⁷²⁶ Id. at 18,771.

¹⁷²⁷ EPA is technically not an "Executive department" within the meaning of 5 U.S.C. § 301. See 5 U.S.C. § 101 (defining "Executive departments"). However, the Department of Justice has concluded that the EPA Administrator has the same "housekeeping" authority under EPA's organic statute. Dep't. of Justice, Office of Legal Counsel, Authority of the Environmental Protection Agency to Hold Employees Liable for Negligent Loss, Damage, or Destruction of Government Personal Property, 32 OPINIONS OF THE OFFICE OF LEGAL COUNSEL 79, 81-83 (May 28, 2008) available at: <https://www.justice.gov/file/482166/download>.

¹⁷²⁸ 5 U.S.C. § 301 (emphasis added).

for their promulgation. We recommend EPA to consider the Federal Housekeeping Statute as additional support for the Transparency Proposal.

Response: EPA appreciates your comment in support of the rule. EPA is relying on its authority to promulgate housekeeping regulations as legal authority for this rule and not the Federal Housekeeping Statute. Also see the response to Comment 31-135.

Comment [6334-3154]: Commenter (6356) expresses that EPA’s proposal is consistent with Congressional directives that EPA is to utilize the “best science.” In the Notice of Proposed Rulemaking at 18,771/col.2, EPA requests additional authority for the proposed regulation. The federal “Information Quality Act,” provides additional authority for the proposed regulation. Pub. L. 106–554 (2001), codified at 44 U.S.C. §§ 3504(d)(1), 3516. While numerous other federal agencies have adopted guidelines implementing the 2001 law,¹⁷²⁹ EPA is conspicuous because it has not adopted such guidelines.

Response: EPA disagrees that the Agency hasn’t adopted information quality guidelines. EPA issued its guidelines in 2002. See <https://www.epa.gov/quality/guidelines-ensuring-and-maximizing-quality-objectivity-utility-and-integrity-information>. Also see the response to Comment 6427-1069.

Comment [6353-2324]: Commenter (6375) notes that EPA solicits comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation. (pg. 18,771). EPA’s statement concerning its legal authority could be enhanced by reference to statutory provisions that require it to rely on “accurate,” “useful,” or “best” data. For example, section 108(a)(2) requires that the Administrator issue air quality criteria that “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health and welfare . . .” 42 U.S.C. § 7408(a)(2). Similarly, section 304 of the CWA requires water quality criteria that “accurately reflect [] the latest scientific knowledge . . .” 33 U.S.C. § 1314(a)(1). The SDWA requires the Administrator to assess risk using “the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices.” 42 U.S.C. § 300g1(b)(3)(A). Increasing the transparency of regulatory science and ensuring that it is reproducible helps in evaluating its accuracy and usefulness.

Furthermore, making data and methods underlying regulatory decisions publicly available is not new. Guidelines issued by both the OMB and EPA implementing the IQA, Treasury and General Government Appropriations Act for Fiscal Year 2001, § 515, P.L. No. 106-554, 114 Stat. 2763 (Dec. 21, 2001), emphasize the importance of reproducibility in assessing the quality and utility of data used in making regulatory decisions. It appears the OMB’s IQA guidelines recognize that the reproducibility of underlying science helps to ensure the integrity of agency decisions and explain that “[m]aking the data and methods publicly available will assist in determining whether analytic results are reproducible.” 67 Fed. Reg. 8452, 8460 (Feb. 22, 2002) (OMB IQA Guidelines).

¹⁷²⁹ The federal departments and independent agencies that have adopted such guidelines are listed at <http://www.ombwatch.org/article/archive/231?TopicID=13>

EPA's IQA guideline¹⁷³⁰ states: "A higher degree of transparency about data and methods will facilitate the reproducibility of such information by qualified third parties, to an acceptable degree of imprecision. . . . It is important that analytic results for influential information have a higher degree of transparency regarding (1) the source of the data used, (2) the various assumptions employed, (3) the analytic methods applied, and (4) the statistical procedures employed."

EPA should also consider replacing some of the citations it provides for its legal authority with others that might be more relevant. For example, the Agency may want to cite 42 U.S.C. § 6981, on research, instead of 42 U.S.C. § 6979, which concerns "Labor standards." In addition, section 115 of CERCLA, 42 U.S.C. § 9615, which authorizes regulations, might be a more appropriate citation than section 116 of that Act, 42 U.S.C. § 9616, which specifies schedules for assessment and evaluation of facilities subject to the Act's requirements.

Response: EPA is not relying on any of the environmental statutes cited in the 2018 and 2020 proposal as legal authority for the rule. EPA acknowledged that there were errors in a few of the citations in the 2018 proposal and corrected them in the 2020 supplemental proposal. EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In the final rule, EPA does not interpret or apply provisions of a particular statute or statutes that it administers. EPA will undertake such efforts in forthcoming substantive actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule.

EPA agrees with the commenter that the IQA provides support for the final rule. That is why the Agency has referenced both the OMB and EPA IQA guidelines, which interpret the IQA, in the rule's preamble.

Comment [6353-2331]: Commenter (6375) notes that EPA solicits comment on whether alternative or additional regulatory or other policy vehicles are appropriate to establish and implement these policies, and whether further regulatory or other policy vehicles at the programmatic or statutory level would be appropriate as alternative or additional steps the agency may take to further the policies articulated in Section II. (pg. 18771 of the NPRM FR notice).

The regulatory language that EPA proposes provides general requirements that apply to the Agency's use of science under the many statutes that it implements. The generality of the proposed regulations may be a function of the diverse purposes of those statutes. Specifically, some of these statutes focus on the introduction of new substances into the marketplace (e.g., FIFRA and TSCA), while others primarily concern regulation of emissions or releases to (e.g., CAA and CWA), or removal from (e.g., CERCLA), the environment. The scientific analyses required for these different programs and the sources of the scientific information underlying those analyses differ. The Agency should consider supplementing the general language that it has

¹⁷³⁰ EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency. Pg. 21 (Oct. 2002, as amended June 24, 2004 & May 13, 2005) (EPA IQA Guidelines).

proposed with statutory specific regulations. A statutory-specific rulemaking would provide greater certainty going forward.

Response: EPA agrees that this rule should be supplemented with statute-specific transparency regulations. EPA intends to undertake such rulemakings beginning in 2021.

Comment [6851-3717]: Commenter (6873) writes that the authority to make data public to the extent envisioned in this proposal, may not lie with the EPA.

This proposal concludes that the EPA has appropriate sources of statutory authority for this regulation; you have asked for comment on whether additional or alternative sources of authority are appropriate. The concern raised by some in our group is not necessarily whether the EPA's authority is appropriate or complete, but whether it is realistic and sufficient to affect the kind of changes you're looking for. It is understood that your proposal is to modify EPA practices, not science publishing practices, but the impact on science publishing—or at least the collision it sets up with existing publishing practices—will be significant. As you know, most US research funding comes from NIH, NSF, DoD, DOE and NASA. The researchers who receive funding from these agencies adhere to the publishing policies set forth by these agencies—which include open and transparency policies—which in turn work in parallel with the US public access program policies managed by OSTP, and with a wide variety of publishing, open and transparency policies put forth by universities, publishers, private funders, foreign governments, and other groups. It's unclear how the EPA will be able to influence this existing symphony of public and private regulation, at least for the research it doesn't fund. The EPA certainly has a right to try, but without broad agreement amongst other stakeholder groups, it's unlikely that any one stakeholder in this space will be able to promulgate or enforce regulations that will have such a broad impact.

Response: EPA disagrees that the final rule will impact science publishing practices. This rule governs internal agency procedures and does not obligate or impact any entity besides EPA. The rule governs how EPA will handle pivotal science based on the availability of the underlying dose-response data. This final rule does not regulate the rights and obligations of any party outside of the EPA let alone have legal force and effect on them. Any incidental impacts on voluntary behavior outside of the EPA do not render this a substantive rule.

Comment [6873-1710]: Commenter (6895) writes that EPA incorrectly cites various authorities in an attempt to use an unsupported claim of lack of transparency as a means to justify the proposed rule, when in fact those authorities make no such findings. For example, in *American Trucking Associations v. EPA* 283 F.3d 355, (DC Cir., 2002), the court found that EPA did not violate procedural rights in relying on scientific studies rather than raw data. EPA itself argued that [i]f EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment...[S]uch data are often the property of scientific investigators and are often not readily available because of ...proprietary interests...or because of [confidentiality] arrangements [with study participants].

Response: EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, EPA does not rely on, interpret or apply provisions of a particular statute or statutes that it administers. Nothing in the final rule will prohibit EPA from relying on studies where the underlying dose-response data are not publicly available. Nor does the rule require that independent validation occur before EPA can use any studies.

Comment [6339-1801]: Commenter (6361) writes that the proposed HONEST Act, the Secret Science Reform Act, and this proposed rule all directly contradict a 2002 ruling and a 2010 ruling from the D.C. Circuit Court of Appeals which states "[w]e agree with EPA that requiring agencies to obtain and publicize the data underlying all studies on which they rely 'would be impractical and unnecessary'. *American Trucking Associations, Inc. v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002) (citation omitted); see also *Coalition of Battery Recyclers Assoc. v. EPA*, 604 F.3d 613, 622-23 (D.C. Cir. 2010) (rejecting claim that EPA was arbitrary and capricious for not making public data from its studies).

Response: EPA did not finalize the categorical exclusion approach from the 2018 proposal. EPA will consider all relevant studies when developing significant regulatory decisions and influential scientific information and will use the availability of dose-response data in determining the weight to assign to the subset of studies identified as pivotal science. The Agency will provide the basis for giving studies lesser consideration in the record for the rulemaking or in the documentation for the influential scientific information. This would provide an opportunity for public comment on the rationale for how EPA handled pivotal science. Further, the final rule does not require EPA to obtain and publish data underlying the studies it uses to support significant regulatory actions and influential scientific information.

Comment [6161-1514]: Commenter (6131) writes that the proposed HONEST Act, the Secret Science Reform Act, and this proposed rule all directly contradict a 2002 ruling and a 2010 ruling from the D.C. Circuit Court of Appeals which stated "[w]e agree with EPA that requiring agencies to obtain and publicize the data underlying all studies on which they rely 'would be impractical and unnecessary'". *American Trucking Associations, Inc. v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002) (citation omitted); see also *Coalition of Battery Recyclers Assoc. v. EPA*, 604 F.3d 613, 622-23 (D.C. Cir. 2010) (rejecting claim that EPA was arbitrary and capricious for not making public data from its studies).

Response: See the response to Comment 6339-1801.

Comment [5154-419]: Commenter (5165) states that the U.S. Court of Appeals for the District Columbia Circuit has affirmed EPA's use of non-public data in support of NAAQS, and in so doing it characterized as "persuasive" EPA's approach to data availability, which the court quoted as follows:

If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. [S]uch data are often the property of scientific investigators and are often not readily available

because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants].¹⁷³¹

Now, EPA indicates that it intends to reverse this policy and adopt one that would expressly preclude it from using studies based on such “non-public data.”¹⁷³² It is inappropriate for EPA to undertake such a consequential policy change without explaining why it believes the concerns it expressed above are incorrect or no longer valid.

Response: See the response to Comment 6339-1801.

Comment [6163-1116]: Commenter (6133) writes that no case law supports the proposal.

The Proposal “directs EPA to ensure that the regulatory science underlying its actions is publicly available in a manner sufficient for independent validation.” 83 Fed. Reg. at 18,773. However, the Proposal fails to identify a single court decision supporting an agency’s decision to bar itself from considering relevant studies or information on the grounds that underlying data are not “publicly available in a manner sufficient for independent validation,” where such a requirement is not statutorily imposed. Indeed, EPA in the entire Proposal only cites two cases related to this question, and EPA admits, as it must, that both cases “upheld EPA’s use (sic) nonpublic data in support of its regulatory actions.” Id. at 18,769 n.3 (citing *Coal. of Battery Recyclers Ass’n v. EPA*, 604 F.3d 613, 623 (D.C. Cir. 2010) & *Am. Trucking Ass’ns v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002)).

Footnote 3 in the Proposal contains two noteworthy, albeit unintended, indictments of the approach proposed by EPA. First, footnote 3 states that “[h]istorically, EPA has not consistently observed the policies underlying this proposal.” Tellingly, EPA does not and cannot identify even one example in which EPA has observed the policies underlying the Proposal. Our research, to the contrary, has identified no instance in which EPA has followed the policies underlying the Proposal, to bar EPA from considering relevant studies or science submitted by the public or gathered by EPA, on the grounds that the underlying data are not “publicly available in a manner sufficient for independent validation.”

Second, footnote 3 implies that there are instances where EPA’s use of non-public data in support of its regulatory actions was rejected by a court. See id. (“courts have at times upheld EPA’s use (sic) non-public data in support of its regulatory actions.”) (emphasis added). Again, the Proposal does not and cannot cite a single court decision that failed to uphold use of nonpublic, relevant science or studies relied on by EPA or any other federal or state agency in support of its regulatory actions. Id. Our research also failed to identify a single instance in which a court failed to uphold an agency’s use of non-public, relevant science or studies by an agency, after that practice was challenged by commenters or petitioners in court.

Of course, in both the cases that the Proposal cites in footnote 3, the D.C. Circuit Court of Appeals refused to prohibit EPA from considering non-public data. In *American Trucking*, the court declined to “impose a general requirement that EPA obtain and publicize the data

¹⁷³¹ *Am. Trucking Ass’ns., Inc. v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002).

¹⁷³² 83 Fed. Reg. at 18,769 n.3.

underlying published studies on which the Agency relies,” holding that the “Clean Air Act imposes no such obligation.” 283 F.3d at 372.¹⁷³³ The court agreed with EPA that “requiring agencies to obtain and publicize the data underlying all studies on which they rely would be impractical and unnecessary.” *Id.* (quoting EPA in Particulate Matter NAAQS, 62 Fed. Reg. at 38,689).

The D.C. Circuit reaffirmed this holding in its 2010 decision, *Coalition of Battery Recyclers*, in which the court reiterated that requiring publication of all data underlying studies would be impractical and unnecessary, and was not required by the Clean Air Act. 604 F.3d at 623. EPA in the Proposal utterly fails to explain or demonstrate why its proposed, self-imposed restriction would be any less impractical or unnecessary than those it previously opposed on these grounds. This failure to explain, failure to offer any convincing counterproof, and failure to explain the agency’s reversal of its positions in *American Trucking* and *Coal. Of Battery Recyclers Ass’n* provide independent grounds for finding EPA’s Proposal arbitrary and capricious and an abuse of discretion. Similarly, the Proposal does not identify any case law supporting EPA’s claimed ability to “exercise its discretionary authority to establish a policy that would preclude it from using such [non-public] data in future regulatory actions.” 83 Fed. Reg. at 18,769 n.3. Our research failed to identify any case in which the courts allowed an agency to categorically bind itself from considering relevant, peer-reviewed science, or otherwise valid studies or evidence, because the underlying data was not made publicly available. Cf., e.g., *Southwest Airlines Co. v. Tr. Sec. Admin.*, 554 F.3d 1065, 1074 (D.C. Cir. 2009) (holding TSA was not required to disclose to airline companies the underlying data file used in a GAO report that informed TSA’s calculation of security fees given the nature of the decision—which was industry-wide rather than an adjudicative decision—and the deference given to agency denials of discovery); *Pharm. Research and Mfrs. v. FTC*, 790 F.3d 198, 210–11 (D.C. Cir. 2015) (holding the FTC was not required to disclose the 66 individual filings underlying its decision to target only the pharmaceutical industry in a new rule because the filings were confidential, were used as a general source of background in the rulemaking process, and were exempted from disclosure by statute); *State Corp. Comm’n of Kan. v. FERC*, 876 F.3d 332, 335–36 (D.C. Cir. 2017) (holding FERC was justified in relying on a study used by the agency to assess the benefits of a power facilities merger, even though the study was objected to by Kansas on the grounds that the study was performed by a third party and its results could not be verified by Kansas. The court rejected Kansas’s objections to the study because Kansas had access to a redacted electronic version of the study, though not the underlying data; Kansas did not pinpoint a specific reason to question the study, and the study’s assumptions and results had been reviewed for reasonability.)

Under some circumstances, the D.C. Circuit has upheld an agency’s decision to exclude an individual piece of evidence from the decision-making process. In *API v. EPA*, the D.C. Circuit upheld the EPA’s decision to discount a published meta-analysis that ran counter to the rule ultimately adopted. 684 F.3d 1342, 1350 (D.C. Cir. 2012). There, EPA considered the study but discounted its results after “[finding] its methodology wanting.” The court found the EPA decision to discount the study was not arbitrary and capricious because EPA had not “entirely

¹⁷³³ As we discuss elsewhere in these comments, *infra* sections IV.A. & V.A., the Clean Air Act also contains no authorization for EPA to refuse to consider published studies submitted by commenters, or gathered by the agency, unless the data underlying the studies have been published and made available. Certainly, there is no suggestion of any such authorization in the *American Trucking* decision or any other court opinion.

failed to consider an important aspect of the problem [or] offered an explanation for its decision that runs counter to the evidence before the agency.” Id. (quoting *North Carolina v. EPA*, 531 F.3d 896, 906 (D.C. Cir. 2008)). Critically, EPA did consider the study (unlike the censorship approach in the instant Proposal). Moreover, following consideration, the agency offered specific reasons for not relying on the study, including its disagreements with the methodology. Id.

Likewise, the D.C. Circuit found in *Intercollegiate Broadcasting System v. Copyright Royalty Board*, that the Copyright Royalty Board had “properly excluded” from evidence a reference to a survey because the survey itself was not entered into evidence and could not be verified. 796 F.3d 111, 129 (D.C. Cir. 2015). In both cases, the court yielded to an agency’s discretion to exclude a particular piece of information where the agency had made an individualized determination about the source. None of these cases support the Proposal’s categorical ban on EPA considering relevant data, science, or studies (where data are not “publicly available in a manner sufficient for independent validation”), that have been submitted to the agency and that have not been the subject of any individualized determination that the studies or information are flawed or erroneous.

In its Proposal, EPA proposed to categorically ignore and exclude all peer-reviewed research with non-public underlying data, without individually considering each study or offering specific reasons for not relying on that study. The Proposal, by barring consideration of foundational scientific research premised upon non-public data, would result in EPA “fail[ing] to consider an important aspect of the problem.” API, 684 F.3d at 1350. There is no evidence of a court supporting an agency’s decision to exclude entire categories of evidence, or studies or information based on categorical prohibitions like the ones in the Proposal, without considering the source and offering specific reasons for not relying on the study. Instead, both EPA and the Courts have indicated already in *API* and *Coalition of Battery Recyclers*, that a rule like the one EPA is currently proposing is not required by the Clean Air Act and would be both impractical and unnecessary. This Proposal runs counter to the D.C. Circuit’s decision in *API* and would render EPA’s regulatory actions based on the Proposal arbitrary and capricious and an abuse of EPA’s discretion. The Proposal’s blanket rule would represent a significant and unlawful departure from D.C. Circuit rulings on agencies’ limited discretion to choose the sources it will consider and ignore.

Response: See the response to Comment 6339-1801.

Comment [6157-901]: Commenter (6127) writes that this is a rejection of the scientific mandate and approach of the agency as mandated in the Environmental Protection Act, including multiple court precedents in favor of the EPA in the use of non-public data for regulatory purposes including *Coalition of Battery Recyclers Assn. v. EPA*, 604 F.3d 613, 623 (D.C. Cir. 2010) and *American Trucking Assn’s v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002).

Response: EPA has no knowledge of the Environmental Protection Act referenced in this comment. Nothing in this rule prohibits EPA from using non-public data for regulatory purposes. Also see the response to Comment 6339-1801.

Comment [1425-4482]: Commenter (1440) suggests that the authorities listed for promulgating this regulation do not make sense. (See "Authority" section for proposed 40 CFR part 30 at 83 FR 18773). For example, the proposed regulations cite to 42 U.S.C. 6912(a)(1) and 42 U.S.C. 6979 under the RCRA as the authority for EPA to promulgate them. There appears to be no basis to such a citation.

42 U.S.C. 6912(a)(1) does give the Administrator the authority to promulgate regulations "as are necessary to carry out his functions under this chapter." However, the "functions" this section refers to involve activities "to promote the protection of health and the environment and to conserve valuable material and energy resources." The proposal provides no justification for how the new regulation would accomplish this goal. Depending exactly on how the vaguely worded provisions are implemented, the proposed regulation could in fact be in direct opposition to the goals of the RCRA statute.

Even stranger is the citation to 42 U.S.C. 6979, which discusses labor standards that must be followed for construction grants made under RCRA and does not appear even tangentially related to the proposed regulation.

While in general the goal of increasing transparency of EPA regulatory science is a laudable one, it is not one that Congress has given EPA explicit authority to promulgate administrative rules to carry out. Since administrative rules have the effect and force of law, they must have a clear basis before EPA can promulgate them. The Agency would better accomplish this goal through developing internal policies rather than attempting a change to the regulation.

Response: EPA is not relying on any of the environmental statutes cited in the 2018 and 2020 proposal as legal authority for the rule. EPA acknowledged that there were errors in a few of the citations in the 2018 proposal and corrected them in the 2020 proposal. This rule does not change any existing EPA regulations. It only applies prospectively to significant regulatory actions and influential scientific information, based on dose-response data, that are developed after the effective date of the rule.

Comment [2393-4702]: Commenter (2408) writes that this effort to exclude important environmental and public health studies while privileging industry-sponsored research is clearly contrary to the public interest as well as to EPA's legislative mandates.

Response: The rule does not require the exclusion of any studies from consideration when the Agency develops significant regulatory actions and influential scientific information. All relevant studies, including industry research will be evaluated using study quality factors in § 30.5.

Comment [5173-455]: Commenter (5184) notes that the TSCA story provides further evidence that NEPA requires EPA to prepare a thorough EIS before it adopts the proposed regulation.

Response: NEPA does not apply to this rulemaking because the rule is not a "major Federal action significantly affecting the quality of the human environment." NEPA section 102(2)(c); 42 USC § 4332(2)(c). The rule is one of internal agency procedure that describes the

consideration the agency will give to studies based on data availability and the factors EPA uses to evaluate studies that may be used for regulatory purposes and influential scientific information and, as such, will not affect the quality of the human environment.

Comment [6112-1612]: Commenter (6137) contends that administrative statutes prohibit the proposed prohibitions.

EPA's Proposed Rule likewise ignores requirements set forth in two administrative statutes that govern its rulemaking: the Regulatory Flexibility Act and the Data Quality Act. Under the Regulatory Flexibility Act, 5 U.S.C. § 601 et seq., federal agencies must consider the impacts their regulations will have on small entities and must consider less burdensome alternatives. In developing a new regulation, an agency must take one of two actions: certify that a proposed rule will not have a significant economic impact on a substantial number of small entities, or prepare an initial regulatory flexibility analysis. EPA must publish its initial regulatory flexibility analysis or a summary of it in the *Federal Register* along with the proposed rule. Here, EPA includes a certification with the Proposed Rule stating that it will not have a significant economic impact on a substantial number of small entities. However, it provides no support for this certification.

Pursuant to the DQA, also known as the IQA, Treasury and General Government Appropriation Act for Fiscal Year 2001, Pub. L. No. 106-554, § 515 Appendix C, 114 Stat. 2763A-153 (2000), the OMB issued government-wide guidelines that "provide policy and procedural guidance to Federal agencies for ensuring and maximizing the quality, objectivity, utility, and integrity of information (including statistical information) disseminated by Federal agencies. . . ." The OMB guidelines directed each federal agency to issue its own information quality guidelines to "ensure and maximize the quality, objectivity, utility, and integrity of information, including statistical information, disseminated by the agency." 67 Fed. Reg. 8451, 8459 (Feb. 22, 2002). Following OMB's instructions, EPA issued its own guidelines that apply to information it disseminates to the public. EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity, or Information Disseminated by the Environmental Protection Agency (Oct. 2002), <https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf>. According to these guidelines, EPA uses a "weight-of-evidence" approach that "considers all relevant information and its quality, consistent with the level of effort and complexity of detail appropriate to a particular risk assessment." EPA Guidelines 6.4 (emphasis added). The Proposed Rule contravenes these requirements, as it will prevent EPA from considering all relevant information by precluding consideration of certain data.

Moreover, pursuant to EPA's guidelines, EPA must ensure that the information it disseminates "is accurate, reliable and unbiased." EPA Guidelines 6.4(A). To do so, it uses:

the best available science and supporting studies conducted in accordance with sound and objective scientific practices, including, when available, peer reviewed science and supporting studies; and (ii) data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies the use of the data).

Id. Given that the Proposed Rule eliminates from consideration any scientific study where the underlying data cannot be made publicly available, it undoubtedly precludes the use of the best available science in certain situations. Thus, the Proposed Rule is inconsistent with EPA's implementation of the DQA.

Response: EPA disagrees that the final rule is inconsistent with the Regulatory Flexibility Act (RFA) or the DQA (also known as the IQA). The final rule is a rule of internal agency procedure. It does not govern or apply to any entity other than EPA. Therefore, it will not result in impacts to small entities. The final rule does not include the categorical exclusion proposed in 2018. Under § 30.5, EPA will evaluate all relevant studies when developing significant regulatory actions and influential scientific information. Studies considered pivotal science will then be weighed based on the availability of the underlying dose-response data.

Comment [6112-1620]: Commenter (6137) contends that the proposed rule violates Public Law 95-622 and the common rule for research involving human subjects.

EPA's Proposed Rule also conflicts with Public Law 95-622 and the interagency regulations on testing of human subjects required by that law. In 1978, Congress created a President's Commission for the Study of Ethical Problems in Medicine and Biomedical and Behavioral Research (the "Commission") and directed the Commission to study the "protection of human subjects," defined to include the "health, safety, and privacy of individuals." 42 U.S.C. § 300v-1(b)(2), (f)(2) (emphasis added). This included a study of and issuance of recommendations concerning, among other subjects, procedures and mechanisms "to safeguard the privacy of human subjects of behavioral and biomedical research, [and] to ensure the confidentiality of individually identifiable patient records." Id. § 300v-1(a)(1)(E), (a)(4) (emphasis added).

In response to this charge, in 1981, the Commission recommended that all federal agencies adopt uniform regulations concerning the protection of human research subjects. See 47 Fed. Reg. 13,272 (March 29, 1982). Accordingly, in 1991, EPA and 13 other federal departments and agencies adopted uniform regulations on this issue (the "Common Rule"), see 56 Fed. Reg. 28,003 (June 18, 1991), requiring that all research involving human subjects that is "conducted, supported or otherwise subject to regulation by any Federal department or agency" be reviewed and approved by an institutional review board ("IRB"). 40 C.F.R. § 26.101(a). In order to approve research involving human subjects, an IRB must ensure that "there are adequate provisions to protect the privacy of subjects and to maintain the confidentiality of data." Id. § 26.111(a)(7).

In particular, the Common Rule prohibits EPA from relying on research that is "deficient relative to the ethical standards prevailing at the time the research was conducted in a way that placed participants at increased risk of harm . . . or impaired their informed consent." Id. §§ 26.1704(b)(2), 26.1705(b). It recognizes that the protection of private information of the subject is central to a subject's ability to provide informed consent. See generally id. § 26.116. And the protection of private information is central to the Common Rule more broadly – one of only two situations under which IRBs may waive the requirement to obtain written consent is if the release of the consent form risks linking the subject to the research. Id. § 26.117(c)(1).

EPA's Proposed Rule is thus antithetical to the confidentiality requirements of the Common Rule. It would ignore relevant health science absent publication of personal data that is required to be kept confidential under the Common Rule. To enable EPA to consider their studies in a relevant rulemaking, IRBs would have to make the underlying data publicly available, which would place them at risk of termination of federal funding, termination of ongoing studies, denial of approval for new studies, or disqualification of the IRB or its parent institution. 40 C.F.R. Part 26 subpart O & §§ 26.103, 26.123, 26.1123.

Response: EPA disagrees that the rule is inconsistent with the Common Rule confidentiality requirements. The final rule does not require disclosure of information subject to statutory or regulatory limitations on disclosure such as those for confidentiality, privacy, and trade secrets. EPA did not finalize the categorical exclusion of studies from the 2018 proposal. All relevant studies will be evaluated and considered by the Agency in developing significant regulatory decisions and influential scientific information.

Comment [6125-2629]: Commenter (6150) agrees that EPA has sufficient legal authority under existing environmental statutes to issue this rulemaking to strengthen the transparency of the science supporting regulatory activity. EPA lays out substantive legal support for this action in the Proposed Rule.¹⁷³⁴ Further, EPA's obligation under the DQA is to "maximiz[e] the quality, objectivity, utility, and integrity of information" and, as importantly, "establish administrative mechanisms allowing affected persons to seek and obtain correction of information maintained and disseminated by the agency."¹⁷³⁵ These provisions can only be met if the public has access to the data, models, and methodologies used by EPA and underlying research used by EPA to justify new and existing regulations.

Response: EPA agrees that the Agency has legal authority to promulgate this rule. However, EPA decided to rely on its housekeeping authority, and not on any of the substantive environmental statutes, as authority for the rule.

Comment [6156-1322]: Commenter (6126) states that the burden on researchers is unassessed, but relevant for implementation.

EPA concluded in the proposed rule that "This action does not contain any information collection activities and therefore does not impose an information collection burden under the [Paperwork Reduction Act (PRA)]."¹⁷³⁶ However, EPA may have failed to conduct an important prospective analysis of the proposed rule necessary for public commenters to understand the implications on data quality, burden, and privacy implications related to data uses.

The PRA provisions for developing Information Collection Requests (ICRs) and corresponding review and public comment procedures may apply to this draft regulation if EPA intends to collect data from researchers in a consistent way. A key purpose of the PRA is to assess the burden of individuals providing information to the government and to ensure public benefit of

¹⁷³⁴ 83 FR 18769 and 18773, listing eight federal environmental statutes that provide specific legal authority.

¹⁷³⁵ 44 U.S.C. Section 3501(1); 67 F.R. 8453 and 8459.

¹⁷³⁶ EPA 2018a, p. 18772.

that information.¹⁷³⁷ PRA requirements apply for “collection of information” which is defined to include “obtaining...facts or opinions by or for an agency, regardless of form or format, calling for...(i) answers to identical questions posed to...ten or more persons...”¹⁷³⁸ To the extent EPA anticipates a regulatory action that would routinely encourage voluntary submission of information to EPA as a normal matter with a consistent request established by the proposed rule, the PRA could apply.

Determination about the appropriate application of the PRA is an important issue because the processes of the PRA’s ICR reviews provide an assessment of the burden of government information collection. The PRA is also an important tool for transparency about confidentiality and privacy protections, because it offers additional notice and comment periods that inform the public and offer executive branch oversight of agency information collection activities.¹⁷³⁹

Minimally, consideration should be given to burdens the proposed rule would impose on researchers, including those whose research objectives may not have a stated relationship to a regulation or policy issue under consideration. Such analysis of the burden imposed by the regulation could be considered as part of the PRA requirements.

Response: Nothing in the final rule requires the collection of information by EPA or obligates outside parties to take any actions, including providing information to EPA. Therefore, there are no burdens on third parties that EPA should have analyzed. See Section III.J. for a discussion of costs and benefits of the final rule. The final procedural rule describes how EPA will handle studies used to support significant regulatory decisions and influential scientific information. In determining how to weight studies determined to be pivotal science, EPA will assess the availability of dose-response data for those studies. Pivotal science where the underlying dose-response data are available for independent validation will be given greater consideration than pivotal science lacking data availability.

Comment [6156-1326]: Commenter (6126) notes that EPA specifically asked for comment about how the rule can best be implemented in “light of existing law and prior federal policies...” Further review is likely needed to determine how the law would apply in conjunction with the IQA,¹⁷⁴⁰ the Privacy Act of 1974, as amended,¹⁷⁴¹ and numerous other statutes and policies that encourage the use of data with appropriate privacy and confidentiality protections. For example, IQA’s two brief provisions collectively encourage agencies to follow OMB guidance in issuing guidelines for “maximizing the quality, objectivity, utility, and integrity of information...disseminated by the agency.”¹⁷⁴² However, EPA’s proposed rule does not appear to reference the IQA or suggest its direct relevance, notwithstanding the implication of substantial overlap with the goals of the proposed regulation.

¹⁷³⁷ 44 USC 3501.

¹⁷³⁸ 44 USC 3502(3).

¹⁷³⁹ Hart and Wallman, 2018.

¹⁷⁴⁰ Section 515 of the Consolidated Appropriations Act, 2001. Pub. L. 106-554, 2001. Available at: <https://www.gpo.gov/fdsys/pkg/PLAW-106publ554/html/PLAW-106publ554.htm>.

¹⁷⁴¹ 5 USC 552a.

¹⁷⁴² Sec. 515(b)(2) of the Consolidated Appropriations Act, 2001.

Response: EPA cited OMB's guidelines because it interprets terminology in the IQA that Congress left undefined. EPA also references its own information quality guidelines. EPA's implementation of the final rule will be consistent with the Agency's obligations under the statutes cited by the commenter because the final rule does not require that the Agency disseminate information that is subject to limitations on disclosure such as confidentiality and privacy.

Comment [6161-1509]: Commenter (6131) writes that it is telling that there have been attempts in Congress to enact legislation regarding the issue of data confidentiality as those legislative efforts demonstrate that the executive branch lacks the authority to undertake a rulemaking to address these issues.

Response: EPA agrees that final rule is similar to several provisions of the HONEST Act and may have been motivated by similar concerns. However, EPA disagrees that it lacks the authority to promulgate this rule in the absence of congressional action. The agency has housekeeping authority to promulgate rules that will govern the internal procedures EPA uses to evaluate the science underlying its significant regulatory actions and influential scientific information. EPA could have revised its internal guidance without notice and comment rulemaking but doing so allowed the agency to inform the public of its efforts to increase transparency of the science the agency relies upon and to help facilitate independent validation of the science.

Comment [6425-2369]: Commenter (6447) suggests that EPA impermissibly failed to notify or seek input from its SAB with regard to the proposal.

As the SAB noted in its May 12, 2018 memo, EPA staff violated the Environmental Research, Development, and Demonstration Authorization Act by failing to inform the SAB about the current proposal.¹⁷⁴³ According to the SAB, it only became aware of the proposal after seeing it in the *Federal Register* and in the news. This is a flagrant violation of law, and of reasoned decision-making. As the SAB notes, "[t]he proposed rule deals with issues of scientific practice and proposes constraints that the agency may apply to the use of scientific studies in particular contexts. As such, this rule deals with a myriad of scientific issues for which the Agency should seek expert advice from the Science Advisory Board."¹⁷⁴⁴

The fact that EPA failed to obtain scientific support for its proposal shows that the proposal has no scientific basis, is ideologically motivated, and is arbitrary and capricious.

Response: EPA disagrees that it violated the Environmental Research, Development, and Demonstration Authorization Act (ERDDAA). EPA did seek and obtain SAB review of aspects of the proposed rule. See [https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebProjectsCurrentBOARD/2DB3986BB8390B308525855800630FCB/\\$File/EPA-SAB-20-005.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebProjectsCurrentBOARD/2DB3986BB8390B308525855800630FCB/$File/EPA-SAB-20-005.pdf).

Comment [6895-3139]: Commenter (6916) writes that to the extent that the Proposal would require release of the underlying confidential data as a prerequisite for EPA to be able to use a

¹⁷⁴³ SAB memo at 2.

¹⁷⁴⁴ Id.

federally funded study in making a rulemaking decision, it also is in conflict with the regulations implementing the FOIA. Those regulations, following the 1998 Shelby Amendment to the 1999 Supplemental Appropriations Act, provide access through FOIA to federally supported studies' "research data" – so long as its confidentiality is preserved. The Shelby Amendment had directed changes to OMB Circular A-110 and FOIA. The implementing rules state that:

[i]n response to a Freedom of Information Act (FOIA) request for research data relating to published research findings produced under a Federal award that were used by the Federal government in developing an agency action that has the force and effect of law, the Federal awarding agency must request, and the non-Federal entity must provide, within a reasonable time, the research data so that they can be made available to the public through the procedures established under the FOIA.¹⁷⁴⁵

But the same rules make clear that "research data" does not include:

Trade secrets, commercial information, materials necessary to be held confidential by a researcher until they are published, or similar information which is protected under law; and (ii) Personnel and medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study.¹⁷⁴⁶

The reasons for this policy are clear: researchers have shown that it takes only two or three factors to permit the identification of a study participant using study data, even if most of the features are made "blind," so that the data set can be shared without exposing confidential information. First, the researchers eliminated as much information as possible from the raw data about a health study's participants, to disguise them. But in order to permit others to meaningfully use the data set, some identifying information had to be preserved. For example, geographic location (the place of death, for example), is required to study the correlation between air quality in that location and deaths. Age is a necessary criterion to account for the effects of normal aging and also the sex of the patient, to factor in any possible sex-related issues. The researchers, who included Douglas Dockery of the Six Cities team, found that even retaining this small number of identifying features meant that the patient could be identified by any researchers wishing to use that data to reproduce a study's results.¹⁷⁴⁷

Response: Nothing in the final rule would require release of confidential data as a prerequisite for EPA to be able to use a federally funded study when promulgating significant regulatory actions or developing influential scientific information. EPA's implementation of this rule will be consistent with statutory mandates, including FOIA, regarding the disclosure of information.

¹⁷⁴⁷ National Research Council, Access to Research Data in the 21st Century: An Ongoing Dialogue Among Interested Parties, at 10-11 (2002), available at: <https://www.nap.edu/catalog/10302/access-to-research-data-in-the-21st-century-an-ongoing> [hereinafter "2002 NRC Report"]; See also Latanya Sweeney, et al., Re-identification Risks in HIPAA Safe Harbor Data: A Study of Data from One Environmental Health Study, TECH . SCI . 2017082801 (Aug. 28, 2017), <https://techscience.org/a/2017082801> (finding that the researchers could re-identify approximately one-quarter of the records in a subset of a HIPAA-compliant environmental health data set).

Comment [8750-1470]: Commenter (9227) suggests that EPA’s proposed rule would violate the IQA.

EPA’s proposed rule is also unlawful because it exceeds EPA’s authority under Section 515(a) of the Treasury and General Government Appropriations Act for Fiscal Year 2001 (Public Law 16-554; H.R. 5658), commonly referred to as the IQA.¹⁷⁴⁸ Specifically, the IQA requires EPA promulgate data quality guidelines that are consistent with those promulgated by the OMB. Contrary to EPA’s assertion in the preamble to the proposal, the Proposed Rule is not consistent with OMB’s data quality regulations.

The OMB Guidelines recognize that data availability is not necessary to high quality science, but is one among many factors. While imposing high standards of quality, objectivity, utility, and integrity of information disseminated by Federal Agencies, the Guidelines recognize the need to implement controls “flexibly, and in a manner appropriate to the nature . . . of the information to be disseminated.”¹⁷⁴⁹ As part of ensuring “objectivity” these guidelines encourage agencies that disseminate influential scientific, financial, or statistical information, “to include a high degree of transparency about data and methods to facilitate the reproducibility of such information by qualified third parties.”¹⁷⁵⁰ However, they emphasize the need to treat certain data differently, due to privacy and confidentiality concerns.¹⁷⁵¹ In fact, the OMB Regulations specifically declare that “[w]ith regard to original and supporting data related thereto, agency guidelines shall not require that all disseminated data be subjected to a reproducibility requirement.”¹⁷⁵² Rather, the OMB Guidelines instruct that agencies “identify, in consultation with the relevant scientific and technical communities, those particular types of data that can practicable [sic] be subjected to a reproducibility requirement, given ethical, feasibility, or confidentiality constraints.”¹⁷⁵³ The OMB Regulations further explain that while “[m]aking the data and methods publicly available will assist in determining whether analytic results are reproducible . . . the objectivity standard does not override other compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections.”¹⁷⁵⁴ OMB explains that “where public access to data and methods will not occur due to other compelling interests, agencies shall apply especially rigorous robustness checks to analytic results and document what checks were undertaken.”¹⁷⁵⁵

By outright prohibiting EPA from relying on a study to support a significant rulemaking if that study’s underlying data and models are not publicly available, EPA’s proposed rule departs from OMB’s unambiguous language instructing agencies that they “shall not” require that all data and models be subject to the reproducibility requirement, and that “the objectivity standard does not

¹⁷⁴⁸ Codified at 44 U.S.C. 3504(d)(1) and 3516.

¹⁷⁴⁹ OMB’s Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information, 67 Fed. Reg. 8,452, 8,453 (Feb. 22, 2002).

¹⁷⁵⁰ 67 Fed. Reg. at 8460.

¹⁷⁵¹ OMB’s Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information, 67 Fed. Reg. 8, 452, 8,460 (Feb. 22, 2002) (interest in making data publicly available “does not override other compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections”).

¹⁷⁵² 67 Fed. Reg. at 8460 (emphasis added).

¹⁷⁵³ 67 Fed. Reg. at 8460. There is no indication that EPA consulted with the scientific and technical community—or even its own Science Advisory Board—before proposing to require that the underlying data and models be made publicly available for all pivotal regulatory science regardless of ethical, feasibility, or confidentiality constraints.

¹⁷⁵⁴ 67 Fed. Reg. at 8460 (emphasis added).

¹⁷⁵⁵ 67 Fed. Reg. at 8460.

override other compelling interests.”¹⁷⁵⁶ The fact that EPA’s proposed rule includes a discretionary “exemption” provision does not correct this problem, as that provision would not require the Administrator even to consider whether an exemption is warranted, let alone grant such an exemption under appropriate circumstances.

Because Congress expressly granted OMB the authority to set guidelines for data quality and instructed agencies like EPA to follow OMB’s lead, EPA lacks statutory authority to adopt a regulation that is contrary to OMB’s guidelines. Accordingly, EPA’s proposed regulation violates the IQA and must be withdrawn.¹⁷⁵⁷

Response: EPA disagrees that the final rule violates with the IQA or is inconsistent with OMB’s IQA guidelines. In 2002, EPA issued its information quality guidelines in compliance with the IQA and OMB’s guidelines. The final rule does not require that the Agency disseminate information that is subject to statutory limitations on disclosure such as confidentiality, privacy and trade secrets. The final rule also does not require the categorical exclusion of studies which was included in the 2018 proposal. The Agency will consider all studies relevant to the development of a significant regulatory action or influential scientific information but will give greater consideration to the studies identified as pivotal science when the underlying dose-response data are available for independent validation.

Comment [8750-1661]: Commenter (9227) contends that EPA arbitrarily failed to consider the implications of this proposal on interagency coordination.

Additionally, the commenter further contends that the EPA arbitrarily failed to consider the far-reaching implications this Proposal could have on inter-agency coordination and consultation given that other agencies normally rely on research potentially excluded by the Proposal.¹⁷⁵⁸ In the numerous environmental statutes that EPA cites, there are dozens of provisions that require EPA to coordinate or consult with other Federal entities—especially when implementing research programs and issuing information or guidelines.¹⁷⁵⁹ The Proposal would almost certainly frustrate and impair this coordination and consultation, either by forcing EPA to ignore the science provided by other agencies or by severely restricting the science that EPA itself would be able to share with other agencies in these statutorily required processes. The Proposal arbitrarily ignores these potential impacts.

¹⁷⁵⁶ See 67 Fed. Reg. at 8460.

¹⁷⁵⁷ *Prime Time Int’l Co. v. Vilsack*, 599 F.3d 678, 685 (D.C. Cir. 2010) (“[B]ecause Congress delegated to OMB authority to develop binding guidelines implementing the IQA, we defer to OMB’s reasonable construction of the statute.”)

¹⁷⁵⁸ See *Motor Vehicle Mfrs. Ass’n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (“Normally, an agency rule would be arbitrary and capricious if the agency has . . . entirely failed to consider an important aspect of the problem.”).

¹⁷⁵⁹ See 42 U.S.C. §§ 7403, 7408(a), 7408(c), 7408(f), 7412 (Clean Air Act §§ 103, 108, 112); 33 U.S.C. §§ 1314, 1317(a)(7), 1345(d)(1) (Clean Water Act §§ 304, 307(a)(7), 404(d)(1)); 42 U.S.C. §§ 6907(a), 6911, 6912(a)(2)-(6), 6942(b), 6981(a) (Resource Conservation and Recovery Act §§ 1008(a), 2001, 2002(a)(2)-(6), 4002(b), 8001(a)); 7 U.S.C. §§ 136w-3, 136w(d), 136a-1(n)(2)-(3), 136(l)(2), 136t(b), 136i-2(c) (Federal Insecticide, Fungicide, and Rodenticide Act §§ 2, 4, 11, 22, 25, 28); 15 U.S.C. §§ 2608(d), 2604(f)(5), 2604(h)(2)(B)(ii) (Toxic Substances Control Act); 42 U.S.C. § 300g-1 (b)(1)(D), 300g-1(d), 300j-13(a)(5), 300j-3d, 300j-19(b)(2)(A) (Safe Water Drinking Act). See also Appendix B: Table of Consultation Requirements.

In addition to the many examples of statutorily required consultation that are identified in Appendix B of the commenter's comment letter, other federal agencies routinely incorporate and rely upon EPA science assessments in their own efforts to carry out their mandates to protect human health and safety. As with statutorily required consultations, the Proposal utterly fails to acknowledge or consider what impacts restricting EPA's own use of dose-response studies would have on the work of these other agencies. Indeed, there is no evidence that these other agencies were even permitted to comment on the Proposal as part of the usual process of interagency review.

Some selected examples of other federal agency programs provided by the commenter that rely on EPA science include:

- The Food and Drug Administration (FDA) enforces tolerances established by EPA for pesticide chemical residues in human and animal foods under the Federal Insecticide, Fungicide, and Rodenticide Act, including through a comprehensive pesticide residue monitoring program that tests for approximately 700 pesticide residues in both imported and domestic commodities.¹⁷⁶⁰ To the extent the Proposal affects EPA's tolerances, the nature and effectiveness of FDA's own work to monitor for violations of those tolerances would be impacted.
- FDA also regulates contaminants in bottled water under the Federal Food, Drug and Cosmetics Act. Section 410 of the Act requires that FDA regulations for bottled water be issued in coordination with the effective date of National Primary Drinking Water Regulations issued under the Safe Drinking Water Act, and be no less protective of public health than those standards. If the Proposal impedes EPA's work to establish drinking water standards, this may affect FDA's own ability to justify protective bottled water standards.¹⁷⁶¹
- In certain circumstances, FDA also coordinates with EPA to provide the public with information and advice on environmental contaminants in foods. For example, in 2017 FDA and EPA released a joint advisory on mercury hazards associated with the consumption of fish and shellfish, which was based in part on EPA's assessment of the "reference dose" or level of exposure that a person can experience over a lifetime without a risk of harm.¹⁷⁶² The Proposal could radically alter the science EPA would be permitted to consider in future such initiatives, and frustrate the ability of FDA and other agencies to coordinate effectively with EPA to develop joint advice and information.
- The Department of Housing and Urban Development (HUD) is required by statute to assist EPA in assessing the extent of radon contamination in the United States and developing measures to avoid and reduce radon contamination.¹⁷⁶³ HUD has also developed policies to require radon testing at properties receiving federal financing,

which incorporate EPA radon standards.¹⁷⁶⁴ To the extent the Proposal affects future EPA assessments of radon risks, the scope, cost and effectiveness of HUD radon programs could be affected as well.

Response: Nothing in the final rule prohibits EPA from using any relevant studies, including studies offered by other federal agencies, in promulgating significant regulatory actions or developing influential scientific information. This rule of internal agency procedures governs how EPA will handle pivotal science based on the availability of underlying dose-response data. This rule will not impact how EPA coordinates and works with other agencies in meeting statutory mandates.

Comment [8750-1765]: Commenter (9227) argues that EPA fails to comply with the PRA.

EPA and the White House OMB must scrutinize the Proposal for its information collection burden, as that concept is defined under the Paperwork Reduction Act (PRA).¹⁷⁶⁵ The only reference to the PRA in the Proposal is EPA's denial that this action "contain[s] any information collection activities" or "impose[s] an information collection burden."¹⁷⁶⁶ But if finalized, the Proposal would significantly increase that burden in the rulemakings to which it applies. EPA and OMB cannot rationally ignore such an entirely foreseeable impact when considering this Proposal.

The PRA institutes procedural safeguards to "minimize the paperwork burden for individuals, small business, educational and nonprofit institutions," and others.¹⁷⁶⁷ It requires that, prior to initiating a "collection of information," agencies must "provide 60-day notice in the *Federal Register* . . . to solicit comment to," inter alia, "evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the agency," "evaluate the accuracy of the agency's estimate of the burden of the proposed collection of information," and "minimize the burden of the collection of the information on those who are to respond."¹⁷⁶⁸ After evaluating public comments, agencies must submit the proposed collection of information to OMB for additional review and publish a notice in the *Federal Register* setting forth "an estimate of the burden that shall result from the collection of information" and "notice that comments may be submitted to the agency and [OMB]."¹⁷⁶⁹ Any such collection of information is subject to OMB approval.¹⁷⁷⁰ OMB is required to determine "whether the collection of information . . . is necessary for the proper performance of the functions of the agency."¹⁷⁷¹ A negative determination precludes the agency from initiating the collection of information.¹⁷⁷²

¹⁷⁷⁰ See id. § 3507(a)(2).

¹⁷⁷¹ Id. § 3508.

¹⁷⁷² Id.

The requirements that EPA would impose through this Proposal qualify as collections of information under the PRA. The statute defines “collection of information” to include “the obtaining [or] causing to be obtained . . . of facts or opinions by or for an agency, regardless of form or format, calling for . . . answers to identical questions posed to, or identical reporting or recordkeeping requirements imposed on, ten or more persons. . . .”¹⁷⁷³ OMB regulations emphasize the breadth of this definition, specifying that “[a] Collection of information may be in any form or format, including . . . reporting or recordkeeping requirements; . . . policy statements; . . . rules or regulations; . . . oral communications;” and others.¹⁷⁷⁴ “Any recordkeeping, reporting, or disclosure requirement contained in a rule of general applicability is deemed to involve ten or more persons.”¹⁷⁷⁵ The definition of “collection of information” is agnostic as to whether disclosure is “mandatory, voluntary, or required to obtain or retain a benefit,” and to whether disclosure is to an agency or “members of the public or the public at large.”¹⁷⁷⁶

The Proposal would impose a burden that falls squarely within the definition of “collection of information.” In order to use scientific research, the agency would “obtain[] or caus[e] to be obtained . . . facts.” Assuming the requirements are applied consistently, the “questions posed,” or “reporting or recordkeeping requirements imposed,” would be “identical.” As the requirements are “contained in a rule of general applicability”—i.e., the instant Proposal—they are “deemed to involve ten or more persons.” It makes no difference whether the agency seeks the information through a questionnaire, telephone call, or some other format. Nor does it matter whether the agency directly mandates that entities provide the information, or provides that entities must “voluntary[ly]” provide the information in order for research to be eligible for consideration in important rulemakings.

While EPA has refrained from detailing the mechanics by which entities would provide the information, the agency expressly contemplates that the burden of providing such information would fall at least partly to members of the public whom the PRA exists to protect.¹⁷⁷⁷ For example, proposed regulation 40 C.F.R. § 30.5 provides that, “[w]here data is controlled by third parties, EPA shall work with those parties to endeavor to make the data available in a manner that complies with this section.” Moreover, the agency specifically “solicits comment on how to incorporate stronger data and model access requirements in the terms and conditions of cooperative agreements and grants.”¹⁷⁷⁸ As noted above, the PRA is implicated when collection of information is “required to obtain or retain a benefit,”¹⁷⁷⁹ and OMB guidance has identified grants as a “Federal benefit” for purposes of the PRA.¹⁷⁸⁰

¹⁷⁷³ 44 U.S.C. § 3502(3)(A)(i).

¹⁷⁷⁴ 5 C.F.R. § 1320.3(c)(1).

¹⁷⁷⁷ *Cf. id.* § 1320.3(k) (defining “person” for purposes of the PRA).

¹⁷⁷⁸ 83 Fed. Reg. at 18,771.

¹⁷⁷⁹ 5 C.F.R. § 1320.3(c).

¹⁷⁸⁰ See Memorandum from Cass R. Sunstein, Administrator, Office of Information and Regulatory Affairs, re: Information Collection Under the Paperwork Reduction Act 3 (Apr. 7, 2010), available at www.whitehouse.gov/sites/whitehouse.gov/files/omb/assets/infoereg/PRAPrimer_04072010.pdf.

EPA cannot evade the PRA requirements by narrowly asserting that “this action” imposes no information collection burden and ignoring the action’s entirely foreseeable future impacts. The proposal expressly “is intended to apply prospectively,” suggesting that it “prospectively” requires burdensome collections of information in future rulemakings. EPA must not ignore the PRA in this rulemaking, only to claim in future rulemakings that this rule moots or constrains the PRA’s application by compelling certain collections of information.

In the alternative, if EPA genuinely believes that this Proposal would not burden the public with new collections of information, then EPA’s stated basis for this rulemaking is exposed as a farce. EPA claims that the Proposal would “ensure” that certain data “are publicly available” and expresses specific concern for science “developed outside the agency.”¹⁷⁸¹ Collection of information, including from researchers employed outside of the federal government, is central to the purpose—and essential to the implementation—of the Proposal. Providing this information would inevitably impose a burden on researchers. If the agency does not actually intend to collect information under this Proposal, it underscores that EPA’s true purpose is not to increase transparency, but rather to thwart the development and maintenance of vital public health protections on the grounds that the agency lacks the information it would need to support them.

At a minimum, EPA must acknowledge and describe the information collection burden that this Proposal would impose so that OMB and the public can conduct a proper evaluation and provide responsive comments.

Response: EPA disagrees that the PRA applies to this rule. Nothing in the final rule requires the collection of information by EPA from outside parties nor does it obligate outside parties to provide information to EPA. The final rule describes how EPA will handle studies used to support significant regulatory decisions and influential scientific information. In determining how to weight studies determined to be “pivotal science,” EPA will assess the availability of dose-response data for those studies. Pivotal science where the underlying dose-response data are available for independent validation will be given greater consideration than pivotal science lacking data availability.

Comment [6895-3138]: Commenter (6916) notes that to the extent that the Proposal would require release of the underlying confidential data as a prerequisite for EPA to be able to use a federally-funded study in making a rulemaking decision, it also is in conflict with the regulations implementing the FOIA. Those regulations, following the 1998 Shelby Amendment to the 1999 Supplemental Appropriations Act, provide access through FOIA to federally supported studies’ “research data” – so long as its confidentiality is preserved. The Shelby Amendment had directed changes to OMB Circular A-110 and FOIA. The implementing rules state that:

[i]n response to a Freedom of Information Act (FOIA) request for research data relating to published research findings produced under a Federal award that were used by the Federal government in developing an agency action that has the force and effect of law, the Federal awarding agency must request, and the non-Federal entity must provide,

¹⁷⁸¹ 83 Fed. Reg. at 18,768, 18770.

within a reasonable time, the research data so that they can be made available to the public through the procedures established under the FOIA.¹⁷⁸²

But the same rules make clear that “research data” does not include:

Trade secrets, commercial information, materials necessary to be held confidential by a researcher until they are published, or similar information which is protected under law; and (ii) Personnel and medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study.¹⁷⁸³

The reasons for this policy are clear: researchers have shown that it takes only two or three factors to permit the identification of a study participant using study data, even if most of the features are made “blind,” so that the data set can be shared without exposing confidential information. First, the researchers eliminated as much information as possible from the raw data about a health study’s participants, to disguise them. But in order to permit others to meaningfully use the data set, some identifying information had to be preserved. For example, geographic location (the place of death, for example), is required to study the correlation between air quality in that location and deaths. Age is a necessary criterion to account for the effects of normal aging and also the sex of the patient, to factor in any possible sex-related issues. The researchers, who included Douglas Dockery of the Six Cities team, found that even retaining this small number of identifying features meant that the patient could be identified by any researchers wishing to use that data to reproduce a study’s results.¹⁷⁸⁴

Response: See response to Comment 6895-3139.

1.8 Trying to Achieve Administratively What Could Not be Done Legislatively

Comment [550-4263]: Commenter (1563) notes that STRS provides that “When promulgating significant regulatory actions, the Agency shall ensure that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation.” It codifies what was intended in the Secret Science Reform Act of 2015, and the Honest and Open New EPA Science Treatment Act of 2017 (HONEST Act), both of which passed the House but never came up for vote in the Senate.

Response: EPA agrees with the commenter that the final rule is consistent with some of the provisions of the HONEST Act.

¹⁷⁸² 2 C.F.R. § 200.315(e)(1) (emphasis added).

¹⁷⁸³ Id. at § 200.315(e)(3); see also 5 U.S.C. § 552(b)(6) (codifying Pub. L. 89-487).

SCI . 2017082801 (Aug. 28, 2017), <https://techscience.org/a/2017082801> (finding that the researchers could re-identify approximately one-quarter of the records in a subset of a HIPAA-compliant environmental health data set).

Comment [997-3842]: Commenter (1012) writes that this rulemaking bears a remarkable similarity to highly partisan legislation that the Chairman of the Committee on Science, Space, and Technology has attempted to enact for the past three Congresses.¹⁷⁸⁵ In each of the past three Congresses, this legislation has failed to be enacted into law. Committee Chairman Lamar Smith was present and standing next to you when you signed the proposed rulemaking on April 24. During the signing ceremony for this proposed rulemaking you acknowledged that the proposed rulemaking was a "culmination of the work" of Chairman Smith's efforts.¹⁷⁸⁶ Further illustrating the notion that this rulemaking is a direct substitute for Chairman Smith's failed legislative efforts is the Chairman's press statement from April 24, when he stated:

Earlier in this Congress, the House passed the HONEST Act with bipartisan support. The legislation requires that scientific information relied upon by EPA for regulations be publicly available for independent analysis. Administrator Pruitt's actions enable us to put the principles of this bill into practice.¹⁷⁸⁷

Article I of the Constitution vests the power to legislate solely in the hands of the U.S. Congress.¹⁷⁸⁸ Despite the repeated efforts of Chairman Lamar Smith, Congress has never enacted a "Secret Science" bill into law. The commenter believes that the EPA's efforts to administratively implement the provisions of Chairman Smith's failed "Secret Science" bills oversteps the EPA's authority under the U.S. Constitution. For that reason, I urge you to withdraw the proposed rulemaking.

Response: EPA agrees that final rule is similar to several provisions of the HONEST Act and may have been motivated by similar concerns. However, EPA disagrees that it lacks the authority to promulgate this rule in the absence of congressional action. The agency has housekeeping authority to promulgate rules that will govern the internal procedures EPA uses to evaluate the science underlying its significant regulatory actions and influential scientific information. EPA could have revised its internal guidance without notice and comment rulemaking but doing so allowed the agency to inform the public of its efforts to increase transparency of the science the agency relies upon and to help facilitate independent validation of the science.

Comment [1370-4426]: Commenter (1385) writes that recent news reports suggest that you plan to adopt restrictions on research similar to those contained in two pieces of proposed legislation (the Secret Science Reform Act and the HONEST Act), which have both repeatedly failed to pass Congress for several years for good reason.

Response: While the final rule is similar to aspects of the legislation cited, the rule will not restrict the use of any scientific studies to support final significant regulatory decisions and

¹⁷⁸⁵ H.R. 4012, 113rd Cong. (2014); H.R. 1030, 114th Cong. (2015); and, H.R. 1430, 115th Cong. (2017).

¹⁷⁸⁷ "Smith Remarks on Administrator Pruitt's Scientific Transparency Announcement," Press Release by Chairman Lamar Smith, Committee on Science, Space, and Technology (April 24, 2018), found at: <https://science.house.gov/news/press-releases/smith-remarks-administrator-pruitt-s-scientific-transparencyannouncement>

¹⁷⁸⁸ 5 United States Const. art. I § I.

influential scientific information. The final rule adopts a weighting approach to evaluating studies rather than the categorical exclusionary approach in the 2018 proposal.

Comment [1380-4438]: Commenter (1395) writes that Congressman Lamar Smith sponsored a bill, the "Honest Act" which would bar the use of data from such studies, which did not pass. This rule making is an attempt to circumvent Congress and implement such a rule anyway.

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [1409-4467]: Commenter (1424) writes that the origin of this proposal is the house bill HR1430, sponsored by the anti-science republican chair of the House of Representatives Science, Space and Technology Committee, Lamar Smith. The EPA, under the troubled head, Administrator Pruitt, has transferred this failed bill to the EPA in an attempt to enact it as an agency regulation.

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [1973-4610]: Commenter (1988) writes that on 24 April 2018, Administrator Scott Pruitt signed the misleadingly named "Strengthening Transparency in Regulatory Science" - a proposal to require the Environmental Protection Agency (EPA) to make the raw data underlying regulatory action publicly available in a way that allows for independent validation. Based on the Secret Science Act and the more recent HONEST Act, this rule would restrict the use of scientific research vital to informed decision-making, such as studies containing private or proprietary information including personal health records, under the guise of transparency and the desire to ensure the robustness of science.

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [4579-2459]: Commenter (4590) writes that a Congressional bill similar in intent to the EPA's proposed rule – the HONEST Act – was offered and defeated last year. Members of Congress had serious and valid concerns about the negative impact the bill would have by significantly reducing the amount of scientific evidence that EPA can consider when adopting regulatory standards to protect public health and the environment. Given the requirements of the APA and federal environmental statutes, the agency cannot do by regulation what Congress declined to do through legislation.

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [4870-2301]: Commenter (4881) writes that the Congress has consistently declined to adopt legislation that would add an explicit requirement to provide public access to raw data. The EPA, in its proposed rule, is attempting to delegate to itself this clearly legislative authority, with no evidence for the allegedly "secret science" raised by a small group of legislators who seek to undermine traditional EPA authority to regulate environmental hazards. That small group of legislators has had a barely concealed focus on several particular studies that have been foundational in establishing the very real connections between exposure to air pollution and adverse public health impacts.

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [4883-2114]: Commenter (4894) writes that the rule's premise, which was also the premise of the Secret Science Act and the HONEST Act, cannot stand.^{1789 1790 1791 1792}

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [5011-2654]: Commenter (5022) writes that the proposal lacks critical citations and documentation or even an adequate justification for why it was proposed. Rather than furnishing the evidentiary support required for administrative action, the agency has merely adopted a legislative initiative¹⁷⁹³ that failed to pass despite support from the energy, chemical, manufacturing, and other key industries. That legislation was proposed by Rep. Lamar Smith (R-TX), Chair of the House of Representatives Committee on Science, Space, and Technology, who questions the science behind climate change¹⁷⁹⁴ and the relationship between air pollution and mortality.¹⁷⁹⁵

Response: EPA explained the justification for the rule in the preamble of the 2018 proposal.

Enhancing the transparency and validity of the scientific information relied upon by EPA strengthens the integrity of EPA's regulatory actions and its obligation to ensure the Agency is not arbitrary in its conclusions. By better informing the public, the Agency in enhancing the public's ability to understand and meaningfully participate in the regulatory process." 83 Fed. Reg. 18769 (April 30, 2018).

Further, EPA cited Executive Orders, OMB memoranda and guidelines, and scientific journal articles, etc., as justification for the rule.

Comment [5153-4081]: Commenter (5164) writes that recent news reports¹⁷⁹⁶ suggest that you plan to adopt restrictions on research similar to those contained in two pieces of proposed legislation (the Secret Science Reform Act and the HONEST Act), which have both repeatedly failed to pass Congress for several years for good reason.¹⁷⁹⁷ Multiple major scientific societies repeatedly came out strongly against the legislation at the time. “We urge caution in setting laws that submerge science beneath politics,” they wrote.¹⁷⁹⁸

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [6104-614]: Commenter (6114) states that the proposal is strikingly similar to both the proposed Honest and Open New EPA Science Treatment (HONEST) Act of 2017 (H.R.1430-115th Congress, 2017-2018) and the proposed Secret Science Reform Act of 2014 (H.R. 4012-113th Congress, 2013-2014) and 2015 (H.R.1030 - 114th Congress, 2015-2016), all of which repeatedly failed to pass in the Senate despite being supported by the energy, manufacturing, and chemical industries.

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [6155-2166]: Commenter (6125) writes that this initiative is clearly based on the so-called HONEST Act, legislation introduced in each of the last two Congresses to restrict EPA’s ability to rely on scientific information, but never enacted into law (H.R. 1030¹⁷⁹⁹ in 2015 and H.R. 1430¹⁸⁰⁰ in 2017). The CBO in consultation with EPA analyzed the costs that would be imposed by these legislative proposals. The 2015 analysis assumed that EPA would reduce the number of studies it relied on by half, but would still need to expend \$250 million/year initially in an effort to determine data availability, and where necessary pay for obtaining and disseminating it. Given EPA’s intention to “minimize” such costs in its proposed rule, this estimate may be considered an upper bound of the direct costs.

The CBO analysis does not tell the whole story, however, because it did not assess the disbenefits to the regulatory process and to public health of being unable to base regulations on numerous influential studies for which data could not be made available. Considering only the science policy value of the information in multiple original studies that are likely to be lost (e.g. the cohort epidemiology studies noted above, which must limit access to protect privacy) it is reasonable to conclude that their loss would almost certainly outweigh the value of any information gained by subsequent re-analyses of a more limited set of studies, which rely on

¹⁷⁹⁶ <https://www.epa.gov/newsreleases/daily-caller-scott-pruitt-will-end-epas-use-secret-science-justify-regulations>

<https://www.cbo.gov/publication/50025>

¹⁸⁰⁰ Congressional Budget Office, H.R. 1430, Honest and Open New EPA Science Treatment Act of 2017.

<https://www.cbo.gov/system/files/115th-congress-2017-2018/costestimate/hr1430.pdf>

publicly available databases that are often inferior to those that contain more relevant information.

In the 2017 legislative analysis, CBO estimated a cost ranging from 1 million to 100 million dollars per year, depending on the approach taken by EPA in assessing studies. They determined that meeting H.R. 1430 requirements would cost EPA an average of \$10,000 per study. EPA officials told CBO that the agency would likely greatly reduce the number of studies it relied on and would not take on the cost of disseminating the underlying data.^{1801 1802} The proposal reiterates EPA's plan to focus on a more limited number of studies. Under these assumptions, CBO suggested costs could be as low as \$1 million/year, but again did not assess the potential implications for existing or future regulations. An unofficial draft response to CBO questions from unidentified EPA staff strongly disagreed with the lower cost estimates, and expressed concern that the legislation would prevent EPA from using the best available science; this response was never forwarded to CBO.¹⁸⁰³

Response: The final rule will not reduce the number of scientific studies that the EPA may use in developing significant regulatory actions or influential scientific information. Further, the rule does not require the EPA to compile, store or disseminate data from outside sources. As discussed in Section III.J. of the preamble, the EPA has identified some incremental costs that the Agency may incur as a result of this rule. The EPA will continue its current practice of conducting extensive review of scientific studies during the development of final significant regulatory actions and influential scientific information. The additional procedures required by this rule only apply to pivotal science, which is a subset of the total number of studies that the EPA would evaluate. Given the costs of the extensive review and documentation and the determination of dose-response data availability is limited to pivotal science underlying final significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule related to the additional review of data availability will be small.

Comment [6161-1506]: Commenter (6131) notes that the proposal is strikingly similar to both the Honest and Open New EPA Science Treatment (HONEST) Act of 2017 (H.R. 1430 – 115th Congress, 2017-2018) and the Secret Science Reform Act of 2014 (H.R. 4012 – 113th Congress, 2013-2014) and 2015 (H.R. 1030 – 114th Congress, 2015-2016), all of which repeatedly failed to

¹⁸⁰¹ Id.

¹⁸⁰² This CBO estimate is “based on information from the EPA’s Office of Research and Development and other federal agencies, as well as feedback from organizations and researchers in the scientific community that publish in peer-reviewed journals.” EPA should give greater weight to its own experts as well as the other Federal Agencies than to the lower estimate provided by a Lutter and Zorn working paper EPA cites in footnote 24. They relied more on costs to industry for providing data from confidential business information, EPA paperwork, and base costs of storing data. Their lower estimate did not recognize the challenges and additional costs involved in providing data and methodology for studies that need to consider protection of privacy. These may require special archiving and access arrangements to limit data sharing, such as those noted in NIH data sharing plans, which are required only for studies that receive and spend more \$500,000 per year.

<https://www.scribd.com/document/344731162/EPA-analysis-of-Honest-Act-to-CBO> Uploaded by Marketplace (see <https://www.marketplace.org/2017/04/10/sustainability/honest-act-seen-critics-undercutting-epa-s-use-science> April 10, 2017) who verified its origin with two current EPA staff.

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC1257652/>
<https://ajph.aphapublications.org/doi/pdfplus/10.2105/AJPH.86.10.1416>

pass in the Senate despite being supported by the energy, manufacturing, and chemical industries.

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [6163-589]: Commenter (6133) contends that the governing, harmful conceit of the Proposal—to censor the best available, peer-reviewed health science that EPA may consider, in order to prevent adoption of protective health and environmental safeguards—is a thinly disguised version of anti-science legislation that Republican members of Congress have introduced, repeatedly, but have been unable to enact into federal law, repeatedly.¹⁸⁰⁴ The commenter opposed those bills strongly, and still does. The commenter raised many of the identical objections to those bills that they raise to the Proposal in these comments.¹⁸⁰⁵ Indeed, it is striking that one of the primary EPA co-authors of the Proposal was a Committee staff person for the leading congressional co-sponsor of the legislation in question when the failed bill was being shepherded through the House of Representatives.¹⁸⁰⁶

Members of Congress understood that new legislation was required to censor EPA consideration of high quality, peer-reviewed science, and yet EPA barreled ahead with a Proposal based on the same legislative approach while pretending, suddenly, that multiple federal laws have authorized that approach, magically, all along. For the reasons discussed in these comments, the Proposal is not authorized by any federal laws. Moreover, the Proposal violates numerous federal laws entrusted to EPA, in addition to being arbitrary and capricious and an abuse of EPA’s discretion.

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [6339-1797]: Commenter (6361) states that the proposal is strikingly similar to both the Honest and Open New EPA Science Treatment (HONEST) Act of 2017 (H.R. 1430 — 115th Congress, 2017-2018) and the Secret Science Reform Act of 2014 (H.R. 4012 — 113th Congress, 2013-2014) and 2015 (H.R. 1030 — 114th Congress, 2015-2016), all of which repeatedly failed to pass in the Senate despite being supported by the energy, manufacturing, and chemical industries. These nearly interchangeable bills would have required all research data used in agency actions to be made available to the public. Our nation's health privacy laws were enacted to address citizen's concerns about this type of information being made public or getting into the wrong hands.

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [6857-2946]: Commenter (6879) writes that the proposed regulation is also arbitrary and capricious. This rule has its origins in a failed congressional attempt to limit the science available for use in EPA rulemaking, and Congress rightfully rejected this extreme and harmful

¹⁸⁰⁴ See, e.g., H.R. 4012, “Secret Science Reform Act of 2014,” 113th Congress, 2d Session, <https://www.congress.gov/113/bills/hr4012/BILLS-113hr4012rfs.pdf>.

¹⁸⁰⁵ See Letter from John Walke, NRDC, to Honorable Lamar Smith, Chairman, Committee on Science, Space, and Technology, et al. (Feb. 11, 2014), available at https://www.nrdc.org/sites/default/files/air_14021101a.pdf.

¹⁸⁰⁶ Scott Waldman, “Meet the man helping Pruitt reshape science,” Climatewire, (May 23, 2018), <https://www.eenews.net/stories/1060082467>.

proposal. It is therefore shocking that EPA would take this failed effort and, unsupported by facts, reason, history, or scientific evidence, put the proposed regulation on a fast-track for administrative approval and adoption.

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [6894-3593]: Commenter (6915) writes that this anti-science approach has stalled in Congress and been rejected by the courts; it has no place at EPA.

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [6897-1882]: Commenter (6918) writes that they support enhanced transparency in EPA rulemakings, but recognize the vital importance of privacy, confidentiality of personal and business information, and national and homeland security as limits on data access. Commenter therefore agrees with EPA's goal of making data and models underlying pivotal regulatory science available while providing a process for protecting data if their release would impair privacy, confidentiality, or security. Commenter recommends that EPA more clearly detail an objective and consistent process that would determine when release of data underlying pivotal studies would be deemed inappropriate because it would impair privacy, confidentiality, and/or national security.

Response: The EPA appreciates your comment in support of this rule. The EPA intends to develop guidance for Agency employees to ensure that the rule implemented in a consistent manner. The EPA will continue to comply with statutory restrictions on the release of dose-response data.

Comment [6907-3957]: Commenter (6928) writes that the new EPA proposal is the latest in a long-running campaign to let the public and regulated industries sift through the raw data of epidemiologists whose work could affect pollution regulations.

In the 1990s, members of Congress pressed for legislation requiring scientists to disclose their raw scientific data, partly in response to a Harvard University study finding a correlation between more air pollution and lower life expectancy. Several times in recent years, the House of Representatives passed a bill requiring public disclosure of data from any new studies used by EPA to write regulations, but the proposal never made it out of Congress.¹⁸⁰⁷

Response: See the responses to Comments 997-3842 and 1370-4426.

Comment [9283-3588]: Commenter (8281) notes that over the last few years, the House Committee on Science, Space, and Technology has considered several iterations of legislation that have many similarities to the proposed rule. Commenter has been a vocal opponent of these bills... Commenter also wants to note that despite repeated efforts by the majority, the so-called secret science legislation has not passed both chambers. Congress has the sole constitutional authority to legislate, and this proposed rule is an administrative attempt to circumvent the

¹⁸⁰⁷ Warren Cornwall, New rule could force EPA to ignore major human health studies, Apr. 25, 2018, <http://www.sciencemag.org/news/2018/04/new-rule-could-force-epa-ignore-major-human-health-studies>

legislative process. Commenter strongly urges EPA to withdraw this proposed rule. It will undermine scientific integrity, jeopardize bedrock public health and environmental standards, and endanger the EPA's ability to protect the American people, which is its mission.

Response: See the responses to Comments 997-3842 and 1370-4426.

1.9 Other Comments (NPRM Comments)

Comment [2157-145]: Commenter (2171) states that this proposed rule is counter to the current goal of Cooperative Federalism.

As an example, the MPCA manages facility air toxics emissions through modeling and risk-based assessments, with support from MDH. Specifically, we compare modeled air concentrations to inhalation health benchmarks. In order to keep our approach systematic and non-biased, the MPCA and MDH pre-select information sources of inhalation health benchmarks in the form of a hierarchy. Approximately 40% of the inhalation health benchmarks that the MPCA uses to manage air toxics emissions are from EPA's IRIS or Provisional Peer-Reviewed Toxicity Values (PPRTV) programs. Our Understanding of this proposed rule leads us to believe that the dose-response information used to develop these values could become mired in redundant and unnecessary review, should the rule be enacted. Any delay in the review of IRIS or PPRTV data greatly compromises the MPCA's ability to assess and appropriately set permit conditions for industries, or to determine clean up requirements for site remediation projects.

Response: This procedural rule only applies to EPA and not to any other party outside of the agency. Any potential implementation issues will be addressed as appropriate in subsequent rulemakings implementing this procedural rule.

Comment [6092-471]: Commenter (6102) suggests that given the practical and legal complexities surrounding this effort, the EPA may want to supplement this rule with statute-specific rulemakings. This would allow EPA to more precisely tailor transparency requirements in the context of individual statutes while providing greater legal certainty.

Response: EPA agrees that statute-specific rulemakings are necessary. As discussed in the final rule preamble at Section III.A, statute-specific transparency regulations or programmatic regulations are forthcoming.

Comment [6119-2471]: Commenter (6144) notes that records released through a FOIA request confirm that EPA staff are aware that the agency does not need to have access to the underlying raw data, codes, etc. to promulgate regulations. In an email sent by Dr. Nancy Beck, the Deputy Assistant Administrator for the Office of Chemical Safety and Pollution Prevention, to her colleagues during the development of this proposed rule, she shares “for awareness” that in the 2002 court decision *American Trucking Association v. EPA*, it became evident that EPA would not be able to use a significant amount of important scientific literature to protect public health and the environment if it had to access the raw data of peer-reviewed scientific studies.¹⁸⁰⁸ The

¹⁸⁰⁸ Documents obtained by the Union of Concerned Scientists through EPA FOIA Request No. EPA-HQ-2018-005145.

courts, through that decision and through *Coalition of Battery Recyclers Association v. EPA*, have made it abundantly clear that EPA is not required to obtain or analyze raw data in order to use independent scientific studies that are published in peer-reviewed journals to regulate.

Response: This final rule does not require EPA or any entity outside of the agency to obtain, analyze, or publicize raw data in order to consider pivotal science to be used in significant regulatory decisions and influential scientific information and does not require EPA to categorically exclude any studies. Therefore, it does not conflict with those decisions.

Comment [6125-1850]: Commenter (6150) writes that increasing transparency will improve the quality of the data used to support regulatory decisions, thereby assuring that EPA relies on the best available science. EPA may want to supplement this rule at a later date with statute-specific rulemakings. This will allow EPA to be more precise in how the transparency requirements apply in the context of individual statutes while providing greater legal certainty. This suggestion should not be justification or causation for not taking steps more generally ahead of addressing any statute-specific rulemakings.

Response: See response to Comment 6092-471.

Comment [6163-5032]: Commenter (6133) notes that EPA identifies no indication under federal laws that Congress intended to create or authorize a lose-lose dynamic, in which EPA could exercise its authority either by excluding the best available, peer-reviewed science to inform health and environmental protections, or force researchers or ordinary Americans to cast aside privacy concerns, as well as legal and ethical restrictions on the sharing of sensitive data. That false choice is entirely a creation of the agency's misguided policy preferences in the Proposal. The rule is arbitrary and capricious and an abuse of EPA discretion, with its selective application of data release requirements and disregard for the quantitative complexities of epidemiologic research.

Response: The final rule does not require EPA to exclude science or to disclose protected information. Rather, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. See the final rule preamble at Section III.E for further discussion of the finalized approach and EPA's process for considering protected information.

Comment [6356-2427]: Commenter (6378) states that drawing from their experience on multiple EPA panels for CASAC, IRIS, and FIFRA, they are convinced that the proposed rule will severely limit the information that EPA can use to make decisions by requiring that studies used in the scientific reviews in support of science make their data publicly available. This will directly contradict the mandates of many Acts that require that the scientific review draw upon the best available science.

Response: As explained in Section III.E of the final rule preamble, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are publicly

available in a manner sufficient for independent validation, and not categorically exclude pivotal science for which the underlying dose-response data are not available. EPA has explained that this procedural rule has limitations on its scope in terms of conflicts with other substantive requirements and that, in situations where this rule applies, EPA will give greater consideration to those studies where the underlying data and models are available for independent validation. The final rule provides that if implementing the rule results in any conflict between this rule and the environmental statutes that the EPA administers, this rule will yield and the statute will control.

Comment [6357-1865]: Commenter (6379) argues that nothing in the Proposed Rule or its implementation should preclude the use of the best available science. Numerous statutes that EPA is charged with implementing require that EPA rely on the best available science and health information. For example, the Toxic Substances Control Act requires that in conducting tests and risk assessments of toxic substances, “the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science.”¹⁸⁰⁹ Similarly, the Safe Water Drinking Act requires that a determination to regulate a contaminant “shall be based on the best available public health information.”¹⁸¹⁰ And, as the Proposed Rule notes, Executive Order 13563 (2011) requires that the “regulatory system” be “based on the best available science.”¹⁸¹¹

However, it is unclear whether it is appropriate and legally durable to restrict the use of the best available science by, as the Proposed Rule does, defining “best” to include a requirement that data be “publicly available.”¹⁸¹² Such a requirement may be inconsistent with Court findings and established Federal and EPA requirements. For example, the Eighth Circuit Court of Appeals has stated in the context of other federal regulations that “it is required of the agencies...to seek out and consider all existing scientific evidence relevant to the decision at hand. [Agencies] cannot ignore existing data.”¹⁸¹³

Response: See response to Comment 6356-2427.

Comment [6852-2763]: Commenter (6874) argues that EPA has failed to demonstrate that its current processes for considering science in regulation have suffered from insufficient transparency that has resulted in outcomes contrary to its statutory mandates or executive orders. Given extensive existing procedures used by EPA and the scientific community at large to assure the quality of research, EPA has failed to make a case that additional public access to data is necessary.

Response: This rulemaking is intended to build on open data initiatives in the Federal government and scientific community, and thereby improve the transparency of EPA decision-making and assessments. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to validate original research.

¹⁸⁰⁹ U.S.C. §2625(h).

¹⁸¹⁰ U.S.C. § 300g-1 (a)(B)(ii)

¹⁸¹¹ 83 Fed. Reg. at 18,769.

¹⁸¹² Fed. Reg. at 18,773.

findings, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Having a better understanding of the underlying data will enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or ISI. EPA further discusses the need for additional transparency in the final rule preamble at Section III.A.1.

Comment [6891-1529]: Commenter (6912) writes that EPA has not engaged in reasoned decision-making in developing this rule.

While judicial review of agency actions is usually "exceedingly deferential,"¹⁸¹⁴ when, given the totality of the circumstances, the agency appears not to have engaged in reasoned decision-making, a rule should be invalidated.

The scope of review under the "arbitrary and capricious" standard is narrow and a court is not to substitute its judgment for that of the agency. Nevertheless, the agency must examine the relevant data and articulate a satisfactory explanation for its action including a "rational connection between the facts found and the choice made." In reviewing that explanation, we must "consider whether the decision was based on a consideration of the relevant factors and whether there has been a dear error of judgement."¹⁸¹⁵

This heightened level of scrutiny calls on a court to "intervene not merely in case of procedural inadequacies, or bypassing of the mandate in the legislative charter, but more broadly if the court becomes aware, especially from a combination of danger' signals, that the agency has not really taken a 'hard look' at the salient problems, and has not genuinely engaged in reasoned decision-making."¹⁸¹⁶

In *Greater Boston Television Corp. v. FCC*, the biggest "danger signal" that caused the court to give an agency's actions a "hard look" was the fact that the chair of the Federal Communications Commission (FCC) had had potentially improper contacts with an executive at one of companies competing for a broadcast license to be attributed by the agency.¹⁸¹⁷ Other "danger signals" that courts have held to trigger heightened scrutiny of agency actions include "abrupt shifts in policy,"¹⁸¹⁸ and "where the agency has demonstrated undue bias towards particular private interests."¹⁸¹⁹ These concerns are epidemic for this proposed rule.

As detailed in Part II A of this comment, the proposed rule is the result of a long, tobacco and fossil fuel industry-led campaign to limit the use of science in rulemaking. This campaign focused on limiting the use of public health studies that demonstrate dramatically negative health consequences of smoking and breathing polluted air. The trick was to take advantage of the

¹⁸¹⁹ *NRDC v. SEC*, 606 F.2d 1031, 1050 (D.C. Cir. 1979)

private nature of underlying individual health care information (a value worth protecting), and twist that into a faux concern about "secret science."

Part II B lays out the myriad connections between Pruitt, congressional champions of this proposed rule, and the EPA political appointees who developed it, and the fossil fuel and tobacco industries who have campaigned for it for decades. This long and well-documented record is rife with the sort of "danger signals" the courts have found to warrant "hard look" review. Potentially improper contacts between regulators and regulated industries,¹⁸²⁰ "abrupt shifts in policy,"¹⁸²¹ and "undue bias towards particular private interests"¹⁸²² are all present in this tawdry tail of industry capture. Based on this record, no court could conclude that EPA "genuinely engaged in reasoned decision making"¹⁸²³ nor did it "articulate a satisfactory explanation for its action including a 'rational connection between the facts found and the choice made.'"¹⁸²⁴

Response: EPA notes that although this is an internal procedural rule not subject to the APA's notice and comment requirements, see 5 U.S.C. § 553(b), EPA nevertheless published a proposed rule and supplemental proposed rule in the *Federal Register*, solicited public comment on both, and made all relevant documents available for public review. In so doing, EPA complied with the APA's notice and comment requirements even though the rule is not subject to them. Taken together, the proposal and supplemental proposal articulate a rational basis for the final rule and demonstrate that the agency engaged in reasoned decision-making, informed by the over 950,000 public comments received (over 22,400 unique comments).

Comment [6891-1530]: Commenter (6912) argues that the proposed rule is an illegal delegation of agency rulemaking authority to the industries it regulates.

Just as an agency rulemaking will be set aside if a court determines that it was arbitrary and capricious, an agency rulemaking should be invalidated if a court finds that the agency delegated its rulemaking authority to one or more private interests; because Congress "cannot delegate regulatory authority to a private entity."¹⁸²⁵ Although objections to delegations are "typically presented in the context of a transfer of legislative authority from the Congress to agencies, [...] the difficulties sparked by such allocations are even more prevalent in the context of agency delegations to private individuals."¹⁸²⁶

While it is clear that an agency may not *explicitly* delegate its rulemaking authority to private interests, an agency that *implicitly* delegates its rulemaking authority to private interests raises the same concerns. An agency is effectively captured by the private interests it regulates when its

¹⁸²⁴ *Motor Vehicle Manufacturers Association v. State Farm Mutual Automobile Insurance Co.*, 463 US 29; 43 (1983), quoting *Burlington Truck Lines v. United States*, 371 U. S. 156, 168 (1962)

¹⁸²⁵ *Ass 'n of American Railroads v. USDOT*, 721 F.3d 666, 670 (D.C . Cir. 2013) rev 'd on other grounds

¹⁸²⁶ *Id.*, quoting *National Ass'n of Regulatory Util. Comm. v. FCC*, 737 F.2d 1095, 1143 (DC Cir. 1984).

"regulation is . . . directed away from the public interest and toward the interest of the regulated industry ' by 'intent and action' of industries and their allies."¹⁸²⁷

As described above, the proposed rule was the product of a process that was effectively delegated to industry, with EPA serving as little more than a rubber stamp on an industry sought and industry-drafted proposal. The evidence is overwhelming that the proposed rule was conceived by the tobacco industry and then advanced by the tobacco and fossil fuel industries and the network of individuals and front groups they have funded for more than two decades.

Steve Milloy and Christopher Horner, two of the biggest players in industry 's "secret science" campaign, even worked for President Trump's EPA transition team, and one boasted that he was "inside the Administrator 's office" on the day the proposed rule was announced. Richard Yamada, the political appointee drafting the proposed rule, spent most of his Washington career working for Representative Lamar Smith, the primary congressional champion of the "secret science" initiative, who also happens to count the fossil fuel industry as his biggest donors. It was Smith whose meeting with Pruitt apparently triggered the drafting of the proposed rule. Brittany Bolen, Ryan Jackson, and Erik Baptist, the other political appointees involved in drafting the proposed rule, all previously worked for Senator James Inhofe, another fossil fuel industry-funded congressional champion of the rule.

The fossil fuel industry and its long-time "secret science" allies quickly took advantage of Scott Pruitt's ascendancy at EPA. At least one company - Chevron - included the "secret science" initiative on its EPA wish list. The fact that Pruitt resigned in disgrace as EPA Administrator after the publication of the proposed rule does not allay these concerns. The man is gone, but his conflicts and the flawed process he oversaw lingers on.

Moreover, the capture of EPA goes deeper than just Scott Pruitt. The case for agency capture survives his departure. Numerous EPA political appointees; all of whom have their own significant ties to the fossil fuel industry, were intimately involved in this rulemaking. Intact current EPA Acting Administrator Andrew Wheeler, who will oversee the rulemaking process going forward, has his own deep ties to the fossil fuel industry.

We are not the only ones to conclude that EPA under the current administration has been captured. by industry. A recently published article in the *American Journal of Public Health* finds that EPA is exhibiting many signs of regulatory capture.¹⁸²⁸ The authors of this article examined EPA actions from December 2016 through June 2017 and they interviewed 45 current and retired EPA employees. Among their findings pointing to regulatory capture:

- Appointees have deep ties with industries."

¹⁸²⁷ Lindsey Dillon , et al., "The Environmental Protection Agency in the Early Trump Administration : Prelude to Regulatory Capture," American Journal of Public Health (April 2018), [The Environmental Protection Agency in the Early Trump Administration: Prelude to Regulatory Capture | AJPH | Vol. 108 Issue S2 \(aphapublications.org\)](https://aphapublications.org/), quoting, Daniel Carpenter, editor, Preventing Regulatory Capture: Special Interest Influence and How to Limit It , pg. 73, Cambridge University Press (2014)

¹⁸²⁸ Lindsey Dillon; et al., "The Environmental Protection Agency in the Early Trump Administration: Prelude to Regulatory Capture," American Journal of Public Health (April 2018)

- "Significant policy changes at the EPA favor businesses and industry, while probably incurring considerable health and environmental "
- "Pruitt has regularly championed the interests of regulated industries, while rarely affirming environmental and health "
- "Pruitt dismissed many members of the EPA's Science Advisory Board and its Board of Scientific Counselors, created a new rule preventing EPA-funded scientists from serving on those boards, and-for the first time in agency history allowed lobbyists on scientific advisory "
- "Pruitt's own meetings and schedule...are almost exclusively with company and trade organizations and rarely with environmental, public health, or citizen groups."¹⁸²⁹

The extreme and well-documented regulatory capture of EPA has effectively delegated its authority to the industry or industries that have captured. There is no substantive difference between an agency explicitly telling a company or industry to write a rule for it, and an agency telling a company or industry that it will write whatever rule the company or industry wants. Like Scott Pruitt's Devon Energy letter, the substance is all industry, whatever the letterhead, and the public interest is ignored.

Response: This procedural rule outlines the internal processes by which EPA will consider dose-response data underlying pivotal science to be used in its significant regulatory actions and influential scientific information. It does not apply to anyone outside of EPA, and therefore cannot be an impermissible delegation of EPA's authority to industry stakeholders.

Comment [6903-1980]: Commenter (6924) points out that despite citing policies from the NIH and the National Science Foundation (NSF), EPA does not appear to have conducted any inter-agency consultation on the rule. EPA's SAB also notes that EPA is legally mandated to make proposed regulations available for SAB review, which the Agency failed to do.¹⁸³⁰

Response: The supplemental proposal underwent interagency review and the SAB reviewed aspects of the proposed rule. See [https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebProjectsCurrentBOARD/2DB3986BB8390B308525855800630FCB/\\$File/EPA-SAB-20-005.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebProjectsCurrentBOARD/2DB3986BB8390B308525855800630FCB/$File/EPA-SAB-20-005.pdf) and response to Comment 6425-2369.

Comment [9078-3499]: Commenter (6194) discusses EPA's failure to address impacts under the Paperwork Reduction Act (PRA).

The PRA requires OMB to review federal rules that impose information collection requirements on "persons," including individuals and corporations. 44 U.S.C. § 3502(10). Such collection of information includes "obtaining, causing to be obtained, soliciting, or requiring the disclosure to third parties or the public, of facts or opinions by or for an agency, regardless of form or format" through the use of "reporting or recordkeeping requirements." 44 U.S.C. § 3502(3)(A)(i). Although EPA asserts that the Proposal is not subject to the PRA, perhaps because it does not

¹⁸²⁹ Id.

¹⁸³⁰ EPA Science Advisory Board. Memorandum: Preparations for Chartered Science Advisory Board (SAB) Discussions of Proposed Rule: Strengthening Transparency in Regulatory Science RIN (2080-AA14). May 12, 2018.

include an explicit reference to information collection, the Proposal would create new reporting requirements that would apply to multiple “persons.”¹⁸³¹ Specifically, for science to be considered in certain regulatory proceedings, someone (whether the person conducting the science, preparing a report, or utilizing data) would have to “clean” confidential data so that it can be made public. Such reporting and recordkeeping procedures are costly and, in some instances, inconsistent with other federal policies governing information use and dissemination.¹⁸³² This aspect of the Proposal must be addressed by OMB as required by the PRA.

Response: This is an internal rule of agency procedure. It does not regulate any party outside of EPA. In any event, this action does not contain any information collection activities and therefore does not impose an information collection burden under the PRA.

Comment [6093-544]: Commenter (6103) notes that the U.S. Court of Appeals for the D.C. Circuit has stated in 2002 and 2010 that the EPA is not legally obligated to obtain and publicize all the data underlying its research when crafting policies and regulations.

Response: See response to Comment 6119-2471.

Comment [6103-518]: Commenter (6113) notes that before EPA approves its proposed regulation, NEPA requires that EPA prepare an EIS. That EIS must include a detailed analysis of each registered pesticide's environmental impacts. Such analysis of each pesticide should include: the quantity of the pesticide used every year, the number of applicators applying the pesticide each year, the human toxicity of the pesticide, the non-human affect of the pesticide on the flora and fauna within wind's reach of the pesticide application area, the pesticide's impact on groundwater underlying the application area. Also in light of the studies relied in the United case, it[']s clear that the EIS must also include a detailed analysis of the pesticide's impact on the family of the applicators and any other people living near the application area. United, slip op at p. 11-12 (discussing internal EPA studies). Given that there are thousands of registered deadly pesticides, EPA should begin work on the EIS immediately. P. Finegan, FIFRA Lite: A Regulatory Solution or Part of the Pesticide Problem?, 6 Pace Environmental Law Review 615, 624 (1989) (noting that there are over fifty thousand registered pesticide products with over 600 active ingredients).

Response: See response to Comment 20-1294.

Comment [6104-621]: Commenter (6114) argues that the proposed HONEST Act, the Secret Science Reform Act, and this proposed rule all directly contradict a 2002 and a 2010 ruling from the D.C. Circuit Court of Appeals which states "we agree with EPA that requiring agencies to

¹⁸³¹ The Proposal would certainly apply to more than the minimum ten persons required by the PRA. See 44 U.S.C. § 3502(3)(A)(i).

¹⁸³² EPA stated that it would implement the Proposal “in a manner that minimizes costs,” but does not discuss fundamental questions such as whose costs should be minimized or techniques for doing so. EPA, Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18,768, 18,774, 40 C.F.R. § 30.8 (Apr. 30, 2018).

obtain and publicize the data underlying all studies on which they rely 'would be impractical and unnecessary'".¹⁸³³

Response: Regarding the HONEST Act and the Secret Science Reform Act, see response to Comment 1370-4426. Regarding the cited court decisions, see response to Comment 6119-2471.

Comment [6133-2172]: Commenter (6158) notes that numerous court cases have weighed in on the best available science standard in the context of numerous different federal laws. For example, courts have found that the agency must use the best science that is available to it at the time of the decision, not the best that might be available to it at some time in the future.¹⁸³⁴

Response: This purely internal procedural rule does not interpret or apply the provisions of any environmental statutes that EPA administers. As discussed in the final rule preamble at Section III.A.3, if implementing this rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes.

Comment [6155-592]: Commenter (6125) writes that numerous courts have indicated that a plaintiff or petitioner can establish a violation of the “best available science” requirement by “point[ing] to any scientific evidence that the agency failed to consider.” *Safari Club Int’l v. Salazar* (In re Polar Bear Endangered Species Act Listing & Section 4(d) Rule Litig. - MDL No. 1993), 709 F.3d 1, 9 (D.C. Cir. 2013). “The best available data requirement ... prohibits [an agency] from disregarding available scientific evidence that is in some way better than the evidence [it] relies on.” *Kern Cnty. Farm Bureau v. Allen*, 450 F.3d 1072, 1080 (9th Cir. 2006) (quoting *Sw. Ctr. for Biological Diversity v. Babbitt*, 215 F.3d 58, 60 (D.C. Cir. 2000)). “Essentially, [the agency] ‘cannot ignore available ... information.’” *San Luis & Delta-Mendota Water Auth. v. Jewell*, 747 F.3d 581, 602 (9th Cir. 2014) (quoting *Kern Cnty.*, 450 F.3d at 1080-81 (quoting *Conner v. Burford*, 848 F.2d 1441, 1454 (9th Cir. 1988)).“

Response: See response to Comments 6133-2172 and 6163-5032.

Comment [6172-3286]: Commenter (6182) suggests that to serve the American public’s interests, EPA should:

1. Codify its findings for “Increasing Consistency and Transparency in Considering Costs and Benefits in Rulemaking Process” as a binding rule in the CFR rather than mere “guidance.
2. Internally enforce such a rule and ensure it is judicially enforceable.

¹⁸³³ *American Trucking Association, Inc. v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002)(citation omitted); see also *Coalition of Battery Recyclers Assoc. v. EPA*, 604 F.3d 613, 622-23 (D.C. Cir. 2010)(rejecting claim that EPA was arbitrary and capricious for not making public data from its studies available).

¹⁸³⁴ *Chlorine Chemistry Council v. EPA*, 206 F.3d 1286 (D.C. Cir. 2000).

Enforcing such a process would also serve the purpose of Executive Order (EO) 12988 to “reduce needless litigation.” Enforcement would also serve to comply with stated objectives of Federal “data quality” policies that are still “on the books” from past Administrations.¹⁸³⁵

DOE’s Process Rule, while ostensibly well intentioned, was fatally flawed in that:

1. It has been generally treated as mere guidance rather than as an enforceable rule (despite its CFR status).
2. It was made immune to judicial review and enforcement by the following text:

(c) Judicial review. The procedures, interpretations, and policies stated in this Appendix are not intended to establish any new cause of action or right to judicial review.

Regulatory staffs often tend to resolve issues by promoting more regulation. This tendency should be guarded against if the public interest is to be served. EPA staff, like DOE’s, may resist enforceability by arguing that it restricts their regulatory flexibility. By yielding to such arguments, EPA would jeopardize the legitimate objectives of this ANOPR.

DOE/EERE’s “process rule” also contains some solid principles regarding transparency and consistency that EPA could adopt. These include:

Use transparent and robust analytical methods. The Department seeks to use qualitative and quantitative analytical methods that are fully documented for the public and that produce results that can be explained and reproduced, so that the analytical underpinnings for policy decisions on standards are as sound and well-accepted as possible.

Unfortunately, notwithstanding the clear statement in favor of rulemaking transparency, EERE’s implementation over the years directly conflicts with the above principles by putting too much emphasis upon outsourced analyses to ostensibly “independent” experts, opaque modelling processes and proprietary data sources. Through the years, such complexity has grown and served to hinder independent verification by the public. The following excerpt is but one example from DOE’s Process Rule that engendered this problem:

Identification of experts and other interested parties for peer review. DOE, in consultation with interested parties, will identify a group of independent experts and other interested parties who can provide expert review of the results of the engineering analysis and the subsequent impact analysis.

The “moral of the story” is that EPA should recognize that ambiguously stated objectives could be misused to justify entrenched or predetermined positions through biased regulatory analyses. DOE’s Process Rule provides a case-in-point.

¹⁸³⁵ Increasing EPA’s Scientific Transparency: <https://www.theregreview.org/2018/06/18/dudley-increasing-epas-scientific-transparency/>

Response: The EPA has finalized the rule “Increasing Consistency in Considering Benefits and Costs in the Clean Air Act Rulemaking Process,”¹⁸³⁶ and plans to issue similar rules for the other substantive environmental statutes that the Agency administers. These are rules of internal agency procedure and are binding to the EPA.

¹⁸³⁶ U.S. EPA. 2020. Final Rule: Increasing Consistency in Considering Benefits and Costs in the Clean Air Act Rulemaking Process. Online at <https://www.epa.gov/air-and-radiation/final-rule-increasing-consistency-considering-benefits-and-costs-clean-air-act>, Accessed December 14, 2020.

Chapter 2: Purpose and Effects

The purpose of the notice of proposed rulemaking (NPRM) and supplemental notice of proposed rulemaking (SNPRM) is to establish a clear policy of transparency of the scientific information used for significant regulations. Specifically, the NPRM preamble states that the proposed rule is designed to increase transparency of the assumptions underlying dose-response models. To meet this purpose, the proposed rule directs EPA to ensure that the regulatory science underlying its actions is publicly available in a manner sufficient for independent validation (40 CFR 30.1). The proposal states that using scientific information that can be independently validated will lead to better outcomes and strengthen public confidence in the health and environmental protections underpinning EPA's regulatory actions.

Several comments were received regarding the purpose/basis and effects of the NPRM and SNPRM, including the effects of the proposal's requirements on available science, health protections, EPA actions, and research activities under the proposal. In this section the public comments are organized according to the following topics under sections 2.1 (Purpose and Effects (NPRM Comments)) and 2.2 Purpose/Basis and Effects (SNPRM Comments):

Section 2.1: Purpose and Effects (NPRM)

- Change in Culture
- What Problem is the Agency Intending to Fix?
- Proposed Rule is Biased
- Environmental and Health Protections Would be Decreased
- EPA Would be at Odds with Other Parts of the Federal Government
- EPA Would be at Odds with Other National and International Bodies
- Proposed Rule is Flawed and Needs to Be Withdrawn/Redone with Feedback from the Scientific Community/Stakeholders
- Other Effects/Impacts

Section 2.2: Purpose/Basis and Effects (SNPRM)

- Purpose/Basis for the Rule
- Effects

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general detailed comments on the purpose and effects of the rulemaking.

2.1 Purpose and Effects (NPRM Comments)

2.1.1 Change in Culture

2.1.1.1 Changing Agency Culture Does Not Occur Through Rulemaking

Comment: Commenter (2171) notes that the EPA states that the proposed rule is designed to "...change agency culture and practices regarding data access so that the scientific justification for regulatory actions is truly available for validation and analysis" (83 FR 18770). The commenter suggests that changing agency culture does not occur through rulemaking, especially if few resources are given to new rule implementation. The commenter explains that agency culture and work practices are changed when agency administrators provide leadership, direction, and support of technical and career staff through adequate funding and, in the case of EPA, partnerships with the health and environmental research communities.

Response: The EPA agrees that agency culture and work practices can be changed through a variety of mechanisms. The promulgation of these internal Agency procedures in this rulemaking provides a more durable, enforceable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data and highlights the Administration's commitment to maximizing transparency in the EPA's most impactful regulatory actions and influential scientific information. The rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made by this rule provides an important step towards prioritizing transparency in particularly impactful rules and assessments and will inform future statute-specific rulemakings.

2.1.1.2 Need to Have "Buy-In" From Publishers and Scientists

Comment: Commenter (6449) provides that a paper cited by EPA in the Proposed Rule, Lutter and Zorn (2016) notes that only 20% of authors contacted to provide data underlying their publication actually provide it. Given this circumstance, the commenter suggests that if EPA wishes to change the culture of data access it seems that they need to receive buy-in from publishers and scientists as well as change the internal EPA culture to ensure requirements for data availability are met by EPA funded laboratory and epidemiological studies.

Response: The findings of Lutter and Zorn (2016) are consistent with findings in other published articles on the current state of data sharing. For this reason, the rule requires the EPA to independently evaluate the availability of dose-response data for pivotal science, rather than relying on publication in a journal or a data availability statement in a published article as evidence of availability. This procedural rulemaking establishes internal Agency procedures and does not intend to change the behavior of external parties, including publishers and scientists. The EPA is also working with scientists through its continued implementation of *EPA's Plan to Increase Access to Results of EPA Funded Scientific Research*, which seeks to ensure greater public access to the EPA's intramural and extramural research data.

2.1.1.3 Changing Agency Culture is Best Addressed by Guidelines and Not a New Federal Rule

Comment: Commenter (4881) notes that, in order to meet its statutory responsibilities for protecting public health and the environment, the EPA must consider the totality of relevant, reliable, peer-reviewed scientific research. The commenter provides that the Agency's responsibility regarding public access to raw data is already the subject of a regulation requiring EPA, in response to Freedom of Information Act (FOIA) requests, to request and make public "research data relating to published research findings produced under an award" of an EPA grant, subject to privacy and other considerations. The commenter suggests that changing agency culture can be accomplished by a thorough airing of internal guidelines, without resorting to a new federal rule subject to considerable political abuse.

Response: The EPA agrees that it is important to consider the totality of relevant, quality research. Therefore, the EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data and models be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is an important aspect of EPA's regulatory actions and assessments, it should be an important consideration in how the Agency considers pivotal science. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Although these goals might be accomplished through guidelines, the promulgation of these internal Agency procedures in this rulemaking provides a more durable, enforceable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data and highlights the Administration's commitment to increasing transparency in particularly impactful regulatory actions and influential scientific information. The rule will also apply to consideration of research that was not funded by an EPA grant.

2.1.1.4 Political Objective Rather Than Scientific Purpose

Comment: Commenter (4839) asserts that pivotal regulatory science is presented as a cornerstone "to change agency culture and practices" an agenda that embodies a political objective rather than a scientific purpose.

Response: The EPA disagrees that this rulemaking embodies a political objective, as transparency assumes no political ideology. The principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. The broader scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journal publishers and the emergence of organizations, such as the Center for Open Science, and international initiatives like Findable, Accessible, Interoperable, and Reusable (FAIR) data principles; Facilitate Open Science Training in European Research

(FOSTER); and Guidelines for Transparency and Openness Promotion (TOP) in Journal Policies and Practices that incentivize greater transparency in research.

2.1.1.5 Lack of Support for Need to Change Culture

Comment: Commenter (4881) provides that footnote number 3 in the Proposal justifies the perceived need to change agency culture by noting that “EPA has not consistently observed the policies underlying this proposal, and courts have at times upheld EPA’s use of non-public data in support of its regulatory actions.” The commenter notes that in the two court cases highlighted in the footnote, the United States Court of Appeals for the District of Columbia Circuit found unpersuasive the petitioners’ claim that the raw data in some of the referenced studies was not publicly accessible. In addition, the commenter adds that the Court dismissed each of the industry petitioners’ more technical claims that EPA had imposed “arbitrary and capricious” standards without adequate research support.

Commenter (4881) provides that the stated goal of the Proposal is “to change agency culture and practices regarding data access so that the scientific justification for regulatory actions is truly available for validation and analysis.” The commenter suggests that making research results available for validation and analysis is and should be the responsibility of scientists and of the peer-review process overseen by scholarly journals. The commenter notes that scientists have organized workshops to address instances where replicating reported research results has been a problem and that scientific journals have been updating their publication policies to facilitate much more detailed reporting and data archiving.^{1837,1838}

Commenter (4848) asserts that the rule promises “to change agency culture and practices regarding data access so that the scientific justification for regulatory actions is truly available for validation and analysis;”¹⁸³⁹ however, the new rule in fact just creates new regulatory hurdles by discounting and precluding consideration of long-standing, established scientific practice. Rather than promote the transparency of the scientific information used to create environmental regulations, the commenter suggests that the rule will obscure the democratic process, slow the pace of science and progress, and potentially prevent important health data from being considered by EPA in outlining environmental policy.¹⁸⁴⁰

Response: As clarified in the preamble to the final rule, because of the potential impact of the EPA’s significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on

¹⁸³⁷ For example, see the report of the Workshop on Robustness, Reliability, and Reproducibility in Scientific Research, http://www.mrsec.harvard.edu/2017NSFReliability/include/NSF_Workshop_Robustness.Reliability.Reproducibility_Report.pdf

¹⁸³⁸ J. Berg, P. Campbell, V. Kiermer, N. Raikhel and D. Sweet, “Joint Statement on EPA Proposed Rule and Public Availability of Data,” *Science*, Vol. 360, Issue 6388, eaau0116 (May 4, 2018) [DOI: 10.1126/science.aau0116]

¹⁸³⁹ 83 Fed. Reg. at 18770. See also Elizabeth Glass Geltman, *The New Anti-Federalism: Late Term Obama Environmental Regulations and the Rise of Trump* (October 24, 2017). 93 N. Dakota L. Rev. 243 (2018).

¹⁸⁴⁰ See Kathleen Rest & Georges C. Benjamin, *Trump’s EPA Puts Our Health at Risk: The agency’s proposed new rule would allow it to ignore the best available science*, <https://blogs.scientificamerican.com/observations/trumps-epa-puts-our-health-at-risk/> (July 13, 2018)

the best information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA truly demonstrate that commitment. The EPA's attention on data transparency is also responsive to the broader interest in greater data and model transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members of the public, scientific community, and Congress on the transparency of the scientific basis for EPA's decisions in many of its previous influential scientific information assessments and regulatory actions.

Further, this rule exclusively governs the EPA's internal process for handling pivotal science. This rule does not require any researcher or other outside entity to provide data or models to the EPA or the public. The final rule gives greater consideration to pivotal science where the underlying dose-response data are available for independent validation rather than providing for a categorical exclusion of the scientific information. The Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information; therefore, the rule will not prevent important scientific data from being considered by EPA.

Finally, the EPA disagrees that requirements of this rule will result in any meaningful delay in promulgating regulations. While this rule does require the Agency to evaluate the availability of dose-response data underlying pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., a small, though highly important, subset of all the studies EPA reviews).

2.1.1.6 Proposal is Counter to EPA's Mission

Comment: Commenters (1433, 2170, 5176, 5179, 6188, 6882, 6884, 6892, 6895, 6915, 8771, 9227) and others that oppose the EPA's proposal contend that the EPA's proposal is counter to the EPA's mission. Comments include:

- If EPA does not use the best available science, it will not be carrying out the mission given to it by Congress to protect Americans and the environment. (1433)
- If EPA wants to change its mission, after nearly 50 years, and advocate for a policy of taking more risks with public health in order to impose fewer costs on industry, that is a policy choice that it should articulate and take comment on. (8771)
- Americans from all walks of life depend on the EPA to create and enforce public safeguards that they trust will protect human health and the environment. The commenter notes that their trust in EPA's work is rooted in the knowledge that agency staff are diligently gathering and reviewing studies of human and environmental risks using their best professional judgement. According to the commenter, a proposal to institute a new system for assessing the validity of scientific evidence undercuts that basis for public trust in EPA and contends that the proposal runs counter to EPA's mission. (6892)
- Commenters (5176, 5179) state that, by promoting an opaque and arbitrary evidence base for policymaking, the proposed rule will erode public trust in the EPA and its regulatory processes.

- The requirements of the Proposal would lead EPA to adopt less-protective standards across many regulatory programs, which is contrary to EPA’s mission to protect human health and the environment. (6915)
- This Proposal is not grounded in a genuine concern for advancing science at EPA and is, in fact, at odds with EPA’s mission of protecting human health and the environment. (9227)

Response: The EPA does not agree that this rulemaking is counter to the Agency’s mission. The requirements in the final rule advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions. As described in the final rule, the EPA will generally use the following factors to assess the quality of studies: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. The EPA will rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies— based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. In compliance with the rule, the EPA shall give greater consideration to evidence, findings, and conclusions of pivotal science where the underlying dose-response data are available in a manner sufficient for independent validation. When the dose-response data underlying pivotal science are not publicly available in a manner sufficient for independent validation, the EPA will give less consideration to the studies’ evidence, findings, and conclusions unless the Administrator grants an exemption request.

The EPA believes this approach will result in significant regulatory actions and influential scientific information based on the highest quality studies that maximize transparency, leading to human health and environmental protections consistent with the statutes the EPA administers.

2.1.2 What Problem is the Agency Intending to Fix?

2.1.2.1 Question the Purpose of the Rule

Comment: In addition to expressing concerns with the Proposal described elsewhere in this document, commenters (0057, 0569, 0611, 1333, 2171, 2548, 2907, 2909, 3132, 3133, 3644, 4588, 4591, 4594, 4595, 5011, 5021, 5164, 5165, 5170, 5172, 5173, 5176, 5178, 5179, 5420, 6046, 6110, 6111, 6120, 6121, 6122, 6123, 6125, 6127, 6130, 6133, 6135, 6145, 6153, 6155, 6158, 6163, 6166, 6169, 6171, 6185, 6194, 6358, 6373, 6378, 6450, 6872, 6876, 6880, 6881, 6893, 6896, 6898, 6899, 6904, 6907, 6915, 6920, 6924, 6928, 6940, 8272, 8275, 8276, 8281-PH48, 8317, 9225, 9227) and others request that EPA withdraw/rescind the proposed rule.

Commenters (0572, 0670, 0671, 1006, 1272, 1301, 1311, 1333, 1335, 1375, 1400, 1409, 1433, 1742, 1883, 1905, 1988, 1995, 2003, 2004, 2004, 2159, 2241, 2361, 2408, 2430, 2472, 2492, 2906, 4843, 4872, 4879, 5129, 5131, 5170, 6107, 6109, 6109, 6110, 6113, 6114, 6131, 6139,

6168, 6357, 6367, 6368, 6370, 6373, 6801, 6860, 6876, 6884, 6894, 6905, 6934, 6937, 6944, 8281-PH84, 8317) assert that the proposed rule will not improve transparency.

Commenters (0044, 0671, 1301, 1445, 1589, 2171, 2787, 3135, 4410, 4589, 4595, 4838, 4840, 4845, 4848, 5021, 5022, 5165, 5170, 6111, 6114, 6116, 6119, 6120, 6125, 6127, 6131, 6132, 6133, 6137, 6163, 6164, 6174, 6185, 6188, 6194, 6196, 6351, 6358, 6361, 6373, 6446, 6447, 6450, 6866, 6868, 6874, 6896, 6903, 6904, 6916, 6920, 6925, 6939, 6940, 6944, 8281-PH6, 8281-PH84, 8771, 8801, 8913, 9227) question the problem that the EPA is intending to fix with its proposal. Several of these commenters and other commenters note that the proposed rule is unnecessary (0671, 1445, 1973, 4595, 4844, 4845, 5012, 6110, 6111, 6125, 6132, 6174, 6194, 6196, 6351, 6358, 6446, 6447, 6450, 6696, 6772, 6868, 6872, 6876, 6882, 6895, 6896, 6916, 6920, 6925, 6940, 9227, 8801) and that there are already guidance/mechanisms/requirements (1589, 1973, 4595, 4845, 5012, 5165, 6125, 6137, 6160, 6194, 6195, 6196, 6351, 6358, 6446, 6447, 6450, 6696, 6868, 6872, 6874, 6876, 6895, 6903, 6904, 6916, 6920, 6925, 6940, 8274, 9066, 9227, 8281-PH6, 8281-PH16, 8281-PH84, 8771, 8801) in place and/or being developed to address issues related to transparency/validation and that the rule should be withdrawn. Some specific comments provided to support assertions include:

- Commenters (2171, 2787, 4838, 4848, 5165, 6114, 6116, 6119, 6127, 6131, 6132, 6133, 6137, 6163, 6174, 6194, 6373, 6447, 6866, 6920, 9227) specifically state or infer that the Proposal is a solution in search of a problem. Specific comments include:
 - EPA does not explain why the Proposal is preferable to existing recommendations and methods vetted and supported by the scientific community, which endeavor to promote transparency through open science policies and secure data-sharing systems. (6194)
 - EPA's Proposal would limit the science the Agency can use to inform decision-making to address an alleged lack of transparency, but there is no crisis or flaw that needs to be addressed. (6174)
 - Rulemaking does not identify key gaps in federal environmental policy but rather seeks to obtain transparency in a process that already has multiple checks and balances. (6119)
 - Without any significant evidence supporting it, the proposed rule is a solution in search of a problem. The commenter suggests that the Proposal fails to identify specific weaknesses in EPA's current scientific process which is grounded in peer review. The commenter provides that Wendy Wagner, author of two of the studies EPA cites to rationalize the Proposal said in response to the proposed rule: "They don't adopt any of our recommendations, and they go in a direction that's completely opposite, completely different."¹⁸⁴¹ (2787)
 - Strengthening Transparency in Regulatory Science, 83 Fed. Reg. 18768 (Apr. 30, 2018), is a solution in search of a problem. According to the commenter, instead of strengthening ways in which EPA can benefit from advances in scientific studies, the proposed rule limits EPA's access to important studies and hampers the development of regulations needed to protect the public health and welfare of the residents of the District of Columbia and the nation. The proposed rule should be withdrawn. (4838)

¹⁸⁴¹ <https://www.theatlantic.com/science/archive/2018/04/how-the-epas-new-secret-science-rule/558878/>

- EPA has not provided any evidence that its staff uses "secret science" or "junk science" in decision-making. The commenter suggests that the agenda spearheaded by Congressman Lamar Smith and then former EPA Administrator Scott Pruitt is a solution in search of a problem. For example, the commenter provides that Smith has claimed, with no evidence, that "EPA has withheld data that has been hidden from the American people,"¹⁸⁴² There is no evidence of this in the record for the proposal (such as it is), or anywhere else. Similarly, the commenter adds that Pruitt announced this proposal by stating that the "era of secret science is coming to an end."¹⁸⁴³ But, according to the commenter, there never was such an era, because "secret science" is a myth. (6447)
- This proposal states that "... EPA solicits comment on this proposal and how it can best be implemented in light of existing law and prior statements of policy that have called for increasing public access to data and influential scientific information use to inform federal regulation. EPA has not previously implemented these policies and guidance in a robust and consistent manner" but the commenters contend that the EPA provides absolutely no evidence to support this statement. The commenters suggest that this appears to be a solution in search of a problem as EPA doesn't offer any evidence that its past decision-making has been inadequate or arbitrary. (6114, 6116, 6131)
- EPA is attempting to undertake these significant changes to its process without identifying particular instances where flawed regulatory science or problems in scientific practice negatively affected EPA action in a manner that the Proposal would prevent in the future. According to the commenter, EPA has failed to cite specific examples of research considered by EPA when promulgating past regulations that were later found to be flawed in a way that the application of the Proposal would have uncovered, or instances where EPA had difficulty verifying the analysis and findings of a study. The commenter suggests that the Proposal appears to be a solution in search of a non-existent problem. The commenter adds that the Proposal does not identify, much less remedy, any flaws in current scientific practice and regulatory process. (6373)
- This rule aims to propose a solution to what some major scientific journals call a replication crisis.¹⁸⁴⁴ The commenter notes that there is no mention in the rule, or its citations, of a study that was shown to be flawed due to a lack of raw data. (6127)
- EPA fails to point to a single example of a case in which, in developing regulations, EPA relied upon a study or studies later found to be questionable or invalid. Having failed to address this foundational question, the commenter suggests that the EPA also misses the questions that would build on that—even if EPA actually had used invalid science in some instance, EPA would still have to ask whether the underlying data for that study had been made publicly available,

¹⁸⁴² See, e.g., Pruitt signs proposed rule to erase 'secret science' from EPA (The Hill, Apr. 24, 2018).

¹⁸⁴³ U.S. EPA, News Release, EPA Administrator Pruitt Proposes Rule to Strengthen Science Used In EPA Regulations (Apr. 24, 2018).

¹⁸⁴⁴ Berg J, Campbell P, Kiermer V, et al. Joint Statement on EPA Proposed Rule and Public Availability of Data. *Science* (80-). 2018;360(May):5-6. DOI:10.1126/Science.AAU0116.

and if not, if the problems with the study could have been avoided through having made the data publicly available. (9227)

- The Proposal provides no information supporting the notion that the overarching processes of EPA assessment of relevant scientific studies and subsequent peer review of such assessments, as well risk and policy assessments that EPA has developed and improved over time, are in any way insufficient to address the concerns that are allegedly the main focus of the proposal. (9227)
- EPA has not adequately explained the purpose and rationale for the proposed rule. The commenter provides that the Agency suggests that both the “integrity” and “validity” of its decision making will be strengthened by requiring full public disclosure of the data and models underlying the scientific studies on which it relies. The commenter suggests that the logical implication is that EPA believes those characteristics are currently lacking. The commenter notes that the agency does not explain how it reached that conclusion, or what particular “problems” the rule is intended to solve. The commenter adds that the EPA never explains why, specifically, it believes that existing policies and tools for vetting scientific research are insufficient, why this rule (or any rule) is the best way to address those deficiencies, or why the proposal would better serve and protect the public than its existing policies and practices. (5165)
- There is no indication that EPA science suffers from the so-called “replication crisis” that the Proposal identifies as the principal reason for requiring the public disclosure of underlying data or models for studies used in EPA decisions.¹⁸⁴⁵ The commenter notes that it is telling that the sources EPA cites in support of its claims of a “replication crisis”¹⁸⁴⁶ call into question its existence¹⁸⁴⁷ and in many instances promote solutions that do not involve access to underlying data¹⁸⁴⁸—such as looking at cumulative evidence using a variety of methods instead of over-emphasizing the results of a single study.¹⁸⁴⁹ The commenter adds that it is even more telling that the Proposal identifies no EPA actions that have been called into question because the science underlying those actions cannot be validated or replicated. In any event, the commenter notes that the Proposal does not require replication of studies and only limits the cumulative evidence and

¹⁸⁴⁵ 83 Fed. Reg. at 18770.

¹⁸⁴⁶ The commenter suggests that it is additionally unclear what EPA means by “replication crisis,” and that EPA appears to be misusing the term, as the source it cites to describes a “reproducibility crisis,” Marcus R. Munafò et. al, *A Manifesto for Reproducible Science*, 1 *Nature Human Behavior* 1 (2017), and another source details how “[a]s the movement to examine and enhance the reliability of research expands, it is important to note that some of its basic terms—reproducibility, replicability, reliability, robustness, and generalizability—are not standardized,” Steven N. Goodman et al., *What Does Research Reproducibility Mean?*, 8 *Sci. Translation Med.* 1 (2016).

¹⁸⁴⁷ Munafò et. al, *A Manifesto for Reproducible Science*, 1 *Nature Human Behavior* 1 (2017) (“Whether ‘crisis’ is the appropriate term to describe the current state or trajectory of science is debatable. . . .”)

¹⁸⁴⁸ See, e.g., Marcia McNutt, Reproducibility, 343 *Science* 229 (2014) (“[J]ournals can only do so much to assure readers of the validity of the studies they publish. The ultimate responsibility lies with authors to be completely open with their methods, all of their findings, and the possible pitfalls that could invalidate their conclusions.”).

¹⁸⁴⁹ John P.A. Ioannidis, *Why Most Published Research Findings Are False*, 2 *PLoS Med.* 0696, 0700–01 (2005) (“Second, most research questions are addressed by many teams, and it is misleading to emphasize the statistically significant findings of any single team. What matters is the totality of the evidence.”).

context in which to interpret any given study—only hampering EPA’s reliance on more robust scientific findings even if such a crisis were to exist.¹⁸⁵⁰ (9227)

- Overarching concern with the Proposal is that it not clear what shortcoming it is designed to address or how EPA would measure the rule’s success. While the commenter agrees with the stated objective of increasing “transparency in the preparation, identification, and use of science in policymaking,” the commenter suggests that the EPA has not demonstrated that there is a problem that is best solved through a broad, prescriptive mechanism like the Proposal. (6866)
- Although EPA’s argument is that there should be a regulation to ensure increased access to dose-response data and models, EPA offers no evidence of an existing problem with dose-response data transparency that needs to be addressed, nor does EPA demonstrate how independent validation outside of existing peer review processes improves upon current data transparency practices and data availability. The commenter adds that EPA offers no evidence that EPA’s previous judgement, particularly in the development of dose-response functions, has been inadequate, invalid, or otherwise arbitrary. (2171)
- The EPA provides no basis for its assumption that science or studies for which data are publicly available yield more valid or reliable results than the best available, peer-reviewed, independent, credible science, for which the underlying data are not publicly available. Similarly, the commenter suggests that the Proposal arbitrarily fails to address, much less explain, why prior EPA regulatory actions that relied upon studies, data, or other information did not reflect the “best available science” or why they were otherwise unreliable, despite failing to meet the Proposal’s standards. (6133)
- The Proposal represents an unworkable, ill-explained, unjustified, and thoroughly unlawful approach to address a problem that does not exist. EPA does not explain why the data sharing requirements outlined in the Proposal are suddenly so urgent. The commenter suggests that this missing argument is especially significant given the decades of peer-reviewed data and models that EPA has justifiably relied on for regulatory actions. The commenter notes that there is no “crisis in replicability” for the types of data and models that the Proposal purports to address; as an indication of this, and EPA has not cited any sources for its assumptions presented in the Proposal. (6133)
- EPA has presented no scientific reason to prevent use of human health studies simply because the underlying medical records are not available for public inspection and review.¹⁸⁵¹ (4848)
- Proposal does not show how or why EPA’s existing practices fail to adequately achieve these purposes, or how the proposed new procedures would do a better

¹⁸⁵⁰ Marcus R. Munafò & George Davey Smith, *Repeating Experiments Is Not Enough*, 553 Nature 399, 399–400 (2018), <https://www.nature.com/articles/d41586-018-01023-3#ref-CR3> (noting that “[i]f a study is skewed and replications recapitulate that approach, findings will be consistently incorrect or biased” and suggesting that instead, “an essential protection against flawed ideas is triangulation,” or “the strategic use of multiple approaches to address one question”).

¹⁸⁵¹ To the contrary, EPA has promulgated materials to ensure the privacy of study participants. See EPA Information Policy, PA Classification No.: CIO 2151.1 (last reviewed Sept. 14, 2018), <https://www.epa.gov/sites/production/files/2015-09/documents/2151.1.pdf> (implementing the requirements of The Privacy Act of 1974, 5 U.S.C. § 552a.).

- job. In reality, EPA’s historic practices in adopting health and welfare standards are extraordinarily transparent, public, and accessible to interested persons. (6137)
- As written, the proposed rule would exclude scientific research if the underlying information is not publicly available in a way that allows for independent validation. However, the notice fails to indicate why such a change is necessary, particularly as the notice acknowledges the existence of laws and policies that promote transparency.¹⁸⁵² While we, the undersigned societies, support transparency and openness of science, we reject the notion that data must be publicly published to be credible and have merit in decision-making. (6163)
 - Proposed rule offers very little in the way of examples of non-transparent science. Instead the rule asserts “[a]s a case in point, there is growing empirical evidence of non-linearity in the concentration-response function for specific pollutants and health effects.” According to the commenter, that is true, however, it has nothing to do with lack of public access of underlying research data. Instead, the commenter expresses that it calls for increased federal funding of research on non-linearity of pollution health impacts. (6920)
 - There is no need for this rule. According to the commenter, in conflict with the oral comments by Steven Milloy, who they state incorrectly suggested in his public EPA testimony that the American Cancer Society (ACS) and the Six Cities Studies’ researchers have not been willing to release their data for validation by others, both of these studies have actually already provided their raw data for validation by the independent and unbiased Health Effects Institute (HEI) (HEI, 2008). The commenter asserts that such independent evaluations could easily be applied to any new cases of concern for data validation, without the risks implicit in the EPA’s proposed rule. Thus, the commenter states that this dangerous rule seeks to needlessly “solve” a purported problem that does not exist. (6132)
- Several commenters (6133, 6137, 6185, 6772) cite court cases that rejected the notion that the EPA must obtain and disclose underlying studies.
 - EPA tries to justify the Proposed Rule as a way to ensure the Agency is not arbitrary and capricious in its conclusions. But the commenter states that the D.C. Circuit has twice rejected the notion that EPA must obtain and disclose data underlying the studies it relies on in National Ambient Air Quality Standards (NAAQS) development. (6137)
 - In light of the court’s holding in *American Trucking Assns. v. EPA* [283 F.3d 355 (D.C. Cir. 2002)] that differentiated the substantial difference and administrative hardship between reliance on peer-reviewed scientific studies cited in a rulemaking record rather than on the raw data underlying those studies, and without additional clarity from EPA, we are having difficulty identifying the problem EPA seeks to address with the Proposal. Therefore, the commenter requests that the Agency withdraw it. (6185)
 - The Proposal is unnecessary because court cases have produced rulings stating that, while the EPA should be as transparent as possible, the EPA is not required,

¹⁸⁵² Office of Management and Budget, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies (2002) (online at www.gpo.gov/fdsys/pkg/FR-2002-02-22/pdf/R2-59.pdf).

for its decision making, to obtain or analyze raw data in order to rely on studies that cannot provide access to that underlying information. (6772)

- Commenter (6109) cites Harvard's Environmental Law program's provided analysis:

The failure of Pruitt's proposal to meet these requirements reflects its lack of validity on the merits. While it's true the proposal reflects the longstanding practice that the EPA rely only on impeccably trustworthy science when formulating standards, performing benefit-cost analyses, and evaluating toxic substances, it fails to articulate either (i) that there is a problem with how the EPA has done its work over the past four decades or (ii) what are the requirements, methods, and practices Pruitt believes are necessary to achieve that goal beyond those long since in place at the agency. Instead, it simply asserts that making certain data available to the public in and of itself will increase the reliability of the science the agency incorporates in performing its various actions. Nowhere does it explain why or how the new data availability requirement would enhance the trustworthiness of the science the agency relies on.

In fact, . . . it is through the scientific peer-review process that the ostensible goals of the proposal can be, and are being, achieved. Since the EPA already relies almost exclusively on peer-reviewed science, it's essential that the proposal explain exactly what its views are as to the adequacy of peer review and how, if the EPA believes current peer-review is inadequate, the proposal specifically addresses those inadequacies.¹⁸⁵³

- The main provisions of the Proposed Rule are either unnecessary, duplicative, burdensome, and likely to be confusing in their application. (4589)
- According to the commenter, the EPA provides no examples of where and how, in the agency's view, past rulemakings specifically failed to make these efforts, and how EPA would change past practice in this context. (5021)
- Commenter urges the EPA to withdraw the rule unless it can be revised to clarify its intent and purpose, and more clearly explain how it would contribute to protecting human health and the environment. (6120)
- EPA has not established a legitimate need for the proposed rule. The commenter provides that the EPA has made thousands of regulatory decisions over the last 50 years. The commenter notes that the Congressional Budget Office (CBO) estimates that EPA "relies on about 50,000 scientific studies annually to perform its mission."¹⁸⁵⁴ The commenter suggests that the proposed rule fails to identify a single regulatory action based on faulty

¹⁸⁵³ Legal Shortcomings in EPA's So-Called "Secret Science" Proposed Rule - Environmental & Energy Law Program - Harvard Law School [replaced cited link with direct link to cited source]

¹⁸⁵⁴ Congressional Budget Office ("CBO"), Cost Estimate: H.R. 1030, Secret Science Reform Act of 2015 2 (Mar. 11, 2015), <https://www.cbo.gov/sites/default/files/114th-congress-2015-2016/costestimate/hr1030.pdf>

science.¹⁸⁵⁵ According to the commenter, the rule is not needed or warranted and will do far more harm than good. (6111)

- If EPA has any doubts or concerns regarding the merits of a particular study, it must address those doubts or concerns for that particular study in the context of a given rulemaking, where agency staff, internal scientific experts, scientific advisory committees, or commenters contend that study is relevant. The commenter contends that the EPA has provided no scientific justification for ignoring an entire class of health science simply because the underlying data has not been disclosed. (6137)
- The EPA invokes "strengthening transparency" as a primary driver for the Proposal but fails to describe how a perceived lack of transparency has hampered past rulemakings. The commenter suggests that it provides no examples of where "EPA has not previously implemented these policies and guidance in a robust and consistent manner" nor what are the specific "agency culture and practices regarding data access" that require changing. (5021)
- It would be relatively simple for EPA or a chartered external review group to analyze a sample of EPA's decisions to see if there really is a problem or whether this transparency rule would have made a difference. The commenter asks why this was not done? (6139)
- Based on the lack of meaningful information and articulated or demonstrated need for the proposed rule, EPA has not made the case for a new regulation at 40 CFR Part 30. (4410)
- EPA has advanced no evidence of a crisis of falsification of underlying data on the part of the U.S. research community. (8913)
- EPA's own Science Advisory Board (SAB) voted to review the Proposal on June 1, 2018. The commenter states that this action is in addition to the vehement reaction that the Proposal has prompted from the most reputable scientists, scientific organizations, and scientific publications in the country directly challenging the need for this proposal—there is no "secret science." (6174)
- Request that the EPA withdraw this proposed rule as the notice does not provide a clear rationale. (5170)
- There is no indication and no specifics regarding alleged deficiencies in research data relied upon by EPA. EPA seeks to apply this new regulation across the board, with no grounding in law or fact as to where and how specific studies have caused regulatory overreach to the public's detriment. Without a reasonable basis to adopt this broad, sweeping, ill-defined regulation, EPA will likely face multiple lawsuits seeking to strike down this new regulation, distracting the EPA from its true, important mission. (6116, 6131)

¹⁸⁵⁵ Importantly, the commenter notes that the proposed rule shifts the presumption of validity away from non-biased, peer-reviewed studies conducted by professional and academic researchers to non-peer reviewed studies conducted by the interested, regulated enterprises. In fact, if there is a problem anywhere in the science on which EPA relies, it is in the industry studies submitted for licensing and permitting—yet these actions are excluded from the coverage of the rule by the definition of "regulatory decisions." See Thomas O. McGarity, *Beyond Buckman: Wrongful Manipulation of the Regulatory Process in the Law of Torts*, 41 Washburn L.J. 549, 559-63 (2002) (detailing incidents in which data required to be submitted by manufacturers or their contractors under the Federal Fungicide, Insecticide, and Rodenticide Act ("FIFRA") and the Food, Drug, and Cosmetic Act ("FDCA") were either withheld or were misleading or fraudulent); cf. Sheldon Krinsky, *Science in the Private Interest: Has the Lure of Profits Corrupted the Virtue of Biomedical Research?* (2003) (discussing this problem throughout the book and providing considerable support).

- Rather than addressing a legitimate problem, the commenter suggests that the Proposal is a next step in a very transparent effort to discredit and make unavailable certain seminal studies that establish the connection between exposure to air pollution and adverse public health impacts. (6174)

Response: The EPA provides more detail explaining the EPA's rationale for this rule in the preamble for the final rule. In brief, the transparency provisions in this final rule are intended to build upon existing efforts and provide incremental progress toward the Agency's overarching and long-standing goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals and the emergence of several international organizations and initiatives focused on increased transparency and data sharing in science. The EPA supports these efforts and believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. The incremental progress made by this rule provides an important step towards prioritizing transparency in particularly impactful rules and assessments and will inform future statute-specific rulemakings.

The EPA also agrees that it is important not to categorically exclude any study because the data underlying a study at the stage required by this rulemaking may not be available for independent validation. Therefore, the EPA is not finalizing the proposal that would have categorically required that for studies to be considered pivotal science the underlying data would need to be available for independent validation. However, given that transparency is an important aspect of EPA's regulatory actions and assessments, it should be an important consideration in how the Agency considers pivotal science. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Comment: Commenter (0044) states that they do not understand the purpose of this potential rule—is the scientific acumen and/or honesty of the EPA's professional staff under question? Has there been evidence that any standards have been done using inappropriate science? The commenter (as a citizen) states that they want government scientists, who are disinterested, to be the arbiters of pollution levels, not industrial scientists who get paid by their companies. The commenter also asks whether EPA identified significant data validity problems associated with toxicity study submissions? The commenter provides, of the approximately 810 inspections performed by the EPA for Good Laboratory Practice (GLP) studies, 27 were either rejected by agencies or became the subject of consent decrees, which computes to $3\frac{1}{3}\%$. Assuming that the rejections by authorities not resulting in consent decrees were due to poor quality while only the consent decrees were due to data falsification/fabrication/etc., the commenter states that the

actual rate of fraudulent data is much less. According to the commenter, this does not warrant major changes in what data are acceptable for EPA submission, but rather to enhancing regulatory inspections to assure data quality.

Response: This rulemaking is not intended to address the conduct of EPA's professional staff nor to remedy a particular instance in which the EPA relied on a poor-quality study or a study for which the conclusions could not be independently validated. The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. Transparency is an important aspect of EPA's regulatory actions and assessments, and it should be an important consideration in how the Agency considers pivotal science.

Comment: Commenter (8801) states that a key point in the proposed regulation is that data from studies used in regulatory decision making be made available to third parties for conducting their own analyses. The commenter contends that this justification fails to recognize that EPA has successfully addressed this issue in the past. For example, the commenter notes that when a series of important studies done in the 1990s by the Harvard School of Public Health and the ACS on effects of fine particle air pollution on human health were questioned by opponents of air pollution regulations, a re-analysis of the data in 2000 by the reputable HEI was undertaken. The commenter states that the independent re-analysis confirmed the findings of the original studies. According to the commenter, this demonstrates that experts independent of the regulators and the regulated can already satisfy one of EPA's primary arguments for the need of the proposed regulation.

Response: Although some mechanisms are in place to allow for data sharing and reanalysis, these mechanisms are not necessarily commonplace. The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. The incremental progress made by this rule provides an important step towards prioritizing transparency in particularly impactful rules and assessments and will inform future statute-specific rulemakings.

2.1.2.2 Existing Mechanisms that Already Address Validity Concerns

Comment: Commenters (1335, 2119, 2908, 4589, 4590, 5170, 5178, 5977, 6111, 6119, 6125, 6137, 6157, 6158, 6160, 6194, 6351, 6373, 6446, 6447, 6872, 6874, 6920, 6924, 6925, 8801, 9227) suggest that current EPA practices are sufficient and provide examples of how existing mechanisms/policies/procedures work to ensure proper review and validation and that the proposal does nothing to improve them. Comments include:

- The EPA already has methods in place, and the proposed rule does nothing to improve upon them while creating unnecessary obstacles for EPA's consideration of the best available evidence for policy and rulemaking. (6160)
- The proposed rule does not acknowledge that the epidemiologic science community ... has been making significant efforts to make data available where possible and to develop studies based on publicly available data where appropriate. (6447)

- EPA's regulatory process already involves peer review, solicitation of expert opinion, steps to ensure data quality, and public comment periods that allow stakeholders to raise questions or concerns and present additional evidence. (5178, 6874) If it had undertaken a similarly thorough process in developing this rule, it could have asked the National Academies of Sciences, Engineering, and Medicine (NASEM) to investigate and report on whether the current level of transparency has resulted in outcomes contrary to EPA's statutory mandates or executive orders; procedures and considerations related to transparency in the scientific community; and the potential results of applying the proposed criteria when regulating. (6874)
- The ultimate safeguard to assure that EPA regulatory action is based on high quality science is the fact that EPA's regulatory action is subject to the notice and comment requirements of the Administrative Procedures Act (APA) (APA, 6 1.J.S.C. § 553) (APA) and ultimately to judicial review. To the extent that scientific information proposed as a basis for regulatory action falls short, the commenter states that the APA provides members of the public, regulated businesses, and other scientists an opportunity to comment to the agency about those shortcomings and to submit contrary studies and information for agency consideration. Following adoption of a regulation, interested parties may seek judicial review to determine whether it is arbitrary, capricious, or lacking in evidentiary support. (5 1.1.S.C. § 706.) According to the commenter, the APA requirements, and the opportunity for judicial review of EPA's regulatory action, protect against the adoption of regulations that lack high-quality scientific support. (6446)
- The proposed rule ignores a host of existing methods and best practices already established—and adhered to—by the research community to ensure the transparency, reproducibility, replicability, objectivity, and validity of studies, analyses, models, and reports. (6111)
- The EPA SAB review process already provides assessment of the adequacy of the approaches taken in the studies considered in setting a standard. (1973, 6125, 6446, 6447, 6920, 8801, 9227)
 - Congress created the SAB to provide the Administrator with scientific advice. (42 U.S.C. § 4365.) The SAB is required by its authorizing legislation to make every effort to maximize public participation and transparency, "including making the scientific and technical advice of the [SAB] and any investigative panels . . . publicly available in electronic form on the website of the Environmental Protection Agency." The commenter notes that the proposed rule does not mention the SAB, or its important function in providing expert assessments of whether scientific research offered as the basis for regulatory action is, in fact, the best available science. (6446)
 - SAB points out multiple ways in which EPA and the scientific community already ensure data quality, obviating the need for any new restrictions. For example, "[t]he proposed rule fails to mention that there are various ways to assess the validity of prior epidemiologic studies without public access to data and analytic methods."¹⁸⁵⁶ The commenter adds that the SAB describes one specific example in which "an unusually rigorous form of peer review and independent reanalysis,

¹⁸⁵⁶ See Memorandum from Alison Collen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science, to Members of the Chartered SAB and SAB Liaisons (May 12, 2018) ("SAB memo"), (Provided as Attachment A to comment letter). at pg. 4.

coupled with many follow-up studies, has accomplished a measure of confidence in findings without public access to data and analytic methods."¹⁸⁵⁷ In addition, "[t]he proposed rule fails to mention that EPA has mechanisms for vetting science through several expert panels," and that review process "goes beyond the typical journal peer review procedures."¹⁸⁵⁸ (6447)

- As part of the process for the evaluation and publication of scientific research, the commenter notes that all of these studies invariably undergo rigorous peer review by independent experts. Peer review is the world-wide gold standard for evaluating scientific research. The commenter submits that no study is published in any reputable journal without undergoing peer review. Thus, the commenter asserts that any pivotal study used for regulatory decision making has already undergone such review. Moreover, the commenter adds that, in the event that EPA determines that further review is necessary, its own expert panels, such as the SAB, exist to serve such a purpose. Unfortunately, according to the commenter, EPA's intentional crippling of its own SAB, involving the replacement of qualified independent experts by industry 7 employees with obvious conflicts of interest, damages the credibility of the SAB to do its job in an impartial manner. (8801)
- Commenters (4845, 6110, 6174, 6446, 6872, 6920) infer that the EPA is already transparent in its use of peer-reviewed research in regulatory science.
 - The proposed rule ignores that much of the scientific research considered in the regulatory context, and all research published in reputable journals, has already been subject to extensive peer review. The commenter adds that, while the proposed rule would place judgments regarding the science that EPA may use in the hands of political appointees—with its suggestion of an ad hoc mechanism for making exceptions to the rule's limitations—the method that is accepted in the scientific community for assessment of the strength of scientific research is peer review. According to the commenter, the fact that scientific studies are regularly peer reviewed, including peer review by expert panels such as the SAB, renders the proposed rule unnecessary. (6446)
 - The commenter adds that situations in which personal data need to be protected are clear and do not compromise the validity of the scientific studies. (6174)
 - It is a standard practice for EPA to conduct comprehensive reviews of the best available scientific research when evaluating air and water quality standards. The commenter states that the EPA relies on peer-reviewed studies that describe the underlying data, methods, assumptions, sensitivity, and uncertainty of the results. These studies are cited and are published and available for public review. The commenter adds that reproducibility and independent validation are critical aspects of the scientific method and have resulted in significant advancements in our understanding of the health effects of air pollutants at different exposures and thresholds. (6920)
 - The EPA also relies on independent advisory panels comprised of nationally recognized experts, such as the SAB, and the CASAC, to review and evaluate the

¹⁸⁵⁷ Id.

¹⁸⁵⁸ Id.

state of the research and to provide an additional layer of independent peer-review. (6920)

- EPA science assessments generally include an exhaustive and critical review of relevant studies and a full explanation of how they are being interpreted. Extensive information about each study is typically part of the public record, even if all underlying data may not be included. EPA assessments are normally subject to public comment and independent peer review. And members of the regulatory community are free at any time to replicate studies they deem flawed or to independently seek access to underlying data and reanalyze them. In short, the “problem” that the proposed rule seeks to fix is largely imaginary. (4845)
- EPA already develops and implements policies, guidance, risk assessments, and toxicology assessments using detailed and transparent approaches that include extensive peer review and public input. (6872)
- There are already Health Insurance Portability and Accountability Act (HIPAA)-compliant and Institutional Review Board (IRB)-approved methods to transfer data between researchers so that studies can be evaluated and verified, and to determine if findings can be replicated. (5012)
- There exist federal guidelines that provide access to and ensure the quality of scientific information used for federal policies and regulation which also emphasize the necessity to maintain needed privacy or assurance of suitable confidentiality.¹⁸⁵⁹ Furthermore, according to the commenter, there are credible procedures for testing results and verifying outcomes with methodologies that do not require access to raw data. There are also procedures for providing protected, limited access to the full raw data to independent researchers for independent validation without making the full data publicly available. These procedures negate the need for this proposed rule, as they respect privacy laws and bona fide practices used by the scientific community. (4595)
- Several aspects of the proposal are already standard Agency practice. For example, the commenter states that the proposed §30.4 would require EPA to “identify all studies (or other regulatory science) relied upon when it takes any final agency action.” According to the commenter, the EPA offers no evidence to suggest that the Agency has ever failed to identify studies or science that it relies upon. Similarly, the commenter states that the proposed §30.6 would require the Agency to “describe and document any assumptions and methods used, and [] describe variability and uncertainty.” Again, the commenter asserts that this is standard Agency practice, and EPA has not provided any evidence to suggest that its staff has ever failed to follow this practice. (6447)
- EPA already has significant data sharing requirements and does not need more. (0671)
- Key information about studies is already publicly available, including study protocols, recruitment criteria, measurement techniques, and statistical modeling methods including lists of the adjustment variables have all been made publicly available, and peer reviewed. According to the commenter, these protocols and guidelines, such as

¹⁸⁵⁹ Part IX OMB Fed Reg 67:36, “Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies.”

CONSORT¹⁸⁶⁰, ARRIVE¹⁸⁶¹ and STROBE¹⁸⁶², do not require public access to all study data but still improve the scientific basis of evaluating studies. (1973)

- The Proposal ignores, or presents no argument for rejecting, scientific practices embodied in the host of nongovernmental methods and best practices established and adhered to by the research community to ensure the transparency, objectivity, and validity of studies, analyses, models, and reports, including by reproduction and/or replication where appropriate.¹⁸⁶³ (6194)
- The EPA's "Scientific Integrity Policy" provides guidance to Agency employees to ensure that science is used and communicated "with honesty, integrity, and transparency."¹⁸⁶⁴ Part of the policy to enhance transparency includes direction that:
 - The Agency will continue to expand and promote access to scientific information by making it available online in open formats in a timely manner, including access to data and non-proprietary models underlying Agency policy decisions. Further, the use of nonproprietary data and models are encouraged, when feasible, to increase transparency.¹⁸⁶⁵ (6903)

Commenter (6446) asserts that the lack of any explanation for a need for the proposed rule is doubtless because procedures are already in place that assure use of the best available science for EPA's regulatory activity. The commenter submits that these procedures include the SAB established by Congress in 1978 to advise on scientific matters (42 U.S.C. § 4365.), existing independent peer review of much of the scientific research relied on for regulatory action, and legal requirements that prohibit adoption of regulations that are arbitrary, capricious, or unsupported by substantial evidence (e.g. 5 U.S.C. §. 706). When consistently implemented, the commenter states that these procedures and requirements, among others, assure that EPA's regulatory actions are based on the best available science and cast substantial doubt that the true purpose of this rulemaking has anything to do with strengthening the validity of regulatory science.

Commenter (9227) suggests that the Proposal neither acknowledges the mechanisms EPA already uses to ensure the integrity of science in decision-making nor establishes that there is a problem that the Proposal is needed to solve. The commenter submits that the reality is that both Congress and EPA have established an array of mechanisms and safeguards over the last five decades to ensure that the Agency's decisions are grounded in best available science. The commenter notes that these mechanisms include review of agency science and decisions by EPA's scientific advisory boards, including the SAB, the CASAC, Board of Scientific

¹⁸⁶³ Existing tools to ensure the rigor, quality, and validity of research include peer review, detailed public methodologies, and corroboration of results by subsequent studies. These issues are further discussed in the Harvard Letter, *supra* note 6.

¹⁸⁶⁴ U.S. Environmental Protection Agency, *Scientific Integrity Policy* (2012) at 1, available at https://www.epa.gov/sites/production/files/2014-02/documents/scientific_integrity_policy_2012.pdf.

¹⁸⁶⁵ *Id* at 4.

Counselors, the Science Advisory Committee on Chemicals, and the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) Scientific Advisory Panel¹⁸⁶⁶—a process that a work group of the SAB recently described as a “rigorous review process that goes beyond the typical journal peer review procedures,”¹⁸⁶⁷ and that the National Research Council (NRC) recognized as playing an “important role in helping EPA to ensure the credibility and quality of . . . science-based decisions.”¹⁸⁶⁸ The commenter adds that the Proposal also ignores EPA’s use of independent peer review processes to evaluate certain studies used in regulatory decisions;¹⁸⁶⁹ the use of transparent literature surveys that are themselves subject to peer review and public comment, such as the ISA that inform the NAAQS;¹⁸⁷⁰ and independent review of EPA science programs and risk assessment practices by authorities such as the NRC.¹⁸⁷¹ Lastly, the commenter states that major regulatory decisions—and the underlying scientific bases for those decisions—are also subject to public comment and judicial review, which serves as an important check on agency decisions that fail to properly account for the best available science.

Commenter (9227) asserts that thanks to these multiple and overlapping safeguards, the quality of the science underlying EPA decisions is robust.¹⁸⁷² In addition, the commenter provides that

¹⁸⁶⁶ See 42 U.S.C. § 4365 (establishing the Science Advisory Board and requiring that EPA seek its review of, among other things, certain rulemakings under the Clean Air Act, Federal Water Pollution Control Act, Resource Conservation and Recovery Act, Noise Control Act, Toxic Substances Control Act, and Safe Drinking Water Act); 42 U.S.C. § 7409 (requiring the Clean Air Scientific Advisory Committee to advise EPA on matters relating to the National Ambient Air Quality Standards); 7 U.S.C. § 136w (requiring EPA to seek comments from the FIFRA Science Advisory Panel on certain rulemakings under FIFRA, and to seek advice on operating guidelines for scientific analyses by EPA that lead to actions carrying out FIFRA)

¹⁸⁶⁷ Memorandum by Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science 4 (May 12, 2018) (observing that the Proposal “fails to mention that EPA has mechanisms for vetting science through several expert panels,” including the SAB and others).

¹⁸⁶⁸ Nat’l Research Council, *Science for Environmental Protection: The Road Ahead* 181 (2012) (“External advisory groups—including SAB, BOSC, and NACEPT—play an important role in helping EPA to ensure the credibility and quality of its scientific studies and science-based decisions.”).

¹⁸⁶⁹ See, e.g., EPA Sci. and Tech. Policy Council, *Peer Review Handbook* xiii, 15 (4th ed. 2015) (noting that EPA has a “long-standing history of peer review” and providing for peer review of internally generated studies designated as “Influential Scientific Information” or “Highly Influential Scientific Assessments”); Nat’l Research Council, *Science for Environmental Protection: The Road Ahead* 180 (2012) (“In rule-making processes that rely on extensive reviews of scientific information, EPA generally imposes a strong preference for reliance on published, peer-reviewed studies. The agency’s peer review policy states that ‘peer review of all scientific and technical information that is intended to inform or support Agency decisions is encouraged and expected.’”).

¹⁸⁷⁰ See EPA, EPA/600/R-15/067, Preamble to the Integrated Science Assessments 5-25 (2015) (describing the steps EPA undertakes in preparing an Integrated Science Assessment, including extensive and transparent compilation and screening of relevant literature; public comment and independent review by the CASAC; and EPA’s application of recognized frameworks in evaluating public health causation relationships).

¹⁸⁷¹ See, e.g., Nat’l Research Council, *Review of EPA’s Integrated Risk Information System (IRIS) Process* 3 (2014) (describing the charge of the authoring committee as encompassing a review of recent changes to EPA’s IRIS program as well as to “review current methods for evidence-based reviews and recommend approaches for weighing scientific evidence for chemical hazard and dose-response assessments.”); Nat’l Research Council, *Science for Environmental Protection: The Road Ahead* at x (explaining that EPA asked authoring committee “to assess independently the overall capabilities of the agency to develop, obtain, and use the best available scientific and technologic information and tools to meet persistent, emerging, and future mission challenges and opportunities”).

¹⁸⁷² See Nat’l Research Council, *Science for Environmental Protection: The Road Ahead* at 13 (“For over 40 years, EPA has been a national and world leader in addressing the scientific and engineering challenges of protecting the environment and human health.”); Wendy Wagner, *Science in Regulation: A Study of Agency Decisionmaking*

numerous independent reviews of EPA's science-based actions by the courts, as well as the consistency with which the Agency has solicited and relied on the advice and approval of its external SAB committees have added to the credibility of EPA's decisions.

Commenter (6125) states that the EPA's past practice reflects the governing authorities far better than the current proposal. Before 2017, the commenter notes that the EPA over the years had developed and refined its approach to these-case-by case assessments, using a variety of methods that include examination of the data underlying studies where it is available, but without exclusive reliance on that examination, much less making it the foundation of a per se rule. Such examinations typically begin with EPA expert staff identifying and assessing peer reviewed studies and studies published in reputable scientific journals.¹⁸⁷³ This includes examining the strengths and weaknesses of individual studies, including factors such as design, the reputation and past work of the researchers, and quality assurance methods and analyses. This is followed by a broader look at the consistency and coherence of the study at issue with similar study types across multiple studies, as well as a more integrated assessment of the weight-of-evidence that considers multiple lines of scientific evidence. The assessments are in turn peer reviewed by panels of EPA's SAB as well as the public.

In conducting such assessments, the commenter (6125) provides that greater weight is given to the results of studies that have been replicated by other investigators using different data sets than to individual studies with limited or no replication. The commenter notes that replication refers to additional studies testing the same hypotheses as the original study, typically conducted by other investigators using different study designs and data sets, to see if the same conclusions are reached.¹⁸⁷⁴ As one of the authors EPA cited in the proposal recognized, replication is "the cornerstone of the scientific method."¹⁸⁷⁵ "Designing and conducting a replication study does not require access to raw data from the original study; this would abrogate the concept of independence."¹⁸⁷⁶ In reviewing the epidemiology studies supporting air quality standards, the commenter states that the EPA has placed greater weight on studies that have been replicated. In cases where one or two new studies appear to break new ground, the commenter notes that reanalysis by EPA or competent third-party investigators can provide some additional credibility, but not as great as that provided by replication.

Response: The EPA agrees that existing mechanisms within the EPA, the federal government, and in the scientific community are increasingly pushing towards greater data sharing and

Approaches 29 (2013) (describing EPA's NAAQS review process as "exemplary" and a "five-star process for incorporating science into regulatory policy").

¹⁸⁷³ For example, see EPA's process for reviewing the science and policy for criteria air pollutants.

<https://www.epa.gov/criteria-air-pollutants/process-reviewing-national-ambient-air-quality-standards>

¹⁸⁷⁴ As discussed in Appendix B, since the court decision noted in proposal footnote.3 that agreed with EPA's considered use of the two fine particle epidemiology studies despite not having access to protected health data, EPA and others in the scientific community conducted dozens of new studies, that replicating the core finding a significant association between fine particles and long-term mortality (reference Burnett, 2018 and our list of 31). By 2009, EPA and CASAC concluded these replications, together with evidence from other studies, was sufficient to conclude this is a causal relationship. (PM ISA 2009).

¹⁸⁷⁵ R. Lutter et al, 2013. Access to Chemical Data: Lutter et al. Respond. Environ Health Perspect A 112

<http://dx.doi.org/10.1289/ehp.1206438R>.

¹⁸⁷⁶ Goldman LR, Silbergeld E. 2013. Access to Chemical Data Used in Regulatory Decision Making. Environ Health Perspect 121(4):a11-a112. DOI: 10.1289/ehp.1206438

increasing scientific rigor. The EPA supports these efforts and is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The EPA believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety.

As described in the final rule, the EPA will use existing factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) to evaluate study quality. When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science. Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. In compliance with the rule, the EPA shall give greater consideration to evidence, findings, and conclusions of pivotal science where the underlying dose-response data are available in a manner sufficient for independent validation. When the dose-response data underlying pivotal science are not publicly available in a manner sufficient for independent validation, the EPA will give less consideration to the studies' evidence, findings, and conclusions unless the Administrator grants an exemption request.

Although current methods and processes do allow for public comment and, where appropriate, peer review in the development of significant regulatory actions and influential scientific information, subject matter experts, peer reviewers (including the SAB and other science advisory panels), and the courts generally have not had access to the underlying data necessary to fully evaluate scientific conclusions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. The EPA is confident that this approach will result in significant regulatory actions and influential scientific information that are based on the

highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

Comment: Commenters (6137, 6446, 6920) provide that the process for establishing NAAQS illustrates the scientific review procedures that are already in place for EPA's regulatory actions.

Commenter (6446) notes that in the NAAQS process, research results that are given the most weight are from the peer-reviewed literature. After EPA staff and their contractors review the literature, the commenter states that the CASAC of the SAB, which consists of internationally recognized experts in their scientific disciplines, reviews the EPA staff reports. The commenter notes that the Committee provides advice to the Administrator regarding the adequacy of current standards and recommendations for revisions, if necessary, for the protection of public health. The commenter adds that EPA staff reports also receive public comment, including from independent and industry scientists, and the Committee review includes consideration of those public comments. The commenter states that EPA NAAQS documents typically receive multiple rounds of expert scientific review before they are finalized.

Similarly, commenter (6920) provides that the NAAQS review process is a model of scientific transparency. Its reviews are renowned for their high quality. In regard to the studies on which they are based, the commenter states that the costs of publication as well as requirements for the privacy of study subjects have prohibited making all the data obtained publicly available. The commenter strongly disagrees that this diminishes the value of such epidemiology and toxicology studies to regulatory science and states that exclusion of such studies would significantly reduce the amount of scientific data available to establish appropriate standards to protect public health and the environment.

Commenter (6137) by way of example provides that the EPA's NAAQS process begins with preparation of an ISA, an extensive review of available science relevant to the development of NAAQS. See EPA, *Integrated Science Assessment for Ozone and Related Photochemical Oxidants*, EPA 600/R-10/076F, at 1i-1ii (Feb. 2013). The commenter adds that the preparation of the ISA is preceded by a public workshop and call for information. *Id.* EPA then collects and screens studies (with a heavy focus on studies that have been peer reviewed), prepares an initial characterization of evidence, and then provides a peer review process of the initial draft materials for scientific quality of "building blocks" from scientists from both outside and within EPA. *Id.* at 1vii. The commenter states that there is then preparation of draft syntheses of the studies and draft conclusions and causal determinations, followed by CASAC input and an opportunity for public comment before preparation of the final ISA. After that, the commenter notes that EPA staff prepares a Policy Assessment (PA) based on integration and interpretation of the findings of the ISA and a separate risk and exposure assessment (REA). The commenter provides that both the PA and REA are themselves subject to separate rounds of public comment and there is yet another round of public comment after EPA proposes its action on the NAAQS.

The commenter (6137) states that all of the foregoing comprises one of the most open, publicly accessible processes ever devised for the development of health standards. The commenter notes that there are multiple layers of peer review and more than ample opportunity for the public to

raise questions about the adequacy and accuracy of the studies and models presented. The commenter expresses that the EPA does not and cannot rationally explain why this system requires yet another layer of complexity to provide adequate transparency, integrity, and public understanding of the process.

Additionally, commenter (6137) notes that the EPA's process for revising ambient water criteria for the protection of human health provides another example of the transparency afforded to its rulemaking, as it provides open access to information for interested persons. In 1998, the commenter provides that the EPA "improved" this process "to provide expanded opportunities for public input, and to make the process more efficient." 63 Fed. Reg. 68,354, 68,355 (Dec. 10, 1998). To revise its ambient water criteria, the commenter states that the EPA must follow a multistep process. First, EPA must "undertake a comprehensive review of available data and information" before developing draft criteria. Id. Second, EPA must "publish a notice in the *Federal Register* and on the Internet announcing its assessment . . . of the pollutant" which "describe[s] the data available to the Agency," and solicits "scientific views as to the application of the relevant Agency methodology." Id. Third, EPA must "utilize information obtained from both the Agency's literature review and [from] the public [comments] to develop draft recommended water quality criteria." Id. Fourth, and concurrent with the development of the draft criteria, EPA must publish in the *Federal Register* a notice soliciting the public's "scientific views on the draft criteria," and must "initiate . . . a documented critical review by qualified independent experts." Id. Fifth, EPA must then evaluate and respond on the record to all "[m]ajor scientific issues" (if any) raised during the peer review or public comment period. Id. Finally, EPA must "revise the draft criteria as necessary, and announce the availability of the final water quality criteria in the *Federal Register* and on the Internet." Id. According to the commenter, like the NAAQS process, this process too is fully open and transparent.

Moreover, the commenter (6137) contends that it would be irrational and impracticable to require EPA to seek out the underlying data for, and demand separate peer review of, all data and models the Agency uses for purposes of characterizing the quantitative relationship between dose or exposure and magnitude of a predicted health or environmental impact. For instance, the commenter notes that in the last ozone NAAQS review, EPA reviewed more than 4,000 studies and references for the ISA, and cited more than 2,200 in the final ISA. See EPA, *Health and Environmental Research Online*, ISA Ozone (2013) (last updated July 2, 2018), https://hero.epa.gov/hero/index.cfm/project/page/project_id/1628. The commenter asserts that it is neither practicable nor necessary for EPA to demand production of underlying data from thousands or even hundreds of studies, and to require new peer reviews of each and that EPA cannot construe the statute in a way that would render it impossible to complete the review and revision of the NAAQS that Congress mandated.

Response: The EPA agrees that existing mechanisms within the EPA include meaningful opportunities for peer review and public comment. Although the process and justifications for scientific decision making is clear, the public, subject matter experts, and peer reviewers (including the SAB and other science advisory panels) generally have not had access to the underlying data necessary to fully evaluate scientific conclusions. Where underlying dose-response data in pivotal science are available, subject matter experts would be able to reanalyze the data and validate the original research findings, check for errors, test alternative assumptions,

and/or better understand and evaluate the implications of the uncertainty. As the EPA better understands the data, the Agency can make stronger, more informed decisions in future rulemakings or in revisions to existing rules or influential scientific information. The incremental progress made by this rule provides an important step towards prioritizing transparency in the EPA's most impactful rules and assessments and will inform future statute-specific rulemakings. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent subject matter experts to validate pivotal science, and as data are better understood through independent reanalysis the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Further, the EPA agrees that determining data availability for all the studies EPA considers in significant regulatory actions and influential scientific information may be infeasible at this time. The EPA modified the scope and the definition of "pivotal science" in the final rule to clarify that the requirements apply to the dose-response data underlying pivotal science and that "pivotal science" is a subset of the studies used in the analysis. The EPA also modified language in 40 CFR 30.6 to clarify that the Agency is not required to peer review to pivotal science that has already undergone adequate peer review.

The EPA would also like to clarify that this rule does not demand the release of underlying data. As stated in the preamble, this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. The EPA is only required to determine if such a mechanism was available, should a subject matter expert decide to use it.

Comment: Commenter (6160) provides that, when assessing scientific evidence for policy and rulemaking, EPA employs a weight-of-evidence method that "considers all relevant information and its quality, consistent with the level of effort and complexity of detail appropriate to a particular risk assessment," according to the EPA Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency ("EPA Guidelines").¹⁸⁷⁷ To insure that the information used in policy and rulemaking is accurate, reliable, and unbiased, the commenter states that the EPA Guidelines require the use of "(i) the best available science and supporting studies conducted in accordance with sound and objective scientific practices, including, when available, peer reviewed science and supporting studies; and (ii) data collected by accepted methods or best available methods ...". Furthermore, the commenter adds that the EPA Guidelines already address the transparency of data and methodology, including "(1) the source of the data used, (2) various assumptions employed, (3) the analytic methods applied, and (4) the statistical procedures employed."¹⁸⁷⁸

¹⁸⁷⁷ EPA Guidelines at page 21. <https://www.epa.gov/quality/guidelines-ensuring-and-maximizing-quality-objectivity-utility-and-integrity-information>

¹⁸⁷⁸ See EPA Guidelines at pages 20-23.

In the General Assessment Factors for Evaluating the Quality of Scientific and Technical Information (“EPA SPC Assessment Factors”),¹⁸⁷⁹ the commenter (6160) provides that the EPA Science Policy Council has established five additional criteria to support the EPA Guidelines. These include:

- Soundness - The extent to which the scientific and technical procedures, measures, methods, or models employed to generate the information are reasonable for, and consistent with, the intended application;
- Applicability and Utility - The extent to which the information is relevant for the Agency’s intended use;
- Clarity and Completeness - The degree of clarity and completeness with which the data, assumptions, methods, quality assurance, sponsoring organizations and analyses employed to generate the information are documented;
- Uncertainty and Variability - The extent to which the variability and uncertainty (quantitative and qualitative) in the information or in the procedures, measures, methods, or models are evaluated and characterized; and
- Evaluation and Review - The extent of independent verification, validation, and peer review of the information or of the procedures, measures, methods, or models.

The commenter (6160) notes that the EPA utilizes these assessment factors to evaluate the scientific quality of individual studies that will contribute to the weight-of-evidence approach. According to the commenter, this balanced approach that is already in use and is consistent with existing scientific practice is more than sufficient to assess the quality of science that is relied upon for policy and rulemaking.

Commenter (6160) states that existing EPA scientific processes and assessment factors are part of various statutory frameworks, including the guidelines issued by EPA. The statutory basis for this proposed rule is not presented in a manner to support upending the existing EPA scientific processes and assessment factors.

Response: The EPA agrees with this comment in part and has clarified the role of the EPA *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency* and assessment factors in the final rule. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with the EPA *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency*. The EPA will generally continue to use the following, established factors when assessing study quality: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. The EPA also clarified that it is relying exclusively on its housekeeping authority to promulgate this purely procedural rule.

¹⁸⁷⁹ “A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information” EPA Scientific Policy Council, EPA 100/B-03/001 (June 2003). <https://www.epa.gov/risk/summary-general-assessment-factors-evaluating-quality-scientific-and-technical-information>

Comment: Commenter (6194) asserts that existing laws, regulations and guidance at the federal level (i.e., the Information Quality Act, OMB and EPA's guidelines implementing the Information Quality Act, Circular A-110, and the 2009 Memorandum for the Heads of Executive Departments and Agencies on Scientific Integrity¹⁸⁸⁰) advance transparency-related goals and make the Proposal redundant.

Response: The EPA agrees that existing mechanisms within the EPA and the federal government are increasingly pushing towards greater data sharing and increasing scientific rigor. The requirements in this final rule build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Although current methods and processes do allow for public comment and, where appropriate, peer review in the development of significant regulatory actions and influential scientific information, subject matter experts and peer reviewers (including the SAB and other science advisory panels) generally have not had access to the underlying data necessary to fully evaluate scientific conclusions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty in the assessment. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. The incremental progress made by this rule provides an important step towards prioritizing transparency in particularly impactful rules and assessments and will inform future statute-specific rulemakings.

Comment: Commenter (6920) notes that EPA also has existing policies and procedures in place to prevent conflicts of interest and ensure that the boards and committees are well-balanced and comprised of independent members with the appropriate expertise. The commenter provides that processes for developing human health assessments and setting and reviewing standards by EPA have been routinely scrutinized by organizations such as the National Academy of Sciences (NAS) and the Government Accountability Office (GAO) and EPA has incorporated their recommendations and improved its approach over time.¹⁸⁸¹

As examples, commenter (6920) notes that several of the landmark studies on the health effects of air pollution, such as the Harvard Six Cities and ACS studies, have been peer-reviewed and

¹⁸⁸⁰ The White House, Office of the Press Secretary, Memorandum for the Heads of Executive Departments and Agencies 3-9-09, at § 1(d) (Mar. 9, 2009), <https://obamawhitehouse.archives.gov/the-press-office/memorandum-heads-executive-departments-and-agencies-3-9-09>

¹⁸⁸¹ See for example National Academy of Sciences, 2018, Progress Toward Transforming the Integrated Risk Information System (IRIS) Program: A 2018 Evaluation, <https://www.nap.edu/catalog/25086/progress-toward-transforming-the-integrated-risk-information-system-iris-program>; National Research Council, 2000, Strengthening Science at the U.S. Environmental Protection Agency: Research Management and Peer-Review Practices, <https://www.nap.edu/catalog/25086/progress-toward-transforming-the-integrated-risk-information-system-iris-program>.

re-analyzed by multi-disciplinary expert panels from the HEI.¹⁸⁸² The commenter describes HEI as an independent non-profit research institute that receives funding from both EPA and industry to provide impartial credible science on the health effects of air pollution. In a testimony before a Congressional committee, the commenter notes that the President of HEI stated that “US EPA and other agencies have established procedures to produce and review science for decisions, and in many cases those procedures work to enhance the quality and credibility of the science.”

Commenter (6920) expresses that the proposed rule uses the phrase “best available science,” but calls into question established processes such as EPA’s Integrated Risk Information System (IRIS) review program and NAAQS program. In fact, the commenter states that the EPA routinely makes the ‘best’ use of scientific information in these programs. That includes, according to the commenter, study-by-study evaluation of strengths and weaknesses of all relevant research. Also, the commenter asserts that the EPA more-than-adequately explains its decisions and analyses both in recommending NAAQS revisions and in quantifying chemical toxicities in IRIS.

Commenter (6920) submits that IRIS is not a regulatory program, but it provides essential scientific information for decisions made by Washington State Department of Ecology. In a recent review of the IRIS program, the commenter states that NAS reported that EPA has made “substantial progress” in implementing the recommendations outlined in previous NAS reports, improving the program’s overall scientific and technical performance.¹⁸⁸³

Commenter (6920) submits that IRIS uses a rational weight-of-evidence method to assess available research and provide access to a comprehensive source of toxicity data. The commenter notes that it increases the capacity to evaluate chemical hazards, and to quantify risk magnitudes and uncertainties, but it does not inform on how to manage risks. The commenter contends that the proposed exclusion of research lacking all underlying data from IRIS would be an unnecessary waste of information.

Response: The EPA agrees that scientific studies should not be categorically excluded from consideration when promulgating significant regulatory actions and developing influential scientific information and has clarified this in the preamble of the final rule. As described in the preamble to the final rule, the EPA will consider data availability, among other factors, when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation. When the dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA will give less consideration to the studies’ evidence, findings, and conclusions unless the Administrator grants an exemption request.

¹⁸⁸² See Health Effects Institute, 2000, Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality, <https://www.healtheffects.org/publication/reanalysis-harvard-six-cities-study-and-american-cancer-society-study-particulate-air>

¹⁸⁸³ National Academy of Science, April 11, 2018, EPA’s IRIS program has made substantial progress, says new report, <http://www8.nationalacademies.org/onpinews/newsitem.aspx?RecordID=25086>

2.1.2.3 Recommend that EPA Continue to Implement Existing Procedures/Policies

Comment: Commenters (2119, 5172, 5178, 5977, 6119, 6160, 6351, 6924, 6925) urge EPA to continue to implement longstanding EPA procedures that promote use of sound science. Comments include:

- It is assumed that EPA's regulations are already and always based on the best science, which regulates itself in proving facts and providing solutions. (5977)
- Commenter urges EPA to follow the current, effective measures in place to ensure the use of robust, uncensored scientific research to protect the health of our patients and our communities. (6361)
- Commenter suggests EPA focus on implementing existing initiatives and guidelines for improving data sharing and transparency at federal agencies. (6924)
- Commenter urges EPA to continue to rely on the existing EPA weight-of-evidence process and assessment factors that are based in scientific standard practices. The commenter does not support a rule that departs from these important EPA-recognized approaches for assessing the quality of science in policymaking. (6160)
- There is an existing and well-established framework in place governing the use of scientific information to ensure that the information informing regulatory actions is the best-available, peer-reviewed science. The commenter provides that this includes EPA's Scientific Integrity Policy,¹⁸⁸⁴ OMB's Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information,¹⁸⁸⁵ and Final Information Quality Bulletin for Peer Review.¹⁸⁸⁶ While EPA alludes to instances where EPA's own policies regarding scientific integrity have been followed inconsistently, the commenter contends that the EPA fails to provide a single example where this occurred and was problematic. Even if this were the case, the commenter asserts that it is unclear why this proposed regulatory action would be needed to cure such problems. The commenter submits that the solution instead seems simple – enforce the current well-established and well-reasoned framework regarding the use of scientific information – either through EPA's own internal procedures, or by OMB during review of regulatory actions. (6925)

Response: The EPA agrees with this comment in part and has clarified the role of the EPA *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency* and assessment factors in the final rule. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with the EPA *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency*. The EPA will generally continue to use the following, established factors when assessing study quality: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review.

¹⁸⁸⁴ U.S. EPA (2012). U.S. Environmental Protection Agency Scientific Integrity Policy. Retrieved from https://www.epa.gov/sites/production/files/2014-02/documents/scientific_integrity_policy_2012.pdf

¹⁸⁸⁵ 67 Fed. Reg. 8451 (2/22/2002)

¹⁸⁸⁶ 70 Fed. Reg. 2664 (1/14/2005)

The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. The requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

2.1.2.4 Support for Proposal to Address Transparency Problem and to Reduce Costs to the Regulated Industry

Comment: Commenters (0050, 0555, 0556, 0560, 0563, 0567, 1273, 1302, 1307, 1784, 1938, 1939, 1972, 2121, 2421, 2426, 2978, 3981, 4009, 4430, 4534, 4541, 4932, 5169, 5419, 6045, 6102, 6112, 6115, 6124, 6140, 6141, 6150, 6151, 6182, 6356, 6362, 6364, 6365, 6366, 6369, 6376, 6377, 6448, 6855, 6857, 6878, 6906, 6911, 6913, 6918, 6921, 6927, 6936, 6942, 6948, 9243) express support for the proposed rule. Commenters generally assert that the proposed rule will help ensure that only scientifically sound regulatory initiatives are considered for implementation. Some specific comments include:

- If the taxpayers are funding the research, the data and results should be open access and available to all. (1939)
- Transparency is especially important given that courts provide deferential review of agency decisions involving scientific or technical matters.¹⁸⁸⁷ (1972)
- Commenter supports EPA's full consideration of making its regulations consistently more transparent, timely and objective by balancing both costs and benefits. (6182)
- Transparent data and scientific debate are critical elements for developing objective and legally defensible regulations, in contrast to the cloistered and opaque science that has been practiced in the past. The commenter states that, without such transparency, the scientific or legal bases for rules are not understood by all and industry is often forced to into appellate litigation. The commenter states that non-transparency usually slows down, rather than expedites, proposed regulations from becoming law. (6182)
- Commenter applauds EPA's willingness to interact with stakeholders while developing this critical regulation. The commenter understands that implementation and application of this regulation is not clear cut and commends EPA on proposing such a challenging regulatory program. The commenter states that they are optimistic that through continued involvement with the public and stakeholder community, EPA will be successful in implementing procedures to ensure sound, science-based decisions in a manner that is verifiable and transparent. (6906)
- Scientific data used by the EPA to make regulatory decisions must be fully available to public analysis and scrutiny so that EPA decision making can be fair, democratic, and responsive to those people who use and rely on the multiple use of federal lands. The

¹⁸⁸⁷ See *Baltimore Gas & Elec. Co. v. NRDC*, 462 U.S. 87, 103 (1983) ("When examining this kind of scientific determination, as opposed to simple findings of fact, a reviewing court must generally be at its most deferential."); *Nat'l Wildlife Fed'n v. EPA*, 286 F.2d 554, 560 (D.C. Cir. 2002) ("particular deference is given by the court to an agency with regard to scientific matters in its area of technical expertise.").

commenter states that scientific data veiled in secrecy will lead to politicized decisions tailored to a particular agenda and not sound environmental policy. (6878)

- Commenter supports the proposed rule's underlying values which originate from EPA's statutory authority and principles of good government, including the following:
 - The NRC concluded that transparent and effective public participation is essential for EPA to issue valid rules that can be effectively implemented.¹⁸⁸⁸
 - EPA recognizes several reasons why public participation in government actions is important, regardless of statutory basis:
 - The dialogue can result in deeper and more practical insights into the issues than if the interested parties acted individually.
 - Those affected are far more likely to understand and accept decisions when their concerns have been acknowledged and addressed.
 - Citizen participation in government programs is a democratic ideal.¹⁸⁸⁹
 - Pursuant to Executive Order 13563, EPA must base its regulatory decisions on the "best available science," and this goal can be significantly aided by informed public comments.
 - EPA's Public Involvement Policy recognizes the importance of public participation to the Agency's core mission of protecting human health and the environment. (6918)
- The Transparency proposal is a vital and very important policy for the EPA that will have beneficial effects in that it will identify the nature and magnitude of the EPA research misconduct that has been intentionally and viciously put forward as good science for purely partisan ideological purposes, not the pursuit of science that allows the EPA to identify real risks and mitigate the effects of those risks. (4009)
- Commenters (6112, 6115) assert that poor rulemaking, particularly when it is not based on sound science, can have disastrous impacts on the aggregates industry. For example, commenter (6115) notes that the "Waters of the United States" (WOTUS) Rule that was proposed in 2015 lacked sufficient science, research methods, and data to support the stated purpose and revisions. In fact, the commenter states that the proposed revisions, as introduced, would have dramatically impacted aggregate operations in the nation with an increase in costs associated with expanding their operations, with the potential to be barred from mining future reserves that will be needed as our economy grows and our population continues to increase. The commenter states that, while their company prides itself as being environmentally responsible, the broadened scope of this WOTUS Rule would directly impact their operations, with little environmental benefit. In turn, according to the commenter, these proposed changes to the "Waters of the US" will increase the costs of public works projects across our nation.
- Commenter supports adoption of the proposed rulemaking because many "significant" and "lesser-significant" regulations have imposed (and will continue to impose) costly requirements and choices on the public but have lacked transparency and replicability with regard to their scientific/technical foundation. According to the commenter, not only has data for these decisions been withheld from public review, but the EPA is

¹⁸⁸⁸ National Research Council, Public Participation in Environmental Assessment and Decision Making (2008), <https://www.nap.edu/catalog/12434/public-participation-in-environmental-assessment-and-decisionmaking>.

¹⁸⁸⁹ EPA, Better Decisions through Consultation and Collaboration: Introduction, https://www.epa.gov/sites/production/files/2015-09/documents/better_decisions.pdf

conspicuous among federal agencies for its reliance on proprietary data and models. The commenter adds that, not only are these agency practices inconsistent with EPA's own Scientific Integrity Guidance,¹⁸⁹⁰ but they also are inconsistent with research and publishing guidelines adopted by hundreds of peer-reviewed scientific journals and universities.¹⁸⁹¹ The commenter states that their (NEDA/CAP's) members support peer-reviewed research that invites scrutiny from researchers worldwide with respect to the foundation, causality, and conclusions of that research. Most important, the commenter notes that their members support public access to the scientific and technical underpinnings of EPA regulation. (6356)

As a general matter, the commenter (6356) suggests that the lack of regulatory transparency on the scientific foundation of EPA regulations has led to fevered political debate on EPA regulations that has impugned their integrity and acceptability by politicians, the regulated community, and the public. As a matter of course, the commenter expresses that the EPA has come to rely improperly on judicial decisions such as *Chevron USA v. Natural Resources Defense Council*, 467 U.S. 837 (1984), which vest the agency with broad discretion in interpreting ambiguous statutory authority and should be distinguished from its obligation to use the best available science in its decision-making. As a consequence, the commenter notes that stakeholders in regulatory development have been asked to trust EPA's conclusions on important health-based initiatives and not given the opportunity to review data, models, and interpolations of dose-response relationships on which they are based. The commenter asserts that, as EPA's regulations become more and more costly in attempts to achieve incrementally smaller reductions in pollution, it is critically important for the agency to take steps to avoid criticism that it regulates in secret.

In short, the commenter (6356) states that the proposed rule generally tracks components of the scientific method in use by scientists and researchers since the seventeenth century. The commenter submits that it is important that EPA codify these principles to ensure that the data and models underlying scientific studies that are pivotal to regulatory actions are made be available to the public.

Response: The EPA agrees with commenters on the importance of data transparency to scientific scrutiny and debate in creating sound environmental policy. Because of the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA truly demonstrate that commitment. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the

¹⁸⁹⁰ See 83 Fed. Reg. 18,70, FN 13.

¹⁸⁹¹ See the "Transparency and Openness Promotion (TOP)" guidelines for scientific publications endorsed by Published in Science in 2015 (OA), implemented by over 850 Scientific Journals and research universities. <https://cos.io/our-services/top-guidelines/> to foster reproducibility of scientific research. See e.g., "Announcement: Transparency Upgrade for Nature journals" 288 Nature 543 (Mar. 16, 2017).

uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent subject matter experts to validate pivotal science, and as data are better understood through independent reanalysis the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Comment: Commenter (0556) suggests that the EPA rule is likely to, according to them, finally establish specific standards for openness. Moreover, the commenter contends that these standards will set a potential precedent for other Federal Agencies, possibly even other Governments, or even for scientific journals.

Commenter (6936) believes that the proposed rule is a major advancement in terms of EPA's compliance with the expectations before regulatory agencies. The commenter states that, by not disclosing relevant data and methodology behind studies used to justify EPA rulemakings, the reviewing public is often left only with the conclusions or findings of the given studies. The commenter provides that a recent Congressional Research Service report regarding judicial review of agency actions notes the following:

[C]ourts require agencies to provide the 'essential facts upon which the administrative decision was based' and explain what justifies their determinations with actual evidence beyond a 'conclusory statement.' An agency's failure to provide an adequate explanation for its decision will typically result in remand or invalidation of its decision.¹⁸⁹²

Commenter (6936) suggests that given the importance of independent verification and replicability of results in terms of confirming scientific conclusions, it is their view that EPA reduces the risk of its future rules being invalidated by the courts by adopting the proposed transparency standards.

Response: The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. The EPA's continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency's decisions. Although other federal agencies may adopt similar standards, the EPA would like to clarify that this rule only applies to EPA practices.

¹⁸⁹² Cole, Jared P., "An Introduction to Judicial Review of Federal Agency Action," Congressional Research Service, December 7, 2016. <https://fas.org/sgp/crs/misc/R44699.pdf>

Comment: Commenter (6140) attached a paper¹⁸⁹³ by Dr. Logomasini and comments offered by Marlo Lewis, Jr. The commenter states that the paper and comments provide details that explain their support for the Transparency Rule. That paper and comments are summarized below:

A summary of the paper:

- The EPA rule on transparency should be viewed as another tool in a larger effort to promote transparency and reproducibility within the scientific community, most of which is happening outside of government.
- The EPA's transparency rule will help bolster private pro-transparency efforts and should be the beginning of a government-wide effort.
- Transparency guidelines could also be applied to government research and government-funded research within all agencies, from the EPA to the National Institutes of Health (NIH), the Food and Drug Administration (FDA), and the Consumer Product Safety Commission.
- The rule contains provisions to protect privacy and provide exceptions that allow regulators to consider quality research that is not fully transparent because of privacy concerns.
- Improving transparency is an achievable goal.
- Transparency ensures that all aspects of scientific methods and results are available for critique, compliment, or reuse.
- Researchers often avoid transparency out of fear that their novel findings may eventually be proven wrong when someone tries to replicate their work.
- Many positive associations will occur by mere chance or unintentional biases.
- The EPA's proposed rule follows principles laid out in 2017 by the bipartisan Commission on Evidence-Based Policymaking— humility, transparency, privacy, capacity, and rigor—and moves us toward providing greater access to scientific data while protecting individual privacy.¹⁸⁹⁴ The commission report addresses privacy issues, finding that transparency of data can be achieved without compromising privacy concerns:
- EPA has plenty of funds within its \$8 billion budget to pay for transparency.
- Transparency might reduce costs for businesses and consumers, who ultimately pay the high costs of misguided regulations.

A summary of the comments:

- Independent validation is difficult if the study's authors refuse to share their data. That is a longstanding problem in air pollution epidemiology.
- EPA is not proposing to require researchers to divulge data in past studies used to support previous regulatory decisions.

¹⁸⁹³ EPA Transparency Rule Will Bolster Science and Improve Rulemaking. When Rules are Based on the Best Available Data, Regulations Are More Effective. By Angela Logomasini, Ph.D. July 17, 2018.

¹⁸⁹⁴ Robert Hahn, "Many mocked this Scott Pruitt proposal. They should have read it first," Washington Post, May 10, 2018, https://www.washingtonpost.com/opinions/many-mocked-this-scott-pruitt-proposal-they-should-have-read-it-first/2018/05/10/31baba9a-53c2-11e8-abd8-265bd07a9859_story.html.

- The rule includes a provision allowing EPA to exempt significant regulatory decisions on a case-by-case basis by the Administrator
- Nothing in the proposal states or implies that EPA will not consider studies or comments referencing studies unless the data are fully transparent or the results are independently validated.
- EPA is within its authority to determine that transparent and reproducible science is of higher quality than opaque and irreproducible science.
- The agency is within its authority to accord greater weight to higher-quality science than to lower-quality science.
- If a study is pivotal to significant regulatory action, preference should be given to studies that can be independently validated. Independent validation is not possible unless the public has access to the underlying data and models.

Response: The EPA agrees that this rulemaking is designed to build upon other important transparency initiatives occurring within the federal government and the scientific community. The incremental progress made by this rule provides an important step towards prioritizing transparency in particularly impactful rules and assessments and will inform future statute-specific rulemakings. Although other federal agencies may adopt similar standards, the EPA would like to clarify that this rule only applies to EPA practices.

Comment: Other comments providing specific support and reasons for addressing transparency include:

- Commenters (0555, 0844, 6150) suggest that greater transparency in the studies, models, assumptions, and risk assessment policy choices used in regulatory decisions could encourage more open, constructive debate on those choices.
- Commenters (1974, 4430, 6102, 6172) support peer review and transparency.
- Commenters (1784, 3971, 4009, 4430, 4541, 5185, 6161, 6176, 6189, 6365, 6376) support the proposed rule and assert that some past, flawed EPA air quality research has been used as the basis of various regulatory actions.
- Commenter (4541) states that, given the agency's own admission that this failure is widespread within the agency due to a culture of disrespect for the scientific method and independent peer review, a new set of rules is desperately needed. Commenter (6161) states that EPA ignores the absence of transparency and findings of irreproducibility when it suits the Agency's desire to regulate. Commenter (6176) asserts that EPA is not immune to seeking preferred policy outcomes and using questionable science to achieve those outcomes; transparency helps to minimize these problems.
- Commenters (4931, 6102, 6108, 6126, 6140, 6141, 6150, 6448, 6857, 6878) support the statement in the proposal that "the best available science must serve as the foundation of EPA's regulatory actions."
- Commenter (3971) states that the proposed regulation is responsive to concerns expressed for the past three or four decades by many within the toxicology community. The commenter states that there are numerous examples of EPA risk assessments that would have been much more readily accepted by the regulatory community had they been more transparent.

- Commenter (5185) states that, for many years EPA has relied upon non-public data to justify its aggressive regulatory agenda. The commenter states that the most egregious but certainly not the only example of this involves two controversial studies undertaken in the 1980s that suggest a linkage between PM_{2.5} and health outcomes. The commenter states that the data associated with these decades-old studies has never been made public, but EPA has nonetheless used them to monetize regulatory benefit claims that dominate the communications and regulatory marketing associated with nearly all of its major rules.
- Commenter (6189) attaches articles and letters regarding PM_{2.5} and states that these are a highly relevant example of the importance of independent access to underlying data and transparency in regulatory science.¹⁸⁹⁵

Response: The EPA agrees that scientific openness benefits both scientific and government processes. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty in the assessment. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenter (6365) states that the Lanphear case study demonstrates the need for EPA to finalize its regulatory transparency rule in the following ways:

- First, it shows that the peer review process does not always identify errors in studies that would constitute “pivotal regulatory science” within the meaning of EPA’s proposed rule.
- Second, the absence of this data prevented EPA and stakeholders from discovering errors in “pivotal regulatory science” at the time EPA relied on it.
- Third, it shows that absent a regulatory transparency rule, it could take stakeholders years of effort and untold expenditures to obtain data that may demonstrate errors in “pivotal regulatory science.”
- Fourth, it shows that making this data available will facilitate the validation and replication of pivotal regulatory science by reducing barriers to obtaining these materials, furthering (not hindering) public health science.

¹⁸⁹⁵ March 28, 2017 Dose-Response article “Fine Particulate Matter and Total Mortality in Cancer Prevention Study Cohort Reanalysis” (<http://journals.sagepub.com/doi/full/10.1177/1559325817693345>); May 29, 2018 Dose-Response Letter “Response to Criticism of ‘Fine Particulate Matter and Total Mortality in Cancer Prevention Study Cohort Reanalysis’” (<http://journals.sagepub.com/doi/pdf/10.1177/1559325818769728>); and Spring 2018 JAPS article “Scientific Distortions in Fine Particulate Matter Epidemiology” (<http://www.jpands.org/vol23no1/enstrom.pdf>).

Response: Although this rulemaking is not intended to remedy a particular instance in which the EPA relied on a poor-quality study or a study for which the conclusions could not be independently validated, it does provide important incremental progress toward the Agency's goal of greater transparency. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. In addition, as data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenter (6376) states that, under President Obama's Administration, the EPA pursued an aggressive regulatory agenda based on single sided scientific studies and modeling. The commenter states that, to provide a real-life example of this misapplication of scientific studies one can look at the Boiler Maximum Available Control Technology (MACT) rulemaking. The commenter states that, when setting the emission standards for the best available technology for boilers the Agency "cherry-picked" data from various boilers and used that data to inform the standard for all boilers. The commenter states that the problem is the final standard was achievable for a hypothetical boiler rather than real life boilers. The commenter states that, not only was the result an unattainable standard, but the difference in the cost estimate from EPA and the regulated community was drastic. The commenter states that EPA estimated it would cost \$3 billion to come into compliance whereas industry estimates put the cost at \$20 billion.

Response: Although this rulemaking is not intended to remedy a particular issue, the EPA agrees that the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods is great; therefore, the American people deserve environmental decisions and policies that are based on the best information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA truly demonstrate that commitment.

Comment: Commenters (0563, 1486, 1939, 2142, 3134, 6350, 6374, 6878) support the proposal that the science used to inform the making of regulations be publicly available for independent verification. Commenter (6878) asserts that, as an agency of a democratically elected government, the EPA should ensure that the American public has full access to its decision-making processes. Commenters (1486, 2142, 6350) assert that evidence is the bedrock of the Scientific Method, and it must be observable and measurable and available to all who wish to verify, validate, or disprove the hypothesis which the evidence is claimed to support. Commenter (6350) states that scientific conclusions said to be made based on evidence that is neither public, repeatable, nor reproducible, are neither scientific, nor conclusive.

Response: The EPA agrees that scientific openness benefits both scientific and government processes. Because of the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best information. Only

through continuous improvement to its procedures, especially those focused on transparency, can the EPA truly demonstrate that commitment.

Comment: Commenters (1939, 0062, 4430, 6045, 6140) support the proposal and agree that, regarding medical information, there are methods available to protect the confidentiality of individuals whose data would be used in environmental studies.

Commenter (6045) states that, while the EPA might agree to redact these data before public posting, they could be given to anyone who signed a confidentiality agreement designed by the agency. The commenter states that all NIH clinical studies can only be approved for funding if the investigators “surrender personally identifiable information — as it pertains to statistical reevaluation of the data and corroboration of the methods employed to study such data, which in turn might lead to public regulatory policy.” The commenter states that EPA clinical studies should be held to the same high standards as all NIH clinical studies.

Commenter (4430) states that EPA’s proposed rule follows principles laid out in 2017 by the bipartisan Commission on Evidence-Based Policymaking — humility, transparency, privacy, capacity and rigor — and moves us toward providing greater access to scientific data while protecting individual privacy.

Commenter (6140) states that, while some claim that the rule will prevent EPA from using research that relies on confidential data collected from study participants, the rule affords the EPA Administrator considerable leeway to permit regulators to use research in cases where privacy or other concerns limit public availability.

Response: The EPA agrees that mechanisms exist to share data while maintaining protections for sensitive information. As discussed in the final rule, underlying data or models are considered available if they can be accessed through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Further, the EPA would like to clarify that the rule does not prevent the Agency from using research with confidential data and does not rely on an Administrator’s exemption to be able to consider such research. As explained in the preamble for the final rule, the EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data be available for independent validation in order for studies to be considered pivotal science. Because the final rule does not categorically exclude any studies, including human health studies, from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations.

Comment: Commenters (0019, 4430, 6102, 6150, 6161, 6910, 6938) support the proposal that scientific studies used by EPA be available in a format that allows other interested parties to replicate or reproduce the results. Commenter (0019) asserts that, if this is not done, EPA could make decisions on research that may be flawed.

Commenter (6102) states that increased transparency and access to underlying decision-making information encourages replication and validation, key steps in the scientific process.

Commenter (6150) states that replication and validation are key tenets to scientific inquiry and promotion of data sharing will allow testing of new ideas on existing data sets. Commenter (6161) states that the reason transparency is paramount in the scientific enterprise is that clear exposition of materials and methods is necessary to allow attempts to replicate studies.

Commenter (6910) states that, in order for science to be accepted and utilized in policy making and consumer choices, science has to be reputable, repeatable, and factual. Commenter (6938) states that too often in the past, EPA has relied upon public health studies with non-public data to justify regulatory policy and without access to the non-public data, it is impossible to replicate and validate the conclusions in those studies.

Response: The EPA agrees with commenters on the importance of data transparency to scientific scrutiny and debate in creating sound environmental policy. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty in the assessment. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenters (0039, 1974, 2114, 4537, 4882, 6112, 6115, 6140, 6162, 6172) support the proposal that regulatory decisions be based on reproducible and transparent research.

Commenters (2114, 4882, 6140) assert that the scientific method requires research to be transparent and reproducible. Commenter (0039) believes that these reforms will strengthen American science, by prompting researchers to incorporate and make routine in their practices the highest standards of reproducibility.

Commenter (4537) states that larger concerns about reproducibility suggest that this measure should be applied more generally within EPA and across the Federal Government.

Commenters (6112, 6115) state that because rulemaking and other regulatory actions by EPA and other agencies have enormous impacts, they should be able to clearly understand the rationale behind EPA actions.

Commenter (6162) states that, while EPA has not consistently followed the current EPA Scientific Integrity Guidance that encourages use of non-proprietary data and models, the proposed rule requires increased access for outside researchers to independently reproduce the underlying analyses on which environmental rulemakings are based.

Response: The EPA agrees with commenters on the importance of data transparency to scientific scrutiny and debate in creating sound environmental policy. Because of the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA truly demonstrate that commitment. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty in the assessment. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will also increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information. Although other federal agencies may adopt similar standards, the EPA would like to clarify that this rule only applies to EPA practices.

Comment: Commenters (4541, 6150, 6878) support the proposal and assert it is consistent with statutes and/or Executive Orders. Commenter (6150) states that EPA's proposal to enhance transparency and to facilitate the use of scientific data that are publicly available in a manner sufficient for independent validation is in keeping with its obligations under federal statutes. Commenter (6878) states that the proposed rule will make EPA decision making more consistent with the requirements in the Administrative Procedures Act (APA) that ensure public participation in the rulemaking process.

Commenter (4541) states that governing statutes and Executive Orders authorize the proposed Rule and, indeed, have long required it. The commenter states that, in not following the proposed rule in the past, EPA has been flouting governing statutes and Executive Orders, particularly in matters of toxicology and epidemiology, and abusing its authority by ignoring and discarding valid objections to EPA adopted science and the derivative policy and regulatory actions.

Response: The Agency agrees that the EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. The requirements in this rule build upon the open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Implementation of this rule will result in significant regulatory actions and influential scientific information that are

based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

Comment: Commenters (0563, 1784, 1939, 0844, 3971, 6102, 6182) support the proposal because it could reduce costs.

Commenters (0563, 0844, 3971, 6102) support the proposal because it could reduce costs of regulations that might be based on data that are not publicly available.

Commenter (1784) states that, with the cumulative economic impact of federal regulations reaching nearly \$2 trillion per year, research reform is essential.

Commenter (3971) states that, if EPA can gain more support for its proposals, which this regulation will do, the number of legal challenges would be lessened and billions of dollars in legal fees and awards would be avoided.

Response: The EPA would like to clarify that this is a rule of internal procedure promulgated under the EPA's housekeeping authority. Because this rule does not require the EPA or other parties to disclose or host data, this rule does not impose costs on the EPA or any other party to make such data available. As more fully discussed in the preamble to the final rule, the EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small. However, the EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety.

2.1.2.5 Proposed Rule Will Not Deliver Improvements in EPA's Current Regulatory Processes

Comment: Commenters (2119, 4589, 4589, 4590, 5170, 6111, 6157, 6160, 6168, 6872, 6924) assert that the proposed rule will not deliver improvements in EPA's current regulatory processes. Commenters (5176, 5179, 6158) assert that the goal of increasing transparency in science and the public's faith in the EPA is undermined by the proposal. Comments include the following:

- EPA calls for transparency, many features of the proposed rule themselves are not transparent. The commenter contends that ambiguity and lack of detail lend themselves to decision-making that is arbitrary and open to influence, i.e. the opposite of transparent or based on best available science. The commenter notes that the rule never addresses the wide range of measures that would be necessary to achieve true transparency for either scientists wishing to replicate results or for a broader public wishing to better understand and participate in the regulatory process. The rule proposes just a single measure -- making data and models available -- and proposes a false equivalence between "transparency" and (poorly defined) independent validation. The commenter adds that the proposed measures on data and model availability and use facilitate not transparency but

the culture of science denialism: dismissing important evidence and dredging data to endlessly produce false uncertainty and delay scientific advances regarding the harmful effects of chemical exposures. The commenter notes that this false uncertainty is used to justify failure to protect environmental and public health. (6168)

- The proposed rule will do little to nothing to improve the transparency. (6872)
- The proposed rule would not improve data sharing, replicability, or transparency in decision-making. (6924)
- The approach advocated in the proposed rule is inconsistent with professional best practices in their respective disciplines for conducting, reviewing, and confirming the results/findings of studies, especially those based on confidential personal health data of study participants. (6111)
- The proposed rule runs counter to the recommendations of leading scientific organizations like the NAS. (6158)
- Commenter urges EPA to abandon its plans to advance this misguided proposal that would undermine sound scientific norms in the rulemaking process. (6157)
- The emphasis of the proposed rule on making data sets publicly available fails to demonstrate any improvement on the existing process and adds nothing to the evaluation of the scientific merit of any piece of evidence. (6160)
- Because of the peer-review process, EPA already has a firm scientific basis for using studies to protect public health. The commenter adds that making the raw data available provides no improvement to the robustness of the studies. (5170)

Response: In response to public comments, the EPA clarified and modified many aspects of the proposed rule in the 2020 supplemental notice of proposed rulemaking and the final rule. As described more fully in the preamble to the final rule, the EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. The provisions of this rule prioritize the transparency of dose-response data in pivotal science, while still ensuring that all quality, relevant literature is considered in the development process.

2.1.3 Proposed Rule is Biased

2.1.3.1 Takeover of EPA Leadership

Comment: Commenter (0844) cites *The Washington Post* quote of the Union of Concerned Scientist's (UCS's) Center for Science and Democracy Director Andrew Rosenberg, who said, "[f]irst, they came after the agency's independent science advisers, and now, they're going after the science itself...what is transparent is the unabashed takeover of EPA leadership by individuals who have demonstrated disinterest in helping communities combat pollution by using the best available science."

Response: The EPA disagrees with this commenter. As discussed more fully in the preamble of the final rule, the federal government and the scientific community have been pursuing greater transparency and data sharing for years. Where underlying dose-response data in pivotal science

are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty in an assessment. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. The EPA is very interested in public engagement and, as data are better understood as a result of the increased opportunity for independent experts to validate pivotal science afforded by this rule, the EPA will facilitate more effective comment and engagement with the public during development of future significant regulatory actions and influential scientific information.

2.1.3.2 Implementation Bias

Comment: Commenters (1006, 2787, 6877) note that proposal could lead to implementation bias. Comments include:

- The Proposal seems like a way for the EPA to have say over what gets implemented by what gets approved with any easy excuse of withholding of data. (1006)
- Contrary to its name, the proposed rule would implement an opaque process allowing EPA to selectively suppress scientific evidence without accountability and in the process undermine bedrock environmental laws. (2787)
- Discriminating what science to use for drafting regulation risks introducing potential bias in the rulemaking process. The commenter suggests that bias is likely to be introduced through the process of identifying what science can and cannot be used because there is not a bright line for what studies this proposed rule would include or exclude. Specifically, the commenter points out that the requirement to make a decision for what constitutes “high quality studies” is problematic because the term is not defined in the proposed rule nor are operational criteria for its definition specified. The commenter provides that recent work in systematic reviewing of research in many areas of science has demonstrated considerable variation in judgments about “quality” by competent scientists unless the criteria for quality are specified precisely. The commenter suggests that this variation in judgement risks arbitrary and capricious decisions as to what evidence to include or exclude. The commenter notes that several good resources for avoiding bias and gaming of the regulatory process in specifying the standard for “high quality” are available.¹⁸⁹⁶ The commenter concludes that the exclusion of otherwise valid and reliable research from consideration would also often result in regulatory analyses that suffer from biased selection and inadequate statistical power. (6877)

Response: The EPA considered these and other similar comments when developing the final rule. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. Where there is convincing and well-substantiated evidence to support a relationship between exposure and effect, the EPA will identify a subset of those studies—based on the exposure situation being addressed, the

¹⁸⁹⁶ <http://us.cochrane.org/resources>; <https://campbellcollaboration.org>; <https://ies.ed.gov/ncee/wwc/WhoWeAre>; <https://www.russellsage.org/publications/handbook-research-synthesis-and-meta-analysis-second-edition>

quality of the studies, the reporting adequacy, and the relevance of the endpoints—for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science. Once the EPA has identified pivotal science—in either final significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of personally identifiable information (PII), confidential business information (CBI), or propriety information, available through restricted access in a manner sufficient for independent validation. Including this review of data availability for pivotal science is critical to the EPA’s progress toward increased transparency and providing increased opportunity for scientific reanalysis and scrutiny by independent third parties. This approach will result in final significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers. The EPA does not believe that this final approach will lead to bias.

The EPA intends for the final rule to be implemented in a transparent manner. The final rule requires the EPA to document the rationale for exemptions granted by the Administrator to the requirements included in the final rule in the final significant regulatory action or final influential scientific information. Additionally, the EPA expects to identify pivotal science in proposed significant regulatory actions or external review drafts of influential scientific information, which will allow the public, if they so choose, to independently validate the pivotal science and provide comment or other input to the EPA.

2.1.3.3 Injects Politics into Science

Comment: Commenters (0040, 0055, 1301, 1395, 2427, 2492, 2907, 4881, 6122, 6152, 6158, 6895, 6903, 6909, 6914, 8274, 9225, 9227) suggest that the proposal is biased in ways that will facilitate political interference in science-based decision-making. Comments provided include:

- Asserts that billion-dollar industries make so much profit that they can spend unlimited amounts of money in lobbying to erode environmental protections that are in the civic best interest. The commenter states the proposal throws away merit-based, evidence-based policy decisions and opens up government policy for hire. (0040)
- Commenter (1301) asserts that the proposal is an attempt to use the concept of transparency to support a policy that provides the ability to reject almost any scientific study of human health effects that EPA would like to jettison to meet Administration goals of subverting environmental protection.
- Asserts the proposal is an abuse of the concept of scientific transparency in the service of political objectives that support increasing pollution limits to serve business interests but will harm people and result in higher long-term public health costs. (2492)

- The proposed regulation would substitute the judgement of political appointees for scientists and technologists, many from Americans leading universities and research organizations. (2907)
- Despite its title, the commenter believes that the EPA's proposal is not an effort strengthen transparency, but to suppress information that exposes corporations of wrongdoing and caters to special interests. (6914)
- Believes that the proposed rule undermines the essential role of science in the regulatory process and would open the door to partisan manipulation of EPA risk assessment science. (4881)
- If finalized, the rule would allow political appointees to reject the best-available science for virtually any reason and delay taking critical, life-saving actions in order to benefit special interests and corporate polluters. (6122)
- The proposed rule would ignore scientific best practice and inject politics into science. (6152)
- While academic science strives to be as disinterested as possible, parties with an interest in regulation could produce a self-serving but flawed analysis of raw data to sow doubt. The commenter contends that the EPA is clearly attempting to divorce itself from the use of real science in order to promote a political agenda. (6895)
- The proposed rule's attempt to exclude perfectly reliable scientific studies from EPA's consideration is a thinly veiled attempt to allow the EPA to ignore sound science at its discretion if that science does not conform with the current Administration's political agenda. (6909)
- Commenter expresses concern that shifting the decision making process for which scientific studies are used or exempted in EPA policy from experts in the field of the respective research to a politically appointed position creates the possibility of a disastrous situation where political ideals replace scientific fact and expert opinion.¹⁸⁹⁷ (8274)
- Rather than strengthen science, the proposal grants the Administrator authority to *censor* science--that by any scientific definition is the best--simply because it conflicts with this Administration's political goals. (9227)

Response: The EPA disagrees that the rule will facilitate political interference in regulatory decision-making. Transparency assumes not political ideology. The intent of the rule is to build upon existing federal government efforts and provide incremental progress toward the Agency's overarching goal of greater transparency. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively

¹⁸⁹⁷ <https://www.epa.gov/laws-regulations/policy-guidance>

comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

The EPA agrees with commenters that it is important to consider the totality of relevant, quality research. Therefore, the EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is an important aspect of EPA's regulatory actions and assessments, it should be an important consideration in how the Agency considers pivotal science. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will continue to evaluate and consider all quality, relevant studies when promulgating final significant regulatory actions and finalizing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The EPA does not agree with commenters regarding the role of the Administrator in determining whether to grant an exemption under 40 CFR 30.9 and finds that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.9 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the final significant regulatory action or final influential scientific information.

2.1.3.4 Industry Bias

Comment: Commenters (1905, 2171, 2787, 4840, 4884, 4933, 6121, 6123, 6125, 6195, 6879, 6892, 9227) suggest that the proposed rule provisions introduce a bias against peer-reviewed research in the use of science in regulatory decision making that favors industry. Comments provided include:

- The EPA is trying to discredit scientific findings that threaten powerful corporate interests. (1905)
- Commenter views the Proposal, and its requirement of making publicly available data for "independent validation", simply as a means of providing industries concerned with various studies an opportunity to reanalyze data to reshape or recast conclusions drawn by researchers and subsequent peer reviews, and to allow EPA to censor important studies without justification. (2171)
- The substance of the rule is concerning. The commenter notes that it appears to be targeted at excluding important public health studies while privileging industry-sponsored research and urges the EPA to withdraw the rule. (2787)
- There is every reason to believe this is the plan of the current leadership of the EPA and is a recipe for privileging mercenary studies by industry commissioned to influence regulatory policy, because they will be structured and released in a way acceptable under this regulation. (4840)
- The real purpose of these rules is to reverse regulations on industries who have been harmful to public health. The commenter suggests that science speaks the truth and the

EPA should hear from all scientific studies, not just the ones the industry wants you to listen to, adding that “[s]cience is the cross before the corporate devil”. (4933)

- The commenter states that business is most often about annual profit and loss while treating a clean environment as a free raw material. The commenter notes that the proposed rule insertion to Title 30 is meant to frustrate and debilitate the legislated missions of the EPA. Rather than the avowed transparent science, the commenter states that it will enable cherry picked industry data and flush valid scientific research. (4884)
- The EPA's proposed rule is *not* about transparency or strengthening science. Instead, the commenter suggests that it is a wolf of pro-industry bias hiding in the sheep's clothing of transparency in science and should be withdrawn. (5022)
- *Deconstructing Regulatory Science,*” by Professors Rena Steinzor and Wendy Wagner (June 19, 2018)¹⁸⁹⁸ (cited by 6892)
- The only “transparency” in this proposed regulation is its clear intent to censor legitimate and sound science that may be inconvenient to powerful industries that are regulated by EPA. The commenter requests withdrawal of the rule. (6879)
- The only outcome of this rule will be to put industry profits before the mission of the EPA, which is to protect human health and the environment by reducing risks based on the best available science and urges EPA to withdraw the rule. (6195)

Commenter (4881) notes that, in the light of other recent EPA directives, the proposed rule can be fairly judged to favor the industry perspective at the expense of public health protection, in violation of the Court-mandated balance. The commenter provides that the EPA is currently operating under a directive that eliminates EPA-funded scientists from consideration for membership on EPA scientific advisory boards, such as the CASAC mandated by the Clean Air Act (CAA). Even if they are subject experts on research relevant to regulatory considerations, the commenter notes that scientists with some EPA funding are judged too conflicted to provide advice, while industry representatives are judged to have no such automatic conflicts. The commenter asks:

- Is the advice of such now unbalanced scientific advisory boards to be critical in judging which published research is acceptable for EPA to include in formulating standards?
- Are intellectual property claims of proprietary data by industry to be handled consistently with claims of confidentiality by independent researchers?
- Will internal industry memos establishing research programs and judging whether results are consistent with industry goals be made publicly accessible, as well as raw data, to strengthen transparency and enable independent judgments on the validity of that research?

Response: The EPA disagrees that the rule will introduce bias in regulatory decision-making. The intent of the rule is to build upon existing federal government efforts and provide incremental progress toward the Agency’s overarching goal of greater transparency. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test

¹⁸⁹⁸ Available at <http://www.progressivereform.org/CPRBlog.cfm?idBlog=F2CE8B0E-A1A1-68E7D85991EF2A1531C9> [Cited article included as attachment in comment letter]

alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public.

The EPA also disagrees that the rule is intended to benefit industry. As stated in 40 CFR 30.3, “The provisions of this part apply to science that serves as the basis for informing a final significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.” The rule requirements also direct the EPA to evaluate the availability of the underlying dose-response data for any subject matter expert, regardless of their affiliation. Further, the final rule dictates that the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or propriety information, available through restricted access in a manner sufficient for independent validation. Restricted access in the context of this rule means that data must be available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. CBI data are not given different or preferential treatment.

The EPA agrees with commenters that it is important to consider the totality of relevant, quality research. Therefore, the EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is a very important aspect of EPA’s regulatory actions and assessments, it should be an important consideration in how the Agency considers pivotal science. Because the final rule does not categorically exclude any studies from EPA’s consideration, the Agency will continue to evaluate and consider all quality, relevant studies when promulgating final significant regulatory actions and finalizing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations.

The EPA would like to clarify that this final rule will be implemented prospectively and rules that have already been finalized will not be subject to this rule’s requirements. The EPA would also like to clarify that this rule is not related to membership processes for the EPA’s scientific advisory boards.

Comment: Commenter (4877) states that their organization and its members support open access to research outputs to democratize access to information, accelerate scientific discovery, and stimulate innovation. However, they express concern about the rule's proposed selective use of "open" as an enabling strategy in the EPA's policy-making process.

Response: In response to public comments, the EPA clarified many aspects of the proposed rule in the 2020 supplemental notice of proposed rulemaking and the final rule. The requirements in the final rule provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

Comment: Commenters (2909, 4596, 4840, 5022, 6046, 6109, 6121, 6123, 6133, 6144, 6157, 6336, 6446, 6895, 6920, 8281-PH34, 9227) point out the inequity/hypocrisy of the proposed rule subjecting health study privacy data to additional scrutiny while allowing continued confidentiality of equally critical and opaque business information. Comments provided include:

- Questions the "double standard" of allowing industry data to be confidential, which favors polluters over those impacted by their pollution. The commenter adds that the only thing transparent about the proposed rule is the outcome it would have compromising science to the detriment of human health and our environment for the benefit of big polluters. (2909)
- EPA's claims of increasing transparency are disingenuous because the Proposal may allow EPA to consider significant amounts of information submitted by industry to the agency, even though the information will be protected as CBI and shielded from the public. According to the commenter, because industry data are associated with CBI claims more so than public health researchers' work, the Proposal reveals its industry bias. (4596)
- The commenter notes that the proposed rule requirements imposed on independent researchers are onerous and burdensome. (4840)
- Proposal would have an effect opposite to its claimed purpose; it would suppress important and relevant science conducted in large part by the best minds in academia and government, thereby unduly restricting the evidence available to EPA and potentially favoring data developed by industry. (5022)
- The Proposal is biased against non-pesticide contaminants while ignoring the very large transparency issue with pesticide evaluations, could result in increased uncertainty in standards and health values, and ignores current measures that try to address scientific credibility of studies. (6046)
- CBI may be exempted from the transparency rule, but not necessarily confidential health information. The commenter provides that the EPA states that it seeks comment on "methodologies and technologies designed to provide protected access to identifiable and sensitive data, such as individual health data" which they believe illustrates EPA's commitment to making health data public. The commenter provides that the EPA sets a different standard for protecting CBI, suggesting CBI may be allowed to remain nonpublic: "EPA seeks comment on how to balance appropriate protections for

copyrighted or CBI, including where protected by law ..." The commenter inquires what EPA means by the phrase "balance appropriate protections" for CBI and why is the same phrase not used for protecting private health data? The commenter suggests that the EPA does not appear to place private health data on the same footing as CBI. This, according to the commenter, suggests EPA will be more likely to allow industry to submit nonpublic data than it will health researchers. The commenter adds that it also suggests that if EPA applies the proposed rule retrospectively, the agency will still consider research that contains nonpublic CBI while discounting research that contains nonpublic private health data. (6109)

- "[P]ublic scrutiny" would only serve industry's interest either through eliminating the use of studies that contradict their claims of chemical safety or through attempting to discredit studies and researchers by "reinterpreting" the data in their favor. (6121)
- EPA indicates that the proposed rule is intended to strengthen transparency of EPA regulatory science, however the commenter finds this to be a duplicitous claim. The commenter states that the proposed rule would favor industry data protected as CBI over public peer-reviewed research. (6123)
- Under the Proposal, EPA would not be able to rely on the best available science for its ISAs of air pollution which inform the NAAQS-setting process, while industry-funded research calling into question the air pollution-health link, would not be subject to similar data release requirements, or even peer-review and independent reevaluation. The commenter notes that this approach is asymmetric and favors selective, opaque, and questionable research methods over the consensus of robust peer-reviewed scientific investigation. The rule is arbitrary in its selective application of data release requirements and disregard for the quantitative complexities of epidemiologic research. (6133)
- If EPA is going to implement any version of this proposed rule, it must not, and cannot include a loophole for industry data while requiring that underlying public health data be made available. (6144)
- The proposed rule would subject health studies alone to additional scrutiny by exposing the privacy of participants and illogically raise the standards by which they can be considered. Meanwhile, the commenter states that the rule would allow for the continued confidentiality of equally critical and often much more opaque business information such as economic cost modeling or industry labeled proprietary data, which is rarely subject to verification at all, let alone rigorous peer review. The commenter contends that this approach would only serve to eliminate the strong and well-founded basis for health and environmental regulations millions of Americans depend on while keeping information deemed confidential by for profit industry interests out of the public eye. The commenter adds that the dividing line drawn by this proposal creates two camps: the privileged, industry data kept out of the public eye and often used to avoid protections like pollution controls for heavily emitting sources such as coal-fired power plants and oil refineries; and the epidemiological data prejudiced by EPA's proposed transparency rule that is used to support protections for the benefit of public health and welfare. (6157)
- Industry research might still be protected as CBI under the proposed rule, while academic or public interest research would not be entitled to rely on intellectual property protections. (6446)
- EPA is looking to establish a rule that would require independent public and private institutions to release confidential data behind environmental health studies while at the

same time seeking to exempt private industry from being required to do the same.¹⁸⁹⁹ Given that the confidential data held by independent institutions are also protected by law, the commenter states that the EPA should be seeking the same transparency privilege as that afforded the private sector. (6895)

- Commenter finds it hypocritical that EPA's proposal appears to not want to increase transparency for the thousands of chemicals in the millions of products we buy everyday citing the need for business to keep trade secrets confidential while pushing for unsubstantiated and unnecessary increases in transparency in science that could threaten public health. (6920)
- The EPA has excluded administrative proceedings where EPA and industry regularly rely on nondisclosed information and where EPA action in general, and particularly expeditious action, tends to favor industry. The commenter suggests that by limiting the proposal to "significant regulatory actions," the proposed rule would treat exactly the same study differently depending on whether it supports regulation or non-regulation in a particular context. The commenter adds that the proposed rule will tend to exclude evidence when it supports a health-protective regulation that is costly to industry, but the proposed rule will then allow the use of the exact same evidence when the ultimate agency decision avoids regulation or deregulates industry activities or otherwise has low compliance costs. Thus, according to the commenter, the Proposal is clearly shaped to favor industry interests, not to further transparency. For example, the commenter contends that the EPA's exclusion of the new chemicals program clearly favors industry, allowing industry to conceal information and evade regulation. In addition, the commenter asserts that the EPA cannot rationally impose stringent new disclosure requirements that exclude extensive peer-reviewed, high-quality studies in some contexts while simultaneously authorizing the commercial distribution of new chemicals with almost no disclosure and no peer-review. (9227)

Response: The EPA disagrees that the rule would be biased toward industry. As stated in 40 CFR 30.3, "The provisions of this part apply to science that serves as the basis for informing a final significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science." The rule requirements also direct the EPA to evaluate the availability of the underlying dose-response data for any subject matter expert, regardless of their affiliation. Further, the final rule dictates that the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or propriety information, available through restricted access in a manner sufficient for independent validation. Restricted access in the context of this rule means that data must be available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject

¹⁸⁹⁹ See proposed §30.5, which states that "(w)here the Agency is making data or models publicly available, it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security."

matter expert access to enough data to support independent validation while still protecting sensitive information. CBI data are not given different or preferential treatment.

Based on a consideration of these and other similar comments, the EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is an important aspect of EPA's regulatory actions and assessments it should be an important consideration in how the Agency considers pivotal science. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will continue to evaluate and consider all quality, relevant studies when promulgating final significant regulatory actions and finalizing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

According to the final rule, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence of a relationship between exposure and effect, the EPA will identify those studies based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. The EPA shall give greater consideration to pivotal science where the underlying dose-response data are publicly available in a manner sufficient for independent validation. The Agency shall give greater consideration to pivotal science based on dose-response data that include CBI, proprietary information or PII if these data are available through a data sharing mechanism sufficient to protect sensitive data, such as through an agreement with the originating author or institution or restricted access in a manner sufficient for independent validation.

Comment: Commenters (6109, 6144, 6915) note that the EPA statement that where "available and appropriate, EPA will use peer-reviewed information, standardized test methods, consistent data evaluation procedures, and good laboratory practices to ensure transparent, understandable and reproducible scientific assessments" displays a bias toward industry-backed research over research from independent and university scientists.

Commenter (6109) provides that GLP, a protocol that federal regulators apply to industrial laboratories, is infrequently used outside of industry. According to the commenter, this is because GLP is expensive and does not reflect science quality. The commenter notes that GLP regulations mandate methods for archiving data, record keeping, equipment calibration, etc., but they do not influence research design or methodology. Conversely, the commenter notes that academic researchers (who are frequently federally funded), on the other hand, follow scientific processes that are subject to the rigors of peer review and independent replication. According to the commenter, if EPA is to truly use the "best available science," it must focus on studies that use appropriate protocols and techniques, not merely favored recordkeeping processes.

Commenter (6915) adds that this would favor consideration of industry toxicology studies over equally valid peer reviewed studies from other institutions. Under current EPA risk assessment approaches, the commenter states that all relevant scientific data are considered.¹⁹⁰⁰ In contrast, the commenter asserts that this language indicates the proposed rule is significantly more restrictive than current EPA guidance as far as the types of valid peer-reviewed scientific data that can be considered.

According to the commenter (6915), it is critical to note that the phrase GLP referenced by EPA is not a value descriptor. Rather, the commenter explains that it is a technical term referring to a specific category of study conduct and reporting that is intended for specific regulatory purposes. The commenter provides that GLP/standardized test method studies are typically conducted by industrial or contract laboratories, and test for limited parameters in order to meet specific regulatory requirements, such as for registration of pesticides, drugs, and other products. The commenter adds that these protocols often have not been updated to incorporate recent approaches in toxicology, and they may not look at the most sensitive and relevant toxicological effects of the product being studied. In contrast, the commenter notes that other equally scientifically valid studies, typically conducted in research laboratories in academic, industrial, or government institutions, use specialized approaches to evaluate specific toxicological effects of the chemical under study, and may not follow the standardized protocols specified in regulatory requirements. The commenter asserts that the use of GLP protocols does not necessarily mean that the study is of higher quality, and there is no scientific reason that the data generated under the highly circumscribed regulatory requirements for product registration should receive greater weight than any other valid scientific data. Rather, the commenter suggests that all studies be evaluated on their own merits.

Similarly, commenter (6144) notes that the EPA's proposed rule alludes to EPA's use of GLP and standardized test methods where "available and appropriate." The commenter states that this would bias the literature supporting rules toward industry funded GLP studies, even though GLP practices are more about recordkeeping than upholding a high quality of research design. As an example, the commenter notes that a study reviewing the quality of GLP literature on the chemical bisphenol A (BPA) led the authors to conclude that "simply meeting GLP requirements is insufficient to guarantee scientific reliability and validity."¹⁹⁰¹ While GLP studies should not be excluded from EPA's consideration, the commenter contends that the highest quality assessment that EPA can engage in would be a systematic review approach that considers all relevant data and establishes criteria for study quality evaluation, as recommended by the NAS.

Response: The EPA considered these and other similar comments when developing the final rule. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The Agency will also continue to evaluate

¹⁹⁰⁰ See, e.g., Integrated Risk Info. System, Nat'l Ctr. for Env'tl. Assessment, Office of Research & Dev., U.S. Env'tl. Prot. Agency, Toxicological Review of Benzo[a]pyrene, xxxiii-xxxvi (2017), available at https://cfpub.epa.gov/ncea/iris/iris_documents/documents/toxreviews/0136tr.pdf.

¹⁹⁰¹ Myers, J.P., F.S. vom Saal, et al. 2009. Why public health agencies cannot depend on good laboratory practices as a criterion for selecting data: the case of Bisphenol A. *Environmental Health Perspectives*, 117(3):309-315. Doi: 10.1289/ehp.0800173. Online at <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2661896/>, Accessed June 24, 2018.

the quality of all relevant studies, consistent with the intended use of the information. The EPA disagrees that this rule will favor any stakeholder group. The EPA would also like to clarify that the purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information, and does not prescribe conformity with GLP or other standard practices.

Comment: Commenters (5022, 6881) note that the proposal runs counter to advice provided to EPA by the NRC in a way that favors industry.

Commenter (5022) contends that the pro-industry orientation of the proposal is revealed in its assault on the linearity assumption in the dose/concentration-response function which runs counter to the advice provided to EPA by the NRC, which stated, "[t]he committee recommends that cancer and noncancer responses be assumed to be linear as a default."¹⁹⁰²

Commenter (6881) notes that the "Science and Decisions" committee was clear that EPA's approach to dose response modeling needed to be changed to reflect growing scientific knowledge and the evolving needs of decision makers. The commenter notes that the proposed rule does not reflect the conclusions from the NRC committee (or other standard mechanisms by which changes in modeling and risk assessment practice are typically promulgated), and instead proposes prescriptive steps that, if taken in aggregate, would delay the risk assessment process and confuse risk managers, ultimately leading to paralysis by analysis.

Response: The EPA disagrees that this final rule favors industry. As stated in 40 CFR 30.3, "The provisions of this part apply to science that serves as the basis for informing a final significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science." The rule requirements also direct the EPA to evaluate the availability of the underlying dose-response data for any subject matter expert, regardless of their affiliation.

In response to public comments, the EPA clarified and modified many aspects of the proposed rule in the 2020 supplemental notice of proposed rulemaking and final rule, including that the rule requirements are now focused on dose-response data and do not apply to dose-response models.

The EPA also disagrees with commenters that requirements of this rule will result in any meaningful delay to its processes. While this rule does require the Agency to evaluate the availability of the underlying dose-response data for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., a small, though highly important, subset of all the studies EPA reviews).

Comment: Commenter (4881) notes that further evidence of an industry bias is reflected in the proposed rule itself by the complaint in footnote of the proposed rule preamble (footnote 3)

¹⁹⁰² National Research Council. Science and Decisions: Advancing Risk Assessment. Washington, D.C.: National Academies Press; 2009, p. 180.

about the Court decision in the case of *Coalition of Battery Recyclers Association v. EPA*, in which a central issue was precisely the “growing empirical evidence of non-linearity in the concentration-response function” that EPA now claims is its primary concern. The commenter provides that, in *Battery Recyclers*, the D.C. Circuit Court supported the EPA’s current practice with respect to scientific evidence, rather than that proposed in the new rule. In particular, the commenter notes that the Court upheld EPA’s use of evidence revealing important non-linearity in dose response to lead concentrations in the atmosphere, in the face of industry arguments opposing the claim of non-linearity. The commenter expresses that the EPA now appears to support the *Battery Recyclers*’ opposition, because the evidence used suggested a non-linearity opposite to that preferred by industry. The commenter provides that the evidence comprised four independent research studies of correlations between blood lead levels and the intelligence quotient (IQ) of young U.S. children. Rather than supporting a threshold effect, the commenter notes that the data indicated that incremental IQ loss actually increased at lower blood lead levels. The Agency thus based its revised standard for atmospheric lead concentrations on analyses of children with blood lead levels closest to the low average levels of children in the United States today. The commenter contends that, having failed to persuade the Circuit Court of its position, industry, it appears, has now found a friendly audience in the current EPA administration. The commenter explains:

The petitioners in the above case complained that EPA had relied more on actual research data for the most vulnerable population sector than on generic risk assessment models that would have suggested greater uncertainty regarding the non-linearity. The petitioners ignored the general argument that models are useful only to the extent that they maintain consistency with actual research data. The issue of lack of public access to the raw underlying data was raised for only one of the four independent research studies on which EPA relied. Had EPA been required to eliminate that study from consideration, as suggested by the proposed new rule, the Agency would have had a more difficult task to convince a court that they were fulfilling their responsibility “to protect the public health with an adequate margin of safety.”

Response: The EPA disagrees that the rule is biased in favor of industry. As explained in the preamble to the final rule, the EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will increase the transparency of the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety. The final rule also does not allow for the categorical exclusion of studies based on the availability of their underlying data.

Comment: Commenters (4840, 4884, 5019, 6132, 6137, 6144, 6171, 6351, 6868, 6876, 6912, 6955, 9227) specifically point to the tobacco industry lawyer tactic of attacking science/studies and other industry “secret assertion” tactics that did not benefit the industry as being similar to what they believe is the intent of the proposed rule. Several of these commenters provide background information to support their assertion and also note that these tactics were the basis of a failed attempt at legislation (i.e., HONEST Act) and bias in favor of the use of industry studies/industry.

Commenter (6132) notes that a past example of abuse by consultants to a vested interest resulted when the State of Georgia set up an Open Records Law. The commenter states that the RJ Reynolds Company used that law to obtain research data to attack study findings that the use of cartoon characters (such as "Joe Camel") in tobacco advertising influences children's product recognition.¹⁹⁰³ The commenter provides that the research was later validated in other studies, but the damage was done, and the physician involved left research for private practice. Thus, the commenter notes that this data release approach has already been tried in the past and has been shown to be too easily abused by vested interests. The commenter also points out that there is also a tobacco industry connection to the proposed rule. Just before the 1997 Open Data amendment was presented in the House, the commenter states that a December, 1996 memo from a consultant to the Tobacco industry,¹⁹⁰⁴ laid out a similar strategy to address federal agency science with respect to secondhand smoke, including a now familiar call for science "Transparency". The commenter states that the tobacco industry's past record of abuse of data they obtained under similar rules, in order to inappropriately attack researchers, makes obvious polluting industries' motive for this misguided change in EPA's handling of scientific data for decision-making.

Commenter (9227) adds that the history of the proposal's internal development indicates that certain representatives of regulated industries had a nearly exclusive role in its promulgation, and that industry concerns were given special solicitude by EPA's senior political leadership. Meanwhile, the commenter complains that the scientific community and the EPA's own SAB were neither involved in the evolution of the proposal nor notified of its initiation until after its official publication in the *Federal Register*.

Commenter (6351) notes that industries and their allies have been pushing to exclude studies for decades, using the same arguments found in EPA's proposal, targeting research that shows harm to public health from their products or their emissions. The commenter provides that, in 1996, attorneys working for tobacco industry giant R.J. Reynolds recommended a similar approach requiring review of documents "because, at some point in the future, EPA will most likely be ordered to re-examine ETS [Environmental Tobacco Smoke]."¹⁹⁰⁵ The commenter states that the EPA had issued its first report on ETS in 1992, concluding that secondhand smoke was responsible for approximately 3,000 deaths from lung cancer annually in nonsmoking adults.¹⁹⁰⁶ To prepare for the anticipated next report's likely conclusion of even greater harm from the products, the commenter provides that R.J. Reynolds attorneys developed a strategy to cast doubt on the studies while obscuring the company's real purpose. As they explained in the memo:

¹⁹⁰³ Burd, S. Scientists See Big Business on the Offensive, *The Chronicle of Higher Education*, Dec. 14, 1994. A26-A31.

¹⁹⁰⁶ U.S. Environmental Protection Agency. 1992. Respiratory Health Effects of Passive Smoking: Lung Cancer and Other Disorders. EPA Document Number 600/6-90/006F. (600690006F)

Because there is virtually no chance of affecting change on this issue if the focus is ETS, our approach is one of addressing process as opposed to scientific substance, and global applicability to industry rather than focusing on any single industrial sector. Thus the examples of questionable science, to justify these standards. Congress must require those examples serve as the test cases.¹⁹⁰⁷

The commenter (6351) adds that tobacco attorneys recommended expanding this approach to other industries,¹⁹⁰⁸ which quickly happened. Two of the early industry targets were landmark air pollution studies completed in the 1990s that found solid evidence that particulate matter air pollution could cause premature death.^{1909,1910} The commenter states that both studies found the particulate matter in the air was linked to increased risk of premature death. The commenter provides that the EPA incorporated these studies into their review of the research, leading to the first national standard for fine particulate matter (PM_{2.5}) in 1997 and were challenged in the 1990s by members of Congress and their industry supporters seeking access to the confidential patient information, arguing that the raw patient data should be public since the research was federally funded.¹⁹¹¹ The commenter adds that other scientists argued for more investigation of whether confounding factors, insufficient years of data collection or other limitations might mean that the findings were not as powerful as they appeared to be.¹⁹¹² According to the commenter, instead of blocking the studies, as this proposal would do, EPA took a logical step and referred both studies to an independent third party, the HEI, for a deep-dive review. There, the commenter notes, autonomous reviewers examined the data and developed a report on the two studies that confirmed their original findings.¹⁹¹³

Commenters (6137, 6144, 6912, 9227) provide a historical description of tactics/bias regarding sound science/secret science and the attempted HONEST Act legislation that they contend was the basis for the proposed rule. The commenters also highlight the proposed rule's biased treatment that favors industry studies over studies conducted by independent academic researchers. Some of their comments (which include points indicated by other commenters) are provided in the following paragraphs.

Commenter (6912) asserts that attempting to require the government to use only studies with publicly accessible data in its rulemaking, and thereby eliminating the most credible science based on actual health information, is a well-documented strategy with roots in the tobacco and fossil fuel industries. The commenter notes that during the mid-1990s, the tobacco industry and its lawyers and lobbyists strategized about changing the rules governing the use of science in agency rulemaking. Christopher Horner, then a lobbyist for the law firm Bracewell and Patterson

(now Bracewell), wrote a memo in 1996 to his client, R.J. Reynolds, outlining a strategy for how to head off future regulation of secondhand tobacco smoke. In this memo, the commenter states that Horner acknowledged that R.J. Reynolds has "virtually no chance" of stopping such a regulation unless the company is able to exercise "behind the scenes leadership" in "construct[ing] explicit procedural hurdles [EPA] must follow in issuing scientific reports."¹⁹¹⁴

The commenter (6912) expresses that Horner's recommended approach to constructing these procedural hurdles is strikingly similar to EPA's proposed rule. The commenter provides that Horner advised that R.J. Reynolds advocate for what he termed "sound science" criteria in rulemaking, requiring the data underlying any study to be publicly available and that a study's results be reproducible.¹⁹¹⁵ Horner further recommended that such a rule be implemented via either an EPA rulemaking or new legislation.¹⁹¹⁶

Commenter (6912) further explains that Horner suggested that oversight hearings on EPA's rulemakings to limit fine particulate matter (PM_{2.5}) and ozone serve as the congressional entry point for the tobacco industry's agenda.¹⁹¹⁷ Fine particulate matter and ozone are both principally generated by the burning of fossil fuels. The commenter adds that, by suggesting that the "sound science" initiative be launched around PM 2.5 and ozone rulemakings, Horner accomplished two goals: hiding the hand of the tobacco industry and helping broaden the coalition of industries supporting the initiative.

In fact, commenter (6912) states that the fossil fuel and electric utility industries were quite concerned about the potential for new regulations limiting PM 2.5 and ozone. The commenter provides that Citizens for a Sound Economy (CSE), a front group founded by Charles and David Koch of Koch Industries, opposed new PM 2.5 regulations.¹⁹¹⁸ CSE was led by C. Boyden Gray, an heir to the R.J. Reynolds tobacco fortune.¹⁹¹⁹ The commenter adds that Gray also ran another front group, the Air Quality Standards Coalition, which was created by the National Association of Manufacturers (NAM)¹⁹²⁰ to fight EPA air pollution regulations.¹⁹²¹

¹⁹²⁰ NAM counts many energy companies among its members. Current members include, among others, American Electric Power, Andeavor, Arch Coal, BP America, ConocoPhillips, Continental Resources, Devon Energy, DTE Energy, EnCana, Exxon Mobil, Koch Companies, Marathon Petroleum, Phillips 66, Shell Downstream, and Southern Company. See, "NAM Affiliated Organizations," National Association of Manufacturers, <http://documents.nam.org/LAW/Q4-2017.pdf> (viewed on June 21, 2018). [Link provided by commenter broken and substitute not found, however, members of the NAM's Council of Manufacturing Associations can be found at: <https://www.nam.org/alliances/council-of-manufacturing-associations/member-organizations/>]

¹⁹²¹ Brad Johnson, Republicans Wage Anti-`Secret Science' Campaign Against The EPA, Huff Post (June 25, 2014), https://www.huffpost.com/entry/secret-science-epa_n_5529521

Commenter (9227) also asserts that the proposal's justifications regarding the private-sector burden of regulatory costs reiterates concerns and suggestions about EPA's policy for evaluating science that the Agency received from industry itself and cites emails to EPA leadership from May 2014, the National Association of Manufacturers ("NAM") that specifically identified dozens of EPA regulations that were "affecting its members," many of which were chemical, air, and water regulations which were based upon the types of research and studies that would be excluded under EPA's proposed rule.¹⁹²²

In response to EPA's 2017 proposed rule, commenter (9227) provides that the Procedures for Prioritization of Chemicals for Risk Evaluations, NAM made recommendations that EPA ensure that Toxic Substances Control Act (TSCA) prioritization relied upon "the best available science" in a process that requires "a heightened level of transparency."¹⁹²³ The commenter notes that NAM also provided the EPA with materials that called for reform of EPA's "process for evaluating science to improve transparency and better involve the public."¹⁹²⁴ This, according to the commenter, parallels NAM's 2014 letter to the House in support of that year's version of Rep. Smith's HONEST Act.¹⁹²⁵ (Whom is discussed further below.)

The commenter (9227) adds that the American Petroleum Institute's (API) Senior Director of Regulatory and Scientific Affairs wrote to the EPA: "[t]he science and data used to support a regulation should be reviewed to determine if they are still valid based on scientific integrity, consistent with EPA's Principles of Scientific Integrity and Policy (2012), with meaningful disclosure of all potential areas of bias, guarding against manipulation or misinterpretation."¹⁹²⁶ The commenter adds that API also issued a press release on that same day, May 15, 2017, in which the organization summarized its conversations with EPA: "API today urged the EPA to adopt a regulatory system that enhances safety and protects the environment while prioritizing the production and refining of American natural gas and oil."¹⁹²⁷

In contrast, the commenter (9227) states that the EPA's SAB leadership was not notified of the rulemaking activity until it was published in the *Federal Register*, in contravention of Agency practices for communicating major actions such as the proposed rule.¹⁹²⁸ The commenter adds that the EPA also failed to provide the SAB with a description of the proposal.¹⁹²⁹ The

commenter notes that SAB leadership took note of the HONEST Act's connection to the proposal, stating the rule was "highly controversial" as indicated by the fact that "a similar legislative effort in the House has been stalled in Congress for several years."¹⁹³⁰

Commenter (6912) notes that the fossil fuel industry strongly supported the tobacco industry's so-called "sound science" initiative. By January 1997, the commenter states that Citizens for a Sound Economy (CSE) organized a protest at a Senate hearing on proposed EPA air pollution regulations. The commenter notes that protestors, dressed in white lab coats, held signs saying "Harvard, release the data!" in reference to a Harvard study demonstrating a link between PM2.5 pollution and increased mortality.¹⁹³¹ The commenter describes that an October 1997 memo obtained from Philip Morris lists the API, the Electric Power Research Institute (EPRI), and the Statistical Assessment Service, a climate denier front group funded by fossil fuel dynasties such as the Kochs and the Scaifes,¹⁹³² as three of the five organizations supporting the "sound science" initiative.¹⁹³³

In 1998, the commenter (6912) provides that the initiative was rebranded "secret science" by Powell Tate, a lobbying firm working for the tobacco industry.¹⁹³⁴ The commenter notes that "secret science" is of course the very phrase Pruitt used when announcing the proposed rule, writing "[t]he era of secret science at EPA is coming to an end."¹⁹³⁵ The commenter adds that Powell Tate recommended identifying a "catalyst organization" to push the initiative, and suggested NAM and the Business Roundtable as two possibilities.¹⁹³⁶ Both NAM and the Business Roundtable count many fossil fuel companies among their members.¹⁹³⁷

During the 1990s, commenters (6912, 9227) submit that Philip Morris (today, Altria) and public relations firm APCO partnered to create a front group to support its campaign to make it more

difficult for regulatory agencies to use scientific studies in rulemaking: The Advancement of Sound Science Coalition (TASSC).¹⁹³⁸ Commenter (6912) notes that, while a creation of big tobacco, the commenter states that TASSC's donors also included the oil companies Amoco, Chevron, ExxonMobil, and Occidental Petroleum.¹⁹³⁹ As such, the commenter adds that TASSC devoted significant efforts to challenging climate science and its executive director, Steve Milloy, helped shape the "Global Climate Science Communications Plan," an API project to develop a strategy to confuse and mislead the public about climate change.¹⁹⁴⁰ Commenter (9227) provides that TASSC led a worldwide publicity campaign in the 1990s to promote "Good Epidemiological Practices" that aimed at undermining U.S. and international regulatory efforts based on epidemiologic studies of passive smoking and lung cancer.¹⁹⁴¹

During the same period, commenter (9227) states that Philip Morris made it a strategic priority to pursue legislation and policies to require public disclosure of epidemiological data. A May 1997 planning document advocated for using "existing political and business coalitions" that opposed clean air regulations to promote "legislative solutions to ensure that public policy is based on sound science" and "require epidemiological studies to meet a minimum set of criteria and/or require researchers to make public the underlying data before these studies can be used as a basis for regulations at the state or federal level."¹⁹⁴² In 1998, the commenter adds that Powell Tate – a lobbying firm that represented R.J. Reynolds – organized a "secret science" working group focused on "requiring the disclosure of taxpayer-funded analytical data upon which federal and state rules and regulations are based, as well as the analytic data underlying health and safety studies funded by the government"¹⁹⁴³

Commenter (9227) provides that, although TASSC no longer exists, its executive director, Steve Milloy, continues the organization's "sound science" rhetoric against other types of regulation through his website, JunkScience.com.¹⁹⁴⁴ In fact, the commenter adds that Milloy has personally taken credit for EPA's proposal and was one of a select few invited to Pruitt's public announcement of the proposal earlier this year.¹⁹⁴⁵ After the proposed rule was announced,

Milloy told reporters, "I look at this as one of my proudest achievements. According to the commenter, the reason this is anywhere is because of Steve Milloy."¹⁹⁴⁶

Commenter (6912) suggests that Milloy, along with Horner and a small number of lawyers and lobbyists closely tied to the tobacco and/or fossil fuel industries,¹⁹⁴⁷ drove the industries' two-decade-long push to erect "procedural hurdles" to the use of science in rulemaking under the guise of defending "sound science" and defeating "secret science." The commenter notes that after Pruitt announced the proposed rule at an event to which Milloy was invited, Milloy declared that he'd been working on furthering the "secret science" initiative "for twenty years."¹⁹⁴⁸

Commenter (6144) asserts that the EPA's proposed rule is not a novel idea. The commenter notes that it originates from the tobacco industry, whose lawyers and lobbyists in the 1990s developed a version of this idea in an attempt to prevent the federal government from regulating second-hand smoke. The commenter provides that the goal back then, as it appears to be today, is to create "procedural hurdles" that would hamstring an agency's ability to implement policy that would protect public health.¹⁹⁴⁹ Furthermore, the commenter contends that the records obtained by the Union of Concerned Scientists through a FOIA request clearly illustrates that this proposal has never been about transparency, and definitely not about science. Under the direction of former Administrator Pruitt, the commenter states that the proposed rule was entirely driven by politics and a way to ignore the will of Congress by administratively implementing the misleadingly named HONEST Act of 2017. The commenter notes that one email sent by an EPA political appointee to his colleagues most accurately describes this proposed rule. In an email dated January 16, 2018, the staffer writes that this idea, if implemented, would result in "no regulation (going) into effect unless the scientific data is publicly available for review."¹⁹⁵⁰ It seems clear that in proposing this rule, EPA's intent is to prevent the promulgation of public health and environmental safeguards, and not increase access to information.

Commenters (6868, 6876) add that the tobacco industry lawyer who authored this 1996 document served on the Trump EPA Transition Team and that it appears that the EPA is literally adopting policy developed by the tobacco industry to undermine the public confidence in pivotal scientific studies. Following Donald Trump's election, the commenter (6912) submits that Milloy

joined the EPA transition team, as did Horner.¹⁹⁵¹ The commenter adds that Milloy celebrated EPA's proposed rule limiting science in rulemaking on Twitter, noting that he was "inside the administrator 's office:"

Commenter (6137) notes that industry lobbied Congress in an effort to gut environmental and health laws by attacking the science upon which they are based. For example, the commenter states that both the Secret Science Reform Act of 2014 and the Secret Science Reform Act of 2015 provided that EPA may not take action “unless all scientific and technical information relied on to support such covered action is . . . publicly available online in a manner that is sufficient for independent analysis and substantial reproduction of research results.”¹⁹⁵² Two years later, after its prior unsuccessful attempts, the commenter states that the House passed the HONEST Act in March 2017, which again would have limited EPA’s ability to perform any assessment or analysis based on science if the public does not have complete access to the underlying data.¹⁹⁵³ When these bills did not succeed, the commenter notes that industry looked to a new audience to try put in place what Congress failed to enact: a ban on consideration of science when making regulatory decisions critical to public health and the environment if the underlying data is not made publicly available.

Commenter (6137) states that industry pitched EPA hard, and found a willing ear, complaining that air pollution limits and toxin tolerances were being set at levels that were too stringent. Given that the strong Congressional mandate expressed in numerous statutes for strict health protections would require EPA to act if the science demonstrated a risk to public health, the commenter contends that industry saw that their best bet was to knock out the science, this time through EPA itself.¹⁹⁵⁴ The commenter provides that industry groups, including the National Association of Manufacturers and American Petroleum Institute, “pitched EPA a Proposal last spring that closely resembled what became Administrator Scott Pruitt’s ‘secret science’ plan,” according to EPA internal documents.¹⁹⁵⁵ This plan closely tracks the longstanding attacks on

¹⁹⁵⁵ Id.

EPA science from these groups.¹⁹⁵⁶ According to the commenter, EPA was responsive to the industry pitch and met with industry groups dozens of time, while repeatedly canceling the few scheduled meetings with public health advocates.¹⁹⁵⁷

Commenter (6137) states that after EPA published its final Risk Assessment for Environmental Tobacco Smoke (secondhand smoke) in 1992, which concluded that secondhand smoke “is a human carcinogen, responsible for approximately 3,000 lung cancer deaths annually in U.S. nonsmokers,”¹⁹⁵⁸ the commenter notes that the tobacco industry went on the attack. The commenter states that the Risk Assessment had been based in part on a meta-analysis of “31 epidemiologic studies from 8 different countries” which showed a significant risk of harm.¹⁹⁵⁹ The commenter contends that recognizing that “[v]igorous denial is not a satisfactory defensive strategy” and that “the most significant [secondhand smoke] problem facing the Industry is the result of epidemiological studies which indicate” a risk from exposure, the tobacco industry decided to attack epidemiological science.¹⁹⁶⁰ The commenter adds that industry lawyers candidly noted that “there is virtually no chance of affecting change on this issue if the focus is” secondhand smoke so “our approach is one of addressing process as opposed to scientific substance, and global applicability to industry rather than focusing on any single industrial sector.”¹⁹⁶¹ Shortly thereafter, the commenter states that one of RJ Reynolds’ lobbying firms organized a “Secret Science” Work Group to “[f]ocus public attention on the importance of requiring disclosure of taxpayer-funded analytical data.”¹⁹⁶²

The commenter (6137) asserts that the Proposed Rule is just another effort to hide evidence of the public health harm of toxic chemicals, given that there is no way to change the research results showing the deleterious effects.¹⁹⁶³ And this time, the commenter states that the effort is much broader, as it is not hiding evidence related to just one industry or one product. According to the commenter, EPA should not be permitted to “deliberately misle[a]d the public about the risks of” certain pollutants or other chemicals by hiding evidence of their harms.¹⁹⁶⁴ As several courts have found, the commenter concludes that the best available politics does not equate to the

¹⁹⁶⁴ Id.

“best available science,”¹⁹⁶⁵ so while this Proposed Rule may serve EPA’s political ends, it does not meet the mandates of sound science.

Commenter (6912) notes that another key player in the push to limit science in rulemaking is Texas Congressman Lamar Smith. The commenter provides that Smith has been the chairman of the House Committee on Science, Space, and Technology since 2013. According to the commenter, the oil and gas industry is Smith's largest source of campaign donations, contributing nearly \$800,000,¹⁹⁶⁶ and Smith has drawn most of his committee staff from the fossil fuel industry.¹⁹⁶⁷ In his role as chairman of the House Science Committee, the commenter suggests that Smith has embraced the "secret science" initiative championed by Milloy, Horner, and the network of tobacco and fossil fuel industry-funded front groups that employ them. According to the commenter, in a 2013 op-ed in the *Wall Street Journal*, Smith attacked EPA for not releasing the data underlying two important peer-reviewed studies¹⁹⁶⁸ that demonstrated the increased mortality associated with exposure to fine particulate matter.¹⁹⁶⁹ The commenter adds that, following several letters to EPA demanding the underlying data for these studies, Smith issued a subpoena to EPA, notwithstanding the fact that Harvard University and the ACS, not EPA, possessed the confidential public health data at issue.¹⁹⁷⁰

Commenter (6912) provides that, realizing he could not force EPA to turn over documents it did not possess, Smith introduced legislation to prohibit EPA from considering scientific studies whose underlying data were not public. In 2015 the commenter states that he introduced the Secret Science Reform Act,¹⁹⁷¹ a bill supported by ExxonMobil, Integrys Energy Group, CMS Energy, Duke Energy, the Edison Electric Institute, the U.S. Chamber of Commerce,¹⁹⁷² Peabody Energy, and NAM.¹⁹⁷³ In 2017, Smith introduced the Honest and Open New EPA Science Treatment Act of 2017 (HONEST Act), which, like the Secret Science Reform Act before it, would prohibit EPA from considering scientific studies whose underlying data are not public.¹⁹⁷⁴

¹⁹⁷⁴ H.R.1430 (115th Congress), <https://www.congress.gov/bill/115th-congress/house-bill/1430> (viewed on June 25, 2018)

Once again, the commenter suggests that energy interests, including ExxonMobil, the U.S. Chamber of Commerce, and NAM all lobbied in support of the bill.¹⁹⁷⁵

Similarly, commenter (9227) asserts that a close examination of the history of this Proposal confirms that its purpose is not to strengthen science at EPA, but to undermine public health and environmental protections by arbitrarily blinding the agency to vital research. The commenter adds that the proposal resembles proposals advanced by the tobacco industry for the specific purpose of suppressing public health science warnings about the dangers of tobacco smoke.¹⁹⁷⁶ The Proposal also resembles failed legislation in Congress that was similarly advanced by industry interests seeking to undermine public health and environmental protections, and criticized by scientific experts.¹⁹⁷⁷

Commenter (9227) also provides arguments regarding how the proposal is an outgrowth of the failed HONEST Act congressional bill:

Internal and external EPA communications illustrate that the HONEST Act served as a precursor to EPA's Proposal. The intertwined history of the HONEST Act and EPA's Proposal cast doubt on the Agency's proffered rationale.

The HONEST Act

The HONEST Act¹⁹⁷⁸ is a House bill introduced in 2017 by sponsor Representative Lamar Smith (R-TX), and is the latest manifestation of various bills aimed at undermining EPA regulation through limitations on the types of scientific research the Agency may use.¹⁹⁷⁹ The HONEST Act and these related bills were introduced and passed in the House three times, but each time, failed to progress in the Senate.¹⁹⁸⁰

Like the current Proposal, the HONEST Act was touted by its proponents as an effort to enhance the transparency and credibility of regulatory science at EPA. But the HONEST Act—like the Proposal—would in fact have had the effect of limiting the scope and

¹⁹⁷⁵ Clients lobbying on H.R. 1430: HONEST Act, Center for Responsive Politics, <https://www.opensecrets.org/lobby/billsum.php?id=hr1430-115> (viewed on June 26, 2018)

Mike Rounds and Sen. Kamala Harris (May 25, 2017) (opposing HONEST Act, H.R. 1430), https://www.amstat.org/asa/files/pdfs/POL-HONEST_ActLetter.pdf.

¹⁹⁷⁸ HONEST Act, H.R. 1430, 115th Cong. (2017).

¹⁹⁷⁹ See Secret Science Reform Act of 2014, H.R. 4012, 113th Cong. (2014); Secret Science Reform Act of 2015, H.R. 1030, 114th Cong. (2015); H.R. 1430; HONEST Act, S. 1794, 115th Cong. (2017).

¹⁹⁸⁰ On March 2017, Representative Smith introduced the HONEST Act in the 115th Congress. On March 29, 2017, the bill passed the House without amendment. Most recently, Senator Mike Rounds (R-SD) introduced a Senate version of the HONEST Act on September 12, 2017. As with past versions of the bill, the Senate referred the Bill to the Committee on Environment and Public Works, but took no further action.

quality of science underlying EPA actions. Indeed the HONEST Act was widely criticized and opposed by scientists, scientific organizations, medical organizations and other scientific authorities for precisely this reason. For example, eight public health and medical associations including the American Lung Association, American Public Health Association, National Medical Association, and Physicians for Social Responsibility issued an open letter to Congress in spring 2017 opposing the HONEST Act because it “would limit the kinds of scientific data EPA can use as it develops policy to protect the American public from environmental exposures and permit violation of patient confidentiality.”¹⁹⁸¹ The American Association for the Advancement of Science and twenty-two other leading scientific organizations and research universities likewise sent a letter to House Majority Whip Kevin McCarthy in March 2017 opposing the bill and warning that it could lead to a “situation where the EPA would be prevented from using the best available science and disseminating public information in a timely fashion.”¹⁹⁸² As we have noted elsewhere in these comments, the CBO – after consulting with EPA staff – likewise concluded that the HONEST Act would “significantly reduce the number of studies that the agency relies on when issuing or proposing covered actions.”¹⁹⁸³

That the HONEST Act would suppress rather than promote good science at EPA is not surprising, given that the sponsors of the HONEST Act have a history of rejecting established climate science and strong ties to industries that would benefit from limiting the role of science in EPA rulemakings. Representative Lamar Smith is widely known as an opponent of mainstream climate science and public health and environmental safeguards.¹⁹⁸⁴ In a July 24, 2017 opinion piece, Representative Smith lauded the benefits of increased atmospheric carbon dioxide: “A higher concentration of carbon dioxide in our atmosphere would aid photosynthesis, which in turn contributes to increased plant

But the truth is there are more questions about climate change than there are answers. For instance, even the most advanced climate models all failed to predict the lack of warming the Earth has experienced over the last 18 years.”); Lamar Smith, The Climate Change Religion, The Wall Street Journal: Opinion | Commentary (Apr. 23, 2015, 7:35 PM), <https://www.wsj.com/articles/the-climate-change-religion-1429832149>, (“When assessing climate change, we should focus on good science, not politically correct science.”); Lamar Smith, Smith: EPA Hides Truth about Climate Regulations, Media Center: Press Releases (Aug. 13, 2014), <https://lamarsmith.house.gov/mediacenter/press-releases/smith-epa-hides-truth-about-climate-regulations>.

growth.”¹⁹⁸⁵ Smith and the sponsor of the Senate version, Mike Rounds, also receive substantial contributions from the same industries that will benefit from the proposal.¹⁹⁸⁶

Representative Smith also has ties to EPA staff who drafted the proposal, underscoring the close connection between his failed legislation and this proposed rule. Dr. Richard Yamada, former professional staff member on Smith’s House Committee on Science, Space & Technology now serves as the Deputy Assistant Administrator for EPA’s Office of Research and Development.¹⁹⁸⁷ At EPA, Dr. Yamada has participated in the drafting and development of the Agency’s version of the proposal.¹⁹⁸⁸

The HONEST Act as Predecessor for the Proposal

As this section details, it is clear that the HONEST Act is a direct predecessor of this proposed rule and that both initiatives share the same purpose: to undermine EPA’s use of rigorous science in crafting health and environmental protections. The language used in the proposal shares strong similarities with the HONEST Act. Furthermore, internal and external communications from EPA leadership demonstrate the proposal’s origins in the HONEST Act.

While lengthier than the congressional HONEST Act, EPA’s proposal contains parallel language to the bill. One can compare examples from the text of the 2017 HONEST Act as passed in the House, to the text of the proposal from the Final *Federal Register* Notice:

The HONEST Act of 2017

An Act: To prohibit the [EPA] from proposing, finalizing, or disseminating regulations or assessments based upon science that is not transparent or reproducible....

The Administrator shall not proposed, finalize, or disseminate a covered action unless all scientific and technical information relied on to support such covered action is—(A) the best available science; (B) specifically identified; and (C) publicly available online in a

Mike Rounds – South Dakota: Summary, Open Secrets: Congress, <https://www.opensecrets.org/members-of-congress/summary?cid=N00035187&cycle=CAREER&type=I> (last visited June 14, 2018).

¹⁹⁸⁷ EPA, Dr. Richard Yamada, EPA Research, <https://www.epa.gov/research/dr-richard-yamada>. (last updated Jan. 12, 2018). [Link provided by commenter broken and substitute not found.]

¹⁹⁸⁸ Email from Richard Yamada, Deputy Assistant Adm’r, Office of Research and Dev., to Drew Feeley, Policy Counsel, Office of Policy; Brittany Bolen, Acting Assoc. Adm’r, Office of Policy; Clint Woods, Deputy Assistant Adm’r, Office of Air and Radiation; Justin Schwab, Deputy Gen. Counsel, Office of Gen. Counsel; Erik Baptist, Senior Deputy Gen. Counsel, Office of Gen. Counsel; and Nancy Beck, Deputy Assistant Adm’r, Office of Chem. Safety and Pollution Prevention (Jan. 29, 2019, 10:58 PM), <https://drive.google.com/file/d/1peMXjBhq6lUYGGNBWbSjpOu1Zh-qLl4p/>.

manner that is sufficient for independent analysis and substantial reproduction of search results....¹⁹⁸⁹

Strengthening Transparency in Regulatory Science Proposal: EPA shall clearly identify all studies (or other regulatory science) relied upon when it takes any final action. EPA should make all studies available to the public to the extent practicable . . . When promulgating significant regulatory actions, the Agency shall ensure that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation.¹⁹⁹⁰

The best available science must serve as the foundation of EPA’s regulatory actions.¹⁹⁹¹

Responsive records released to the Union of Concerned Scientists (“UCS”) make evident that the HONEST Act served a predecessor to the proposal. Administrator Pruitt’s schedule reveals that he met with Representative Smith on January 9, 2018, less than four months before the *Federal Register* announcement of the proposal.¹⁹⁹² Emails from Pruitt and his staff, dated just over a week after that meeting, indicate that Smith was working on a “pitch that EPA internally implement the HONEST Act.”¹⁹⁹³ Subsequent emails sent between Pruitt’s EPA staff in February 2018 demonstrate that EPA officials promptly began drafting the proposal.¹⁹⁹⁴

Before Smith’s internal EPA ‘pitch,’ Agency leadership commented favorably on the HONEST Act of 2017. Although EPA initially estimated that implementation of the act would cost over \$250 million per year,¹⁹⁹⁵ that estimate was never reported to the CBO. As CBO’s cost estimate determination indicates, EPA political leadership diverged from the earlier estimate and instead assured CBO that the bill could be implemented “with

minimal funding.”¹⁹⁹⁶ Several news sources have reported that the Administrator’s Office of the EPA became involved in communications with CBO, and decided to respond to CBO directly with the assurance the bill could be implemented at ‘no cost.’¹⁹⁹⁷

Finally, in an exclusive interview with the Daily Caller shortly before the proposal’s publication, former Administrator Pruitt promised:

If we use a third party to engage in scientific review or inquiry, and that’s the basis of rulemaking, you and every American citizen across the country deserve to know what’s the data, what’s the methodology that was used to reach that conclusion that was the underpinning of what — rules that were adopted by this agency.

The Daily Caller directly linked the proposal to the HONEST Act, “Pruitt’s pending science transparency policy mirrors Smith’s HONEST Act, which passed the House in March 2017.”¹⁹⁹⁸

Spokeswoman for Chairman Smith’s House Committee on Science, Space, and Technology, Thea McDonald, also told the Daily Caller: “[t]he chairman has long worked toward a more open and transparent rule-making process at EPA, and he looks forward to any announcement from Administrator Pruitt that would achieve that goal.”¹⁹⁹⁹

Response: The EPA, the federal government, the international scientific community, and Congress have pursued efforts to increase data sharing and transparency for many years. The EPA is committed to furthering this effort with the implementation of this final rule. This rulemaking is in no way related to any industry, including the tobacco or energy industries, or an EPA review of environmental tobacco smoke. The EPA’s attention to data transparency is responsive to the broader interest in greater data transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members of the public, scientific community, and Congress on the transparency of the scientific basis for EPA’s decisions in previous influential scientific information assessments and regulatory actions. Although these criticisms helped shape the rulemaking, the actual text of the rulemaking was initiated and revised by EPA personnel and was not overly influenced by any particular stakeholder.

The EPA provides more detail explaining its rationale for this rule in the preamble for the final rule. In brief, the transparency provisions in this final rule are intended to build upon existing efforts and provide incremental progress toward the Agency’s overarching goal of greater

¹⁹⁹⁹ Id.

transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a good government principle that is inherently valuable to the public. The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journal publishers and the emergence of several international organizations and initiatives focused on increased transparency and data sharing in science. The EPA supports these efforts and believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation provides additional certainty and increases the transparency of the EPA's scientific analyses and resulting regulatory actions. The incremental progress made by this rule provides an important step towards prioritizing transparency in the EPA's most impactful rules and assessments and will inform future statute-specific rulemakings.

In consideration of public comments on this rulemaking, the EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is a very important aspect of EPA's regulatory actions and assessments it should be an important consideration in how the Agency considers pivotal science. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating final significant regulatory actions and finalizing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The EPA disagrees with commenters that requirements of this rule will result in procedural hurdles resulting in any meaningful delay in promulgating regulations. While this rule does require the Agency to evaluate the availability of underlying dose-response data for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., a small, though highly important, subset of all the studies EPA reviews).

Comment: Commenters (6125, 6144, 6912, 6944, 9227) suggest that the pre-proposal correspondence between senior political officials at EPA, the Deputy Assistant Administrator for Chemical Safety and Pollution Prevention and industry, and the resulting proposal infer an industry bias.

Commenter (6944) suggests that the manner in which this rule was initiated began the process by clearly indicating whose input the EPA Administration would be considering and provided a clear example of what a predetermined (or desired) outcome would be as applied under this rule and what the Administrator and his staff considered as acceptable "peers" for review purposes. The commenter notes that conducting meetings with, and accepting input from, private sector business and industry that seek to reduce the regulatory impact and authority of the EPA, while essentially shutting out various environmental parties does not provide a good example of what

will be accepted by the Agency Administrator and Staff as “transparent, understandable, and reproducible scientific assessments”

In early 2018, having been unsuccessful at moving his HONEST Act through Congress, the commenter (6912) asserts that Texas Congressman Lamar Smith (Rep.Smith) took his case directly to Administrator Pruitt (as noted previously). On January 16, the commenter states that Pruitt met with Smith to discuss implementing the HONEST Act at EPA.²⁰⁰⁰ The commenter adds that, just a few days prior to Pruitt's meeting with Smith, internal EPA emails reveal that political appointees indicated that they had identified "a path forward" on the "secret science" initiative.²⁰⁰¹ These emails were sent between Brittany Bolen, EPA Senior Deputy Associate Administrator for Policy and former counsel for Senator Jim Inhofe,²⁰⁰² Richard Yamada, EPA Research and Technology Policy Advisor and former aide to Congressman Lamar Smith,²⁰⁰³ Erik Baptist, EPA Senior Deputy General Counsel and former senior counsel for API,²⁰⁰⁴ and Ryan Jackson, EPA Chief of Staff and former chief of staff for Senator Inhofe.

Commenter (6144) contends that EPA also appears to be more concerned with protecting industry data and CBI than with protecting public health information. According to the commenter, this disparity is exemplified by the fact that the agency requests that commenters provide feedback on how to balance protections for copyrighted and CBI but does not seek similar advice on how to protect patient health data. Furthermore, the commenter notes that emails obtained by Union of Concerned Scientists (UCS) through a FOIA request show that top EPA officials responsible for drafting the proposed rule, including Dr. Beck and her colleague Dr. Richard Yamada, the Deputy Assistant Administrator for the Office of Research and Development (ORD), struggled with how to incorporate exemptions and limit the impact on industry data.²⁰⁰⁵ The commenter adds that comments raised by Dr. Beck on how to protect CBI are also very similar to those in her testimony in front of a Senate Homeland Security and Government Affairs subcommittee, where she represented her former employer, the American Chemistry Council, whose membership has a significant financial interest in EPA regulatory matters.²⁰⁰⁶

²⁰⁰⁵ Kothari, Y. 2018. Internal EPA Emails Confirm that Scott Pruitt's Secret Science Proposal Is Entirely Driven By Politics, April 19. Online at <https://blog.ucsusa.org/yogin-kothari/internal-epa-emails-confirm-that-scott-pruitts-secret-science-proposal-is-entirely-driven-by-politics>, Accessed August 10, 2018.

²⁰⁰⁶ Beck, N. 2017. Written Statement before the U.S. Senate Committee on Homeland Security and Governmental Affairs, Subcommittee on Regulatory Affairs and Federal Management, Regarding a Hearing on the Agency Use of Science in the Rulemaking Process: Proposals for Improving Transparency and Accountability, March 9. Online at <https://www.hsgac.senate.gov/imo/media/doc/BECK%20TESTIMONY.pdf>, Accessed August 10, 2018.

Commenter (9227) provides that EPA documents released in response to FOIA requests relating to the Proposal show that Trump Administration appointees deliberately tailored the scope of the Proposal in order to promote industry interests. Commenter (6125, 6912) notes that emails released pursuant to FOIA requests reveal that senior political officials at EPA did not know that pesticide registrations depend on information which is protected from disclosure to the public. The commenter states that when this was pointed out to them by Nancy Beck, Deputy Assistant Administrator for Chemical Safety and Pollution Prevention and a former senior director of regulatory science policy at the American Chemistry Council raised concerns that requiring underlying data be publicly available would create a problem for the chemical industry,²⁰⁰⁷ the draft proposal was revised so that it would not cover licensing actions like pesticide registrations and other activities providing a benefit to industry.²⁰⁰⁸ Commenter (9227) adds that this industry considers chemical testing data to be CBI.²⁰⁰⁹ Several commenters (6144, 6912, 9227) state that FOIA requests indicate that Yamada assured Beck that he would address her concerns, responding he "didn't know about the intricacies of CBI - ok, we will need to thread this one real tight!"²⁰¹⁰

The commenter (6144) expresses that they believe the emails also show the lack of engagement with the independent scientific community, let alone EPA's own scientists. In addition, the commenter adds that the emails show that EPA not once considered the impact of this proposed rule on its ability to protect human health and the environment.

Commenter (6144) contends that the EPA is seeking an opportunity to protect data for the industries it is supposed to regulate at the expense of science-based public health safeguards. The commenter asserts that the focus on protections for industry over the public health research community illustrates that the agency is not interested in seeking actual transparency in decisionmaking through this proposed rule. The commenter asserts that the focus on protections for industry over the public health research community illustrates that the agency is not interested in seeking actual transparency in decisionmaking through this proposed rule. Commenter (9227) states that this distinction between using studies when they confer a benefit on industry but disallowing them when used to influence public health protection is not only arbitrary but insidious. Commenter (6144) states that the proposal is irretrievably tainted at its inception as a result. Commenter notes that this bias is affirmed by Dr. Yamada's response to an

²⁰⁰⁷ Nancy Beck, LinkedIn, <https://www.linkedin.com/in/nancybbeck/> (viewed on June 26, 2018)

²⁰⁰⁸ The commenter provides one of the relevant e mails, where Ms. Beck explains that the proposal will have to be amended so as not to affect industry submissions under FIFRA and TSCA: So for pesticide registrations, the regulation ... requires a huge amount of data to be submitted to the agency-- it costs companies millions of dollars...My understanding is that these studies come in as CBI but for a large majority of these, the CBI can be waived and the data made available (on request). Making data available is very different from a publication requirement....There will also be a problem for TSCA where for many existing chemicals ... companies conduct OECD guidelines studies ... The directive needs to be revised. Without change it will jeopardize our entire pesticide registration/re-registration process and likely all TSCA risk evaluations.

²⁰⁰⁹ January 31, 2018 2:51 PM email from Nancy Beck to Richard Yamada, Erik Baptist, and Justin Schwab, <https://www.expressnews.com/news/local/article/Lamar-Smith-EPA-10924598.php> (viewed on June 26, 2018)

²⁰¹⁰ January 31, 2018 7:54 PM email from Richard Yamada to Nancy Beck, Erik Baptist, and Justin Schwab, <https://www.expressnews.com/news/local/article/Lamar-Smith-EPA-10924598.php> (viewed on June 27, 2018)

email from Dr. Beck, where he writes that he “didn’t know about the intricacies of [confidential business information]” and that the agency would have to “thread this one real tight!”²⁰¹¹

Commenter (6912) asserts that, although it would be blatantly biased to treat industry studies differently than ones conducted by independent academic researchers, EPA found a way to “thread this one tight.” The commenter submits that the proposed rule allows the Administrator to waive the data availability requirement for any study if it is not feasible to make the underlying data publicly available “in a manner sufficient for independent validation, in a fashion that is consistent with law, protects privacy, confidentiality, *confidential business information*, and is sensitive to national and homeland security.”²⁰¹² (Emphasis added.)

Response: The EPA’s attention to data transparency is responsive to the broader interest in greater data transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members of the public, scientific community, and Congress on the transparency of the scientific basis for EPA’s decisions in previous influential scientific information assessments and regulatory actions. Although these criticisms helped shape the rulemaking, the actual text of the rulemaking was initiated and revised by EPA personnel and was not overly influenced by any particular stakeholder. As described more fully in the preamble to the final rule, the transparency provisions are intended to build upon existing efforts and provide incremental progress toward the Agency’s overarching goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a good government principle that is inherently valuable to the public. The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journal publishers and the emergence of several international organizations and initiatives focused on increased transparency and data sharing in science. The EPA supports these efforts and believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation provides additional certainty and increases the transparency of the EPA’s scientific analyses and resulting regulatory actions. The incremental progress made by this rule provides an important step towards prioritizing transparency in the EPA’s most impactful rules and assessments and will inform future statute-specific rulemakings.

The EPA disagrees that the rulemaking was heavily influenced by or designed to benefit industry or provide preferential treatment to industry data. The EPA seeks to appropriately protect all sensitive information (i.e., PII, CBI, proprietary information) in this rule by providing equal consideration of studies with data that is publicly available or available through restricted access or, in the case of data that cannot be appropriately safeguarded, consideration of technical factors in 40 CFR 30.5(e) or an Administrator’s exemption under 40 CFR 30.7 that would also allow

²⁰¹¹ Waldman, S. and N. Heikkinen. 2018. Trump’s EPA wants to stamp out ‘secret science.’ Internal emails show it is harder than expected. E&E News, April 20. Online at <http://www.sciencemag.org/news/2018/04/trumps-epa-wants-stamp-out-secret-science-internal-emails-show-it-harder-expected>, Accessed August 10, 2018.

²⁰¹² “Strengthening Transparency in Regulatory Science,” 83 FR 18768, 18774, <https://www.federalregister.gov/documents/2018/04/30/2018-09078/strengthening-transparency-in-regulatory-science>

greater consideration to be given in the absence of data availability. Further, the Agency treats all valid claims of CBI equally under the statutes that it administers, regardless of the entity that generates it. The treatment of CBI in this rule or under the statutes that the EPA administers does not give preferential treatment to industry. In both the NPRM and SNRPM the Agency asked the public to comment on all forms of confidential information, including PII and how best to protect that information while still facilitating the transparency intentions of the rule.

The EPA also wishes to clarify that public input was an important part of shaping the final rulemaking. The EPA accepted public comment on the proposed rule from April 30, 2018 to August 16, 2018, and held a public hearing on July 17, 2018. In response to public comments, the EPA released a supplemental notice of proposed rulemaking and took public comment from March 18, 2020 to May 18, 2020. All of these comments were considered in developing the final rule.

Finally, the final rule maintains language in 40 CFR 30.3 stating that the statutes and regulations will control in the event of any conflicts, and clarifies in the preamble that the requirements in this final rule set the overarching structure and principles for transparency in the EPA's final significant regulatory actions and influential scientific information. The EPA intends to develop internal implementing guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes that the EPA administers.

2.1.3.5 Deliberate Attempt to Limit Science Used for Decision-Making

Comment: Commenters (1272, 1390, 1589, 1997, 2428, 2495, 2501, 2905, 4840, 5016, 5019, 6107, 6132, 6446, 6915, 8281-PH5, 9227) suggest that the Proposal is a deliberate/intentional attempt to limit science used for decision-making. Comments include:

- Commenter (1272) states that applying the proposed rule to decision making would decimate the amount of research policy makers had access to and would unfairly skew the information available to those parties. Commenter (1272) states that applying the proposed rule to decision making would decimate the amount of research policy makers had access to and would unfairly skew the information available to those parties.
- Commenter states that scientific methods are based upon healthy skepticism. According to the commenter, determining that scientific findings will be ignored or considered, when forming public policies, based upon conditions that exceed the criterion for peer-reviewed presentations in scientific meetings and scientific publications is not important for transparency. The commenter asserts that the EPA Administrator, EPA, and other government agencies should not be developing or considering any definitions - about what science is and is not worthy for informing public policy --- that are incongruent with the consensus of scientific community. (1390)
- According to the commenter, the entirety of the proposed rule is steeped in purposefully obtuse and misleading language and the logic of the rule is dubious and built on unfounded suppositions, misrepresented data, and spurious conclusions, within the guise of increasing "transparency." (1589)

- Commenter (1997) states that the proposed rule is designed to make it so that the EPA can't use most of the best research on human health or cognitive outcomes (e.g. test scores), since most studies of human health and cognitive outcomes use restricted data sets. (1997)
- The Proposal is nothing more than an attempt to remove valid, relevant and peer-reviewed scientific data from the rule-making process without having provided the necessary scientific input to back up this proposal and suggests that the proposal be rejected. (2428)
- Commenter asserts that they believe that the purpose of this proposal is not to achieve "transparency," but rather to remove valid and relevant scientific evidence from the rule-making process to bias the outcome. (2495)
- Commenter questions whether the EPA wants to regulate scientific research by making it available to the public is honestly for openness and transparency. Instead, the commenter suspects that the purpose is to derail science by subjecting it to scrutiny by people who don't understand or oppose it. Could the proposed regulation's intent be to someone's financial or ideological benefit? Or to slow scientific communication to a snail's pace? (2501)
- The proposed rule is designed to slow down the scientific process by requiring EPA to provide all raw data, including CONFIDENTIAL medical and business information, which would both jeopardize the studies and tie up EPA employees in a tangle of sifting, redacting, and plowing through unnecessary hurdles to providing scientific information. Rather than providing transparency, the commenter contends that it is a transparent attempt by this Administration to undermine science and sabotage the work of the EPA. (2905)
- Certainly, according to the commenter, calls for transparency and reproducibility sound reasonable, but exposing poorly conducted studies is not what this effort is about. Instead, the commenter contends that the proposal is designed to impose onerous and burdensome requirements on independent researchers, and would result in much environmental health science, particularly epidemiologic studies, being excluded from the evidence base and becoming irrelevant to efforts by EPA to protect the public and the environment. The commenter states that valuable research findings in areas like climate change, lead exposure and particulate pollution would be ignored. (4840)
- The commenter asks:
 - Why would the EPA's political leadership not want to add to the studies?
 - I know they are on the "drill baby drill" ilk, but why would they want to expose themselves and the public to possible adverse health effects of these new pollutants?
 - Additionally, why is the EPA curtailing the activities of their staff scientists who are so experienced? (5016)
- The proposal is intentionally misleading and being sold by EPA leadership as an effort to increase "transparency." The commenter contends that the facts suggest that the real motivation is simply to sweep under the rug the scientific evidence disfavored by polluting companies. The commenter notes that the flimsy proposal was designed without adequate input from the scientific community, according to members of EPA's own SAB. The commenter adds that it was rushed through the regulatory process and was originally

proposed with a gallingly short public comment period, suggesting an intention of casting less light on the rulemaking process, not more. (5019)

- Forcing EPA to ignore such private (and appropriately non-public) data, the proposed anti-environment rule is fiendishly calculated to block the EPA staff from considering the best data available. The commenter notes that this scheme has at least two devastating impacts:
 - Would nonsensically bar EPA from considering the best scientific data available disabling EPA rulemaking.
 - Would violate the agency's common sense and statutory duty to consider the best data. (6107)
- The abuse of research data to undermine science credibility is likely the most dangerous aspect of this proposal. (6132)
- The fact that the proposed rule is at odds with the manner in which the scientific community evaluates research—underscored by the large number of comments submitted in opposition to the rule by scientists, scientific organizations, and scientific journals—and also at odds with methods EPA uses and is required to use to evaluate scientific information suggests that the proposed rule's true purpose is other than to ensure that EPA relies on the "best available science." Instead, the commenter contends that the true purpose appears to be to exclude from consideration scientific research that might support a need for rigorous regulatory action. The commenter recommends that EPA continue to use of the comprehensive criteria used by the scientific community (and historically used by EPA) to evaluate scientific research. (6446)
- The EPA's failure to consult with its own internal science experts when developing the proposal is, at best, gross malfeasance and, at worst, a conscious effort to subvert the Agency's statutorily mandated practice of using the best available science. (6915)
- The proposed rule has nothing to do with transparency and is a thinly veiled campaign to limit serious and highly credible scientific research that supports critical regulatory action. The commenter inquires: Why would a science-driver public agency undertake such a radical departure from existing and widely accepted scientific standards? They note that they have yet to hear a credible answer to this question that is not rooted in favors to industry polluters. (8281-PH5)
- While the Proposal suggests that its aim is to improve transparency by increasing public availability of data, in actuality it proposes none of the steps that a proposal seriously aimed at that goal would propose, such as increasing funding for EPA grantees to undertake this effort, or proposing solutions to real concerns about patient confidentiality. Instead, the commenter contends that the heart of the proposal is a bar on considering science simply because the underlying data is not publicly available, regardless of whether the science has been peer reviewed, reproduced, or contains other hallmarks of scientific quality. The commenter adds that the agency's recent communication to the CBO that a similar Congressional proposal could be implemented at "no cost" proves the point: EPA's aim here is not to make more data available (which costs money), but to rely on less science in decisionmaking. The commenter adds that the agency's recent communication to the CBO that a similar Congressional proposal could be implemented at "no cost" proves the point: EPA's aim here is not to make more data available (which costs money), but to rely on less science in decisionmaking. That, according to the commenter, appears to be the current Administration's goal. (9227)

Response: The EPA disagrees that the intent of this rulemaking is to limit the science used for decision-making. As described more fully in the preamble to the final rule, the transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals and the emergence of several international organizations and initiatives that incentivize greater transparency in research. The EPA supports these efforts and believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. The EPA's continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency's decisions. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments.

The EPA agrees that it is important to consider the totality of relevant, quality research. Therefore, the EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data and models be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is an important aspect of EPA's regulatory actions and assessments it should be an important consideration in how the Agency considers pivotal science. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Consistent with existing Agency practice, the EPA will use existing factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) to evaluate study quality. When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science. Once the EPA has identified pivotal science—for either significant regulatory actions or influential

scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. In compliance with the rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or propriety information, available through restricted access in a manner sufficient for independent validation. Including this review of data availability for pivotal science is critical to the EPA’s progress toward increased transparency and providing increased opportunity for scientific reanalysis and scrutiny by independent third parties. This approach will result in final significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers. When the dose-response data underlying pivotal science are not publicly available in a manner sufficient for independent validation, the EPA will give less consideration to the studies’ evidence, findings, and conclusions unless the Administrator grants an exemption request.

The EPA disagrees that this final rule is biased in favor of industry. As stated in CFR 30.3, “The provisions of this part apply to science that serves as the basis for informing a final significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.” Further, the rule requirements direct the EPA to evaluate the availability of the underlying dose-response data for any subject matter expert, regardless of their affiliation.

The EPA also wishes to clarify that public input was an important part of shaping the final rulemaking. The EPA accepted public comment on the proposed rule from April 30, 2018 to August 16, 2018, and held a public hearing on July 17, 2018. In response to public comments, the EPA released a supplemental notice of proposed rulemaking and took public comment from March 18, 2020 to May 18, 2020. All of these comments were considered in developing the final rule.

Finally, the EPA disagrees that requirements of this rule will result in any burdensome requirements on independent researchers, a curtailing of staff scientist activities, or any meaningful delay in promulgating regulations. This is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will continue to consider and evaluate all high-quality, relevant science in its significant regulatory actions and influential scientific information. While this rule does require the Agency’s staff scientists to evaluate the availability of underlying dose-response data for pivotal science, the incremental burden to the Agency’s staff scientists to carry out these requirements is expected to be small given (1) the extensive scientific review EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., a small, though highly important, subset of all the studies EPA reviews).

2.1.3.6 Deliberately Prohibiting Epidemiological Studies

Comment: Commenters (1409, 1905, 2171, 2408, 4410, 4840, 6137) suggest that the Proposal appears to intentionally limit EPA’s use of epidemiological health studies. Comments include:

- The requirement that data be publicly available may sound "transparent," but in fact seems to (deliberately) prohibit epidemiological studies in which the underlying data is subject to confidentiality requirements. (1409)
- Commenter contends that the rule targets long-term epidemiological studies that linked air pollution to shorter lives and were used to justify air-quality regulations. The commenter asserts that the rule could keep that and other high-quality evidence from being used to shape regulations, even if there are legitimate reasons, such as patient privacy, why some data cannot be made public. (1905)
- The proposed rule was clearly designed to undermine and disparage the important epidemiological studies that support public health protection from all pollutants, be they in the air, water, or soil. Simply stated, according to the commenters, the proposal was written with the intent to cast doubt on EPA's prior judgement of and dependence on, health research - and to create suspicion significant enough to deter future use of health-based studies in regulatory decision-making. The commenters assert that the EPA's proposal flagrantly ignores the reasons for the privacy of health data used for epidemiological studies. (2171, 4410)
- The rule as designed would help polluters avoid regulations that protect public health and would intentionally limit EPA's use of epidemiological health studies because they contain confidential medical information that cannot be shared with the public. (2408)
- Much environmental science, particularly epidemiologic studies, would be excluded from the evidence base and would become irrelevant to efforts by EPA to protect the public and the environment. (4840)

Response: The EPA disagrees that the intent of this rulemaking is to undermine or otherwise limit the EPA's use of epidemiological studies in its decision-making. The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety.

The EPA agrees that it is important to consider the totality of relevant, quality research. Therefore, the EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data and models be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is an important aspect of EPA's regulatory actions and assessments, it should be an important consideration in how the Agency considers pivotal science. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating final significant regulatory actions and finalizing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

2.1.3.7 Reliability of a Study Should Be Determined by Experts in the Field

Comment: Commenters (0671, 1481, 1973, 2907, 4933, 8274) assert that how studies are conducted, reproduced and used should be determined by experts in the field and not by the EPA's political appointees. Comments include:

- The decision to make data public (and which data to make public) should stay between the researcher, the IRB, and journal editors and not through waivers granted according to politically biased and often scientifically illiterate views of Administrators. (0671)
- It is unclear why an EPA Administrator rather than experts in the field should be given final authority on the reliability of the study. The commenter notes that peer reviewed publications already exist to address concerns over poor statistical analysis and scientifically unethical policies by subjecting studies to other experts in the field prior to publication. The commenter states that giving the EPA Administrator say in which of the studies did or did not meet the transparency criteria is equivalent to allowing them to discard expert accredited research at whim. The commenter contends that the proposed policy has grave potential for the capricious disregard of facts and subsequent policies which are ignorant of reality and harmful to the public at large. (1481)
- The EPA's attempt to prescribe how a scientist should assess the shape of concentration-response relationships seems designed more to tie EPA's hands and prevent it from considering studies most scientists think are relevant, rather than to serve any public health purpose. (1973)
- Commenter asserts that the country's public health protections could be hampered by allowing the agency's political leadership to select studies that benefit its agenda and ignore those that don't, opening the door to industry interests and secrecy. The commenter adds that, with limited access to the most recent scientific research, how will the EPA make the best decisions on behalf of the American people consistent with its regulations? (2907)
- While the goal of transparency in how studies are conducted and the ability to reproduce scientific results are important, the commenter notes that it can offer a politically motivated Administration a convenient excuse for eliminating or ignoring scientific studies that may go against the wishes of a powerful industry group. The commenter adds that all one has to do is demand the data sets be handed over for "further scrutiny" or demand that the study be repeated before basing a regulation on the study in question. The commenter notes that since the founding of the EPA, independent scientific research has been the foundational basis of your mission. The commenter suggests that the science be allowed to speak the truth and that the EPA should hear from all scientific studies, not just the ones the industry wants. (4933)
- It is the scientific community, with public comments, that are best able to determine a study's value to the EPA's policy making process. (8274)

Response: The EPA disagrees that the EPA's political appointees will determine how studies are conducted, reproduced, or used. As described in the preamble to the final rule, EPA staff will continue to use best practices to review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information. The EPA will use existing factors (including soundness, applicability and utility, clarity and completeness,

uncertainty and variability, and evaluation and review) to evaluate study quality. When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science. Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. In compliance with the rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or propriety information, available through restricted access in a manner sufficient for independent validation. Including this review of data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and scrutiny by independent third parties. This approach will result in final significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers. When the dose-response data underlying pivotal science are not publicly available in a manner sufficient for independent validation, the EPA will give less consideration to the studies' evidence, findings, and conclusions, unless the Administrator grants an exemption request. The rule also provides factors for consideration that balance some of the important scientific considerations an EPA analyst may want to consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. EPA analysts will continue to play an important role in evaluating all relevant scientific studies and determining their quality using existing guidelines.

The EPA also does not agree with commenters regarding the role of the Administrator in determining whether to grant an exemption under 40 CFR 30.9 and finds that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.9 of the final rule that requires the Agency to document the rationale for any exemptions granted by the Administrator in the final significant regulatory action or final influential scientific information.

The EPA agrees with commenters about the importance of data sharing and analysis by subject matter experts. When data are widely available, researchers can validate research results and help identify and correct unintended errors, as well as reanalyze the data for new and different purposes, examine novel questions, provide new scientific insights, and improve model development.

In response to public comments, the EPA clarified and modified many aspects of the proposed rule in the 2020 supplemental notice of proposed rulemaking and final rule, including that the rule requirements are now focused on dose-response data and do not apply to dose-response models. The EPA would also like to clarify that the final rule does not require any researcher or other outside entity to provide data or models to the EPA, nor does it require the EPA to disclose or host data. Instead, it governs internal agency procedures for determining the consideration to afford to pivotal science according to factors that include the availability of underlying dose-response data.

2.1.3.8 History of Suppressing Science Puts the Credibility of the Goal of Transparency in Doubt

Comment: Commenter (9227) suggests that EPA, under the Trump Administration, has a history of suppressing science and transparency and purported justifications for the proposal. Similarly, commenter (6937) suggests that the current EPA upper Administration (and industry as well) is not usually a champion of transparency. Therefore, the commenter contends that the call for transparency regulation is hypocritical and lends credibility to those that doubt whether transparency and replication are the true goals of the proposal. Transparency, according to the commenter, so lauded in this regulatory proposal, has been decimated by the current Administration – with extensive restrictions and changes to climate change websites²⁰¹³, extreme efforts at secrecy and avoiding public scrutiny,^{2014,2015,2016} and efforts to end disclosure of chemicals used in hydraulic fracturing.²⁰¹⁷

Commenter (9227) provides that a FOIA request submitted by E&E News uncovered a document emailed by former EPA official David Schnare laying out a strategy to overturn the 2009 Greenhouse Gas Endangerment Finding.²⁰¹⁸ In the document, the commenter notes that one of the steps contemplated as part of the reconsideration included EPA only relying “on information, data and studies where the original data upon which assessment is based is available to the public. . . . EPA would not rely on any study whose authors refuse to provide the underlying data, including computer code used to evaluate and analyze the data.”²⁰¹⁹ This, according to the commenter, is just one example among numerous others that this proceeding is not intended to increase transparency, but rather aimed at weakening EPA standards that the current Administration disapproves of, despite their grounding in robust scientific evidence.

²⁰¹⁹ Id.

The commenter (9227) contends that EPA's non-transparent approach to this rulemaking, as well as other Agency actions, underscore that the proposal was not offered in good faith. The commenter provides that the Agency has removed thousands of webpages from its website, limited public and press access to Agency events, and withheld key data underlying rulemakings and proceedings. According to the commenter, these practices cast doubt on EPA's proffered justifications of transparency and accountability. The commenter cites examples related to the stay of the *Oil and Natural Gas Sector: Emissions Standards for New, Reconstructed, and Modified* Sources rule, and the removal and modification of climate related and Clean Power Plan materials, webpages and files. The commenter states that the Administration has also not rigorously pursued its purported goal of transparency in other contexts by limiting public and press access to Agency events and withholding key data underlying several recent rulemaking proceedings. For example, the commenter notes that, at the event where former Administrator Pruitt announced the proposal, reporters were not invited to attend.²⁰²⁰ The commenter notes that documents received in response to a Sierra Club FOIA request to the EPA reveal that the Administrator had requested press access and advertisement to the public be limited for other events (and cites examples):

- For his speaking engagement at a Federalist Society event in March 2017, Pruitt's scheduling director asked that organizers not advertise to press directly and directed organizers to tell media that the event "is not open to press and is off the record."²⁰²¹
- Emails also demonstrate that the Agency worked with a public relations firm to devise a plan to promote positive comments and censor negative comments on media from the Administrator's facility visits.²⁰²²

According to the commenter (6125), EPA has not even applied the principles of its proposal to rulemaking when that would get in the way of its central agenda of providing relief to industry. The commenter notes that the EPA's commitment to "transparency" seems to be a recent invention that it has not followed in recent rulemaking proposals. The commenter states that just a few months before issuing this proposal, when EPA proposed to rescind the rule restricting glider trucks (trucks with old diesel engines placed in new truck chassis), the agency uncritically summarized purported emission test results of glider trucks. The commenter provides that the study it used was not peer reviewed; did not disclose its methodology (it turned out the critical observation was done by 'visual observation', i.e. eyeballing!), and EPA did not examine it for any indication of reliability. See 82 FR 53444 (Nov. 16, 2017). In contrast, the commenter adds that the EPA's National Vehicle and Fuel Emissions Laboratory (NVFEL) laboratory conducted its own study using, "standardized test methods, consistent data evaluation procedures, and good laboratory practices to ensure transparent, understandable, and reproducible scientific

²⁰²⁰ Miranda Green, Pruitt signs proposed rule to erase 'secret science' from EPA, The Hill (Apr. 24, 2018, 2:40 PM), <http://thehill.com/policy/energy-environment/384636-pruitt-signs-proposed-rule-to-erase-secret-science-from-agency>.

²⁰²¹ Email from Juli Nix, Director of Conferences, Federalist Society, to Millan Hupp, Director of Scheduling and Advance, EPA (Mar. 17, 2017, 12:30 PM)(on file with Sierra Club), <https://www.documentcloud.org/documents/4453164-Pruitt-Sierra-Club-NYT-Foia.html#document/p29/a422141>.

²⁰²² Email from Gus Wagner, Partner and Creative Dir., ARC Media, forwarded to Barry Hart, CEO, Nat'l Rural Electric Coop. Ass'n; Amy Graham, Dir. of Commc'n, EPA; Tate Bennett, Assoc. Adm'r, Office of Public Engagement and Envvtl. Educ.; Joe Wilkinson, Sr. Vice Pres., Assoc. Electric Coop. (Apr. 18, 2017).

assessments.”²⁰²³ 83 FR 18770. The commenter notes that the EPA did not even consider the NVFEL study in its proposal. Similarly, commenter (9227) states that the EPA has failed to provide the public with access to data in key rulemakings and proceedings. For example, in EPA’s rulemaking to repeal emissions requirements for glider vehicles, engines, and kits, commenced in November 2017, the Agency failed to release the underlying reports and data before the public comment period closed. At this date, EPA still has not released data used in a key study cited in the Agency’s proposal. Commenter (2427) expresses concern that, given EPA’s recent proposals to restrict the use of certain scientific studies in regulatory decision-making and to allow the widespread sale of “glider kit” trucks which lack modern emission controls shows the Agency’s disregard for objective information and the scientific process, and its move to rely on analysis that supports particular outcomes.

Commenter (9227) adds that, in EPA’s stay of the Oil and Natural Gas Sector: Emissions Standards for New, Reconstructed, and Modified Sources, EPA failed to disclose directly relevant evidence for the basis of revision of the standards consisting of industry compliance reports.²⁰²⁴ Despite the fact that these compliance reports were in the agency’s possession and comprised of public documents containing factual data that should have been available for public inspection, EPA has to date still not released all of the compliance reports in its possession. The commenter provides that, in August 2017, EDF received information pursuant a FOIA request revealing that more than 1,900 climate-related webpages and files on EPA’s website were removed or modified.²⁰²⁵ Many of the removed and modified pages were related to climate change science and impacts, such as “Climate Impact on Health Through Life Stages,” “Climate Change Science,” and “Methane and Black Carbon Impacts on the Arctic: Communicating the Science.”²⁰²⁶

In January 2018, commenter (9227) states that the EDF received additional responsive records to another FOIA request demonstrating that former Administrator Pruitt directed the removal of many climate change science, impacts, and resources pages as well as all material related to the Clean Power Plan on EPA.gov.²⁰²⁷ At the same time, the commenter states that the EPA was

²⁰²⁶ Id.

²⁰²⁷ E-mail from Lincoln Ferguson, Senior Advisor, Office of Public Affairs, to Amy Graham, Advisor, Office of Public Affairs; John Konkus, Deputy Associate Administrator, Office of Public Affairs; JP Freier, Associate Administrator, Office of Public Affairs; Liz Bowman, Acting Associate Administrator, Office of Public Affairs; and Jahan Wilcox, Strategic Communications Advisor, Office of Public Affairs (Apr. 5, 2017, 4:15 PM) in EDF, Newly Released Records Refer to Pruitt’s Personal Involvement in Removal of Climate Information from EPA Website,

soliciting comments on its proposal to repeal the Clean Power Plan. The commenter suggests that the removal of webpages related to climate and Clean Power Plan topics from the EPA website restricted the public's ability to formulate informed comments throughout the rulemaking process.²⁰²⁸ Thus, according to the commenter, the public lacked the same "access to data and influential scientific information used to inform federal regulation"²⁰²⁹ which EPA claims to observe in its proposal.

Commenter (9227) asserts that, in the words of the proposal, EPA acted in contravention of its goals of "better informing the public," "enhancing the public's ability to understand and meaningfully participate in the regulatory process," and "ensur[ing] that its decision-making is marked by independence, transparency, clarity, and reproducibility" as it proceeded through rulemakings that "will affect the public" and where "the public is likely to bear the cost of compliance."²⁰³⁰

Response: This rule does not target specific EPA rulemakings and only applies prospectively. The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider the availability of underlying dose-response data when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation. Including this review of dose-response data availability for pivotal

science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and scrutiny by independent third parties. The approach in this rule will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

2.1.3.9 Societal Bias

Comment: Commenter (0567) states that pivotal regulatory science as currently performed often includes societal objectives. The commenter states that some scientific assessments state that to be "protective," authors use "conservative" assumptions. The commenter states that the inclusion of societal objectives ideology, religious, or other beliefs, or any other non-scientific goal would cause damage to scientific assessment. The commenter states that to be protective is the responsibility of policy makers rather than of scientists.

Response: Recognizing that assumptions are an inherent part of scientific assessments, this rule seeks to provide greater transparency into the critical assumptions made in an assessment and the impact of those assumptions on the assessment conclusions. As stated in 40 CFR 30.5(e), "The EPA shall also describe critical assumptions and methods used in its dose-response assessment and shall characterize the variability and uncertainty of the assessment. The EPA shall evaluate the appropriateness of using default assumptions on a case-by-case basis. The EPA shall clearly explain the scientific basis for critical assumptions used in the dose-response assessment that the EPA relied on for the significant regulatory action or influential scientific information."

2.1.3.10 Science and Transparency of Decision-making is the Most Unbiased Way to Collect Data

Comment: Commenter (1559) contends that science and transparency of decision-making is the most unbiased way to collect data and to analyze it in order to make decisions and to regulate so that the health of Americans is properly protected as the government is obligated to do by the Constitution's right "to life, liberty, and the pursuit of happiness."

Response: The EPA agrees that transparency is beneficial to scientific assessments and the public. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety.

2.1.4 Environmental and Health Protections Would be Decreased

Comment: Commenters (0017, 0055, 0559, 0945, 1012, 1346, 1461, 1476, 1481, 1512, 1536, 1554, 1559, 1753, 1793, 1813, 2002, 2171, 2425, 2495, 2787, 2902, 2907, 2910, 2977, 3131, 3132, 4542, 4596, 4828, 4838, 4839, 4840, 4842, 4843, 4844, 4872, 4877, 4878, 4881, 4933, 5011, 5020, 5021, 5041, 5113, 5115, 5120, 5122, 5172, 5178, 5183, 5184, 5418, 5979, 6046,

6103, 6109, 6111, 6114, 6116, 6118, 6121, 6122, 6123, 6125, 6127, 6130, 6133, 6137, 6144, 6145, 6153, 6156, 6158, 6159, 6166, 6168, 6169, 6173, 6174, 6181, 6185, 6188, 6351, 6355, 6358, 6368, 6373, 6446, 6450, 6464, 6696, 6860, 6868, 6869, 6871, 6874, 6876, 6877, 6879, 6880, 6882, 6884, 6893, 6894, 6897, 6898, 6903, 6915, 6919, 6920, 6924, 6928, 6932, 6939, 6940, 8274, 8276, 8277, 8281-PH5, 8281-PH10, 8281-PH15, 8281-PH20, 8281-PH24, 8281-PH29, 8281-PH34, 8281-PH63, 8281-PH84, 8317, 9225, 9227) express concern that the proposed rule/policy to limit the research and data that EPA can use to make informed policy decisions under major public health and environmental laws will reduce environmental and health protections. Commenter (1346) requests that EPA please rewrite this rule, to make it clear that the health and well-being of people and the environment comes first in these decisions. Several of these commenters also express concern that the negative health impacts of inadequate environmental regulation will fall disproportionately on children, the elderly, pregnant women/fetuses, and marginalized populations, particularly low-income black and Latino communities. Several of the commenters provide specific examples of health protections that could be rolled-back (e.g., water quality criteria, air toxic regulations, drinking water standards, pesticide regulations, chemical use bans/restrictions/control, criteria pollutant standards) or not be pursued or possible (e.g., fracking health exposure/effects studies, pesticide and Parkinson's disease research, greenhouse gas emissions effects on climate change and public health) as a result of the proposal and that the proposal should be withdrawn. Specific comments include:

- Commenters (2002, 6932) assert that, because the proposed rule is retroactive, it is an attempt to reverse much-needed protections. Commenter (2002) states that, since the proposed rule is retroactive, it could lead to the dismantling of many of EPA's most important and effective health protections, including the CAA, rules that set limits on lead in drinking water, and bans on some uses of neurotoxic pesticides, as they all rely on epidemiological studies.
- Commenter (6879) states that, although the proposed regulation has a particular emphasis on undermining the application of science in regulations focused on human health, it sets a dangerous precedent for ignoring and discounting legitimate and sound science in all other areas of EPA's responsibility, including the protection and restoration of natural habitats vital for wildlife conservation.
- While EPA's previous science-based regulatory process has saved countless lives, prevented chronic diseases, and improved the quality of the air pregnant women and children breathe, the water they drink, and the world in which they will grow, the proposed rule will instead prevent evidence-based policies from being enacted and will contravene EPA's mission to ensure that American pregnant women, children, and families have clean air, land and water, and we strongly urge you not to move forward with it. (2425)
- EPA's efforts to reduce lead and methylmercury exposure for women, pregnant people, and children might not have been as successful if the agency had used the overly stringent definition of transparency it now proposes. The commenter states that programs that might not exist, or exist in less-effective forms, include those to reduce lead exposure from paint, gasoline, and drinking water; limit mercury emissions; and advise pregnant

people to steer away from consuming fish species that often contain high levels of methylmercury.²⁰³¹ (6893)

- Commenter (6915) asserts that the requirements of the proposed rule would lead EPA to adopt less-protective standards across many regulatory programs. The commenter states that the proposed rule would allow for the use of less protective dose response models and assumptions in human health risk assessment. The commenter states that it would also preclude consideration of scientifically valid human and animal studies reporting sensitive and relevant toxic effects based on unjustified requirements for public availability of data, and instead favor consideration of studies that do not assess the most sensitive and relevant health effects endpoints. The commenter states that, for example, while the NAAQS review process builds on the administrative record from prior rulemakings, under the proposed rule, EPA may refuse to consider these studies and others because they rely on data pertaining to the personal medical histories of participants that cannot, by the studies' terms or by law, be divulged. The commenter states that restricting the use of such studies would significantly undermine current and future NAAQS reviews.

Commenter (9227) provides that leading experts in public health, science, and environmental policy agree that the proposed rule would have far-reaching, detrimental impacts on public health. The commenter contends that, by limiting the scientific studies that EPA may consider, the proposed rule would lead to less effective environmental policies and weaker public health protections. The commenter notes that experts have said the following:

- “[The proposed rule] will threaten the lives of real people.” – Commissioners of the Minnesota Pollution Control Agency and Department of Health.²⁰³²
- “If the proposed rule is approved, science will be practically eliminated from all decisionmaking processes. Regulation would then depend uniquely on opinion and whim.” – John P. A. Ioannidis, C.F. Rehnborg Chair in Disease Prevention at Stanford University.²⁰³³
- “It does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them. . . . Excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes.” – Editors of science family of journals, Nature, Public Library of Science journals, Proceedings of the National Academic of Sciences, and Cell.²⁰³⁴
- “Without access to the restricted data, regulatory programs could become more or less stringent than they otherwise would be, with consequences for both regulatory costs and

benefits. . . . [the proposed rule] could have the effect of removing legal, ethical, and peer-reviewed studies of health effects as sources to support the agency’s regulatory efforts.” – Members of the SAB.²⁰³⁵

- “[The proposed rule] would prevent the best science from informing policy decisions and result in weaker health safeguards.” – Harold P. Wimmer, National President and CEO of the American Lung Association.²⁰³⁶
- “If [the proposed rule] had been in effect 20 years ago, the nation might have forgone programs that are preventing over 50,000 premature deaths each year.” – Environmental Protection Network.²⁰³⁷
- “[The proposed rule] would greatly weaken EPA’s ability to comprehensively consider the scientific evidence across the full array of health effects studies. This would negatively impact EPA public protections that reduce levels of lead, harmful chemicals, and fine particle pollution, among others.” – 985 scientists in a joint letter to Administrator Pruitt.²⁰³⁸
- “[The proposed rule] would severely hamstring the agency when it comes to developing and enforcing public health rules by limiting the kinds of research the EPA can use in crafting rules.” – Union of Concerned Scientists.²⁰³⁹
- “[Administrator] Pruitt is moving to rid the EPA of the science needed for effective regulation. . . . Its potential impact goes well beyond the EPA’s regulatory effectiveness to the underlying role of science in American society.” – Dr. Bernard Goldstein, Professor Emeritus of Environmental and Occupational Health at the University of Pittsburgh and former EPA Assistant Administrator for Research and Development.²⁰⁴⁰

Additionally, commenter (9227) states that when the U.S. House of Representatives passed similar legislation in 2017, H.R. 1430, numerous professional organizations raised concerns about the implications of the proposed legislation.²⁰⁴¹ The commenter adds that the Environmental Data & Governance Institute (EDGI) found that:

A bill that provided genuine provisions for public data access and usability, and did not focus on mandating the reproducibility of studies and on prohibiting the use of any data that could not be divulged to the general public in its entirety, would not be expected to hamper the EPA in a significant way. EDGI's analysis of H.R. 1430 shows that it does not achieve its stated goals. Instead, our research shows that H.R. 1430 would not promote transparency and that its passage would instead block the EPA from using the data it needs to fulfill its mission of protecting public health and the environment.²⁰⁴²

Commenter (6137) provides several examples where the Proposed Rule's restriction on the science could and would potentially undercut the support provided for environmental programs and resulting adverse consequences to public health protections. The commenter notes that, in a world in which EPA cannot consider critical studies demonstrating the deleterious impacts of toxic chemicals, pollutants, and pesticides when developing rules governing exposure levels, acceptable uses, and safety measures, there will be little to no available evidence to support the imposition of public health protections. Absent such evidence, according to the commenter, the EPA will be unable to implement rules that protect our air and water from harmful pollution, our farmworkers from toxic pesticides, and the public from overall exposure to chemicals, as EPA will have no science to point to as justification for such measures. Simply put, the commenter asserts that the removal of this science from consideration in the rulemaking process will cause the very foundation upon which many of our public health standards depend to crumble.

Commenter (6137) notes that not only is EPA's elimination of its use of critical human health research and studies that serve to protect and promote public health and the environment unlawful, but it is also discriminatory. The commenter asserts that the Proposed Rule has a disproportionately deleterious impact on low-income communities and minority communities – the overburdened populations that benefit most from the epidemiological studies used to set limits on air and water pollutants and to set safe exposure levels for pesticides and other toxics. According to the commenter, by removing this critical category of studies from consideration when setting limits on pollutant and toxic exposure as well as standards for safe air and water, EPA is turning a blind eye to accessible and illuminating evidence that provides much-needed safeguards to the vulnerable communities most impacted by the laws EPA is charged with enforcing. These communities will disproportionately suffer as a result.

Commenter (6137) provides several examples of public health studies that indicate that communities of color and economically disadvantaged populations are disproportionately impacted by pollution. The commenter provides that since the 1987 landmark report *Toxic Wastes and Race in the United States*,²⁰⁴³ studies have confirmed again and again that communities of color and also economically disadvantaged populations are disproportionately located near toxic waste sites and other sources of pollution. And research has also found that

Amy Petz, Cong. Budget Office, H.R. 1430: Honest and Open New EPA Science Treatment (HONEST) Act of 2017 (2017).

²⁰⁴³ Dr. Benjamin F. Chavis, Jr. & Charles Lee, *Toxic Wastes and Race in the United States*, Commission for Racial Justice, United Church of Christ (1987).

overall air pollution exposure is more strongly concentrated in communities of color.²⁰⁴⁴ The commenter adds that pesticide exposure likewise disproportionately impacts low-income and minority communities: farmworkers tend to be poor,²⁰⁴⁵ and the vast majority are of Latin American origin,²⁰⁴⁶ and they have a higher incidence of pesticide poisoning than other workers.²⁰⁴⁷ For example, the commenter notes that in California, the counties with the greatest use of the highly toxic pesticide chlorpyrifos are the counties with the highest poverty levels and largest Latino populations.²⁰⁴⁸ The commenter states that, in April 2014, the California Department of Public Health issued a report showing that thousands of children, disproportionately people of color, attend school in close proximity to pesticide use.²⁰⁴⁹ Overall, according to the commenter, the disproportionate burden of environmental exposure among these low-income communities and communities of color cannot be disputed.²⁰⁵⁰

Commenter (6137) expresses that, fundamental to the research revealing the disproportionate impact of environmental harms on low-income and minority communities and the need to set appropriate standards is epidemiological data. The commenter states that this category of science that EPA wants to eliminate has been foundational to establishing disparate harms from a variety of toxics in air, water, pesticides, and other environmental sources. For example:

- Epidemiological studies have shown that there is a persistent disparity in the blood lead levels measured in children of color compared to white children. These studies revealed that in 2011-2012, the mean level was almost 40 percent higher in black children 1-5 years old than in white children of the same age.²⁰⁵¹
- While studies have shown that the mean blood lead level in black children is much lower than it was several decades ago, epidemiological studies have shown that even low levels of lead in the blood are harmful.²⁰⁵²
- A 2011 peer-reviewed epidemiological study found that urine samples of children ages 6 to 24 months were more likely to have six organophosphate metabolites the closer the child lived to a pesticide application site.²⁰⁵³

²⁰⁵³ Asa Bradman et al., Determinants of Organophosphorus Pesticide Urinary Metabolite Levels in Young Children Living in an Agricultural Community, 8 Int. J. Env'tl. Res. Public Health 1061 (2011).

- Longitudinal cohort epidemiologic studies have shown that even low levels of exposure to the highly toxic pesticide chlorpyrifos can disrupt brain development in prenatally exposed children, leading to developmental delays, lower IQ, learning disabilities, and ADHD-like behaviors.²⁰⁵⁴
- Epidemiological studies demonstrate that farmworkers have a higher rate of pesticide poisoning than any other workers.²⁰⁵⁵

Thus, the commenter (6137) contends that it is clear that epidemiological studies have provided a consistent source of reliable data that has been critical to demonstrating disproportionate exposure to toxic chemicals. The commenter states that these studies in turn have been pivotal to setting air, water, and pesticide standards necessary to protect low-income and minority populations from harmful levels of exposure.

The commenter (6137) asserts that the EPA's proposal to eliminate use of epidemiological studies will have a disparate impact on the most overburdened and vulnerable communities, eliminating the very source of data relied upon to provide protections crucial to their health and wellbeing. The commenter contends that this Proposed Rule will perpetuate the environmental injustices that low-income and minority communities already face, as it will remove the primary tool used to study and address the inequitable environmental harms suffered by these populations.

Commenter (6919) expresses concern that the proposed EPA rule leads to the questioning of studies that reveal negative effects of environmental exposures and allow policymakers to take protective action on behalf of those at greatest risk. The commenter notes that, by undermining existing evidence, the EPA would set back the clock on fighting environmental injustices that are taking place in Colorado. The commenter provides that, without evidence from studies like those presently being conducted, in which personal health data is gathered and protected when the data is aggregated, we cannot protect those who are at greatest risk and have lived with the burden of environmental exposures for decades while the current evidence base was built up. For example, the commenter states that a Colorado School of Public Health study shows the negative health effects of exposures on populations living close to oil and gas operations, adding that, in parts of Colorado these are some of the only affordable places to live.

Commenter (6939) asserts that the United States has a positive obligation to ensure equality of rights.²⁰⁵⁶

²⁰⁵⁶ International Covenant on Civil and Political Rights (ICCPR), adopted December 16, 1966, G.A. Res. 2200A (XXI), 21 U.N. Doc. A/6316 (1966), 999 U.N.T.S. 171, entered into force March 23, 1976. General Comment 18, para. 5.

Commenters (1481, 6168) note that decreased health protections will lead to increased health costs to the public. Commenter (2907) also notes that there could also be a loss of productivity due to air pollution created illnesses, which, according to the commenter, shows the folly of focusing only on business cost savings in the energy sector when considering environmental regulation. The commenter states that all Baltimore City area employers suffer financial consequences when productive workers are absent due to illnesses caused by air pollution. The commenter adds that future generations suffer when they are under-educated due to missed days of school.

Commenter (5977) asserts that the main consideration for all EPA's regulations should be the costs on human and non-human communities in the United States and all over the planet and not the costs of compliance for businesses, real or perceived. The commenter states that the very need for EPA's regulations is caused by the negative externalities generated by businesses.

Response: The EPA does not agree that this rulemaking is counter to the Agency's mission or that the implementation of the rule would result in regulatory actions that are less protective. The EPA is committed to its mission of protecting human health and the environment through sound policy decisions that are informed by robust scientific and technical research. Because of the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best scientific information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA fully demonstrate that commitment. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

The EPA agrees that it is important to consider the totality of relevant, quality research. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider the availability of underlying dose-response data when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for

independent validation. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating final significant regulatory actions and finalizing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations. Including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties. This approach will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

The EPA would like to clarify that this final rule will be implemented prospectively and rules that have already been finalized will not be subject to this rule's requirements.

2.1.5 EPA Would be at Odds with Other Parts of the Federal Government

2.1.5.1 Impact on Other Agencies by Limiting the Use of Best Available Science

Comment: Commenters (1493, 2335, 2430, 2909, 5022, 6111, 6194, 6915, 9227) express concern that the proposed rule could negatively impact other federal agencies. Commenter (9227) provides that other federal agencies routinely incorporate and rely upon EPA science assessments in their own efforts to carry out their mandates to protect human health and safety. As with statutorily required consultations, the commenter asserts that the Proposal utterly fails to acknowledge or consider what impacts restricting EPA's own use of dose-response studies would have on the work of these other agencies.

Commenter (2335) states that other government agencies use studies that rely on data from individual health records to develop policy and regulations. The commenter is concerned that moving forward with this proposed rule could undermine decisions made by other federal agencies based on similar studies and could invite challenges to other federal agencies' policies.

Commenter (6915) states that, if EPA adopts a deficient standard due to the arbitrary exclusion of available scientific information, other federal agencies relying on EPA standards as a basis for action would be affected, as would be the states that interface with those federal programs.

Commenters (2430, 2909, 5022, 6194, 9227) state that EPA's scientific research policies and findings influence not only EPA's work, but also the work of other agencies charged with protecting our health and environment. The commenters further states that the National Park Service (NPS), Occupational Safety and Health Administration (OSHA), Department of Housing and Urban Development (HUD), and FDA all rely on the data and findings of the EPA to fulfill their duties. The commenters contend that these agencies cannot effectively protect our health and environment if EPA unreasonably limits the scientific record, as the proposal would. Commenter (2430) states that moving forward with this proposed rule would undermine, and invite challenges to, decisions made by other federal agencies based on similar kinds of studies.

Commenter (6194) states that, in order for OSHA to promulgate standards under OSHA, the agency is required to demonstrate the existence of significant risks to employees using “best available evidence.” The commenter states that, currently, OSHA fulfills this obligation, in part, with information provided by EPA’s TSCA Section 9(a) reports. The commenter expresses concern that, if the Proposal results in the exclusion of confidential data, then OSHA will likely be forced to either gather supplementary evidence or ignore the reports altogether. The commenter contends that such an outcome will not only impede OSHA in its regulatory functions but could also burden EPA with additional responsibilities.

Commenter (9227) states that HUD is required by statute to assist EPA in assessing the extent of radon contamination in the United States and developing measures to avoid and reduce radon contamination. The commenter states that HUD has also developed policies to require radon testing at properties receiving federal financing, which incorporate EPA radon standards. The commenter contends that, to the extent the proposed rule affects future EPA assessments of radon risks, the scope, cost and effectiveness of HUD radon programs could be affected as well.

Commenter (9227) states that FDA enforces tolerances established by EPA for pesticide chemical residues in human and animal foods under the FIFRA, including through a comprehensive pesticide residue monitoring program that tests for approximately 700 pesticide residues in both imported and domestic commodities. The commenter states that to the extent the proposed rule affects EPA’s tolerances, the nature and effectiveness of FDA’s own work to monitor for violations of those tolerances would be impacted. The commenter further states that FDA also regulates contaminants in bottled water under the Federal Food, Drug and Cosmetics Act. The commenter states that Section 410 of the Act requires that FDA regulations for bottled water be issued in coordination with the effective date of National Primary Drinking Water Regulations issued under the SDWA and be no less protective of public health than those standards. According to the commenter, if the proposed rule impedes EPA’s work to establish drinking water standards, this may affect FDA’s own ability to justify protective bottled water standards. The commenter states that, in certain circumstances, FDA also coordinates with EPA to provide the public with information and advice on environmental contaminants in foods, for example, in 2017 FDA and EPA released a joint advisory on mercury hazards associated with the consumption of fish and shellfish, which was based in part on EPA’s assessment of the “reference dose” or level of exposure that a person can experience over a lifetime without a risk of harm. The commenter contends that the proposed rule could radically alter the science EPA would be permitted to consider in future such initiatives and frustrate the ability of FDA and other agencies to coordinate effectively with EPA to develop joint advice and information.

Response: This is a rule of internal procedure promulgated under the EPA’s housekeeping authority. The rule does not impose requirements on parties external to the EPA, including state governments and other agencies within the federal government. External users of EPA scientific assessments can still use these assessments. There are also provisions in the final rule (e.g., requirements for the EPA to document critical assumptions and methods used in its dose-response assessment, studies considered pivotal science, the rationale for the level of consideration for studies in the significant regulatory action or influential scientific information, and any Administrator exemption) that will make it clear how the provisions of this rule may have impacted the significant regulatory action or influential scientific information and will help

external users determine whether the product is fit for their purpose. The final rule also provides that the EPA will give greater consideration to pivotal science where the underlying dose-response data are available for independent validation, rather than providing for a categorical exclusion, so the EPA will not be limiting the scientific record. Federal agencies were given the opportunity to provide comment on this rulemaking through the interagency review process associated with Executive Order 12866, but comments on that deliberative process are outside the scope of this rulemaking.

2.1.5.2 Coordination Among Agencies

Comment: Commenters (6194, 9227) express concern that the proposed rule would compromise coordination among federal agencies.

Commenter (6194) asserts that the proposed rule would compromise coordination requirements and data sharing agreements between the EPA and the Department of Agriculture, the Food & Drug Administration, and Agency for Toxic Substances and Disease Registry (ATSDR). The commenter asserts that such a blow to inter-agency information sharing would be devastating to regulatory progress throughout the federal government.

Commenter (9227) argues that the EPA arbitrarily failed to consider the implications of this proposal on interagency coordination and consultation given that other agencies normally rely on research potentially excluded by the Proposal. The commenter states that, in the numerous environmental statutes that EPA cites, there are dozens of provisions that require EPA to coordinate or consult with other Federal entities—especially when implementing research programs and issuing information or guidelines. The commenter contends that the proposed rule could frustrate and impair this coordination and consultation, either by forcing EPA to ignore the science provided by other agencies or by severely restricting the science that EPA itself would be able to share with other agencies in these statutorily required processes.

Commenter (9227) states that, in addition to statutorily required consultations, other federal agencies routinely incorporate and rely upon EPA science assessments in their own efforts to meet mandates to protect human health and safety. The commenter contends that, as with statutorily required consultations, the proposed rule fails to acknowledge or consider what impacts restricting EPA's own use of dose-response studies would have on the work of these other agencies.

Response: The EPA disagrees that this rule would compromise interagency coordination. This is a rule of internal procedure promulgated under the EPA's housekeeping authority. The rule does not impose requirements on parties external to the EPA, including other agencies within the federal government. External users of EPA scientific assessments can still use these assessments. There are also provisions in the final rule (e.g., requirements for the EPA to document critical assumptions and methods used in its dose-response assessment, studies considered pivotal science, the rationale for the level of consideration for studies in the significant regulatory action or influential scientific information, and any Administrator exemption) that will make it clear how the provisions of this rule may have impacted the significant regulatory action or influential scientific information and will help external users determine whether the product is fit for their

purpose. The EPA also disagrees that implementation of this rule would limit the scientific record. The final rule does not categorically exclude any studies from EPA's consideration, so the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations. Federal agencies were given the opportunity to provide comment on this rulemaking through the interagency review process associated with Executive Order 12866, but comments on that deliberative process are outside the scope of this rulemaking.

2.1.5.3 Counter to Policies of Other Agencies

Comment: Commenters (0671, 1973, 1796, 2746, 5170, 6117, 6125, 6152, 6158, 6896) suggest that the EPA proposal runs counter to policies that are currently being implemented by other agencies.

Commenter (0671) states that no other federal agency has such a broad standard as the one proposed by EPA. The commenter states that the EPA knows that IRBs will not allow such studies' data to be made public, so to require public data from these studies will make them invisible to the rulemaking process.

Commenters (1973, 1796, 5170, 6125) state the proposal would put EPA in direct opposition to the standards currently implemented by the Department of Health and Human Services (HHS). This includes the evidence considered on the health effects of smoking, high cholesterol, etc. by the Centers for Disease Control (CDC), the studies considered for issuing guidelines generated by the NIH, and the FDA's reliance on non-publicly available studies to approve drugs for use by people. HHS has demonstrated it is possible to reconcile the principles of access to, reliability of, and reproducibility of data while respecting the confidentiality of individual patient data.

Commenters (5170, 6117, 6125, 6158) state that the NIH and numerous other federal agencies have required public access for their funded research and they promote data sharing among researchers. The commenters state that none of these agencies require full public disclosure of confidential personal data from health studies and, consequently, EPA's proposed rule would not be consistent with other agencies.

Commenters (6152, 6158) state that the proposed rule is not consistent with the principles of open science as articulated and adopted by leading U.S. scientific bodies including the NAS, NIH, and the CDC. The commenters contend that these bodies recommend that the agency implement existing, broadly accepted tools, including "systematic review methods" rather than arbitrarily excluding science based on rigid data disclosure requirements.

Commenter (2746) expresses concern that that the proposed rule would limit EPA from basing policy on the best available science even though similar data restrictions do not apply to other areas of public policy, such as diplomacy, economy, housing, etc.

Commenter (6896) states that, while each federal agency has different requirements and protocols to ensure sensitive data held under their agency is appropriately protected, the proposed rule does not address these interagency complications. Commenter states that these include data collected and provided by government agencies under specific conditions that vary by agency and dataset and are meant to ensure fair, ethical, and scientific usage. Commenter provides examples from the Bureau of Labor Statistics (BLS), OSHA, the Department of Energy (DOE), the National Institute of Occupational Safety and Health (NIOSH), and CDC's National Center for Health Statistics (NCHS)'s Research Data Center.

Commenter (6125) states that the CDC and other Federal Agencies involved in reducing lead risk, would not be subject to the restrictions on use of science imposed by the proposal, and thus would continue to use the older studies as evidence, creating an unwarranted science practice and policy schism in the federal government. The commenter provides the following examples:

- The CDC has acknowledged that no safe level of lead in blood has been identified and has identified a “reference level” to define especially high-risk populations and geographic areas most in need of primary prevention. Even some of the studies that the Federal government’s most respected lead advisory group (CDC’s Advisory Committee on Childhood Lead Poisoning Prevention, or ACCLPP) used to develop background justification for the reference level could be precluded from EPA use under this policy. If some of those 92 plus references and studies fail to meet this policy, EPA could not rely on them in developing regulations, and thus could issue regulations that fail adequately to address CDC’s high-risk exposures. Further, the additional requirements in the proposal could require that EPA re-evaluate the appropriateness of the CDC dose-response relationship and give “explicit consideration” to other dose-response models even if, as in this case, they have been vetted and rejected by CDC and its advisory committee.
- Both EPA and the U.S. Department of Housing and Urban Development (HUD) regulate similar residential sources of lead (paint, soil, and dust) - EPA in private housing, and HUD in Federally supported housing, including Federally supported units in private buildings. This policy shift increases the potential for disparate treatment and public confusion stemming from those situations. The identical risks addressed by the two programs should be analyzed consistently. HUD has already acted to incorporate CDC’s statement into its programs by making its policy on dust-lead clearance levels more stringent;²⁰⁵⁷ is still considering its response. But under this proposal, EPA might not be able to rely on as wide a range of studies as would be available to the rest of the federal family, which could result in different risk assessments and regulatory outcomes for similar, and possibly even adjacent, dwellings.

Response: As discussed in the preamble of the final rule, the transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency’s goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of

²⁰⁵⁷ HUD Policy Guidance Number: 2017-01, Revised Dust-Lead Action Levels for Risk Assessment and Clearance; Clearance of Porch Floors, January 31, 2017, <https://www.hud.gov/sites/documents/LEADDUSTCLEARANCE.PDF>

good government that is inherently valuable to the public. For example, in 2002 the OMB released its *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies*, which includes discussion of the importance of the reproducibility of analyses underlying influential information. The EPA's 2016 *Plan to Increase Access to Results of EPA-Funded Scientific Research* noted that "transparency is a core EPA value" and that increased availability of research data would accelerate scientific breakthroughs that support the Agency's mission and policymaking efforts. The EPA's *Open Government Plan 5.0* also details the EPA's progress in implementing the tenets of the numerous data transparency initiatives in the federal government prior to 2018, including OMB M-10-06, the Office of Science and Technology Policy Memorandum of February 22, 2013, and OMB M-13-13. In 2019, Congress passed the Foundations for Evidence-Based Policymaking Act of 2018 (or OPEN Government Data Act, Pub. L. 115-435) into law, which included requirements for federal agencies to prioritize making their data available to the public, and OMB has released additional guidance for implementing the act.

Further, as discussed in the final rule, underlying dose-response data are considered available if they can be accessed through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The EPA agrees with commenters that it is important to consider the totality of relevant, quality research. Therefore, the EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data and models be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is an important aspect of EPA's regulatory actions and assessments it should be an important consideration in how the Agency considers pivotal science. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

2.1.5.4 Different Federal Definitions of Science

Comment: Commenters (6125, 8913) express concern that the proposed rule would create different federal definitions of science.

Commenter (6125) states that the proposal on its face does not apply to other federal agencies or to states and tribes (or for that matter, even to EPA outside of major rulemaking). The commenter provides that the proposed rule does not acknowledge that this would result in two different federal definitions of science, nor does it address the potential confusion this would create. The commenter explains one of the definitions is applicable only to major rulemaking and the other for everything else; in other words there would be two different EPA definitions of science for actions addressing the same subject, the risk from the conduct, under the same statute. The commenter asserts that this is the very definition of arbitrary. The commenter contends that EPA has not attempted to explain how the different federal definitions of science would work, nor has it identified it as a source of potential problems for EPA or other agencies.

Commenter (6125) asks: How would EPA address such a situation? The commenter notes that the proposal says nothing about this, despite the obvious potential for confusion. For example, the commenter asks, would a decision whether to enforce a regulation based on the constricted new rule on science be based on all relevant science, including data not considered in developing the rule in the first place? What about permitting, licensing and registration decisions? What about evaluating a grant proposal under traditional science, for activities governed by a regulation using censored science? The commenter states that none of these serious concerns are addressed in the proposal. The commenter suggests that, if the agency insists on attempting to promulgate this flawed rule, there should be no distinction made between application of its provisions to major rules and to all other regulatory actions with regard to the consideration of the science in the development of such decisions. The commenter states that, if it is appropriate for one category of rules, then it is appropriate for all of them.

Commenter (6125) states that both EPA and HUD regulate similar residential sources of lead (paint, soil, and dust) - EPA in private housing, and HUD in federally supported housing, including federally supported units in private buildings. The commenter asserts that the EPA's proposed policy shift increases the potential for disparate treatment and public confusion stemming from those situations. According to the commenter, the identical risks addressed by the two programs should be analyzed consistently. According to the commenter, HUD has already acted to incorporate CDC's statement into its programs by making its policy on dust-lead clearance levels more stringent. The commenter states that, under the proposed rule, EPA might not be able to rely on as wide a range of studies as would be available to the rest of the federal family, which could result in different risk assessments and regulatory outcomes for similar, and possibly even adjacent, dwellings.

Commenter (8913) states that an ill-considered consequence of the proposal is the degree to which the rule would sow chaos in government and research domains. The commenter states that governmental record-keeping/information-sharing would be fractured and thrown into confusion. The commenter states that many other regulatory bodies would continue to follow law and rely on best available science. For example, according to the commenter, the FDA, NIH and CDC

would be funding research, evaluating medical findings, and focusing on public health values quite differently from EPA. The commenter contends that state and local officials acting to protect the air and water of their regions and the health of the families and children in their communities would no longer be able to rely on EPA standards for guidance.

Commenter (1973) contends that the proposal would put EPA in direct opposition to the standards for considering evidence of health effects of smoking, high cholesterol, etc. by the CDC, of the studies considered for issuing guidelines generated by the NIH, and of the FDA reliance on non-publicly available studies to approve drugs for use by people.

Response: As discussed in the preamble of the final rule, the transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. For example, in 2002 the OMB released its *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies*, which includes discussion of the importance of the reproducibility of analyses underlying influential information. The EPA's 2016 *Plan to Increase Access to Results of EPA-Funded Scientific Research* noted that "transparency is a core EPA value" and that increased availability of research data would accelerate scientific breakthroughs that support the Agency's mission and policymaking efforts. The EPA's *Open Government Plan 5.0* also details the EPA's progress in implementing the tenets of the numerous data transparency initiatives in the federal government prior to 2018, including OMB M-10-06, the Office of Science and Technology Policy Memorandum of February 22, 2013, and OMB M-13-13. In 2019, Congress passed the Foundations for Evidence-Based Policymaking Act of 2018 (or OPEN Government Data Act, Pub. L. 115-435) into law, which included requirements for federal agencies to prioritize making their data available to the public, and OMB has released additional guidance for implementing the act.

This is a rule of internal procedure promulgated under the EPA's housekeeping authority. The rule does not impose requirements on parties external to the EPA, including other agencies within the federal government. External users of EPA scientific assessments can still use these assessments. There are also provisions in the final rule (e.g., requirements for the EPA to document critical assumptions and methods used in its dose-response assessment, studies considered pivotal science, the rationale for the level of consideration for studies in the significant regulatory action or influential scientific information, and any Administrator exemption) that will make it clear how the provisions of this rule may have impacted the significant regulatory action or influential scientific information and will help external users determine whether the product is fit for their purpose. The EPA also disagrees that implementation of this rule would limit the scientific record. The final rule does not categorically exclude any studies from EPA's consideration, so the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

2.1.6 EPA Would be at Odds with Other National and International Bodies

Comment: Commenters (1973, 4827, 4878, 6906) contend that the proposal would create an approach to the use of scientific evidence on the adverse health effects of air pollution by EPA that would be at odds with the World Health Organization (WHO), the Royal Society for Medicine, and other national review bodies and law. Several commenters (4840, 4878, 6906) express concern that this could result in the EPA being unable to use beneficial studies conducted in compliance with other national and international bodies. Specific comments include:

Commenter (4840) states that some of the findings on which our public health protections are based are the result of studies done across the globe. The commenter suggests that it is unlikely that Canadian or European scientists would turn over their raw data to a U.S. agency for “independent validation.”

Commenter (4878) states that there is little currently known about air pollution and its impacts on the brain. The commenter provides that recent studies have linked particulate exposures to Parkinson’s disease including a large study done in Denmark. The commenter states that this study used several thousand people with and without a current diagnosis of Parkinson’s disease. Using extremely specific (within 5-50 meters of the front door) geo-coding to estimate participant’s exposure to contaminants, the commenter notes that the study estimated that ambient air pollution from traffic increased risk of developing Parkinson’s disease by 9 percent.²⁰⁵⁸ The commenter adds that researchers found an increased risk of Parkinson’s disease after exposure to particulate matter in studies from Taiwan²⁰⁵⁹ and South Korea,²⁰⁶⁰ as well.

The commenter (4878) expresses that, in addition to concerns about the usefulness of data if enough information is redacted to protect privacy, these studies raise additional challenges because they were performed internationally. The commenter provides that, in the Danish study participants are protected by European Union (EU) law. Going forward, the commenter notes that an EU study’s compliance with the proposed rule will need to be reconciled with the new General Data Protection Regulation,²⁰⁶¹ which is seen as more restrictive than HIPAA²⁰⁶². The privacy directive raises many issues for science not discussed here, but it is clear that many studies that involve people located in the EU will have a difficult time both complying with the new directive and providing enough information to EPA to be considered.

The commenter (4878) contends that studies coming from other countries are vital to health determinations in the U.S. because people in other countries are exposed to chemicals at different rates than in the U.S. The commenter states that the ability to compare and contrast exposure to

²⁰⁵⁸ Beate Ritz, et al., Traffic-Related Air Pollution and Parkinson’s in Denmark, *Envtl. Health Persp.*, Mar. 2016, at 351356.

²⁰⁵⁹ Chiu-Ying Chen, et al., Long Term Exposure to Air Pollution and the Incidence of Parkinson’s Disease: A Nested Case-Control Study, *PLOSOne*, Aug. 15, 2017, at 1-14.

²⁰⁶⁰ Hyewon Lee, et al., Short-term Air Pollution Exposure Aggravates Parkinson’s Disease in Population-based Cohort, *Scientific Reports*, Mar. 16, 2017, at 1-14.

²⁰⁶¹ Council Directive 2016/679 2016 O.J. (L119) 1, 88 (EC).

²⁰⁶² Int’l Ass’n of Privacy Prof’l, GDPR Matchup: The Health Insurance Portability and Accountability Act (2018), <https://iapp.org/news/a/gdpr-match-up-the-health-insurance-portability-and-accountability-act>

health outcome can be enlightening; average particulate matter concentrations in South Korea and China are several times higher than in the United States,²⁰⁶³ making relatively subtle effects stand out more easily. The commenter asserts that studies done in other countries can also help researchers tease out whether an effect is dose or length of exposure dependent and the inability to review and use international research in determinations will virtually guarantee EPA is missing major findings and important data.

Commenter (6906) also adds that recognition of internationally available data reduces EPA's burden in performing evaluations and allows for the consideration of hazard and risk assessments from other jurisdictions for Risk Evaluations under TSCA (§§ 4 and 6). According to the commenter, it also reduces industry's burden by allowing industry to rely on and/or provide data across countries. The commenter asserts that this promotes a uniform international market by coming to a common understanding of risk.

Specifically, commenter (6906) states that Effects and Environmental Fate of Chemicals Access to hazard characterizations, exposure assessments and environmental fate analysis in the EU, Canada and other jurisdictions assists with risk evaluation and new chemical review as required under the TSCA (§§ 4 and 6). The commenter is concerned that the new rule could limit recognition of analysis conducted and information available in foreign jurisdictions.

Commenter (6906) notes that many manufacturers of paint, coatings, sealants and adhesives operate at an international scale, importing raw materials and exporting products to foreign jurisdictions. The commenter states that the U.S. exports of paint and coatings totaled \$2.3 billion in 2017, the second-highest level in more than a decade. An analysis of exports to 20 EU member countries, out of 28 EU countries, including Germany, France, United Kingdom, Spain and Portugal shows exports of 86.8 million to EU members. Being the U.S.' most important trade partner, Canada consumed the largest amount of U.S. paint and coatings exports at 1.034 billion, accounting for 45% of all U.S. exports globally.

Response: As discussed in the preamble of the final rule, the rule requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information. The incremental progress made possible by this rule provides an

²⁰⁶³ Katherine Ellen Foley, Every Country has Terrible Air Pollution, but these are the World's Worst, Quartz Media, Sep. 28, 2016, <https://qz.com/794542/air-pollution-map-by-country-fine-particulate-matter/>

important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

As discussed further in the preamble of the final rule, the EPA will continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies— based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. The EPA provides these factors in 40 CFR 30.5(d) and they are discussed more fully in the preamble of the final rule.

Further, as discussed in the final rule, underlying dose-response data are considered available if they can be accessed through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The EPA would also like to clarify that the rulemaking does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

Comment: Commenter (6873) notes that, not only are there well-established requirements and procedures for protecting the privacy rights of research participants (45 CFR, Pub. L. 93-348, etc.), but that these rights are also encoded in the international Helsinki Declaration of the World Medical Association. The commenter contends that, coming up with new guidelines for releasing private data, even if the intent is to mask this data and make it available only to government scientists, will require review and approval by the U.S. (the FDA and other agencies) and the global research community.

Response: The EPA would like to clarify that this is a rule of internal procedures and does not direct or require any outside entity or EPA to establish data sharing mechanisms or create new guidelines for releasing data. Further, the rulemaking does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

2.1.7 Proposed Rule is Flawed and Needs to Be Withdrawn/Redone with Feedback from the Scientific Community/Stakeholders

2.1.7.1 Feedback from the Scientific Community/Stakeholders

Comment: Commenters (0055, 0057, 1742, 2907, 3644, 3971, 4594, 4831, 4894, 5165, 5181, 6115, 6119, 6125, 6126, 6144, 6373, 6894, 6904, 6924, 8272) urge the EPA to not implement the proposed rule and instead to consult with the stakeholders before issuing the rule, including scientists, medical researchers and health professionals, universities, hospitals, peer-reviewed journals/publishers, science advisory panels, and communities who participate in research studies. Commenters (2472, 2904, 4595, 4839, 5011, 5165, 6117, 6119, 6144, 6163, 6595, 6909, 6915, 8272, 9225) states that the EPA has failed to get adequate input from the scientific community in developing this proposed rule. Commenter (1006) suggests that EPA “take down” the proposal and come back with something that takes in mind the countless feedback that the scientific community has given in response to the Proposed Rule. Commenter (6158) states that the proposed rule appears to have been written by government officials who do not understand the scientific process and thus there is a glaring lack of analysis and rationale in the *Federal Register* announcement. In particular, the commenter adds that no formal scientific argument or policy rationale is made that would justify the need for this rule.

Commenter (6117) asserts that it is inappropriate to establish major changes in research priorities through insertion of additional language in a proposed regulation ostensibly on another topic, as was done here, rather than to use the normal channels of consultation with stakeholders, advisory boards, and reference to prior commissioned studies from the NAS.²⁰⁶⁴

Commenter (6144) states that it is clear both from the number of questions posed by the agency during its comment period about how the rule might be implemented and from the outcry of the scientific community that the agency did not consult with scientists or respected national scientist organizations as it crafted this rule.²⁰⁶⁵

Commenter (6126) states that the EPA’s proposed rule raises complex and multifaceted issues, and its implementation would likely have meaningful consequences for environmental regulation and, therefore, public health and the environment. The commenter expresses that they (BPC) are disappointed EPA did not engage in a more deliberate and robust effort to engage stakeholders while initially developing the proposed regulation. While the commenter appreciates EPA’s efforts since publication of the proposed rule to gather public input, the lack of foresight to engage in meaningful public discourse about the proposed activities prior to publication is troubling. According to the commenter, the now partisan debate over this rule’s motives and

²⁰⁶⁴ National Research Council. 2009. Science and Decisions: Advancing Risk Assessment. Washington, DC: The National Academies Press. <https://doi.org/10.17226/12209>.

²⁰⁶⁵ Letter to the Honorable Scott Pruitt. 2018. Re: Don’t Restrict EPA’s Ability to Rely on Science. Online at <https://s3.amazonaws.com/ucs-documents/science-and-democracy/secret-science-letter-4-23-2018.pdf>.

meaning could have been diminished if EPA had taken time to more meaningfully and transparently engage the public.²⁰⁶⁶

Commenter (6126) notes that, as EPA determines whether or how to move forward in developing this regulation, they encourage a much more robust and thorough consultative process. The commenter states that this process should include direct consultation and dialogue with key stakeholders and experts likely to be impacted by the issues of the regulation, including scientists, industry, academic institutions, states, other federal agencies, and EPA's relevant advisory boards. The commenter contends that such a process will likely necessitate a new notice of proposed rulemaking for public comment prior to developing a final rule. The commenter suggests that EPA engage in much more extensive public and interagency dialogue, then subsequently issue a new Notice of Proposed Rulemaking on data sharing and use issues. The commenter suggests that the EPA could either (1) withdraw the rule and issue a new Notice of Proposed Rulemaking informed by a robust dialogue or (2) issue a new Notice of Proposed Rulemaking that supersedes the proposed rule published on April 30, 2018.

Commenters (4595, 5165) recommend that EPA withdraw this proposed rule until a more thorough examination by an independent scientific organization/scientific community can be completed. Commenter (4595) urges EPA to consider carefully and deliberately, in concert with the scientific community and other stakeholder communities, any policy changes that could diminish the important role of scientific evidence in helping to make decisions that impact the health of Americans. Commenter (5165) suggests that a regulation with such significant ramifications for EPA's science-based decision making should be thoroughly vetted by the scientific community²⁰⁶⁷ and other key stakeholders, including the state and local air agencies that rely on the scientific integrity of EPA's regulations to protect public health and the environment from the harmful effects of air pollution. Commenter (5165) adds that EPA should also consult from the earliest stages with the state and local agencies that are responsible for implementing our nation's environmental laws.

²⁰⁶⁶ According to the commenter: EPA could have taken numerous actions to productively engage with stakeholders as the proposed policy was being developed. Such early engagement could have minimally involved listing the tentative proposal in "Pre-Rule Stage" in EPA's Fall 2017 Regulatory Plan submitted to the Office of Management and Budget. (Available at <https://www.gpo.gov/fdsys/pkg/FR-2018-01-12/pdf/2017-28234.pdf>) EPA could have elected to issue an Advance Notice of Public Rulemaking (ANPRM) to pose a series of questions about how to best articulate the problem statement and potential solutions. EPA could have issued a Request for Comments in the Federal Register to solicit additional information about existing data infrastructure or to help define the nature of the problem the proposed rule seeks to address. EPA could have consulted with the Science Advisory Board, and other EPA Federal Advisory Committees about the potential implications and applications across policy areas and environmental laws. Yet, these simple actions were not taken by the agency.

²⁰⁶⁷ In a memorandum dated May 12, a Science Advisory Board (SAB) Work Group Chair indicated that EPA made no effort to seek the input of its own scientific advisors and that Work Group members were only made aware of the proposal "via the Federal Register and news articles." The Work Group concludes that the action warrants further review by the SAB and lays out a number of specific concerns with the proposal, all of which NACAA concurs warrant serious consideration. See Memorandum to Members of the Chartered SAB and SAB Liaisons from Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration, "Preparations for Chartered Science Advisory Board (SAB) Discussions of Proposed Rule: Strengthening Transparency in Regulatory Science RIN" (May 12, 2018).

Commenter (5181) expresses that, given the broad scope and potential effect of the proposed rule, they recommend that an additional step be added for EPA to hold discussions with impacted states and tribes and other stakeholders to provide supplemental information to the current proposal. The commenter also requests that EPA provide a supplement to the rule to explain more fully how the proposed rule would increase transparency without delaying decision-making or excluding consideration of traditionally acceptable data and publications, given the numerous federal provisions already in place to achieve the goal of ensuring transparency.

Commenter (3971) states that the proposed approach, if carefully designed with input from all stakeholders (which will require a series of science advisory panels), can be brought into rulemaking. The commenter states that possible benefits of bringing to the table both classic toxicologists (who embrace historical in-vivo, whole animal, testing), as well as “modern era” toxicologists and physicians (who are well versed in predictive structure activity models, in-silico models, and low-dose modeling) could take rulemaking to a new level of sophistication. The commenter states that doing so would allow all reasonable scientific approaches to be given serious consideration when working toward a final recommendation for a particular conclusion. The commenter states that NAS and numerous respected scientific bodies, as well as trade associations, have made many proposals as to how this approach could be carried out, and these are well documented within EPA files. The commenter states that one unfortunate aspect of this proposed regulation is that the possible published papers that may help guide the Agency are not listed in the appendix.

Typically, according to the commenter (6125), these actions rely heavily on work done by the career staff in ORD and/or program offices and consultation with the SAB, the FIFRA Science Advisory Panel (SAP), and/or the NAS and others before proposing a regulation. The commenter notes that none of this was done here. The commenter states that multiple reports based on emails and other documents obtained by the Union of Concerned Scientists (UCS) indicate that the idea of developing a policy memorandum or a rule based on legislation developed by Congressman Lamar Smith of the House Science, Space, and Technology Committee began in January 2018.²⁰⁶⁸ Serious work on drafts took place during February under some deadline pressure, as evidenced by email traffic mainly involving EPA political staff. The commenter provides that the Administrator’s first public mention of the effort appeared in a March 19 story in the Daily Caller,²⁰⁶⁹ which was linked in an official EPA news release.

Commenter (6125) contends that the agency was in such a rush to judgment that it did not provide a role for its own career scientific and science/policy experts in crafting the policy/regulation or assessing potential unanticipated impacts, never included the rule in its regulatory agenda, did not follow its guidance for how to develop agency rules,²⁰⁷⁰ did not notify or consult with or request a review of the proposal by its SAB, SAP, or the Department of Agriculture (USDA) as required by law, did not solicit the advice of the NAS on provisions that

²⁰⁶⁹ Daily Caller. Scott Pruitt Will End EPA’s Use of ‘Secret Science’ to Justify Regulations. March 19, 2018. <https://www.epa.gov/newsreleases/daily-caller-scott-pruitt-will-end-epas-use-secret-science-justify-regulations>

²⁰⁷⁰ EPA’s Action Development Process, EPA Office of Policy, March 2011 [https://yosemite.epa.gov/sab/sabproduct.nsf/5088B3878A90053E8525788E005EC8D8/\\$File/adp03-00-11.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/5088B3878A90053E8525788E005EC8D8/$File/adp03-00-11.pdf)

would change dose-response models used in risk assessment from those previously recommended by the NAS.

The commenter (6125) notes that the EPA initially allowed only a 30-day comment period, which would close one day before a long-scheduled meeting of the full SAB. According to the commenter, this rushed and largely secret process, antithetical to any standard of reasoned consideration or transparency, shows that EPA is not really concerned about transparency in public policy, much less in science.²⁰⁷¹

Commenter (5022) states that the Proposal violates fundamental tenets of transparent rulemaking. The commenter suggests that the EPA apparently failed to consult with relevant stakeholders such as scientific, research, or health professional associations, did not consult with other federal agencies, and did not even make the proposed rule available to its own SAP for review.²⁰⁷²

Similarly, commenter (6163) notes that the proposed rule was published without input from internal or external scientific experts, including the EPA SAB and the NASEM. According to the commenter, as a policy that would significantly impact the use of science at the agency and the clear solicitation of input about process and data management infrastructure included in the notice, experts in science and data management would have greatly informed the agency's actions.

Commenter (4831) states that they (The National Academies) have carried out numerous studies that advise EPA on the scientific bases of regulatory decisions related to human health and the environment. The commenter notes that examples of relevant reports that advise on dose-response analysis and models, as well as how to perform literature-based reviews, include:

- Application of Systematic Review Methods in an Overall Strategy for Evaluating Low-Dose Toxicity from Endocrine Active Chemicals (NASEM, 2017a;),
- Review of EPA's IRIS Process (NRC, 2014; <http://dels.nas.edu/Report/Review-Integrated-Risk/18764>),

²⁰⁷¹ According to the commenter, it is useful to contrast this process with the one EPA followed for a less far-reaching change in science/policy assessment that took place largely in 2006. The deputy Administrator requested a top to bottom review of the process of reviewing scientific criteria supporting the review and setting NAAQS and to make recommendations that would strengthen the process. It began with a workgroup that included experienced staff from both the research and air offices. They first consulted with CASAC and some other stakeholders and within three months wrote a report with conclusions and recommendations and an analysis of how the process could be completed in the mandated five years. This was followed by a public workshop involving stakeholders and public comments. EPA management made final decisions based on staff recommendations and CASAC and public comment and announced a revised process in December 2006. Some smaller changes were made based on EPA and CASAC experience with executing the process in later years. EPA, Historical Information on the NAAQS Review Process <https://www.epa.gov/naaqs/historical-information-naaqs-review-process>

²⁰⁷² EPA Science Advisory Board. Memorandum: Preparations for Chartered Science Advisory Board (SAB) Discussions of Proposed Rule: Strengthening Transparency in Regulatory Science RIN (2080-AA14). May 12, 2018, [https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/\\$File/WkGrp_memo_2080-AA14_final_05132018.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/$File/WkGrp_memo_2080-AA14_final_05132018.pdf).

- Critical Aspects of EPA's IRIS Assessment of Inorganic Arsenic: Interim Report (NRC, 2013; <http://dels.nas.edu/Report/Critical-Aspects-IRIS/18594>),
- Review of the Environmental Protection Agency's Draft IRIS Assessment of Formaldehyde (NRC, 2011; <http://dels.nas.edu/Report/Review-Environmental-Protection-Agency/13142>),
- Finding What Works in Health Care: Standards for Systematic Reviews (IOM, 2011; <http://www.nationalacademies.org/hmd/Reports/2011/Finding-What-Works-in-Health-Care-Standards-for-Systematic-Reviews.aspx>),
- Science and Decisions: Advancing Risk Assessment (NRC, 2009; <http://dels.nas.edu/Report/Science-Decisions-Advancing-Risk-Assessment/12209>), and
- Models in Environmental Regulatory Decision Making (NRC, 2007; <http://dels.nas.edu/Report/Models-Environmental-Regulatory-Decision-Making/11972>).

According to the commenter (4831), these reports encourage EPA to consider all available science in the rule-making process and provide guidance about how the agency could be more transparent in describing how evidence is gathered and evaluated. Specifically, the commenter suggests that systematic-review methods be adopted to ensure objectivity, rigor, and transparency in performing literature-based reviews (IOM, 2011; NRC, 2011, 2014). The commenter states that NASEM, 2017a, includes four case examples of systematic reviews.

Commenters (2907, 4438, 4831, 4839, 5022, 5165, 5178, 6126, 6373, 8272) suggest EPA work with the National Academies. Commenter (4839) asserts that the design and content of the proposal contradicts credible and well-established scientific principles and methods used across academia, the business community and the public sector. The commenter requests that EPA withdraw the proposed rule and suggests that, if EPA wishes to re-engage in evaluating the topic of transparency in regulatory science, the EPA seek an independent review of key issues from the NAS/NRC and invite the input of other established, competent and credible professional bodies. Commenter (5022) asserts that heeding the advice provided by the National Academies to use the best and most current science to support and revise default assumptions, make implicit defaults explicit, and provide clear standards for the level of evidence needed to depart from default assumptions,²⁰⁷³ taking into account data-sharing guidelines already developed by NIH.²⁰⁷⁴ Commenter (4438) suggests that subsequent EPA transparency initiatives, if any, be based on consultation with the NAS and should not restrict EPA's ability to rely on the universe of best available science when promulgating regulations.

Commenter (5011) states that crafting the rule without consulting with the scientific community is a fatal error for this proposal. According to the commenter, even the agency's own SAB has noted the need to consult with scientists in any further development of this proposal. Commenters (1012, 2427, 2472, 3135, 5178, 6144, 6447, 6897, 6915, 6916, 6943, 8272, 8281-PH10, 9225) suggest that the SAB should have been given the opportunity to review the rule and make recommendations. Comments include:

²⁰⁷³ Institute of Medicine of the National Academies. Identifying and Reducing Environmental Health Risks of Chemicals in Our Society: Workshop Summary. Washington, D.C.: National Academies Press; 2014, p. 55.

²⁰⁷⁴ NIH. Data Sharing Policy and Implementation Guidance. March 5, 2003. https://grants.nih.gov/grants/policy/data_sharing/data_sharing_guidance.htm

- From a process standpoint, the SAB should have been given the opportunity to consider the EPA's proposed rule before it was released for public input. The commenter notes that the SAB has advised the EPA about the quality of the scientific information utilized in policymaking and EPA research programs and plans for over 40 years. The commenter adds that this Board has an ethical responsibility to remain impartial, consider public input, and consider the best scientific evidence available when making decisions. The commenter notes that SAB's analysis would have provided unparalleled insight into the potential effects of the proposed rule. (6897)
- It seems to reason that when you propose a rule which directly affects how the EPA uses science, you'd want to consult with scientists. The commenter states that they hope that EPA will heed their advice and consult, not just with your SAB, but with the many scientific organizations and societies which have previously expressed concerns about the "Secret Science Act." In the meantime, the commenter strongly urges the EPA to withdraw the proposed rule. (1012)
- Commenter (3135) supports the SAB workgroup's May 12 memo recommending that the SAB review the agency's April proposed rulemaking, "Strengthening Transparency in Regulatory Science." The commenter notes that the workgroup points to a number of complex scientific issues for which the Agency should seek expert advice from the SAB. According to the commenter, the proposed rule suffers from lack of involvement of the scientific community, either within or outside of the EPA. The commenter urges the SAB to recommend that the Administrator:
 - Not use the agency's regulatory authority to prescribe specific risk assessment processes;
 - Not adopt any major changes to EPA's foundational policies on the use of science in rulemaking without thorough advice and consultation with the SAB, and other authoritative scientific bodies.
- The EPA has failed to consult its own SAB about this proposed rule despite the SAB's assessment that "this rule deals with a myriad of scientific issues for which the Agency should seek expert advice."²⁰⁷⁵ The commenter contends that proposing a rule that limits the use of scientific data without even notifying, let alone consulting, the Agency's own expert scientific advisors is a text book example of an arbitrary and capricious failure to consider "relevant factors." *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 42-43 (1983). The commenter adds that the EPA offers no explanation for its inexplicable failure to consult with science experts, including the SAB, on this proposal, and it is beyond question that this highly consequential proposal demanded such consultation. The commenter argues that, not only is this statutorily required, see 42 U.S.C. §4365(c)(1), but as the SAB Work Group Memo states, "[t]he proposed rule deals with issues of scientific practice and proposes constraints that the [A]gency may apply to the use of scientific studies in particular contexts. As such, this rule deals with a myriad of scientific issues for which the Agency should seek expert advice from the [SAB]."

²⁰⁷⁵ Memorandum from Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science to Members of the Chartered SAB and SAB Liaisons, Preparations for Chartered Science Advisory Board (SAB) Discussions of Proposed Rule: Strengthening Transparency in Regulatory Science RIN (2080-AA14) 2 (May 12, 2018) [hereinafter SAB Work Group Memo], available at [https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/\\$File/WkGrp_memo_2080-AA14_final_05132018.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/$File/WkGrp_memo_2080-AA14_final_05132018.pdf).

SAB Work Group Memo at 2. The commenter provides that, underscoring the importance of the issue, the full 44-member SAB followed up on the Work Group's Memo with a unanimous vote to review the proposal and urged EPA to proceed no further until EPA does what it should have done in the first place: "request, receive and review scientific advice from the SAB." SAB June 28 Letter at 1. The commenter asserts that the EPA's effort to rush this proposed rule out the door without any input from the SAB or other scientists violates basic principles of good government and policymaking as well as EPA's legal duty. We urge EPA to withdraw this ill-conceived proposal and to consult with the SAB, the NAS, and the broader scientific community before determining if any rule is needed. (6915)

- The EPA failed even to confer with its chartered SAB, and seek its input, as required under the Environmental Research Development and Demonstration Authorization Act (ERDDAA), 42 U.S.C. § 4365(c)(1), even though EPA claims authority under the CAA, and admits in the Proposal that it is a "significant regulatory action" submitted to OMB for review.²⁰⁷⁶ As EPA's SAB recently wrote to the Administrator, the commenter notes that a proposal like this, which "focus[es] on the EPA's foundational policies related to the use of science in rulemaking and policy development," is within the SAB's purview and should have been submitted to it for review."²⁰⁷⁷ According to the commenter, EPA's failure even to submit the Proposal to SAB review, never mind take account of the SAB review results, is evidence of the arbitrary and capricious nature of this whole undertaking.²⁰⁷⁸ (6916)
- Of particular concern, the EPA's own SAB was not given the opportunity to review the proposed rule before it was announced. The commenter provides that a June 28, 2018, letter from SAB Chair Dr. Michael Honeycutt explained that the SAB only found out about the proposed rule after the related press event and subsequent announcement in the *Federal Register*. "SAB members had no information regarding the timeline for finalizing the rule and the proposed rule was not identified as a major action in either of

²⁰⁷⁶ 42 U.S.C. § 4365(c)(1)(requiring, inter alia, EPA to make available to the SAB any CAA rule that is provided to any other Federal agency for formal review and comment); 83 Fed. Reg. at 18,772; see also *Bad Science Fiction*, supra note 14 at 79-80 & n. 66 ("Science advisory boards are mandatory for EPA's promulgation of air quality standards and for regulatory action on pesticides. See 7 U.S.C. § 136w(d)-(e) (requiring the scientific advisory panel established under FIFRA to review the scientific basis for major regulatory proposals concerning pesticides and to adopt peer-review procedures for scientific studies carried out pursuant to FIFRA); 42 U.S.C. § 7409(d)(2)(B)-(C) (2000) (establishing the CASAC to review EPA's ambient air quality standards). ...[S]ee also 42 U.S.C. 4365(c)(1) (2000) (establishing a science advisory board to review scientific and technical information relevant to any proposed action under EPA's authority if EPA is forwarding the proposal to any other federal agency for formal review). The FDA, EPA, and OSHA each has advisory bodies available to them for various regulatory activities, but the agencies are not required to seek their assistance. See, e.g., 42 U.S.C. 4365 (2000) (creating a Science Advisory Board to assist EPA in its research initiatives and science-based regulatory determinations). EPA's SAB "has played an increasingly influential role in reviewing the agency's science....The agencies have also developed, without legislative direction, a variety of peer review and science consensus panels. The NIH, for example, has developed an innovative expert panel to reach consensus on issues of medical import.").

²⁰⁷⁷ Letter from Dr. Michael Honeycutt, Chair, EPA SAB, to Administrator Scott Pruitt, EPA, at 3 (June 28, 2018). See also Memorandum from Alison Cullen, Chair, SAB Work Group to Members of the Chartered SAB (May 12, 2018) (raising numerous and significant concerns with the Proposal).

²⁰⁷⁸ *Public Employees v. Hopper*, 827 F.3d 1077, 1083 (D.C. Cir. 2016) (holding that where an agency relies "solely on data...roundly criticized by its own experts, [it] fail[s] to fulfill [its] duty" to exercise its discretion in a reasoned manner.).

the Spring 2017 or Fall 2017 semi-annual Regulatory Agendas.”²⁰⁷⁹ The commenter adds that the letter goes on further to explain that, “the precise design of the proposed rule appears to have been developed without a public process for soliciting input specifically from the scientific community.”²⁰⁸⁰ The SAB consists of EPA-appointed members of the scientific community whose role is to review this type of rule prior to proposal. According to the SAB website, one of the roles of the SAB is to, “...advise the agency on broad scientific matters.”²⁰⁸¹ The commenter contends that the proposed rule on “transparency” in science surely fits under the umbrella of a “broad scientific matter.” (6919)

- The SAB should have been given the opportunity to thoroughly review the proposed rule and make recommendations that would serve to identify and address the specific problems inherent with the implementation of this rule. The commenter notes that this step would have allowed the acknowledged scientific leaders in their respective fields to consider elements in the proposed rule that may be either too far-reaching or otherwise inconsistent with current scientific protocol. (6943)
- The EPA SAB has asked to review the rule under the authority vested in it by the Environmental Research, Development and Demonstration Authorization Act. The commenter provides that the SAB sent a letter to the EPA administrator, raising many of the same scientific issues of confidentiality, feasibility, and the need for a clearer definition of crucial concepts, such as replication and validation. The commenter urges the EPA to fully consult with the SAB before moving forward with this rule. After the SAB review is complete, the commenter suggests that EPA either withdraw the proposal, or provide an additional opportunity for public comment based on that SAB review. (8281-PH10)
- EPA’s SAB, tasked with reviewing the Agency’s regulatory agenda and recommending actions that merit independent review, only learned about the rulemaking after it was already proposed. As a result, the commenter provides that an SAB workgroup recommended that the advisory body review the merits of the rule because “it deals with a myriad of scientific issues for which the Agency should seek expert advice from the Science Advisory Board.”²⁰⁸² After a nearly unanimous vote concurring with the memo, the commenter notes that the SAB wrote in a June 28 letter to former Administrator Scott Pruitt that “[t]he SAB urges the Agency to ... request, receive, and review scientific advice from the SAB before revising the proposed rule.”²⁰⁸³ (9225)

Response: Public input was an important part of shaping the final rulemaking. The EPA accepted public comment on the proposed rule from April 30, 2018 to August 16, 2018, and held a public hearing on July 17, 2018. In response to public comments, the EPA released a supplemental

²⁰⁷⁹ June 28, 2018, Letter to former EPA Administrator Scott Pruitt from Michael Honeycutt, SAB Chair at 2.

²⁰⁸³ Honeycutt, M. 2018. Letter Re: Science Advisory Board (SAB) Consideration of EPA Proposed Rule: Strengthening Transparency in Regulatory Science, June 28, 2018.

NPRM and took public comment from March 18, 2020 to May 18, 2020. In addition, the EPA's SAB provided advice and comments on mechanisms for secure access to PII and CBI under the proposed rule on September 30, 2020, and the proposed and supplemental rulemakings on April 24, 2020. All of these comments were considered in developing the final rule.

As discussed more fully in the preamble of the final rule, the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Comment: Commenter (3971) states that, in an ideal world, a “middle ground” proposal would come from balanced committees of experienced professionals. Specifically, the commenter suggests that EPA return to its historical (pre-2000 era) position that these groups have representatives from nongovernmental organizations (NGOs), the private sector (corporations), academia, consultants, trade associations, as well as others who are genuine experts on the topic. The commenter adds that, in the future, it would be good to include at least one or two experts from countries outside the United States. Hopefully, the commenter contends, such committees would contain persons who have not been heavily influenced by forces that are stubbornly wedded to certain positions.

Commenter (3971) expresses that the demand that professionals cannot have ever worked in a corporation that has an interest (knowledge) in a topic, or that someone must be disqualified because he or she has performed research funded by the regulated community, or served as an expert in court for “one side or the other,” is not appropriate criterion for exclusion. Often, the commenter notes, special interest groups claim that certain experts are unable to serve on various advisory boards because of claims of bias or conflict of interest. According to the commenter, the result is that SAB often convenes committees that lack persons who have spent a lifetime studying a particular issue.

Commenter (3971) contends that banning true experts because they have served as experts in litigation or conducted studies for the regulated community (often having QC and rigor far higher than studies in universities or government labs) is not an optimal or appropriate policy. Again, the commenter claims that, as this regulation attempts to address, “transparency” is important. The commenter states that if all SAB participants share their possible conflicts and bias with the ethics lawyers at EPA and the public, I believe the public deserves to hear their views.

Commenter (3971) expresses that, as noted in many published papers of the past 5 years, the trial lawyers have had a significant impact on the views of government employees, NGOs, and some experts. The commenter asserts that the SAB group within EPA needs to be more sensitive to possible or likely conflict of interest. According to the commenter, it is no surprise that trial lawyers write many letters complaining of conflicts of interest when consultants or corporate scientists (who often conducted the original studies) are nominated for appointment. The commenter provides that when university professors who receive government grants intended to highlight adverse effects (at any dose) of a chemical, no questions are raised. According to the

commenter, it is well known that scientists who report an adverse effect, even if not a physiologically or environmentally dose (with a factor of 1,000), are more likely to get funding than those who do not. Currently, the commenter claims that there is no opportunity for an expert to rebut the claims of parties who have a vested interest in the outcome of the committee process (which should occur to insure proper “due process”).

As has been noted by others, commenter (3971) notes that when EPA uses the new “conflict of interest” criterion, sometimes committees of persons who don’t know the topic in an in-depth manner are convened, and they reach very poor scientific conclusions. The commenter contends that Committees of well-meaning volunteers who have not “labored in the field” for decades on a particular topic cannot recognize shortcomings in various studies that are brought before them because it does take 10-20 years of study of a particular topic to recognize such flaws. For example, the commenter notes that the presumption that all research that is conducted under a federal grant is valid, while that conducted by the regulated community is compromised, is not appropriate. Although the public and many NGOs believe that research conducted by universities surely must be objective and weighed more heavily than an industry sponsored study, the commenter states that is not a valid assumption. The commenter provides that few universities, if any, perform their work using GLP, or meet the expectations for analytical testing quality that the regulated community must meet. The commenter notes that studies by non-industry groups often have fewer animals, fewer doses, less quality control, improper statistical analyses, and other shortcomings. Future committees should reflect the expertise necessary to weigh the quality of the studies and evaluated the studies objectively.

Commenter (6104) provides contact information for any questions on their comments and requests that EPA periodically meet with states to share information the agency has learned, and to consider any intended and unintended impacts to state programs. The commenter notes that their members, the directors of state surface water quality programs, possess unique knowledge and insight into those clean water program areas that rely most heavily on data, scientific studies, and models. The commenter asserts that, as with all of their comment letters, they encourage the agency to also consider recommendations provided by individual states.

Response: Comments related to conflicts of interest reviews for members of the SAB or other advisory committees are outside the scope of this rulemaking. The EPA agrees that a thorough study quality evaluation should be conducted for all studies used in significant regulatory actions and influential scientific information. Studies are not considered more or less credible based on the affiliation of the authors. The rule requirements also direct the EPA to evaluate the availability of the underlying dose-response data for any subject matter expert, regardless of author’s affiliation or funding status.

2.1.7.2 Proposal Did Not Include Cost Benefit Analyses/Impacts Assessments

Comment: Commenters (2171, 2335, 2430, 2902, 5011, 5021, 5022, 5170, 5172, 5178, 5181, 6046, 6125, 6126, 6133, 6168, 6185, 6358, 6446, 6447, 6874, 6877, 6879, 6893, 6915, 6916, 6919, 6920, 6924, 8272, 8281-PH20, 8801, 9227) assert that the proposal fails to conduct appropriate costs and/or benefits analyses/impacts assessments. Comments include:

- The EPA provide more information about the potential impacts of this proposal in order for the public to fully weigh the proposed rule's implications. (2335)
- Requests that the EPA publicly define the potential data and policy impacts of the proposed rule. (2430)
- The Proposal is fatally flawed because it provides almost no analysis of the impacts of the proposed change in policy. (5011)
- Despite its professed fealty to cost effectiveness in rulemaking, the proposed rule provides no cost-effectiveness analysis whatsoever. According to the commenter, the proposal simply asserts blithely that "EPA believes the benefits of this proposed rule justify the costs." (5022)
- While the proposed rule states that EPA "believes the benefits of this proposed rule justify the costs," EPA offers no estimation or calculation of either the potential costs or benefits. The commenter states that, for such a significant change in policy, a statement of belief is not adequate. (5170, 6125)
- Although this proposal would do real harm to EPA's ability to protect public health and the environment, the proposed rule does not include any assessment of its impact on public health and the environment. (5172)
- Commenter (6879) states that the EPA is proposing to make significant changes to long-standing policies without adequate analysis of the costs and benefits of the proposal. Commenters (6877, 6879) note that EPA has failed to demonstrate that the purported benefits of this regulation would outweigh the costs, including costs in compliance as well as increased risks to human health and the environment.
- Proposal fails to acknowledge the costs from delays in rulemaking proceedings while EPA performs the additional review called for above and beyond the extensive scientific peer review to which scientific studies have already been subjected. (6915)
- The proposed rule has not provided any supporting information to justify why the rule is beneficial. Moreover, the commenter adds that the EPA has not fully evaluated the costs and benefits of the rule. The commenter states that the costs of the rule could be significant, especially if EPA decides to apply the rule retrospectively, and use the rule as a tool to revise existing health-based air quality standards. The commenter urges EPA to include an evaluation the costs and benefits. The commenter also requests that EPA evaluate what data would be available for setting health-based air quality standards if the rule was applied retroactively and prospectively and consider how it would impact the EPA's ability to protect public health and the environment. (6920)
- The analysis of costs and benefits should include an examination of the studies that have previously informed regulation and the extent to which they will meet the proposed criteria; an analysis of regulations that would not have been promulgated, would have included less-protective limits, or that could be weakened in the future under the proposed criteria; an analysis of the time and costs required to bring all relevant studies into compliance with the criteria; and a calculation of the foregone public-health benefits and associated costs to the U.S. economy when regulations are delayed or are less protective due to this rule. Commenters assert that the analysis of benefits is also lacking, given that EPA failed to present convincing evidence that insufficient data access has caused a problem, or that addressing the purported problem would improve public health, including reproductive health and the health of children. (5178, 6893)

- EPA has completely failed to evaluate the costs and benefits of this action. The commenter asserts that it is a basic tenet and requirement of reasoned decision-making that an agency must provide a reasoned explanation of its action that considers both the advantages and disadvantages of issuing a rule [*Michigan v. EPA*, 135 S. Ct. 2699, 2707 (2015)]. The commenter states that there is no question that the proposed rule could have profound consequences on the regulatory process at EPA, and ultimately on human health and environmental quality. (6447)
- Commenters (6153, 6358, 6874) note that the EPA the proposal does not contain a thorough analysis of costs and benefits and EPA could have obtained information to inform a robust cost-benefit analysis by issuing an advanced notice of proposed rulemaking (ANPRM) and seeking SAB input, but it did not do so. Commenter (6358) suggests that the analysis of benefits is lacking, given that EPA failed to present convincing evidence that insufficient data access has caused a problem, or that addressing the purported problem would improve public health, including reproductive health and the health of children. Commenters (6153, 6874) contends that such an analysis should include an examination of the studies that have previously informed regulation and the extent to which they will meet the proposed criteria; an analysis of regulations that would not have been promulgated, would have included less-protective limits, or that could be weakened in the future under the proposed criteria; an analysis of the time and costs required to bring all relevant studies into compliance with the criteria; and a calculation of the foregone public-health benefits and associated costs to the U.S. economy when regulations are delayed or are less protective due to this rule.
- In the background section of this proposed rule, the cost of compliance with “significant regulations” is provided as justification for the proposed rule. The commenter states that, subsequently, it is suggested that dose response modeling used by EPA scientists for “pivotal regulatory science” is overly protective of health and the environment and therefore places unnecessary regulatory and financial burdens on industry. The commenter states that this justification for the proposed rule does not account for the short and long-term costs to individuals and communities from environmental degradation and the resulting population health impacts. (6130)
- The proposed rule does not include any assessment of its impact on public health and the environment. The commenter asks: “Where is the EPA’s risk assessment that shows that the proposed changes will have a positive impact on, and not unintended consequences of doing harm to, the groups it is purportedly intended to protect?” The commenter asserts that there are important questions that must be answered before EPA proceeds. The commenter notes that sound scientific information is crucial to creating regulations and policies that protect the health and well-being of us all and that they are concerned that there is little evidence to suggest that the proposed changes would not adversely affect the quality of the resulting policies. (8801)
- The EPA does not present any analyses of benefit-cost, children’s environmental health risks or environmental justice in support of the rule, which are required under Executive Orders 12291, 13045, and 12898. (6924, 8281-PH20) Commenter (6450) states there has been no environmental justice analysis conducted.

Response: The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs or benefits of the proposed action. As discussed in the preamble to the

final rule, this is a rule of internal procedure promulgated under the EPA's housekeeping authority and a benefit-cost analysis is not required. However, the EPA has included a discussion of costs and benefits in the preamble of the final rule.

Briefly, the additional procedures required by this rule only apply to pivotal science, which is a subset of the total number of studies that the EPA would evaluate. Given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small. The Agency may also incur other administrative costs to perform analyses and evaluations to support activities such as exemption decisions made by the Administrator, and documenting these or other decisions made pursuant to the requirements of the final rule. Again, the Agency anticipates that the incremental costs for these activities will be small relative to current administrative costs for developing significant regulatory actions or influential scientific information. Finally, this final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to pivotal science for which the underlying dose-response data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

The main benefits of this rule spring from greater transparency in significant regulatory actions and influential scientific information. By placing greater emphasis on the availability of dose-response data underlying pivotal science, the rule will allow for greater scientific scrutiny as EPA decision makers are developing significant regulatory actions and influential scientific information and increases the likelihood that any errors will be identified and corrected. Greater transparency is also inherently valuable as a principle of good government and provides benefits to the public at large, including reducing the risk of errors in EPA analyses and in the science such analyses rely upon. The ability for independent subject matter experts to validate pivotal science will facilitate more effective comment and engagement with the public during development of future significant regulatory actions and influential scientific information.

Comment: Commenter (6125) asserts that reasoned decision making requires an agency to identify and address the impact of its proposed actions on its ability to perform its Congressionally mandated functions, *State Farm*, 463 U.S. at 43, because the likely impacts of the proposal are a critical issue in deciding whether to proceed with the rule. Nevertheless, the commenter states that the proposal outright fails to consider any impacts at all — literally none at all! The commenter argues that the failure to consider potential environmental impacts in a proposal that fundamentally affects each of EPA's core statutory responsibilities is fatally arbitrary. See *Sierra Club v. Costle*, 657 F.2d 298, 326 (D.C. Cir. 1981) (“[W]e can think of no sensible interpretation of the statutory words ‘best technological system’ which would not incorporate the amount of air pollution as a relevant factor.”) See also *N.L.R.B. v. Creative Food Design Ltd.*, 852 F.2d 1295, 1306 (D.C. Cir. 1988) (noting that agencies “may not ignore relevant factors” in making decisions); *Small Refiner Lead Phase-Down Task Force v.*

U.S.E.P.A., 705 F.2d 506, 521 (DC. Cir. 1983) (“Arbitrary and capricious” review generally refers to the requirement that an agency “must consider all the relevant factors” and reach a “reasonable” conclusion; *Sierra Club v. Costle*, 657 F.2d at 323.”); *Environmental Defense Fund, Inc. v. Costle*, 657 F.2d 275, 283 (DC Cir. 1981) (“Thus, we must be assured that the agency action was “based on a consideration of the relevant factors,” *Citizens to Preserve Overton Park, Inc. v. Volpe*, supra, 401 U.S. at 416, 91 S. Ct. at 823; and that “the agency has exercised a reasoned discretion, with reasons that do not deviate from or ignore the ascertainable legislative intent,” *Ethyl Corp. v. EPA*, supra, 541 F.2d at 35-36, quoting *Greater Boston Television Corp. v. F.C.C.*, 444 F.2d 841, 850 (1970), cert. denied, 403 U.S. 923, 91 S.Ct. 2229, 29 L.Ed.2d 701 (1971).)”

Moreover, commenter (6125) argues that as in *CMA v. EPA*, 217 F. 3d 861, 865-66 (D.C. Cir 2000), EPA’s assertion of potential benefits without demonstrating their existence or providing any quantitative comparison of their value as compared to costs and disbenefits to public health is yet another clear indicator of arbitrariness and lack of support in the evidence before the agency. *Id.* (citing *State Farm*, 463 U.S. at 43).

Response: Based on a consideration of these and similar comments, the EPA has included a discussion of the effects of the final rule on the studies the EPA uses to support final significant regulatory actions and influential scientific information in the preamble of the final rule. Briefly, consistent with existing Agency practice, the EPA will use existing factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) to evaluate study quality. When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science. Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. In compliance with the rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or propriety information, available through restricted access in a manner sufficient for independent validation. Including this review of data availability for pivotal science is critical to the EPA’s progress toward increased transparency and providing increased opportunity for scientific reanalysis and scrutiny by independent third parties. This approach will result in final significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and

ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers. When the dose-response data underlying pivotal science are not publicly available in a manner sufficient for independent validation, the EPA will give less consideration to the studies' evidence, findings, and conclusions unless the Administrator grants an exemption request. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. The EPA provides these factors in 40 CFR 30.5(d) and they are discussed more fully in the preamble of the final rule.

The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. As discussed more fully in the preamble of the final rule, the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs or benefits of the proposed action. As discussed in the preamble to the final rule, this is a rule of internal procedure promulgated under the EPA's housekeeping authority and a benefit-cost analysis is not required. However, the EPA has included a discussion of costs and benefits in the preamble of the final rule.

Briefly, the additional procedures required by this rule only apply to pivotal science, which is a subset of the total number of studies that the EPA would evaluate. Given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small. The Agency may also incur other administrative costs to perform analyses and evaluations to support activities such as exemption decisions made by the Administrator, and documenting these or other decisions made pursuant to the requirements of the final rule. Again, the Agency anticipates that the incremental costs for these activities will be small relative to current administrative costs for developing significant regulatory actions or influential scientific information. Finally, this final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to pivotal science for which the underlying dose-response data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI

are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

The main benefits of this rule spring from greater transparency in significant regulatory actions and influential scientific information. By placing greater emphasis on the availability of dose-response data underlying pivotal science, the rule will allow for greater scientific scrutiny as EPA decision makers are developing significant regulatory actions and influential scientific information and increases the likelihood that any errors will be identified and corrected. Greater transparency is also inherently valuable as a principle of good government and provides benefits to the public at large, including reducing the risk of errors in EPA analyses and in the science such analyses rely upon. The ability for independent subject matter experts to validate pivotal science will facilitate more effective comment and engagement with the public during development of future significant regulatory actions and influential scientific information.

Comment: Commenter (6133), without support, provides that the Proposal states that “EPA believes the benefits of this proposed rule justify the costs.” 83 Fed. Reg. at 18,772. Commenters (6133, 6446, 6916) assert that the only further discussion in the proposal that the benefits of the proposed rule justify the costs is a reference to the Mercatus Paper.²⁰⁸⁴ Commenters (6133, 6446) note that the proposal (83 FR 18772) includes the following quote from the Mercatus paper:

One recent analysis found that: “[i]mprovements in reproducibility can be thought of as increasing the net benefits of regulation because they would avoid situations in which costs or benefits are wrongly estimated to occur or in which regulatory costs are imposed without corresponding benefits. . . .” They concluded that “an increase in existing net benefits from greater reproducibility, which, if it occurred, would cover the costs of obtaining the data and making the data available.”

Id. (quoting Randall Lutter and David Zorn, On the Benefits and Costs of Public Access to Data Used to Support Federal Policy Making, Mercatus Working Paper, September 2016).

The commenter (6133) asserts that this quote is not close to a sufficient cost-benefit analysis. First, according to the commenter, the Working Paper’s plausibility analysis is dubious. Among other problems, the commenter states that the analysis examines the time it takes for chemical manufactures, processors, and distributors to identify and provide studies in their possession related to a specific chemical and equates that to the time it would take EPA to obtain, review, process, redact, and publicly maintain data for any study it considers. Lutter and Zorn, at 21–22 (citing (40 C.F.R. pt. 716)). The commenter provides that the chemical study Health and Safety Data Reporting Rule and the cost estimate the Working Paper’s analysis is based on does not require submission of underlying data unless requested by EPA. 40 C.F.R. § 716.10(a)(4). The analysis also does not include time or costs to the researchers outside of the agency. Lutter and Zorn, at 21–22. Further, the commenter notes that the Working Paper assumes that EPA would only receive the underlying data for 20% of the requested scientific studies EPA relies on. Id. at 25. Therefore, the commenter asserts that the Working Paper lowers the already questionable cost estimate by eliminating costs associated with collecting and preparing data for the other

²⁰⁸⁴ Footnote 24 (of comment letter) at 83 FR 18772

80% of studies. *Id.* The commenter adds that the Working Paper does not explain what the authors expect EPA to do about 80% of studies EPA currently relies on for which it does not receive the underlying data, but the Proposal would require the agency to unlawfully ignore those studies in regulatory decision making.

Importantly, the commenter (6133) contends that even the partial quote the Proposal presents does not provide results of a cost-benefit analysis nor conclude the costs outweigh the benefits. Instead it says that if an increase in benefits occurred, the costs would be covered. The commenter provides that the same article states this point explicitly:

Of course, our estimates of the benefits of public access to data supporting federal regulatory decisions fall short of proving that the benefits outweigh the associated costs. They do show, however, the plausibility of such a claim.

Lutter and Zorn, at 29.

According to the commenter (6133), the Proposal does nothing to address this or try to determine how plausible such a claim is. The commenter argues that the EPA has not provided a defined Proposal, nor done any cost analysis of its Proposal, that could be analyzed. The commenter adds that the fact that this is the best support the EPA could provide for its baseless belief that the Proposal's benefits justify its costs further shows that EPA must withdraw the Proposal.

Similarly, commenter (6916) notes that the Agency fails to provide analysis accompanying the Proposal, as required by Executive Order 12866, "assess[ing] both costs and benefits" to assure "a reasoned determination that the benefits of the intended regulation justify its costs."²⁰⁸⁵ Instead, the commenter states that the EPA makes unsupported statements about its "belie[f that] the benefits of the proposed rule justify the costs."²⁰⁸⁶ The commenter adds that the only further discussion on this point is a reference to the industry-funded Mercatus Paper, which rejects a CBO projection that proposed legislation, with terms similar to the Proposed Rule here, would cost the country \$250 million a year.²⁰⁸⁷ The commenter provides that the Mercatus Paper, however does not find the new policy to be cost-free. Instead the commenter states that it reports that compliance with the proposed legislation would add \$2,558 to the costs of each study – and EPA never explains how that compares with the \$250 million price tag from the CBO.²⁰⁸⁸

According to the commenter (6916), EPA baldly asserts that the benefits will outweigh the costs because the Proposal "will improve the data and scientific quality of the Agency's actions and facilitate expanded data sharing and exploration of key data sets,"²⁰⁸⁹ citing only a 2005 NRC report.²⁰⁹⁰ But the commenter notes that the NRC report does not assess the cost of eliminating

²⁰⁸⁵ 83 Fed. Reg. at 18,772 (referencing Exec. Order No. 12,866, but no analysis completed thereunder); but see Exec. Order Nos. 12,866 §§ 1(b)(6), 6(a)(3)(B)-(C) & 13,563 § 1(b)(1) (requiring such analysis).

²⁰⁸⁶ 83 Fed. Reg. at 18772.

²⁰⁸⁷ Lutter & Zorn, Mercatus, *supra* note 65, at 32 (citing CBO, Cost Estimate: S. 544, Secret Science Reform Act of 2015 (June 5, 2015)).

²⁰⁸⁸ *Id.* at 23.

²⁰⁸⁹ 83 Fed. Reg. at 18,772 & n. 23.

²⁰⁹⁰ See generally National Research Council, Expanding Access to Research Data: Reconciling Risks and Opportunities, (2005) [hereinafter "2005 NRC Report"].

peer-reviewed quality science from consideration, it merely discusses the tension between providing more transparency and access to data while continuing to protect confidentiality. Indeed, the NRC explicitly states that its work does not “weigh[] the potential harm posed by disclosure against the benefits potentially foregone.”²⁰⁹¹

There is, moreover, according to the commenter (6916), no attempt made by the Agency to quantify or qualify lost benefits, were the new policy to take effect. The commenter asserts that there is no analysis of the number of studies that could be affected by the Proposal, the effects of the Proposal on research, the potential for weakening of environmental regulations, and the resulting environmental or public health costs, or any other costs for that matter associated with eliminating dose-response studies and methods from regulatory decision making because the underlying data cannot be released. In fact, the commenter notes that the EPA does not even seem to understand that there could be such costs associated with its Proposal – it asserts (without support) only that making underlying data available “will improve the data and scientific quality of the Agency’s actions.”²⁰⁹²

Commenter (6919) expresses that, on the whole, the proposed rule attempts to make a case for the need for open and transparent data and models, yet the notice solicits information and comments from the public without providing any analysis of the impact of the EPA’s proposed action. The commenter asserts that this is the type of significant federal action that should have an accompanying regulatory impact analysis. The commenter states that a cost analysis for this proposed action is unavailable, but a comparison can be made with the projected costs from the CBO’s review of the HONEST Act of 2017, on which this proposal is based. The commenter notes that the CBO analysis found that the EPA would, “...need to spend at least \$100 million dollars per year to upgrade the format and availability of those studies’ data to the level required by H.R. 1430.”²⁰⁹³ Under Executive Order 12866, the commenter provides that a significant regulatory action is one that may, “[h]ave an annual effect on the economy of \$100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or state, local, or tribal governments or communities.”²⁰⁹⁴

Commenter (6919) expresses that the lack of sufficient analysis before publishing the proposed rule makes it extremely difficult, if not impossible, for commenters to provide meaningful and in-depth comments. According to the commenter, this fact, together with the extraordinary number and complexity of the questions that the EPA asks of its commenters, could make the ultimate rule vulnerable to challenges for insufficiency of notice and insufficient consideration of comments received.

Response: The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs or benefits of the proposed action. As discussed in the preamble to the final rule, this is a rule of internal procedure promulgated under the EPA’s housekeeping

²⁰⁹¹ 2005 NRC Report at viii.

²⁰⁹² 83 Fed. Reg. at 18772.

²⁰⁹³ Congressional Budget Office, Cost Estimate, H.R. 1430 Honest and Open New EPA Science Treatment (HONEST) Act of 2017, March 29, 2017 at 3.

²⁰⁹⁴ 58 FR 51735, Executive Order 12866 of September 30, 1993.

authority and a benefit-cost analysis is not required. However, the EPA has included a discussion of costs and benefits in the preamble of the final rule. The analysis by CBO noted by the commenters is not applicable to this rule because the analyses were not for this rule and the requirements analyzed are not the same as those in this rule.

Briefly, the additional procedures required by this rule only apply to pivotal science, which is a subset of the total number of studies that the EPA would evaluate. Given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small. The Agency may also incur other administrative costs to perform analyses and evaluations to support activities such as exemption decisions made by the Administrator, and documenting these or other decisions made pursuant to the requirements of the final rule. Again, the Agency anticipates that the incremental costs for these activities will be small relative to current administrative costs for developing significant regulatory actions or influential scientific information. Finally, this final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to pivotal science for which the underlying dose-response data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

The main benefits of this rule spring from greater transparency in significant regulatory actions and influential scientific information. By placing greater emphasis on the availability of dose-response data underlying pivotal science, the rule will allow for greater scientific scrutiny as EPA decision makers are developing significant regulatory actions and influential scientific information and increases the likelihood that any errors will be identified and corrected. Greater transparency is also inherently valuable as a principle of good government and provides benefits to the public at large, including reducing the risk of errors in EPA analyses and in the science such analyses rely upon. The ability for independent subject matter experts to validate pivotal science will facilitate more effective comment and engagement with the public during development of future significant regulatory actions and influential scientific information.

Comment: Commenter (6125) asserts that the proposed rule is mute regarding its impacts on rules across each of EPA's core environmental statutes, both as to how this rule would apply and how it would affect existing regulations. The commenter notes that the proposal does not even identify the relevant statutory provisions, much less potentially affected regulations. According to the commenter, if the proposal would leave those rules in place, it would accomplish little. The commenter adds that, if the proposal would repeal some or all of them, either directly or by requiring them to be redone, EPA should say so and describe the scope of the proposal's impact. Instead, the commenter states that the proposal is completely silent about whether any existing rules would be affected, and does not even identify any such rules, much less describe how this rule would affect them. Thus, the commenter concludes that it provides no basis for informed public comment.

Response: Based on consideration of this comment and similar comments, the EPA clarified in the 2020 SNPRM the relationship between this rulemaking, the environmental statutes and their implementing regulations by adding language to proposed 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations would control in the event of any conflicts. With this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

2.1.7.3 No or Insufficient Basis for Rule

2.1.7.3.1 EPA Fails to Provide Support for Proposal

Comment: Commenters (2171, 2561, 5011, 6046, 6125, 6133, 6137, 6164, 6879, 6916, 8771, 9227) suggest that the EPA has failed to provide the required reasoning/basis to support for why there is a need to change longstanding Agency practice/need for the rule or why other alternatives are not sufficient. Comments include:

- Based on the lack of meaningful information and articulated or demonstrated need for the proposed rule, EPA has not made the case for a new regulation at 40 CFR Part 30. (2171)
- EPA needs to provide the legal authority to impose the proposed rule (they find EPA's legal authority citations to be unconvincing and incomplete). (6109)
- The proposed rule is written with limited explanation, as stated by the Union of Concerned Scientists, limiting the ability for an effectively administered rule. (2561)
- The Proposal is fatally flawed because it provides almost no justification for the proposed change in policy. (5011)
- Neither the Proposal nor docket contains any factual, scientific, technical, logical, or legal support for the suggestion that science and data that are “publicly available in a manner sufficient for independent validation” are necessary elements for the “validity,” “reliability,” or “transparency” of scientific information. (6133)
- The EPA alludes to “transparency” multiple times, but the without defining what that concept means, or explaining why it believes existing statutes, regulations, guidelines and protocols fail to meet it.²⁰⁹⁵ (6916)
- Commenter expresses concerns that the EPA is proposing to make significant changes to long-standing policies without adequate justification. The commenter adds that EPA has failed to show any compelling need or justification for the proposed regulation. (6879)

²⁰⁹⁵ In 83 Fed. Reg. at 18,768-18,774, EPA includes 13 preamble references to “transparency,” and one rule text reference, at proposed 40 C.F.R. § 30.7, without providing any indication of the intended meaning of that term. Also see generally, Dan Farber, “Pruitt’s Utterly Opaque Transparency Proposal,” (Apr. 26, 2018), available at: <https://legal-planet.org/2018/04/26/pruitts-utterly-opaque-transparency-proposal/>.

- There is insufficient justification for the proposed rule and portions of it are seriously flawed (e.g., no solutions for confidential data or costs and responsibility for such measures; one person determining exceptions). (6046)
- The proposed rule is predicated on irrational and unsupported conclusions. According to the commenter, a close examination of generally applicable data access policies and guidelines – including policies and recommendations of third party organizations and major scientific journals upon which EPA allegedly relies – reveals that EPA’s Proposed Rule is not based on a reasoned explanation and has no rational connection to facts in the record, but rather is entirely baseless. The commenter adds that the EPA has not demonstrated that it is consistent with scientific principles to categorically exclude peer-reviewed scientific information from all consideration in a rulemaking, as EPA proposes to do. (6137)
- The EPA fails to adequately describe the justification behind this policy change, how it builds upon current policies regarding transparency, such as the IQA and EPA’s Information Quality Guidelines, or what the potential impacts of restricting science will be on current and future decision-making. The commenter urges the agency to elaborate on these substantive details and provide the science community and the public the opportunity to provide feedback. (6164)
- EPA has completely failed to follow well-established principles for establishing the legal need for reasoned agency decision-making generally, and in particular for any change to a prior position. According to the commenter, to comply with these requirements, an agency must, among other things:
 - Explain why the agency is rejecting policy judgments or factual determinations underlying the prior rule or position.²⁰⁹⁶
 - Provide a “reasoned explanation” for changing course;²⁰⁹⁷
 - Demonstrate that the new policy is itself consistent with the governing statute;²⁰⁹⁸
 - Ensure that the new policy is itself supported by the record, “based on consideration of the relevant factors,” and supported with “rational connection[s] between the facts found and the choice made”;²⁰⁹⁹ and

²⁰⁹⁹ See *State Farm*, 463 U.S. at 43 (agency decision must be “‘based on a consideration of the relevant factors’” and agency cannot have “relied on factors which Congress has not intended it to consider”) (quoting *Burlington Truck Lines v. United States*, 371 U.S. 156, 168 (1962)); *Pub. Citizen v. Fed. Motor Carrier Safety Admin.*, 374 F.3d 1209, 1216 (D.C. Cir. 2004); 42 U.S.C. 7607(d)(9).

- Consider relevant alternatives reflected in the prior rule’s record, in particular, alternatives most consistent with statutory goals and purposes, and explain why the agency is not adopting them in the new rule ²¹⁰⁰ (6125)
- There are “significant and viable and obvious alternatives” to this Proposal,²¹⁰¹ which the Agency has failed to adequately consider, nor has the Agency explained why it believes such alternatives are not sufficient. The EPA has not supported why releasing confidential health and business information is necessary. Nor, according to the commenter, is the Agency’s rationale completely clear in the Proposal. When commenters are left to guess, the commenter notes that is not lawfully sufficient notice of the subjects and issues involved. (6916)
- The failure to adequately justify a changed agency position is one of the hallmarks of arbitrary and capricious decision making²¹⁰² The commenter adds that the Agency must “provide a more detailed justification than would suffice for a new policy...when, for example, its [revised] policy rests upon factual findings that contradict those which underlay its prior policy; or when its prior policy has engendered serious reliance interests that must be taken into account. It would be arbitrary and capricious to ignore such matters.”²¹⁰³ The Proposal fails to engage with the reasoning or facts underlying the Agency’s longstanding policy position, which respected the confidentiality of underlying data and accounted for all relevant science.²¹⁰⁴ (6916)
- Little use of the FOIA to obtain research data has been made over the years, as far as the Congressional Research Service could ascertain²¹⁰⁵. The commenter states that this is an indication that the EPA proposal may impose burdens on researchers, making them produce products that will never be used, except in rare cases. Thus, if EPA proceeds with the rule, the commenter asserts that the EPA needs to justify the requirement that all studies on which it relies must provide public access, rather than requiring public access only in situations where EPA receives a request. (6955)
- The EPA must offer a detailed justification for the premise that there is a “reanalysis crisis” to solve, and a detailed analysis of how its refusing to look at studies that don’t do the skeptics’ work for them could provide incremental benefits—otherwise, the proposal must be withdrawn for utter lack of purpose. The commenter states that the EPA has not yet even provided a single anecdotal example of a study whose meaningful reanalysis is hampered. (8771)

- EPA appears to leap to the conclusions (again without any supporting evidence) that the only way to strengthen the validity of the science is by enhancing transparency, that no other possible steps to enhancing integrity are worth considering, and that enhancing transparency means making underlying data and models publicly available. According to the commenter, this is all before EPA even gets to its obviously illogical conclusion that threatening exclusion of studies without publicly available data will “increase access to dose response data and models underlying pivotal regulatory science,”²¹⁰⁶ rather than simply bar EPA from considering a vast universe of useful and rigorously vetted studies. The commenter adds that the evidence cited by EPA in support of the need to strengthen science through its proposed approach is so vague and perfunctory that it is largely impossible even to tell which conclusions various sources are supposed to support. The commenter provides that the EPA’s rationale for its data availability requirements consists of a few conclusory statements by EPA itself, a reference to “the replication crisis,” and citations to a handful of articles and guidance issued by EPA and OMB. The commenter contends that none of these provide a rational basis of support for the Proposal. (9227)

Response: In response to public comments, the EPA clarified many aspects of the proposed rule in the 2020 supplemental notice of proposed rulemaking and final rule, including the purpose, legal authority, and definitions of key terms. The purpose of the rule is detailed in the preamble of the final rule. In brief, the transparency provisions in this final rule are intended to build upon existing efforts and provide incremental progress toward the Agency’s overarching goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals and the emergence of several international organizations and initiatives focused on increased transparency and data sharing in science. The EPA supports these efforts and believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety. The incremental progress made by this rule provides an important step towards prioritizing transparency in particularly impactful rules and assessments and will inform future statute-specific rulemakings.

The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule.

Further, in consideration of public comments, the EPA is also finalizing the alternative approach presented in the SNPRM, rather than providing for the exclusion of studies based on the

²¹⁰⁶ 83 Fed. Reg. at 18,770.

availability of their underlying data. As described in the final rule, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. When characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, the EPA will identify pivotal science and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation. Including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties. This approach will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

The EPA would also like to clarify that the rule does not impose requirements on parties external to the EPA, including researchers. The rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

Comment: Commenter (9227) asserts that the EPA has provided no explanation or justification for targeting dose response studies in particular or for not including other types of studies or scientific information. The commenter adds that the EPA has not suggested that these studies are inherently less reliable than other studies, that they more commonly fail to publicly disclose data and modeling information, that replication is more necessary for these studies than others, or any other conceivable reason. Absent any explanation from the agency, the commenter contends that it is impossible to comment on the factual predicates for EPA's proposed decision, or the reasonableness of EPA's justification, except to state that it appears completely arbitrary in the absence of any rationale. See, e.g., *Transactive Corp., v. United States*, 91 F.3d 232, 237 (D.C. Cir. 1996) ("A long line of precedent has established that an agency action is arbitrary when the agency offered insufficient reasons for treating similar situations differently.").

Response: As explained above, in response to public comments, the EPA clarified many aspects of the proposed rule in the 2020 supplemental notice of proposed rulemaking and final rule, including the purpose, legal authority, and definitions of key terms. As discussed more fully in the preamble of the final rule, the rule is designed to build upon data initiatives across the federal government and scientific community. The rule is not intended to fix a particular error, but rather to pursue an incremental approach to maximizing transparency in the science that EPA relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or

more pollutants, contaminants, or substances are integral to the Agency's mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. In addition, the data underlying the dose-response assessment are more distinct than the broad range of data informing an entire risk assessment. Therefore, the EPA is concentrating its current efforts to increase transparency on a well-defined step in the quantitative assessment of risk supporting specific Agency actions. This final rule provides an important step in furthering the progress already being made toward maximizing transparency and will provide important insight for developing future statute-specific requirements.

Further, in consideration of public comments, the EPA is also finalizing the alternative approach presented in the SNPRM, rather than providing for the exclusion of studies based on the availability of their underlying data. As described in the final rule, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. When characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, the EPA will identify pivotal science and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation. Including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties. This approach will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

2.1.7.3.2 Materials Cited/Administrative Record Do Not Support Proposal

Comment: Commenters (5022, 6133, 6447, 6450) express that materials cited/administrative record do not support proposal. Comments include:

- The proposal lacks critical citations and documentation. According to the commenter, rather than furnishing the evidentiary support required for administrative action, the agency has merely adopted a legislative initiative²¹⁰⁷ that failed to pass despite support from the energy, chemical, manufacturing, and other key industries. (5022)
- Materials cited by EPA also do not provide any support for the Proposal, on scientific, technical, policy, logical, or legal grounds, and in fact, the materials actually undermine the Proposal. According to the commenter, the cited materials demonstrate that the Proposal is unsupported, arbitrary, capricious, and otherwise inconsistent with law. The commenter contends that the fact that EPA cites many of these materials because they contain, from different contexts, options EPA could enact as part of the proposed rule further demonstrates that the Proposal must be withdrawn as it fails to provide fair notice to the public of what is being proposed. (6133)

²¹⁰⁷ H.R.1430 - HONEST Act. <https://www.congress.gov/bill/115th-congress/house-bill/1430>.

- The administrative record before the Agency offers no evidence of Congressional intent that the EPA should consider transparency of underlying data and models that inform the scientific research the Agency relies on when adopting regulations pursuant to the Acts. The commenter states that, without such Congressional intent, the EPA has no basis to adopt the Transparency Rule as proposed. The commenter states that to do so very likely would contradict the Congressional intent evident in the cited sections of the Acts. (6178)
- The Proposal is not supported by the administrative record. (6447)
- Many of the relevant documents underlying the proposal have been excluded from the record, meaning there is not sufficient specificity to allow for a sound response. (6450)

Response: As explained above, in response to public comments, the EPA clarified many aspects of the proposed rule in the 2020 supplemental notice of proposed rulemaking and final rule, including the purpose, legal authority, and definitions of key terms. As further discussed in the preamble of the final rule, the rule is designed to build upon open data initiatives across the federal government and scientific community developed over the last several years. The rule is not intended to fix a particular error, but rather to increase transparency in the pivotal science used in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

2.1.7.3.3 No Basis for Assumption that Science or Studies for Which Data are Publicly Available Yield More Valid Results

Comment: Commenters (6125, 6133, 6361) suggest that EPA has not provided support for their assertion that the proposal will “improve the data and scientific quality of the agency’s actions.”

Commenter (6133) asserts that the EPA provides no basis for its assumption that science or studies for which data are publicly available yield more valid or reliable results than the best available, peer-reviewed, independent, credible science, for which the underlying data are not publicly available. The commenter adds that the proposal arbitrarily fails to address, much less explain, why prior EPA regulatory actions that relied upon studies, data, or other information did not reflect the “best available science” or why they were otherwise unreliable, despite failing to meet the Proposal’s standards.

Commenter (6133) states that the Proposal fails to explain how the term, “in a manner sufficient for independent validation,” and the proposed §30.5 definition will increase transparency in science or why it is necessary to ensure that EPA will consider the best available science. To the contrary, the commenter contends that the Proposal’s approach would preclude EPA from considering the best available science that is relevant to EPA’s responsibilities. The commenter also states that the EPA also fails to explain why data underlying peer-reviewed studies must be publicly available “in a manner sufficient for independent validation” when independent researchers can verify science without making the underlying data, which is often confidential, publicly available.

Commenter (6133) notes that the Proposal does not require that any information actually be independently validated before EPA may consider it or base regulatory decisions on such verification. Accordingly, there is an irrational disconnect between EPA's insistence that information be "publicly available for independent validation" and the Proposal's claim that this ensures EPA will consider and use the "best available science." See 83 Fed. Reg. at 18,769. The commenter adds that the EPA itself has not outlined a process by which "dose response data and models" would be validated, and the Proposal does not seriously consider the methodological complications of partial redaction of underlying study data.

Commenter (6361) suggests that the EPA also does not explain how the Proposed Rule approach will ensure the application of "best available science" which is the standard in all environmental laws. According to the commenter, it is possible that EPA's proposed regulation will result in a failure to rely on the "best available science" as EPA arbitrarily disqualifies important scientific studies if the underlying data cannot be disclosed to the public or cannot be independently validated.

Commenter (6125) states that the proposed rule directs EPA to make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making dose response models and data underlying pivotal regulatory science used in significant regulatory decisions available to the public in a manner sufficient for independent validation, consistent with law and protection of privacy, confidentiality, and national and homeland security. However, it does not compel the Agency to make that information available where it concludes after all such reasonable efforts that doing so in way that complies with the law and appropriate protections is not possible.

Commenter (6125) adds that, while it is not flatly untrue that the proposal "does not compel" EPA to make the information available, it is worse than disingenuous not to mention also that unless the information is publicly available it cannot be used as a basis for the rulemaking decision unless EPA grants an exemption. See at 18770 n. 7. The commenter contends that, even though limited by time and resources, their assessment shows the magnitude of the issue and the absolute need for EPA to address the potential damages to public health and the environment before any final action. To issue a valid rule, the commenter states that the EPA would have to analyze this issue on its own, including what studies the proposal will exclude, present the results for public comment, and explain why the benefits of the per se rule justified the public health sacrifice and regulatory confusion that it would cause.

Response: As detailed in the preamble to the final rule, the purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the

uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information and does not modify the Agency's interpretations of "best available science." The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. The EPA will then identify and consider pivotal science in accordance with the provisions of this rule, unless the implementation of the rule conflicts with statutory requirements and associated implementing regulations. The EPA also wishes to clarify that the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

2.1.7.3.4 No Support for Assertion that the EPA has Not Consistently Followed EPA Policies

Comment: Commenter (6133) adds that the Proposal provides no support for the idea that EPA has not consistently followed previous EPA policy that encouraged the use of non-proprietary data and models. To the extent EPA believes this is a problem, the commenter suggests that the EPA withdraw the Proposal and explain what policies it has not followed and how it has not followed those policies. The commenter notes that EPA should then present options to address those alleged shortcomings.

Commenter (6133) argues that if EPA decides to move ahead with this reckless, unjustified, and unlawful effort to censor the science that EPA may consider, and must consider, to protect Americans' health and environment, the agency must first issue a supplemental proposal and actual administrative record to cover the multitude of issues, evidence, and specific regulatory text for which EPA fails to provide fair notice. According to the commenter, the Proposal fails to provide fair notice or justifications addressing numerous issues that our comments detail—from an absence of any statutory authority, to failures to address statutory authorities that the Proposal squarely contravenes, to failures to provide reasoned explanations, including basic justifications for EPA's numerous departures from past practices. The commenter adds that the proposal fails to propose specific regulatory text addressing numerous implementation elements, as well as issues that are touched upon only in passing in the preamble (e.g., non-linearity and LNT). Apart from all of the significant substantive and procedural defects from which the Proposal suffers, the commenter contends that it still manages to be a shockingly shoddy effort missing actual regulatory text and supporting legal, factual, scientific, and technical information that would provide fair notice to the public.

Response: The purpose of the rule is detailed in the preamble of the final rule. In brief, the transparency provisions in this final rule are intended to build upon existing efforts and provide

incremental progress toward the Agency's overarching goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals and the emergence of several international organizations and initiatives focused on increased transparency and data sharing in science. The EPA supports these efforts and believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. The incremental progress made by this rule provides an important step towards prioritizing transparency in particularly impactful rules and assessments and will inform future statute-specific rulemakings.

Further, in consideration of public comments, the EPA is also finalizing the alternative approach presented in the SNPRM, rather than providing for the exclusion of studies based on the availability of their underlying data. As described in the final rule, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. When characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, the EPA will identify pivotal science and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation. Including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties. This approach will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

Finally, the EPA clarified many aspects of its rulemaking in the 2020 SNPRM and the final rule, including its authority. The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule.

2.1.7.3.5 Mismatch Between Problem Identified and Solution Adopted

Comment: Commenter (6933) suggests that, in general, the NPRM should be withdrawn because to the extent it can be understood what it requires—through the haze of vague definitions and exceptions—it both fails to address the issue which it purports to be concerned with, and is inconsistent with EPA's obligations to use best available science under both statutory requirements and caselaw. In essence, the commenter notes that the rule identifies the goal of

improving the quality and transparency of EPA's science and uses it as an excuse to adopt policies that actually reduce the quality, and likely the transparency, of EPA's scientific decision-making. The commenter contends that there is a fundamental mismatch between the problem identified and the solution adopted.

Commenter (6933) asserts that the contradiction between purpose and means that lies at the core of the NPRM is clearly exposed by the fact that on the one hand it purports to be a proposal "to provide a mechanism to increase access" to scientific information, 81 FR 18770, and other hand it purports to impose no requirements on outside parties at all. See 81 FR 18772 (noting that the rule is not covered by Executive Order 13771 because "it relates to 'agency organization, management, or personnel'"); *id.* (stating the action does not contain any paperwork collection activities); *id.* (Regulatory Flexibility Act (RFA) certification that the action "will not impose any requirements on small entities"). According to the commenter, the agency cannot maintain on the one hand that the proposal simply governs what science the agency can review, and is not intended to change the behavior of outside parties, and at the same time assert that imposing these requirements will lead to greater access to data by the public.

The commenter (6933) contends that it is apparent that any handwaving the NPRM makes in the direction of the idea that the proposal will ultimately encourage investigators to make data more available are merely window dressing for the rule's actual purpose and effect—to reduce the scope of scientific information considered by the agency by making public access to data the sole criterion of the quality of scientific research.

Commenter (6933) states that, by failing to wrestle with significant dimensions of the problem and explanation on how its suggested solution will actually improve them, the agency fails to satisfy basic requirements of administrative law. In addition, the commenter notes that the rule is so vague that it fails to provide any basis on which the public can comment. The commenter adds that it is not mere happenstance that section II of the NPRM is labeled "background" and section III is "request for comment." The commenter argues that the NPRM spends some time discussing the alleged problem, almost no time describing what the rule actually does, and then has a long section identifying all of the issues which the NPRM does not address but on which comment is solicited, including such fundamental issues as to what data and models it should apply to, what rules it should apply to, how it applies to reviews of the NAAQS, whether or how to apply it retrospectively, whether and which exemptions are appropriate, etc. etc. In the absence of any information as to the agency's proposed course of action on these fundamental questions, the commenter asserts that the opportunity for public comment has been rendered meaningless just as much as if the agency had limited the scope of comment to a narrow subset of issues.

Commenter (6933) asserts that, even for things that are actually proposed, the NPRM is too vague to support a final rule. For example, proposed §30.2 ("Definitions") states that "all terms not defined herein shall have the meaning given them in the Act or in subpart A." But the commenter notes that given that there is no subpart A, how is anyone supposed to comment on the definitions? And the commenter adds that the definition of "pivotal regulatory science" is "the specific scientific studies or analyses that drive the requirements and/or quantitative analysis of EPA final significant regulatory decisions." The commenter states that often there is no single

“specific” scientific study that “drive[s]” a regulatory decision. The commenter provides that ISAs for NAAQS may be thousands of pages long and cite many thousands of studies and that the scientific record for the Clean Water Rule was likewise a myriad of studies constituting thousands of pages. According to the commenter, it is reductivist and scientifically inaccurate to identify any single study as “the” specific study, so what are the criteria EPA will use to implement this definition? The commenter contends that without adequate information, the proposal could mean anything to everything and that is an inadequate basis for public comment.

Commenter (6194) asserts that notices of proposed rulemakings must also include “the terms or substance of the proposed rule or a description of the subjects and issues involved.” 5 U.S.C. § 553(b)(3). The commenter notes that the purpose of this requirement is to “provide sufficient factual detail and rationale for the rule to permit interested parties to comment meaningfully.” *Honeywell International, Inc. v. EPA*, 372 F.3d 441, 445 (D.C. Cir. 2004). The commenter asserts that the *Federal Register* notice of the Proposal is too vague to allow for fully meaningful and targeted comments. Given the ambiguities of the rule, the commenter states that the public cannot adequately assess what EPA thinks the Proposal means or how it will implement it. Nevertheless, for purposes of these comments, the commenter assumes EPA intends a broad interpretation that would preclude a swath of scientific studies and information from use and consideration in regulatory proceedings.

Moreover, commenter (6194) notes that many of the sources cited in the Proposal either do not support the text of the proposed regulation, do not support the proposition for which they are cited, or are so broad that the public does not have fair notice of, and therefore cannot evaluate, EPA’s rationale for the Proposal. The commenter adds that the overall lack of clarity is illustrated by EPA’s own solicitation of feedback; it covers so wide a range of issues—posing over two dozen questions—that it makes clear EPA has not identified a proposed path forward on which the public can comment.²¹⁰⁸ The commenter asserts that the Proposal would be more appropriately posited as an Advanced Notice of Proposed Rulemaking; it does not meet the APA’s standards for proposed rules.

Response: In response to public comments, the EPA clarified many aspects of the proposed rule in the supplemental notice of proposed rulemaking and final rule. As further discussed in the preamble of the final rule, the rulemaking establishes internal Agency procedures and does not intend to change the behavior of external parties. Further, in response to public comments, the EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data and models be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is an important aspect of EPA’s regulatory actions and assessments it should be an important consideration in how the Agency considers pivotal science. Because the final rule does not categorically exclude any studies from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating final significant regulatory actions and finalizing influential scientific information. As clarified in the preamble to the final rule, the EPA is pursuing an incremental approach to maximizing transparency in the

²¹⁰⁸ See e.g., *Prometheus Radio Project v. F.C.C.*, 652 F.3d 431, 449 (3d Cir. 2011) (“[A]n agency proposing informal rulemaking has an obligation to make its views known to the public in a concrete and focused form so as to make criticism or formulation of alternatives possible.”) (internal citations omitted).

science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

2.1.7.4 Proposed Rule's Requirements Insufficient

Comment: Commenters (0057, 0556, 2876, 2907, 4831, 4838, 4881, 4884, 5021, 5165, 5170, 5178, 5287, 6046, 6104, 6109, 6110, 6125, 6126, 6133, 6142, 6146, 6147, 6152, 6163, 6164, 6185, 6188, 6194, 6233, 6351, 6447, 6450, 6875, 6909, 6915, 6916, 6919, 6920, 6924, 6933, 9224, 9225, 9227) oppose the proposed rule because the process it prescribes is too vague/lacking in detail, flawed, or illegal. Comments include:

- The proposed regulation is too vague to be meaningfully evaluated and successfully implemented. For example, according to the commenter, it is unclear whether §30.7 requires EPA to conduct its own peer review of all pivotal regulatory science and, if so, whether EPA has the capacity or capability to perform those reviews. See 83 Fed. Reg. at 18774. Likewise, the commenter states that the exemption process does not provide sufficient standards to ensure that the Administrator makes consistent determinations. (4838)
- The consequences of the proposed rule, significant they may be, are indeterminate in light of the proposal's vagueness. (5021)
- The proposal fails to clearly articulate the specific proposed requirements, impairing informed public comment. (5021, 6185)
- EPA needs to first propose a rule for using studies confirmed by peer-led and noted duplicate study confirmation. According to the commenter, the regulation as it stands is highly incomplete and highly questionable. (5287)
- A detailed operational structure for implementation needs to be developed. (6142)
- The specific actions of the proposed rule are difficult to identify in the docket due to being intermingled with reasoning for why the proposed rule should be implemented. (6046)
- EPA has failed to provide the public with sufficient information on which to offer comment. In fact, the commenter contends that it is clear from the "Request for Public Comment" section that EPA does not have a full understanding of the very rule it is proposing. The commenter contends that the EPA clearly does not have a plan for how it will implement the rule or what its effects will be. The commenter states that the topics upon which EPA seeks comment should have been provided to the public as part of a fully thought-out rule proposal. The commenter adds that because EPA provides only questions and no proposed actions, EPA eliminates their ability to comment on many aspects of the rule. (6109)
- The Proposal suffers from what the commenter believes is unlawful vagueness. If EPA intends to finalize what they believe is an unlawful proposal, EPA first must withdraw

the Proposal, then issue a supplemental proposal with the necessary definitions and explanations. Better yet, the commenter suggests that EPA abandon what they believe to be an illegal and harmful proposal altogether. (6133)

- Commenters are supportive of scientific transparency in regulatory development. Unfortunately, according to the commenters, the rule is vague in several areas and does not provide specific regulatory language for review and comment. Commenters (6104, 6878) request also that the EPA provide more details regarding the intent, scope, and implementation processes associated with this proposal. The commenter believes these discussions would improve the quality of the comments on the rule and will contribute to an enhanced and improved final rule, should this rulemaking go forward. Further, the commenter requests that EPA issue a supplemental notice of proposed rulemaking that includes actual regulatory language. As part of this supplemental notice, the commenter requests that EPA provide sufficient detail for an analysis of whether this new approach would achieve the results intended, while also continuing to support states efforts to implement environmental requirements in their states. (6104, 6878) . In the spirit of cooperative federalism, commenter (6104) suggests that before the rule is finalized, the EPA host coregulatory discussions.
- The proposed rule lacks clarity and it is difficult to ascertain what it seeks to achieve, whether EPA is interested in greater transparency across all of its programs and activities, and what the long-term implications could be of any changes made. The commenter welcomes additional dialogue with the Agency on what this rule aims to achieve, but even with an extended comment period, the commenter believes that the proposed rule is too ambiguous for the commenter to provide detailed comments. (6146)
- The rule is poorly written and in fact lacks transparency which it purports to support. The rule is vague, open-ended and without necessary safeguards to assure that scientific evidence is used without social, political, or economic modifying factors. (6147)
- The proposal is vague and unworkable and notes that it was developed without significant input from the scientific community, and therefore the definitions and processes in the proposed rule are not specific. The commenter contends that this leaves stakeholders unable to determine how the rule would be applied. (6152)
- The Proposal's vague language suggests unpredictable implementation. (6188)
- The current proposal is far too vague and missing key components that must be included in the final rule to ensure its understandability and appropriate implementation. For example, the commenter notes that currently the proposal lacks definitions for many key terms, omits critical protocols and methodologies necessary to put this rule into action, and does not fully explore the implications of implementing a rule of this nature. (6875)
- The EPA has not adequately considered the implications of this rule for the conduct of science as a whole, and those implications are very negative. According to the commenter, the proposed rule is so woefully incomplete and lacking in support as to deprive the public of a meaningful opportunity for comment. (6909)
- With respect to EPA's process, this proposal has been rushed, is vague, and creates more questions than it answers: it does not clearly state the actual parameters of the proposed rule, it is open-ended in terms of alternatives under consideration, and it fails to provide critical information such as projected costs. The commenter also notes that it is also completely unclear—or worse, contradictory—whether and how this proposed rule would apply to EPA's cost-benefit analyses. (6915)

- The Proposal’s terms are so vague as to fail to afford an opportunity for meaningful comment. The commenter provides that significant issues are presented in the Proposal only in the broadest terms, despite an APA requirement that a proposed rule includes “the terms and substance of the proposed rule or a description of the subjects and issues involved,” 5 U.S.C. § 553(b)(3), and with enough specificity “to permit interested parties to comment meaningfully.”²¹⁰⁹ (6916)
- The process underlying the proposed rule is flawed due to its lack of adequate analysis and input from the start and the insufficiency of the notice and information provided to commenters. As such, the commenter suggests that the proposal be withdrawn until proper preliminary analysis has been completed. (6919)
- The language of the rule is confusing, contradictory, and poorly and incorrectly referenced with little science or policy foundation. According to the commenter, this suggests the rule authors lack understanding of the scientific process. (6924)
- The current proposal is far too vague and missing key components that must be included in the final rule to ensure its understandability and appropriate implementation. (9224)
- The ill-conceived, badly written, and unlawful proposal is flawed beyond repair and should be rescinded. Further, according to the commenter, this proposed rule runs counter to EPA’s stated commitment to “robust and civil dialogue with the public.”²¹¹⁰ The commenter contends that any further time and money spent on this proposal would be a waste of valuable public resources and that EPA and OMB should focus their limited resources on protecting public health and the environment rather than continuing to consider such a flawed proposal. (9225)

Response: In response to public comments, the EPA clarified many aspects of the proposed rule in the supplemental notice of proposed rulemaking and final rule, including key definitions and an overview of the process that the EPA would follow. The final rule clarifies that the rule requirements set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. As further discussed in the preamble of the final rule, the EPA maintains that this rulemaking establishes internal Agency procedures and does not intend to change the behavior of external parties. Finally, in consideration of public comments, the EPA did not finalize the 2018 proposal or the 2020 SNPRM proposed option that would have categorically required that the underlying data and models be available for independent validation in order for studies to be considered pivotal science. However, given that transparency is an important aspect of EPA’s regulatory actions and assessments, it should be an important consideration in how the Agency considers pivotal science. Because the final rule does not categorically exclude any studies, including human health studies, from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information.

²¹⁰⁹ *Honeywell Int’l, Inc. v. EPA*, 372 F.3d 441, 445 (D.C. Cir. 2004).

²¹¹⁰ Wheeler, A.R. 2018. Message from the Acting Administrator: Public Participation and Transparency in EPA Operations, July 30. Online at https://www.eenews.net/assets/2018/07/30/document_pm_02.pdf, Accessed July 31, 2018.

Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations. The final rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

2.1.7.5 Insufficient Details Regarding the Handling of and Sensitive Personal Data

Comment: Commenters (0068, 2429, 2787, 4594, 4831, 6125, 6133, 6362, 6448, 6893, 6911, 6916, 6955, 8272, 9227) suggest that there is insufficient detail regarding the handling of CBI and sensitive personal data. Comments include:

- Before EPA imposes a requirement that all primary data developed in future studies be publicly available, the Agency should perform a systematic review of the relevant literature on the strengths and limitations of strategies to anonymize. (0068)
- Proposed rule does not state the Agency's plans for disseminating publicly available data that are under the jurisdiction of other federal agencies, such as Medicaid and Medicare. The commenter points out that a recent study that might be excluded from consideration showed that long-term exposure to particulate matter and ozone at levels below the annual standards was associated with an increase in mortality in the Medicare population.²¹¹¹ (2429)
- Key issues including how data would be made available to the public and how private information would be protected are not addressed. According to the commenter, this is a serious deficiency in a rule meant to increase access to data for the public. (2787)
- EPA has solicited input on measures to "provide protected access to identifiable and sensitive data." The commenter asserts that this is a significant issue and one that EPA should fully understand prior to moving forward with any new rule. The commenter recommends that EPA initiate a formal request for public comment on this issue alone and use what is learned to help inform and guide any potential future rule on transparency. (4594)
- The proposal acknowledges that data may be "controlled by third parties," but its entire explanation of what this may mean is a vague promise that "EPA shall work with those parties to endeavor to make the data available in a manner that complies with this section." The commenter notes that this language does not begin to address the variety of complexities involved with data controlled by a wide variety of third parties each with different policies of access, making it nearly impossible for commenters to know whether third party studies can ever be used without some type of interactive process between the study authors and EPA. Again, the commenter states that even if EPA does not intend to apply this provision to categorically bar the use of third party studies, its failure to point

²¹¹¹ Di, Qian, et al. "Air pollution and mortality in the Medicare population." *New England Journal of Medicine* 376.26 (2017): 2513-2522.

this out, or otherwise explain this provision makes the rule too vague to implement and is still another instance of failure to provide adequate notice. (6125)

- Commenter suggests that EPA should provide greater clarity regarding what it intends to do in circumstances where raw data cannot be made publicly available. (6362)
- Concerned with the lack of details around appropriate access to confidential information. While noting that "[n]othing in the proposed rule compels the disclosure of any confidential or private information in a manner that violates applicable legal and ethical protections," the lack of specificity and applicability is found wanting and the Agency should expand at great length should the rule go forward. (6448)
- The proposed rule states that EPA aims to honor "legal and ethical obligations to reduce the risks of unauthorized disclosure and reidentification"²¹¹² and that concerns about access to confidential or private information can "be addressed through the application of solutions commonly in use,"²¹¹³ but it does not describe criteria or processes for determining which data sets would be exempted from data release requirements, what alternative requirements might be applied to data sets containing identifiable information, or which activities the Administrator will exempt. (6893)
- Commenter suggests that the Proposal be revised to further clarify how EPA will protect private, sensitive and confidential information, as well as provide an exemption process that allows for clearly and objectively assessing studies without excluding them from the rulemaking and guidance process. (6911)
- The Proposal provides no discussion of how underlying data of relevant studies can be released consistent with the various laws and regulations protecting privacy and prohibiting disclosure. According to the commenter, the failure to "consider an important aspect of the problem" renders the Proposal arbitrary and capricious.²¹¹⁴ (6916)
- No protections have been built into the proposal to prevent or reduce potential abuse of researcher data. (6955)
- The proposal states that EPA aims to honor "legal and ethical obligations to reduce the risks of unauthorized disclosure and re-identification" and that concerns about access to confidential or private information can "be addressed through the application of solutions commonly in use," but it does not describe criteria or processes for determining which data sets would be exempted from data release requirements, what alternative requirements might be applied to data sets containing identifiable information, or which activities the Administrator will exempt. (8272)
- In the proposal, EPA blithely and irrationally ignores or assumes away the real and significant issues, suggesting that existing mechanisms and techniques can be used to protect privacy and confidentiality while making underlying research data publicly available. In fact, the commenter provides that evidence (including several of the sources that EPA cites) indicates that the potential mechanisms alluded to by EPA would only have the potential to address some of the barriers cited above, have serious limitations even for those, and are actually becoming less effective as it becomes easier to combine and manipulate public data sets. The commenter adds that the "solutions" EPA might have in mind do not address the issues raised by the Proposal because no other agency

²¹¹² 83 Fed. Reg. 18770 (April 30, 2018).

²¹¹³ *Id.*

²¹¹⁴ *Motor Vehicle Mfrs Ass'n v. State Farm Mut. Life Ins. Co.*, 463 U.S. 29, 43 (1983).

has tried to implement a requirement such as the one EPA proposes. The commenter provides that other agencies provide guidance and techniques to protect privacy during data collection and disclosure to allow more use of data collected by the government, not to mandate that data collected by academic or industry researchers be publicly available for purposes of replicating analyses. The commenter adds that the EPA cursorily mentions a range of options for facilitating secure access to confidential data, including: “[r]equiring applications for access; restricting access to data for the purposes of replication, validation, and sensitivity evaluation; establishing physical controls on data storage; online training for researchers; and nondisclosure agreements.”²¹¹⁵ The commenter states that the EPA does not indicate whether it would deem providing access with these types of controls in place sufficient to meet EPA’s proposed requirement “publicly available in a manner sufficient for independent validation.” Comments provided by this commenter that are specific to de-identification methodologies/issues, implementation costs, and privacy data requirements are presented in other relevant sections of this document. (9227)

Commenter (6133) provides that the EPA concedes that concerns about access to confidential or private information cannot always be addressed but says nothing about these instances or how it intends to evaluate them. The commenter notes that, for the times that EPA believes concerns about access to confidential or private information can be addressed, the Proposal does not explain how it plans to do so nor address the costs. The commenter adds that the Proposal merely directs readers to general and vague statements from different contexts and fails to provide fair notice or justification of what EPA would do to address issues with confidential or private information.

Commenter (6133) states that the Proposal merely says to “[s]ee examples from the U.S. Department of Health and Human Services, National Institute of Standards and Technology, U.S. Department of Education, and the U.S. Census Bureau,” *id.* n.16, and points generally to Health and Human Services “Guidance Regarding Methods for De-identification of Protected Health Information in Accordance with the HIPAA Privacy Rule,” *id.* n.17. The commenter notes that the Proposal does not say what actions from these examples EPA proposes to use.

Commenter (6133) also states that the Proposal states that the National Academies have noted that in the past, restricted data products were created by relatively simple data masking, coding, and de-identification techniques, and notes that “[n]othing in the past suggests that increasing access to research data without damage to privacy and confidentiality rights is beyond scientific reach.” 83 Fed. Reg. at 18,771 (citing *Expanding Access to Research Data Reconciling Risks and Opportunities*, The National Academies Press, 2005, <https://www.nap.edu/catalog/11434/expanding-access-to-research-data-reconciling-risks-and-opportunities> at 27, 36). First, according to the commenter, this is not fully supported as experience shows increasing access to data can damage privacy and confidentiality rights. Again, the commenter notes that the Proposal does not say which, if any of these techniques the EPA will use, or how the EPA will use them. And while the National Academies may believe that increasing access to data without damage to privacy and confidentiality is not beyond scientific reach, the Proposal does not explain how this belief translates to past, present, and future

²¹¹⁵ 83 Fed. Reg. 18771.

scientific studies EPA considers in regulatory decision making. The commenter provides that this document does not explain how EPA will address concerns about confidential or private information and does not support EPA's Proposal to preclude consideration of those studies that do not make public underlying data for those, or other reasons.

The commenter (6133) provides that the Proposal next cites to two National Academies documents and a document from the Bipartisan Commission on Evidence Based Policy. 83 Fed. Reg. at 18,771 & n.19. But, according to the commenter, the Proposal fails to explain how these documents support its proposed actions or explain how EPA intends to protect confidential information. The commenter notes that the Proposal merely states that they "have discussed the challenges and opportunities for facilitating to secure access to confidential data for nongovernment analysts." 83 Fed. Reg. at 18,771. The Proposal does not address those challenges or describe the opportunities it intends the EPA to use. Again, the commenter asserts that these documents do not support the vague Proposal.

Commenter (6133) states that the Proposal states that "the requirements for availability may differ," and "may range from deposition in public data repositories, consistent with requirements for many scientific journals, to, for certain types of information, controlled access in federal research data centers that facilitate secondary research use by the public." Id. (footnotes omitted). The commenter provides that the Proposal again cites to journal policies or recommendations generally and the policies for access to data from NIH and Census Bureau. Id. nn.20 & 21. Importantly, the commenter notes, the Proposal does not say how the requirements would differ, what studies would be required to deposit what data into what repositories, and what studies would be required to allow controlled access to what data in what federal research data centers. Moreover, the commenter provides that the Proposal does not address the costs that these actions would entail. Again, according to the commenter, if EPA intends to use these different ways to provide data that meet concerns about confidential and private information, the agency must withdraw the rule and issue a new proposed rule that explains the methods it proposes to use.

The commenter (6133) expresses that the proposal generally wraps up this section with:

EPA should collaborate with other federal agencies to identify strategies to protect confidential and private information in any circumstance in which it is making information publicly available. These strategies should be cost-effective and may also include: Requiring applications for access; restricting access to data for the purposes of replication, validation, and sensitivity evaluation; establishing physical controls on data storage; online training for researchers; and nondisclosure agreements.

83 Fed. Reg. at 18,771 (footnote omitted).

The commenter (6133) contends that the Proposal's many flaws are clear in these sentences. The commenter asserts that the EPA does not know what the Proposal entails. The commenter notes that the Proposal suggests that EPA should identify strategies in the future and that these strategies should be cost-effective. The commenter further notes that the Proposal does not say what cost-effective means, nor what EPA should do if it does not identify any cost-effective strategies, yet it still seeks to alter legal obligations and regulatory decision making in reliance on

this unexplained suggestion. The commenter adds that the EPA also does not point to any authority for the proposition that the agency's consideration of peer reviewed scientific studies depends on the cost-effectiveness of some strategy the agency develops for publicizing and protecting the underlying data. The commenter argues that listing options EPA can use does not help. The commenter asserts that the Proposal fails to explain why EPA has not already identified the strategies or options and in what circumstances it would use them. The commenter adds that the Proposal suggests that it will exclude a large class of scientific studies from regulatory decision making but contains a vague assertion that it will look for "cost effective" ways in the future to exclude less them.

Commenter (6133) concludes that the EPA's belief that concerns about access to confidential or private information caused by the Proposal should be addressed in the future is problematic by itself. The commenter provides that the cited materials—describing ways different organizations can address concerns in different contexts—do not support this belief. The commenter adds that the Proposal does not propose or analyze any strategies it notes EPA should consider, even though it seeks to implement a binding legal change. While at least EPA recognized the merit to concerns about confidential or private information, the commenter states that in the four days since sending the version for review the agency clearly did not perform the analysis necessary to figure out how those concerns would be addressed. The commenter states that the impact and costs of the Proposal are dependent on such strategies and cannot be measured or analyzed without proposed regulatory text. The commenter contends that the EPA cannot publish a final rule without first proposing what it will do about confidential and private information and analyzing the option it proposes and that the EPA should withdraw the Proposal.

Response: Upon consideration of public comments, the EPA agrees that it is important not to categorically exclude any study because the data underlying a study at the stage required by this rulemaking may not be available for independent validation.. Therefore, the EPA is not finalizing the 2020 SNPRM proposed option that would have categorically required that for studies to be considered pivotal science the underlying data would need to be available for independent validation. However, given that transparency is an important aspect of EPA's regulatory actions and assessments, it should be an important consideration in how the Agency considers pivotal science. As described in 40 CFR 30.5 of the final rule, the EPA will rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies—based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. Further, the EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset,

a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The EPA would also like to emphasize that the EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule and the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

2.1.7.6 Proposal Should be Revised to Include a Clearly Defined Process for Checks and Balances in the Implementation of the Rule

Comment: Commenter (0562) suggests that the EPA release a revised proposed rule with explicit language as to who would be advising the Administrator on which data or models are valid for decision making, and what form of independent review is needed if they have been exempted under §30.9. According to the commenter, advisors should have the authority or recourse to call into question decisions by the Administrator that are counter to good scientific practice and that result in excluding valid data or models from consideration in a regulatory decision based solely on lack of transparency. The commenter states that the “scientific” criteria used by the Administrator or his or her advisors to make such decisions should be explicitly stated (or referenced) in the revised rule. In other words, the commenter asserts that there should be a clearly defined process for checks and balances in the implementation of the proposed rule to instill trust both within the Agency and for stakeholders, and that decisions on what data or models could or could not be used in a regulatory decision are not the result of the Administrator’s personal bias. In the absence of such explicit language, the commenter states that one can only assume that these decisions “could” be made solely at the Administrator’s discretion.

Commenter (2169) states that there is no mechanism in the regulation for assuring that the science drives the decision. Therefore, according to the commenter, there is no means for judging the term pivotal. The commenter contends that, without transparent consideration of all the information available, and public comment on whether all pertinent information was considered, it is pointless to promulgate rules on the availability of the information.

Response: In consideration of public comments, the Agency is retaining the Administrator’s exemption provision because there are conditions under which compliance with the requirements in 40 CFR part 30 might be impracticable. For example, the underlying dose-response data for some studies, particularly older studies, may not be readily publicly available because of the technological barriers to data sharing (e.g., differences in data storage devices or data retention practices) that existed when they were developed. As a result, the EPA is finalizing the Administrator’s exemption provision as proposed in the 2020 SNPRM, with additional conditions described here.

The EPA does not agree with the comments regarding the role of the Administrator in determining whether to grant an exemption and finds that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator's decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation.

The EPA is also including criteria that may be used by the Administrator when he or she is determining whether greater consideration should be afforded to pivotal science for which the underlying dose-response data are not available in a manner sufficient for independent validation. As a result, the Administrator may determine that greater consideration is warranted when:

- Technological or other barriers render sharing of the dose-response data infeasible;
- The development of the dose-response data was completed or updated before the effective date of this final rule;
- Making the dose-response data would conflict with laws and regulations governing privacy, confidentiality, CBI, or national security;
- Third-party independent validation of the study's underlying dose-response data through reanalysis has been conducted; or
- The factors in 40 CFR 30.5 used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

To assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption. The EPA will document the rationale for the Administrator's exemption in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

Finally, in consideration of public comments, the EPA clarified the definition of pivotal science in the final rule. Rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as "pivotal science," the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, "pivotal science" includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate points of departure (PODs)). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or

quantitative analyses of EPA significant regulatory actions or influential scientific information. Future statute-specific rulemakings may interpret “pivotal science” more broadly.

2.1.7.7 Request for EPA to Clarify Why Additional Peer Review of Data is Necessary When it Has Already Been Reviewed or Adequately Describes the Process

Comment: Commenters (5165, 5419, 6125, 6373, 6915, 9227) suggest that EPA clarify why the proposed rule is requiring additional peer review of data and/or present an adequate description of what the peer review process would entail.

Commenter (9227) notes that the EPA’s proposed peer review regulations do not even mention EPA’s Peer Review Handbook, let alone explain how the new proposed regulations would impact EPA’s compliance with the Handbook. For example, the commenter states that the EPA’s Handbook specifies “exemption criteria” in Section 3.3.²¹¹⁶ The commenter requests that EPA clarify whether anything in the proposed peer review regulation would supplant instructions in the Peer Review Handbook, and if so, provide a reasoned explanation for the change. Likewise, the commenter suggests that EPA explain the role of the Peer Review Handbook going forward in administering peer review requirements. Additionally, the commenter notes, the preamble to the proposed rulemaking lacks any explanation whatsoever for why EPA is proposing this new peer review requirement or what its impact might be. The commenter adds that the EPA has additionally not provided any information to suggest that EPA is not already following OMB’s Peer Review Bulletin. According to the commenter, EPA’s lack of any supporting rationale or analysis frustrates the public’s ability to provide meaningful comment on this provision,²¹¹⁷ and is itself a sign that this requirement is fundamentally arbitrary.

Commenter (5165) notes that the proposed rule would require EPA to conduct “independent peer review” of scientific studies underlying its significant regulatory decisions, such as the establishment of health-based air quality standards and that EPA’s in-house peer reviewers would also be tasked with articulating “the strengths and weaknesses of EPA’s justification for the assumptions applied and the implications of those assumptions for the results.” The commenter notes that it is difficult to provide meaningful comments on this aspect of the proposal because EPA has included no details about how the “independent peer review” requirement would be implemented. According to the commenter, the fact that EPA has requested comment on “which parts of the Agency should be responsible for carrying out these requirements” suggests that it has not worked out a plan for this fundamental provision. The commenter inquires: Would EPA have to hire new experts, and if so, how many and in what fields? How much would this cost? More fundamentally, the commenter asks why should scientific literature that has already undergone peer review and been vetted by EPA’s science

²¹¹⁶ U.S. EPA, Science and Technology Policy Council Peer Review Handbook, 4th Ed. (2015), at 44-45.

https://www.epa.gov/sites/production/files/2016-03/documents/epa_peer_review_handbook_4th_edition.pdf.

²¹¹⁷ See *Connecticut Light & Power Co. v. Nuclear Regulatory Com.*, 673 F.2d 525, 530 (D.C. Cir. 1982) (“The purpose of the comment period is to allow interested members of the public to communicate information, concerns, and criticisms to the agency during the rule-making process. If the notice of proposed rulemaking fails to provide an accurate picture of the reasoning that has led the agency to the proposed rule, interested parties will not be able to comment meaningfully upon the agency’s proposals.”); *Honeywell Int’l, Inc. v. EPA*, 372 F.3d 441, 445, (D.C. Cir. 2004) (“Under the Administrative Procedure Act, a notice of proposed rulemaking must “provide sufficient factual detail and rationale for the rule to permit interested parties to comment meaningfully.”).

advisory panels be subjected to an additional layer of government peer review? The commenter asserts that these key questions should have been considered, and the answers made public, prior to the rule's proposal.

Commenter (5419) states that §30.7 of the proposed rule states that EPA shall conduct independent peer review of pivotal regulatory science but lacks any detail of this process, including selection criteria for peer reviewers, decision criteria, and how this compares to existing processes through the SAB and third-party contractor-managed peer reviews. The commenter requests clarification and additional detail related to this key provision of the proposed rule.

Commenter (6915) notes that the EPA apparently proposes to require that EPA itself conduct an additional "independent" review. See 83 Fed. Reg. at 18774. Yet the commenter notes that the proposal nowhere discusses how EPA would vet reviewers to identify persons who are purportedly more competent than those already used in past or current peer review processes, or the level of EPA staffing and associated costs that would be needed for additional review—only stating that EPA will implement the proposed rule in a manner "that minimizes costs." Id. at 18774. But, according to the commenter, any requirement for EPA to conduct additional review would entail additional significant costs, contrary to the proposal's assertion. Id. at 18772. The commenter contends that the practical outcome of the proposal is that EPA may end up relying on a much smaller number of studies and/or on a less robust subset of relevant available studies, thus undermining the regulatory decision-making process. In sum, the commenter asserts that the EPA fails to acknowledge the rigor of existing processes in statutes, policies and federal procedures, or to explain how its proposal would provide any added value and minimize costs. EPA should abandon this unnecessary and counterproductive exercise.

Commenter (6125) states that the meaning of proposed §30.7 suggests that EPA will be required to re-peer review every study upon which it relies.²¹¹⁸ The commenter notes that the regulatory text is accompanied by no explanation, leaving commenters to speculate about how it would apply, or what problems its implementation might present. The commenter contends that the proposal's complete failure to explain this far-from-self-explanatory provision is yet another instance of failure to give adequate notice of the substance and basis of the rule.

Commenter (6373) provides that the Rule does not describe how EPA intends on conducting the assessment of models and assumptions described in §30.6 or the independent peer-review

²¹¹⁸ The commenter notes that the proposal may be trying to revive the argument thoroughly rejected and debunked by the *D.C. Circuit in Coalition for Responsible Regulation v. EPA*, 684 F. 3d 102 (D.C. Cir. 2012) (finding that substantial evidence supported EPA's finding that emissions of enumerated greenhouse gases endanger public health and welfare and that vehicular emissions contribute to that endangerment). There, the court stated that "EPA simply did here what it and other decision-makers often must do to make a science-based judgment: it sought out and reviewed existing scientific evidence to determine whether a particular finding was warranted. It makes no difference that much of the scientific evidence in large part consisted of 'syntheses' of individual studies and research. Even individual studies and research papers often synthesize past work in an area and then build upon it. This is how science works. EPA is not required to re-prove the existence of the atom every time it approaches a scientific question." 684 F. 3d at 120. Proposed section 30.7 shows signs of being designed to 're-prove the existence of the atom' by requiring re-peer review. No need for doing so is apparent, none is provided in the notice, and this proposed provision appears both substantively and procedurally defective as a result.

process described in §30.7 or identify which individuals would be a part of these reviews. The commenter notes that it is unclear if the peer-reviewers will consist of EPA staff, a group of independent individuals, a single reviewer, or if the peer-reviewers will be required to have varying backgrounds free from personal and professional conflicts of interests to promote a complete and adequate review of the science. According to the commenter, the Rule provides no insight into if, or how, the “independent” analyses for validation would be incorporated into the federal decision-making process, or if such analyses would be required before the findings from peer-review studies could be considered.

Response: As discussed in the preamble to the final rule, the EPA would like to clarify that the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule.

The EPA is, therefore, finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will conduct independent peer review, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review, of individual studies identified as pivotal science if the studies have already undergone journal peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

2.1.7.8 Request that EPA Provide Greater Detail on the Kinds of Research/Data that Could be Used/Excluded from the Rulemaking Process

Comment: Commenters (0556, 2335, 2876, 6357, 6873) request clarity on the kinds of research/data that could be used/excluded from the rulemaking process. Commenter (6357) recommends the EPA work with the scientific community to develop clear processes and inclusion and exclusion criteria regarding studies that can inform health impact, but for which ethical and practical considerations may preclude public release of data.

Commenter (6873) expresses concerns regarding what the proposed rule will actually do (albeit unintentionally) is create a new category of “EPA usable research.” The commenter asks the following:

- What does it mean to make research “usable” or “accessible”?
- In what format?
- At what stage of research?
- Will data standardization be required (otherwise, usability can be quite limited)?
- On what timetables, with what funding and on whose authority?

- What protections will be applied for the use and reuse of data?
- And what might be the potential broader effects on research in general if we don't know exactly which forthcoming studies will be potentially of interest to the EPA?
- Will this cause all science to shift to an EPA-standard of openness?

The commenter (6873) notes that the answers to these questions are not simple and will require a significant and lengthy undertaking.

Commenter (6357) encourages the EPA to clarify the process by which the Agency will make determinations about the inclusion of studies that cannot ethically or legally release certain types of data. The commenter notes that the proposed Rule states that “concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions” already in use by the federal government. The commenter asserts that the document does not articulate how current EPA practices differ from other federal agencies’ processes, what gaps the proposed EPA Rule would address, and what precisely would be updated or changed at EPA to address those gaps.

Commenter (6358) provides that the proposal states that EPA aims to honor “legal and ethical obligations to reduce the risks of unauthorized disclosure and re-identification” and that concerns about access to confidential or private information can “be addressed through the application of solutions commonly in use,” but it does not describe criteria or processes for determining which data sets would be exempted from data release requirements, what alternative requirements might be applied to data sets containing identifiable information, or which activities the Administrator will exempt.

Commenter (0556) provides that EPA needs to address the following:

First, they have to figure out what "using" a given research result even means. For example, proposed major rules are accompanied by a voluminous Technical Support Document. It may cite hundreds, or even thousands, of research journal articles. Does each of these have to meet the availability and replicability standard? Or is regulatory usage confined to just a few key studies?

Second, what does availability mean? For example, does the researcher have to document their data, or just provide it? What about the decisions made as the research progressed, which can be numerous? Does each of these have to be explained? How documented does the software have to be, etc. Here the danger is that the availability requirement might become too burdensome.

The commenter adds that, assuming that these deep challenges finally get worked out, the EPA needs to consider what the regulation does. The commenter notes that the rule, in effect, creates a new category of “EPA usable research”. According to the commenter, researchers (or their institutions) will want their research to be usable, even if EPA does not fund it, but that it will be a big step forward with regards to open science and a big job for the EPA and research community to work out the extension of Public Access.

Commenter (2335) states that there is a need for more details about the kinds of research that could be excluded from the rulemaking process and the kinds of decisions that could be affected.

Commenter (2876) requests that the proposed rule explicitly identify some number of publications with standards that would fail to meet the proposed transparency rules. Further, the commenter suggests that the proposed regulation clearly state how those publications could bring their practices into compliance with the new standards while still meeting legal and ethical requirements for protecting the privacy of research subjects.

Response: In response to public comments, the EPA clarified many aspects of the proposed rule in the 2020 supplemental notice of proposed rulemaking and the final rule, including definitions of key terms and the stage of data required under the rule. As discussed in the preamble to the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

The EPA also clarified the definition of pivotal science in the final rule. Rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as “pivotal science,” the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. Future statute-specific rulemakings may interpret “pivotal science” more broadly.

As also detailed in the preamble to the final rule, underlying data or models are considered available if they can be accessed through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The EPA also modified the definition of “publicly available” in the final rule to add the following at the end of the definition: “The public must be able to access the information on the date of publication of the proposed rule (or, as appropriate, a supplemental notice of proposed rulemaking, or notice of availability) for the significant

regulatory action or on the date of dissemination of the draft influential scientific information for public review and comment.”

Finally, the EPA will not be categorically excluding studies based on the availability of their underlying data. Because the final rule does not categorically exclude any studies, including human health studies, from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating final significant regulatory actions and finalizing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations. The EPA believes that the implementation of this final rule will increase the transparency of pivotal science for significant regulatory decisions and influential scientific information, while still ensuring that all quality, relevant literature is considered in the development process. The final rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

2.1.7.9 Rule Needs to be Clarified – Specific Requests

2.1.7.9.1 How will the Rule be Applied to Past Regulatory Actions

Comment: Commenter (6447) states that the EPA has not explained whether or how this new policy will be applied to past regulatory actions. If EPA is planning to use this new policy to go back and revisit past regulatory decisions, it should say so explicitly. Commenter (6909) inquires whether the rule can and will be applied retroactively. The commenter states that the EPA has specifically asked for comment from the public as to how it should approach this issue. According to the commenter, this is hugely significant in terms of what the rule’s effects will be.

Commenter (6915) states that the proposal says the rule is intended to apply prospectively, but also states that EPA “should be guided by this policy to the maximum extent practicable during ongoing regulatory action.” *Id.* at 18,771. Yet it never explains how or why ongoing EPA actions would be subject to the proposed rule and which existing scientific studies are implicated by the proposed rule.

Response: This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on existing significant regulatory actions or influential scientific information. As described in 40 CFR 30.3, the rule provisions apply to significant regulatory actions for which a proposed rule was published in the *Federal Register* after the effective date of this rule and influential scientific information submitted for peer review after the effective date of this rule. This final rule is effective upon publication in the *Federal Register*.

2.1.7.9.2 Specific Language of Proposed Rule that is Unclear

Comment: Commenter (6120) states that the language in the proposed rule is not clear. For example, the commenter notes that the proposed rule states that the "EPA should give appropriate consideration to high quality studies that explore: a broad class of parametric concentration-response models with a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the exposure range; and spatial heterogeneity." The commenter states that this type of statement needs to be described more explicitly. The commenter inquires: How does the EPA define "high quality studies"? The commenter requests that the language that describes the models should be written in language that is clear to the public and gives examples of what is truly being referred to here. The commenter contends that this type of language is found throughout the proposed rule. The commenter encourages the EPA to clarify the text throughout so that each proposed action is clear and easy to understand by everyone.

Commenter (6194) asserts that key issues beyond definitions also raise issues in such a general manner that it fails to provide the public with adequate notice of what EPA intends. For instance:

- The Proposal requires that certain data and models be made "publicly available in a manner sufficient for independent validation," and indicates that information will satisfy this standard when "it includes the information necessary for the public to understand, assess, and replicate findings." 83 Fed. Reg. at 18,773-74. But it is not clear what degree of availability or explanation would satisfy the Proposal. For example, the "public" referenced in the Proposal could be scientists trained in the relevant field or members of the general public.
- The Proposal provides that, "where necessary, data would be made available subject to access and use restrictions." *Id.* What this process would look like is not addressed in the Proposal or discussed at all in the preamble. This leaves significant open questions, such as who will pay for and implement these restrictions and who will decide which people are allowed to access the data and under what standards.
- The Proposal appears to require EPA to conduct independent peer review of all "pivotal regulatory science," but provides no detail as to what this means or how it will be implemented. *Id.* For example, it is unclear who within the agency would perform this peer review, when it would occur, and whether (and when) prior peer review in the journal publication process would serve as a substitute for EPA peer review.
- The Proposal includes an exemption mechanism but does not provide information about the process or conditions under which exemptions shall or can be sought and granted.

Response: The preamble to the final rule clarifies that the requirements in this final rule set the overarching structure and principles for transparency in the EPA's final significant regulatory actions and influential scientific information. The EPA intends to develop internal implementing guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes that the EPA administers.

In the final rule, the EPA clarifies how the Agency will evaluate the quality of scientific studies when promulgating significant regulatory actions and developing influential scientific information. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with the EPA Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency. The EPA will generally continue to use the following, established factors when assessing study quality: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review.

The rule also clarifies other general aspects noted by the commenters. For example, criteria that the Administrator would consider in determining whether to grant an exemption to the provisions in this rule are provided in 40 CFR 30.7. As described in the preamble, the rule also does not direct or require any outside entity or the EPA to establish data sharing mechanisms, nor does it require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. The EPA is only required to determine if such a mechanism was available, should a subject matter expert decide to use it. The EPA also modified the definition of independent validation to now mean the reanalysis of study dose-response data by subject matter experts who have not contributed to the development of the study to evaluate whether results similar to those reported in the study are produced. The preamble to the final rule also provides clarity regarding peer review of pivotal science.

2.1.7.9.3 Need for Greater Clarification on Data Refinement Issues

Comment: Commenter (6362) notes that an important aspect relevant to “public availability” is the level of data refinement EPA will require. The commenter notes that the NAS held a workshop in 2016 to discuss obstacles for sharing data²¹¹⁹ and they defined several key terms to ensure clarity at the workshop. The commenter recommends that the EPA consider adopting a similar lexicon to increase the clarity of its regulation (and refers to Table 1 in Appendix B). Definitions in NAS Principles and obstacles for sharing data from environmental health research: Workshop summary) of their comment letter). In addition, the commenter provides that the NAS Report suggests a “cleaned dataset” would be acceptable to use for all routine analyses and verification (and refers to Table 2 in Appendix B (Data flow from NAS Report) of their comment letter). EPA should establish clear standards on the acceptability of “cleaned datasets.” According to the commenter, this will help to standardize data reporting and formatting. It will also prevent over- and under-reporting.

Response: In this final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information. The EPA does not agree

²¹¹⁹ National Academies of Sciences, Engineering, and Medicine. 2016. Principles and obstacles for sharing data from environmental health research: Workshop summary. Washington, DC: The National Academies Press. doi: 10.17226/21703.

with establishing standards for the acceptability of data independent of the definition provided in the final rule because additional standards would be overly prescriptive and not informative.

2.1.7.9.4 Implementation Requirements Vague/Insufficient

Comment: In addition to comments on the overall general vagueness of the proposal, several commenters specifically request/point out the deficiencies in requirements set out in the Proposal that would allow them to properly comment on and implement the rule. Comments include:

- The proposed rule lacks clarity as to how the rule would apply and how EPA intends to implement the rule. (2876, 5165, 6351, 6920)
- For those researchers who do attempt to comply with the proposed rule's requirements, the extent and nature of the data that must be maintained and made publicly available is vague and unclear, making compliance virtually impossible. (6915)
- The proposal lacks details on how its provisions would be implemented, specifically when it comes to privacy issues, reproducibility, and possible exemptions. (6110)
- The rule as written is too vague with regards to implementation, which leaves far too much editorial discretion up to the politically appointed administrative roles on what constitutes "transparent" study data and model design. (6127)
- The Proposal offers no process for public hearing or even consultation with the SAB over implementation.²¹²⁰ As written, the commenter notes that the Proposal would require review and assessment of volumes of existing research and revisions to internal processes yet to be determined and seems to give arbitrary decision-making authority to the Administrator to determine the fate of such research. (6351)
- The lack of clarity regarding how the EPA will implement the proposed Rule risks exclusion of scientifically valid and relevant studies during the Agency's decision-making process. The commenter asserts that the rulemaking process itself benefits from the same transparency, consistency, and objectivity. As such, they suggest that clear guidelines around how rules are implemented are as important as data transparency in ensuring public trust and an objective approach that prioritizes the EPA's mission of protecting human and environmental health. (6357)
- Commenter (6916) assumes (as they say they must, given no other information from the Agency), that the Proposal is aimed at precluding EPA's reliance on studies for which the data are not made public. The commenter notes that is the natural reading of the proposed regulatory language, which is the most choate information offered in the Proposal. But even that reading is not certain, and the commenter states given the very broad discretionary nature of the exemptions provided for in the rule text (see, e.g., 83 Fed. Reg. 18774, proposed 40 C.F.R. §30.9, giving the Administrator the ability to grant an exemption to the data publication requirement if that is "impracticable," which is undefined in the Proposal). As a result, the commenter states that it is unclear how this rule would apply to EPA decision making, and how it would be different than the Agency's current protocol for considering studies relevant to specific rulemaking proposals. (6916)

²¹²⁰ Memo from Cullen, May 12, 2018

- While asserting an interest in “ensur[ing] that the data and models underlying science is [sic] publicly available in a manner sufficient for validation and analysis,”²¹²¹ the commenter notes that there is no more specific statement explaining how that would be implemented. (6916)
- The proposal also omits critical protocols and methodologies necessary to put this rule into action and does not fully explore the implications of implementing a rule of this nature. (9224)

Commenter (6046) contends that several of the requests for comment topics should have been evaluated and decided upon by EPA and then incorporated into the proposed rule. The commenter adds that just throwing out a rule without tools to implement the rule is inefficient and a waste of time. For example, the commenter notes that the EPA requested comment on the following: “EPA solicits comment on implementation of the proposed regulation, including which parts of the Agency should be responsible for carrying out these requirements.” The commenter states that the EPA best knows which part or if multiple parts of the Agency should be responsible. Further, the commenter notes that a request for comments on implementing the regulation is analogous to saying that our agency’s goal is to fly every person to the moon and then ask how the agency should do it.

Commenter (6104) raises questions that states believe should be considered before the rule is finalized. These questions include:

1. How would the \$100 million economic threshold analysis be implemented? Would new rules be assessed differently than updates to current rules?
2. Where data masking, coding, or de-identification is not technically feasible, will EPA still consider using high quality scientific research?
3. While it appears this rule would only apply prospectively to regulations, would there be any impact to science historically used to inform regulations that have existed for years/decades? How will EPA ensure the science remains timely?
4. If EPA were to phase in the requirements or prioritize certain specific actions, will states have any role in helping identify those priorities?
5. What impact, if any, would this rule have on institutions of higher education, hospitals, and other nonprofit organizations that received EPA funding through grants and cooperative agreements?

Commenter (6109) states that the EPA should provide the public with the answers to the very questions it poses, including:

- When or how it will develop procedures for protecting private information such as patient health records of the sort currently kept confidential by researchers;

²¹²¹ 83 Fed. Reg. at 18769

- How the proposed rule will be applied to its regulatory actions and under what circumstances;
- Whether other regulations might be necessary to implement the proposal, or whether statutory changes would be needed;
- Whether and how the agency will establish exceptions, including whether it will provide case-by-case exceptions;
- Whether the proposal will apply to a broader or narrower set of regulatory proceedings than it would as currently drafted, or whether certain categories will be exempt; and
- Whether the agency will add stronger data access requirements to the terms of research grants

Commenter (6133) notes that proposed §30.7 states that “EPA shall conduct independent peer review” without providing any coherent explanation or accompanying regulatory text about what that means: how will that peer review be conducted? By whom? Who will select the peer reviewers? How many will there be? Who will assure their independence and expertise? Will peer reviewers be subject to federal conflict of interest rules and policies? Will peer reviewers be anonymous? Where will the funds come from to conduct EPA peer reviews for “all pivotal regulatory science”? Has EPA estimated how many instances of “pivotal regulatory science” it anticipates conducting peer review for in one year? In prior years? Will the peer review be conducted openly and publicly? Will it be conducted in accordance with the Federal Advisory Committee Act? What will the duration of any peer review be? What purpose will that peer review serve? How will it affect future regulatory decisions? Or will it? Will there be an administrative docket? Will any product of the peer review be included in the administrative dockets for rulemaking? Will peer reviewer comments be part of the certified record for judicial review? Will the agency seek deference from future reviewing courts for the views expressed by peer reviewers? Does EPA not believe that peer review conducted by professional journals and societies is valid? Or sufficient? On what basis does EPA think professional peer review is invalid or insufficient, considering there is not one iota of evidence or support for that belief in the Proposal or the accompanying docket? What is the basic justification for proposed §30.7? The commenter asserts that the Proposal provides no answers to these questions.

Commenter (4831) suggests that the potential impacts of the proposed rule on the quality of regulatory science will depend on many aspects of the rule’s implementation that are not described in detail in the *Federal Register* notice, including the following:

- Criteria and processes to make objective and transparent decisions about which studies will be included in scientific analyses used to inform federal regulations;
- Approaches for evaluating the data and models used to characterize the dose-response relationships underlying federal regulations; and
- Approaches for protecting the confidentiality of certain kinds of data while balancing the need to make data publicly available.

Response: As discussed in the preamble of the final rule, the EPA intends to develop internal implementing guidance and promulgate either statute-specific science transparency regulations or programmatic guidance implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the

statutes EPA administers. The final rule also provides more detail regarding selection of pivotal science, consideration of restricted access to underlying data to protect privacy, criteria for the Administrator's exemption, and peer review.

In brief, the EPA will continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies— based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. In compliance with the rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or propriety information, available through restricted access in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. The EPA provides these factors in 40 CFR 30.5(d) and they are discussed more fully in the preamble of the final rule. The EPA will comply with OMB guidance on peer review for pivotal science and will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review. Criteria for the Administrator's exemption are provided in 40 CFR 30.7.

The rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

Comment: Commenter (5181) states that they find it difficult to predict the effect of the proposed transparency rule given the broad and general nature of the described intent and applicability, and lack of information regarding how it would be implemented in practice. According to the commenter, it is impossible based on the information provided in the *Federal Register* notice to fully evaluate the potential demand on time and agency resources, and to ascertain the benefits or impediments that might result from the proposed regulation. The commenter expresses concern that the notice fails to provide sufficient detail for an analysis of whether the new approach will achieve the stated purpose without creating unintended consequences that could make it difficult for states to implement clean water programs.

Response: The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs to the Agency. The EPA emphasizes that this is a rule of internal procedure promulgated under the EPA's housekeeping authority. However, the EPA has identified some incremental costs that the Agency may incur as a result of this final rule.

As detailed in the preamble to the final rule, the EPA will continue its current practice of conducting extensive review of scientific studies during the development of significant regulatory actions and influential scientific information. The additional procedures required by this rule only apply to pivotal science, which is a subset of the total number of studies that the EPA would evaluate. Given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small. The Agency may also incur other administrative costs to perform analyses and evaluations to support activities such as exemption decisions made by the Administrator, and documenting these or other decisions made pursuant to the requirements of the final rule. Again, the Agency anticipates that the incremental costs for these activities will be small relative to current administrative costs for developing significant regulatory actions or influential scientific information. Finally, this final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to pivotal science for which the underlying dose-response data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

The EPA also agrees that the benefits of the rule were not fully characterized in the 2018 proposed rule or the 2020 SNPRM. The EPA emphasizes, however, that this is a rule of internal procedure promulgated under the EPA's housekeeping authority. As discussed in Section III.A.1, the main benefits of this rule spring from greater transparency in significant regulatory actions and influential scientific information. By placing greater emphasis on the availability of dose-response data underlying pivotal science, the rule will allow for greater scientific scrutiny as EPA decision makers are developing significant regulatory actions and influential scientific information and increases the likelihood that any errors will be identified and corrected. Greater transparency is also inherently valuable as a principle of good government and provides benefits to the public at large, including reducing the risk of errors in EPA analyses and in the science such analyses rely upon. The ability for independent subject matter experts to validate pivotal science will facilitate more effective comment and engagement with the public during development of future significant regulatory actions and influential scientific information.

2.1.7.9.5 Definitions

Comment: Commenters (2426, 3971, 5170, 6125, 6126, 6133, 6137, 6194, 6351, 6360, 6361, 6362, 6373, 6447, 6449, 6875, 6910, 6915, 6924, 6955, 8281-PH20, 9224) express that definitions are not defined or ill-defined. Comments include:

- Commenter (6373) asserts that the impacts of the proposed changes will be difficult to predict unless EPA better defines what data the Rule applied to, and terms such as “independent validation.” Commenter (6126) suggests that after EPA clarifies definitions, a new round of public comment will likely be needed to address the basic questions raised by EPA in the proposed rule on other matters.
- The EPA solicits comment on the definition of “pivotal regulatory science” and the “dose-response data and models” and how to implement such definitions” (page 13 of 27; second para). The commenter responds to this solicitation by stating that this question is not trivial, but it can be resolved by assembling small groups of dedicated scientists who will invest the time to share information with the Agency. The commenter notes that EPA did this on many occasions in the 1980s and 1990s when they were working on the cancer risk assessment and exposure assessment guidelines. According to the commenter, they participated on several highly productive SABs that saved the Agency tens of thousands of wasted hours. (3971)
- There are multiple terms that will need to be defined in the final rule. In particular, they suggest that “transparency”; “data”, singular versus set; and “reasonable effort/endeavor”, in relation to how much work the agency must put in before justifying the use of data that cannot be made available to the public. The commenter suggests that if the agency wants a rule focused on the raw data then EPA must better define what “data” would be included within this rule. The commenter inquires: Is it just data produced by EPA? If not, is it the methods and protocols or the actual raw data? (6875)
- The terms “pivotal regulatory science,” “replication,” “reproducible,” and “research data,” are not defined or are problematic. (6924, 8281-PH20)
- Neither the proposal, nor the legislation it is based on, define “reproducible,” or “replicable” as used in the rule and are in fact not clear on how broadly this goal might be applied. §30.5 (information must be sufficient to “replicate” findings). The commenter notes that under standard usage, a study can be replicated without access to the underlying data. (6125)
- The proposed §30.2 refers to “pivotal regulatory science as the studies or analyses that drive the requirements and/or quantitative analysis of EPA final significant regulatory decisions.” The commenter adds that this definition is distinguished from “regulatory science,” defined as “scientific information, including assessments, models, criteria documents, and regulatory impact analyses, that provide the basis for EPA final significant regulatory decisions.” According to the commenter, these two definitions can be interpreted as simultaneously referencing something identical as well as one being a subset of the other. Therefore, the commenter contends that the definitions are vague and need clarification. (6362)
- Commenter suggests that the Agency clearly communicate its expectations regarding “replicability”, “validation” and availability of “data” to scientists designing and publishing their studies. (6449)
- The Proposal argues that research must be “replicable” without defining what that means. The commenter provides that many studies cannot be specifically repeated, especially those that examine the impacts of historic events, such as the exposure of a half-million Americans to no longer-existing levels of air pollution, or the health effects stemming from a massive oil spill. The commenter notes that subsequent, similar studies from

around the world have echoed their findings on health impacts. The commenter asks “[w]hich concept would EPA consider as replication?” (6351)

- Commenter expresses that the definition of the goal of study validation, is missing and no indication is given as to how public access is actually expected to produce validation. The commenter states that, based on the top-down nature of the proposal and the views of the former EPA Administrator who promoted it, the commenter notes that it is possible to guess at the unspoken definition: a study is validated if no stakeholder or true believer²¹²² in alternate models can find anything to criticize about it after a (post-hoc) analysis of a study’s data, which the commenter states is an impossible standard to meet. (6955)
- Although the proposed rule includes a definition for "pivotal regulatory science," the definition is useless. As defined, the commenter states that "pivotal regulatory science" could be as narrow as the study or studies from which a specific point of departure was selected, or as broad as all information considered by EPA in a risk assessment or rulemaking. The commenter notes that the public has no way of knowing how narrow or broad EPA intends this proposal to be. (6447)
- The proposed rule would require the Agency to make certain data and models are "publicly available in a manner sufficient for independent validation." Proposed §30.5. The commenter provides that, as the SAB notes, the concept of "validation" is not clearly defined in the rule. Generally speaking, the commenter contends that due in large part to the vague language used, the proposed rule gives EPA broad discretion to suppress science. The commenter expresses that this appears to be the whole point of the proposal. (6447)
- Where possible, the EPA should be explicit about important definitions, including "publicly available," "pivotal regulatory science," "dose response data and models," and "validation." (2426)
- Definitions that would be helpful in framing the proposed rule include "pivotal regulatory science," "dose response data and models," and "validation." According to the commenter, although "pivotal regulatory science" is likely intended to mean just the key study or studies underlying a regulatory analysis, it could be argued that supporting studies (i.e., those that help to build the weight of evidence or describe the mode of action) are also pivotal to the analysis. In addition, the commenter notes that it is unclear what the term "dose response data and models" includes. The commenter suggests that this term could mean anything from summary data to specific calculations and code, which matters for the potential sensitivity of the information. Finally, the commenter recommends that the EPA define what it means to "validate" study results. The commenter contends that this could be interpreted to mean that the study must be repeated (i.e., a new group of human subjects are exposed in a controlled experiment or are assessed in an observational setting) or simply that the statistics and models are recalculated from the existing data. Further, the commenter suggests that the EPA determine what level of validation is necessary for pivotal regulatory science so that it can be consistently applied. (2426)
- The term “independent validation” is insufficiently defined in the Rule. The commenter provides that validation typically refers to the ability to replicate a study’s results, based

²¹²² The commenter defines a true believer in this context as one whose theoretical beliefs trump all conflicting data. A conflicting study must be wrong, a priori. Confirming studies are judged by their strengths and conflicting studies by their weaknesses.

on the published methods and using the original data. The commenter notes that, to be independent, validation must be performed by groups without conflicts of interest related to the exposures and outcomes of the original research and its findings. According to the commenter, independence is not clearly required by the Rule, and therefore “independent” could be interpreted to require only that validators be external to the original research study team. The commenter contends that, by not clearly defining independence, the Rule creates the opportunity for groups with strong economic conflicts of interest related to environmental regulations to try to undermine scientific processes related to validation. The commenter asserts that, unless the Rule clarifies the process for the “independent validation” and who would conduct it, such “validation” may lead to an analysis of poorer scientific quality than the original study. (6373)

- The proposal does not indicate how “validation” will occur. The commenter notes that scientists familiar with these types of studies are also familiar with the protocols under which these studies are carried out and the studies are peer-reviewed, providing an independent, assessment of the studies. EPA has not identified any deficiencies with the current, time-tested approach, and thus, EPA's desire for "independent validation" is unclear how EPA believes it would be best suited to provide this validation and how this independent review is completed. (6361)
- The commenter provides that outside the context of this proposed rule, "publicly available" generally means that information is available without restriction to anyone who wants it. According to the commenter, while this level of accessibility is acceptable for most information, it becomes problematic for sensitive personal information, personal health information, or CBI. The commenter recommends that the EPA strongly consider implementing a formal request and approval process for qualified researchers to obtain access to data that is protected by confidentiality laws, rather than aiming for all data to have unrestricted access. According to the commenter, this process would still allow identifiable or fairly refined de-identified data to be re-evaluated by experts external to the EPA or the original study authors, while protecting the privacy of the study participants or businesses who created the model or dataset. (2426)
- The proposed rule is lacking in defining the boundaries of the terms used in section I. General Information, including, “ *strengthen* ,” “ *transparency* ,” “ *publicly available* ,” and “ *inform* .” The commenter encourages the EPA to revisit these terms and discuss how the public will benefit from this new proposed rule. The commenter raises the following questions regarding the ambiguous nature of the listed terms:
 - How would this new transparency initiative change things? Is the proposed rule referring to research, general science, or regulation outreach?
 - What specific things are happening now that are not considered to be transparent in nature?
 - How will resources become more publicly available? Will there be more online outreach regarding policy & regulations? Will there be additional supporting documents and resources for pivotal regulatory science research? How will this be more publicly accessible? (6910)
- The proposed rule lacks definitions as well as key implementation and operational information, including critical information about what it would cover and how it would be implemented. The commenter states the following terms need to be explained and operationalized:

- replication
- to the extent practicable
- minimizes costs
- not feasible. (5170)
- The proposal lacks definitions for many key terms. The commenter suggests, in particular, “transparency”; “data”, “singular” versus “set”; and “reasonable effort/endeavor”, be defined in relation to how much work the agency must put in before justifying the use of data that cannot be made available to the public. The commenter adds that EPA should also clarify what it considers to be “publicly available”. (9224)
- The purported need and objective of the Proposal is couched in references to “transparency” and “validation” but that these terms are not defined in the Proposal, nor do they have a single definition amongst professionals in the fields impacted by the Proposal.²¹²³ The commenter adds that the Proposal also improperly uses distinct concepts, such as “reproducibility” and “replicability,” as though they are interchangeable. (6194)
- The proposal defines “pivotal regulatory science” as “the specific scientific studies or analyses that drive the requirements and/or quantitative analysis of EPA final significant regulatory decisions.” 83 Fed. Reg. 18773 (April 30, 2018). The commenter notes that the proposal does not specify to what extent studies must support regulatory decisions to be considered a “driver,” who will determine what qualifies as pivotal regulatory science, or at what stage of the rulemaking process such determinations will be made. The commenter adds that the proposal is also unduly vague in its use of undefined terms that are subject to interpretation, such as the use of the term “uncertainty” in §30.6 of the proposed rule. 83 Fed. Reg. 18774. (6915)
- Commenter (6137) notes that the Proposed Rule defines “regulatory science” as “scientific information . . . that provide the basis for EPA final significant regulatory decisions.” 83 Fed. Reg. at 18,773. The commenter states that this definition lacks any discernible meaning. According to the commenter, there is no standard or definition for determining when scientific information does or does not “provide the basis” for a regulatory decision, nor are there any standards or definitions for what subset of “regulatory decisions” should be deemed “significant.” Likewise, the commenter notes that the Proposed Rule defines “pivotal regulatory science” as studies that “drive the requirements and/or quantitative analysis” of EPA’s action, *id.*, but the commenter notes that this too lacks any understandable meaning. The commenter states that there is no standard governing what science does or does not “drive” the regulatory action. The commenter contends that the lack of regulatory standards here means that EPA staff will impermissibly determine applicability of the rule “based upon their own unwritten personal standards.” *White v. Roughton*, 530 F.2d 750, 754 (7th Cir. 1976).

²¹²³ For a detailed explanation of this point, the commenter refers to a the separate comment letter submitted by the Emmett Environmental Law & Policy Clinic on August 7, 2018 on behalf of the President of Harvard University, the Presidents and a number of Department Chairs and Chiefs of four of the world’s foremost research and teaching hospitals (Beth Israel Deaconess Medical Center, Brigham and Women’s Hospital, Massachusetts Eye and Ear, and Massachusetts General Hospital), the Deans of Harvard’s T.H. Chan School of Public Health and Harvard Medical School, preeminent faculty at the Harvard T.H. Chan School of Public Health, the Harvard Medical School, and the Harvard School of Engineering and Applied Sciences, and numerous esteemed research and clinical doctors affiliated with Harvard and its research hospitals [hereinafter “the Harvard Letter”].

- Commenter states that, while proposed §30.2 specifies that “all terms not defined herein shall have the meaning given them in the Act or in subpart A,” the proposal nowhere says to what “Act” it is referring. The commenter states the proposal purports to implement multiple Acts administered by EPA, with different terms and definitions and court interpretations that may contradict one another. The commenter states that nowhere does the proposal square this factual and legal reality with structure of its unlawful approach, and the language in proposed §30.2. The commenter states that, in the Proposal at issue here, it is incoherent and internally inconsistent across the different statutes that EPA administers. The commenter states it also is not clear to what “subpart A” EPA is referring, because there is no citation to the Code of Federal Regulations. If this is intended to reference 40 C.F.R. Part 30, Subpart A, that Subpart was removed from the C.F.R. in 2014. See 79 Fed. Reg. 75,871; see also 80 Fed. Reg. 61,087. (6133) Similarly, one commenter states that §30.2, addressing definitions, unhelpfully provides that all undefined terms “shall have the meaning given them in the Act or in subpart A,” without identifying either the Act or subpart A. (The commenter notes that these are yet other examples of failure to notify the public of the substance and basis of the rule). (6125)

Response: Based on a consideration of this and other similar comments, the EPA clarified and modified key definitions in the supplemental notice of proposed rulemaking and final rule. The EPA considered comments received on the 2018 NPRM and 2020 SNPRM when finalizing the definitions included in the final rule.

Comment: Commenter (6360) expresses that the EPA could fundamentally improve the rulemaking through more precise definitions in both the preamble and regulatory text states that the rule’s definitions should start with grounding EPA’s rulemaking in fundamental terms. The commenter provides suggestion for definitions for what they believe are the most foundationally important terms here:

- *Science.* The study of nature as it is. Science can also refer to the collection of scientific facts and relationships between these facts. For example, biology is a branch of the study of nature that is concerned with living organisms.
- *Scientific fact.* A claim about nature that is objective and reproducible. A scientific fact must be transparent to be objective – no matter who the viewer or experimenter is, the same result of nature is observed. Objectivity is a necessary foundation for reproducibility. If a claim is not transparent enough to be objective or reproducible, it is not a scientific fact.
- *Applied Science.* The use of scientific facts to create a tool. Fields like engineering, toxicology, economics use scientific facts to construct models, cell phones, bridges, dose-response relationships, markets, and many other things that give us longer, happier, and safer lives.

According to the commenter (6360), the EPA’s rulemaking’s scope is applied science. The commenter notes that the EPA must use tools developed by the applied sciences to achieve its statutory responsibilities. Traditionally, according to the commenter, terms important to EPA’s purview such as “best available science” encompass both scientific facts and applied science constructions. The commenter asserts that choosing among different models, dose-response

relationships, or mousetraps involves judgement -- e.g., what is “available” and what is “best?” The commenter states that this judgement is independent from the question of whether a claim is a scientific fact. The commenter asserts that error is the choice to apply it where it is not useful and that the practical question is EPA’s judgement. The commenter states that using the word “judgement” for EPA’s application of science carries with it a minimum expectation of transparency in our society. We expect almost all our government decisions of judgement to be open and to be able to be observed by all citizens. The commenter asserts that trials, notice-and-comment rulemakings, permits, records of decision, and many government judgements contain opportunities for public comment and levels of transparency.

Response: Based on a consideration of this and other similar comments, the EPA clarified and modified key definitions in the supplemental notice of proposed rulemaking and final rule. The EPA considered comments received on the 2018 NPRM and 2020 SNPRM when finalizing the definitions included in the final rule.

The EPA does not find it necessary to include definitions for the terms identified by the commenter but agrees with the commenter’s general observation of the need for transparency in government decisions. The EPA believes the final rule will result in final significant regulatory actions and influential scientific information based on the highest quality studies that maximize transparency.

2.1.7.10 Proposed Rule Requirements are Based on a Fundamentally Invalid Assumption

Comment: Commenter (4589) notes that the proposed rule makes a fundamentally invalid assumption that the creation of public policy typically has been and should be based on specific studies targeted to policy application. According to the commenter, this is an unwarranted assumption because it suggests that individual studies must be policy-relevant and therefore subjected to a standard of evaluation laid down by a risk manager that is different from the study’s authors or other scientists. The commenter contends that the proposed rule appears to ignore the practical problems of conducting human epidemiologic studies, which are often of value only in retrospect, especially toxicological studies dealing with exposure-response relationships and low-dose extrapolation.

Response: As described in the preamble to the final rule, the EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA’s most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or more pollutants, contaminants, or substances are integral to the Agency’s mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. In addition, the data underlying the dose-response assessment are more distinct than the broad range of data informing an entire risk assessment. Therefore, the EPA is concentrating its current efforts to increase transparency on a well-defined step in the quantitative assessment of risk supporting specific Agency actions. This

final rule provides an important step in furthering the progress already being made toward maximizing transparency and will provide important insight for developing future statute-specific requirements.

2.1.7.11 The Process EPA Used to Develop the Notice of Proposed Regulation Lacked Transparency, and Thoroughness

Comment: Commenters (0055, 0057, 1742, 2907, 3644, 3971, 4594, 4831, 4894, 5022, 5165, 6115, 6119, 6125, 6126, 6144, 6194, 6373, 6879, 6894, 6897, 6904, 6924, 8272, 8281-PH39, 9227) express concern that the process EPA used to develop the NPRM lacked transparency and thoroughness.

Commenter (6125) asserts that the substantive concerns about inadequate justification can only be magnified by the process EPA followed in developing the proposed rule, which was anything but transparent and indicates that the proposal was not the result of reasoned consideration. The commenter notes that, even their imperfect knowledge of the speed with which this proposal was put together, and the specific steps taken to develop it, indicates a complete departure from approaches that have been used by all past EPA Administrations for developing rules, policies, and procedures that involve the assessment and use of scientific information.

Commenter (6126) provides that the Commission on Evidence-Based Policymaking, established through bipartisan legislation in 2016, recently completed a lengthy fact-finding and deliberative process, followed by the release of unanimous recommendations relevant to EPA's proposed rule.²¹²⁴ The commenter states that the commission's fact-finding process included seven public meetings, three public hearings, a *Federal Register* request for public comment, a survey of federal offices, and meetings with representatives of more than 40 organizations. According to the commenter, this thorough effort to understand the implications of using data along with the necessary protections for confidential data—which included participation from researchers, former program administrators, privacy experts, and dozens of federal agencies—demonstrates the importance of giving this regulation due consideration with extensive stakeholder feedback. The commenter contends that the commission's research process itself could serve as a valuable model for EPA in taking additional steps to develop this proposal.

Commenters (0046, 1689, 5178, 6155, 6918, 8272) suggest EPA treat the proposed rule as an ANPRM. Commenters (6155, 6918) recommend that EPA review the comments it receives on the current proposal and then issue a new or supplemental proposal with revised proposed regulatory language that reflects the full range of issues on which the Agency has sought comment.

Commenter (1689) joins others in asking EPA to withdraw this proposal and re-propose the rule after considering the many comments received, rather than proceeding to a final rule. The commenter states that EPA's request for comment "on whether the disclosure requirements applicable to dose response data and models in the proposed rule should be expanded to cover

²¹²⁴ The Commission was established by the Evidence-Based Policymaking Commission Act of 2016 (P.L. 114-140), jointly sponsored by Speaker Paul Ryan (R-WI) and Senator Patty Murray (D-WA). The full fact-finding and input process used by the commission is described in their final report: CEP, 2017.

other types of data and information, such as for example economic and environmental impact data and models that are designed to predict the costs, benefits, market impacts and/or environmental effects of specific regulatory interventions on complex economic or environmental systems "is more like an ANPRM than a proposed rule. The commenter suggests that EPA treat the Proposed Rule as an ANPRM, and that EPA review the comments it receives on the current proposal, then issue a new or supplemental proposal with revised proposed regulatory language that reflects the full range of issues on which the Agency has sought comment.

Commenters (5178, 8272) urge EPA to undertake a more thorough process to identify if problems with data transparency exist that impede health protections, including by issuing an ANPRM and requesting a study by the National Academies. The commenters state that, if a problem is identified, EPA should then issue a proposed rule that includes a full analysis of costs and benefits.

Commenter (6918) suggests that, because the Proposed Rule identifies a number of open questions, many of which address core issues, EPA should evaluate and reach decisions on before issuing a new or supplemental proposed rule. The commenter states that the ANPRM approach would allow the Agency to address some lack of clarity in the language of the proposal.

Commenter (6918) expresses that, given the breadth of the request for comments in the preamble as compared to the proposed regulatory language, they suggest EPA consider treating the Proposed Rule as an ANPRM. The commenter recommends that EPA review the comments it receives on the current proposal and then issue a new or supplemental proposal with revised proposed regulatory language that reflects the full range of issues on which the Agency has sought comment. The commenter notes that the Proposed Rule identifies a number of open questions, many of which address core issues that EPA should evaluate and reach decisions on before issuing a new or supplemental proposed rule.

Commenter (6918) asserts that the ANPRM approach would allow the Agency to address some lack of clarity in the language of the Proposed Rule. For example, the commenter states that the heading of proposed 40 C.F.R. §30.7, "What role does independent peer review in this section?" seems to be missing a verb. See 83 Fed. Reg. at 18774. In addition, the commenter provides that some of the citations in the authority section of the proposed rule text, *id.* at 18773, appear incorrect. The commenter expresses that Section 115 of CERCLA is codified at 42 U.S.C. § 9615, not at 42 U.S.C. § 9616, as indicated in the proposed regulatory language; Section 7009 of the RCRA (or the Solid Waste Disposal Act), 42 U.S.C. § 6979, concerns labor standards; Section 8001 of that act, 42 U.S.C. § 6981, which concerns "Research, demonstration, training and other activities," would appear to be a more appropriate citation as providing authority for the Proposed Rule.

Response: Based on a consideration of these and other similar comments, the EPA issued a SNPRM in 2020, which included clarifications, modifications, and additions to certain provisions proposed in the 2018 NPRM and allowing for additional public comment. Public comments received on both the 2018 NPRM and the 2020 SNPRM were considered in the

development of the final rule. In addition, as detailed in the preamble to the final rule, the EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or more pollutants, contaminants, or substances are integral to the Agency's mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. In addition, the data underlying the dose-response assessment are more distinct than the broad range of data informing an entire risk assessment. Therefore, the EPA is concentrating its current efforts to increase transparency on a well-defined step in the quantitative assessment of risk supporting specific Agency actions. This final rule provides an important step in furthering the progress already being made toward maximizing transparency and will provide important insight for developing future statute-specific requirements. In addition, the EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule.

Commenter (9227) provides that Executive Order 12866 requires "an assessment of the potential costs and benefits of the regulatory action" in addition to other analyses.²¹²⁵ As indicated above, the commenter states that the Proposal gives scant consideration to the costs of the proposed action.

Commenter (6126) notes that reports that EPA did not follow the agency's own internal guidance for development of regulations through the Action Development Process (ADP) are alarming.²¹²⁶ As the ADP states, the commenter provides that the guidance helps to "ensure that Agency actions are of consistently high quality, involve senior managers early in the development process, are supported with strong analysis, and are developed via an open process."²¹²⁷ According to the commenter, failure to engage in thoughtful policy discussion with EPA's career senior leaders likely resulted in a less well-developed and lower-quality proposed regulation than the agency could have otherwise put forward for public debate. Altogether, the commenter states that there is an irony in EPA's rationale that the proposed rule is intended to promote transparency while the very process used to develop the regulation lacked transparency and engagement.

²¹²⁷ Environmental Protection Agency (EPA). (2011). EPA's Action Development Process: Guidance for EPA Staff on Developing Quality Actions. Washington, D.C.: EPA. Available at: [https://yosemite.epa.gov/sab%5CSABPRODUCT.NSF/5088B3878A90053E8525788E005EC8D8/\\$File/adp03-00-11.pdf](https://yosemite.epa.gov/sab%5CSABPRODUCT.NSF/5088B3878A90053E8525788E005EC8D8/$File/adp03-00-11.pdf).

Commenter (8272) asserts that the EPA's process for promulgating this rule represents a gross deviation from the agency's typical action development process. The commenter expresses that the EPA failed to perform an appropriate regulatory impact analysis, despite indications that implementation costs could be substantial.²¹²⁸ The commenter adds that the EPA does not appear to have met with outside groups during the development process, or with its SAB, which states that the rule "deals with a myriad of scientific issues for which the Agency should seek expert advice from the Science Advisory Board."²¹²⁹ Taken together, the commenter states that these deviations from typical process leave EPA unable to consider its proposal accurately, and constitute an arbitrary and capricious approach to rulemaking.

Response: Public input was an important part of shaping the final rulemaking. The EPA accepted public comment on the proposed rule from April 30, 2018 to August 16, 2018, and held a public hearing on July 17, 2018. In response to public comments, the EPA released a supplemental notice of proposed rulemaking and took public comment from March 18, 2020 to May 18, 2020. All of these comments were considered in developing the final rule.

The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs or benefits of the proposed action. As discussed in the preamble to the final rule, this is a rule of internal procedure promulgated under the EPA's housekeeping authority and a benefit-cost analysis is not required. However, the EPA has included a discussion of costs and benefits in the preamble of the final rule.

Briefly, the EPA will continue its current practice of conducting extensive review of scientific studies during the development of significant regulatory actions and influential scientific information. The additional procedures required by this rule only apply to pivotal science, which is a subset of the total number of studies that the EPA would evaluate. Given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small. The Agency may also incur other administrative costs to perform analyses and evaluations to support activities such as exemption decisions made by the Administrator, and documenting these or other decisions made pursuant to the requirements of the final rule. Again, the Agency anticipates that the incremental costs for these activities will be small relative to current administrative costs for developing significant regulatory actions or influential scientific information. Finally, this final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other

²¹²⁹ EPA Science Advisory Board. (2018). Memorandum: Preparations for Chartered Science Advisory Board (SAB) Discussions of Proposed Rule: Strengthening Transparency in Regulatory Science RIN (2080-AA14). Accessed May 23, 2018 at [https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/\\$File/WkGrp_memo_2080-AA14_final_05132018.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/$File/WkGrp_memo_2080-AA14_final_05132018.pdf)

party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

The EPA also agrees that the benefits of the rule were not fully characterized in the 2018 proposed rule or the 2020 SNPRM. The EPA emphasizes, however, that this is a rule of internal procedure promulgated under the EPA's housekeeping authority. As discussed in Section III.A.1, the main benefits of this rule spring from greater transparency in significant regulatory actions and influential scientific information. By placing greater emphasis on the availability of dose-response data underlying pivotal science, the rule will allow for greater scientific scrutiny as EPA decision makers are developing significant regulatory actions and influential scientific information and increases the likelihood that any errors will be identified and corrected. Greater transparency is also inherently valuable as a principle of good government and provides benefits to the public at large, including reducing the risk of errors in EPA analyses and in the science such analyses rely upon. The ability for independent subject matter experts to validate pivotal science will facilitate more effective comment and engagement with the public during development of future significant regulatory actions and influential scientific information.

This action did not trigger the PRA; because it does not contain any information collection activities, it does not impose an information collection burden. Comments related to the deliberative interagency review process are outside the scope of this rulemaking.

Comment: Commenter (6879) cites *Pruitt's Utterly Opaque 'Transparency' Proposal*, " by Professor Daniel Farber (April 26, 2018)²¹³⁰:

This proposal raises a host of legal and policy issues ... I wanted to kick off the conversation with a basic legal point: the document fails to meet the fundamental legal requirements for a valid rulemaking proposal. It is vague as to the actual parameters of the proposal, open-ended in terms of the alternatives under consideration, and utterly lacks the data transparency it purports to advocate. Any rule issued on the basis of this notice will be invalid, quite apart from its merits. ...

Really, the agency might just as well have said: 'We want to do something about data transparency. Just spit balling, folks, but here's one idea. We're also open to doing something completely different. Let's just bat this around and see what we come up with.' That might be fine for a brainstorming session over a few beers. But it's not what the courts expect from a notice of proposed rulemaking.

Response: Based on a consideration of these and other similar comments, the EPA issued a SNPRM in 2020, which included clarifications, modifications, and additions to certain provisions proposed in the 2018 NPRM and allowing for additional public comment. Public comments received on both the 2018 NPRM and the 2020 SNPRM were considered in the development of the final rule. As detailed in the preamble to the final rule, the rule requirements

²¹³⁰ Available at <http://legal-planet.org/2018/04/26/pruitts-utterly-opaque-transparency-proposal/> [Includes cited article as attachment to comment letter]

provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

2.1.7.12 EPA's Proposed Data Transparency Regulation Can Be Substantially Improved to Promote the Rule's Stated Goal, But Substantial Modifications Will Be Needed

Comment: Commenter (6126) states that the preamble to EPA's proposed data transparency regulation indicates that the purpose is to "strengthen the transparency of EPA regulatory science." The commenter notes that their assessment of the proposed regulatory text is that this goal cannot currently be achieved based on the information provided in the Notice of Proposed Rulemaking in conjunction with the current EPA organizational infrastructure. The commenter contends that the proposed rule is vague in ways that make some details of its likely implementation difficult to understand in the absence of further elaboration or subsequent implementation guidance. Based on the issues EPA solicits comment on, the commenter (BPC) offers 10 areas for consideration about how to improve the proposed rule consistent with the principles of evidence-based policymaking,²¹³¹ while also setting an expectation about responsible and reasonable implementation of an effort that encourages science transparency while protecting the confidentiality of data subjects. The commenter states that their comments on the proposal identify select areas for improvement or concern and are not intended to be comprehensive of all aspects of the rulemaking that may need modification.

Response: Based on a consideration of these and other similar comments, the EPA issued a SNPRM in 2020, which included clarifications, modifications, and additions to certain provisions proposed in the 2018 NPRM and allowing for additional public comment. Public comments received on both the 2018 NPRM and the 2020 SNPRM were considered in the development of the final rule. As detailed in the preamble to the final rule, the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings. The EPA also intends to develop internal implementing guidance and promulgate either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule, which will clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

²¹³¹ See CEP, 2017.

2.1.8 Other Effects/Impacts

2.1.8.1 Openness and Transparency Improvements Will Take Time and Needs to Be Developed to Benefit and Not Harm Research

Comment: Commenter (6873) states that everyone in science acknowledges there is room for improvement when it comes to openness and transparency, which is why the systems for handling transparency and fact-checking communication (peer review, journal publishing, conferences, replicability, statistical analysis, etc.) are slowly changing for the better. The commenter notes that perhaps where the conflation comes in about secrecy is that, at the study level, there is a tolerance of and even need for certain research practices that are not entirely open (including but not limited to the privacy concerns mentioned above. The commenter asserts that this will continue to be a reality even as science becomes more open—there will be a continued need to preserve the research and development (R&D) incentives of drug companies by keeping certain data private, for instance, and to recognize that researchers want to avoid being scooped (to preserve their job security and future funding) by releasing their data too soon.

Commenter (6873) adds that, overall, the global research community is working hard to make the transformation to more openness and transparency but it's a long way from getting there and they are only at the starting edge of discussing how some of these changes will be able to happen (especially with regard to open data). The commenter notes that animating concern in this global push for transparency and openness is to benefit science and society. Along the way, though, the commenter states that there is a need to be careful to ensure that the openness and transparency improvements we make end up benefitting research and not harming it.

Response: The EPA agrees that transparency and openness are benefits to science and society. The EPA also agrees that this rulemaking augments other important transparency initiatives occurring both inside and outside of the federal government.

2.1.8.2 Limits on the Use of Scientific Evidence by EPA

Comment: Commenters (0040, 0043, 0055, 0057, 0061, 0064, 0566, 0569, 0670, 1011, 1012, 1170, 1358, 1433, 1796, 1822, 1943, 1994, 1997, 2170, 2171, 2259, 2336, 2353, 2361, 2428, 2429, 2431, 2479, 2495, 2548, 2907, 2908, 3131, 3132, 4410, 4542, 4588, 4590, 4591, 4595, 4596, 4597, 4840, 4842, 4844, 4877, 4878, 5011, 5129, 5165, 5170, 5172, 5173, 5176, 5178, 5184, 5977, 6046, 6103, 6108, 6110, 6111, 6114, 6119, 6121, 6123, 6125, 6127, 6130, 6131, 6133, 6137, 6142, 6144, 6145, 6152, 6153, 6156, 6157, 6158, 6159, 6166, 6168, 6170, 6171, 6173, 6188, 6194, 6351, 6355, 6357, 6373, 6378, 6426, 6447, 6450, 6464, 6872, 6874, 6877, 6879, 6880, 6882, 6884, 6893, 6894, 6896, 6897, 6904, 6909, 6915, 6919, 6920, 6924, 6932, 6941, 6955, 8272, 8275, 8317, 9227) oppose the limits on the use of scientific information/best available science. Commenter (6125) asserts that, without the information provided in excluded research studies it would no longer be possible to assess the full weight of the available scientific evidence – a key guiding principle for judging the scientific integrity of the decision-making process. Comments include:

- The proposal could result in unprecedented limits on the use of scientific evidence by EPA. The commenter notes that these limits in turn will shape the development of evidence-based public health policies, including air pollution standards, drinking water regulations, pesticide tolerances, worker protections, and more. (0566)
- The proposed rulemaking jeopardizes the integrity of the science that the EPA relies upon. (1012)
- The promulgation of this proposed rule would set a dangerous and potentially life-threatening precedent regarding the use of health-based data, modeling, and research in regulatory decision-making. (4410)
- Studies will have difficulty being approved by the IRB if raw patient data must be made public. (4844)
- If EPA's rule takes effect, it could introduce selection bias that may slow studies and alter results and thereby affect regulatory decisions. (4878)
- Commenter asserts that they depend on the science the EPA uses to protect their health and the health of their family and community. The commenter notes that the proposed rule, which would place unprecedented limits on the use of science at the EPA, would prevent the agency from using the most strongly scrutinized peer-reviewed science. (5129)
- Commenter states that multiple aspects of the proposed rule will be costly, including its demand to make data publicly available and its metrics of high-quality studies that cover a broad range of models and doses. The commenter states that costs such as these not only eat up scarce resources, but they also lead to selection biases regarding which studies EPA will include in risk analysis. The commenter states that smaller organizations will likely lack the financial resources both to support such comprehensive studies and to make their data publicly available, so their studies may be excluded. The commenter states that, alternatively, if EPA is covering part of the cost of making data public, it may choose fewer, more general studies to include in its analyses. (6168)
- Denying the EPA the ability to use studies without making all the data public would seem to cripple the standard-setting process with no actual gain. (5170)
- The proposal would dramatically limit the human health studies the EPA can use to support development of health-protective regulations, eliminating critically important research from the policy-making process. (5172)
- By disallowing EPA researchers and analysts the use of study data which are not published, the non-published study data, regardless of their quality and applicability, will not be used or discussed by EPA, thus hiding their existence from the public. Thus, according to the commenter, the public is less informed about the spectrum of data and a thorough critical weight of evidence evaluation cannot be conducted. (6046)
- The Proposal may have the unintended consequence of excluding sound, peer-reviewed science in the rulemaking process. (6108)
- Although the proposed rule may be striving to improve regulatory science, they fear that it could be a case in which the "best is the enemy of the good. The commenter contends that the EPA cannot let their pursuit of "perfect science' lead them to disregard good scientific studies. The commenter suggests that, just as scientists cannot pick and choose the data they use for analysis, it is imperative that EPA use all available scientific studies to formulate its decisions. The EPA should not ignore existing data. (6110)

- State and tribal environmental agencies rely on the EPA to provide accurate scientific information. The commenters contend that the proposed rule would slow the EPA's work to a near standstill or leave it open to criticism in terms of credibility, leaving states with data gaps that they cannot fill. (6114, 6131, 6361)
- The implementation of the proposed rule would undermine the ability of the Agency to use the best available science to protect public health and the environment. The commenter adds that the proposal will not improve the use of science at EPA, but instead would restrict the types of science the Agency may use in regulatory decision-making. (6166)
- Many academic scientists whose research is relevant to EPA regulations may not conduct and report their studies in a way that satisfies the requirements of the proposed rule. The commenter adds that the proposed rule's provisions would require significant additional resources and could impose unreasonable and impractical requirements beyond those included in current protocols. The commenter notes that academic researchers, who often study sensitive and relevant health effects that are not evaluated in industry-sponsored GLP studies, typically focus on publishing their studies in peer-reviewed journals and obtaining research funding; they may not be concerned about or even consider whether their studies would qualify for use in establishing EPA regulations, and/or may not have the resources to reshape their approach to maintaining data. Additionally, according to the commenter, many researchers, particularly in other nations but also in the United States, may not even be aware of EPA requirements for a study's use in regulations. (6915)

Commenters (0043, 5176, 6880) object to the proposed rule because it would weaken science by rejecting a century of scientific and medical knowledge and progress. Comments include:

- The proposed rule will weaken science by drawing a line in the sand that effectively disregards scientific discoveries prior to the first part of the 21st century when the importance of open data started to be increasingly recognized. The commenter states that the EPA proposal would throw out the mass of accumulated scientific evidence from the past, when open practices were not customary – and indeed often not practical before computers for big data were available. The commenter adds that most studies that would be relevant to EPA take years to do, and even longer to filter through to affect policy. The commenter states that recognition, for instance, of the dangers of asbestos, took years because the impacts on health were not immediate. The commenter states that work demonstrating the connection occurred many years ago and the data are not openly available, yet the EPA's proposed rule would imply that it could be disregarded. The commenter states that, similarly, open data demonstrating the impact of lead in paint or exhaust fumes, or of pesticides such as DDT are not available: does this mean that manufacturers would be free to reintroduce these? (0043)
- The proposed rule, if applied retroactively, would prohibit the EPA from considering studies completed prior to the effective date of the rule for which the data are not publicly available. The commenter states that this entails rejecting the contributions of thousands of individuals who—for the benefit of future generations and to advance the public good—agreed to take part in research. The commenter states that many important public health and environmental studies have taken place after one-time events and natural disasters and replicating these studies would be ethically impossible, as doing so would

require intentionally exposing people to harmful contaminants or recreating one-time public health disasters. The commenter states that disqualifying such studies, as the rule proposes to do, means losing valuable public health knowledge, for instance, on the effects of environmental pollutants on human health. (5176)

- Commenter (6880) suggests the rule would apply its restrictions to any scientific study conducted before or after the rule is promulgated. The commenter states that, since most science conducted prior to the Internet age would likely fall short of the rule's transparency standard, the proposed rule would essentially throw out a century (and more) of scientific and medical knowledge and progress. The commenter states that this certainly contradicts the stated purpose of the proposal in the preamble, which is that the proposal will "help ensure that EPA is pursuing its mission of protecting human health and the environment."

Response: The EPA considered these and other similar comments when developing the final rule. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider the availability of underlying dose-response data when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation. By placing greater emphasis on the availability of dose-response data underlying pivotal science, the rule will allow for greater scientific scrutiny as EPA decision makers are developing significant regulatory actions and influential scientific information and increases the likelihood that any errors will be identified and corrected. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations. This approach will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers. The EPA does not believe that this final approach will lead to bias towards any party.

The EPA intends for the final rule to be implemented in a transparent manner. The final rule requires the EPA to document critical assumptions and methods used in its dose-response assessment, studies considered pivotal science, the rationale for the level of consideration for studies in the significant regulatory action or influential scientific information, and any Administrator exemption in the significant regulatory action or influential scientific information. Additionally, the EPA expects to identify pivotal science in proposed significant regulatory actions or external review drafts of influential scientific information, which will allow the public, if they so choose, to independently validate the pivotal science and provide comment to the EPA.

2.1.8.3 Research Will Not be Pursued or Will Be of Less Value

Comment: Commenters (1012, 2336, 2431, 4594, 4840, 4844, 4878, 5170, 5418, 6114, 6121, 6131, 6132, 6145, 6152, 6188, 6361, 6373, 6877, 6894, 6909, 6924, 6937, 8274, 9227) express concern that the Proposal will result in research not being pursued and/or it would be of less value. Comments include:

- It is likely that fewer scientists or research institutions will want to participate in EPA funded research if they are concerned that the personal health information, they collect may have to be publicly disclosed. The commenter adds that scientists and researchers may also find it difficult to recruit participants for long-term, large-scale studies that are needed to understand air and water quality issues if the participants are concerned that their medical records may be made publicly available. (1012)
- To satisfy a blanket disclosure requirement, a blanket redaction will become necessary. The commenter states that the resulting increase in costs will substantially reduce the number of future studies that can be conducted under a given level of spending. (2336)
- Individuals may be dissuaded from participating in new studies if privacy information commitments are not assured, and the quality of future science would suffer. (2431)
- The proposed rule could force scientists to disclose the health records of the families and children who suffer from asthma or are sickened by polluted water or to not conduct scientific studies at all. (2909)
- A failure to protect privacy data will hinder future scientific investigations as people will refuse to participate in research studies if they are not confident that their most personal information is protected. (4594)
- The proposal will impose costs and impediments that will discourage scientists from undertaking studies of great importance. (4840)
- In terms of future studies, researchers may have difficulty recruiting participants if they fear that their confidential information will be made public. (4844)
- Persons willing to participate in studies may be different as a result of the proposal in ways we cannot currently predict or describe, which could introduce confounding variables and bias that may question the study's results. (4878)
- If the proposed rule were to be implemented as currently written, it is highly likely that fewer scientists or research institutions will participate in EPA funded research because of concerns that the personal health information collected as part of research may have to be publicly disclosed. Consequently, the commenter suggests that researchers will find it difficult to recruit participants for long-term, large-scale studies that are needed to understand the health impacts of environmental quality issues as few participants are willing to have their medical records made public. (5170)
- Without the ability to protect and respect patient/human subject privacy and confidentiality, signatories and other researchers would not be able to conduct the studies that are pivotal to their work and to EPA's ability to fulfill its statutory duty to protect public health. (5418)
- While the language of the proposed rule would allow personal data to be redacted, it would also allow that data to be unredacted by the EPA Administrator. The commenters state that no information is given about how the Administrator would reach this kind of decision. Therefore, the commenters believe that participants from academia, industry,

and members of the public would likely be hesitant to participate in studies, not knowing if or when confidential information could be released. (6114, 6131, 6361)

- The proposal will damage the ability of researchers to conduct future studies. The commenter suggests that researchers' ability to recruit potential research participants will be severely undermined if they fear that their personal information may be made available for public scrutiny. The commenter notes that this is particularly true for vulnerable communities that are both disproportionately exposed to hazardous chemicals and have historical reasons to distrust researchers. (6121)
- The proposal could result in lost publications (loss of intellectual property) and academic career derailment. The commenter adds that, when people no longer wish to enroll for fear their medical data will be released, new scientific studies could be inhibited, thereby damaging future scientific research. (6132)
- Commenter suggests that the release of data underlying scientific studies will limit the level of participation in future studies. (6145)
- Concerned that the proposal would undermine the quality of science that EPA uses to promulgate regulations. (6152)
- The proposed rule would impede the development and utilization of new science. (6894)
- Proposed rule has the potential to have significant negative impacts on the conduct of human health research in the United States. The commenter states that privacy concerns may begin to influence what science gets done and what does not. The commenter states that lines of scientific inquiry that would have been pursued may not be. The commenter states that the quality of data that is obtained may be poorer than it otherwise would have been. (6909)
- The rule's emphasis on publicly available data would have the perverse effect of discouraging individual participation in scientific studies due to personal privacy concerns. The commenter notes that potential study subjects, uncertain about EPA's willingness or ability to protect their identities and sensitive health information, would be more likely to be hesitant about participating in any study that could inform an EPA regulation. As a result, the commenter states that researchers could face increased difficulty in attracting subjects for crucial studies, reducing the availability of scientific information upon which to base EPA's decisions. The commenter contends that studies upon which EPA would be forced to rely could be less rigorous and trustworthy; the fact that a study's underlying data is publicly available has no bearing on the quality of the data or the study, and ground-breaking research on the health and environmental effects of pollution often relies upon the very kinds of highly sensitive data that would be most likely to be excluded from EPA review if the Proposed Rule were to be implemented. (6188)
- If EPA requires the distribution of identifiable data (*i.e.*, individual data elements such as date of admission and residential zip code, a combination of which can identify a person), participants would have to sign agreements allowing the release of their private information and, as a result, they may decline to participate. According to the commenter, resulting impacts on participation rates could greatly increase the cost of studies and in the worst case, render research inconclusive because of a lack of representation. The commenter notes that researchers may have to redesign studies in a way that would reduce invasion of privacy, which could affect the accuracy or nuance achievable in a study, or account for the time and expense necessary to redact private information. The

commenter contends that both of these consequences could damper studies' ability to answer critical research questions. (6373)

- Public health research, specifically observational cohort studies, can't be conducted without the cooperation and trust of study participants. Knowledge that their private data may be released to the public may severely impact the information study participants are willing to share. This in turn will compromise the quality of the research I and other public health researchers can conduct. There could be spillover effects from this proposed rule into other research studies that won't necessarily be considered for regulatory purposes, also compromising the quality of those studies. (6378)
- New studies may be discouraged for privacy and/or cost considerations. The commenter explains that the need to provide data will make it harder to obtain consent from subjects worried about personal identification and that it is possible that even very expensive measures such as use of the Federal Research Data Centers may not be adequate to maintain adequate privacy. The commenter adds that, with the stringent data requirements, and the increased concern about privacy, it is likely that the costs of compliant research would go up and that this may discourage researchers from undertaking future studies. (6877)
- Commenter is concerned that researchers would choose not to pursue research with human subjects, stifling scientific discovery; or that they will forgo compliance with the EPA proposed rule to obtain IRB approval and their research will be ignored by EPA because: (1) the researcher would have to make participant data publicly available and would not be able to ensure privacy/confidentiality; and (2) the researcher would have no control over how data they make publicly available would be used—it could very well be used in a way that adversely impacts research subjects through privacy invasions or weakening of protections that safeguard communities. (6924)
- Under the proposed regulation, there will be pressure to submit protected data to third party partners, federally sanctioned privately managed data centers, and/or federal repositories. The commenter notes that this will be a Catch-22 for researchers. The commenter provides that the researcher's choice will be to submit data to unproven or untrusted repositories, risking catastrophic release or misuse – or to not participate at all in research and grants that touch on policy-relevant issues. (6937)
- Communities with lower socioeconomic status have been shown to be underrepresented in studies for various reasons. The commenter adds that restriction of evidence based upon data that is reliant on public access will certainly further confound this matter in these communities. The commenter notes that when community members are fearful that identification could lead to job loss or other negative personal impacts they are much less likely to participate in studies that examine personal health and environmental impacts linked to an employer.^{2132,2133} The commenter suggests that trust of confidentiality of and restriction to data accessibility increases study representation by reducing the exposure risk factors based upon individual identity. The commenter contends that restricting

²¹³² Sprague Martinez, L., Freeman, E., & Winkfield, K. (2017). Perceptions of Cancer Care and Clinical Trials in the Black Community: Implications for Care Coordination Between Oncology and Primary Care Teams. *Oncologist*, 22(9), 1094-1101.

²¹³³ Bonevski B, Randell M, Paul C, et al. Reaching the hard-to-reach: a systematic review of strategies for improving health and medical research with socially disadvantaged groups. *BMC Medical Research Methodology*. 2014;14:42. doi:10.1186/1471-2288-14-42.

representation of communities that would result from these data accessibility issues leads to bias in a study's evidence by misrepresenting the community group that is being studied. (8274)

- Commenter (2478) expresses that the extent to which efforts to "strengthen transparency in regulatory science" would have led to a reduction in sponsored research into climate science, the EPA should have the burden of proving that this proposed rule was not designed to prejudice any particular area of scientific inquiry germane to the charge of the EPA. In other words, the commenter states that the EPA should have to demonstrate that this proposed rulemaking is not a pretext to de-prioritize research into climate science.
- Commenter (9227) states that the proposed rule does not disclose the cost—highlighted on the very first page of a NAS report on data access—that “perceived risks to privacy and confidentiality reduce survey participation,” a cost that the NAS explains is “borne out by research.”²¹³⁴ The commenter notes that NAS explains that this “threatens the research enterprise itself, because concerns about privacy and confidentiality are among the reasons often given by potential respondents for refusing to participate in surveys, and those concerns have been shown to affect behavior as well.”²¹³⁵ The commenter adds that the NAS panel emphasized: “Any confidentiality breach that became known would be likely to heighten such concerns and, correspondingly, reduce survey response rates. Efforts to increase researchers’ access to data must, therefore, take into account the need to avoid increasing the actual and perceived risks of confidentiality breaches.”²¹³⁶

The commenter (9227) provides that this confidentiality risk has a further cost: it affects the quality of the data collected. As the NAS explained:

The reason for confidentiality pledges and for stringent procedures to prevent disclosure is that they improve the quality of data collected from individuals, households, and firms. It is essential that respondents believe they can provide accurate, complete information without any fear that the information will be disclosed inappropriately. Indeed, if the information was disclosed, harm might come to an individual respondent.²¹³⁷

The commenter (9227) asserts that the proposal's only acknowledgment of this complex problem and cost is its statement that “EPA believes that concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions commonly in use across some parts of the Federal government.”²¹³⁸ Remarkably, the commenter adds that the EPA does not cite a single example of these common solutions, citing only vaguely to “examples from the U.S. Department of Health and Human Services, National Institute of Standards and Technology, U.S. Department of Education, and the U.S. Census Bureau” and some

²¹³⁴ National Research Council, *Expanding Access to Research Data: Reconciling Risks and Opportunities*, vii (National Academies Press (2005)).

²¹³⁵ *Id.* at 51; see also *id.* at 52-54 (describing the research supporting this risk).

²¹³⁶ *Id.* at 51.

²¹³⁷ *Id.*

²¹³⁸ 83 Fed. Reg. at 18,770.

hyperlinks not in the Proposal added to the docket almost a month into the comment period.²¹³⁹ Accordingly, the commenter states that, not only does the Proposal include no analysis of these alleged solutions and their costs and benefits, it does not even explain what the solutions are that EPA believes address this concern.

Response: The EPA considered these comments when finalizing this rulemaking, and the EPA does not believe the final rule will result in research not being pursued and/or research having less value. The provisions of this rulemaking are not restricted to any particular scientific discipline, but apply to all pivotal science used in significant regulatory actions and influential scientific information. As discussed in the final rule, underlying data or models are considered available if they can be accessed through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

2.1.8.4 Competitive Nature of Scientific Funding

Comment: Commenter (1170) expresses that the proposed rule is that it also ignores the intrinsically competitive nature of scientific funding, which means that even when there is no legal barrier to making data public, groups are strongly incentivized to keep some data non-public at least in the short term, so that they may carry out further analysis. The commenter notes that this is particularly true of data that takes months or years to obtain.

Response: The EPA considered this comment and similar comments when finalizing this rulemaking. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. The EPA would also like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to establish data

²¹³⁹ Id.

sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

2.1.8.5 Proposal Would Result in Fundamental Changes in the Use of Scientific Data and Research

Comment: Commenter (5170) states that the proposed rule would result in fundamental changes in the use of scientific data and research by the EPA, which they note is one of the most significant users of scientific data in the federal government. The commenter adds that there is a great deal at stake, in human health, lives and economic benefits and costs in such a significant change to the use of science as is being proposed in this rule and should, therefore, have a compelling, demonstrated need.

Response: The EPA considered this and other similar comments when developing the final rule and believes the approach used in the final rule will result in final significant regulatory actions and influential scientific information based on the highest quality studies that maximize transparency. The final rule also clarifies how the EPA will consider studies when developing final significant regulatory actions and influential scientific information. As more fully described in the preamble to the final rule, the EPA will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider the availability of underlying dose-response data when evaluating pivotal science and give greater consideration to pivotal science where the underlying dose-response data are available for independent validation. The rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

2.1.8.6 Benefits of Environmental Protection Standards

Comment: Commenters (0017, 1331, 1424, 5120) suggest the economic benefits of environmental rules are greater than the implementation costs. Commenter (1331) asserts the public health costs of its implementation severely outweigh its benefits.

Commenter (0017) states the proposal will have a tremendous negative impact on the U.S. economy. The commenter states that, according to a 2011 EPA study, the estimated annual economic benefits of air quality improvements are estimated to be nearly \$2.0 trillion in 2020 if they were to be fully implemented as laid out under the CAA. The commenter states that, in comparison, the cost of this benefit due to regulatory compliance actions would be approximately \$65 billion. The commenter states that the EPA report estimates that the economic benefits of clean air to human health and environmental improvement exceed the costs by more than 30 to one.

Commenter (1424) states that all cost-effective studies show that protective environmental regulations save money, as they save billions in health care costs caused by toxic chemicals that

cause cancer (PCBs), neurological deficits (lead), lung disease (PM_{2.5}) and others. Commenter (5120) states that air quality legislation, culminating in amendments to the CAA in 1990, has produced an estimated \$59-140 billion in health savings.²¹⁴⁰

Response: This rule sets the overarching structure and principles for transparency of pivotal science in significant regulatory actions and influential scientific information. The final rule provides that if implementing the rule results in any conflict between this rule and the environmental statutes that the EPA administers, and their implementing regulations, this rule will yield and the statutes and regulations will be controlling. This is a rule of internal procedure promulgated under the EPA's housekeeping authority. This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. Additionally, this rule does not require the EPA or other parties to disclose or host data. Hence, this rule does not impose costs on the EPA or any other party to make such data available. The EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small. As discussed in the preamble to the final rule, the main benefits of this rule spring from greater transparency in significant regulatory actions and influential scientific information. By placing greater emphasis on the availability of dose-response data underlying pivotal science, the rule will allow for greater scientific scrutiny as EPA decision makers are developing significant regulatory actions and influential scientific information and increases the likelihood that any errors will be identified and corrected. Greater transparency is also inherently valuable as a principle of good government and provides benefits to the public at large, including reducing the risk of errors in EPA analyses and in the science such analyses rely upon. The ability for independent subject matter experts to validate pivotal science will facilitate more effective comment and engagement with the public during development of future significant regulatory actions and influential scientific information.

2.1.8.7 Proposed Rule Could Further Delay Development and Update of Toxicity Values/Reference Values/Guidelines/Policies/Rules

Comment: Commenters (0476, 2171, 5977, 6119, 6127, 6130, 6142, 6168, 6446, 6872, 6881, 6905, 6935, 6941, 8272) object to the proposal because it could delay needed federal action, development of protective standards, and development/update of toxicity values or reference values. Comments include the following:

- Properly implementing this rule will require EPA to first address many legal aspects surrounding public and nonpublic data, significantly expand database tools and peer review capacity, and develop guidelines for the use of "independent validation" -- all of which require considerable time and financial resources. The commenter states that, as a result, the proposed rule will delay the adoption of human health-based pollution standards for the foreseeable future. (2171)
- The proposal could further delay development and update of toxicity values or reference values published in the CERCLA, TSCA, CWA, SDWA and other federal acts authorized by EPA. The commenter provides that states, EPA and the public are already

²¹⁴⁰ Ross, K., J.F. Chmiel, and T. Ferko I, The impact of the Clean Air Act. J Pediatr, 2012. 161(5): p. 781-6.

struggling to respond to emerging contaminants for which toxicity values and risk-based standards have yet to be developed. There are currently more than 129 million organic and inorganic substances identified with a chemical abstracts service number in the open scientific literature. Yet, the commenter notes that only a handful have been studied and even fewer with “*dose response data and models*” (reference values (reference dose and/or reference concentrations)) used for “*pivotal regulatory science*” as noted in the proposed rule. The commenter contends that unnecessarily restricting the data currently in practice or potentially used for regulatory development would do little to rectify the situation in a timely or “transparent” manner. (6119)

- The added administrative barriers resulting from the proposed rule are likely to significantly delay the development of EPA guidelines and policies. The commenter adds that such delays are expected due to decreased access to industry claimed CBI, exclusion of relevant peer reviewed scientific studies, and the need for researchers to prepare publicly disclosable datasets. (6130)
- The proposed rule, if adopted, would inevitably delay setting protective standards through prolonged evaluation of the sufficiency of the public availability of research data and methods, rather than evaluation of the actual quality and import of scientific research. The commenter adds that the fact that the public would be able to de-anonymize much epidemiological data, after de-identification processes have been applied, would almost certainly have a chilling effect on voluntary public participation in important research, and would also prevent EPA from relying on the “best available science” in carrying out its work. (6446)
- Overly prescriptive and poorly defined list of modeling approaches will not either decrease or illuminate uncertainty and will not provide the basis for the specific decisions that confront the Agency; they are merely a recipe for obfuscation and delay. (6881)
- Commenter suggests EPA consider the impact of this proposed process on the pace of regulatory action and ensure the proper balance is struck between the potential value of independent validation—which could take substantial time and, if so, be at odds with statutory requirements—and the certainty and efficiency of regulatory decision making. The commenter states that, for example, if new transparency requirements cause delays in implementation of statutory provisions that cause statutory deadlines to be missed, then consequences can include deadline suits. (6935)
- Commenter is concerned that excluding data that cannot be made publicly available would slow the development and implementation of test methods and strategies to replace animal testing. The commenter states that such alternative methods and strategies can provide information of equivalent or better scientific quality and relevance for assessing risks of injury to health or the environment, and their increased acceptance is one of TSCA’s goals. (6941)

Response: The EPA disagrees that the requirements of this rule will result in any meaningful delay in promulgating regulations. While this final rule requires the Agency to evaluate the availability of dose-response data for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review the EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of the studies the EPA would review). Additionally, this rule does not require the EPA to disclose or host data, but to determine if the

dose-response data underlying pivotal science are available and to give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation.

2.1.8.8 Proposal Will Not Increase the Public's Understanding

Comment: Commenter (6046, 6133, 6168) contend that the proposed rule would not result in more transparency to the public. Commenter (6046) suggests that, instead of the proposed rule, the EPA could greatly improve its transparency by making its documents and memos (particularly those cited by pivotal science EPA documents) more easily accessible to the public.

Commenter (6133) suggests that the Proposal utterly fails to demonstrate or even support the claim that its approach ensures the information relied upon by EPA would be more understandable to the public. According to the commenter, the EPA fails to establish or even support the premise of its wrongheaded belief: that the best available, peer-reviewed, independent, credible science is not understandable already to the public, or the informed, knowledgeable members of the public versed in the scientific, technical, legal, economic or policy matters relevant to EPA's regulations, actions and mission. Additionally, the commenter notes that the proposal's claim about enhanced public understanding suffers from a fundamental internal contradiction and logical failing inherent to its approach: nothing in the Proposal requires that (1) publicly available data be actually considered, addressed, verified or replicated by EPA prior to the agency being allowed to consider the study based on that data; (2) publicly available data be actually considered, addressed, verified or replicated by any other person or party prior to EPA being allowed to consider the study based on that data; and (3) publicly available data be actually considered, addressed, verified or replicated by EPA, any person, or any party ever, before or after EPA is allowed to consider the study based on that data. Accordingly, the commenter contends that it is false and unsupported to suggest that the proposal ensures greater public "understanding" than the longstanding regulatory landscape where the Proposal's prescriptions and proscriptions do not exist.

Commenter (6168) notes that, if the EPA intends transparency in how research informs regulations, it must devote substantial resources to improving explanations of research utilized and their various caveats and not require dumps of "raw" data and algorithms without context. The commenter contends that "raw" data and algorithms are largely unintelligible, so this rule gives the appearance of transparency without actually enhancing science or participation. According to the commenter, as any scientist knows, data is never just data -- it is never really "raw" because it is always shaped by techniques of sampling, collection, entry, storage, and so forth. Because the proposed rule fails to acknowledge this basic fact about scientific data, the commenter states that the rule fundamentally misrepresents the practice and applications of research. The commenter notes that this is one sense in which the proposed rule impedes meaningful public understanding and engagement.

Response: The EPA disagrees with these comments. The final rule will result in final significant regulatory actions and influential scientific information based on the highest quality studies that maximize transparency. Additionally, the EPA intends for the final rule to be implemented in a transparent manner and expects to identify pivotal science in proposed significant regulatory

actions or external review drafts of influential scientific information, which will allow the public, if they so choose, to independently validate the pivotal science and provide comment to the EPA.

2.1.8.9 Proposal Would Constrain EPA's Consideration of a Regulation's Public Health Benefits

Comment: Commenter (6922) expresses concern that the proposal, if finalized, would constrain EPA's consideration of a regulation's public health benefits. The commenter notes that environmental statutes often call on EPA to evaluate the benefits and costs of a rulemaking when determining the most appropriate standard, control technology, and other regulatory requirements. In addition, the commenter adds that Executive Order 12866 requires agencies to conduct a cost-benefit analysis of major regulations. The commenter provides that the proposal, if finalized, would have the effect of precluding EPA's consideration of CBI and epidemiological studies for which underlying data is protected from public disclosure in EPA's development of the regulations and in assessing the costs and benefits of those regulations. Historically, the commenter notes that the EPA has been able to monetize only the public health benefits of reducing pollutants for which large-scale epidemiological studies are available and epidemiological studies, which predict mortality risks and other health effects, often rely on data that are not public, for various legitimate reasons.

Commenter (6922) contends that prohibiting reliance on epidemiological studies and/or CBI in analyzing benefits or costs would reduce the likelihood that EPA could consider the full suite of costs and benefits of regulation. The commenter is concerned that this would have the effect of elevating some considerations, such as cost of compliance, over other considerations, to the detriment of reasoned decision-making. The commenter concludes that both benefits and costs must be based on the best data in order to have reasoned decision-making.

Commenter (6915) states that restricting the use of studies that underlie emission standards for criteria pollutants could significantly impact the cost-benefit analyses for various other health-related rules by failing to account for all the benefits, making it far more likely that the costs will be predicted to exceed the benefits and that the regulatory standards will, accordingly, be lowered. The commenter states that, for example, in calculating the costs and benefits of rules to reduce air emissions, in some cases the majority of the benefit estimates are attributable to reductions in one or more criteria pollutants that are not the primary objective of the rule. The commenter states that these reductions are referred to as co-benefits, and the health impacts and monetized benefits are based on studies used in the air quality standards-setting process for criteria pollutants. The commenter states that, for example, in promulgating the Mercury and Air Toxics Standard rule governing air emission standards for hazardous air pollutants (including mercury) from power plants, EPA states "[i]t is important to note that the monetized benefits include many but not all health effects associated with PM_{2.5} exposure." 77 Fed. Reg. 9304, 9431 (Feb. 16, 2012); see also id. at 9305.

Response: The EPA considered this and other similar comments when developing the final rule and believes the approach used in the final rule will result in final significant regulatory actions and influential scientific information based on the highest quality studies that maximize transparency. The final rule also clarifies how the EPA will consider studies when developing final significant regulatory actions and influential scientific information. As more fully described

in the preamble to the final rule, the EPA will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider the availability of underlying dose-response data when evaluating pivotal science and give greater consideration to pivotal science where the underlying dose-response data are available for independent validation. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating final significant regulatory actions and finalizing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations. The rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

Based on consideration of this comment and similar comments, the EPA clarified in the 2020 SNPRM the relationship between this rulemaking, the environmental statutes and their implementing regulations by adding language to proposed 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations would control in the event of any conflicts. With this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

2.1.8.10 Proposal will Lead to Increased Litigation

Comment: Commenter (6937) suggests that the most likely outcome of the proposed regulation is not an improvement in the regulatory process or outcomes, but that every major regulation will be litigated on the topic of whether regulatory standards of transparency and replicability were met. The commenter notes that trying to write a regulatory one size fits all "bar" for transparency and replicability is an impossible task, given the incredible heterogeneity of scientific data and "the array of workflows across scientific fields" as well as "the case for data sharing at different levels of stringency" (quotations from source in footnote 10 of the *Federal Register* Notice). For example, the commenter provides that they can easily imagine lawsuits where EPA is challenged with the accusation that it did not work hard enough to meet the following proposed requirement: "where data is controlled by third parties, EPA shall work with those parties to endeavor to make the data available..." (§30.5, page 18774). Or that EPA could be EPA challenged over the degree of "access" and "use restrictions" (§30.5, page 18774), since these are left very vague in the proposal.

Response: The EPA disagrees that implementation of this rule will necessarily lead to increased litigation. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. The rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings. The EPA would also like to emphasize that the final rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

2.1.8.11 Credibility/Public Trust of the Agency

Comment: Commenter (8913) suggests that an unintended consequence of the proposal is the inevitable negative impact the Transparency Rule would have upon commerce and American industry. The commenter contends that the disregard of sound science and the drastic constriction of evidence considered by the EPA, will greatly reduce the credibility of the agency. In short order, the commenter adds that this will result in reduced confidence in businesses and industries which manufacture or use toxic agents. The commenter notes that it will also damage the credibility of industries involved in containment activity and fabrication of products and structures designed to control or mitigate the release of chemicals, radioactivity, and other harmful substances. Thus, according to the commenter, the products and services even of companies and industries which perform careful robust safety studies will be suspect. Lastly, the commenter states that the EPA imprimatur will also cease to have strong force globally, resulting in less competitive export industries.

Commenter (5165) asserts that transparency concerns must not override EPA's obligation to consider the full range of peer-reviewed, sound scientific research that is available and relevant to its regulatory decisions. In the commenter's view, the proposal would likely hinder, rather than promote, EPA's use of best-available science and it would tend to diminish public confidence in the integrity of EPA's scientific decision making.

Conversely, commenters (1971, 5185, 5891, 6150, 6376) suggest that the proposed rule could be a step that increases public trust in and support for EPA itself. Commenter (5185) states that, while the agency's proposed reforms are clearly controversial, they are grounded in an accepted democratic principle: citizens have a right to the data and information that are used in the development of public policy. Commenter (5891) states that refusing to disclose the studies, surveys, etc., upon which any rule is based, is disheartening, dishonest and in-American.

Commenter (6150) states that new causal analytical techniques can be used to test validity of existing data thereby increasing public confidence in results. The commenter states that, by relying on data, models and processes subject to rigorous disclosure, the Agency will better inform the public and enhance the public's ability to understand and meaningfully participate in

the regulatory process. Commenter (6176) states that the public should not be expected to just trust the EPA (or any agency) to promulgate any rule it wants and draw its own conclusions without the public knowing how those conclusions were reached. Commenter (6376) states that creating and codifying a standard of scientific transparency should result in better regulations and strengthen public trust in the regulatory agenda.

Response: The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty of the assessment. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. The EPA's continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency's decisions. The requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

Finally, because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

2.1.8.12 Unable to Fully Assess Likely Impacts on EPA and State Programs

Comment: Commenter (6126) suggests that given the vague nature of certain definitions, the commenter states that they are unable to fully assess the likely impacts on EPA programs.

Commenter (5181) states that it is unknown how the proposed rule would impact development of Water Quality Standards for wetlands. The commenter notes that many states include pollutant and toxic discharge standards among those that are applied to wetlands. The commenter states that the proposal should clearly address and answer this question, and also clarify the impact on grants to states.

Commenter (6915) states that, based on EPA's complete failure to consider or discuss the effects of its action on state programs, the proposal should be withdrawn so that EPA can adequately consult with state officials to analyze these important impacts. See Exec. Order 13132 § 6(a) (instructing agencies to "ensure meaningful and timely input by State and local officials in the

development of regulatory policies that have federalism implications”); *Chem. Mfrs. Ass’n v. U.S. Env’tl. Prot. Agency*, 870 F.2d 177, 203 (5th Cir. 1989).

Response: The EPA clarified in the final rule that the requirements in 40 CFR part 30 apply to significant regulatory actions and influential scientific information. With this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

2.2 Purpose/Basis and Effects (SNPRM Comments)

2.2.1 Purpose/Basis for Rule

2.2.1.1 Alternative Purpose for Rule Besides Transparency

Comment: Commenters (10974, 10975, 11339, 11361, 11391, 11392, 11401, 11920, 13788) contend that the rulemaking is not an intention to improve transparency in EPA decision-making, but instead an attempt by EPA to undermine the scientific basis of the process. Specific concerns include:

- Commenter (10974) states that EPA’s revisions do not clarify how this proposed rule enhances the public’s ability to understand or meaningfully participate in the regulatory process and questions who represents “the public” in the context of independent validation. The commenter suggests that the limitation of reanalysis to individuals with expertise contradicts EPA’s broader argument that the rule would benefit “the public’s” understanding of science and EPA’s rulemaking process. Further, the commenter contends that reanalysis by “subject matter experts” is redundant of current practices and that EPA is overstepping its authority to determine how individuals and organizations share their data, in turn confusing rather than clarifying the public’s understanding and participation in the rulemaking process.
- Commenter (10975) states that the purpose of the proposed rule is to allow EPA to bypass its statutory duties and congressional mandates to enact restrictive rules in the first place, even when the evidence of potential public harm is clear. According to the commenter, this proposed rule does not come from rational public administrative concerns, nor from science, but from what political scientists call “Agency capture.” The commenter also queries how this proposed rule can avoid the legal and moral taint of a highly partisan de-regulatory agenda for cutting back on public protections.
- Commenter (11339) states that the proposal is the cornerstone in a large-scale attack on health science at EPA, specifically, the scientific process of CAA rulemaking. The commenter provides examples of changes to the NAAQs rulemaking process

- including: disbanding advisory panels, lessen scientific review without adequate expertise, barring EPA funded scientists from serving on advisory panels, while creating no equivalent limits on the appointment of industry funded scientists.
- Commenter (11361) asserts that the “clarifications” offered in the SNPRM demonstrate the intention to undermine science through the façade of increasing transparency and that the framing of the rule around “recent innovations and policies surrounding information access” is actually disingenuous to the spirit of that spirit. The commenter contends that the data disclosure requirements in the 2020 SNPRM “allow stakeholders to reanalyze the data and models and explore the sensitivity of the conclusions to alternative assumptions”²¹⁴¹ would make it easier for outside parties to cast doubt on peer-reviewed science. The commenter states that similarly, EPA’s statement that the Proposed Rule does not “require that EPA, a member of the public or other entity must independently validate a study before it can be considered”²¹⁴² indicates that the Proposed Rule would not improve the quality of the scientific information relied upon by EPA by ensuring it is independently verified, but would instead advance tactics used by industry to avoid regulation.²¹⁴³
 - Commenter (11392) states that this proposed rulemaking undermines the ability of EPA to protect human health and the environment and contravenes the Agency’s statutory responsibility to use the best available science in promulgating health-protective regulations. The commenter contends that this rulemaking is not only dangerous, but is fundamentally flawed by failing to justify a legitimate purpose beyond arbitrary, political manipulation of the Agency’s science-based work.
 - Commenter (13788) contends that the suggestion that the rule could apply to studies retroactively if the Administrator does not grant an exemption further illustrates the intention to undermine longstanding reliance on the human health studies that have done the most to advance air quality and public health. The commenter states that the EPA has provided no reasoning to explain how retroactive application to past studies—including the Harvard Six Cities and American Cancer Society particulate matter health studies and subsequent work that links exposures to air pollution with declines and damages to human health—is justified. The commenter states that it certainly has not provided any information to suggest that this rule would encourage the release of more data from those studies. The commenter states that this proposal’s focus is clearly on arbitrarily excluding or diminishing the value of quality scientific research rather than any real commitment to transparency.

Response: Because of the potential impact of the EPA’s significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best scientific information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA fully demonstrate that commitment. Data transparency is vital for individuals who have not contributed to the study to be able to verify the quality and strength of published studies and the opportunity to independently validate the pivotal science that the EPA

²¹⁴¹ 2020 SNPRM, at 15399

²¹⁴² *Id.* at 15403.

²¹⁴³ *See generally*, Naomi Oreskes & Erik M. Conway, *Merchants of Doubt* (2010).

relies upon is important in furthering scientific understanding and the Agency's mission. Increasing the availability of the underlying dose-response data upon which the EPA makes its decisions is integral to demonstrating accountability and this dedication to public health and the environment. Therefore, the EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalyses, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information. The final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

As discussed in the preamble of the final rule, the rule is designed to build upon open data initiatives in the federal government and scientific community. The rule is not targeted to a particular set of rulemakings or scientific studies, but rather intends to increase transparency in the pivotal science used in significant regulatory actions and influential scientific information. The EPA believes that the implementation of this final rule will increase the transparency of pivotal science for significant regulatory decisions and influential scientific information, while still ensuring that the highest quality, most relevant studies are considered in the development process.

Comment: Commenters (11190, 12720) contend that the rule is designed as an avenue to allow polluters to provide legal challenge to regulations under the new data availability requirement.

Commenter (11920) contends that through restricting the use of relevant and high-quality scientific information, the EPA is seeking to protect polluters and regulated industries, rather than carry out its statutory mandate to protect the environment and American citizens.

Response: The EPA disagrees that this rule is intended to benefit industry. The EPA is committed to its mission of protecting public health and the environment through sound policy decisions that are informed by robust scientific and technical research. Because of the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best scientific information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA fully demonstrate that commitment. Data transparency is vital for individuals who have not contributed to the study to be able to verify the quality and strength of published studies and the opportunity to

independently validate the pivotal science that the EPA relies upon is important in furthering scientific understanding and the Agency's mission. Increasing the availability of the underlying dose-response data upon which the EPA makes its decisions is integral to demonstrating accountability and this dedication to public health and the environment. Therefore, the EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access.

2.2.1.2 Rule Does Not Have Adequate Basis or Justification

Comment: Commenters (11332, 11392, 11490 11894, 12430, 12455, 12456, 12727, 13788) assert that the Proposal and subsequent SNPRM do not have adequate basis or justification for the need to alter EPA's rulemaking process. Specifically:

Commenter (11332) states their concern considering EPA's lack of justification for this sweeping reach of the supplemental proposal, which is all-encompassing compared to even the original proposed rule. The commenter states that EPA's rule would apply to any data and models used by the Agency to craft its regulations, and that the change is significant. The commenter notes that it is an expansion of the net cast in the original proposal, which was limited to dose response data and models, and that this change could weaken a wider range of current pollution controls all across this country. The commenter contends that this major change in scope was never justified in the proposal.

Commenter (11392) notes that they agree with the members of EPA's handpicked SAB that this rule "risks serious and perverse outcomes" and that the Agency has not justified "why existing procedures and norms utilized in the U.S. scientific community, including the federal government, are inadequate, and how the Proposed Rule will improve transparency and the scientific integrity of the regulatory outcomes."

Commenter (11894) states that since EPA has failed to justify any *per se, a priori* restrictions based on data availability, any proposals for relief from those restrictions are proposals for relief from something that should not exist in the first place. The commenter asserts that as such, they are both unnecessary, and unable to increase in any way the legal defensibility of those restrictions, since they still allow the Agency, to the exact extent that the relief provisions do *not* apply, to unjustifiably refuse to consider certain studies. Furthermore, the commenter queries what possible sense does it make to exclude, arbitrarily and without justification, categories of studies that can contribute to understanding of particular problems that EPA is directed by statute to manage. The commenter agrees that EPA should be sure that regulatory decisions with binding legal effect rest on information whose quality has been tested, but the studies themselves have no binding effect; they are building blocks and evidence that the Agency uses to reach a conclusion. The commenter contends that process is debased when science is excluded for reasons that have nothing to do with its quality and probity, and to do so violates well-developed

understandings of how science works. The commenter notes that the cure is not arbitrary exclusion, but, as John Milton said in a different context, to “Let [Truth] and Falsehood grapple; who ever knew Truth put to the worse, in a free and open encounter?” The commenter questions what EPA is so afraid of that it proposes to exclude these studies from the decision process as EPA manages major, consequential public health issues?

Commenter (12430) contends that as part of its notice-and-comment rulemaking requirements, the APA requires an Agency to provide notice of a proposed rulemaking,²¹⁴⁴ and to “disclose in detail the thinking that has animated the form of a proposed rule and the data upon which that rule is based.”²¹⁴⁵ The commenter provides that the D.C. Circuit Court of Appeals has noted, “a prerequisite to the ability to make meaningful comment is to know the basis upon which the rule is proposed.”²¹⁴⁶, yet EPA has not provided a justification, let alone a detailed disclosure of its reasoning and data, for either the Proposal or the dramatic expansion proposed in the SNPRM. According to the commenter, the proposals merely assume and assert that: transparency is the determinant of scientific quality; transparency is presently lacking; public data availability is the only guarantor or indicator of transparency; and there exist no less disruptive means of increasing transparency that EPA could consider. The commenter states they have discussed EPA’s failure to explain the basis of its NPRM in their 2018 comments and that the SNPRM fails to rectify this issue. The commenter notes that as in the NPRM, the SNPRM provides no references to U.S. EPA regulatory science or influential scientific information that subsequent review suggests were falsified or otherwise problematic, or instances in which public unavailability of data or models has resulted in irrational or arbitrary regulations or other harms. The commenter also contends that instead of providing a justification for profoundly expanding the scope of the Proposal in the SNPRM, EPA references only unspecified public comments and uncomplicated requests for clarification of the Proposal. The commenter provides that for example, the Proposal’s preamble clearly explained the proposal’s applicability only to dose-response data and models, but one provision of the proposed regulatory text was ambiguous on this point. The commenter asserts that EPA now cites this single ambiguity as its basis for the SNPRM’s dramatic expansion of the proposal to all types of data and models.²¹⁴⁷ Additionally, the commenter contends that the citation of the OMB Memorandum does not provide basis for the proposed rule. Ultimately, the commenter states that EPA provides no reasoned basis for the SNPRM’s drastic expansion of the Proposed Rule and that instead, the Agency summarily announces its intent to expand the provisions of the rule, which does not comprise the detailed disclosure of basis and data that the APA requires.²¹⁴⁸

Commenter (12727) states that EPA does not explain or acknowledge its departure from existing approaches for assessing the weight of scientific evidence. The commenter notes that EPA’s Risk Assessment Forum recommends weighting evidence based on relevance, strength, and reliability.²¹⁴⁹ Even within reliability, the commenter provides that the Forum observes that “scoring the most important component properties” is useful.²¹⁵⁰ According to the commenter,

²¹⁴⁴ 5 U.S.C. 553(b).

²¹⁵⁰ *Id.* at 33.

transparency is only one such component, and it is merely “presumed to increase reliability by reducing the likelihood of hidden faults.”²¹⁵¹ The commenter contends that EPA offers no reason to give overwhelming importance to one component of reliability in this framework, and, in turn, to reliability over the strength and relevance of a study. In fact, the commenter states EPA does not discuss existing approaches to weighting evidence at all and has therefore failed to acknowledge that it is changing policies or to provide a good reason for doing so, rendering a final rule that is similarly deficient and unlawful.²¹⁵²

Additionally, commenters (12455, 12456) request that EPA provide specific examples to justify the 2018 proposed rule and the SNPRM.

Commenter (13788) asserts that EPA has provided no reasoning to explain how retroactive application to past studies—including the Harvard Six Cities and American Cancer Society particulate matter health studies and subsequent work that links exposures to air pollution with declines and damages to human health—is justified. The commenter notes EPA has not provided any information to suggest that this rule would encourage the release of more data from those studies

Response: As discussed in the preamble of the final rule, the rule is designed to build upon open data initiatives in the federal government and scientific community and advances the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Having a better understanding of the underlying data will enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

As described in the preamble to the final rule, there will be no categorical exclusion of studies based on the availability of their underlying dose-response data and the applicability of the rule is focused on dose-response data to provide incremental progress toward the Agency’s goal of greater transparency. Briefly, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information: soundness, applicability and utility, clarity and completeness, uncertainty

²¹⁵¹ *Id.* at 34 (emphasis added); see also *id.* at 36 (“Reliability has at least 11 component properties that are conceptually distinct, ... and more than one can be applied to a piece of evidence.”).

²¹⁵² See *FCC v. Fox Television Stations, Inc.*, 556 U.S. 502, 515 (2009); Physicians for Soc. Responsibility, 2020 U.S. App. LEXIS 12727, at *22-28.

and variability, and evaluation and review. When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science. Once the EPA has identified pivotal science—in either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA believes that the implementation of this final rule will increase the transparency of pivotal science underlying significant regulatory actions and influential scientific information, while still ensuring that the highest quality, most relevant studies are considered in the development process.

The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Finally, the EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. One of the criteria the Administrator may use in his/her

determination to grant a waiver is that the development of the dose-response data was completed or updated before the effective date of the rule. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

2.2.1.2.1 Provided Citations Do Not Provide Solid Backing

Comment: Commenters (11894, 12645, 12727) provide that the SNPRM's citations are unable to be used to provide firm support for the rulemaking. Specific concerns include:

Commenter (11894) states that the memorandum cited in the supplemental proposal says nothing about precluding use of, or downgrading consideration given to, scientific information for which raw data are not publicly accessible. The commenter notes that the memorandum in fact continues to recognize (at p. 5) that agencies must "ensure that privacy and confidentiality are fully protected and that data are properly secure so that open data do not disclose personally identifiable information." The commenter asserts that it does discuss circumstances under which tiered access to data is appropriate (p. 9), a discussion that does nothing to support the sweeping scope of this supplemental proposal. Further, the commenter provides that the supplemental proposal also cites a NAS report entitled "Principles and obstacles for sharing data from environmental health research."²¹⁵³ The commenter contends that that assertion rests on a generic reference to an unspecified portion of a 148-page document. According to the commenter, the Agency is apparently unaware (or, worse, failed to disclose) that the NAS document in question is merely a workshop report even though its own citation clearly states just that. The commenter states that workshop reports are assembled to represent all divergent points of view, and have no other purpose; these are *not* NAS consensus recommendations and contain a very strong disclaimer to this effect.

Commenter (12645) contends that the most authoritative citation is to a *Workshop on Principles and Obstacles for Sharing Data from Environmental Health Research*.²¹⁵⁴ According to the commenter, this Workshop is cited 9 times, all within the *Federal Register* section on Definitions, which addresses the central issues raised by the proposal. The commenter notes that none of the other 9 references within this section is cited more than once. The commenter states that the U.S. NAS is perhaps the most respected source of unbiased scientific opinion in the world, so citation to the NAS would seem to provide authoritative backing for EPA's proposal, but not if it is to a workshop. The commenter provides that speakers are chosen by the NAS to accurately and fairly represent divergent points of view rather than to present a recommendation obtained through the consensus of an expert scientific committee. The commenter asserts that in this case, industry representatives were involved in the planning committee for this Workshop and three were speakers, including the industry consultant who controversially heads EPA's

²¹⁵³ See 85 Fed. Reg. 15404

²¹⁵⁴ National Academies of Science, 2016. *Principles and obstacles for sharing data from environmental health research: Workshop summary*. National Academies Press, Washington, DC

CASAC. Additionally, the commenter provides that the NAS report has a very strong disclaimer that EPA chose to ignore:

The statements, recommendations, and opinions expressed are those of individual presenters and participants, and are not necessarily endorsed or verified by the [NAS] and they should not be construed as reflecting any group consensus.

According to the commenter, individual opinions summarized by rapporteurs in the Workshop report, as well as specific quotations, are citable, but only to the individual who made the comments.

Commenter (12727) notes that the original proposal's cited support proved to be either inapplicable, irrelevant, or contrary to EPA's proposed action.²¹⁵⁵ The commenter states that further, EPA's failure to explain its proposed departure from current Agency policies and its reversal of prior Agency conclusions on data availability are a hallmark of arbitrary decision-making.²¹⁵⁶ The commenter provides that the supplemental proposal drastically expands the scope of the original proposal, yet it rectifies neither its earlier citation of inapplicable, non-supportive authorities nor its failure to acknowledge or explain contradictions with current policies and prior conclusions. The commenter also states that the supplemental proposal does not cite any new authorities that support its approach aside from OMB memorandum M-19-15,²¹⁵⁷ which the commenter asserts does not provide support for the proposal. According to the commenter, EPA's failure to provide adequate support for its proposed course of action is the antithesis of reasoned decision making.²¹⁵⁸

Response: As discussed in the preamble of the final rule, the rule is designed to build upon open data initiatives in the federal government and scientific community. Additional discussion and citations for the rationale are provided. In addition, underlying dose-response data are considered available if they can be accessed through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Further, the EPA would like to clarify that the rule does not prevent the Agency from using research with confidential data and does not rely on an Administrator's exemption to be able to

²¹⁵⁵ Environmental Defense Fund 2018 Comments at 138-82; Environmental Protection Network, Comments on EPA's Proposal entitled "Strengthening Transparency in Regulatory Science," Docket ID No. EPA-HQ-OA-2018-0259-6125, at App. D (Aug. 14, 2018).

²¹⁵⁶ See *Physicians for Soc. Responsibility v. Wheeler*, 2020 U.S. App. LEXIS 12727, at *26 (D.C. Cir. Apr. 21, 2020) ("An agency's wholesale failure to address 'past practice and formal policies regarding [an issue], let alone to explain its reversal of course . . . [is] arbitrary and capricious.'") (quoting *Am. Wild Horse Pres. Campaign v. Perdue*, 873 F.3d 914, 927 (D.C. Cir. 2017)) (alterations in original).

²¹⁵⁷ 85 Fed. Reg. at 15,398.

²¹⁵⁸ See, e.g., *AT&T v. FCC*, 86 F.3d 242, 298 (D.C. Cir. 1996) (reliance on conclusory assertion without supporting evidence is arbitrary); *Chemical Mfrs. Ass'n v. EPA*, 28 F.3d at 1266 (stubborn adherence to conclusion without supporting evidence is arbitrary); *Fred Meyer Stores, Inc. v. NLRB*, 865 F.3d 630, 639 (D.C. Cir. 2017) (similar).

consider such research. As explained in the preamble for the final rule, the EPA did not finalize the 2018 proposal or the proposed option in the 2020 SNPRM that would have categorically required that the underlying dose-response data be available for independent validation in order for studies to be considered pivotal science. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Also as discussed in the preamble to the final rule, the EPA is retaining the Administrator's exemption provision with some added considerations in response to public comments. To ensure that the Administrator's decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation. The EPA is confident that the criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

The EPA has also clarified references to the 2016 NAS workshop report entitled *Principles and obstacles for sharing data from environmental health research: Workshop summary* (Ref. 26) in the preamble text of the final rule. All references to this report in the final preamble clearly state that this was a workshop report.

2.2.1.3 The EPA Has Not Sufficiently Articulated the Problem the Rule Is Intended to Fix

Comment: Several commenters (10742, 10974, 11332, 11339, 11390, 11391, 11395, 11396, 11404, 11408, 11473, 11479, 11484, 11497, 11576, 11579, 11892, 11894, 11920, 12403, 12412, 12427, 12464, 12546, 12617, 12645, 12688, 12692, 12707, 12716, 12720, 12727, 13549) express that EPA has not sufficiently articulated the problem that the EPA is intending to fix by its proposal/supplemental proposal. These commenters generally also note that EPA has not sufficiently justified their purported effort to address “transparency,” and that sufficient peer review and other mechanisms already exist to validate studies and ensure transparency. Examples of some of the specific comments include:

Commenter (11390) contends that the proposed rule disregards settled scientific standards and drums up a transparency problem that does not exist, focusing on data availability instead of study reliability. According to the commenter, it adds nothing to—and in fact completely ignores—the complex discussions within the scientific community about how best to achieve additional transparency and enhance replicability while maintaining commitments to patient confidentiality and production of high-quality science.

Commenter (11473) states that the rulemaking is needless regulation seeking to solve a purported problem that does not exist. According to the commenter, sufficient safeguards already exist in the present peer review system, and the approach put forward by this proposed regulation will not achieve the Agency's claimed goals of “transparency.”

Commenter (12720) contends that it is problematic that, two years since the original proposed rule, EPA has not identified any reasons to introduce such drastic changes to the Agency's science activities through the supplemental proposal.

Commenter (11497) states that multiple steps of independent scientific review already ensure the integrity and objectivity of science. The commenter notes that soundness of scientific methodology is thoroughly reviewed at many points in the process of designing, conducting and publishing research. The commenter adds that the competitive grant process; IRB requirements; peer-review prior to publication; the expertise and judgment of career EPA scientists when considering the strength and relevance of studies included in EPA decisions; and finally, the review of those decisions and the science they are based on by EPA's SAB all provide more than sufficient opportunities to assess the soundness of scientific studies.

Commenter (11894) expresses that the Agency suggests that it might consider studies for which the underlying data were unavailable due to concerns about privacy, confidentiality, CBI, or national security. The commenter notes that you will search the proposal in vain for any reference to considering studies because they had repeatedly been confirmed by other studies, or because their quality had been assured by other means, or because analysis could adjust for any likely flaws, or because they were the only data available to address a pressing regulatory issue.

Commenter (10742) notes that after a careful review of the supplemental notice of proposed rulemaking, the commenter found that the Agency has failed to fully identify the problem that finalizing this rule will solve. The commenter asserts that it is, therefore, difficult to analyze the individual components of the rule and if they will solve any problems.

Commenter (11920) contends that, quite simply, this rulemaking addresses a problem that does not exist, and would dramatically undermine the ability of the EPA to make use of best available scientific information to protect the environment and public safety.

Commenter (10974) states that there is no information-based demonstration of either the need for additional procedural transparency, or for furthered public understanding of EPA's critical rulemakings. The commenter contends that this proposed rule, if enacted, would provide no such clarity – it is a solution looking for a problem. The commenter also notes the SNPRM's reference to OMB M-19-15, and notes that the memo addresses, for all Federal executive agencies, what EPA is trying to do with this internally focused rulemaking. The commenter provides that the EPA says that this SNPRM is partly intended to “ensure consistency” with M-19-15, but, at the expense of duplicating work, and doing so to the detriment of “[e]nsuring and [m]aximizing the [q]uality, [o]bjectivity, [u]tility, and [i]ntegrity of [i]nformation”, EPA has not established the need to take further action beyond following M-19-15 and the underlying guidance document. According to the commenter, the argument could be made that publishing this SNPRM in order to align a previous attempt at rulemaking to a new memo further confuses the issues at hand, rather than providing clarity.

Commenter (11332) provides that EPA has not in the original proposed rule or in the SNPRM adequately identified any particular problem to be addressed by this unprecedented Agency action. According to the commenter, the concern was identified earlier by EPA's own SAB. The

commenter notes that this was months ago in regards to the original proposal, but the Agency did not address that concern in the supplemental proposal. The commenter contends that EPA has not meaningfully engaged with the SAB in assembling its supplemental proposal, and in the supplemental proposal, EPA has not responded in any meaningful way to the major questions and concerns identified by the SAB about this rushed effort. Additionally, the commenter states that the recently finalized ISA for Fine PM, Soot Air Pollution demonstrates that the existing scientific review processes are fully functioning to capture and characterize the best available science as mandated by law and that the health and economic benefits to the American public using the current approach to parsing the best available science over the past fifty years provide no reasonable legal or scientific rationale for the SNPRM. In summary, the commenter asserts that the Agency has not adequately shown the need for this proposed regulation. To the contrary, the commenter provides that the SNPRM would ignite cascading waves of unnecessary, unworkable, and hugely expensive implementation issues and also directly enable selective interference in the science.

Commenter (11350) states that EPA science assessments generally include an exhaustive and critical review of relevant studies and a full explanation of how they are being interpreted and adds that extensive information about each study is typically part of the public record even if all underlying data may not be included. The commenter notes that EPA assessments are normally subject to public comment and independent peer review and members of the regulatory community are free at any time to replicate studies they deem flawed, or to independently seek access to underlying data and reanalyze them. The commenter suggests that the so-called problem that the proposal seeks to fix is largely imaginary and asserts that the stakes for EPA science and the protection of public health are simply too high to finalize this deeply problematic and unnecessary proposal.

Commenters (12412, 13549) state that proposed 40 C.F.R. § 30.5 remains a poorly formed scheme in search of a problem that would ultimately force EPA to arbitrarily make public health and environmental decisions based on incomplete or improperly weighted information.

Commenter (11395) contends that the SNPRM does not address the need for the regulation and does not provide evidence that implementation of the proposed rule would improve regulatory outcomes. The commenter provides that appropriate data sharing mechanisms already exist and major funding sources, including the NIH and EPA, require scientists to establish a data sharing plan as part of the scientific granting process. Additionally, the commenter notes that the NIH currently operates multiple data repositories and that major journals, including Lancet, the Journal of the American Medical Association, and the New England Journal of Medicine, require researchers to specify a mechanism for sharing data with other scientists consistent with NIH policies and the FAIR (findable, accessible, interoperable, reusable) principles as part of their manuscript submission to facilitate replication of findings, or pooling of data from multiple studies. The commenter asserts that EPA should focus on implementing existing initiatives and guidelines for improving data sharing and transparency at federal agencies rather than promulgating a regulation that requires additional data sharing as a condition for consideration of a study.

Commenter (11404) provides that there is already a robust scientific information vetting process outlined in the executive orders and guidance documents referenced in the background document for this rulemaking. According to the commenter, these include Executive Order 12866: Regulatory Planning and Review; Executive Order 13563: Improving Regulation and Regulatory Review; EPA’s Scientific Integrity Guidance; OMB’s Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information.

Commenter (11576) contends that the request for comment on how to improve information availability over time and how to incentivize researchers is a request for solutions to a problem that does not exist. The commenter states that EPA has not shown that its regulatory decisions and scientific analyses have been at all compromised due to the public not having access to the models and data underlying scientific studies.

Commenter (12688) provides that this proposal is both unnecessary, and inferior to current practices. The commenter notes that FOIA, including the Shelby Amendment, already serves the purpose of transparency, and Agency reliance on the best available science and considering all information available in rulemaking records is both a superior practice, and required by law.

Commenter (12546) contends that the proposal continues to have fundamental flaws and this supplement will not improve the use of science for decision-making; EPA has failed to provide a reasonable science or policy rationale supporting these actions. The commenter provides that EPA and numerous other agencies (such as the FDA) routinely make regulatory decisions without having access to “all data and models.”²¹⁵⁹ According to the commenter, lacking “access to part or all of the data and Models” or “not hav[ing] the authority to provide access to part or all of the data and models,”²¹⁶⁰ does not prevent EPA from determining the validity of scientific methods and conclusions and using science to inform decisions, as EPA repeatedly states in its own plan to increase access to results of EPA-funded scientific research.²¹⁶¹ The commenter states that overall, the proposed rule and supplemental proposal is not consistent with the principles of open science,^{2162,2163} and continues to lack a scientific basis or policy rationale.

Commenter (12727) states that EPA has failed to articulate a defensible rationale for this proposal or to describe what effects the proposal might produce. The commenter notes that the SAB recently observed that “[c]osts of processing and documenting data will be difficult to assess in advance until EPA has developed a system for dealing with the requirements of the rule.”²¹⁶⁴ The commenter asserts that basic ambiguities in the proposal might further obscure

²¹⁶⁴ Final SAB Report at 14.

potential costs, as the SAB noted with respect to the definition of “data.”²¹⁶⁵ The commenter contends that a reasoned decision-making process would have generated more information upon which to analyze costs and benefits, rather than the near-total absence of information that we now face. According to the commenter, this lack of information is not carte blanche to forego an analysis, but rather an indication that this rulemaking is arbitrary and unsupported.

Similarly, another commenter (11579) states that EPA has yet to offer any evidence or substantial arguments in their defense of why the proposed restrictions on science are necessary. The commenter provides that the Agency’s own SAB recently noted in its comments on the proposal, “[t]here is minimal justification provided in the Proposed Rule for why existing procedures and norms utilized across the U.S. scientific community, including the federal government, are inadequate, and how the Proposed Rule will improve transparency and the scientific integrity of the regulatory outcomes in an effective and efficient manner.”²¹⁶⁶ According to the commenter, the EPA’s continued failure to provide such “justification” has significant substantive and procedural implications.²¹⁶⁷ Substantively, the commenter contends that the Agency’s unwillingness to address the implications of its proposal has disguised the severe problems the regulation would cause. The commenter notes that, in the words of the SAB (11579):

It is plausible that in some situations, the Proposed Rule will decrease efficiency and reduce scientific integrity, [and] determining if in fact that will be the case requires a thorough and thoughtful examination that is currently absent in the Proposed Rule. Moving forward with altered transparency requirements beyond those already in use, in the absence of such a robust analysis, risks serious and perverse outcomes.²¹⁶⁸

Commenter (12716) states that as the Agency points out, there are numerous laws and policies that already govern the requirements that must be met for the Agency to use science in its rulemaking, including OMB’s *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies* and *Memorandum 13-13: Open Data Policy – Managing Information as an Asset*, EPA’s *2016 Plan to Increase Access to Results of EPA-Funded Scientific Research to Significant Regulatory Decisions Plan*; *EPA Open Government Plan 4.0*; (3) *Open Data Implementation Plan*; and *EPA’s Scientific Integrity Policy*; *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency*.²¹⁶⁹

The commenter (12716) contends that an examination of the EPA’s *Information Quality Guidelines* demonstrates that EPA is already required to have transparency in its reliance on scientific studies used in the establishment of regulations. For example, the commenter notes that

²¹⁶⁵ *Id.* at 17.

²¹⁶⁶ Science Advisory Board Consideration of the Scientific and Technical Basis of EPA’s Proposed Rule Titled “Strengthening Transparency in Regulatory Science” (Apr. 24, 2020) (“SAB Comments”) (attached), at 18.

²¹⁶⁷ *Id.*

²¹⁶⁸ *Id.* See also *id.* at 1 (noting that “key considerations that could inform the Proposed Rule are not present in the proposal, or presented without analysis”)

²¹⁶⁹ 83 FR 18768, 18770, April 30, 2018.

in regard to ensuring and maximizing the quality of “influential” information (which includes information in support of Agency actions including rules), EPA states:

EPA recognizes that influential scientific, financial, or statistical information should be subject to a higher degree of quality (for example, transparency about data and methods) than information that may not have a clear and substantial impact on important public policies or private sector decisions. A higher degree of transparency about data and methods will facilitate the reproducibility of such information by qualified third parties, to an acceptable degree of imprecision. For disseminated influential original and supporting data, EPA intends to ensure reproducibility according to commonly accepted scientific, financial, or statistical standards. It is important that analytic results for influential information have a higher degree of transparency regarding (1) the source of the data used, (2) the various assumptions employed, (3) the analytic methods applied, and (4) the statistical procedures employed. It is also important that the degree of rigor with which each of these factors is presented and discussed be scaled as appropriate, and that all factors be presented and discussed. In addition, if access to data and methods cannot occur due to compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections, EPA should, to the extent practicable, apply especially rigorous robustness checks to analytic results and carefully document all checks that were undertaken. Original and supporting data may not be subject to the high and specific degree of transparency provided for analytic results; however, EPA should apply, to the extent practicable, relevant Agency policies and procedures to achieve reproducibility, given ethical, feasibility, and confidentiality constraints.²¹⁷⁰

In addition to all of the already existing laws and guidance under which EPA is directed to review scientific information in its promulgation of regulations, the commenter (12716) notes that EPA also has “several mechanisms for vetting science through several expert panels, including the EPA SAB, the EPA CASAC and the EPA [Federal Insecticide, Fungicide and Rodenticide] FIFRA Scientific Advisory Panel . . .”²¹⁷¹ Altogether, the commenter asserts that these safeguards are sufficient to ensure that the science relied upon by EPA is the best available science and that it is subject to peer review and available to the public.

Commenter (12427) states that EPA is trying to “solve” a “problem” that doesn’t exist. According to the commenter, there is not a problem with “transparency” in current scientific practice; reputable journals encourage or require complete disclosure of data and models, with the reasonable exception in cases where disclosure would infringe on patient right to privacy or would disclose confidential information. Thus, the commenter contends that EPA is attempting to solve a problem that doesn’t exist. The commenter provides that PLOS One requires full disclosure but also instructs that “All efforts should be made to protect patient privacy and

²¹⁷⁰ Emphasis added by commenter, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency, EPA/260R-02-008, pp. 23-24, October, 2002, <https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf>.

²¹⁷¹ Memorandum from Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science to Members of the Chartered SAB and SAB Liaisons, Preparations for Chartered Science Advisory Board (SAB) Discussions of Proposed Rule: Strengthening Transparency in Science RIN (2080-AA14), p. 4, May 12, 2018.

anonymity.”²¹⁷² Additionally, the commenter states that EPA should address the following questions:

- What is the current practice among scientific journals regarding “transparency”? (answer: journals already promote this)
- What is the actual problem? What actual harm has been done because of lack of transparency? In what ways have existing peer review mechanisms failed to address studies that lack “transparency” but that are otherwise rigorous?
- If there is a problem, is a regulation the best approach? Why not do some test cases? Why not a white paper? Why not develop an internal guidance document?

Commenter (12727) contends that there is a plethora of evidence that EPA’s existing approaches to evaluation of scientific studies, models, and other information underlying influential scientific information are not only functioning well, but are exemplary. The commenter states that EPA’s requirement of peer review of all influential scientific information assures that influential scientific information and underlying information are rigorously examined both within and without the Agency before dissemination or other utilization.²¹⁷³ Furthermore, the commenter asserts that EPA’s Scientific Integrity Policy successfully promotes use of best science by not imposing a priori constraints on which information is to be used, but rather by considering data on its individual merits, unconstrained by political or other interference.²¹⁷⁴ The commenter notes that although the policy recognizes the importance of the ability to independently validate scientific information and methods, as well as the importance of access to data and non-proprietary models used to support Agency action, these values are not absolute rules barring or downgrading consideration of legitimate data and information.²¹⁷⁵ The commenter contends that EPA’s traditional weight-of-evidence approach to data evaluation has express judicial imprimatur, as does its decision to consider studies for which not all underlying data are publicly available for legitimate reasons.²¹⁷⁶

Response: The final rule provides more detail explaining the EPA’s rationale for this rule. In brief, the EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety. This rule is designed to build upon OMB M-19-15, which highlights the need to characterize the sensitivity of an agency’s conclusions to analytic assumptions, as well as other federal guidance documents that require greater data transparency. The EPA’s attention to data transparency is also responsive to the broader interest in greater data and model transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members

of the public, scientific community, and Congress on the transparency of the scientific basis for EPA's decisions in previous influential scientific information assessments and regulatory actions. The EPA's continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency's decisions. Further, although the scientific community and government agencies are making great strides in data transparency, improvements can still be made over existing policies and mechanisms. Therefore, the rule requirements for the EPA's independent evaluation of the availability of data are necessary and critical to prioritizing data transparency in the pivotal science underlying its significant regulatory actions and influential scientific information. Although current methods and processes do allow for public comment and, where appropriate, peer review in the development of significant regulatory actions and influential scientific information, subject matter experts and peer reviewers (including the SAB and other science advisory panels) generally have not had access to the underlying data necessary to fully evaluate scientific conclusions. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information. The promulgation of these internal Agency procedures in this rulemaking highlights the Administration's commitment to ensuring transparency in the EPA's most impactful regulatory actions and influential scientific information.

In addition, as explained in the preamble for the final rule, the EPA did not finalize the 2018 proposal or the proposed option in the 2020 SNPRM that would have categorically required that the underlying dose-response data be available for independent validation in order for studies to be considered pivotal science. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The EPA agrees that data sharing mechanisms already exist. The preamble to the rule clarifies that restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The rule does not prescribe a particular mechanism but does require the EPA to independently verify that such a mechanism exists for dose-response data underlying pivotal science.

The EPA received comments from the SAB on the 2018 NPRM and 2020 SNPRM on April 24, 2020. The EPA considered these comments in development of the final rule. In brief, the SAB consensus was that it supported the precept of enhancing public access to scientific data and analytical methods to ensure scientific integrity, consistency, and robust analysis and their consensus recommendations were that the EPA develop additional policy and/or guidance documents; further describe how pivotal science would be selected, made available, and peer reviewed; consider establishing an office on data sharing with the support of a peer review panel; provide greater clarity in the definitions of key terms, including data, independent validation, and publicly available; develop specific criteria for the Administrator's exemptions under the rule; consider applying rule requirements only to information developed after the effective date of the rule; seeking input from experts to identify best practices to ensure efficiency, utility, and protection of data that are made available; and consider funding reanalysis work.

As noted in the preamble for the final rule, this rule sets the overarching structure and principles for transparency of pivotal science in significant regulatory actions and influential scientific information and technical considerations, including those noted by the SAB, could be addressed in subsequent implementation guidelines and/or statute-specific rulemakings. Further, in response to comments from SAB and the public, the EPA clarified and modified several key definitions, including data, independent validation, and publicly available, in the final rule. The EPA also provided criteria for the Administrator's exemption in 40 CFR 30.7 of the final rule. The EPA would like to clarify that this rule does not direct or require any outside entity or the EPA to establish data sharing mechanisms and does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. Comments related to making data available and future funding opportunities are not within the scope of this rulemaking. Finally, the EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. However, in consideration of instances where data cannot be made available, the EPA amended the rule to provide technical considerations (40 CFR 30.5(d)) that can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability in the absence of maximum transparency and included an exemption criterion—that the development of the dose-response data was completed or updated before the effective date of the rule—to 40 CFR 30.7 to account for the concerns raised by the SAB and other public commenters.

Comment: Commenter (12427) asserts that the need to establish the quality of published information described in the proposed rule is accomplished through peer view, as discussed in the following sentence from the 2004 OMB Information Quality Bulletin for Peer Review: "Peer review is one of the important procedures used to ensure that the quality of published information meets the standards of the scientific and technical community."²¹⁷⁷ The commenter asserts that science should be evaluated by the scientific and technical community, not by political appointees of EPA. The commenter contends that the transparency rule and SNPRM vest decisions about what studies to exclude from these proposals solely with the politically-appointed Administrator and do not include any science-based criteria for making such decision, nor are such decisions vested in a scientific advisory committee. Furthermore, the commenter states that there are existing scientific Federal advisory committees that serve EPA that already

²¹⁷⁷ https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/assets/OMB/inforeg/peer_review041404.pdf.

review, evaluate, and assess scientific knowledge pertinent to regulatory and other decision making. The commenter notes that yet, EPA is silent regarding the important role of peer review and fails to explain why existing peer review mechanisms are inadequate.

The commenter asserts that peer review related to scientific rigor and not the narrow definition of “transparency” that EPA is attempting to codify into a regulation. Additionally, the commenter asserts that the lack of consideration for CBI and intellectual property in the proposed rule is inconsistent with current practice in scientific journals, and OMB’s Information Quality Bulletin for Peer Review. The commenter also expressed concern for patient privacy.

Response: The EPA agrees that existing mechanisms within the EPA, the federal government, and in the scientific community are increasingly pushing towards greater data sharing and increasing scientific rigor. The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency’s goal of greater transparency. Although current methods and processes do allow for public comment and, where appropriate, peer review in the development of significant regulatory actions and influential scientific information, subject matter experts and peer reviewers (including the SAB and other science advisory panels) generally have not had access to the underlying data necessary to fully evaluate scientific conclusions. The final rule also provides that the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA believes that the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

Also as discussed in the preamble to the final rule, the EPA is retaining the Administrator’s exemption provision with some added considerations in response to public comments. To ensure that the Administrator’s decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation. The EPA is confident that the criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

Commenter (12427) contends that EPA has failed to justify that its existing peer review mechanisms fail to address scientific rigor in assessing science relevant to regulatory decision making. The commenter provides that peer review mechanisms already available to EPA include but are not limited to scientific Federal advisory committees (*e.g.*, EPA SAB, EPA’s CASAC, EPA FIFRA Scientific Advisory Panel), as well as ad hoc reviews (organized as panels or based

on reviews from multiple individuals). Furthermore, the commenter states that for changes that may broadly affect the scientific enterprise, EPA has routinely sought advice from the NASEM, including but are not limited to, Risk Assessment in the Federal Government: Managing the Process; Review of EPA's Integrated Risk Information Systems; Science and Judgment; Science and Decisions; and many others. According to the commenter, EPA has failed to engage CASAC, the SAB, or any other of its advisory committees on the transparency rule or its supplement, has not engaged external experts to review any scientific work products for this proposed rule and supplement, and has not engaged NASEM.

Response: The EPA agrees that existing mechanisms within the EPA, the federal government, and in the scientific community are increasingly pushing towards greater data sharing and increasing scientific rigor. The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. Although current methods and processes do allow for public comment and, where appropriate, peer review in the development of significant regulatory actions and influential scientific information, subject matter experts and peer reviewers (including the SAB and other science advisory panels) generally have not had access to the underlying data necessary to fully evaluate scientific conclusions. This rule provides that the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA believes that the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

The EPA's SAB provided advice and comments on mechanisms for secure access to PII and CBI under the proposed rule on September 30, 20 and the proposed and supplemental rulemakings on April 24, 2020. All of these comments were considered in developing the final rule. In brief, the SAB consensus was that it supported the precept of enhancing public access to scientific data and analytical methods to ensure scientific integrity, consistency, and robust analysis and their consensus recommendations were that the EPA develop additional policy and/or guidance documents; further describe how pivotal science would be selected, made available, and peer reviewed; consider establishing an office on data sharing with the support of a peer review panel; provide greater clarity in the definitions of key terms, including data, independent validation, and publicly available; develop specific criteria for the Administrator's exemptions under the rule; consider applying rule requirements only to information developed after the effective date of the rule; seeking input from experts to identify best practices to ensure efficiency, utility, and protection of data that are made available; and consider funding reanalysis work.

As noted in the preamble for the final rule, this rule sets the overarching structure and principles for transparency of pivotal science in significant regulatory actions and influential scientific information and technical considerations, including those noted by the SAB, could be addressed

in subsequent implementation guidelines and/or statute-specific rulemakings. Further, in response to comments from SAB and the public, the EPA clarified and modified several key definitions, including data, independent validation, and publicly available, in the final rule. The EPA also provided criteria for the Administrator's exemption in 40 CFR 30.7 of the final rule. The EPA would like to clarify that this rule does not direct or require any outside entity or the EPA to establish data sharing mechanisms and does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. Comments related to making data available and future funding opportunities are not within the scope of this rulemaking. Finally, the EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. However, in consideration of instances where data cannot be made available, the EPA amended the rule to provide technical considerations (40 CFR 30.5(d)) that can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability in the absence of maximum transparency and included an exemption criterion—that the development of the dose-response data was completed or updated before the effective date of the rule—to 40 CFR 30.7 to account for the concerns raised by the SAB and other public commenters.

Comment: Commenter (12430) notes that congressional directives already require U.S. EPA to consider whether scientific information is reasonable, clear, and complete and whether it has been peer reviewed.²¹⁷⁸ The commenter states that existing mechanisms complement these directives, including: the SAB, established by Congress in 1978 to advise on scientific matters;²¹⁷⁹ existing independent peer review of much of the scientific research relied on for regulatory action and publication; legal requirements that prohibit U.S. EPA's adoption of regulations that are arbitrary, capricious, or unsupported by substantial evidence²¹⁸⁰; and procedures to request reconsideration of Agency decisions and correction of Agency information.²¹⁸¹ Additionally, the commenter contends that the process for setting the NAAQS illustrates the scientific review procedures that are already in place for EPA's regulatory actions.²¹⁸² The commenter provides that after determining weight by independent peer review, EPA staff and their contractors review the literature and subject it to further internal review, they develop a staff report. The commenter states that CASAC, which consists of internationally recognized experts in their scientific disciplines, reviews the EPA staff report, and in turn provides advice to the Administrator regarding the adequacy of current standards and recommendations for revisions, if necessary, for the protection of public health. Additionally, the commenter states that the reports receive public comment, including from independent and

²¹⁷⁸ See, e.g., the Toxic Substances Control Act at 15 U.S.C. § 2625, subds. (h) and (i), requiring U.S. EPA to consider several factors to evaluate science relating to toxic chemicals and requiring that decisions be based on “the weight of the scientific evidence,” the Safe Drinking Water Act at 42 U.S.C. § 300g-1(b)(3)(A)(i), requiring U.S. EPA to rely on “the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices,” and the Clean Air Act at 42 U.S.C. § 7408(a)(2), requiring U.S. EPA to use “latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare.”

²¹⁷⁹ 42 U.S.C. § 4365.

²¹⁸⁰ E.g., 5 U.S.C. § 706.

²¹⁸¹ U.S. EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency (2002), <https://www.epa.gov/quality/guidelines-ensuring-andmaximizing-quality-objectivity-utility-and-integrity-information>, at 30.

²¹⁸² See 42 U.S.C. § 7409(d).

industry scientists, and the CASAC review includes consideration of those public comments. According to the commenter, the EPA NAAQS documents typically receive multiple rounds of expert scientific review before they are finalized.

Commenter (12715) states that EPA never explains, in either the initial proposal or the SNPR, how its new approach will improve the Agency's scientific decision-making and references a 2019 joint statement of the editors of leading scientific journals.²¹⁸³ The commenter contends that the scientific bases of EPA risk and policy assessments are already peer reviewed by panels such as the EPA SAB panels, CASAC, FIFRA Science Advisory Panels, and the TSCA Science Advisory Committee to ensure that the evaluation of studies is performed using appropriate scientific criteria. According to the commenter, these reviewers have ample tools to evaluate the merit and robustness of scientific studies and information, including assessing: the quality of a study's design; the reasonableness of any assumptions; whether sample sizes are sufficient; whether the evidence is strong enough to support a conclusion; and how the study compares with other studies in the same subject matter area. The commenter asserts that EPA does not explain why these existing review criteria are insufficient or how its new, arbitrary requirements will add "transparency" or improve EPA's decision-making.

Response: The EPA agrees that existing mechanisms within the EPA, the federal government, and in the scientific community are increasingly pushing towards greater data sharing and increasing scientific rigor. The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. Although current methods and processes do allow for public comment and, where appropriate, peer review in the development of significant regulatory actions and influential scientific information, subject matter experts and peer reviewers (including the SAB and other science advisory panels) generally have not had access to the underlying data necessary to fully evaluate scientific conclusions. This rule provides that the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA believes that the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings

Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential

²¹⁸³ Berg J, et al. Joint Statement on EPA Proposed Rule and Public Availability of Data. *Science*. 2018;360(6388); Thorp HH, et al. Joint Statement on EPA Proposed Rule and Public Availability of Data (2019). *Science*. 2019;366(6740).

scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information. The promulgation of these internal Agency procedures in this rulemaking highlights the Administration's commitment to ensuring transparency in the EPA's most impactful regulatory actions and influential scientific information.

Comment: Commenter (11391) states that in its notice announcing the 2018 proposed rule, EPA claimed that it is needed to ensure the validity of the scientific information relied upon by the Agency, and enhance the transparency of regulatory processes,²¹⁸⁴ and while the earlier comments submitted by the commenter and others clearly show that is not the case, EPA has doubled-down on its claim, but again offered no evidence to support it.²¹⁸⁵

The commenter (11391) notes that it is well established that Agency actions must be based on a consideration of relevant evidence and accompanied by a clear statement of how that evidence supports the action taken.²¹⁸⁶ The commenter states that as the Supreme Court explained in *Federal Commissions Commission v. Fox Television Stations, Inc.*, an Agency must supply “good reasons” for reversing a previously held position,²¹⁸⁷ and that those reasons must be especially compelling where, as here, the agency's new position “rests on factual findings that contradict its prior policy.”²¹⁸⁸ In such cases, the commenter provides that the Agency must provide “a more detailed justification than what would suffice for a new policy created on a blank slate,” including a “reasoned explanation” for disregarding the facts and circumstances on which its prior policy was based.²¹⁸⁹ According to the commenter, in the absence of such an explanation, the Agency's action must be considered arbitrary and capricious in violation of the APA.

As such, the commenter (11391) states that EPA has not provided any justification for its newfound view that the validity of scientific research can only be assessed if the underlying data are disclosed.²¹⁹⁰ The commenter contends that this view is at odds with the widespread

²¹⁸⁴ 2018 Notice, *supra* note 2, at 18769.

²¹⁸⁵ See e.g., 2020 SNPRM, at 15340 (discussing the need for “reanalysis” of data underlying scientific research).

²¹⁸⁶ *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto Ins. Co.*, 463 U.S. 29, 43 (1983) (an agency must “articulate a satisfactory explanation for its action including a rational connection between the facts found and the choice made). See also *Fed. Comm'n Comm'n v. Fox Television Stations, Inc.*, 556 U.S. 502, 513 (2009) (an agency must “examine the relevant data and articulate a satisfactory explanation for its action”)

²¹⁸⁷ *Fox Television Stations, Inc.*, 556 U.S. at 515.

²¹⁸⁸ *Id.*

²¹⁸⁹ *Id.* at 515-516. See also *U.S. Sugar Corp. v. Envtl. Prot. Agency*, 830 F.3d 579, 626 (D.C. Cir. 2016) (when an agency reverses a previous policy and “its new policy rests upon factual findings that contradict those which underlay its prior policy,” it must “provide a more substantial explanation or reason . . . than [would be required] for any other action”).

²¹⁹⁰ The commenter asserts that this was recognized by EPA's Science Advisory Board in its review of the Proposed Rule. See Science Advisory Board (SAB) Consideration of the Scientific and Technical Basis of EPA's Proposed Rule titled Strengthening Transparency in Regulatory Science 18 (2020), <https://perma.cc/D34M-979N> (EPA has not adequately explained “why existing procedures and norms utilized across the U.S. scientific community,

consensus within the scientific community that existing peer review processes, which do not require data disclosure, are sufficient to ensure the validity of scientific research.²¹⁹¹ The commenter notes that recognizing this, in 2016 EPA concluded that the availability of underlying data “does not affect the validity of the scientific conclusions from peer-reviewed research publications.”²¹⁹² Now, less than four years later, EPA has suddenly changed its view. According to the commenter, neither the 2018 Notice nor the 2020 SNPRM acknowledge the change, much less provide a reasoned explanation for it.²¹⁹³

Furthermore, the commenter (11391) states that in the 2020 SNPRM, EPA baldly asserts that the Proposed Rule is needed to ensure Agency practices are consistent with new guidance from the OMB, but does not explain why,²¹⁹⁴ nor could it, since the referenced guidance—an April 2019 Memorandum on Improving Implementation of the Information Quality Act²¹⁹⁵—does not require EPA to adopt the Proposed Rule or even support its stated reasons for doing so. The commenter asserts that whereas EPA claims that access to underlying data is needed to ensure the validity of scientific research, the memorandum indicates that this can be achieved through peer review.²¹⁹⁶

The commenter (11391) also points to EPA’s reference to OMB’s 2002 Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies²¹⁹⁷ but, again, they do not support adoption of the Proposed Rule. The commenter contends that while the Guidelines do call for increased transparency in science, the provisions in the proposed rule that require disclosure are inconsistent with provisions in the Guidelines that indicate that transparency does not necessarily require disclosure of the data underlying research studies, that such disclosure can raise ethical and/or other issues,²¹⁹⁸ and that

including the federal government, are inadequate, and how the Proposed Rule will improve transparency and the scientific integrity of the regulatory outcomes”).

²¹⁹¹ Jeremy Berg et al., Joint Statement on EPA Proposed Rule and Public Availability of Data, 360 Science (May 4, 2018), <https://science.sciencemag.org/content/360/6388/eaau0116>. The commenter states that this view is also shared by the Office of Management and Budget. See Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies, 67 Fed. Reg. 8452, 8454 (Feb. 22, 2002) (“[W]e regard technical information that has been subjected to formal, independent, external peer review as presumptively objective”).

<https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf>

²¹⁹³ The commenter contends that EPA has implied that it has not previously had a coherent policy with respect to the use of scientific studies, but that is not the case. The commenter states that EPA’s approach is similar to that at issue in *Physicians for Social Responsibility v. Wheeler*, wherein the D.C. Circuit Court of Appeals held the agency had acted arbitrarily, including because it failed to adequately explain its change in position. See *Physicians for Social Responsibility v. Wheeler*, 2020 U.S. App. LEXIS 12727 (D.C. Cir. 2020).

²¹⁹⁷ Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies, 67 Fed. Reg. 8452, 8454 (Feb. 22, 2002)

²¹⁹⁸ Id. at 8460 (“With regard to original and supporting data [underlying scientific research], agency guidelines shall not require all disseminated data be subjected to a reproducibility requirement. Agencies may identify . . . those

balances the need for transparency against “other compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections.”²¹⁹⁹ The commenter asserts that rather than attempt such a balance, EPA has declared a blanket standard, under which it must ignore or give lesser weight to studies for which the underlying data are not available, even if those studies have been independently verified (e.g., through peer review) and the researchers have valid reasons for withholding the underlying data.

Finally, the commenter (11391) notes that the 2018 Proposed Rule applied only to dose-response data and models underlying pivotal regulatory science that is used to justify significant regulatory decisions and that EPA is now proposing to expand the scope of the Proposed Rule in two ways:

1. the Proposed Rule would apply not only to the science relied upon in promulgating significant regulatory decisions, but also in finalizing influential scientific information; and
2. the Proposed Rule would apply to all data and models underlying such science, instead of only dose-response data and models.

The commenter (11391) contends that EPA offers no explanation for the first change. With respect to the second, the commenter provides that EPA asserts that “[t]ransparency of EPA’s science should not be limited to dose-response data and dose-response models, because other types of data and models will also drive . . . significant regulatory decisions and influential scientific information.”²²⁰⁰ The commenter asserts that EPA has still not explained why its version of “transparency” is necessary or appropriate.

Response: The EPA agrees that existing mechanisms within the EPA, the federal government, and in the scientific community are increasingly pushing towards greater data sharing and increasing scientific rigor. The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency’s goal of greater transparency. Although current methods and processes do allow for public comment and, where appropriate, peer review in the development of significant regulatory actions and influential scientific information, subject matter experts and peer reviewers (including the SAB and other science advisory panels) generally have not had access to the underlying data necessary to fully evaluate scientific conclusions. This rule augments, but does not replace, existing Agency procedures for evaluating science underlying significant regulatory actions and influential scientific information. As further discussed in the preamble to the final rule, the EPA is focusing on dose-response data in this rule to pursue an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done

particular types of data that can practicable [sic] be subjected to a reproducibility requirement, given ethical, feasibility, or confidentiality constraints”). *See also id.* at 8455-8456 (“Agencies are encouraged to address ethical, feasibility, and confidentiality issues with care . . . OMB urges caution in the treatment of original and supporting data because it may often be impractical or even impermissible or unethical to apply the reproducibility standard to such data”).

²¹⁹⁹ *Id.* *See also id.* at 8453 (indicating that “agencies must apply these standards flexibly, and in a manner appropriate to the nature and timeliness of the information” at issue).

²²⁰⁰ 2020 SNPRM, at 15399-400

in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. When implemented, the rule provides that the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA believes that the implementation of this final rule will increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information. The promulgation of these internal Agency procedures in this rulemaking highlights the Administration's commitment to ensuring transparency in the EPA's most impactful regulatory actions and influential scientific information.

In addition, the EPA clarified 40 CFR 30.5 to give equal consideration to dose-response data that are publicly available or available through restricted access. As discussed in the final rule, underlying dose-response data are considered available if they can be accessed through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The EPA believes that the final rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

In the preamble to the final rule, the EPA clarifies that although the availability of dose-response data underlying a study in a manner sufficient for independent validation is an important component of determining the level of consideration to afford a study, the EPA agrees that availability by itself is not sufficient to determine study quality or validity. As explained in 40 CFR 30.5, the EPA will use existing factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) to evaluate study quality. Subsequently, after identifying the highest quality, most relevant studies that would inform a dose-response assessment and identifying the availability of pivotal science, the EPA would consider additional applicable factors as described in 40 CFR 30.5(d) when determining the level of consideration to give pivotal science where the underlying dose-response data are not available for independent validation.

The EPA disagrees with commenters that peer review can achieve the goals of this rulemaking. Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule. Jamieson et al. (2019) state, "Journals play a key role in ascertaining the quality of the evidence in work submitted for publication through peer review. However, that practice is neither uniform

nor free of exploitation. While it can select for trustable results, its existence alone is not sufficient to verify the quality of the evidence used to back claims.”²²⁰¹ The authors go on to say that additional confidence could be gained from third-party reanalyses that independently validate the study results.²²⁰² In addition, as detailed in OMB’s Final Information Quality Bulletin for Peer Review, “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals²²⁰³ and the emergence of organizations, such as the Center for Open Science, and international initiatives like FAIR data principles; FOSTER; and Guidelines for TOP in Journal Policies and Practices that incentivize greater transparency in research.^{2204,2205} The EPA supports these efforts and believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety.

2.2.1.4 Basis for Proposal is Valid

Comment: Commenter (11401) states that they understand why EPA felt it necessary to supplement the rulemaking due to the Proposal’s mischaracterization as an effort to block science. The commenter contends that this is not the case and that EPA is well within its authority to carry out the provisions of the SNPRM and it is a laudable effort to hold itself to scientific standards, as is only right and equitable as it holds companies and citizens to strict environmental standards that cost society billions of dollars every year.

Commenter (12692) contends that the Environmental Protection Network’s assertion the rulemaking has no problem it is trying to solve is flawed. The commenter provides that it is a bit much to demand that EPA produce a list of its own “bad decisions” as any such determination would require a rulemaking of its own. The commenter states that the core thesis of the Transparency proposal is not that EPA knows the studies it relies on lead to “bad” decisions but that, in many cases, it cannot properly evaluate those decisions because the underlying studies incapable of independent validation. The commenter asserts that quality control via the “marketplace of ideas” has been precluded.

²²⁰¹ Jamieson, K. H., McNutt, M., Kiermer, V., and Sever, R. (2019). Signaling the trustworthiness of science. *Proceedings of the National Academy of Sciences in the United States of America* 116(39):19231-19236. <https://doi.org/10.1073/pnas.1913039116>.

²²⁰² Ibid.

²²⁰³ McNutt, M. (2016). Taking up TOP. *Science* 352, 1147. Available at <https://doi.org/10.1126/science.aag2359>.

²²⁰⁴ NAS (National Academies of Sciences, Engineering, and Medicine). (2019). *Reproducibility and replicability in science*. Washington, DC: The National Academies Press. Available at <https://www.nationalacademies.org/our-work/reproducibility-and-replicability-in-science>.

²²⁰⁵ Nosek, B. A. et al. (2015). Promoting an open research culture. *Science* 348, 1422-1425. Available at <https://doi.org/10.1126/science.aab2374>.

Additionally, the commenter (12692) states that the “replication crisis”²²⁰⁶ is very real and that many studies published in prestige journals turn out to be junk. The commenter references *The Economist*, in an editorial cited by the Transparency proposal, that explained the problem as follows:

A simple idea underpins science: “trust but verify.” Results should always be subject to challenge from experiment. That simple but powerful idea has generated a vast body of knowledge. Since its birth in the 17th century, modern science has changed the world beyond recognition, and overwhelmingly for the better.

The commenter (12692) provides that success can breed complacency and that modern scientists are doing too much trusting and not enough verifying—to the detriment of the whole of science, and of humanity. According to the commenter, too many of its findings that fill the academic ether are the result of shoddy experiments or poor analysis (see pages 26-30). The commenter asserts that a rule of thumb among biotechnology venture-capitalists is that half of published research cannot be replicated, even that may be optimistic. The commenter notes Amgen and Bayer have failed to reproduce many research projects, as well as the doubt of a leading computer scientist that frets that three quarters of papers in his subfield are bunk. The commenter also references that between 2000-10 roughly 80,000 patients took part in clinical trials based on research that was later retracted because of mistakes or improprieties.²²⁰⁷

According to the commenter (12692), *The Economist* identifies three main causes of replication failure: The publish-or-perish imperative of academic life; the associated career-related inducements to exaggerate, cherry pick results, and spin causality out of chance correlations; publication bias against studies finding negative results; and lax peer review. The commenter provides that for example, the article reports, “When a prominent medical journal ran research past other experts in the field, it found that most of the reviewers failed to spot mistakes it had deliberately inserted into papers, even after being told they were being tested.” The commenter also reiterates Lutter and Zorn’s concern over replicability.²²⁰⁸

Response: The EPA agrees with commenters on the importance of transparency and scientific scrutiny and debate in creating sound environmental policy. Because of the potential impact of the EPA’s significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA fully demonstrate that commitment.

2.2.1.5 Prior Basis for Rule

2.2.1.5.1 Previous Environmental Rulemakings Necessitate Transparency

Comment: Commenter (9335) points to CASAC's 2019 Draft Review of the Particulate Matter Policy Assessment (PM PA) as a basis for the Proposed Rule. The commenter states that their comments reflect the need for transparency as follows: 1) there is NO causal relationship between PM2.5 and total mortality in the US, 2) the PM PA cites 'positive authors' and omits 'null authors' and their criticism, 3) the PM PA does not address the PM2.5 deaths controversy, 4) analyses of underlying data for four key US cohorts, including the Harvard Six Cities Study and the American Cancer Society Cancer Prevention Study II, support the need for the proposed EPA Transparency Rule, and 5) the PM PA must be revised to incorporate the CASAC Review and the criticisms by the commenter and others.

Response: Although the rulemaking is not related to any specific EPA rulemaking or particular study, the EPA agrees with the commenter that transparency and scientific scrutiny and debate is integral to creating sound environmental policy.

Comment: Commenter (9588) states that there is a very real need to review science and notes the FDA's five-step process for drug approval, EPA's chemical review process under the TSCA, and the OMB's requirement for review of all new regulations as a need for review. The commenter also provides that peer-review is a necessity at most legitimate science journals and considered the question of grantees serving on review committees, siding with the financial independence of advisory committee members. Additionally, the commenter notes several critiques of government transparency rules and their importance as they relate to science and policymaking.^{2209,2210,2211,2212,2213}

Response: The EPA agrees with the commenter on the importance of transparency and scientific scrutiny and debate in creating sound environmental policy. Because of the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best scientific information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA fully demonstrate that commitment. The EPA would also like to clarify that reviews conducted by other federal agencies and OMB are outside the scope of this rulemaking.

Comment: Commenter (11899) contends that past EPA rulemakings, including the Clean Power Plan and Endangerment Findings, were often not only secretive and arbitrary, but also adversely affected job creation and retention; the price and availability of the energy, food and consumer products needed in the daily lives of all Americans; and ultimately the health and welfare of

millions of families, especially poor, minority and blue-collar families in states that rely on coal and natural gas for electricity, industries and factories for jobs and salaries – and on other activities that may have some adverse effects on environmental quality and human health and welfare, but also improve our environment, health and welfare in significant ways. The commenter provides that this negative impact provides a compelling case for the threat of EPA's rules on health, welfare, and pursuit of happiness, justice and civil rights progress of our members, the people we represent, and all Americans, than do the damages of any environmental contaminants being regulated, especially when based on secret science and pressure politics.

Response: Although the rulemaking is not related to any specific EPA rulemaking or particular study, the EPA agrees with the commenter that transparency and scientific scrutiny and debate is integral to creating sound environmental policy. Because of the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA fully demonstrate that commitment.

2.2.1.5.2 Roots in Previous Legislation

Comment: Commenter (11392) states that the rulemaking's legacy lies in the failed Secret Science Reform Acts of 2014²²¹⁴ and 2015²²¹⁵ and the Honest and Open New EPA Science Treatment (HONEST) Act of 2017²²¹⁶, bills that passed out of the House Committee on Science, Space, and Technology under Republican leadership but that the Senate did not see fit to consider. The commenter contends that this attempt to implement the provisions of failed legislation through rulemaking is an inappropriate circumvention of the authorities granted to the executive branch by the Constitution, and that the executive branch cannot exercise such legislative powers.

Response: The EPA disagrees that this rule is politically motivated, as transparency assumes no political ideology. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. The EPA is committed to furthering this effort with the implementation of this final rule. The EPA drafted this rulemaking independent of any external parties.

Comment: Commenter (11890) notes that many of the same arguments were made in support of the Shelby Amendment of 1999. Following passage, the commenter states that broad demand for this public access never materialized. According to the commenter, the amendment and subsequent OMB Circular A-110 included provisions for public access to data from federally funded research. The commenter states that the mechanism providing access included procedures established under the FOIA. The commenter provides that an investigation into requests to EPA made between 2002 and 2012 for underlying study data (beyond published findings) found only two such requests.²²¹⁴ Both were granted through the FOIA mechanism provided by the Shelby

²²¹⁴ Lynn R. Goldman and Ellen K. Silbergeld, "Assuring Access to Data for Chemical Evaluations," *Environmental Health Perspectives* 121, no. 2 (December 11, 2012): 149-152

Amendment. The commenter contends that this is hardly evidence of broad public demand for underlying study data.

Conversely, commenter (11915) states that the underlying intent of these reforms is grounded in the broadly agreed upon principle that citizens should have a right to the data and information that are used in the development of public policy. The commenter contends that this spirit of openness with respect to the regulatory process is found throughout government; it is enshrined in statute (known as “the Shelby Amendment”) and countless federal directives and EPA memos reinforce the principle and detail guidance for implementing it. The commenter notes that publicly available data and information is also supported by experts of all political stripes, referencing a 2012 congressional testimony where White House science advisor Dr. John Holdren stated that “absolutely, the data on which regulatory decisions and other decision are based should be made available to the Committee and should be made public.”

Response: The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. This rule is designed to build upon OMB M-19-15, which highlights the need to characterize the sensitivity of an agency’s conclusions to analytic assumptions, as well as other federal guidance documents that require greater data transparency. The EPA’s attention to data transparency is also responsive to the broader interest in greater data and model transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members of the public, scientific community, and Congress on the transparency of the scientific basis for EPA’s decisions in previous influential scientific information assessments and regulatory actions. The EPA’s continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency’s decisions.

2.2.2 Effects

2.2.2.1 Limits Available Science

Comment: Several commenters (9372, 10045, 10055, 10740, 10748, 10749, 10751, 10752, 10753, 10865, 10944, 10969, 10973, 10974, 11176, 11183, 11192, 11330, 11339, 11340, 11347, 11349, 11350, 11354, 11359, 11360, 11377, 11387, 11390, 11392, 11395, 11396, 11402, 11403, 11404, 11408, 11479, 11484, 11489, 11490, 11495, 11496, 11497, 11498, 11576, 11894, 11903, 11911, 11918, 11919, 11921, 12404, 12405, 12412, 12415, 12422, 12427, 12430, 12431, 12435, 12442, 12443, 12456, 12458, 12464, 12466, 12474, 12688, 12540, 12645, 12701, 12707, 12712, 12715, 12716, 12720, 12727, 13549, 13788) that oppose the proposed rule note that the proposed rule would limit the use of science (and/or “best available science”) valuable research from being considered in the EPA rule making process and that the supplemental proposal compounds the problem by expanding the scope of science that the rule would apply to. Additional comments and responses to comments on the implications for health and environmental protections are included in Section 2.2.2.3 of this Chapter. Commenters claim that most of the best research does not use publicly available data. Several examples of specific comments follow:

Commenter (11403) notes that providing raw data is not often a requirement for scientific publication. The commenter states that this does not mean that scientists should ignore any study that does not provide raw data; it simply means the peer review process ensures that data analysis is done properly. The commenter provides that this has been the scientific standard for more than 100 years. As noted by many commenters, the commenter states that raw data from epidemiological studies are often not made public in order to protect patients' identities as required by federal law. The commenter notes that many epidemiological studies that measure exposure to and harm from pollutants look at vulnerable populations in order to get a sense of how these populations respond compared to the general population. For instance, the commenter states that exposure to sulfur dioxide in the air is particularly worrisome for young people who have asthma, and exposure to pesticides tend to have a greater effect on the farmworker population due to disproportionately high chronic exposures.

Commenter (12442) contends that the EPA's supplemental rule proposal unnecessarily modifies which studies can be considered and unscientifically reduces the consideration of valuable and necessary studies that aid the Agency in setting policy to protect public health and the environment.

Commenter (11484) states that while they agree in principle that the increase of transparency in regulatory science is beneficial, that increase cannot come at the expense of EPA's statutory requirement to rely on the best available science.

Commenter (12435) contends that past, current and proposed research would be stifled by the SNPRM, due in part to state privacy rules. The commenter states that the proposed regulations force a false, illegal and unreasonable choice between protecting privacy and protecting public health.

Commenters (12435, 12456) express concern that, if the current language proposed by the SNPRM is adopted, studies conducted by researchers in Colorado would no longer be given weight because the underlying data would not be publicly available in accordance with Colorado Board of Public Health Rules, regardless of the quality of the study and the relevance of the information. The commenters state that, although these studies can be useful and even essential when EPA considers new rules or changes to existing regulations, current Colorado Board of Public Health Rules limit the availability of data collected by health departments to protect privacy.

Commenter (12435) states that the proposed rule may unjustifiably exclude water sampling data collected by the Water Quality Control Division and entities within Colorado due to conflicts with the Colorado Open Records Act. The commenter states that the EPA should have access to all sampling data in Colorado while developing its guidance and rules, and the use of this data should not be at the discretion of the EPA Administrator, or excluded from consideration because the data was collected from drinking water system intakes or private wells.

Commenter (12456) states that high-quality research by Colorado Parks and Wildlife has been used by EPA to develop cadmium, copper, lead, silver and zinc criteria to protect aquatic life. The commenter states that the EPA should have access to all high-quality data, studies, and

models while developing its guidance and rules, and the use of this data should not be at the discretion of the EPA Administrator, or excluded from consideration because all or part of study took place on private lands in Colorado. The commenter urges the EPA to change the 2020 proposed rule to promote the use of all high-quality data and studies in EPA's decision making, including studies that may include data that is not publicly available.

Commenter (11498) notes that the widening of the scope won't just limit EPA's use of science underpinning regulation, but also EPA's use of science underpinning other significant outputs of the Agency. According to the commenter, the changes mean EPA will likely be unable to cite important studies on topics relating to the levels of contaminants in water, air and land; epidemiological studies that describe clinical markers of exposure or effect; and many other studies that are fundamental in understanding and protecting human health.

Commenter (11894) states that, in short, adopting this proposal would do even more than adoption of the initial proposal to bar the Agency from basing its decisions on the best available science as the law requires.

Commenter (12707) states that the changes provided in the supplemental rule fail to clarify how EPA will approach long standing scientific studies – it only creates further confusion and broadens the scope of science that will be covered. According to the commenter, the initial proposal and this supplemental proposal are a next step in a very transparent effort to discredit and make unavailable certain seminal studies that establish the connection between exposure to air pollution and adverse public health impacts.

Commenter (12464) notes that in their comments on the initial proposal, they explained that the proposed rule would prevent EPA from relying on studies involving confidential human health data, thus violating the Agency's duty to rely on the best available science. The commenter states that the supplemental proposal offers two alternatives that purportedly address this concern, one allowing EPA to consider studies without publicly-available data "if there is tiered access to these data and models in a manner sufficient for independent validation," 85 Fed. Reg. at 15,399, and the other giving lesser weight to studies whose data are not publicly available, *id.* The commenter contends that while the supplemental proposal presents the proposed and alternate versions of 40 C.F.R. 30.5 as solutions to concerns that they and many others raised regarding the initial proposal, the new provisions are in fact no improvement.

Commenter (11330) states that the 2018 proposed rule would have allowed the EPA to selectively exclude studies with conclusions they found unfavorable. The commenter notes that he was joined by over one hundred members of Congress, a thousand scientists, and the leading scientific advocacy organizations in America in condemning the proposal. Clearly, according to the commenter, the EPA did not heed their call. The commenter contends that the path the EPA chose given this blowback was to release a supplemental rule that effectively does the same thing. The commenter adds that the supplemental proposal allows the EPA to prioritize studies, and not just for rulemaking, for all EPA activities.

Commenter (11489) states that the proposed rule and SNPRM serve only to limit the studies the EPA can consider to those in which the data is publicly available, regardless of quality and value.

The commenter states that these efforts limit the EPA's own ability to engage in evidence-based policymaking and do not address a legitimate need, as the EPA already has the authority to determine which studies it will consider during rulemaking.

Commenter (11903) states that under its first option, the EPA is proposing rules forbidding the use of scientific evidence, including evidence from "high-quality studies", without regard to relevance, in a way that will obviously impose costs on others, by narrowing the indicia that scientists routinely use when determining what evidence is reliable. Under its second option, EPA proposes to bind itself to a complex decision-making contraption, requiring EPA and the public to interpret and apply at least ten newly promulgated regulatory definitions, all as a predicate to allow EPA to give "greater consideration" to certain data.

Commenter (12431) expresses concern that in its desire to ensure that the data underlying its significant regulatory actions and influential scientific information are publicly available, the EPA may exclude information that is most relevant to its assessment of risks to human health and the environment. In particular, the commenter states that excluding information that cannot be made publicly available would slow the development and implementation of alternative test methods and strategies to replace animal testing. The commenter adds that expanding the scope of this rulemaking would obviously compound the issue of potentially excluding information relevant to EPA's regulatory actions and scientific information.

Commenter (11183) states that the supplemental notice extends its reach. The commenter notes that the EPA's Risk Assessment paradigm has 3 components: Hazard Identification, Dose Response Analysis and Exposure Assessment, that then feed into the final Risk Characterization. The commenter notes that the proposal highlighted only the dose response data for limitation; the supplemental notice expands it to include all the components of the Risk Assessment. The commenter contends that limiting the use of the best science, viz human exposure and health data, throughout the Risk Assessment will eviscerate the science. Similarly, the commenter states that the supplemental notice expands the application of this policy from only regulatory decisions to include other 'influential scientific information', that is, all the business of EPA.

Commenter (12427) states that the combination of the proposed rule and supplemental notice will have the effect of restricting the use of rigorous scientific studies with the following features:

- Health studies with PII
- CBI
- Intellectual property
- Older studies for which the data and models may no longer be available.
- International studies (e.g., because privacy and confidentiality restrictions in other countries may not enable full disclosure of raw data)

Commenter (10055) specifically asserts that the proposed supplement would throttle the science that supports standard-setting for the future and for the renewal of current standards. The commenter adds that it would greatly reduce the number of high-quality studies that could

support environmental policy and regulation because these studies rely on confidential medical data and cannot be made publicly available or even posted on a tiered-access program.

Commenter (12701) expresses concern that if this rule goes into effect, the EPA might disregard premier peer-reviewed studies when revising air quality or drinking water regulations because confidential health information from study participants cannot be verified. Ultimately, the commenter is concerned that if what they believe is an this overly broad rule goes into effect, future EPA information and regulations intended to protect public and environmental health will not be informed by the best science.

Commenter (11402) states that the proposal would undermine EPA's ability to use the best available science in its policy-making process and thus impede EPA's mission to protect human health and the environment. The commenter states that the proposed supplemental rule would significantly undermine the ability of the EPA to use the best available science in setting policies and regulations if implemented. The commenter adds that it would result in a significant reduction in science that could be used by EPA, risking direct harm to our citizens and their environment. Therefore, the commenter contends that the effect of the rule would be to weaken the scientific underpinnings of federal policy and that standards created and enforced by the EPA should be based on ALL of the best available published science, data, and models. The commenter states that peer-reviewed literature is considered to be the gold standard for high quality research and that the use of such peer-reviewed scientific studies and conclusions in policy deliberations should not be restricted to studies with publicly available underlying data.

Commenter (12715) states that the supplemental proposal would eliminate or de-emphasize consideration of relevant, peer-reviewed scientific studies where the underlying data cannot all be made public or cannot be made available via the proposed complicated tiered access system. In addition, the commenter notes that the proposal gives complete discretion to the EPA Administrator to decide what studies with non-public data are subject to the rule. The commenter contends that this would likely eliminate from consideration any research studies that, for valid reasons, do not have underlying data that can be made publicly available, including public health studies that form the basis of many critical nationwide protections.

Commenter (12715) states that applying the public availability requirement to all studies, regardless of when they were generated would severely restrict the body of scientific literature that could be considered as the basis for a "pivotal" science decision. According to this requirement, the commenter expresses concern that studies based on data that is not available or obtainable—which is the case for most older studies, many of which are crucial to the scientific issues considered by EPA—would no longer be used by EPA in its decision-making processes unless the Administrator used his or her discretion to grant an exemption under section 30.9. For example, the commenter notes that the EPA is required to review its NAAQS for criteria pollutants every five years and, if necessary, revise them to protect public health and the environment. See 42 U.S.C. § 7409(d). The commenter provides that the NAAQS review process builds on the administrative record from prior rulemakings, including historic studies that are part of that record. Under the supplemental proposal, the commenter states that the EPA could refuse to consider these studies and others because they rely on data pertaining to the personal medical histories of participants that cannot, by the studies' terms or by law, be divulged. The

commenter contends that restricting the use of such studies would significantly undermine current and future NAAQS reviews and other rulemakings and would flout EPA's duty to use the best available science when protecting public health and the environment.

Additionally, commenter (12715) notes that given that the requirements set forth in the supplemental proposal might also be applied to historical studies considered by the Agency in any actions it takes going forward, many groundbreaking studies conducted in accordance with accepted scientific research principles could be either excluded from consideration or accorded less weight under EPA's tiered hierarchy for consideration. The commenter states that environmental research also may rely on CBI or data collected on private land that owners may not want made public. In short, the commenter asserts that the proposed rule will limit the scientific research that can be used to protect public health and the environment, which in turn will have a material adverse effect on State, local, and tribal communities

Commenter (12715) states that the supplemental proposal's requirement that underlying data be available in a manner sufficient for independent validation is technically unworkable. The commenter notes that the potential problems with this approach include that the actual feasibility of making data and models available in a manner sufficient for independent validation is unclear, as studies may be formatted in a manner that makes the data difficult to share, the lab that has generated the data may not be willing or able to collate and release the data, data from studies generated in other countries may be difficult to obtain, and some important conclusions are drawn from meta-analysis of numerous other studies. The commenter concludes that these issues would preclude potentially relevant studies from being considered or would give them less weight without a valid scientific reason for such a restriction.

Commenter (12415) states that helpful, representative tribal data will be more difficult to generate and make available to inform regulatory processes if the rule is adopted. The commenter states that the rule would dismantle decades of precedent and sound practice involving acceptable science, studies, and their use in assisting with regulatory development. The commenter states that thousands of rigorous, peer-reviewed studies and analyses rely on private, confidential patient data—medical studies, personal health data, and clinical reports—which by law cannot be made public.

Commenter (11921) states that their experience makes clear that the EPA should use the broadest possible range of science for making decisions on risk, causality, and other important policy. The commenter notes that, while reproduction of the results of single studies is sometimes helpful in such systematic reviews, limiting evidence synthesis and assessment to only studies that have accessible data would seriously circumscribe the Agency's decision making and the robustness of such decisions.

Commenter (11390) states that even as the EPA expands the proposed rule to capture nearly all science the Agency considers—while still exempting without explanation Agency adjudications and enforcement activities—it presents among these revisions an “alternative” approach that would, if adopted, allow EPA to consider studies based on non-publicly available data under certain circumstances. In reality, the commenter contends that the revised proposed rule further hamstring EPA's ability to use the best science when it regulates. The commenter asserts that

the proposed rule is not only unnecessary and antithetical to the goal of achieving regulatory transparency but would also severely constrain EPA's ability to use the best quality science to make critical decisions. According to the commenter, eliminating the consideration of relevant science from the decision-making process based solely on the availability of underlying data would compromise the EPA's ability to effectively carry out its mission to protect public health and the environment.

Commenter (11192) notes that while the supplemental proposal resolves some of the ambiguities of the original proposal, it exploits the concept of transparency, and provides an avenue for unwarranted dismissal of high-quality science. As a result, the commenter contends that the supplemental proposal further clarifies that this proposed rule would undermine science-based decision-making at the EPA. The commenter adds that, from ethical, legal, financial, and logistical considerations, it is clear that compliance with this proposed rule is untenable for existing public health studies, and the rule could cause the EPA to disregard studies crucial for the protection of human health.

Commenter (11192) asserts that it is an ill-conceived move by the EPA to put current researchers in the position of either complying with privacy laws or allowing their research to have real-world impacts by informing regulations. The commenter states that the effect of this is readily apparent: it will dramatically shift the balance of the kinds of studies that will be utilized in Agency decision-making, reducing the proportion of public health studies and increasing the proportion of assay-based and computational modeling studies. According to the commenter, this is likely to make the link between regulations and health protections less clear, not more.

Commenter (13788) provides that the expansion of the rule to apply to influential scientific information could either arbitrarily erode the usefulness of its peer-reviewed influential scientific information and limit the Agency's ability to rely on influential scientific information in situation where it is required to use the best available science, or, if the Agency chooses to rely on the influential scientific information despite the exclusion of the best available science, potentially allow the Agency to circumvent statutory requirements. According to the commenter, neither of these outcomes is justified.

Commenter (11491) states that both options presented in the SNPRM, which allow for prohibiting, discouraging, or differentially weighing agency use of non-public data, are inconsistent with 2019 guidance from the OMB.²²¹⁵ The commenter states that an approach most consistent with the OMB guidance would be to continue to use the best available science regardless of underlying PII or CBI, and then explore the extent to which that science (possibly through tiering) could be made more accessible. The commenter states, in contrast, the EPA is proposing to give lesser or no consideration to science where data are confidential. The commenter states that, rather than maximizing access to data supporting influential science, the EPA's proposed approach would limit the science on which it can rely to make decisions, capriciously favoring not the most relevant or carefully designed studies, but those with public data.

²²¹⁵ Office of Management and Budget, Improving Implementation of the Information Quality Act; M-19-15 (April 24, 2019).

Response: As more fully discussed in the preamble to the final rule, the EPA is concentrating its efforts in the final rule to increase transparency on dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. Specifically, the scope of dose-response data in this final rule is those studies consisting of the data integral to characterizing dose-response relationships. In some instances, this group will consist of a handful of studies. In other instances, where there are multiple toxicity endpoints, there may be more studies that are crucial to characterizing dose-response relationships. In some other cases, there may be a large number of studies that are used to characterize a dose-response relationship (e.g., where the dose-response is based on a meta-regression of epidemiology studies). However, not all of these studies would be considered pivotal science. This final rule provides an important step in furthering the progress toward maximizing transparency and will provide insight for future statute-specific requirements.

In addition, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA will continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies—based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. When evaluating those scientific studies considered to be pivotal science—in either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. Because the final rule does not categorically exclude any studies, including public health studies, from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations.

In addition, the EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. However, in consideration of instances where data cannot be made available, the EPA amended the rule to provide technical considerations (40 CFR 30.5(d)) that can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability in

the absence of maximum transparency and included an exemption criterion—that the development of the dose-response data was completed or updated before the effective date of the rule—to 40 CFR 30.7 to account for the concerns raised by the SAB and other public commenters.

Moreover, although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may be instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Again, because the final rule does not categorically exclude any studies, including public health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations. Because of these considerations and exemption criteria, the EPA disagrees that implementing this rule will reduce the proportion of public health studies or increase the proportion of assay-based and computational modeling studies. The EPA maintains that this rule is designed to build upon OMB guidance.

With this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

The EPA disagrees with the commenter that the rule is unworkable. Specifically, the commenter specifically stated that there was a feasibility issue with making data and models available. As discussed in the preamble to the final rule, the scientific community has already embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals and the emergence of organizations, such as the Center for Open Science,

and international initiatives like FAIR data principles; FOSTER; and Guidelines for TOP in Journal Policies and Practices that incentivize greater transparency in research. Data sharing mechanisms, like those provided for in the rule, already exist and provide a way to allow a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. Further, in consideration of instances where data cannot be made available, the EPA amended the rule to provide technical considerations (40 CFR 30.5(d)) that can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability in the absence of maximum transparency and included an exemption criterion—that making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, CBI, or national security—to 40 CFR 30.7 to make the rule more flexible. Again, because the final rule does not categorically exclude any studies, including public health studies, from EPA's consideration, the Agency will not be precluded from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The EPA believes that the approach described in the final rule will result in significant regulatory actions and influential scientific information based on the highest quality, most relevant studies and ensure adequate human health and environmental protections while maximizing transparency and maintaining consistency with the statutes the EPA administers. The rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Comment: Commenter (9372) states that it would be foolish not to consider the best research in the field on pollution, nearly all of which uses restricted data on individuals. For example, the commenter notes that the growing literatures in economics, public health and epidemiology have documented the contemporaneous health (Anderson and Thundilyil, 2011; Ransom and Pope, 1995; Pope and Dockery, 1999; Friedman et al., 2001; Moretti and Neidell, 2011; Schlenker and Walker, 2015) and mortality-related impacts among infants and the elderly (Anderson, 2016; Deryugina et al, 2016) of pollution, as well as linked it to bronchitis (Beatty and Shimshack, 2011), diabetes (Bowe et al, 2018) and missing school (Currie et al, 2008). The commenter adds that a growing literature also documents how in utero exposure to pollution affects health outcomes at birth such as infant mortality (Currie and Neidell, 2005; Chay and Greenstone, 2003), birth weight (Currie, Davis, Greenstone, and Walker, 2015) and the development of congenital anomalies (Currie, Greenstone, and Moretti, 2011). See also Jayachandran (2009), Currie and Walker (2011), Knittel, Miller, and Sanders (2015), ArceoGomez, Hanna, and Oliva (2015), and Almond and Currie (2011). Additionally, the commenter provides that some recent research also investigates how pollution exposure during gestation affects later human capital outcomes (Almond, Edlund, and Palme, 2009; Bharadwaj, Gibson, Graff Zivin, and Neilson, 2017; Black, Bütikofer, Devereux, and Salvanes, 2013; Ferrie, Rolphe and Troeskin, Persico, Figlio and Roth, 2016; Rau et al., 2015; Sanders, 2012). For example, Persico and Venator (2020), who find that pollution from local industrial sites opening affect students' academic

achievement and behavioral incidents in nearby schools, as well as school rankings showing that there are community-wide effects of environmental policies. The commenter also adds that a few studies also document how acute, short term exposure to air pollution on testing days affects test score performance and performance in high-skilled occupations (Archsmith, Heyes, and Saberian, 2017). For example, Marcotte (2017) uses the variation in air quality on different testing days and finds that children who take tests on days on worse days for pollen and fine airborne particulate matter have worse outcomes. Similarly, the commenter provides that Roth (2016) finds that pollution on testing days affects college students' performance in the United Kingdom, and Ebenstein and Roth (2014) find that pollution affects performance on high school exit exams in Israel. Hernstadt and Muehlegger (2015) find that crime is higher downwind of highways than on the opposite upwind side, implying that pollution might have cognitive effects. As Almond, Currie and Duque (2016) point out in their recent literature review, even mild health shocks in early life can lead to substantial long-term negative outcomes.

Response: The EPA agrees that the Agency should consider all relevant scientific information when developing significant regulatory actions and influential scientific information and has clarified this point in the preamble of the final rule. As described in the preamble to the final rule, the EPA will continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies— based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. The EPA intends to issue implementation guidelines and statute-specific rulemakings to further clarify and describe how the EPA will identify pivotal science in its assessments and rulemakings. The specific criteria for determining “pivotal science” may necessarily be specific to the authorizing statute, as well as the significant regulatory action or the influential scientific information. The EPA intends to explain in each significant regulatory action and for influential scientific information how the pivotal studies were identified. Once studies considered to be pivotal science are identified, the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. Because the final rule does not categorically exclude any studies, including human health studies, from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations.

The EPA believes that the approach described in the final rule will result in significant regulatory actions and influential scientific information based on the highest quality, most relevant studies and ensure adequate human health and environmental protections while maximizing transparency and maintaining consistency with the statutes the EPA administers.

Comment: Commenter (10740) cites that Professor Steinzor and Professor Wendy E. Wagner have written cogently on how science is normally considered during the regulatory process, when agencies must evaluate the scientific evidence that informs a significant policy decision about health or environmental hazards. The commenter provides that they outline four sequential steps that are normally taken and note that an elaborate version of such steps is mandated by the CAA for EPA to use when setting NAAQS.

The commenter (10740) asserts that the proposed rule, instead, advances a process that Steinzor and Wagner have called “deconstruction” of the evidence. The commenter provides that deconstruction is accomplished through a myriad of techniques, including undermining the validity of studies for nonscientific reasons, encouraging the reconsideration of raw data using unreliable models, and adding research engineered to confound a finding of harm.

Response: The EPA disagrees with the commenter and finds that evaluating the availability of underlying dose-response data for pivotal science is critical to the EPA’s progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by subject matter experts. The rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. Additionally, the EPA believes that the approach described in the final rule will result in significant regulatory actions and influential scientific information based on the highest quality, most relevant studies and ensure adequate human health and environmental protections while maximizing transparency and maintaining consistency with the statutes the EPA administers.

Comment: Commenter (12715) states that although EPA rightly recognizes that it may not be possible to make data and models publicly available for many older studies, focusing the exemption solely on models and data developed before the effective date of the rule ignores the fact that academic researchers and others whose research is relevant to EPA’s work may not conduct and report their studies in a way that satisfies the rule’s requirements, and may not have the resources to change their protocols simply to comply with the rule’s requirements. Moreover, the commenter notes that academic researchers who are focused on publishing their studies in peer-reviewed journals and on obtaining grants and other funding sources for their research have little reason or incentive to even consider whether their studies would qualify for EPA’s use under this rule. The commenter adds that members of the academic community may have conducted and published a particular study with grant money that is long gone, may have moved on to other projects or endeavors, and may have utilized research participants who can no longer be found. By contrast, the commenter states that industry-generated studies are almost always funded and conducted for the purpose of being submitted for consideration by EPA and the industry sector has a strong incentive, as well as sufficient resources, to provide whatever is

required to address any modified or additional “data transparency” requirements imposed by EPA in this new rule. It is therefore unreasonable, according to the commenter, for the EPA to expect that data generated and models used in academic research will be available in ways that comply with the proposed rule simply because they were developed after its effective date.

Response: The EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. One of the criteria the Administrator may use in his/her determination to grant a waiver is that the development of the dose-response data was completed or updated before the effective date of the rule. Because the final rule does not categorically exclude any studies from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations.

These considerations, the Administrator’s exemption, and the EPA’s incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as that noted by the commenter. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Comment: Commenter (12718) states that the EPA elected to broaden the applicability of the proposed regulation through the supplemental proposal. The commenter notes that one effect could be that restrictions may be placed even on industry-produced scientific evidence required under the country's chemical and pesticides laws, which has long been viewed as credible and necessary by EPA officials during both Republican and Democratic administrations. For example, how the SNPRM requirements align with the FIFRA and the TSCA expectations remains unspecified in the SNPRM.

Response: With this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Comment: Commenter (11495) states that, in at least two instances the D.C. Circuit Court of Appeals has recognized that studies for which the underlying data are not publicly available may constitute the "best available science." In *American Trucking Associations, Inc. v. EPA*, the commenter notes that the court held that the CAA did not require EPA to make underlying data public where EPA relied on the study itself and not the raw underlying data. The commenter provides that the court agreed with the EPA's argument that requiring the Agency to obtain and publicize the relevant data "would be impractical and unnecessary." In *Coalition of Battery Recyclers Association v. EPA*, the court again upheld EPA's reliance on non-publicly available data, reasoning that EPA relies on studies and their results rather than the raw data underlying those results.

Response: As described in the preamble to the final rule, the EPA will continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies—based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. When evaluating those scientific studies considered to be pivotal science—in either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. Because the final rule does not categorically

exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science

Comment: Commenter (12720) expresses that the EPA commonly relies on studies conducted outside of the United States, including environmental epidemiology studies of air pollution and health in Canada. Such studies provide relevant information to EPA but are unlikely to meet stringent data requirements in the proposal. The proposal does not engage with this issue at all or identify any ways in which the significant reduction in research input from international community would affect EPA's science activities. The Proposal does not address these difficulties and should be withdrawn.

Commenter (12430) states that the supplemental proposal could potentially screen out "high-quality studies" developed by a mixture of academic, governmental, and private researchers over several decades and skew the scientific record in favor of newer industry-funded studies. The commenter contends that existing studies would be less likely to comply with the supplemental proposal, and unless the Administrator applies an ad hoc and discretionary exemption, would be discounted relative to newer studies created after the adoption of the supplemental proposal. The commenter provides that academic and government researchers generally prefer, and only receive funding, to focus on expanding scientific knowledge and do not have the resources to revisit established scientific conclusions. The commenter points out, however, that industry-funded groups, may have an incentive to invest in additional research to disprove those scientific conclusions. The commenter contends that the potential effect of the supplemental proposal's

new and arbitrary criteria for assessing the relative value of scientific studies and information, would unscientifically skew the weight of the evidence toward industry research and interests.

Response: As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

Although the EPA is prioritizing transparency in pivotal science, the EPA also acknowledges and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as the potential skew toward newer, domestic, and/or industry-funded studies suggested by the commenters. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential

scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Comment: Commenter (11396) states that the Agency has not articulated whether and how it will keep track of studies that are excluded from regulatory decision-making. In the interest of scientific transparency, the commenter suggests that the Agency at least develop a protocol for documenting and disclosing the reasons specific studies are excluded.

Response: As described in the preamble to the final rule, the EPA intends for the final rule to be implemented in a transparent manner. The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. Additionally, the final rule requires the EPA to document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

Comment: Commenter (11176) states that the category of “non-federally funded and non-EPA data” likely makes up the largest category informing EPA’s many actions. The commenter states that it is also the category that poses the most challenges for making data available. The commenter states that such studies generally provide important scientific contributions and should not be discounted because their data are not readily available. The commenter states that, while such work will not necessarily be excluded through the proposed rule with the SNPRM, it is likely to be de-emphasized to the detriment of evidence-based policymaking at EPA.

Response: As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum

transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

The considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as the potential for non-federally funded and non-EPA studies to be de-emphasized as suggested by the commenter. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

2.2.2.1.1 Specific Studies That Would Not Comply with Rule

Comment: The commenter (12465) provides the example of the Westat Survey. The commenter notes that the report entitled "Household Solvent Products: A National Usage Survey" (or the Westat Survey) is a survey of consumer usage for a wide variety of products to determine various attributes and inform exposure assessments. According to the commenter, while the report was completed in 1987, it remains in use today informing the EPA's Consumer Exposure Model and the Westat Survey informed several of the first 10 chemicals currently being evaluated under reformed TSCA. The commenter states that it is unclear in the proposal how the Westat Survey would be treated, let alone the multitude of exposure models that rely upon it.

Further, the commenter (12465) states that it is unclear that the supplemental proposal has adequately considered the numerous types of data and models EPA relies upon to support its regulatory decisions. The commenter provides that the 1987 report "Household Solvent Products: A National Usage Survey"²²¹⁶ remains in use today informing the EPA's Consumer Exposure Model and several of the first 10 chemicals currently being evaluated under reformed TSCA. According to the commenter, the supplemental proposal is unclear how this information would be treated, let alone the exposure models that rely upon it. Additionally, the commenter

²²¹⁶ U.S. EPA. (1987). National Survey Products: A National Usage Survey. Washington, DC: Prepared for the EPA's Office of Toxic Substances by Westat, Inc.

notes that this study is likely worthy of being updated, however it is not clear that respondents would be afforded sufficient privacy protections to elicit responses.

Response: As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

With this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Comment: Commenter (11894) states that the EPA's NAAQS established under the CAA were the primary target of EPA's original proposal. The commenter adds that the EPA's new proposal would further increase that impact in at least two ways: First, as noted it would extend the bar on the use of undisclosed data from dose-response models to all models. That would affect the many other models - for example, economic models, energy use models, and atmospheric models - on which NAAQS analysis relies. Second, many of the documents prepared in the course of setting a NAAQS are themselves "influential scientific information" or rely on other studies that would or could qualify as "influential scientific information."

Commenter (11894) suggests that the application of the bar on the use of undisclosed studies to these documents would further increase the cost and complexity of establishing NAAQS and diminish the quality of the decision-making record. The commenter provides that this would be particularly clear in the case of the Regulatory Impact Analysis that is prepared for every NAAQS. By law, the commenter notes that these documents play no part in EPA's decision, so the original proposal would not have covered them. However, the commenter states that they would unquestionably qualify as "influential scientific information." According to the commenter, the EPA's proposal does not analyze any of these issues. The commenter adds that it is ironic then, that developments since EPA's original proposal have further underlined the complete lack of justification for anything like EPA's proposal where NAAQS establishment is concerned.

Response: The rulemaking is intended to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

Comment: Commenter (11921) provides that EPA should recognize that expectations for data access for studies have evolved over time and in many cases older studies that did not and are unable to comply after a prolonged interval still have substantial scientific merit and value for informing regulations. According to the commenter, some studies, e.g. the National Institute for Occupational Safety and Health/National Cancer Institute Diesel Exposed Miners Study (DEMS), have made their data available through federal RDCs, however other critical studies, e.g. the North American Rubber Workers Study (Delzell, 2006), which has played and continues to play a key role in assessment of risk from 1,3-butadiene and styrene, was designed and implemented at a much earlier time and would not be readily available. The commenter states that this supplemental proposal would require a significant delay in the use of a study that has been vetted and peer-reviewed by a wide range of scientists (including – in both these cases - the most recent update subjected to HEI project oversight and intensive independent peer review).

Response: Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent

validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

Comment: Commenter (12715) states that while the initial proposal applied only to studies that provide the dose-response data for human health risk assessment, the supplemental proposal expands the types of studies to which the proposed rule would apply and now includes “data and models underlying pivotal regulatory science and pivotal science used to support significant regulatory decisions and influential scientific information.” 85 Fed. Reg. at 15,400-01. The commenter provides that the expanded scope would thus include the data from many other types of studies such as environmental fate and transport, bioaccumulation, and ecological toxicity studies and will severely curtail EPA’s ability to consider studies that provide the most relevant data in many types of regulatory and non-regulatory scientific decision-making. For example, the commenter notes that while risk assessment evaluations performed under the EPA’s IRIS are not regulatory in nature, the toxicity factors provided by IRIS are used as the basis for many regulatory standards developed by the EPA and numerous states, as well as federal and state guidance values and cleanup decisions. In fact, the commenter notes that some states’ regulations require that IRIS toxicity factors be used as the basis for human health standards for environmental contaminants. The commenter states that the supplemental proposal would significantly limit IRIS’s consideration of and reliance on many key studies that are crucial for the assessment of human health effects and development of toxicity factors for environmental contaminants.

Commenter (12456) states that the systematic review process in place for IRIS and other review processes already includes consideration of the quality of a research study and methods. The commenter asserts that the best professional judgement of data quality should be left to subject matter experts and not assigned solely on the basis of data availability.

Commenter (11349) provides that the EPA and National Institute for Environmental Health Sciences’ (NIEHS’s) Children’s Environmental Health and Disease Prevention Research Centers may certainly be excluded by this supplemental proposal and that the expansion increases the studies that can be excluded even further.

Response: Based on a consideration of these and other similar comments, the preamble to the final rule describes the EPA’s rationale for modifying the applicability of the rule to focus on dose-response data and clarifies how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. Briefly, the EPA is concentrating its efforts in the final rule to increase transparency on dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. This final rule provides an important step in furthering the progress toward maximizing transparency and will provide insight for future statute-specific requirements. In addition, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to

studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available or not available in a manner sufficient for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

Including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties.

Comment: Commenter (11482) states that the inherently interdisciplinary and connected nature of the ocean means that more information, from more sources, is critical to gaining an understanding of ocean issues and being prepared to act from a regulatory perspective. The commenter notes that the proposed rule, which would limit rather than increase actionable knowledge, is likely to harm ocean and coastal ecosystems. Additionally, the commenter states that given the vast amounts of ocean data held by the U.S. Navy and shared with ocean researchers — but with important redactions and aggregation of data for reasons of national security — this rule could limit the information available to the EPA from such sources, despite that information being trustworthy and the findings vetted through extensive peer review. Similarly, the commenter provides that the EPA would be barred from relying on information from the National Oceanic and Atmospheric Administration that may not withstand these overly burdensome standards. For example, the commenter states that many environmental studies, including those intentionally conducted in the ocean and those that are the result of accidents like the Deepwater Horizon, simply can't (or shouldn't) be replicated in any meaningful way—yet they provide key insights that should be taken into consideration by federal regulators. The commenter suggests that the rule may also hamper the use of climate models.

In short, the commenter (11482) contends that public health studies related to the ocean would suffer under this rule; this is particularly worrisome at a time when warming waters and deoxygenation are combining to exacerbate the problem of harmful algal blooms, with potentially negative, far reaching health consequences.

Response: In the final rule the terms replicate and reproduce (or other forms of the word) are no longer used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” In addition, the EPA is modifying the definition of “independent validation” in the

final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30.

Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. One of the criteria the Administrator may use in his/her determination to grant a waiver is that making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, CBI, or *national security* (emphasis added). Because the final rule does not categorically exclude any studies from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations.

The considerations in 40 CFR 30.5, the Administrator’s exemption in 40 CFR 30.7, and the EPA’s incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as the potential unintended impact on ocean studies suggested by the commenter. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific

transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Comment: Commenter (11392) notes that past products designated influential scientific information, such as chemical draft risk evaluations, ISAs, IRIS toxicological reviews, and a scientific assessment of the impact of climate change on human health,²²¹⁷ would be undermined by imposing arbitrary limitations on the scientific studies that can be considered in the drafting of these products.

Response: The EPA disagrees that scientific assessments would be undermined by this rule. The approach outlined in this rule will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers. Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent

²²¹⁷ Environmental Protection Agency, "Science Inventory," viewed April 1, 2020, accessed here: https://cfpub.epa.gov/si/si_public_pr_agenda_archive.cfm.

validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

EPA would also like to clarify that the final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on existing significant regulatory actions or influential scientific information. Past products will not be impacted.

Including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties.

Comment: Commenter (11576) states that the inclusion of “influential scientific information” will impede Agency scientists from relying on the best available science while also compromising scientific integrity.²²¹⁸ The commenter notes that EPA's Peer Review Agenda describes different types of highly influential scientific assessments developed by the Agency.²²¹⁹ and includes a list of influential assessments, including the ISA for Ozone and Related Photochemical Oxidants (Office of Research and Development), the Peer Review of EPA's Biologically Based Dose-Response Model for Perchlorate (Office of Water), and the EPA's Draft Risk Evaluation for 1-Bromopropane (Office of Chemical Safety and Pollution Prevention), all of which rely on studies that may be arbitrarily excluded if the proposed rule is finalized.²²²⁰

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods.

As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's

²²¹⁸ See August 2018 Coalition Comments at 14; Comments of the Int'l Society for Environmental Epidemiology on EPA's Proposed Rule on Strengthening Transparency in Regulatory Science (EPA-HQ-OA-2018-0259-1973).

²²¹⁹ See EPA, Peer Review Agenda, available at https://cfpub.epa.gov/si/si_public_pr_agenda.cfm.

²²²⁰ Id.

conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

Including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties.

Comment: Commenter (11890) provides that the rule would impair EPA's science assessments by excluding or downgrading high quality studies of human health impacts of environmental chemicals or agents. The commenter asserts that this is at odds with EPA's mission and duty to use the best available science and that critical evaluation programs impacted by the inclusion of "influential science" include drinking water health advisories, IRIS assessments, FIFRA re-registrations, children's lead hazard evaluation, and TSCA risk evaluations.

Response: The EPA does not agree that this rulemaking is counter to the Agency's mission. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an

exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

In addition, as clarified in the preamble to the final rule, this rulemaking is not intended to modify the Agency's interpretations of "best available science." The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. The EPA will then identify and consider pivotal science in accordance with the provisions of this rule, unless the implementation of the rule conflicts with statutory requirements and associated implementing regulations.

The EPA believes that the approach described in the final rule will result in significant regulatory actions and influential scientific information based on the highest quality, most relevant studies and ensure adequate human health and environmental protections while maximizing transparency and maintaining consistency with the statutes the EPA administers.

Comment: Commenter (11894) notes that EPA has issued about 170 separate documents to establish scientific guidance for water quality. According to the commenter, these do not have regulatory effect but provide background for regulatory decisions that set actual water quality standards. The commenter states that these criteria are, therefore, an essential part of the water quality standards program which is, in turn, an essential part of the CWA, and taken by themselves, they would clearly qualify as "influential scientific information." As such, the commenter contends they would often rely on studies and models that would not meet the new requirements. The commenter questions whether these would be "agency actions" exempt from the new requirements despite their lack of legal effect, and if not, what would be the impact of the new requirements on human and environmental health, program functioning, and resource needs? The commenter also considers EPA and the National Highway Traffic Safety Administration's Heavy Duty Rule's inclusion of hundreds to thousands of references, each with sub-references, all of which appear to be "influential scientific information". The commenter questions whether or not these references are or would be covered by the rule, why, what the effects on EPA's authority to control emissions of pollutants under CAA sections 202 (a)(1), (2) and (3) are or would be, and EPA's reasoning for these findings. Additionally, the commenter suggests EPA should analyze how references in various significant rules would be impacted by this proposal.

Response: As described in the preamble to the final rule, the requirements in the final rule set the overarching structure and principles for transparency in the EPA's significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

In addition, the preamble discusses that the EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes

unintended consequences, and informs future transparency requirements. The EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or more pollutants, contaminants, or substances are integral to the Agency's mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. In addition, the data underlying the dose-response assessment are more distinct than the broad range of data informing an entire risk assessment. Therefore, the EPA is concentrating its current efforts to increase transparency on a well-defined step in the quantitative assessment of risk supporting specific Agency actions. This final rule provides an important step in furthering the progress already being made toward maximizing transparency and will provide important insight for developing future statute-specific requirements.

The EPA is also finalizing regulatory text in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict.

Comment: Commenter (12464) states that many assessments, reviews, and reports of EPA cite thousands of scientific papers. According to the commenter, it is unclear how many of those papers would be subject to the proposal. Additionally, the commenter notes that because the supplemental proposal would systematically exclude studies that do not meet EPA's criteria for reanalysis and independent validation, critical studies that would otherwise inform influential scientific information would not be incorporated into key documents, such as the Integrated Scientific Assessment for Particulate Matter.²²²¹ The commenter asserts that many of the studies cited in the assessment are epidemiological papers analyzing the numbers of patient hospital visits or other sensitive medical information. As such, the commenter provides that these studies cannot be made publicly available due to laws and contracts designed to protect patient and human subject privacy.²²²² Thus, the commenter contends that the supplemental proposal's expansion in scope would in many instances prohibit EPA from relying on the best available science when assessing and determining highly influential scientific information, depriving regulators, researchers, and academics of a valuable and objective source of information.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how pivotal science would be selected. As discussed in the preamble to the final rule, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as "pivotal science," the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, "pivotal science" includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying

²²²¹ EPA, EPA/600/R-19/188, Integrated Science Assessment (ISA) for Particulate Matter at 2-97 to 2-122 (Final Report, 2019), http://ofmpub.epa.gov/eims/eimscomm.getfile?p_download_id=539935.

candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.

The final rule also clarifies how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Comment: Commenter (11894) notes that, as detailed in Appendix B of their comment letter, the supplemental proposal would either bar a majority of the key long-term cohort studies in the 2018 PM ISA from consideration, or perhaps merely downgrade them (the proposal is too opaque to allow any certainty as to its intended result) -- all without reference to the studies' methodological quality, consistency with prior studies, or any other individual consideration.

Commenter (12435) provides that the current ozone standard relies on "controlled human exposure studies conducted over many decades" (Ozone Standards ISA). The commenter notes that these studies were conducted with the informed consent of human participants and most

studies were published more than ten years ago. While the underlying raw data may not be available, the commenter states that these studies have gone through peer review and the relevant information is now retained in the published journal articles. The commenter adds that the consistency of findings across decades contributes to the weight of evidence used to set this standard to be protective of public health. The commenter expresses concern that, in Colorado, 3.9 million people live within the ozone nonattainment area. Without this standard, the commenter states that Colorado would be hindered in its ability to regulate emissions that contribute to ozone and the health of many would suffer without going through incredible expense and time of setting standards under State law that should be done properly by EPA under the CAA. The commenter provides that epidemiology studies find that ozone concentrations “are associated with a range of respiratory effects, including asthma exacerbation, chronic obstructive pulmonary disease (COPD) exacerbation, respiratory infection, and hospital admissions and emergency department (ED) visits for combined respiratory diseases” (Ozone Standards ISA, page ES-8). The commenter states that Colorado’s health agencies rely on policy based on the types of studies that could be dismissed under this proposal.

Commenter (12720) expresses that, under the Supplemental Proposal, the EPA would not be able to rely on the best available science for its ISAs of air pollution which inform the NAAQS-setting process, while industry-funded research calling into question the air pollution-health link, would not be subject to similar data release requirements, or even peer-review and independent reevaluation.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health

studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Comment: One example of the historic studies that would have difficulty meeting the "open data" criteria, several commenters (11408, 11495, 11396, 12715) point out that the researchers who originally conducted the Harvard University's seminal, peer-reviewed "Six Cities Study," completed in 1993 (and reanalyzed in 2000) would have difficulty meeting the "open data" criteria the supplemental now proposes for inclusion in EPA's decision-making, even under the proposed tiered system.

Commenter (11396) states that industries and their allies have been pushing to exclude studies for decades, using the same arguments found in EPA's proposal, targeting research that shows harm to public health from their arguments found in their emissions. The commenter highlights the history of how (outlined in their comment letter and by several comments on the 2018 proposal), in 1996, attorneys working for tobacco industry giant R.J. Reynolds recommended a similar approach requiring review of documents "because, at some point in the future, EPA will most likely be ordered to re-examine ETS [Environmental Tobacco Smoke]." The commenter adds that the tobacco attorneys recommended expanding this approach to other industries, which quickly happened. The commenter provides that two of the early industry targets were landmark air pollution studies completed in the 1990s that found solid evidence that particulate matter air pollution could cause premature death. The two long-term studies - the 1993 Harvard Six Cities Study and the 1995 ACS Study - looked at large population in multiple locations. The commenter notes that both studies found the particulate matter in the air was linked to increased risk of premature death. Instead of blocking the studies, as this proposal would do, the commenter notes that the EPA took a logical step and referred both studies to an independent third party, the HEI, for a deep-dive review. There, the commenter notes, autonomous reviewers examined the data and developed a report on the two studies that confirmed their original findings. Since these studies, the commenter notes that other research has confirmed their findings as well, including some studies that used publicly available datasets. The commenter suggests that similar third-party reviews could readily address concerns about existing or future studies as needed.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the

quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available (either publicly or through restricted access) in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. One criterion for the Administrator's consideration of an exemption is that a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis.

Although independent validation by a third-party can be informative, the presence of a third-party validation is provided as a case-by-case exemption criterion instead of an automatic rule consideration in order to more fully realize the benefits of open data. As discussed in the preamble to the final rule, when data are widely available, researchers can validate research results and help identify and correct unintended errors, as well as reanalyze the data for new and different purposes, examine novel questions, provide new scientific insights, and improve model development. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety.

The EPA also agrees that data sharing mechanisms, such as that used by the Health Effects Institute in conducting their reanalysis study, already exist. The final rule gives equal consideration to studies with underlying dose-response data that are available publicly and studies with underlying data that are available through restricted access. The preamble to the rule clarifies that restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The rule does not prescribe a particular mechanism but does require the EPA to independently verify that such a mechanism exists for dose-response data underlying pivotal science. As discussed in the

preamble to the final rule, including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties.

Comment: Commenter (11479) contends the SNPRM and draft rule would prevent critically important research from being used to inform the EPA's decision making on public health protections. The commenter states that, for example, the EPA funded four university-based Clean Air Research Centers between 2011 and 2016 to better understand complex air quality and health issues—research that directly informed the Agency's air pollution standards, required under the CAA.²²²³ The commenter states that the four centers have generated hundreds of research publications and helped answer crucial scientific questions that inform how the EPA can best protect public health, including that of at-risk subpopulations, from ambient air pollution, with an adequate margin of safety.²²²⁴ The commenter states that the centers' contributions include understanding of multipollutant mixtures on health outcomes; stratification of health effects across geographies and populations; characterization of air pollution measurement error; and improved measurement and characterization of traffic emissions and their health outcomes. The commenter states that Dr. Gretchen T. Goldman, Research Director at the Union of Concerned Scientists' Center for Science and Democracy, contributed to this research with several studies²²²⁵ that informed current and past EPA decisions on air pollution standards on ozone and particulate matter.²²²⁶

Commenter (11403) states that, by deliberate design, the proposed rule would have the EPA ignore some of the most rigorous, long-term, peer-reviewed studies conducted by leading independent researchers. For example, the commenter provides that a recent study found that for

children younger than age two even extremely short exposure to soot particles, like those created by burning fossil fuels such as coal, oil, and natural gas, increases the kinds of respiratory infections that are the leading cause of sickness and death. This is the kind of study EPA would ignore or deprioritize because HIPAA correctly makes it illegal for researchers to release the identities and health histories of the nearly 150,000 people in the study, making the data incapable of being disclosed.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations

Comment: Commenter (12442) states that together, the expansion of the rule and the tiered-access approach brings into question whether or not a study such as the 2013 report, "National Park Service Visitor Values & Perceptions of Clean Air, Scenic Views & Dark Night Skies 1988-2011" (Exhibit A in their comment letter), which followed standard scientific norms for gathering information from groups of people visiting parks, could be considered by EPA to inform internal scientific assessments or rulemakings in the future. The commenter notes that if this kind of study were to be devalued or disregarded for the protection of clean air in national parks because individuals weren't named, it would be a great loss of information that shows the

clear co-benefits of the economic value that people place on clean air—for many different reasons—when visiting parks.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how pivotal science would be selected. As discussed in the preamble to the final rule, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as “pivotal science,” the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.

The final rule also clarifies how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response

data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Comment: Commenter (12716) states that many of the ongoing programs and policies in place that will restore the Chesapeake Bay are based upon regulations promulgated by EPA and supported by the Agency's consideration of the best available science. In 2010, the commenter notes that the EPA issued a total maximum daily load (TMDL) for the Chesapeake Bay region. It "sets Bay watershed limits of 185.9 million pounds of nitrogen, 12.5 million pounds of phosphorous and 6.45 billion pounds of sediment per year -- a 25 percent reduction in nitrogen, 24 percent reduction in phosphorous and 20 percent reduction in sediment." In doing so, it set a cap on Nitrogen Oxides (NOx) from air deposition to 15.7 million pounds and "committed to reducing nitrogen deposition to the Bay and its surrounding waters by a total of 3.7 million pounds between 2009 and 2025, the year all practices are to be in place to meet the Bay TMDL goals." The commenter states that the Bay TMDL based these limits on years of peer-reviewed science and relied on the implementation of various federal regulations to achieve these reductions.

In addition to regulatory programs upon which the success of the Chesapeake Clean Water Blueprint relies, the commenter (12716) states that the Agency's proposed changes could also impact other CAA and CWA programs needed to meet the goals of the Chesapeake Bay Watershed Agreement and reduce the effects of climate change. The commenter provides that the restoration of the Chesapeake Bay is dependent on the implementation of numerous federal CAA and CWA programs that are based upon the best available science. The commenter contends that a narrowing of the use of science -- under the guise of transparency -- in the promulgation of rules threatens the implementation of those programs, and therefore threatens the health of the Chesapeake Bay.

Response: The EPA is finalizing the applicability of this rule to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

As described in the preamble to the final rule, the requirements in the final rule set the overarching structure and principles for transparency in the EPA's significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Comment: Commenter (12466) states that while they support greater transparency in EPA actions around the use of antibiotics in animal agriculture, they do not believe that the proposed rule actually provides the needed transparency and add that it may make it more difficult for EPA to properly take into consideration some of the limited information that is available related to use of antibiotics in vegetable and fruit production. The commenter explains that, in the realm

of crop use of antibiotics, there is very limited data available and the data that is available covers mainly apples and pears not other crops such as citrus fruits. Because approvals for citrus use in the U.S. are fairly recent, the commenter states that studies on antibiotic use in citrus are primarily available from researchers in other countries, which increases the risk that the underlying data will not be available. The commenter states that the raw data from studies on impacts of worker exposure to antibiotic pesticides might not be available both due to the confidentiality of medical records and due to the need to protect workers from retaliation by crop production companies. Despite these limitations, the commenter asserts that this type of data is often the best available. Given the low number of studies related to crop use of antibiotics and the real risk that underlying data will not be available for studies published in the peer reviewed literature for the reasons described above, it is inappropriate for EPA to move forward with the proposed rule.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

Comment: Commenter (11386) states that, in the case of air quality, privately-owned satellites play an increasingly important role in the observation of concentrations of atmospheric constituents. The commenter states that satellites take years to develop and launch, and private companies currently dominate the field of high-resolution atmospheric observations from satellites. The commenter states that MethaneSAT, a subsidiary of the Environmental Defense Fund, may provide publicly available data at coarser resolution than those provided by satellites like GHGSat-D, complicating the estimation of methane emission rates for point emission sources such as oil and natural gas facilities. The commenter states that there may be no plans to launch a satellite that would provide publicly available methane observations at similar

resolution to those produced by GHGSat's instruments. The commenter states that excluding these observations from all regulatory science, as per the expanded scope of the proposed rule, would harm the improvement of emission inventories and the resulting policy.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

2.2.2.1.2 Epidemiological Studies

Comment: Commenters (10040, 11182, 11359, 11360, 11400, 11403, 11404, 11492, 11497, 11576, 11890, 11911, 12405, 12422 12430, 12431, 12435, 12720, 12715) express concern that, under this rule, many epidemiological studies that are pertinent to the EPA's work could not be considered during the rulemaking process due to data confidentiality obligations.

Commenter (11359) contends that crucial epidemiological studies would be excluded from consideration under the transparency requirements. The commenter highlights the value of using epidemiological studies for chemical risk assessment as they provide human data to accurately evaluate health impacts. To that end, the commenter states that epidemiological data should be considered essential for all chemical risk assessments, with key examples of important human

studies conducted on the pesticides paraquat²²²⁷, atrazine²²²⁸, glyphosate²²²⁹, chlorpyrifos²²³⁰, and other chemical substances used in industrial and agricultural applications, such as PFAS²²³¹. Additionally, the commenter provides a cancer risk study²²³² that would likely be excluded from consideration to further demonstrate the value of using human health data to better protect human health.

Commenter (11360) states that data privacy laws largely prevent information from studies involving humans from being made public in the manner being considered by the EPA. As a result, the commenter asserts, if the EPA proceeds with downgrading or dismissing such science from consideration, the Agency will be excluding from their policy and rulemaking process epidemiology studies linking air pollution to serious outcomes such as death, heart attacks, and strokes; disinfection byproducts to birth outcomes; and, toxic exposure to cognitive function.

Commenter (12405) provides that human-based clinical trials or epidemiology (observational) studies form the bedrock of knowledge for determinations about the environment's impact on human health. The commenter states that exclusion of these studies stands to affect every decision made at EPA from NAAQS to chemical registration and regulation in consumer products and pesticides. In effect, the commenter asserts the rule would restrict access to science rather than make it more transparent.

Commenters (10040, 11360) state that this proposal would result in the exclusion of epidemiology studies linking air pollution to serious outcomes such as death, heart attacks, and strokes; disinfection byproducts to birth outcomes; and toxic exposure to cognitive function in the EPA regulatory rulemaking. Commenter (11360) states that the fact that this information must be kept confidential to protect research participants does not make the data any less valid.

Commenter (11182) disagrees with the proposal to include studies containing PII in this rule. The commenter states that epidemiologic studies are the foundation of many, if not most, environmental and occupational regulations to protect workers and the public. The commenter notes the studies of asbestos-exposed insulators and lung cancer (Selikoff et al., 1979), benzene-exposed rubber workers and leukemia (Rinsky et al., 1987), and in children, low level lead

exposure and brain damage (Lanphear et al., 2002) and states that these epidemiologic studies were pivotal research in the subsequent regulations that have saved many workers' lives and improved the health of millions of children. The commenter states that these studies would likely not have been considered under this supplemental proposal; the simple but profound reason is the principle of confidentiality.

Commenter (11400) contends that, under the proposed rule, large epidemiological studies like the effect of air pollution and correlation with public health in regard to respiratory, cardiac, and neurological impacts would be discounted, to the detriment of people living close to polluting sources. The commenter states that the problem is that this will exclude studies where the patient information cannot be made public, even where the study is of higher quality than studies with no PII. The commenter states that environmental and epidemiological studies often consider where people are as they are exposed to pollutants: their residence and their subsequent health issues are germane to the studies. The commenter states that residence, cause of death on death certificates, older age, are PII. The commenter states that excluding these studies because they contain PII of the patients' proximity to sources of pollution means that the most relevant studies will not be given appropriate weight.

Commenter (11403) asserts that, without these epidemiological studies, it would be impossible to put in place necessary protections to adequately protect vulnerable populations. The commenter states that studies done on animals are simply not protective of these populations. The commenter states that lab animals lack genetic heterogeneity; they live in tightly controlled environments, are fed an optimal diet, and lack any pre-existing health conditions. The commenter states that this is not reflective of the human race. The commenter states that, unlike animal studies, epidemiological studies look at human subjects, deliver results that reflect real-world exposure conditions, and are able to tease out populations that may be more vulnerable than the general population. The commenter states that these studies often have personal data associated with them that cannot be made public. The commenter states that forcing mass storage of this PII in an EPA system so that it can be released through a tiered access program is a security risk and puts members of these communities even more in danger.

Commenter (11404) expresses that the rule might greatly reduce the number and quality of health studies available to support the development of air quality standards or regulations and hinder the health protection work the EPA is entrusted to do. The commenter notes that a reduction in availability of epidemiological studies would affect not only the EPA, but also other environmental and health protection agencies - such as the Air District - via the work of our sister agencies, the California Air Resources Board (CARB) and the Office of Environmental Health Hazard Assessment (which independently establish California's ambient air quality standards and health values for toxic compounds). The commenter contends that the proposal undermines, rather than enhances the scientific studies, data and models that are needed to develop meaningful, cost-effective air quality regulations. As drafted, the commenter states that the proposal would stifle efforts to make decisions based on the best scientific information and ultimately impact our ability to protect the health of Bay Area residents.

Commenter (11492) states that the supplemental proposal assigns greater value to dose-response studies, thereby reducing the use/value of epidemiological studies. The commenter notes that

EPA has acknowledged that “there is frequently a lack of dose-response data available for human subjects. When data are available, they often cover only a portion of the possible range of the dose-response relationship.”²²³³ As epidemiological studies form the bases of many human health exposure studies, the commenter contends that EPA must continue to use epidemiological studies; to do so otherwise is to compromise the health of all Americans.

Commenter (11497) contends that while much of the data showing a connection between chemicals and breast cancer risk comes from laboratory studies, epidemiological studies, in particular longitudinal studies, provide critical insights and important corroboration for these findings. Additionally, the commenter states epidemiological studies allow researchers to look at numerous factors in the lived experience of women to understand and parse out some of these complexities. Once such study provided by the commenter is the National Institute of Environmental Health Science’s Sister Study that has and will continue to provide data on breast cancer and disease prevention. The commenter notes that most of these critical epidemiological studies, are funded by the NIH, and that their strong confidentiality policy would force EPA scientists to disregard the studies, resulting in less scientifically sound conclusions and diminished public health benefits.

Commenter (11576) states that epidemiological and public-health studies often involve confidential data related to people, and researchers must protect the privacy of study participants, rendering disclosure of the underlying data impossible and in some cases unlawful. The commenter states that the rule could have the effect of removing valid, credible, peer-reviewed studies of health effects as sources to support the Agency’s regulatory efforts: “The proposed rule does not acknowledge that the epidemiologic science community, for example, has been making significant efforts to make data available where possible and to develop studies based on publicly available data where appropriate.”²²³⁴ The commenter states that excluding studies where it is not possible to make the underlying data publicly accessible would unnecessarily and irrationally exclude reliable science for no legitimate reason.

Commenter (11890) states that, if enacted, the proposal would disable the EPA's ability to use U.S. and most other countries' epidemiological studies that relied on private medical information.

Commenter (11911) states that epidemiological studies enjoy the support of the scientific community and provide the main justification—in some cases the only possible justification—for some of our most important environmental protections. The commenter states that these protections have significantly improved the wellbeing of the American people. The commenter states that excluding studies simply because the raw data cannot be made publicly available would result in inadequately informed regulatory decisions that could subject people to real harm.²²³⁵

²²³⁴ See Memorandum from Alison Cullen, Chair, SAB Work Group, to Members of the Chartered SAB and SAB Liaisons, Preparations for Chartered Science Advisory Board.

²²³⁵ Public Health, Medical, Academic, and Scientific Groups, Oppose EPA Transparency Rule, MICHAEL J. FOX. FOUNDATION (July 16, 2018), <https://www.michaeljfox.org/publication/public-health-medical-academic->

Commenter (11911) states that many epidemiological studies that are pertinent to the EPA’s work could not be considered during the rulemaking process due to data confidentiality obligations. The commenter states that, for example, in a study published in the *American Journal of Respiratory and Critical Care Medicine* in June 2018, researchers discovered that fine particulate matter exposure was more strongly associated with respiratory emergency hospital visits for children than for adults, while ozone exposure was more strongly associated with respiratory emergency hospital visits for adults than for children. The commenter states that the researchers concluded that in light of this finding, relying on Medicare data and other studies that restrict their analysis to populations over age sixty-five “could underestimate population respiratory health impacts of PM_{2.5} or ozone.”²²³⁶ The commenter states that, because the study was based on confidential emergency room visit records aggregated by state agencies to protect the patients’ privacy, the proposed STRS Rule would bar the EPA from considering it.²²³⁷ Commenter (11911) asserts that the proposed rule is likely to have particularly harmful effects for regulations that rely on studies of low probability but high impact events, such as natural disasters, environmental catastrophes, wars, or terrorist attacks.²²³⁸ The commenter states that some of these studies have unavailable data due to their age and changing data transparency norms. The commenter states that the data cannot be newly collected again as the disastrous event cannot be experimentally replicated. The commenter states that studies of the health effects from nuclear plant failures in Chernobyl or Fukushima, or fallout from deployment of nuclear weapons in Hiroshima and Nagasaki, likely fall in this category.

Commenter (12430) asserts the SNPRM would dramatically impede the EPA’s ability to consider epidemiological studies because of the type of data collected. The commenter states that epidemiological studies rely on confidential information—with geographical location, and birth and death dates to determine the effects of specific hazards—to link health and lifestyle information. The commenter states that, for example, had the proposed rule been in place 25 years ago, when the Harvard Six Cities and American Cancer Society studies were first published, air pollution today would be much worse. The commenter states that these two studies laid the foundation for the 1997 PM NAAQS that set the first national standard for PM_{2.5}. The commenter states that they also were used in all subsequent updates to the federal PM_{2.5} standard

[andscientific-groups-oppose-epa-transparency-rule?category=7&id=663](#) (“The result would be decisions affecting millions based on inadequate information that fails to include well-supported studies by expert scientists. These efforts are misguided and will not improve the quality of science used by EPA nor allow the agency to fulfill its mandate of protecting human health and the environment.”).

as well as development of the national PM₁₀ standard. The commenter states that, in addition, these studies were integral to the development of more than two dozen different rules adopted by the EPA to implement the NAAQS since 1997. The commenter states that key rules developed using these studies to evaluate particle pollution impacts on mortality and illnesses include the Control of Emissions from Non-road Diesel Engines and the Mercury and Air Toxics Standards.²²³⁹ The commenter provides several examples of the types of studies and models that, according to the commenter, the SNPRM would force the EPA to reject or discount including studies related to (1) fecal indicator bacteria concentrations and water-content recreation at ocean and freshwater beaches; (2) recent U.S. EPA lifetime health advisories for PFOA and Perfluorooctane Sulfonate (PFOS); and (3) studies that document adverse health impacts associated with air pollutants as part of setting NAAQS.

Commenter (12430) discusses the reliance of EPA lifetime health advisories for Perfluorooctanoic Acid and Perfluorooctane Sulfonate on epidemiological studies, for which exposure may result in several adverse health effects.²²⁴⁰ The commenter also states the importance of epidemiological studies in relation to setting NAAQS, highlighting the importance of the Harvard Six Cities study²²⁴¹ and American Cancer Society study²²⁴² in the first national PM_{2.5} standard.

²²³⁹ U.S. EPA has cited to the Harvard Six and/or American Cancer Society studies in support of, among other actions, regulatory impact analyses for Reclassification of Major Sources as Area Sources under section 112 of the Clean Air Act; Mercury Cell Chlor Alkali Plants NESHAP; ICI Boilers and Process Heaters NESHAP; Brick and Structural Clay Products NESHAP; Portland Cement Manufacturing NESHAP; Non-road Diesel Engines; Oil and Natural Gas Review, NESHAP, and NSPS; Petroleum Refineries NSPS; Manganese Ferroalloys RTR; Existing Stationary Spark Ignition (SI) RICE NESHAP; Existing Stationary Compression Ignition (CI) Engines NESHAP; Existing Reciprocating Internal Combustion Engines NESHAP Analysis of Potential Costs and Benefits for the “National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units – Subcategory of Certain Existing Electric Utility Steam Generating Units Firing Eastern Bituminous Coal Refuse for Emissions of Acid Gas Hazardous Air Pollutants; Repeal of the Clean Power Plan, and the Emission Guidelines for Greenhouse Gas Emissions from Existing Electric Utility Generating Units; Memo: Compliance Cost, HAP Benefits, and Ancillary Co-Pollutant Benefits for “National Emission Standards for Hazardous Air Pollutants: Coal-and Oil-Fired Electric Utility Steam Generating Units—Reconsideration of Supplemental Finding and Residual Risk and Technology Review”; Emission Guidelines for Greenhouse Gas Emissions from Existing Electric Utility Generating Units; Revisions to Emission Guideline Implementing Regulations; Revisions to New Source Review Program; Review of the Clean Power Plan; GHGs from Existing Electric Utility Generating Units, Federal Plan Requirements; NSPS for GHGs from New Electric Utility Generating Units; Carbon Pollution Guidelines for Existing Power Plants and Emission Standards for Modified and Reconstructed Power Plants; Mercury and Air Toxics Standards; Utility MACT and NSPS, Toxics Rule; Municipal Solid Waste Landfills NSPS; Commercial and Industrial Solid Waste Incineration Units NSPS and Emissions Guideline; Sewage Sludge Incineration Units, NSPS and Emissions Guideline, Cost and Benefit Changes Since Proposal; Residential Wood Heaters NSPS Revision.

²²⁴² C. Arden Pope, III, PhD, Richard T. Burnett, PhD, Michael J. Thun, MD, Eugenia E. Calle, PhD, Daniel Krewski, PhD, Kazuhiko Ito, PhD, and George D. Thurston, ScD. Lung Cancer, Cardiopulmonary Mortality, and Long-term Exposure to Fine Particulate Air Pollution. JAMA. 2002 Mar 6; 287(9): 1132–1141.

Commenter (12430) states that the proposed rule is likely to preclude U.S. EPA from considering high-quality CARB-funded research that provides critical findings on air pollution exposures and health impacts. The commenter notes that a significant number of the studies that CARB supports are epidemiological/cohort studies that the SNPRM is likely to preclude from U.S. EPA consideration. The commenter provides the following examples:

- The 10-year Children's Health Study (CHS): Initiated in 1993, this was the first major study to assess the impacts of long-term air pollution exposure on the respiratory health of California's children. Following 5,500 students in 12 southern California communities from fourth grade through high school, this study revealed the extent to which ozone, nitrogen dioxide, acid vapors consisting of nitric acid and hydrogen chloride, and particulate matter affect children's lung development. The results of this study are evidence for classifying children as sensitive receptors to air pollution and have influenced research since and shaped California legislation addressing children's microenvironments.
- The Los Angeles Family and Neighborhood Survey (LAFANS): This was a study of families in different neighborhoods in Los Angeles County. The researchers found that children more highly exposed to traffic pollution were 30-40 percent more likely to report wheeze symptoms.
- The East Bay Kids Study and the California Health Interview Survey (CHIS): These studies sought to determine impacts of pollution levels and greater sensitivity in low income neighborhoods on asthma, including in the CHIS study, on whether the asthma burden disparity is due to exposure to higher levels of air pollutants, greater vulnerability, or both. Findings from these studies have helped to inform policy decisions on motor vehicle emissions control and enforcement, and asthma prevention, control, and education in low socioeconomic status populations.
- Wildfire Impact: Studies currently in progress are examining the impacts of wildfire smoke on lost work days and on respiratory symptoms.

Commenter (12431) states that the proposed rule could force the EPA to exclude from its consideration epidemiologic studies that use confidential health data. The commenter states that such studies are frequently the most relevant to protecting public health as they assess outcomes in humans following real world exposures. The commenter states that the exclusion of this information may lead the EPA to increase its reliance on information from less relevant animal toxicity studies.

Commenter (12435) notes that the retroactive application could include studies on toxic substances ranging from lead to particulate matter which were properly conducted in accord with health privacy regulations, including the Harvard Six Cities and American Cancer Society Cancer Prevention Study II that serve as major references to the PM NAAQS. Additionally, the commenter states that a majority of the cost-benefit analyses for air regulations is based on these studies because they present the best epidemiological data available. According to commenter, if these studies are excluded from future regulatory action, this would also prevent their use for the EPA's cost-benefit analyses. The commenter provides that foundational studies that have gone through peer review contribute to the body of knowledge on a topic and should not be excluded.

Commenter (11497) states that a likely outcome of the proposed rule is that many epidemiological studies showing the effects of environmental exposures would be disregarded; studies which cannot now be replicated, and whose contribution to and critical role in the pool of “best available science” is undisputed.

Response: In the final rule the terms replicate and reproduce (or other forms of the word) are no longer used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” In addition, the EPA is modifying the definition of “independent validation” in the final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30.

Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. Only later in the process, after study quality has been assessed, the EPA will then identify those studies considered to be pivotal science. When evaluating those scientific studies considered to be pivotal science—in either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA’s consideration, the Agency will not be prevented from

evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Although independent validation by a third-party can be informative, the presence of a third-party validation is provided as a case-by-case exemption criterion instead of an automatic rule consideration in order to more fully realize the benefits of open data. As discussed in the preamble to the final rule, when data are widely available, researchers can validate research results and help identify and correct unintended errors, as well as reanalyze the data for new and different purposes, examine novel questions, provide new scientific insights, and improve model development. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety.

The EPA also agrees that data sharing mechanisms, such as that used by the Health Effects Institute in conducting their reanalysis study, already exist. The final rule gives equal consideration to studies with underlying dose-response data that are available publicly and studies with underlying data that are available through restricted access. The preamble to the rule clarifies that restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The rule does not prescribe a particular mechanism but does require the EPA to independently verify that such a mechanism exists for dose-response data underlying pivotal science. As discussed in the preamble to the final rule, including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions

implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Finally, the EPA would like to clarify that the final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on existing significant regulatory actions or influential scientific information.

Comment: Commenter (12720) asserts that it may not be feasible to identify and make available data in epidemiological studies and, as a result, the proposal would disallow use of an enormous body of carefully protected, de-identified health data from epidemiological studies large and small, for which IRBs have approved collection because patient privacy has been protected. The commenter states that this measure would hamstring the research community's ability to continue to produce foundational, health-protective research. The commenter states that not only would the rule destroy society's collective ability to benefit from studies of the causes of and potential cures for ill health, it also would veer dangerously toward compromised privacy during an era in which electronic data security is a nationwide crisis. The commenter states that the proposal flies in the face of decades of statutory, regulatory and institutional progress to simultaneously protect public health and privacy and should be withdrawn.

Commenter (12720) states that the supplemental proposal is even more expansive than the proposal and would seriously reduce the Agency's ability to characterize health impacts of proposed regulations in influential science products, including key regulatory impact analyses regularly produced by the Agency. For example, the commenter notes that in the last three years alone, EPA has regularly relied on a set of peer-reviewed epidemiology studies that relate long-term air pollution exposures to premature mortality risks (a list of these studies can be found in Table 1 of their comment letter). The commenter states that each of the environmental epidemiology studies identified in Table 1 of their comment letter does not meet the strict data release requirements identified in the supplemental proposal; nevertheless, EPA has identified these studies as providing robust dose-response information upon which to base regulatory impact analyses across a range of sectors.

Commenter (12720) asserts that the foundational research in air pollution epidemiology demonstrating a causal link between pollution exposures and adverse health outcomes — including early death, heart disease, lung cancer, stroke, and asthma exacerbations — is at risk of being excluded from the regulatory process - seriously undermining the efficacy of regulations on which this research has historically been based - if the Supplemental Proposal is finalized.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information: soundness, applicability and

utility, clarity and completeness, uncertainty and variability, and evaluation and review. Only later in the process, after study quality has been assessed, the EPA will then identify those studies considered to be pivotal science. When evaluating those scientific studies considered to be pivotal science—in either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. One of the criteria the Administrator may use in his/her determination to grant a waiver is whether making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, CBI, or national security. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

These considerations, the Administrator's exemption, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as that noted by the commenter. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either

statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Comment: Commenter (12720) states that vinyl chloride (VC) is regulated in workplaces, and in drinking water, food, and air:

- OSHA issued workplace regulations in 1974, forcing a reduction in the allowable level of the VC monomer by 500-times, from 500 ppm to 1 ppm averaged over an 8-hour workday. Despite predictions of dire job losses, virtually all U.S. manufacturing facilities met the new standard within a few years while reducing costs, largely through better containment of the unpolymerized monomer and improved exposure monitoring.
- EPA regulates VC pollution under the SDWA (Maximum Contaminant Level (MCL)=0.02 mg/L based on increased risk of cancer), and under EPA's Ambient Water Quality Criteria (0.025 ug/L).
- FDA regulations limit vinyl chloride in food contact materials and packaging.

The commenter (12720) provides that studies that support these EPA safeguards, and particularly the identification of diseases in workers like acroosteolysis that were not identified in rodent studies, are critical to protecting human health and preventing adverse environmental impacts. The commenter adds that thanks to effective health-protective regulatory actions by EPA, OSHA and other federal agencies - regulatory actions that were based on these studies - the elevated exposure conditions suffered by industrial workers in the 1970s and earlier are no longer the industry norm. Thus, the commenter states that these studies cannot meet the standards of transparency and replicability set out in the Proposal. Because these studies cannot meet the "standards" set out in the supplemental proposal, the commenter expresses concern that they may no longer form the basis of regulatory action, seriously compromising the safeguards on which we rely to protect against exposure to VC.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In

order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Comment: Commenter (12720) provides that Congress recognized that pesticides are designed to be poisonous, and thus requires them to be registered by EPA, under FIFRA. The commenter states that Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) requires that when used according to the label, a pesticide will not cause unreasonable adverse effects on the environment or human health, which is commonly referred to as FIFRA's safety standard. The commenter adds that FIFRA was amended by the Food Quality Protection Act (FQPA), which was passed by Congress unanimously in 1996.

Due to risks to children's health, the commenter (12720) states that in 2000 EPA banned household use of chlorpyrifos and most other organophosphate pesticides. The commenter notes that residential uses prior to the ban were causing very high exposures to pregnant women and young children and scientists have since learned that even much lower levels may be harmful to children.

However, according to the commenter (12720), scientists have since shown in longitudinal cohort epidemiologic studies, that even low levels of exposure—too low to poison a pregnant mother—can disrupt brain development in their prenatally exposed children, leading to developmental delays, lower IQ, learning disabilities, and ADHD-like behaviors.

To protect these children, in October 2015, the commenter (12720) provides that the EPA proposed to ban chlorpyrifos because Agency scientists found contamination of drinking water. A year later, the commenter states that the EPA found that chlorpyrifos residues on food, including fruits and vegetables, are unsafe for pregnant women and children; residue levels were far above their target risk level—in some cases, by up to 140 times.

According to the commenter (12720), these epidemiologic studies can no longer be reproduced because—thanks to FQPA and the ban on residential uses—pregnant women and young children are no longer poisoned by indoor use of organophosphate pesticides at such high levels. Without these epidemiological studies, the commenter states that our regulators will no longer be able to use the best available science to ensure that pregnant women, fetuses, and young children receive protection from exposure to chlorpyrifos. The commenter contends that the exclusion of these

studies and its corresponding impact reveals EPA's Proposal and Supplemental Proposal to be arbitrary, capricious, and an abuse of discretion.

Response: In the final rule the terms replicate and reproduce (or other forms of the word) are no longer used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was "reanalyze" rather than "replicate." In the 2020 SNPRM, the EPA proposed using the term "reanalyze" instead of "replicate" and proposed at 40 CFR 30.2 a definition for "reanalyze." In addition, the EPA is modifying the definition of "independent validation" in the final rule by replacing "capable of being substantially reproduced" with "produced." The EPA will not finalize the proposed 40 CFR 30.2 definition of "capable of being substantially reproduced" because the term is not used in the final rule's definition of "independent validation" or elsewhere in 40 CFR 30.

Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation.

Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. One of the criteria the Administrator may use in his/her determination to grant a waiver is whether making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, CBI, or national security. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

These considerations, the Administrator's exemption, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as that noted by the commenter. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties.

Comment: Commenter (12720) asserts that lead regulations and reduction measures resulting from the implementation of science-based EPA regulations are essential for reducing lead poisoning effects in the U.S. population. According to the commenter (12720), since 2001, life-saving EPA standards under TSCA have protected children and families from exposure to lead in paint, dust, and soil, in and around homes and childcare facilities. The commenter also notes that the EPA Lead and Copper Rule (LCR) of 1991 established drinking water protections by requiring tap water monitoring and triggering a public alert and some protective action such as corrosion prevention measures or service line replacement if lead levels exceed 15 ppb. 40 C.F.R. Part 141 Subpart I. The LCR rule applies to water utilities, and the companion Reduction of Lead in Drinking Water Act sets standards for pipes, solder, and other plumbing fittings.

The commenter (12720) provides that the lead rules are based on risk analyses conducted by EPA using epidemiology studies published in the 1990s that correlate childhood blood lead levels with impaired brain function and adverse behavioral effects. The commenter notes that many of the published studies are longitudinal cohort studies that include measurements of lead in blood from children decades ago, and then follow them out over time to observe lasting effects. The commenter states that if these studies are excluded from consideration under the Supplemental Proposal, the integrity of regulations designed to limit exposure to lead would be seriously undermined.

Further, the commenter (12720) adds that precisely because of important EPA regulations and effective lead-reduction measures in gasoline and paint, overall blood lead levels have been reduced in many people. As a result, the commenter states that it is impossible to replicate the exposure conditions at the time the original children in the study cohort had their blood lead levels measured, such as the Port Pirie cohort study population living near a lead smelter in the

1980s. The commenter contends that studies like these—longitudinal cohort studies, particularly those that capture exposures that may no longer occur—are not reproducible.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will evaluate the quality of scientific studies when promulgating final significant regulatory actions and finalizing influential scientific information. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The EPA will subsequently consider data and model availability when evaluating pivotal science and give greater consideration to studies where the underlying data and models are available for independent validation. The EPA acknowledges that there may be pivotal science where the underlying data and/or models are not available in a manner sufficient for independent validation. In these cases, the EPA may still use these studies in final significant regulatory actions and influential scientific information after either giving lesser consideration to the study or studies or if the Administrator grants an exemption under 40 CFR 30.9.

Comment: Commenter (12720) provides that mercury is a powerful neurotoxic agent capable of adversely affecting fetus and childhood development in low concentrations. The commenter provides an extensive review of the scientific literature in their comments pertaining to health effects and costs of mercury exposure.

The commenter (12720) notes that the mercury Reference Dose (RfD) is based on recommendations of the NRC of the NAS, that conducted an extensive analysis and calculations derived from three longitudinal epidemiologic studies: the Seychelles Islands, the Faroe Islands, and the New Zealand studies. The commenter states that the studies measured neuropsychological effects in children that were exposed prenatally to methylmercury as a result of pregnant mother's consuming contaminated seafood. The commenter adds that the use of these studies to set EPA exposure limits was the result of a years-long transparent process of expert scrutiny, public engagement, inter-agency cooperation, and publication in scientific journals.

However, according to the commenter (12720), the studies can no longer be reproduced, particularly the Faroe Islands study in which the exposure to the community was a result of eating whales, a practice that has since declined due to public alerts about the hazards of eating the mercury-tainted meat particularly for children and pregnant and breastfeeding women. In addition, the commenter states that it would take decades to repeat the studies, which took decades to conduct in the first place. The commenter notes that if EPA may no longer rely on these studies under the Supplemental Proposal, the Agency will not have access to the information it needs to ensure its regulations are sufficiently protective of public health.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will evaluate the quality of scientific studies when promulgating final significant regulatory actions and finalizing influential scientific information. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent

with existing Agency practice. The EPA will subsequently consider data and model availability when evaluating pivotal science and give greater consideration to studies where the underlying data and models are available for independent validation. The EPA acknowledges that there may be pivotal science where the underlying data and/or models are not available in a manner sufficient for independent validation. In these cases, the EPA may still use these studies in final significant regulatory actions and influential scientific information after either giving lesser consideration to the study or studies or if the Administrator grants an exemption under 40 CFR 30.9.

Comment: Commenter (12431) states that excluding information that cannot be made publicly available would slow the development and implementation of alternative test methods and strategies to replace animal testing. The commenter states that such approaches can provide information of equivalent or better scientific quality and relevance for risk assessment, and their development and implementation are mandated by the TSCA. The commenter states that this potential conflict between public accessibility and continued progress in regulatory science has been recognized by EPA's Office of Pollution Prevention and Toxics (OPPT). The commenter states that, in its Strategic Plan to Promote the Development and Implementation of Alternative Test Methods Within the TSCA Program, OPPT states that public access to the datasets used to build models that predict human outcomes may not be possible in some cases, because OPPT uses CBI to update and refine its models, and these activities are critical to its mission of evaluating chemicals under TSCA. The commenter states that, under the proposed rule and SNPRM, OPPT could be limited to using only publicly accessible information and open source models. The commenter states that, in some cases, results from commercially available models can be used without the need to release proprietary code, and requiring commercial model developers to release this intellectual property would likely restrict their ability to continue developing and supporting their models.²²⁴³ The commenter states that sponsors of new industrial chemicals and agrochemicals sometimes submit chemical and toxicological information derived from proprietary alternatives in lieu of certain animal tests. The commenter states that, under the proposed rule and SNPRM, the EPA may be unable to consider this information, resulting in animal testing that would, in the case of industrial chemicals at least, be conducted in violation of TSCA provisions to use available nonanimal test methods and strategies.

Commenter (12720) states that the epidemiologic science and associated studies that are the basis of adherence to the current EPA's radiation protection standards are likely to be expressly excluded from consideration by EPA by the terms of this Proposal. The commenter notes that the EPA relied on radiation dose-response models to develop its radiation protection reports and regulations.

The commenter (12720) provides that, for the past several decades, these models have been used when developing practical and prudent guidance on ways to protect the public from potentially harmful effects of radiation while, at the same time, balancing the beneficial, justified and optimized use of radiation. The commenter states that these models are derived from studies by authoritative scientific bodies, including the U.S. NAS, and the National Council on Radiation Protection and Measurements (NCRP). According to the commenter, the EPA's proposal, if

²²⁴³ Robert DeWoskin, etioLogic LLC. EPA-HQ-OA-2018-0259-0562.

implemented, would limit EPA's staff from basing regulatory actions on precisely these types of studies by requiring that all the underlying data be publicly shared.

The commenter (12720) states that these are profoundly important studies that have been peer-reviewed for decades and the science that has emerged from them has been validated multiple times. According to the commenter, however, these are not studies where the entirety of the public data can be shared or independently replicated. The commenter expresses that there are no other radiation epidemiologic studies of health and longevity on a large population (example: more than 120,000 individuals in the atomic-bomb survivor studies) that have continued for more than 60 years. Thus, the commenter states that the replication of the studies is impossible and unethical as this data comes from individuals exposed to significant acute and a protracted dose of radiation. The commenter contends that the implementation of the rule would effectively block the use of such key scientific studies and allow for radiation standards to be weakened.

The commenter provides examples of regulations that could be adversely impacted by this rule include:

- Cancer Risk Coefficients for Environmental Exposure to Radionuclides
- EPA Radiogenic Cancer Risk Models and Projections for the US Population (the "Blue Book")
- The Uranium Fuel Cycle (40 CFR Part 190) – a standard that sets generally applicable environmental limits for the entire uranium fuel cycle
- Soil cleanup levels for Superfund sites
- The concept of ALARA (As Low As Reasonably Achievable) in radiation protection

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements

of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

With this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

2.2.2.1.3 Meta-Analyses

Comment: Commenters (9455, 11176, 11911, 12405, 12617, 12720) express concern that, while systematic reviews and/or meta-analyses are often extremely informative in the health and environmental sciences, the proposed rule may discount or exclude such studies.

Commenter (9455) asserts that, because only those studies with accessibility would be allowed into the highly considered level, evaluation of consonance among all high-quality, unbiased studies would not occur under this scheme. The commenter states that this is a glaring scientific gap that disallows full meta-analyses and comparison of all high-quality studies.

Commenter (11176) states that meta-analyses and systematic reviews have become important tools in evidence-based policy making. The commenter states that meta-analyses present a special challenge for data sharing because meta-analyses often do not begin with raw data, but with data that have already been "processed" to some degree (for example, the data may be from the results of primary analyses in the studies contained in the meta-analysis). The commenter states that, in such cases, the definition of raw data underlying the meta-analysis is ambiguous and the author of the meta-analysis may not have access to the underlying data in each study used in the meta-analysis. The commenter states that, even if the data were available for meta-analyses, data repositories for meta-analytic data do not currently exist. The commenter states that systematic reviews, one particular form of meta-analysis, are regularly used by EPA to bring together the many relevant studies and develop a summary weight-of-evidence recommendation.²²⁴⁴ The commenter states that de-emphasizing such analyses could greatly

²²⁴⁴ For systematic reviews, see, for example, <https://www.epa.gov/assessing-and-managing-chemicals-under-tsca/application-systematic-review-tsca-risk-evaluations>. For meta-analysis, see, for example, <https://www.epa.gov/environmental-economics/report-epa-work-group-vsl-meta-analyses-2006>.

weaken the EPA's ability to develop regulations and make them harder to defend in court challenges.

Commenter (11176) notes that researchers are developing multi-level models and privacy-preserving distributed algorithms to draw scientific conclusions based on data stored in multiple locations. The commenter states that related work is also a major focus in medical informatics for data from different hospitals (*e.g.*, electronic health record data²²⁴⁵ and biobank data²²⁴⁶) while protecting patient privacy. The commenter states that making such data available in any way would be impractical if not impossible.

Commenter (11911) states that the EPA has not addressed the impact of the proposed rule on scientific meta-analyses. The commenter states that, if researchers conclude that the rule's exclusion covers meta-analyses that incorporate some studies with underlying, unavailable, data, this would threaten the reliability of the meta-analyses themselves.²²⁴⁷ The commenter states that the entire purpose of a meta-analysis is to aggregate large numbers of scientific studies, incorporating different datasets and research methods that span years. The commenter states that designating a study as having no evidentiary value simply because the underlying data cannot be made publicly available is arbitrary, and would result in a less accurate, or biased, average estimate.²²⁴⁸ The commenter states that it would reduce the sample size of a meta-analysis, making it more difficult to draw legitimate statistical conclusions.²²⁴⁹ The commenter states that doing so is inconsistent with the EPA's own guidance for conducting meta-analyses, which states that studies should be weighted according to their sample size or standard error.²²⁵⁰

Commenter (11911) states that the harmful effects of categorical-exclusion policies can be witnessed in the recent proposals to repeal and replace the 2015 Clean Water Rule. The commenter states that the Agency excluded studies for reasons such as study age, type of wetlands, sample size, and lack of summary statistics.²²⁵¹ The commenter states that each of those issues could be addressed by weighting the studies appropriately as part of a meta-analysis.

Commenter (12405) states that the herbicide paraquat is currently undergoing reregistration review.²²⁵² The commenter states that over the past few decades, studies consistently show a correlation between exposure to pesticides and Parkinson's disease, but that full breadth of data may not be reviewable by EPA under the current proposal. The commenter states that, for example, a meta-review examined 40 studies and concluded, "epidemiologic studies suggest a relatively consistent association between exposure to pesticides and an increased risk of developing [Parkinson's disease], despite differences in study design, case ascertainment and definition, control selection, and pesticide exposure assessment." The commenter states that many of these studies would be excluded from consideration under the proposed rule.

Commenter (12617) expresses concern that, while systematic reviews and meta-analyses are often extremely informative in the health and environmental sciences, it is unclear how the SNPRM applies to such studies. The commenter asks if the data access requirements apply to every study considered in a review or meta-analysis and, if so, systematic reviews and meta-analyses would be, in effect, universally ineligible for consideration at EPA.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how pivotal science would be selected. As discussed in the preamble to the final rule, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as "pivotal science," the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, "pivotal science" includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In some cases, there may be a large number of studies that are used to characterize a dose-response relationship (e.g., where the dose-response is based on a meta-regression of epidemiology studies); however, not all of these studies would be considered pivotal science. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.

The final rule also clarifies how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data

²²⁵² Paraquat Dichloride Human Health Mitigation Decision, 82 Fed. Reg. 118 (Env'tl. Prot. Agency Jan. 1, 2017) (notice of availability).

are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The EPA also clarified in the preamble to the final rule that the requirements in the final rule set the overarching structure and principles for transparency in the EPA's significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes EPA administers.

2.2.2.1.4 Coronavirus Disease 2019 (COVID-19) Implications

Comment: Commenter (12411) states that the proposed rule will limit the EPA's ability to create scientifically informed clean air regulations, which is especially reckless, right now, as the world faces COVID-19. Scientists have made the link between poor air quality and increased COVID-19 related health risks.

Commenter (12458) states that a large body of research has linked air pollution to premature death over the past several decades but in the current COVID-19 crisis, several preliminary studies have linked air pollution specifically to higher rates of COVID-19 fatality. The commenter contends that functionally excluding these kinds of public health studies would undermine public health at any time and to do so during a public health crisis is starkly at odds with the Agency's obligation to protect human health.

Commenter (12430) provides that a recent report from the Harvard T.H. Chan School of Public Health studied data from 3,000 counties and found that the presence of particulate matter in the atmosphere could increase the severity of COVID-19 cases. Specifically, it concluded:

- A small increase in long-term exposure to PM2.5 leads to a large increase in COVID-19 death rate, with the magnitude of increase 20 times that observed for PM2.5 [fine particulate] and all-cause mortality. The study results underscore the importance of continuing to enforce existing air pollution regulations to protect human health both during and after the COVID-19 crisis.
- Other studies will likely follow; indeed, U.S. EPA has already directed the Science Advisory Board to investigate “[e]nvironmental [f]actors affecting transmission and severity of COVID-19.” More specifically, U.S. EPA has requested that the Science Advisory Board examine the following questions:
 - Can particulate matter in the atmosphere serve as a vehicle for the transmission of SARS-CoV-2?
 - Does exposure to air pollutants, including wildland fire smoke or other air pollutants (e.g. ozone, particulate matter, diesel exhaust, pollen) increase the susceptibility to respiratory viruses like SARS-CoV-2? Or exacerbate existing COVID-19 infection?
 - Does ambient or indoor temperature or humidity affect the transmission of SARS-CoV-2 and severity of the COVID-19 illness?

To the extent that current or future studies on these issues rely upon restricted data or models, the commenter contends that the supplemental proposal would prevent U.S. EPA from considering them. As a result, it would interfere with U.S. EPA’s long-term efforts to address this virus or potential future ones.

Commenter (12692) states that, as summarized by E&E, Stanford Children’s Health doctor, Lisa Patel, warned that the Rule would “bar the agency from using the latest scientific research on air pollution and disinfectants amid rapidly evolving public health crises.” In other words, the commenter provides that the Transparency Rule would somehow prohibit EPA from posting and updating a list of recommended disinfectants for use against COVID-19. The commenter contends that is beyond ridiculous. The commenter states that the Transparency Rule applies only to “pivotal regulatory science” and “influential scientific information” (85 FR 15405) and that nothing in either the original proposal or the subsequent supplemental would prevent EPA from recommending the use of hydrogen peroxide or ammonium chloride (the chemical in disinfectant wipes) to kill viral pathogens on contaminated surfaces.

Commenters (10045, 11378, 11386, 11403, 14397, 12617) express concern that studies that could be usefully relied upon during a pandemic or other crisis would be systematically excluded from being used in EPA’s scientific and regulatory efforts if this rule is finalized.

Commenter (10045) states that COVID-19 provides an example of the public health risks of this proposal. The commenter states that placing time-consuming barriers to the use of scientific information could in some cases be more than a mere annoyance or ministerial task; it could be fatal. The commenter states that the following are three examples of research that would seem highly applicable to EPA’s responsibilities to respond to the COVID-19 pandemic:

- A March 2020 survey²²⁵³ of existing research that describes the interaction of several coronaviruses on surfaces with biocidal agents; the EPA is responsible²²⁵⁴ for recommending disinfectants for use against SARS-CoV-2 and other pathogens.
- A 2003 paper²²⁵⁵ which describes a statistical correlation between SARS fatalities in China and higher exposure to air pollution, information that could be relevant to EPA air officials as new criteria pollutant standards or air quality advisories for those at risk of the most adverse effects of COVID-19 are developed.
- A 2015 paper²²⁵⁶ that describes the challenges associated with the sterilization and disposal of medical waste contaminated by Ebola; the EPA worked jointly²²⁵⁷ with CDC to develop disposal and sterilization guidelines and could be called on to do the same for SARSCoV-2.

Commenter (10045) states that, since the proposed rule would systematically exclude studies that do not meet the EPA's criteria for independent validation, critical studies that would otherwise inform influential scientific information will not be used or incorporated into key documents such as the *Integrated Scientific Assessment for Particulate Matter*. The commenter states that this document is informed by studies that show that air pollution exposure increases the risk of developing lower respiratory infection.²²⁵⁸ The commenter states that an examination of Table 5-10 of this document reveals that many of these studies are epidemiological papers analyzing the numbers of hospital visits or other medical outcomes in locations all around the world on days when air pollution is high. The commenter states that it is highly likely that some or all of these studies would be presumptively excluded from being used by EPA's rule, which means that they could cease to be incorporated into updates of EPA's Integrated Scientific Assessment, and thus excluded from being used both to inform the EPA's criteria air pollutant regulatory efforts as well as to inform policymakers seeking to assess the influence of air pollution on and develop and implement measures to mitigate COVID-19 (or other future national or global challenges).

Commenter (11378) contends that confidential and proprietary geospatial data, including remotely sensed satellite imagery, location tracking of individual mobility, and georeferenced demographic and health information (which can reveal identity), play essential roles in environmental and health research. The commenter states that, for example, the U.S. response to the COVID-19 pandemic depends on temporarily restricting human mobility and tracing the spatial contacts of infected individuals in order to mitigate disease transmission, which both rely on confidential, individual-level geospatial location data for monitoring and modeling. The commenter states that the proposed rule suggests that such research could be discounted unless the underlying data, containing real-time whereabouts of individuals, be made available to the public.

²²⁵³ <https://www.ncbi.nlm.nih.gov/pubmed/32035997>.

²²⁵⁴ <https://www.epa.gov/pesticide-registration/list-n-disinfectants-use-against-sars-cov-2>.

²²⁵⁵ <https://ehjournal.biomedcentral.com/articles/10.1186/1476-069X-2-15>.

²²⁵⁶ <https://onlinelibrary.wiley.com/doi/abs/10.1002/wmh3.164>.

²²⁵⁸ *Integrated Science Assessment (ISA) for Particulate Matter (Final Report, Dec 2019) | ISA: Integrated Science Assessments | Environmental Assessment | US EPA*. See Table 5-10.

Commenter (11386) states that the proposed rule discounts the use of study conclusions based on publicly unavailable data. The commenter states that an example of when this policy may be harmful is in the case of a quickly evolving health emergency such as the current COVID-19 pandemic. The commenter states that, in this case decisions may need to be made quickly based on the science that is available at the time, which may be incomplete or may not have had enough time to undergo the thorough cleaning, scrubbing, and organization that would be necessary to safely and lawfully make that data publicly available. The commenter states that, by not considering such data in these situations the EPA may respond poorly to important public health emergencies as a result of this rule.

Commenter (11403) states that the current COVID-19 pandemic has highlighted just how important it is for government agencies to be able to use health data in decision making. The commenter states that future studies on the spread and effects of the virus would be limited by the availability of the raw data, which is rightly protected by HIPAA. The commenter states that, for example, any studies drawing a comparison between instances of predisposition to respiratory illness in areas of poor air quality to cases of COVID-19 would be excluded from consideration by EPA. The commenter states that studies of this nature are of critical importance for an environmental health agency, and restricting the degree to which they may be considered is irrational.

Commenter (12617) expresses concern that the proposal places an extra burden on research that helps the world understand and fight the COVID-19 epidemic; the requirements to make all the raw data public while somehow attempting to protect people's medical information. The commenter states that one striking study showed a strong correlation between risk of death from the disease and exposure to particulate air pollution;²²⁵⁹ and states that this work, at least after peer review, ought to be allowed to inform rules on particulate emissions.

Commenter (14397) states that the current coronavirus pandemic is an excellent example of a health crisis that could be exacerbated by this SNPRM. The commenter states that an article in *The Independent* quotes James Goodwin, senior policy analyst at the Center for Progressive Reform as saying: "A lot of the science needed to effectively respond to this pandemic would not be available if this rule existed today."²²⁶⁰ The commenter states that these fears were echoed by Senator Tom Carper who stated "the ongoing COVID-19 pandemic has illustrated the importance of ensuring rapid access and response to scientific information, as well as the utilization of that information."²²⁶¹ The commenter states that it is difficult to see how the research community could, under this proposal, learn anything from this pandemic while still following the appropriate HIPAA regulations. The commenter states that those who survive this crisis can be thankful that this proposal was not in affect at the time of the initial outbreak, as

²²⁵⁹ A national study on long-term exposure to air pollution and COVID-19 mortality in the United States. <https://projects.iq.harvard.edu/covid-pm>.

²²⁶⁰ Boyle, Laura. (March 24, 2020). Coronavirus: Trump administration pushes environmental rollbacks while Americans battle pandemic. *The Independent*.

²²⁶¹ Durkee, Allison. (March 26, 2020). Coronavirus Won't Stop the Trump Administration from Destroying the Environment, *Vanity Fair*.

virtually no medical data could be immediately shared with epidemiologists or researchers under that scenario.

Commenter (12701) asserts that the current pandemic underscores the need for decision-making of federal agencies, including the EPA, to be informed by the best available science. For example, the commenter provides that policymakers need to understand scientific evidence regarding environmental transmission of the coronavirus and how environmental factors such as air quality might impact COVID-19 outcomes. According to the commenter, the supplemental proposal would not adequately allow the EPA to prioritize the best emerging scientific studies when assembling influential scientific information necessary to inform the best policy.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The EPA believes that the approach described in the final rule will result in significant regulatory actions and influential scientific information based on the highest quality, most relevant studies and ensure adequate human health and environmental protections while maximizing transparency and maintaining consistency with the statutes the EPA administers.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Finally, the EPA acknowledges that the COVID-19 situation is unprecedented. The EPA's most important environmental statutes provide the Agency with the authority to issue emergency orders or respond to address emergencies to protect human health and the environment. This final rule would not limit or impede the EPA's authority to undertake such responses. Moreover, the final rule includes sufficient flexibility in terms of the considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data in order to minimize potential unintended consequences, such as a potential impact during a crisis situation. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

2.2.2.1.5 Comments on Other Commenters' Science Limitation Concerns

Comment: Commenter (12692) disputed/commented on several claims regarding the limiting of science/data as a result of the proposal made by a commenter (Deborah Wallace, Ph.D. in Ecology) as follows:

Claim: The proposal would thwart meta-analysis, or research that analyzes studies across disciplines, because many studies would be excluded.

Comment: A meta-analysis is the use of statistics to summarize the results of other studies. Nothing in the Transparency proposal would prevent EPA analysts from conducting or reviewing meta-analyses. The new emphasis on independent validation might, however, make meta-analyses more useful by making the underlying studies more reliable.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how pivotal science would be selected. As discussed in the preamble to the final rule, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as "pivotal science," the EPA is balancing transparency and feasibility by

focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In some cases, there may be a large number of studies that are used to characterize a dose-response relationship (e.g., where the dose-response is based on a meta-analysis); however, not all of these studies would be considered pivotal science. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.

As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations.

Comment: Commenter (12692) states that the Environmental Protection Network (EPN) cites an article titled “All science should inform policy and regulation” by Stanford professor John Ioannidis, the most prominent replication crisis scholar. Ioannidis warns that EPA’s plan to “ban the use of scientific studies for regulatory purposes unless all their raw data are widely available in public and can be reproduced,” would have dreadful consequences: “science would be practically eliminated from all decision-making processes. Regulation would then depend uniquely on opinion and whim.”

In response to this, commenter (12692) states that Dr. Ioannidis' description of EPA's proposal is a caricature. The commenter notes that the EPA is not proposing to "ban" the use of studies unless the raw data are "widely available." The EPA is proposing a system of "tiered" access including the use of highly restricted "data enclaves."

The commenter (12692) provides that independent researchers seeking access to data involving PII would be subject to the same legal requirements and penalties that prevent the original researchers from publicizing confidential information. And that is only if such access is legally permissible. As noted, the commenter states that the EPA's goal is to "ensure that, over time, more of the data and models underlying the science that informs regulatory decisions . . . is available to the public for validation in a manner that honors legal and ethical obligations to reduce the risks of unauthorized disclosure and re-identification" (83 FR 18770).

Additionally, the commenter (12692) states that banning studies with inaccessible data would eliminate most science used in rulemaking precisely because of the replication crisis Dr. Ioannidis has documented and brought to national attention.

Response: As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. Only later in the process, after study quality has been assessed, the EPA will then identify those studies considered to be pivotal science. When evaluating those scientific studies considered to be pivotal science—in either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health

studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

2.2.2.2 Legal Validity of Ignoring Studies

Comment: Commenter (11894) states that if EPA plans to comply simply by ignoring studies that do not meet the new requirements, an assessment of the legal validity of that approach would also be required. According to the commenter, the EPA has not done this and apparently, as with many other issues, throws the burden on commenters to figure out what it meant and why.

Response: As described in the preamble to the final rule, the rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. The rule does not provide for categorically excluding or ignoring studies. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Further, the EPA intends for the final rule to be implemented in a transparent manner. The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. Additionally, the final rule requires the EPA to document the rationale for exemptions granted by the Administrator to the requirements included in the final rule in the significant regulatory action or influential scientific information.

Comment: Commenter (10944) states that any use of the supplemental proposal to nullify research data used as the basis for existing regulations is in direct violation of the fourteenth amendment as the reductions in environmental regulations are more burdensome to communities of color, low income communities, and children.

Response: The EPA would like to clarify that the final rule applies prospectively to significant regulatory actions and influential scientific information; the final rule has no retrospective effect on either significant regulatory actions or influential scientific information. Further, the final rule does not violate the Fourteenth Amendment to the United States Constitution and does not deprive any person of due process or equal protection under the law. The EPA would also like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA

to establish data sharing mechanisms. The rule also does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Moreover, as described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

2.2.2.3 Health and Environmental Protection Implications

Comment: Many commenters (9336, 9338, 9372, 9455, 10055, 10749, 10865, 10866, 10974, 10975, 11103, 11190, 11192, 11330, 11354, 11359, 11370, 11377, 11390, 11393, 11403, 11407, 11479, 11482, 11487, 11496, 11576, 11895, 11907, 11920, 12405, 12411, 12412, 12422, 12423, 12430, 12435, 12463, 12474, 12688, 12707, 12716, 12727, 13549) express that, as a result of the rule limiting the use of science to inform regulatory and policy decisions, there will be adverse health and/or environmental protection implications. Several of these commenters also contend ²²⁶²~~FOI~~ [See also comments and EPA's response to comments in Chapter 13, section 13.4 (Limits Use of Science When Making Policy and Regulatory Decisions).] A sample of the specific comments follow:

- Commenter (11920) states that while the original proposal was seriously flawed, the supplemental notice dramatically expands the reach and impact of this arbitrary and unlawful effort to restrict the EPA's use of valid and credible peer-reviewed science. By excluding high-quality, peer-reviewed, and validly published science from the regulatory

Chapter 1: ²²⁶² Chavis, B.F., Lee, C. Commission for Racial Injustice, United Church of Christ (1987). Toxic Wastes and Race in the United States: A National Report on the Racial and Socio-Economic Characteristics of Communities with Hazardous Waste Sites; Mohai, P., Lantz, P.M., Morenoff, J., House, J.S., & Mero, R.P. (2009). Racial and Socioeconomic Disparities in Residential Proximity to Polluting Industrial Facilities: Evidence from the Americans' Changing Lives Study, American Journal of Public Health, 99 (Suppl 3), S649; Zwickl, K., Ash, M., & Boyce, J.K. (2014). Regional variation in environmental inequality: Industrial air toxics exposure in U.S. cities. Ecological Economics, 107, p. 494-509.

decision-making process, the commenter contends that the proposed rule undermines the integrity of these laws and will result in under-informed and inadequate protections for vulnerable communities of people and for wildlife. According to the commenter, a plain reading of this supplemental notice reveals that through restricting the use of relevant and high-quality scientific information, the EPA is seeking to protect polluters and regulated industries, rather than carry out its statutory mandate to protect the environment and American citizens.

- Commenter (12435) states that the degradation in air quality that would surely result from this proposal would undermine public health while we are fighting a pandemic respiratory virus for which conditions such as asthma and COPD are serious risk factors.
- Commenter (12435) states that the supplemental proposal asserts that the action “does not establish an environmental health or safety standard.” According to the commenter, while there are no specific standards included in the proposed rule, it has a direct impact on the data and models that can be relied on as the basis of environmental health or safety standards that demonstrably affect minority and low-income populations.
- Commenter (12435) states that the supplemental proposal asserts that the action “does not concern an environmental health risk or safety risk.” To the contrary, the commenter asserts that the proposed rule could limit the ability of the Agency to consider all relevant data and models when making decisions that could have a direct impact on environmental health or safety of children. The commenter notes that children are considered a vulnerable class under the Federal Policy for the Protection of Human Subjects or “Common Rule” and dissemination of data from studies of children are even more stringently regulated than for the general adult population. Therefore, the commenter contends that it is reasonable to expect that environmental health studies involving children would be disproportionately discounted under the proposed rule, leading to regulations that do not adequately protect this sensitive population as required by the CAA. Further, the commenter adds that the proposed rule could restrict states ability to protect public health and the environment at EPA-lead CERCLA sites if EPA fails to consider data or models that might allow a greater level of protection.
- Commenter (11393, 11407, 11895) expresses that this rule would preclude EPA from considering important and pertinent scientific health studies that contain personal medical information which cannot be publicly released. The commenter contends that the rule would create barriers to regulations and arbitrarily deny consideration of important findings, thereby restricting EPA's ability to protect human health and the environment.
- Commenter (11482) states that the proposed rule has implications for environmental health associated with the oceans, a core advocacy objective of Ocean Conservancy’s mission.
- Commenter (11330) states that this proposed rule will be used to erode landmark advancements -- achievements in public health and environmental safety. For example, the commenter notes that they know the Clean Power Plan would have led to reductions in pollution that were predicted to prevent some three -- thirty-six hundred premature deaths, ninety thousand asthma attacks in children, and three hundred thousand missed school and work days each year. The commenter states that many of these health benefits were partially determined by landmark clean air studies like the Harvard Six City study. The commenter contends that this is equivalent to telling CDC they can't use health data when fighting the coronavirus.

- Commenter (11390) states that the proposed rule, if adopted, will impose serious costs to public health and safety. The commenter contends that eliminating the consideration of relevant science from the decision-making process based solely on the availability of underlying data would compromise EPA's ability to effectively carry out its mission to protect public health and the environment.
- Commenter (9455) contends that contrary to the assertion that this proposed rule has no environmental impact, it would open current regulations to dilution or even elimination and needed new regulations to dilution or failure to be promulgated. Thus, the commenter suggests that it potentially would return the country to the days of killer smogs, rivers catching fire, widespread poisoning of fetuses and young children with heavy metals, massive illegal dumping, and extinction of species from persistent pollutants.
- Commenter (12411) states that not only will this proposed rule be detrimental to the development of environmental and public health regulations, but it will also hurt businesses across all sectors by intensifying the climate crisis and impacting air, water, and wildlife.
- Commenter (12716) states that, in addition to threatening environmental harm, the rule would jeopardize critical programs (e.g., NAAQS) that protect human health in the watershed and throughout the country.
- Commenter (11576) notes that EPA has relied on well-established studies conducted before mechanisms existed for sharing data publicly in its assessments of the environmental risks of pesticides. The commenter also mentions that bioaccumulation data's inclusion in the supplemental proposal and the potential for undermining established science on the accumulation of mercury, lead, and other metals in aquatic systems and wildlife.

Conversely, commenter (11899) argues that critics claim the rules will exclude so much research that the rules will actually endanger public health. In fact, the commenter states that only studies EPA will likely not see is what researchers know will not survive robust peer review, and thus do not submit in the first place. According to the commenter, the real danger comes from research that is based on shoddy data, algorithms, models and analyses that past researchers have been able to keep secret. The commenter contends that is precisely what the rules will ferret out and correct.

Commenter (11479) states that, with the proposed rule's implementation, underserved communities are likely to face exacerbated harms from hazardous chemicals like ethylene oxide (EtO), which is known to increase the risk of certain cancers. When conducting the 2014 National Air Toxics Assessment, the commenter provides that the EPA determined that a number of communities are now exposed to EtO levels higher than the level that EPA has deemed safe.²²⁶³ Because EPA was able to conduct this science-based assessment, the commenter states that it could pursue policy options to alleviate harm. For instance, the commenter notes that the

²²⁶³ EPA. 2018. Fact Sheet: EPA Taking Steps to Address Emissions of Ethylene Oxide. Online at <https://www.epa.gov/hazardous-air-pollutants-ethylene-oxide/fact-sheet-epa-taking-steps-address-emissions-ethylene-oxide>, Accessed May 14, 2020.

EPA's Office of the Inspector General²²⁶⁴ recently highlighted the need for EPA to take prompt action to inform and act on concerns from residents living near EtO-emitting facilities. However, the commenter states that if the proposed rule, as modified by the supplemental notice, is implemented, the EPA will lose the ability to rely on important scientific evidence for its internal risk assessments, likely resulting in less protective policies. According to the commenter, communities like St. James, Louisiana—plagued by EtO levels up to 765 times higher²²⁶⁵ than the levels EPA considers safe—would be unaware about the risks they face and lose the ability to advocate for policy mechanisms that reduce those risks.

The commenter (11479) notes that another example concerns the aforementioned chemical class Per- and PFAS. EPA is currently developing regulations for PFAS chemicals, like proposing maximum contaminant levels for PFOA and PFOS in drinking water.²²⁶⁶ But because research from the C8 Science Panel studies relied on human health data from tens of thousands of people, the commenter is concerned that this research could be excluded or down-weighted under the proposed rule. According to the commenter, this would weaken the scientific legitimacy of EPA's regulatory decisions and endanger public health. Since evidence suggests that PFAS contamination occurs far more frequently near communities of color and low-income communities,²²⁶⁷ the commenter adds that the proposed rule is likely to disproportionately affect underserved communities.

In addition, commenter (11479) states that, under the proposed rule, as modified by the SNPRM, the EPA would be prevented from using much of this crucial research, because it relies on personal health information that cannot legally or ethically be disclosed in many cases.²²⁶⁸ The commenter states that such restrictions on EPA's ability to rely on relevant scientific research on air pollution and health—even research that the EPA itself funded—will hinder the Agency's ability to enact health-protective NAAQS and other public health and environmental protections that the Agency is charged with enacting.

Commenter (11576) refers to detailed examples of influential human-health studies that necessarily relied on sensitive human data.²²⁶⁹ The commenter states that such studies have led to the crucial strengthening of public-health protections by, for example, linking exposure to chemicals to the risk of disease.²²⁷⁰ The commenter states that the SNPRM expands the scope of studies that might be subjected to the rule, which could greatly weaken public-health protections.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. Only later in the process, after study quality has been assessed, the EPA will then identify those studies considered to be pivotal science. When evaluating those scientific studies considered to be pivotal science—in either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR

²²⁶⁹ Id. at 10. Epidemiological studies have been foundational to understanding critical connections between exposure to toxic chemicals and public-health harms. For example, links between certain occupations and incidences of cancer were discovered through the precursors to epidemiological studies. See Dana Loomis, Neela Guha, Amy Hall, and Kurt Straif, Identifying Occupational Carcinogens: An Update from the IARC Monographs, *Occup. & Environ. Med.* (2018) (attached), available at <http://oem.bmj.com/content/early/2018/05/16/oemed-2017-104944>.

²²⁷⁰ August 2018 Coalition Comments at 10-14 (outlining specific studies that have been relied upon to show how certain chemicals pose a danger to health, particularly for vulnerable populations like children).

30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The EPA does not agree that this rulemaking is counter to the Agency's mission or that it would weaken human health protections. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. The approach described in the final rule will result in significant regulatory actions and influential scientific information based on the highest quality, most relevant studies and ensure adequate human health and environmental protections while maximizing transparency and maintaining consistency with the statutes the EPA administers.

Comment: Commenter (12411) states that, overwhelmingly, scientists agree that a man-made climate crisis is upon us, warranting the need for strong environmental regulations now more than ever. The commenter notes that the impacts from the climate crisis, such as rising oceans and disruptions to supply chains, pose existential threats to our entire economy, indeed to human life itself. Unchecked, the commenter adds that the climate crisis will impact gross domestic product (GDP) by \$44 trillion in just the next 40 years, while a study from the Brookings Institute says by 2100, climate impacts will slash global GDP by more than 20 percent. Yet, the commenter states that this proposed change would require scientific studies to make all their raw data public, including confidential medical records, or else not be considered for future environmental rulemaking processes. According to the commenter, while public statements from the EPA have deemed this a step towards transparency, it will in fact do just the opposite by limiting legitimate research that goes into creating clean water, clean air, and other vital regulations for the environment and public health because of privacy requirements. The commenter adds that this proposed rule does not make long-term business sense, as environmental and public health regulations directly affect businesses and their workers.

Similarly, the commenter (12411) expresses that the proposed rule will weaken clean water protections. The commenter provides that clean waterways are vital for sectors like breweries, the seafood industry, and the hospitality industry. The craft brewing industry contributed \$76.2 billion to the U.S. economy in 2017, more than 500,000 jobs, and depends heavily on clean water to create a high-quality product for its consumers. The commenter adds that consumers spend \$887 billion annually on outdoor recreation overall, and nearly \$175 billion on fishing, kayaking, rafting, canoeing, scuba diving and other water sports alone – all of which thrives on a visibly healthy water supply. Further, the commenter states that clean water is important for the real estate industry – home values can erode by as much as \$85,000 each on land near water with high nutrient pollution levels. Lastly, the commenter states that a clean water source allows each of these industries to provide safe products and activities for their customers to enjoy, while also reducing the cost of water treatment for each sector.

Commenter (12707) contends that both safe recreational enjoyment of the Great Lakes and water quality are threatened by EPA's proposal. The commenter provides that the availability of scientific data has been key to addressing important public health issues in the Great Lakes, such as the development of the 2012 Recreational Water Quality Criteria (RWQC), "designed to protect the public from exposure to harmful levels of pathogens in water-contact activities."²²⁷¹ The commenter states that the RWQC sets recommended concentration thresholds of known pathogens that cause gastrointestinal illness from exposure in water, such as E. Coli and enterocci. The commenter adds that these recommendations are informed by "the latest research and science, including studies that show a link between illness and fecal contamination in recreational waterways."²²⁷² According to the commenter, these recommendations provide essential information for determining warnings and beach closures for recreational users in the Great Lakes region.

Finally, the commenter (12707) states that with the rise of toxic harmful algal blooms (HABs) in the region safe drinking water has become a primary concern. The commenter provides that the EPA's 2015 Drinking Water Health Advisories for Two Cyanobacterial Toxins provide necessary guidance based on scientific studies that indicate the health effects of exposure to cyanotoxins, such as gastroenteritis and liver and kidney damage.²²⁷³ The commenter notes that cyanotoxins, similar to pathogens like E. Coli and enterocci, pose serious health risks from exposure in recreational settings as well. According to the commenter, this relatively new area of concern is still being studied and access and use of the latest research as it continues to evolve is critical to protecting the safety of drinking water and recreation in the Great Lakes region.

Response: The EPA does not agree that this rulemaking is counter to the Agency's mission or that it would weaken environmental protections. As further detailed in the preamble to the final rule, the rule will not limit research. The requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The EPA believes that the approach described in the final rule will result in significant regulatory actions and influential scientific information based on the highest quality, most relevant studies and ensure adequate human health and environmental protections while maximizing transparency and maintaining consistency with the statutes the EPA administers.

Finally, as described in the preamble to the final rule, that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

²²⁷² Ibid.

²²⁷³ https://www.epa.gov/sites/production/files/2017-06/documents/cyanotoxins-fact_sheet-2015.pdf

Comment: Commenter (12430) states that the supplemental proposal would preclude U.S.EPA from researching and fully considering the health and economic impacts to disadvantaged communities. The commenter notes that this would include both the impacts of increased exposure to pollution from nearby sources and the increased rates of illness and death from heightened vulnerability to the effects of pollution. Studies related to environmental justice are often conducted at the community level.²²⁷⁴ The commenter states that it would not be possible to organize the participants into larger and less identifiable groups and be able to fulfill the purpose of the studies, which is to identify the health impacts at the community level. The commenter adds that grouping in this way is costly, time consuming, and would result in a data set that would not have the same analytical power as the original study.²²⁷⁵ The commenter further adds that grouping would also reduce the locational sensitivity of the data and make more local and community-based studies unusable.

The commenter (12430) states that community level studies by CalEPA agencies—including those required under state law²²⁷⁶ and important for environmental justice considerations—would not be considered by U.S. EPA under the SNPRM, if finalized. The commenter provides that the proposal would, for example, exclude multiple studies of the effects on children of prenatal pesticide exposure.²²⁷⁷

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges that there may instances where the

commenter states that structural stress such as job strain, economic insecurity, racism, and sexism gives rise to numerous health impairments such as increased coronary heart disease (Marmot et al, 1997, abstract attached), low-weight births (Geronimus, 1996, abstract attached), metabolic syndrome and diabetes (Rosmond and Bjorntorp, 1998, abstract attached; Bjorntorp, 2001), Alzheimer’s Disease and other dementias (Elovainio et al, 2009; Wang et al, 2012), chronic obstructive pulmonary disease (Clark et al, 2015), high blood pressure (Michaels et al, 2019), disturbed sleep patterns (Johnson et al, 2016), and obesity and the consequences of obesity (Brunner et al 1997; Bjorntorp, 2001). The commenter adds that these outcomes of structural stress indicate deterioration of underlying health in the afflicted and that many outcomes are identical to those of environmental exposures and raise the probability that structural stress and environmental exposures interact to reinforce each other and increase community incidence and prevalence of health impairments well beyond what they would be if the community had to contend with only one of the two afflictions, the well-known non-linear synergistic effect. The following examples are provided:

Example 1. Incidence of Low-Weight Births. My own work revealed that geographic and temporal patterns of low-weight births in New York City reflected the years and neighborhoods subjected to “planned shrinkage”, an extra-legal mode of urban renewal (Wallace 2011, full text attached). The discovery of the temporal patterns depended on medically confidential data on individuals. Discovery of geographic patterns depended on administrative datasets that, in turn, depended on medically confidential data (birth certificates). Other researchers (examples: Laurent et al, 2016, abstract attached; Twum et al, 2016, abstract attached) have shown that exposure to air pollutants also results in raised incidence of low-weight births, findings that depended on medically confidential data. Are we, as a nation, going to experiment with babies born to women in low income communities and brutally segregated communities of color by failing to properly regulate air pollution and seeing whether these chemicals and particles interact with structural stress to produce enormous increases in incidence of low-weight births? That would be a consequence of implementing the proposed rule.

Example 2. Lead Body Burden Interacting with Structural Stress. Another example of how the structural stress/environmental interaction plays out involves body burden of lead. The literature on the harmful effects of lead stretches back for many decades. In the latter half of the 20th Century, effects of low exposures to lead on fetuses, babies and small children formed the basis of much regulation of air-borne, water-borne, and surface-borne lead (soil and painted surfaces). These publications depended on

confidential medical data. Needleman et al (1996) studied a cohort of boys in Pittsburgh to document whether lead body burden associated with impulsivity and potential for violence. To the authors' surprise, lead body burden associated with these traits only in the African-American boys. The demographic data in the paper hint at different processes and stresses within the black and white populations in the study area: the black subcohort numbers remained fairly stable during the several years of study, but white numbers dwindled rapidly. White families moved out of the study zone but black families did not. The answer to the puzzle came, not from Needleman's team but from the social psychiatrist Mindy Fullilove in her 2005 book *Root Shock* which described urban renewal in several US cities and its impact on the affected communities and individuals. Pittsburgh was one of those cities. Additionally, the University of Pittsburgh, in the 1980's-1990's, bought up large tracts of "slums" and evicted the residents (personal communication, Mindy Fullilove, 2008). Pittsburgh and the University degraded and destabilized the so-called slum neighborhoods. The white families could flee but the black families had to shift around, even doubling up in the remaining housing, because of housing segregation practices and because of the need for survival to maintain community ties. Thus, Needleman, unknown to himself, was dealing with an afflicted black community and a disappearing white one. The dose/response pattern of lead body burden with impulsivity and potential for violence detected only in the black subcohort reflected the synergism of community destruction and lead body burden. Carol Stack (1974) documented how poor black families rely on a dense social network of women to survive. Ida Susser (2012) documented how poor white families rely on a dense social network of women to survive. Destruction of poor neighborhoods, especially deliberate destruction by public policies such as urban renewal and planned shrinkage (the withdrawal of essential services such as fire service and sanitation) shred these vital networks but have differing impacts on black and white families because of pervasive and illegal housing segregation maintained by such practices as racial steering and refusal to sell or rent to black families and individuals. Massey and Denton (1993) documented these practices in the late 1980's-early 1990's but they persist into the present. For example: the NYS Attorney General is now investigating racial steering by realty agents on Long Island (Newsday, 2019). Housing injustice, thus, imposes a broader and deeper structural stress on black than white communities, as well as the unraveling of social networks on which families rely for survival. It is but one of the many race-based disempowering outcomes of oppressive policies that erode the underlying health of individuals and communities of color. The bodies of residents of oppressed communities reflect the chronic and acute institutionalized violence directed against them and cannot cope with environmental exposures with the same efficacy that is shown by less-oppressed individuals and communities. Present and future regulations and policies on lead must rely on confidential medical data. The proposed rule would constitute yet another avenue of chronic and acute racial oppression.

Example 3. Traffic Fumes and Violence: Raised Incidence of Asthma. Rosalind Wright's team at Harvard studied a cohort of children in poor communities of Boston (Clougherty et al, 2007, full text attached). One important study result was that children exposed to both traffic fumes and violence had much higher incidence of asthma. Since 2007, similar studies in other venues have confirmed the Boston findings. The website Pubmed

produces a long list of peer-reviewed publications when search terms are “asthma and violence”. The list includes several papers documenting the greater incidence of asthma in the aftermath of the 9/11 World Trade Center attack among people exposed to the dust and suffering from PTSD. This 2007 paper is an example of one supported by consonant results from other studies.

The commenter (9455) contends that barriers to new regulations and policies imposed by the proposed rule would constitute environmental injustice by continuing unjust exposures that interact with socioeconomic factors to produce patterns of worse health and higher mortality rates in low-income communities and communities of color.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations.

As discussed more fully in the preamble of the final rule, the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The EPA believes that the approach described in the final rule will result in significant regulatory actions and influential scientific information based on the highest quality, most

relevant studies and ensure adequate human health and environmental protections while maximizing transparency and maintaining consistency with the statutes the EPA administers.

Comment: Commenter (10749) states that, since this proposed rule will apply to all research that the EPA uses, many studies that have found strong associations between adverse health effects and environmental hazards would also be discarded, such as evidence that links mercury from power plants to impaired brain function²²⁷⁹ and lead in paint dust to behavioral disorders in children.²²⁸⁰ Commenter suggests that a consequent decrease in air quality standards would lead to more air pollution across the United States, resulting in a higher prevalence of asthma, respiratory diseases, and cancer, especially among children.²²⁸¹ The commenter states that these high cost-to-treat diseases will cause more people to seek out medical attention leading to higher rates of hospitalization and a higher burden on the healthcare system and hospitals.

Commenter (10865) states that, if the EPA excludes studies or diminishes the consideration of studies because the data cannot be made public, children and their families may be exposed to real harm. The commenter states that the resulting policy decisions affecting millions of children would be based on inadequate information that fails to include well-supported studies by expert scientists.

Commenter (12430) contends the SNPRM would allow public availability of data to supersede the evaluation of scientific quality by independent expert peer reviewers, to the detriment of public health in both routine regulatory actions and crises that rely on the federal government's use of science. The commenter states that it would reduce the consideration given to many important, high-quality studies (or preclude that consideration entirely) and could even distort the practices used to conduct certain studies in the first place.

Commenter (12707) asserts that the negative effects of the SNPRM on individual EPA programs would be far reaching and would undermine the EPA's ability to protect air and water quality across the Midwest. The commenter states that foundational studies about the impact of air pollution on public health are in the bullseye of this proposal— indeed, they have been the target of legislative efforts to restrict Agency science for years. The commenter states that these studies have been reviewed numerous times and found to be sound and appropriate. The commenter states that, under the EPA's proposed rule, however, they could be out of bounds, compromising the Agency's ability to truly assess the impacts of air pollution and to set national air health standards at a level that will protect the public health, as required by the CAA. The commenter states that less protective standards will mean even more air pollution in our communities.

Commenter (12707) contends that the elimination of these studies would skew the evaluation of costs and benefits, inappropriately minimizing the public health benefits. The commenter states

²²⁸¹ WHO, "How air pollution is destroying our health" (n.d.). Available at <https://www.who.int/news-room/spotlight/how-air-pollution-is-destroying-our-health>.

that artificially suppressing the benefits will lead to less protective rules that will not be based on a true accounting of the cost to the public in terms of public health impacts.

Commenter (12720) states that the Proposal and Supplemental Proposal has clear adverse consequences for cost-benefit analyses that consider the substantial costs of health effects caused by exposure to air pollution. The commenter notes that this area of work includes efforts to address carbon dioxide (CO₂) pollution and climate change, such as the Clean Power Plan. The commenter asserts that health and air quality-related monetized benefits from reducing PM_{2.5} pollution, a co-benefit of CO₂ reductions, would be substantially reduced if EPA is unable to rely on the best available science for pollution-health impacts.

The commenter (12720) that in its proposed rule repealing the Clean Power Plan, EPA signaled this approach: the economic health benefits of PM_{2.5} reduction were zeroed-out²²⁸² by EPA after levels reached the current annual NAAQS (12 µg/m³)^{2283,2284} The commenter states that this approach of using the NAAQS or LML as a safe threshold directly contradicts the best available science^{2285,2286} and EPA's own stance on the pollution threshold issue as recently as 2012,²²⁸⁷ *more* than even the current EPA dose-response approach for PM_{2.5} exposure assumes.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating significant regulatory actions or developing influential scientific information. As described in the preamble to the final rule, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information, consistent with existing Agency practice. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or

cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The EPA disagrees that implementation of the rule would either eliminate key health studies or minimize public health benefits. The benefits of greater data transparency and the significance of reanalyzing and validating study results are well-documented in scientific literature. McNutt (2014) noted, "reproducibility, rigor, transparency, and independent verification are cornerstones of the scientific method."²²⁸⁸ The National Academies of Sciences, Engineering, and Medicine (NAS) workshop on Reproducibility and Replicability in Science also noted that "certainly, reproducibility and replicability play an important role in achieving rigor and transparency."²²⁸⁹ Munafò et al. (2017) state, "the credibility of scientific claims is rooted in the evidence supporting them, which includes the methodology applied, the data acquired, and the process of methodology implementation, data analysis and outcome interpretation. Claims become credible by the community reviewing, critiquing, extending and reproducing the supporting evidence. However, without transparency, claims only achieve credibility based on trust in the confidence or authority of the originator. Transparency is superior to trust."²²⁹⁰ The 2019 NAS workshop on Reproducibility and Replicability in Science also concluded, "the scientific enterprise depends on the ability of the scientific community to scrutinize scientific claims and to gain confidence over time in results and inferences that have stood up to repeated testing."²²⁹¹ The EPA agrees that data transparency is vital for individuals who have not contributed to the study to be able to verify the quality and strength of published studies and finds that the benefits of reanalysis are especially important for data that drive the quantitative requirements or analyses of EPA

²²⁹⁰ Munafò, M. R. et al. (2017). A manifesto for reproducible science. *Nature Human Behaviour* 1(0021). Available at <https://doi.org/10.1038/s41562-016-0021>.

²²⁹¹ NAS (National Academies of Sciences, Engineering, and Medicine). (2019). *Reproducibility and replicability in science*. Washington, DC: The National Academies Press. Available at <https://www.nationalacademies.org/our-work/reproducibility-and-replicability-in-science>.

significant regulatory actions or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and, thus, increase the opportunity for independent subject matter experts to validate pivotal science, and as the dose-response data are better understood through independent reanalysis the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information. Further, the rule offers sufficient flexibility in terms of the considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data in order to minimize potential unintended consequences.

As described in the preamble to the final rule, that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

As discussed more fully in the preamble of the final rule, the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The EPA believes that the approach described in the final rule will result in significant regulatory actions and influential scientific information based on the highest quality, most relevant studies and ensure adequate human health and environmental protections while maximizing transparency and maintaining consistency with the statutes the EPA administers.

2.2.2.4 EPA Programs

2.2.2.4.1 Need for Assessment of Impact on EPA Programs and Regulations

Comment: Commenter (11395) asserts that EPA did not evaluate the impact of the proposed rule on the existing regulations and programs that have been adopted to implement those laws. The commenter provides that EPA has not provided an analysis of how the requirements in this regulation would affect key studies that support the periodically updated IRIS risk assessments, which are used to support regulations adopted pursuant to several of those statutes and that it is irresponsible to proceed with adopting this rule without such an analysis.

Commenter (11894) contends that EPA has failed to address how it can refuse to apply these new requirements to data and models used to support Pre-manufacture Notices (PMNs) given express direction from Congress to the Agency to consider data quality. The commenter provides that EPA has not addressed the issue of applicability to this program at all, or addressed the impacts on the public health or the environment if it did. Furthermore, the commenter notes that EPA has not explored the resources that would be needed to respond.

Commenter (12403) contends that the proposed rule and the SNPRM do not provide meaningful assessments of the cost of implementing the rule or of the impact of the rule on existing regulations and programs. The commenter notes that on the other hand, a 2019 SAB draft report identifies a number of costly activities that implementation would require, including establishing an office for data-sharing, funding replication studies, promulgating guidance on methods and analysis, developing tiers of public access, and conducting data reanalysis. The commenter provides that these costs should be thoroughly assessed prior to finalization of the rule.

Response: The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs or benefits of the proposed action. As discussed in the preamble to the final rule, this is a rule of internal procedure promulgated under the EPA's housekeeping authority and imposes no enforceable duty on any state, local, or tribal governments or the private sector. Additionally, this rule does not require the EPA or other parties to disclose or host data. Hence, this rule does not impose costs on the EPA or any other party to make such data available. The EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small. In addition, the Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

The main benefits of this rule spring from greater transparency in significant regulatory actions and influential scientific information. By placing greater emphasis on the availability of dose-response data underlying pivotal science, the rule will allow for greater scientific scrutiny as EPA decision makers are developing significant regulatory actions and influential scientific information and increases the likelihood that any errors will be identified and corrected. Greater transparency is also inherently valuable as a principle of good government and provides benefits to the public at large, including reducing the risk of errors in EPA analyses and in the science such analyses rely upon. The ability for independent subject matter experts to validate pivotal science will facilitate more effective comment and engagement with the public during development of future significant regulatory actions and influential scientific information.

With this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

2.2.2.4.2 Superfund National Priorities List

Comment: Commenter (11894) discusses the Superfund National Priorities List (SNPL) and EPA's three-tier hierarchy to select human health toxicity values for use in risk assessments to guide those cleanups. The commenter notes that these Superfund risk assessments do not set absolute legally binding standards but rather presumptive levels. The commenter asserts that the

methodology under which the assessments are conducted expressly recognize that EPA should take action to reduce public health risks using the best available science without waiting for further study to improve the certainty of the toxicity values. According to the commenter, insisting on certainty leads to delay, which has its own costs.

The commenter (11894) contends that if the final science transparency rule applies retroactively to every one of these toxicity values will have to be re-examined. The commenter states that if the human toxicity studies underlying these values fail to meet the new tests of transparency and reproducibility, the cleanup levels for air, water and soil based on these toxicity values will be discredited. Furthermore, the commenter provides that as a result, the cleanup actions underway at all 1335 Superfund sites will be undermined, as well as the cleanups completed at 424 sites that have been deleted from the SNPL. Meanwhile, the commenter notes that if the final science transparency rule applies only prospectively to new toxicity values, EPA will still need to revise the hierarchy of human health toxicity values to incorporate the new transparency and reproducibility requirements. The commenter asserts that EPA will incur significant costs and time replacing the hierarchy, the toxicity values, and the cleanup levels at many sites.

Commenter (12720) states that the expansion to “influential scientific information” would impact cleanup levels at the 1,335 sites on the SNPL. Should the human toxicity studies underlying toxicity values used at these sites be discredited due to the failure to meet the new requirements, the commenter asserts that cleanup actions at all sites will be undermined, as well as the cleanups at the 424 sites that have been deleted from the SNPL.

Response: This rule sets the overarching structure and principles for transparency of pivotal science in significant regulatory actions and influential scientific information. The final rule provides that if implementing the rule results in any conflict between this rule and the environmental statutes that the EPA administers, and their implementing regulations, this rule will yield and the statutes and regulations will be controlling. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

The EPA would also like to clarify that the final rule applies prospectively to significant regulatory actions and influential scientific information; the final rule has no retrospective effect on either significant regulatory actions or influential scientific information.

2.2.2.4.3 Safe Drinking Water Act Programs

Comment: Commenters (11894, 12720) provide that EPA’s proposal will affect two major elements of EPA’s SDWA program: drinking water health advisories and human health benchmarks for pesticides in drinking water. According to the commenters, neither the advisories nor the benchmarks are enforceable, but water utilities often use them when their source water is contaminated with a pollutant for which there is no federal drinking water standard. The commenters contend that if the final science transparency rule applies retroactively to influential scientific information, every one of these advisories and benchmarks will have to be re-examined. The commenters maintain that if the human and/or animal toxicity studies underlying these advisories and benchmarks fail to meet the new tests of transparency and reproducibility, the treatment provided by utilities for these pollutants will be discredited. The commenters also provide that if the final science transparency rule applies only prospectively to new advisories and benchmarks, EPA will still need to replace the current methodologies for these recommended values in order to incorporate the new transparency and reproducibility requirements. According to the commenters, EPA will incur significant costs and time replacing these methodologies and recommendations.

Response: This rule sets the overarching structure and principles for transparency of pivotal science in significant regulatory actions and influential scientific information. The final rule provides that if implementing the rule results in any conflict between this rule and the environmental statutes that the EPA administers, and their implementing regulations, this rule will yield and the statutes and regulations will be controlling. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

Comment: Commenter (6901) states that federal regulations are the basis for the actions of state drinking water programs in protecting public health. The commenter contends that the SDWA has clear statutory language that requires regulations to be based on sound science to appropriately protect public health. According to the commenter, while states may disagree at times with details of the final regulations, states are generally comfortable with the transparency of the regulatory development process as practiced by the Office of Ground Water and Drinking Water (OGWDW). The commenter does not recommend making significant changes in that process. In fact, the commenter suggests that, if other environmental programs do not currently have a robust science-based regulatory development process, the process used by OGWDW would be a good model.

Commenter (6901) states that the SDWA statutory language in §1412(b)(3) requires the use of “best peer reviewed science and supporting studies conducted in accordance with sound and objective scientific practices.” Therefore, according to the commenter, a statutory requirement

that the drinking water regulations have a strong scientific basis already exists. The commenter states that this section of the SDWA also outlines the way this information must be shared with the public, so the process is currently transparent. The commenter provides that the EPA has followed this statutory mandate since the 1996 SDWA Amendments and has relied not only on peer reviewed scientific studies but has also directly involved the scientific community in supporting rule development. The commenter adds that states have also been active participants in this science-based process. The commenter suggests that the rule development currently underway for perchlorate is a good example of the process at work. According to the commenter, recommendations from the SAB helped guide the methodology to develop the Maximum Contaminant Level Goal (MCLG) and the EPA has held two peer reviews to help refine the models and determine how best to apply the modeling to determine the appropriate MCLG. The commenter states that the SAB and the peer review process are all open and the recommendations are public, providing full transparency to the deliberations and decisions.

Response: This rule sets the overarching structure and principles for transparency of pivotal science in significant regulatory actions and influential scientific information. The final rule provides that if implementing the rule results in any conflict between this rule and the environmental statutes that the EPA administers, and their implementing regulations, this rule will yield and the statutes and regulations will be controlling. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The specific criteria for determining “pivotal science” may necessarily be specific to the authorizing statute, as well as the significant regulatory action or the influential scientific information. The EPA intends to explain in each significant regulatory action and for influential scientific information how the pivotal studies were identified

2.2.2.4.4 Aquatic Life Criteria

Comment: Commenter (11894) notes that aquatic life criteria have been published for 47 toxic chemicals. The commenter provides that these criteria are designed to protect plant and animal life in surface water bodies from both short and long-term exposures to pollutants. Additionally, the commenter states that human health criteria have been published for 120 toxic chemicals, two pathogen indicators, and two harmful algal bloom toxins. The commenter contends that if the final science transparency rule applies retroactively, every one of these criteria will have to be re-examined. The commenter asserts that if the studies and bioaccumulation models underlying any of these criteria fail to meet the new tests of transparency and reproducibility, the enforceability of state water quality standards will be undermined since most such standards are based on the EPA criteria. According to the commenter, if the final science transparency rule applies only prospectively to new criteria, EPA will still need to replace the current methodologies for both aquatic life and human health criteria in order to incorporate the new transparency and reproducibility requirements. The commenter states that EPA will incur significant costs and time replacing these methodologies and water quality criteria. Despite this major impact, the supplemental notice provides no estimation of the costs and benefits.

Response: As further described in the preamble to the final rule, based on public comments and other considerations, the EPA is concentrating its efforts in the final rule to increase transparency of dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. The rule does not apply to dose-response models or other types of data and models, including the bioaccumulation

Further, as discussed in the preamble to the final rule, the final rule applies prospectively to significant regulatory actions and influential scientific information; the final rule has no retrospective effect on either significant regulatory actions or influential scientific information. Therefore, existing water quality criteria would not be impacted by this rule.

This rule sets the overarching structure and principles for transparency of pivotal science in significant regulatory actions and influential scientific information. The final rule provides that if implementing the rule results in any conflict between this rule and the environmental statutes that the EPA administers, and their implementing regulations, this rule will yield and the statutes and regulations will be controlling. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

The EPA would also like to clarify that the final rule applies prospectively to significant regulatory actions and influential scientific information; the final rule has no retrospective effect on either significant regulatory actions or influential scientific information.

2.2.2.4.5 Clean Water Act (CWA)

Comment: Commenter (12720) provides that the CWA requires each state to develop TMDLs for every waterbody the state identifies as having uses impaired because of pollution. According to the commenter, if EPA disapproves a state TMDL, EPA must develop a replacement TMDL. The commenter contends that if the final science transparency rule applies retroactively, over 65,000 TMDLs will have to be re-examined.

The commenter (12720) contends that if the model underlying a TMDL fails to meet the new tests of transparency and reproducibility, the enforceability of the state's point source permit limits and nonpoint source controls based on that TMDL will be undermined. The commenter states that if the science transparency rule applies only prospectively to new TMDLs, EPA will need to disapprove any new TMDL based on a proprietary model since such a model would not meet the new transparency and reproducibility requirements. The commenter provides that

whether the science transparency rule applies retroactively or prospectively, EPA will incur significant costs and time replacing TMDLs.

Response: As further described in the preamble to the final rule, based on public comments and other considerations, the EPA is concentrating its efforts in the final rule to increase transparency of dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. The rule does not apply to dose-response models or other types of data and models.

The water quality criteria that support TMDLs may be applicable to this rule if they are classified as influential scientific information. As discussed in the preamble to the final rule, the final rule applies prospectively to significant regulatory actions and influential scientific information; the final rule has no retrospective effect on either significant regulatory actions or influential scientific information. Therefore, existing water quality criteria would not be impacted by this rule.

This rule sets the overarching structure and principles for transparency of pivotal science in significant regulatory actions and influential scientific information. The final rule provides that if implementing the rule results in any conflict between this rule and the environmental statutes that the EPA administers, and their implementing regulations, this rule will yield and the statutes and regulations will be controlling. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

2.2.2.4.6 NAAQS

Comment: Commenter (11479) asserts that the coverage of influential scientific information would be problematic for EPA programs with reoccurring rulemakings, such as NAAQS, because it would prevent adequate implementation of the review.

Commenter (12720) contends that many scientific interpretation activities at EPA, including legally-mandated reviews of the NAAQS, are projects that build upon a growing scientific evidence base. The commenter provides that for example, the recently-completed ISA²²⁹² and

²²⁹² U.S. Environmental Protection Agency. 2015. "Integrated Science Assessments (ISAs)." Collections and Lists. US EPA. January 29, 2015. <https://www.epa.gov/isa>.

Policy Assessment²²⁹³ for Fine Particulate Matter rely on scientific data and models and other information previously synthesized by the Agency for prior reviews. The commenter notes that in this case, the Agency is consulting thousands of peer-reviewed studies that already meet significant requirements established by EPA.

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how pivotal science would be selected. As discussed in the preamble to the final rule, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as “pivotal science,” the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. In the context of this rule, studies informing the dose-response modeling (e.g., benchmark response selection), studies identifying data for toxicokinetic adjustments, or studies informing the selection of uncertainty factors do not drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.

In addition, with this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Comment: Commenter (12727) states that some actions EPA intends to cover with this rule, such as ISAs that inform NAAQS, are based on an assessment of overall confidence in an at-risk factor (i.e., a factor that potentially increases the risk of air-pollutant related health effects for individuals in certain subpopulations), and excluding one or more studies showing a relationship between that factor and adverse health effects could tip the balance toward, for example, recommending a change in the NAAQS.²²⁹⁴ Thus, the commenter asserts that arbitrarily ignoring

²²⁹³ U.S. Environmental Protection Agency. 2019. “Particulate Matter (PM) Standards - Policy Assessments from Current Review.” Policies and Guidance. US EPA. September 5, 2019. <https://www.epa.gov/naaqs/particulate-matter-pm-standards-policy-assessments-current-review-0>.

²²⁹⁴ EPA, Preamble to the Integrated Science Assessments at 25-27 (Nov. 2015).

rigorous studies at one or multiple stages of the regulatory process could alter critical health and environmental protections and would be illegal.²²⁹⁵

Response: As described in the preamble to the final rule, the rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. The rule does not provide for categorically excluding or ignoring studies. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

In addition, with this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

2.2.2.4.7 Toxic Substances Control Act Programs

Comment: Commenter (11894) states that TSCA §4 gives EPA authority to require chemical manufacturers to test their product for several reasons, one of which is that "there is insufficient information or experience to determine or predict the effects of these activities." The commenter contends that the new data availability requirement would logically imply that in assessing the "sufficiency" of effects information on a chemical, EPA will have to avoid reliance on studies without data disclosure, and instead order manufacturers to conduct new and conforming studies to replace the studies that do not meet the disclosure standards. The commenter queries whether EPA is legally obliged to apply its own view of high standards of data quality to the implementation of a statute for which Congress expressly made data quality a central implementation concern, and if not, why not?

Response: In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule.

²²⁹⁵ See, e.g., *U.S. Air Tour Ass'n v. FAA*, 298 F.3d 997, 1013, 1018-19 (D.C. Cir. 2002) (invalidating the FAA's decision to ignore noise from non-tour aircraft over national parks, when the Agency had "given every indication it w[ould] employ [the decision] in future rulemakings").

Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation.

In addition, the EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities. The provisions of the final rule also do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses, and influential scientific information and/or pivotal science that meet one or more of the exemptions identified in Section IX of the OMB Final Information Quality Bulletin for Peer Review.

2.2.2.4.8 Pesticide Restrictions and Approvals

Comment: Commenter (11576) states that the SNPRM lists environmental-fate studies and models as an example of the types of studies included in its new, broader scope. The commenter states that these data and models are critical for the EPA's assessments of the environmental risks of pesticides, for example, and the Agency has relied on well-established studies that were conducted before mechanisms existed for sharing data publicly. The commenter states that this requirement would place an uneven burden on data requirements for pesticide restrictions compared to that required for pesticide approvals, especially if implemented retroactively.

Response: Based on comments and other considerations, the EPA is concentrating its efforts in the final rule to increase transparency on dose-response data, as further described in the preamble to the final rule. The EPA is maintaining the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities. The provisions of the final rule also do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses, and influential scientific information and/or pivotal science that meet one or more of the exemptions identified in Section IX of the OMB Final Information Quality Bulletin for Peer Review.

With this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and

promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

2.2.2.5 General Delay

Comment: Commenter (11360) contends that the current COVID-19 pandemic is showing the necessity of scientific expertise in decision-making. The commenter states that the speed of the release of the virus' genetic code was unheard of, and that making that information available to other researchers who wanted to study it, unleashed a massive collaborative effort to understand the mysterious new pathogen that rapidly spread across the world. The commenter provides that if EPA's proposed transparency rule was in place at that moment, it seems like there would be a need to determine a) whether this type of information sharing would meet the rule's requirements and/or b) whether they require independent validation or a case-by case exemption from the rule's applicability before they could be used for EPA decision-making purposes. The commenter asserts that even if these and other relevant studies were ultimately deemed to be eligible for use under this rule, this proposed rule would clearly establish barriers and result in fatal delays to using the best available science to inform EPA's actions.

Response: The EPA considered this and other similar comments when developing the final rule and does not believe that the final rule will result in any meaningful delay in promulgating regulations because of the limited application of this rule to pivotal science underlying significant regulatory actions and influential scientific information. Additionally, this rule does not require the EPA to disclose or host data, but to determine if the dose-response data underlying pivotal science are available and to give greater consideration to pivotal science for which dose-response data are available in a manner sufficient for independent validation.

Comment: Commenter (11408) states that the rulemaking would likely also be costly in terms of the forgone benefits that would occur as a result of the additional regulatory delays that it would create. The commenter contends that the "cost" of one year's delay of some of the EPA's biggest CAA rules could be measured in thousands of premature deaths and tens of thousands of asthma attacks and missed school and work days.²²⁹⁶ The commenter asserts that as legal scholars across the political spectrum recognize, the rulemaking process has become extraordinarily slow, due in large part to the combination of agencies' dwindling resources and the proliferation of additional procedural and analytical requirements that agencies must satisfy before issuing new rules. The commenter contends that as a result, it already can take anywhere from five to ten years for the most complex rules to complete the rulemaking process. The commenter provides that in 2012, the Government Accountability Office found that OSHA spent an average of seven years on each of its major rulemakings.²²⁹⁷

²²⁹⁶ See, e.g., U.S. Env'tl. Protection Agency, Mercury and Air Toxics Standards: Healthier Americans, <https://www.epa.gov/mats/healthier-americans> (last visited May 14, 2020).

²²⁹⁷ U.S. GOVT. ACCOUNTABILITY OFF., WORKPLACE SAFETY AND HEALTH: MULTIPLE CHALLENGES LENGTHEN OSHA'S STANDARD SETTING (2012), available at <https://www.gao.gov/assets/590/589825.pdf>

Further, the commenter (11408) contends that implementation of this rulemaking would only exacerbate this problem, leading to even more costly delays that harm public health, safety, financial security, and the environment. The commenter recommends that to better fulfill its mission of protecting public health and the environment, the EPA should be exploring opportunities to streamline its processes for issuing new safeguards – not making the problem of alarming delays even worse.

Commenter (11495) notes that in an era of limited EPA funding, the expanded scope of the supplement potentially would overrun the Agency’s capacity to review data and the studies relevant to any review process. The commenter provides that just handling these challenges for a single Agency action, such as reviewing the Particulate Matter (“PM”) NAAQS with its over 2,000 references, would be an enormous undertaking and it begs the question whether any newly adopted system hosted by the EPA can handle what it is requesting in the Supplemental Notice.

Commenter (11890) maintains that the cost of delays for EPA programs should be considered. For example, the commenter provides that it would take considerable staff time to track down data owners and obtain consent from all studies included in a typical IRIS review. The commenter questions several aspects of this process: Will all study authors need to consent? If the study was funded by a consortium, will all participating companies need to consent? What about companies that have since been purchased by others? Will the EPA be asking international and privately funded researchers to provide data access only when a specific requester submits a request or must they provide data to a data repository to comply? The commenter states that this rule will likely further deteriorate the EPA’s ability to comply with statutory reassessment deadlines in a number of programs, causing delays that keep EPA from updating their assessments and meeting its mission of protecting human health and the environment.

Response: The EPA considered this and other similar comments when developing the final rule and does not believe that the final rule will result in any meaningful delay in promulgating regulations because of the limited application of this rule to pivotal science underlying significant regulatory actions and influential scientific information. Additionally, this rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which dose-response data are available in a manner sufficient for independent validation.

Comment: Commenter (12720) highlights concerns of Senator Thomas Carper’s letter to the EPA Administrator that explains that the Supplemental Proposal’s “time-consuming barriers to the use of scientific information could in some cases be more than a mere annoyance or ministerial task; it could be fatal” because it could significantly delay EPA’s ability to make timely use of critical public health research.²²⁹⁸ The letter notes that

If EPA’s rule was in place, before these studies could be used by EPA decision-makers there would, at minimum, be a time-consuming review needed in order to determine a) whether they meet the rule’s requirements and/or b) whether they require independent validation or a case-by case exemption from the rule’s applicability before they could be

²²⁹⁸ Carper, Thomas R. 2020. “Letter to EPA Administrator Andrew Wheeler Regarding ‘Strengthening Transparency in Regulatory Science,’” March 24, 2020.

used for EPA decision-making purposes. Even if these and other relevant studies were ultimately deemed to be eligible for use under this rule, this rule would clearly establish barriers and delays to using available science to inform EPA's response.²²⁹⁹

Within the text of the Supplemental Proposal, the commenter (12720) provides that EPA has not explained what safeguards are in place so that new public data release requirements do not inhibit EPA's response to public health emergencies. The letter also notes that

it is also possible that studies that could be usefully relied upon during a pandemic or other crisis would be systematically excluded from being used in EPA's scientific and regulatory efforts well before the next pandemic or other crisis occurs if this rule is finalized.²³⁰⁰

The commenter (12720) notes that the Supplemental Proposal includes a provision that gives the EPA Administrator the ultimate authority to decide which studies are exempt from new public data release requirements.²³⁰¹ As applied to the current crisis, the commenter contends that the Supplemental Proposal's requirements for public data release conflict with the Executive Branch's approach to releasing data and models within the context of the current COVID-19 response. For example, the commenter provides that a White House representative recently told reporters that the COVID-19 task force "has not publicly released the models it drew from out of respect for the confidentiality of the modelers, many of whom approached the White House unsolicited and simply want to continue their work without publicity."²³⁰²

The commenter (12720) contends that EPA runs the risk of discouraging researchers from working with the Agency to quickly and safely meet the challenges presented by the COVID pandemic. Additionally, the commenter states that EPA's failure to explain how the Supplemental Proposal would not obstruct the Agency in responding to emergencies is further evidence that the Supplemental Proposal is arbitrary and capricious, an abuse of discretion, and otherwise unlawful.

Response: The EPA considered this and other similar comments when developing the final rule and does not believe that the final rule will result in any meaningful delay in promulgating regulations because of the limited application of this rule to pivotal science underlying significant regulatory actions and influential scientific information. Additionally, this rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which dose-response data are available in a manner sufficient for independent validation.

Finally, the EPA acknowledges that the COVID-19 situation is unprecedented. The EPA's most important environmental statutes provide the Agency with the authority to issue emergency

²²⁹⁹ *Id.* at 2.

²³⁰⁰ *Id.* at 3.

²³⁰¹ Natural Resources Defense Council Comments, section XV

²³⁰² Wan, William, Josh Dawsey, Ashley Parker, and Joel Achenbach. 2020. "Experts and Trump's Advisers Doubt White House's 240,000 Coronavirus Deaths Estimate - The Washington Post." Washington Post, April 2, 2020. <https://www.washingtonpost.com/health/2020/04/02/experts-trumps-advisers-doubt-white-houses-240000-coronavirus-deaths-estimate/>

orders or respond to address emergencies to protect human health and the environment. This final rule would not limit or impede the EPA's authority to undertake such responses. Moreover, the final rule includes sufficient flexibility in terms of the considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data in order to minimize potential unintended consequences, such as a potential impact during a crisis situation. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Comment: Commenter (12692) contends that the independent validation of all data used in hundreds of decisions regarding permits and product approvals would be quite impracticable, bringing the daily work of the Agency to a screeching halt, and imposing unreasonable burdens on the private sector. The commenter notes that this "lack of consistency" in application is valid due to the difference in scope, number, and consequence. The commenter provides that if consistent application across all actions was sound logic, all NEPA proceedings would require full-blown environmental impact statements. According to the commenter, there would be no provision for shorter environmental assessments, much less categorical exclusions for actions an Agency has determined have no significant impact on the human environment.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities. The provisions of the final rule also do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses, and influential scientific information and/or pivotal science that meet one or more of the exemptions identified in Section IX of the OMB Final Information Quality Bulletin for Peer Review.

With this final rule, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the

provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Comment: Commenter (10045) states that, even if relevant studies were ultimately deemed to be eligible for use under this rule, this rule would clearly establish barriers and delays to using available science to inform the EPA's response. The commenter states that, if the EPA's rule were in place, before these studies could be used by EPA decision-makers there would, at minimum, be a time-consuming review needed in order to determine a) whether they meet the rule's requirements and/or b) whether they require independent validation or a case-by case exemption from the rule's applicability before they could be used for EPA decision-making purposes.

Commenter (10742) expresses concern that the EPA has not analyzed whether the additional time needed to upload information to this database would delay rulemaking, which, in turn, would allow additional pollution to continue, potentially costing years of human life.

Commenter (11408) states that having the EPA acquire a collection of raw data would be burdensome to both the Agency and study investigators, and create major delays in rulemaking.

Commenter (11576) has concerns with respect to the practicability of requiring all information to be made available, given unequivocal statutory deadlines embedded within environmental statutes.²³⁰³

Commenter (12412) suggests that, by not using the best available science, the SNPRM may delay regulations on emerging contaminants, such as PFAS. The commenter states that, with the exclusion of the best available science, regulations like this will likely be delayed much longer, due to the need for more studies which have all data publicly available, and may not be accurate, due to the exclusion of a portion of the best available science. The commenter states that this delay in proposing regulations could harm public health in the future, especially in communities, such as tribes, which are disproportionately exposed to environmental contaminants.

Commenter (12430) asserts that, if a team of researchers investigated and published in a top medical journal, following a rigorous peer-review process, urgent information about the health effects of lead, the SNPRM could preclude or delay EPA consideration of this information. The commenter states that, if the study relied on extensive exposure analyses with county-level data on household wipe samples and vital signs in populations of concern, the SNPRM would prohibit or undermine EPA consideration of the study until the time-consuming process of redacting PII from the raw data was complete, if even possible. The commenter states that, further, another team of scientists could publish an inferior study without county-level or demographic data, albeit with underlying data made available, that does not help state and local officials identify hot-spots based on county results or populations of concern. The commenter states that, depending on the proposed alternative, the SNPRM would either favor the inferior study or prohibit EPA experts from considering the superior study. The commenter states that

²³⁰³ See August 2018 Coalition Comments at 85-87 (discussing potential delays in the implementation of critical public-health protections).

such an outcome would fall short of the Agency's statutory duties and would adversely affect public health.

Response: The EPA clarified 40 CFR 30.5 that it will give equal consideration to dose-response data that are publicly available or available through restricted access. As discussed in the final rule, underlying dose-response data are considered available if they can be accessed through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. Therefore, a redaction of the PII in the hypothetical example may not be necessary in order for the study to be fully considered as the EPA promulgates significant regulatory actions or develops influential scientific information. The EPA would like to emphasize that such behavior would be purely voluntary on behalf of the researchers; the rule does not regulate the rights and obligations of any party outside of the EPA let alone have legal force and effect on them.

Further, although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

Further, the EPA considered this and other similar comments when developing the final rule and does not believe that the final rule will result in any meaningful delay in promulgating regulations because of the limited application of this rule to pivotal science underlying significant regulatory actions and influential scientific information. Additionally, this rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which dose-response data are available in a manner sufficient for independent validation.

The EPA does not agree that this rulemaking is counter to the Agency's mission. The EPA believes that the approach described in the final rule will result in significant regulatory actions and influential scientific information based on the highest quality, most relevant studies and ensure adequate human health and environmental protections while maximizing transparency and maintaining consistency with the statutes the EPA administers.

Comment: Commenters (11400, 11480, 12546) express concern that the proposal could result in substantial delays as studies are subjected raw data availability, reanalyzes, and independent validations.

Commenter (11400) asserts that this rule would make the process of seeking to use well established studies onerous and lengthy, as persons are forced to re-analyze data and apply for consideration and access. The commenter states that this rule would likely result in a lengthy, bureaucratic process to use epidemiological studies. The commenter states that, following the suggested model for tiered access, researchers would have to submit a research proposal outlining the need for restricted use data. The commenter states that the government is still developing standard data repositories. The commenter states that studies would have to be reviewed for meeting the criteria; researchers would need to apply to have the study considered or exempted; interested parties would have to redact information or see if it could be reanalyzed and validated. The commenter states that these are burdensome and time-consuming requirements, that would keep scientists from evaluating and relying on relevant studies. The commenter states that this rule will impede timely actions to protect public and environmental health.

Commenter (11480) states that tactics to demand access to raw data and selective reanalysis is a key part of the strategy that corporations from the tobacco, diesel, chemical, and pharmaceutical industries, among others, have used for decades to question the science underlying regulation and other information disseminated by government agencies (regulatory and non-regulatory).²³⁰⁴ The commenter states that lobbyists have attempted many legal maneuvers to formalize processes for raw data availability and reanalysis to undermining science involved in rulemaking over the decades, from the Shelby Amendment in Fiscal Year (FY) 1999 omnibus appropriations act to this SNPRM.

Commenter (12546) objects to the proposal's statement that "approaches to increasing access to data and models can often allow stakeholders to reanalyze the data and models and explore the sensitivity of the conclusions to alternative assumptions." The commenter asserts that this sets a dangerous precedent, opening the policy and rulemaking processes to potentially endless debate via "reanalysis", "alternative models", and "independent validation" by stakeholders who may have a vested financial interest (and capability) to impact or perpetually delay critical policies to protect public and environmental health.²³⁰⁵

Commenter (12715) states that, although data may technically be "available," it is likely to be difficult to obtain and often may not be received by the requestor until after the comment period ends, if at all. The commenter states that, if this is the case, it is unlikely that interested parties would be able to obtain the information in a manner timely enough to allow for their own review and comment within any timeframe designated by EPA.

²³⁰⁴ Michaels, David. 2020. *The Triumph of Doubt*. (p. 92).

²³⁰⁵ Lundh A, Sismondo S, Lexchin J, Busuioc OA, Bero L. 2012. Industry sponsorship and research outcome. *Cochrane Database Syst Rev* 12:MR000033. Barnes DE, Bero LA. 1998. Why review articles on the health effects of passive smoking reach different conclusions. *JAMA* 279:1566–1570.

Response: The EPA considered this and other similar comments when developing the final rule and does not believe that the final rule will result in any meaningful delay in promulgating regulations because of the limited application of this rule to pivotal science underlying significant regulatory actions and influential scientific information. Additionally, this rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which dose-response data are available in a manner sufficient for independent validation.

The EPA disagrees that implementation of the rule would result in a lengthy process in order to use epidemiology data. The final rule includes sufficient flexibility in terms of the allowance for restricted access, considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data to minimize such potential unintended consequences. The EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small.

2.2.2.6 Research Impacts

2.2.2.6.1 Burdens on Researchers Outside EPA

Comment: Commenters (10974, 11377, 11404, 11495, 12422, 12718, 12727) assert that the rulemaking will impose substantial burdens on researchers and that the supplemental notice adds to those burdens. According to the commenters, these burdens may result in the reduction of future studies necessary for policymaking due to the perceived difficulty of adjusting study designs to meet the new requirements with constrained resources. Additional comments and responses to comments on monetary costs to researchers are included in section 14.2.4.3 of Chapter 14. Examples of specific comments follow:

Commenter (11377) states the expansion of scope increases the already substantial burden that this rule would place on researchers to ensure the privacy and confidentiality of research subjects by including influential information rather than only regulatory decision-making information.

Commenter (11495) takes issue with the EPA's position that the proposed policy "exclusively pertains to the internal practices of EPA." The commenter contends that if implemented, the proposed policy would impact a wide range of external stakeholders, including scientists, research volunteers who participate in environmental health studies and the general public.

The commenter (11495) states that while the specific mechanisms regarding how this rule would be carried out has not been described in either the original proposed rule or this latest supplement, it is clear that many of the burdens of this Supplemental Notice would fall to the individual investigators and their institutions. The commenter contends that at a minimum, there would be a shared responsibility between individual researchers and EPA staff to carry out the requirements of the Supplemental Notice. The commenter provides that given that the burden of these new requirements far exceeds the EPA's capacity, most of these new responsibilities imposed by the Supplemental Notice would necessarily fall on individual researchers outside of the Agency to complete.

Additionally, the commenter (11495) asserts that contrary to the EPA's assertions in the supplement, this proposed rule would dictate the conduct of scientists outside the federal government and would place burdens on individual researchers that would go beyond just the time and resources required to adhere to these new requirements. The commenter states that if promulgated, the proposed rule would place an enormous strain on researchers as they decide whether they are able to comply with the rule. The commenter provides that on one hand, if a scientist does not share the data out of concern for violating consent agreements and breaching subject privacy, then the EPA will give less weight to the study in policymaking; on the other, if a scientist inadvertently discloses information in a way that violates data use agreements or contractual obligations, they may leave themselves open to legal action, dismissal, or have restrictions placed on their ability to conduct research in the future. The commenter notes that this is not an easy decision for scientists committed to generating and disseminating knowledge useful for the public good.

Commenter (11495) states that it is possible that fewer scientific studies will be performed and made available to the scientific community due to an awareness by potential study participants or researchers that underlying data will be released to the public, potentially subjecting them to privacy intrusions or harassment by regulated industry.²³⁰⁶

Commenter (12405) asserts that, if the EPA's rule takes effect, it could introduce selection bias that may slow studies and alter results and thereby affect regulatory decisions. The commenter states that large-scale population studies rely on many people — often numbering in the thousands — to reveal sensitive or private information. The commenter states that studies may have difficulty recruiting or retaining volunteers if the researchers are required to make deidentified data publicly available as some may be more hesitant to share their information. The commenter states that those who are willing to participate may be different from others in ways that cannot currently be predicted or described, which could introduce confounding variables and biases that may question the study's results.

Commenter (12422) provides that these new strictures will be particularly burdensome to the environmental health research community, ironically imposing substantial new costs during a time of drastic proposed research funding cuts. The commenter notes that epidemiologic research will be particularly challenged. According to the commenter, epidemiology is the foundation of public health, providing essential evidence of the distribution of disease, risk factors, and vulnerable populations. The commenter contends that while it remains to be determined how this historical evidence would be considered under this proposed rule, the implications are ominous for public health measures that have improved the health of millions of Americans.

The commenter (12422) asserts that many in the scientific and regulatory communities recognize the importance of transparency and access to the data underlying important studies. The

²³⁰⁶ See *e.g.*, Kelsey Brugger, Critics: Secret science rule will spur 'public health crisis,' Greenwire (April 15, 2020) <https://www.eenews.net/greenwire/2020/04/15/stories/1062882421>; Michael Halpern, Corporations and Activists are Exploiting Open Records Laws. California is Trying to Change That, Union of Concerned Scientists (Feb. 22, 2019) <https://www.ucsusa.org/sites/default/files/attach/2015/09/freedom-to-bully-ucs-2015-final.pdf>; see also Michael Halpern, Freedom to Bully: How Laws Intended to Free Information Are Used to Harass Researchers, 1, 12, Center for Science and Democracy at the Union of Concerned Scientist (Feb. 2015) <https://www.ucsusa.org/sites/default/files/attach/2015/09/freedom-to-bully-ucs-2015-final.pdf>.

commenter states that addressing these issues can be accomplished without injuring the scientific enterprise or discouraging scientists from pursuing pressing scientific questions. The commenter provides that mechanisms to accomplish this that do not require new regulation include development of public access databases, use of the FOIA, and reanalysis by third parties. The commenter notes that certain journals, for example require authors to agree to make their data available to editors and others upon request.

Commenter (11404) states that the concepts in the SNPRM would negatively impact future studies. According to the commenter, this proposed regulation could have the unintended consequence of tainting the epidemiological research process. The commenter notes that if this proposal were adopted, epidemiological researchers may feel pressured to modify their research processes to meet the additional standards imposed by the rule, so as to secure federal funding and / or ensure the research can be used in regulatory development. The commenter notes that giving “greater consideration” to studies that are able to make their data available for independent validation, via the SNPRM’s alternative approach, would promote this as well. The commenter maintains that the risk would be a less-than-ideal research plan and less robust results.

Commenter (12718) contends that the application of restrictions for data not funded by government, even when such information can be useful for decision-making, is peculiar. The commenter provides that without grant-making powers or resources to support the scientific community or the provision of incentives for shifting expectations and requirements, there is only one logical conclusion about the impact of the regulation in practice – instead of transparency, the rule would likely discourage evidence-based policymaking.

Response: The EPA disagrees that this rule would impose costs on third-party researchers. This procedural rule does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. This is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA’s position on data availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make data and models available. Researchers may choose to make more data and models available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate.

The EPA agrees with the commenter that data sharing mechanisms already exist; however the rule is not intended to develop public access databases or encourage authors to share their data, as the commenter suggests. The purpose of the rule is to increase transparency by codifying the EPA’s own internal procedures for determining the consideration to afford pivotal science according to the availability of underlying dose-response data. The preamble to the rule clarifies that restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or

some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The rule does not prescribe a particular mechanism but does require the EPA to independently verify that such a mechanism exists for dose-response data underlying pivotal science. As discussed in the preamble to the final rule, the EPA cannot rely on data access statements made by authors to journals. Instead, in order to realize the benefits of open data, the EPA must conduct an independent evaluation of the availability of the data.

Comment: Commenter (10974) states that EPA, in this SNPRM, claims that the proposed rulemaking “does not regulate any entity outside the Federal Government...”, and that “the [a]gency recognizes that any entity interested in EPA’s regulations may be interested in this proposal.”²³⁰⁷ The commenter provides that although this language has not changed from the 2018 NPRM, the commenter still finds that this claim is incorrect, appearing purposefully deceptive. The commenter provides that at the least, this rule would impact how EPA scientists and policy makers are able to consider their own research; at worst, it would impact how epidemiological (and all other) research would be conducted in the future, thereby altering the entire environmental health science and policy landscape.

Objecting to both proposed alternatives at 40 CFR § 30.5, the commenter (10974) states that the EPA Administrator is inappropriately given carte blanche authority to judge research on a case-by-case basis. The commenter notes that when promulgating new standards or rules, EPA is expected to incorporate all available research into their findings – even when research results are contradictory, and/or demonstrate a broad range of possible environmental or health outcomes. According to the commenter, in either proposed version of 40 CFR § 30.5, the EPA Administrator could make the decision about what research is “worthy” of use based solely on the availability of underlying data. The commenter states that this decision would undermine, even ignore, factors that are more important for determining the validity of research – for example, how well a study was controlled, the power in the results used to make the conclusions, or the relevance of the study variables to the question being investigated.

Furthermore, the commenter (10974) asserts that the proposed change in the criteria for scientific studies’ acceptance into decision making at 40 CFR § 30.5 would change how academia, private companies, state, local, and tribal governments, and others must conduct research in order for it to be considered relevant and useable by EPA. The commenter maintains that such a change would undoubtedly also impact how study participants perceive and ultimately decide to participate, or not, in environmental health research. Additionally, the commenter states that research would have to be conducted differently, and that is not merely an internal change in EPA processes and procedures.

Response: As discussed in the preamble to the final rule, the EPA is retaining the Administrator’s exemption provision with some added considerations in response to public comments. To ensure that the Administrator’s decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the

²³⁰⁷ 85 FR 15397

proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation. The EPA is confident that the criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

Further, this procedural rule does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. The EPA disagrees that this rule would impose costs on third-party researchers. This is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA's position on data availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make data and models available. Researchers may choose to make more data and models available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate.

Comment: Commenter (12727) asserts that the costs that this proposal would impose on the research community would likely be significant and pervasive, thoroughly impacting the scientific process. According to the commenter, these costs are even higher than those that would have been imposed under the 2018 proposal because of the wider range of studies and EPA actions encompassed by the supplemental proposal. The commenter states that EPA cannot disregard these costs by claiming that the supplemental proposal does not directly impose requirements upon the research community. The commenter contends that researchers performing public health and environmental studies have an ethical, professional, and personal stake in how their studies are utilized. The commenter provides that it is untenable for EPA to ignore the impacts that this proposal would have on the research community, as if scientists would—or even could—conduct their research in a vacuum, with complete indifference to whether their work would be deemed unsuitable for consideration by the nation's top environmental regulator. Some of the specific issues/concerns highlighted by the commenter follow:

Commenter (12727) asserts that attempting to satisfy the rulemaking's parameters would be costly and convoluted for researchers. The commenter notes that the recent SAB report reveals several contexts in which costs for researchers could increase, including “researchers’ time to collate data and work with EPA to make these data publicly available,” and likely “additional costs that occur at an institutional level (i.e., IRBs) that would be substantial.”²³⁰⁸ Furthermore, the commenter provides that “there are legitimate legal, ethical, professional and financial reasons why researchers may be unable or unwilling to fully share ‘data.’”²³⁰⁹ The commenter states that individual members of the SAB have also observed that study subjects may decline to participate in studies if researchers may ultimately share their data with others, raising serious concerns that researchers who attempt to comply with the requirements of this proposal will have difficulty persuading members of the public to participate in studies, or that participation in such studies may be biased or skewed in ways that would influence the results. The commenter

²³⁰⁸ Final SAB Report at 15.

²³⁰⁹ *Id.* at 17.

contends that this proposal lacks any discernible benefit, so researchers' efforts to meet EPA's arbitrary strictures would be superfluous to any measures taken to ensure scientific rigor and valid, evidence-based outcomes; such efforts would increase costs and administrative burdens but provide almost nothing in return except checking off EPA's irrational requirements.

The commenter (12727) contends that researchers unable to obtain additional funding would have two options: (1) they could continue their study without meeting EPA's requirements (assuming funders would support a study that the Agency would ignore), with the bleak awareness that its benefit for public health and the environment—not to mention the researchers' professional advancement—might be arbitrarily thwarted by EPA or, (2) they might drop the study entirely in order to avoid the Agency's erratic minefield of requirements, which would deprive the entire public of the benefits of their study.

The commenter (12727) states that even if some researchers obtained additional funding to meet requirements, the overall pool of research funding cannot be expected to increase commensurately. Therefore, the commenter provides that if the cost of each study increases, and the total funding remains constant, then fewer studies could be funded; impeding not only studies incompatible with the proposal's arbitrary criteria, but even those that are compatible, drastically winnowing the available body of evidence upon which to base public health protections. The commenter asserts that organizations that devote resources to meet the proposal's requirements "will have to shift funding from ongoing, vital new research to fund this activity, at the net negative cost to the nation's health."²³¹⁰ The commenter notes that aside from constraining funds available for new research, the proposal would pose unique challenges when applied retrospectively to prior research, possibly precluding the use of past studies, with distortionary impacts on Agency analyses.²³¹¹

Commenter (12727) contends that the introduction of the tiered access alternative in the supplemental proposal raises major additional concerns about the costs to the research community. The commenter states that the tiered access approach would likely be difficult and costly to administer, but EPA has not explained, even in general terms, how this approach would be implemented, the degree of burden it would impose, or who would bear the costs. However, the commenter points to a recent briefing with staff on the House Committee on Science, Space, and Technology, where EPA staff revealed that "key implementation responsibilities [for tiered access] will fall on the research community."²³¹² The commenter provides that EPA's apparent expectation that it will impose massive new costs on the research community without acknowledging as much in the Supplemental Notice is arbitrary and a violation of notice requirements. According to the commenter, it would further privilege EPA's reliance on studies from wealthy organizations or those with a financial incentive to expend the necessary resources for EPA to consider their work.

Commenter (12727) notes that EPA's arbitrary fixation on the public availability of underlying data would impair scientific research is the deterrent effect on study participants. The commenter

²³¹⁰ SAB Consultation at B-25 (comments of Robert W. Merritt)

²³¹¹ "[R]etrospective application of the requirement . . . could arbitrarily impact the conclusions drawn." Final SAB Report at 17.

²³¹² Memo to Chairwoman Johnson, *supra* note 120, at 3.

asserts confidentiality pledges to study participants are often essential in order to collect accurate and complete information.²³¹³ The commenter maintains that this concept was reinforced by a SAB member, who advised EPA that the possibility of disclosure of PII would “[c]ertainly . . . cause[] some participants to decline participation.”²³¹⁴ The commenter contends that the proposal could encumber the researcher-participant relationship by introducing several unnecessary concerns into the process: (1) some subjects in public health studies may lose confidence that their data will remain confidential; even if researchers withhold the names of study participants, the increased pressure on researchers to release information could instill a reasonable fear in subjects that their data could be traced back to them; (2) if researchers committed to keeping underlying data confidential, subjects might reasonably fear that EPA would arbitrarily disregard the findings of the study, lowering their incentive to participate, EPA seems to acknowledge that study participants are motivated in part by the potential impact of a study on public health protections;²³¹⁵ (3), by imposing new requirements for data availability that have no scientific basis, EPA may create a false impression that the public release of data is an indicator of study quality, this could deter participants from participating in studies for which data will be kept confidential.

The commenter (12727) contends that as a result, scientific research would become more arduous and expensive; fewer studies could be performed, to the detriment of public health policy at EPA and other regulatory bodies. The commenter provides that EPA’s failure to consider these costs is arbitrary and unlawful and notes that while these concerns also applied to the 2018 proposal, the expanded scope of the Supplemental Notice greatly exacerbates them.

Response: This procedural rule does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. The EPA disagrees that this rule would impose costs on third-party researchers. This is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA’s position on data availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make data and models available. Researchers may choose to make more data and models available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate. Additionally, this rule does not require the EPA or other parties to disclose or host data. Hence, this rule does not impose costs on the EPA or any other party to make such data available. Analyses of proposals that impose such requirements are, therefore, not relevant for this rule. The EPA recognizes there

Your participation will help make the world a better and healthier place for us all.”); EPA, Clinical Studies in Environmental Health, Study Results, <https://epastudies.org/Public/EPASTudies/Results.aspx> (date of last update not indicated) (“Results of studies performed by the Human Studies Facility . . . directly impact the creation of regulations responsible for protecting the health and environment of millions of Americans.”).

will be some incremental review and administrative costs to the Agency but anticipates these will be small. The analysis noted by the commenter is not applicable to this rule because the analyses were not for this rule and the assessed requirements are not part of this rule.

The EPA acknowledges that data sharing mechanisms already exist and that researchers, if they so choose, could select the mechanism that best suits their needs and effort. The preamble to the rule clarifies that restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The rule does not prescribe a particular mechanism but does require the EPA to independently verify that such a mechanism exists for dose-response data underlying pivotal science.

Further, although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

2.2.2.6.2 Resulting Bias in Available Research

Comment: Commenters (10974, 11479, 11491, 11576, 11920, 12430, 12464, 12546, 12720, 12727, 12731) contend that the proposed rule will result in a bias in what information EPA is able to utilize due to capabilities of certain stakeholders to abide by the rule's requirements and the ease of some studies being able to adapt comparative to others. Additional comments and responses to comments on monetary costs to researchers are included in section 14.2.4.3 of Chapter 14. Examples of specific comments follow:

Commenter (11479) notes that EPA's proposed rule alludes to the use of good laboratory practices (GLP) and standardized test methods, where "available and appropriate." The commenter contends that this would bias EPA's literature review toward industry-funded GLP studies, even though GLP practices are more about recordkeeping than quality of research design. The commenter provides that for example, in a study reviewing the quality of GLP literature on the chemical bisphenol A (BPA), the authors concluded that "simply meeting GLP

requirements is insufficient to guarantee scientific reliability and validity.”²³¹⁶ The commenter maintains that while GLP studies should not be excluded from EPA’s consideration, the highest-quality assessment that EPA can conduct would be a systematic review approach that considers all relevant data and establishes criteria for evaluating study quality, as recommended by NAS.

Commenter (12720) states that the potential for dangerous bias with adverse impacts on achieving quality scientific input at EPA is large. The commenter provides that for example, it may be relatively less burdensome for small epidemiologic studies with limited numbers of study participants to meet data release requirements-- but the results of such studies are generally less reliable and include the potential for more random error and larger confidence intervals than cohort studies that span larger population groups. The commenter asserts that the proposal threatens to bias Agency decision making towards smaller studies and anecdotal case reports rather than robust scientific information provided in larger epidemiologic cohort studies.

Commenter (10974) contends these proposed changes would bias research results and thereby erode the quality, dependability, and power of research used by EPA, state, local, and tribal governments when charged to develop programs designed to protect environment and public health. As such, the commenter does not support either proposed definition at 40 CFR § 30.5, nor do they support, generally, EPA’s attempts to discredit research based on data availability or model reproducibility by either the oft-referred to “subject matter experts” or the public.

Commenters (11491, 11576, 11920) state that the EPA’s own SAB highlighted that adoption of this rule would introduce bias by selectively excluding relevant data. The commenters states that, specifically, the Board found that “exclusion of segments of the scientific literature, with the possibility of inclusion of other selected information without pre-defined criteria, could allow systematic bias to be introduced with no easy remedy.”²³¹⁷

Commenter (12430) states that in the SNPRM the EPA disclaims any responsibility for obtaining, redacting, or publishing the restricted data,²³¹⁸ and the SNPRM has no provisions for compensating researchers for this activity. The commenter states that developing and maintaining a tiered access system could prove onerous and expensive. The commenter states that large industrial actors would be able to absorb the costs more readily than other researchers could. The commenter states that, as a result, industry-funded science would be more likely to satisfy the requirements of the SNPRM and qualify for EPA consideration than other science would.

²³¹⁸ 85 FR 15402 (“EPA is also clarifying that the Agency does not intend to make all data and models underlying pivotal regulatory science and pivotal science publicly available . . . Rather, EPA is describing how it will handle studies based on whether the underlying data and models are publicly available.”).

Commenter (12546) states that it is well documented that financial sponsorship (i.e. source of funding) introduces a risk of bias in the results and conclusions in favor of the regulated industry's interests, including animal studies examining the effect of exposure to atrazine on reproductive or developmental outcomes.²³¹⁹ The commenter states that this has the impact of potentially reducing or eliminating regulations that apply to industry products and ultimately have the effect of increasing profits.

Commenter (12464) asserts that the fact that the proposal places the burden of making data publicly available on researchers systemically favors industry data over academic data. The commenter states that academic scientists have no incentives to go back to old studies and—at a considerable cost of time and money—identify the relevant data and make it available to the general public or through a tiered access system.²³²⁰ The commenter states that industry scientists, however, have a financial incentive to make available data from studies that support those industries' goals. The commenter states that such an approach does not evenhandedly promote transparency in science.

Commenter (11497) states that, in reality, “public scrutiny” would only serve industry's interest, either by eliminating the use of studies that contradict their claims of chemical safety or by allowing them to attempt to discredit studies and researchers by “reinterpreting” the data in their favor.

Commenter (12415) contends that, if the rule is adopted, the EPA may rely less on valid information and more on potentially biased data and research from the regulated community (e.g., polluting industries) that would ostensibly meet the standard of “public” while not meeting the standard of independent science.

Response: As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological

feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

The technical considerations in 40 CFR 30.5(d), the equal consideration of data available through restricted access, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as the potential for bias suggested by the commenter. In addition, this final rule sets the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

The EPA received comments from the SAB on the 2018 NPRM and 2020 SNPRM on April 24, 2020. The EPA considered these comments in development of the final rule. In brief, the SAB consensus was that it supported the precept of enhancing public access to scientific data and analytical methods to ensure scientific integrity, consistency, and robust analysis and their consensus recommendations were that the EPA develop additional policy and/or guidance documents; further describe how pivotal science would be selected, made available, and peer reviewed; consider establishing an office on data sharing with the support of a peer review panel; provide greater clarity in the definitions of key terms, including data, independent validation, and publicly available; develop specific criteria for the Administrator's exemptions under the rule; consider applying rule requirements only to information developed after the effective date of the rule; seeking input from experts to identify best practices to ensure efficiency, utility, and protection of data that are made available; and consider funding reanalysis work.

As noted in the preamble for the final rule, this rule sets the overarching structure and principles for transparency of pivotal science in significant regulatory actions and influential scientific information and technical considerations, including those noted by the SAB, could be addressed in subsequent implementation guidelines and/or statute-specific rulemakings. Further, in response to comments from SAB and the public, the EPA clarified and modified several key definitions, including data, independent validation, and publicly available, in the final rule. The

EPA also provided criteria for the Administrator’s exemption in 40 CFR 30.7 of the final rule. The EPA would like to clarify that this rule does not direct or require any outside entity or the EPA to establish data sharing mechanisms and does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. Comments related to making data available and future funding opportunities are not within the scope of this rulemaking. Finally, the EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. However, in consideration of instances where data cannot be made available, the EPA amended the rule to provide technical considerations (40 CFR 30.5(d)) that can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability in the absence of maximum transparency and included an exemption criterion—that the development of the dose-response data was completed or updated before the effective date of the rule—to 40 CFR 30.7 to account for the concerns raised by the SAB and other public commenters.

Comment: Commenters (12727, 12731) note that SAB member Robert W. Merritt commented that data from older studies may be located in obsolete storage media or data formats that are either impossible or very costly to convert to a shareable form.²³²¹ Moreover, the commenter states that grants funding older studies have likely lapsed and little to no funding would be available to academic and non-profit institutions to make data available, potentially skewing the pool of research towards for-profit industry studies.²³²² The commenter also asserts that EPA has disclaimed any responsibility for this cost and is instead opting to discard studies out of hand.^{2323,2324}

Response: As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation.

Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides

²³²¹ SAB Consultation at B-24 to -25

²³²² *Id.*

²³²³ 83 Fed. Reg. at 18,771 (“EPA should collaborate with other federal agencies to identify strategies to protect confidential and private information in any circumstance in which it is making information publicly available. These strategies should be cost-effective.”).

²³²⁴ 85 Fed. Reg. at 15,402.

additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

Comment: Commenters (11576, 12720) notes that the proposal states that “the Agency does not intend to make all data and models underlying pivotal regulatory science and pivotal science publicly available (85 FR 15402). The commenters state that the rule fails to consider how the EPA plans to assess which studies and underlying data will be made publicly available, or how it plans to prevent potential bias in its decision to make certain data and models publicly available as opposed to other data and models.

Commenter (12720) states that there is a significant potential that the EPA could selectively release only specific types of studies to members of the public, including biased handling of data and models involving CBI. The commenter states that CBI is already protected from release under FOIA. The commenter states that, in 2019, the EPA finalized an update to its FOIA Regulations. Under this rule, the Administrator and other officials are allowed to review all materials that fit a FOIA request criteria and can decide “whether to release or withhold a record or a portion of a record on the basis of responsiveness or under one or more exemptions under the FOIA, and to issue ‘no records’ responses.” The commenter states that, given the vague language in this proposal and existing FOIA regulations at EPA, there is a significant potential for political interference and arbitrary determinations within EPA for public release of data and models.²³²⁵

Response: Based on a consideration of these and other similar comments, the EPA clarified in the final rule how pivotal science would be selected. In addition, the EPA intends for the final rule to be implemented in a transparent manner. The final rule requires the EPA to document the rationale for exemptions granted by the Administrator to the requirements included in the final rule in the significant regulatory action or influential scientific information.

Comment: Commenter (11176) expresses concern that the rule will hamper the use of evidence in EPA work because of the discounting of important research and introduce potential bias in the rulemaking process, which in turn may have very detrimental health and environment effects.

Commenter (11186) asserts that the EPA should not pick and choose which studies go into laws based on public availability because this approach would not be telling all sides of the story: that would be biasing our laws to minimize the impacts of environmental exposures.

Commenter (11495) states that, in the alternative Option, the EPA is proposing to “give greater consideration,” but this is absent of any scientific justification. The commenter states that the “greater consideration” Option is not fully discussed with no details provided about how the Agency would go about providing a weight to an individual study based on the availability of

²³²⁵ Green, Miranda. 2019. “New EPA Rule Could Expand Number of Trump Officials Weighing in on FOIA Requests.” Text. The Hill. June 25, 2019. <https://thehill.com/policy/energy-environment/450169-new-epa-rulewould-allow-more-administration-officials-to-weigh-in-on-foia-requests>.

underlying data. The commenter states that this presents a considerable potential to introduce bias. The commenter states that, for instance, studies which contain PII are most likely to reflect specific health outcomes at an individual level, where the existing detail promotes mechanistic understanding and generalizability by clearly defining the impacted population. The commenter adds that, without CBI and proprietary data, analyses are not sufficiently informed of the true impact on business practices, management and economic outcomes.

Commenter (12430) contends the SNPRM would introduce a bias towards less sensitive studies. The commenter states that higher-quality study designs typically collect detailed demographic information and information on risk factors and medical conditions so that susceptible subpopulations can be identified. The commenter states that the more detailed the study, the more difficult it would be to remove PII and eliminate the risk of re-identification. The commenter states that, under the SNPRM, studies that omit personal information would be given greater weight, since this information can be released without linking to an individual. The commenter states that personal information is used to strengthen a study by providing a way to account for impacts due to characteristics other than the exposure effects, such as effects due to age, gender, smoking status, and preexisting medical conditions. The commenter states that it also allows an investigator to stratify the analysis by income and race/ethnicity to see whether any subgroups may be more susceptible to exposure to pollution. The commenter states that studies with individual personal information often are subject to agreements with the study subjects that limit who can view their personal information, making it impossible for this information to be released, even if it can be grouped in such a way as to not identify individuals. The commenter states that the studies that do not contain detailed personal level data are not as strong, since potential confounders cannot be corrected for, thereby limiting the ability of EPA to discover, and base its decisions on, the most accurate determination of the true causes and consequences of a health impacts.

Commenter (12458) contends that giving greater weight to studies where the underlying data is available will increase the relative weight of industry-funded research and research using non-human subjects, which are less likely to foreground questions about human health.

Response: The EPA considered these and other similar comments when developing the final rule. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a

study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

The technical considerations in 40 CFR 30.5(d), the equal consideration of data available through restricted access, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as the potential for bias suggested by the commenter. In addition, this final rule sets the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

Including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties. This approach will result in significant regulatory actions and influential scientific information based on the highest quality, most relevant studies and ensure adequate human health and environmental protections while maximizing transparency and maintaining consistency with the statutes the EPA administers. The EPA does not believe that this final approach will lead to bias towards any party.

2.2.2.7 Retroactive Application Would be Burdensome

Comment: Commenter (11358) reiterates their 2018 comments that, regardless of the components of the final rule, EPA should seek to phase-in whatever requirements are justified to allow for sufficient time to respond and prepare for the implications of this rule. The commenter contends that this rule should also not apply to the previous record, and that trying to apply this proposal to models, rules, and research that has already begun or has concluded would only serve to set current work back and complicate work already done. The commenter provides that it makes sense to "grandfather" what has already been completed and to implement this rule in stages in order to not compromise or delay EPA's work.

Commenter (12720) states that the supplemental proposal "would apply to reviews of data, models, and studies at the time a rule is developed or influential scientific information is

finalized, regardless of when the data and models were generated.” According to the commenter, this requirement raises numerous serious implementation issues.

Response: The final rule applies prospectively to significant regulatory actions and influential scientific information; the final rule has no retrospective effect on either significant regulatory actions or influential scientific information.

Comment: Commenter (11391) states that applying the Proposed Rule retroactively could undermine the scientific bases supporting many of our most important environmental protection programs.²³²⁶ According to the commenter, retroactive application would mean that when EPA is, for example, conducting a review of NAAQS or considering modifying the list of Hazardous Air Pollutants pursuant to the CAA, or reviewing Water Quality Standards under the CWA, it could refuse to consider valid, peer-reviewed epidemiological studies that have supported existing standards if all the underlying data in those studies has not been made public.²³²⁷ The commenter contends that this could potentially decimate many of the existing pollution standards that unquestionably protect both the environment and human health.

Further, the commenter (11391) notes that in many cases, there will be valid reasons why the data underlying historic studies cannot be made public. In this regard, the SAB has noted that the underlying data “may have been discarded if they were deemed not necessary to maintain” and, even if they still exist, “the researchers may no longer be alive or in a position to assemble the data.”²³²⁸ The commenter provides that data assembly is time consuming and labor intensive;²³²⁹ it is unclear whether EPA would perform the necessary work itself or require researchers to do it. The commenter states that either way, regulatory decision-making would be delayed, and scientific research hampered.

Response: The final rule applies prospectively to significant regulatory actions and influential scientific information; the final rule has no retrospective effect on either significant regulatory actions or influential scientific information.

Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full

²³²⁶ See generally, CSLDF 2018 Comments, at 3.

²³²⁹ *Id.* at 17.

consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

Comment: Commenter (11576) contends that the proposed rule must not be applied retroactively to existing data, models, and studies—indeed, it must not be applied at all. The commenter provides that complying with the requirements of the proposed rule would represent a significant departure from standard scientific practices, as data availability typically has no bearing on the accuracy or robustness of scientific findings.²³³⁰ The commenter asserts that if EPA finalizes the proposed rule, EPA must provide adequate notice to allow researchers to attempt to comply with the rule’s requirements, which will impact not only data reporting but privacy agreements for data collection. Furthermore, the commenter notes that without ensuring that infrastructure exists to make such data sharing feasible, the EPA cannot expect previously generated data and models to be able to be shared. The EPA’s SAB has rightly warned that “retrospective application of the requirement would be difficult to implement, could be expensive with no clear responsibility regarding who would cover the added costs, and could arbitrarily impact the conclusions drawn.”²³³¹

According to the commenter (11576), retroactively applying the proposed rule to existing science would arbitrarily and unjustly eliminate a large collection of established, peer-reviewed, and verified science generated prior to the establishment of the rule’s expectations. Furthermore, the commenter states that the proposed rule would impose new challenges for researchers related to data handling, storage, and the protection of sensitive information, and studies conducted prior to this rulemaking would likely not have made arrangements to allow for sharing of sensitive data publicly in the ways required by the proposal. Additionally, the commenter (11576) asserts that retroactive application of the proposed rule would conflict with the practice of building scientific studies and models iteratively over time in the context of existing literature, as it would essentially wipe out consideration of older and established studies conducted prior to the establishment of mechanisms for sharing data publicly. The commenter states that effectively excluding older studies based on this arbitrary criterion would undermine the most critical and foundational studies and impose tremendous challenges for more recent studies to re-establish foundational findings for acceptance under the guidelines described in the rulemaking.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The provisions of the final rule apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.

Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are

²³³⁰ Jeremy Berg, Philip Campbell, Veronique Kiermer, Natasha Raikhel, and Deborah Sweet, Joint Statement on EPA Proposed Rule and Public Availability of Data, *Nature* (Apr. 30, 2018) (attached), available at <https://www.nature.com/articles/d41586-018-05026-y>.

²³³¹ SAB Comments at 17.

not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

The EPA would also like to emphasize that the final rule applies prospectively to significant regulatory actions and influential scientific information; the final rule has no retrospective effect on either significant regulatory actions or influential scientific information.

Comment: Commenter (12720) contends that one important aspect of the retroactivity issue that EPA must consider is that it is not sufficient to apply the policy prospectively to new *agency actions*, because such actions may rely on *scientific products* that pre-date the new policy. The commenter refers to the CWA, which requires revision of standards every three years, and notes section 304(a)(1) of the CWA, where the water quality criteria that state standards include are commonly based on levels EPA determines to be safe enough to support various uses in reliance on available science.²³³²

According to the commenter (12720), EPA's criteria guidance is -- as the statute provides -- periodically updated, but any new update will be based on then-existing scientific studies (especially if there is no evidence to suggest that those studies should be ignored). The commenter notes that accordingly, EPA may be issuing revised criteria documents and making approval/disapproval decisions on newly-submitted state standards that rely on science products that pre-date this rule for many years into the future. The commenter asserts that any final rule must not limit EPA's ability to use these pre-existing studies for new Agency actions.²³³³

²³³² 33 U.S.C. § 1314(a)(1). State criteria may also be based on "[o]ther scientifically defensible methods." 40 C.F.R. § 131.11

²³³³ Thorp, H. Holden, Magdalena Skipper, Veronique Kiermer, May Berenbaum, Deborah Sweet, and Richard Horton. 2019. "Joint Statement on EPA Proposed Rule and Public Availability of Data (2019)." *Science* 366 (6470): eaba3197. <https://doi.org/10.1126/science.aba3197>.

Response: The final rule applies prospectively to significant regulatory actions and influential scientific information; the final rule has no retrospective effect on either significant regulatory actions or influential scientific information.

Further, as described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider underlying dose-response data availability when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. Although the EPA is prioritizing transparency in pivotal science, the EPA acknowledges, and agrees with commenters, that there may instances where the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

2.2.2.8 Benefits of Proposal

Comment: Commenter (11911) contends that the Agency does not adequately explain the expected benefits of the proposed rule. According to the commenter, applying this rule retroactively does not alter the incentive for papers that have already been published, while penalizing the Agency and public by excluding potentially valuable information from the regulatory process.²³³⁴

Commenter (10742) states that implementing this tiered system would likely require a significant investment of staff time and resources and it is not clear that the potential costs of the proposal outweigh the benefits.

Commenter (12727) contends that the Supplemental Notice does not cure EPA's failure in the 2018 proposal to articulate the benefits of its policy. The commenter provides that the error is even more glaring now that the scope of the proposal has significantly expanded. The commenter asserts that the SNPRM would have contained at least the seed of benefits that should be all the more obvious now that the proposal covers a wider range of studies and actions, yet EPA still has not characterized what positive outcomes this proposal would deliver. The commenter states that

²³³⁴ Timothy Vines et al., The Availability of Research Data Declines Rapidly with Article Age, 24 CURRENT BIOLOGY, 94 (2014)

EPA's failure to characterize or analyze the benefits of its proposal—or to acknowledge the absence of benefits—is arbitrary and unlawful.

Response: The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs or benefits of the proposed action. As discussed in the preamble to the final rule, this is a rule of internal procedure promulgated under the EPA's housekeeping authority and imposes no enforceable duty on any state, local, or tribal governments or the private sector. Additionally, this rule does not require the EPA or other parties to disclose or host data. Hence, this rule does not impose costs on the EPA or any other party to make such data available. The EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small. In addition, the Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

The main benefits of this rule spring from greater transparency in significant regulatory actions and influential scientific information. By placing greater emphasis on the availability of dose-response data underlying pivotal science, the rule will allow for greater scientific scrutiny as EPA decision makers are developing significant regulatory actions and influential scientific information and increases the likelihood that any errors will be identified and corrected. Greater transparency is also inherently valuable as a principle of good government and provides benefits to the public at large, including reducing the risk of errors in EPA analyses and in the science such analyses rely upon. The ability for independent subject matter experts to validate pivotal science will facilitate more effective comment and engagement with the public during development of future significant regulatory actions and influential scientific information.

Chapter 3: Capable of Being Substantially Reproduced, Independent Validation, and Reanalyze

In the notice of proposed rulemaking (NPRM), the Agency discusses reproducibility and ability to replicate findings as important qualities of information that fulfills the proposal's requirements.

The Agency is proposing a definition for the term “capable of being substantially reproduced” in §30.2 of the supplemental notice of proposed rulemaking (SNPRM) to read:

Capable of Being of Substantially Reproduced means that independent analysis of the original or supporting data using identical methods would generate similar analytic results, subject to an acceptable degree of imprecision or error.

The EPA's interpretation of “capable of being substantially reproduced” as included in the proposed definition above builds on the description in the “*Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies*”²³³⁵. The Agency states that these guidelines, which were issued by the Office of Management and Budget (OMB), are intended to help agencies ensure and maximize the quality, utility, objectivity and integrity of the information that they disseminate.

Several comments were received regarding reproduction, replicability, reanalysis, and independent validation. In this section the public comments are organized according to the following topics under sections 3.1 NPRM Replicability, Reproducibility, and Reanalysis and 3.2 SNPRM Capable of Being Substantially Reproduced; Replication and Reproduction:

Section 3.1: NPRM Replicability, Reproducibility and Reanalysis

- Proposed Rule Requirement to Make Available Information Necessary for the Public to Replicate Finding (§30.5)
- Clarification of the Meaning of Terms Used in the Proposal
- Replication versus Reproducible versus Reanalysis
- Whether the Ability to Reanalyze, Replicate and Reproduce a Study Should Determine the Quality of the Study
- Replicability-Specific Comments
- Reproducibility-Specific Comments
- Replication (or Reproduction) Crisis
- Reanalysis-Specific Comments
- Recommends Further Consultation to Develop New Rule Addressing Reproducibility and Replicability Concerns

²³³⁵ OMB (Office of Management and Budget). (2002). *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies*; Final guidelines. 67 FR 8452-8460. <https://www.govinfo.gov/content/pkg/FR-2002-02-22/pdf/R2-59.pdf>.

Section 3.2: SNPRM Capable of Being Substantially Reproduced; Replication and Reproduction

- Capable of Being Substantially Reproduced; Replication and Reproduction
- Reanalyze

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

3.1 NPRM Replicability, Reproducibility and Reanalysis

3.1.1 Proposed Rule Requirement to Make Available Information Necessary for the Public to Replicate Findings (30.5)

3.1.1.1 Comments Supporting the Proposed Replicability Requirement

Comment: Commenters (1941, 2421, 6105, 6365, 6864, 6921) support the proposed requirement to make available information necessary for the public to replicate findings. Commenters (0039, 0563, 0844, 1486, 2850, 4541, 6867, 6921) refer to a replication (or reproduction) crisis as evidence that supports the need for the proposed rule (specific comments related to replication (or reproduction) crisis provided in section XIV.G.1). Specific comments supporting study reproducibility are provided in section XIV.F.2.

Commenter (2421) expresses support for the proposed rule because they believe it is common sense to base administrative policies, procedures and rules on valid, verifiable information.

Commenter (6864) states the public's interest is best served when science is replicable, transparent, and explainable with other toxicology information. The commenter states that, when studies cannot be replicated or when such studies are not consistent or explainable with other information, using such studies then depends on having access to the underlying data for independent analysis.

Commenters (6105, 6864) state that for many chemicals regulated by EPA, these data are often from dozens to hundreds of studies conducted according to federal guidelines. The commenters report that studies that are not replicated, or for which the results appear to be outlier(s), or that are not consistent within an overall pattern, are still considered by EPA. According to the commenters, EPA's scientists will often contact the authors to obtain additional information or data in order to conduct their own analysis. When such data are forthcoming, independent analyses can be conducted by EPA scientists without the need to disclose confidential information, and public health is better served. The commenters express concern that, when such

information is withheld by the authors, EPA's scientists are left with a dilemma—whether and how to use the study.

Commenter (1941) specifically endorses the core precepts of section 30.5. The commenter reports that efforts to gain access to the NIOSH/NCI “Diesel Exhaust in Miners Study” (“DEMS”) data, and the results obtained, serve as a clear-cut example of the vital importance of ensuring that pivotal scientific data are made available for review, replication and reanalysis by other independent scientists. The commenter states that, without that type of third-party expert review, the original results of pivotal regulatory science might not receive the scrutiny and reassessment that is warranted, and the appropriate corrections and amendments of those original results might not be made. The commenter asserts that in turn could lead to the implementation of mis-informed regulatory policy and inherently flawed regulations. According to the commenter, the notice of proposed rulemaking (NPRM), when properly implemented, can serve as a safeguard against that type of adverse outcome. The commenter provided additional information regarding the DEMS study, which is summarized below.

The DEMS study covered more than 10-year period and published their results in 2012. DEMS' purpose was to assess the potential association between exposures to diesel engine exhaust (DEE) and lung cancer among a population of 12,315 mine workers employed in eight U.S. non-metal mines. The NIOSH/NCI investigators claimed to observe a positive exposure-response trend between estimated levels of respirable elemental carbon and lung cancer. There were a number of significant questions regarding the scientific robustness of the DEMS' investigators' methods and observations. Efforts to help facilitate independent investigators' access to the full DEMS data sets in a manner sufficing to allow for a thorough replication and reanalysis of the DEMS results took well over three years and well over \$200,000. The investigators ultimately were able to complete their reanalyses, which in turn led to the publication of four peer-reviewed journal articles highlighting the significant questions and uncertainties that pertain to the original DEMS results. The independent investigators were able to demonstrate that: (i) when better estimates of exposure to DEE are utilized, the reported associations between occupational exposures to DEE and lung cancer are greatly attenuated, with most being statistically non-significant; (ii) the observed health impacts were associated principally with only one mine (the limestone mine); (iii) exposures to radon were significant cofounders, and appear to account for most of the remaining observed lung cancer associations; and (iv) the DEMS results are not sufficiently robust to serve as the basis for a quantitative risk assessment for occupational exposures to DEE and lung cancer.

Commenter (6365) contends that the experience of the lead national ambient air quality standards (NAAQS) rulemaking demonstrates the salutary purpose that transparency would serve in the regulatory process. The commenter states that, while EPA relied heavily on the Lanphear et al. (2005)²³³⁶ study in its analysis of the health effects of lead exposure, the underlying data for the Lanphear study were not available to EPA or to stakeholders for replication and validation at the time of publication. The commenter reports that it took stakeholders years, including

²³³⁶ BP Lanphear et al. (2005), “Low-Level Environmental Lead Exposure and Children’s Intellectual Function: An International Pooled Analysis.” *Environ Health Perspect.* 2005 Jul; 113(7): 894–899.

litigation under the Freedom of Information Act (FOIA), to obtain that data. According to the commenter, due to the lack of availability, there was no complete reanalysis of that data for nearly a decade and EPA relied on the study in both the 2008 and 2016 lead NAAQS reviews. The commenter states that the lack of available data has been noted in the scientific literature as preventing alternative statistical analyses to be performed, which is particularly important given that key confounding factors such as parental education, intelligence, birthweight, smoking, and race were not controlled in several of the Lanphear study cohorts and may contribute to an overestimation of health effects. The commenter reports that when the data underlying the Lanphear study was reanalyzed in Crump, KS et al. (2013)²³³⁷, numerous errors that were not discovered in the peer-review process and that were not previously known to EPA were uncovered and analyzed. The commenter notes that, although EPA ultimately determined that these errors did not materially affect the NAAQS review documents that relied on the Lanphear study, the Agency considered the errors and their potential impact on EPA's regulatory efforts to be sufficiently substantial so as to include a memorandum in the subsequent NAAQS rulemaking docket acknowledging those errors and considering their impact on the regulatory process.

Commenter (6864) refers to an example supporting the need for replication where there was the publication of a series of studies on a single human group from exposure to a commonly used insecticide that showed an unexpected effect at extremely low exposures. The commenter notes that the finding of these studies has not been replicated in other human studies and is in contrast to extensive animal and other limited human studies. The commenter reports that, while EPA scientists asked the authors of the studies for the underlying data in order to confirm the results at the lower exposure, the authors refused the release of data citing confidentiality concerns. According to the commenter, since EPA had neither confirmatory studies, nor consistent information that made sense in light of the multitude of available studies of the chemical, nor the ability to conduct its own analysis, it chose not to use the incompletely published information from this single human group. The commenter contends that EPA's decision not to use studies with incomplete information is correct. The commenter asserts that when the underlying data are not provided to EPA scientists, especially those adept in the receipt and protection of confidential information, it is difficult to use these studies with confidence to make a credible risk judgment for public health, much less national rulemaking.

Response: The EPA found that comments regarding confusion around the definition of “replicate” in the 2018 proposed rule have merit and is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” Therefore, in the final rule the term replicate is not used.

3.1.1.2 Comments Opposing the Proposed Replicability Requirement

Comment: Commenters (1409, 1973, 4894, 6117, 6144, 6170, 6880, 6895, 6915, 8276, 9227) oppose the proposed requirement for information necessary for the public to replicate findings. Specific comments supporting their opposition and others' opposition to the proposed study

²³³⁷ Crump, KS, et al. “A statistical reevaluation of the data used in the Lanphear et al. (2005) pooled-analysis that related low levels of blood lead to intellectual deficits in children.” Crit Rev Toxicol. 2013 Oct;43(9):785-99. doi: 10.3109/10408444.2013.832726.

replicability requirement, where specifics provided, are included under relevant topics under sections XIV.B through I.

Response: The EPA found that comments regarding confusion around the definition of “replicate” in the 2018 proposed rule have merit and is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” Therefore, in the final rule the term replicate is not used.

3.1.2 Clarification of the Meaning of Terms Used in the Proposal

3.1.2.1 Recommendation that EPA Better Define Terms Used in the Rule

Comment: Commenters (6114, 6880, 6915, 6909, 8281-PH20) recommend that the EPA better define the terms used in the rule. Commenter (8281-PH20) states that the terms, “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not defined or are problematic.

Response: In this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not used in this final rule.

3.1.2.2 Request that EPA Clarify/Define Replicability and Reproducibility

3.1.2.2.1 Clarify/Define Replicability and Reproducibility Differences

Comment: Commenters (6114, 6125, 6351, 6915, 6909) request that EPA clarify or include definitions to better *inform* the meaning and differences *between* “*replicability*” and “*reproducibility*” in the rule. Commenter (6351) requests clarification on what the EPA considers “replication”.

Commenter (6114) states that this proposal calls for “replication” and “reproducibility” of studies, yet there are questions within the scientific community as to what these terms mean, and to what degree they are needed.

Commenter (6125) asserts that, in context, EPA is using “replicate” not in the sense of conducting a new study to determine if the original conclusions also are supported by analyses of new data, but whether the results are “reproducible” by other analysts using the original data. The commenter reports that neither the proposal, nor the legislation it is based on, define “reproducible,” or “replicable” as used in the rule and are in fact not clear on how broadly this goal might be applied (information must be sufficient to “replicate” findings).

Commenter (6909) reports that EPA has seemingly used the words “reproducibility” and “replicability” interchangeably when in fact they do not mean the same thing. According to the commenter, the EPA’s lack of clarity here is one example of the numerous ways in which this

proposed rule is so vaguely written and uses terms which are so ill-defined that it is difficult to comment effectively – it is unclear whether EPA is concerned about only using studies that can be “reproduced” or only using studies that can be “replicated”.

Commenter (6880) recommends EPA consider sources discussing the difference between “replicable” and “reproducible” which include:

- <http://www.replicability.tau.ac.il/index.php/replicability-in-science/replicability-vs-reproducibility.html> [Note: link does not work – double-checked comment letter-correct cite],

<https://jblevins.org/log/rep>, and

<https://osf.io/tvyxz/wiki/6.%20Future%20Directions/>.

Response: In the final rule the terms replicate and reproduce (or other forms of the word) are no longer used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” In addition, the EPA is modifying the definition of “independent validation” in the final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA did not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30.

3.1.2.2.2 Interpretation and Definition of Replicability

Comment: Commenters (1973, 6114, 6116, 6125, 6131, 6876, 6880, 6895, 6909, 6924, 9227) who note that the term “replicate” needs to be defined or clarified in the rule refer to literature references defining and interpreting “replication” and provide their interpretation of the term.

Definitions/Interpretations in the Literature

- Commenters (6924, 9227) refer to a 2016 NAS workshop report²³³⁸ and suggest that the EPA should use the term as defined in the 2016 NAS workshop report:
Replication means that a scientific experiment or a trial to obtain a consistent result is repeated. The repeated experiment uses exactly the same protocols and statistical programs but with data from a different population. The goal is to see if the same results hold with data from a different population.

²³³⁸ National Academies of Sciences, Engineering, and Medicine, Principles and obstacles for sharing data from environmental health research: Workshop summary, The National Academies Press (2016), <https://www.nap.edu/catalog/21703/principles-and-obstacles-for-sharing-data-from-environmental-health-research>.

- Commenters (6114, 6116, 6131) refer to an opinion piece by Dr. Bernard Goldstein (Goldstein, B., 2017)²³³⁹ which states that replication is best achieved, when the findings of the initial study are supported by other studies approaching the same question in different ways.

Commenter Interpretation of the Term

- Commenter (6876) states that replication refers to the fact that consistent findings from studies in different populations in different places strengthens the likelihood of an effect.
- Commenter (6880) states that to “replicate” findings means to repeat an entire experiment, generate new data, and get the same results.
- Commenter (6895) states that replicability is one of the principles of scientific research and in environmental exposure studies that is used to determine if linkages to health effects caused by environmental pollutants can be confirmed in similar or in other populations. The commenter provides that replication means that any scientist studying the same population-wide health effects and pollutant concentrations in an environment should come to the same conclusion regarding linkages between those two factors.
- Commenter (6909) states that, to replicate a study is to repeat the entire study, independent of the original researcher, using the same methods (but without the use of the original data).
- Commenter (6125) states that, under standard usage, a study can be replicated without access to the underlying data and this standard usage would apply.
- Commenter (9227) states that replicating studies does not require access to underlying study data, but rather details regarding the methodological design.
- Commenter (1973) states that replication tests whether different populations recruited in different ways in different locations, with different data collected on them, or in a different manner, and potentially analyzed in a different manner, produces similar results. The commenter provides that this is why scientists believe that replication is the key approach to reaching conclusions.

Response: In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.”

3.1.2.2.3 Interpretation and Definition of Reproducibility

Comment: Commenters (6117, 6362, 6868, 6875, 6880, 6909, 9224, 9227) who note that the term “reproducibility” needs to be defined or clarified in the rule refer to the NAS workshop report definition of “reproduction” and provide their interpretation of the term.

²³³⁹ Goldstein, Bernard. Opinion Contributor. “The HONEST Act is actually dishonest and will hurt the EPA” The Hill. April 20, 2017. Washington, DC (Goldstein, B., 2017)

Commenters (6875, 9224) express concern that, according to Goodman, Fanelli, and Ioannidis (2016)²³⁴⁰, there is no scientific consensus for what “methodologically reproducible” is. The commenters suggest that, if EPA wants to build a rule around transparency in regards to methodology, “methodologically reproducible” must be defined.

Definition/Interpretation in the Literature

- Commenters (6924, 9227) refer to the 2016 NAS workshop report and suggests EPA should use the term as defined in the 2016 NAS workshop report:
Reproduction means producing something that is very similar to the original research, but in a different medium or context. A researcher who is reproducing an experiment addresses the same research question but may use different methodologies or experimental measurements than the original researcher did.

Commenter Interpretation of the Term

- Commenter (6880) states that to “reproduce” findings, which requires publicly available data, means to analyze the data provided and come to the same conclusions.
- Commenter (6909) states that to “reproduce” a study is to take the original data from a study and to reproduce its findings by analyzing the data in the same way or using the same code.
- Commenter (9227) states that reproduction refers to a body of evidence addressing the same hypothesis, but using different populations, methods, etc.
- Commenter (6117) states that “methods reproducibility” is when a study provides enough information about the experimental and/or computational procedures so that future authors can repeat the study using the same data to obtain the same results.

Response: In the final rule the term reproduce (or other forms of the word) is no longer used. The EPA is modifying the definition of “independent validation” in the final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA did not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30.

3.1.2.3 Interpretation and Definition of *Reanalysis*

Comment: Commenters (6924, 9227) refer to the 2016 NAS workshop report and suggest EPA should use the term as defined by the NAS:

Reanalysis is conducting a further analysis of data. A person doing a reanalysis of data may use the same programs and statistical methodologies that were originally used to analyze the data or may use alternative methodologies, but the point is to analyze exactly the same data and see if the same result emerges from the analysis.

²³⁴⁰ Goodman, S.N., Fanelli, D., & Ioannidis, J.P.A. (2016). “What does research reproducibility mean?” Science Translational Medicine. 8(341). pp. 1-6.

Commenter (9227) states that reanalysis is a tool to demonstrate the robustness of an effect to changes in the statistical model underlying an analysis of a single data set. The commenter contends that reanalysis does not validate or invalidate a study's findings.

Commenter (1973) states that, compared to replication, reanalysis is a thin reed. The commenter provides that reanalysis can determine whether the same data, analyzed in a different manner (which may or may not be appropriate) produces similar results.

Response: The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was "reanalyze" rather than "replicate." In the 2020 SNPRM, the EPA proposed using the term "reanalyze" instead of "replicate" and proposed at 40 CFR 30.2 a definition for "reanalyze." In the final rule, Part 30.2, the EPA defines *reanalyze* to mean to analyze exactly the same dose-response data to see if a similar result emerges from the analysis by using the same methods, statistical software, models, or statistical methodologies that were used to analyze the dose-response data, as well as to assess potential analytical errors and variability in the underlying assumptions of the original analysis.

3.1.2.4 Interpretation and Definition of *Validation*

Comment: Commenters (0671, 6915) express concern that "validation" of scientific studies is mentioned in the proposed rule, but the term is not defined.

Commenter (0671) states that the proposed rule is using a very narrow definition of "validation"; in reality the best validation is not from the same data already used but from new data on other populations using other methods. The commenter asserts that the best replication happens when there is agreement across populations and methodologies and study designs. The commenter reports that his broader type of replication is what EPA already highlights when making rules.

Response: As discussed in the preamble to the final rule, EPA defines "validation" as to substantiate or confirm. In the final rule, EPA defines "independent validation" as "the reanalysis of study dose-response data by subject matter experts who have not contributed to the development of the study to evaluate whether results similar to those reported in the study are produced."

In the 2020 SNPRM, the EPA proposed using the term "reanalyze" instead of "replicate" and proposed at 40 CFR 30.2 a definition for "reanalyze." Given that proposed 40 CFR 30.5 also included the term "independent validation" and that this term directly relates to "replicate," the EPA also proposed a definition at 40 CFR 30.2 for this term. The proposed definition of "independent validation" included the term "capable of being substantially reproduced." The EPA also defined this term because it was an important component of the definition of "independent validation." The EPA modified the definition of "independent validation" in the final rule by replacing "capable of being substantially reproduced" with "produced." The EPA did not finalize the proposed 40 CFR 30.2 definition of "capable of being substantially reproduced" because the term is not used in the final rule's definition of "independent validation" or elsewhere in 40 CFR 30. The EPA is also modifying the definition of "reanalyze" to specify the use of the same methods because the proposed rule specified the use of the "same

or different” methods. This change was made so that the definition would be consistent with the final rule’s definition of “independent validation.”

3.1.3 Replication versus Reproducible versus Reanalysis

Comment: Commenters (1973, 4840, 6132, 6158, 6170, 6874, 6880, 6893, 6916, 6924, 6925, 8771-PH56, 9227) contend that while replication is important, replication is not done by making underlying data available to reanalyze but is by determining whether the same effects occur and that making data publicly available is insufficient to allow someone to replicate findings. Commenters explain that *validation* in science is usually accomplished not by reanalyzing published studies’ data, as proposed by this draft rule, but instead by other scientists conducting separate studies in other populations to test if the study results are replicable elsewhere or not.

Commenter (1973) states that it has been argued that public data would allow reanalysis of data to ensure conclusions of the studies EPA relies on are valid. The commenter agrees that reanalysis has a role to play, however, the commenter states that the key determination of the consistency of scientific evidence comes from replication, not reanalysis. The commenter asserts that replication is not the re-analysis of previously published studies. It occurs when other researchers, independently conduct similar research on different populations in different locations and come to similar conclusions. Science reaches consensus when competing hypotheses have been tested in multiple independent replications with broadly consistent results, not when one data set has been reanalyzed many times. The commenter asserts that the only thing that would ostensibly be gained by EPA’s rule would be, were investigators to comply with EPA’s request, the ability for others to re-analyze the same data.

Commenter (4840) states that the scientific enterprise involves approaching the same question in different ways to determine if the results support each other. The commenter asserts that reanalyzing the same study over and over is little different from checking on a surprising newspaper article by buying additional copies of the same paper to see if it says the same thing.

Commenter (6158) states the proposed rule would only address the issue of reanalysis (i.e. analyzing exactly the same data and determining if the same results emerges from this new analysis), but this would do nothing to address replication (i.e. doing the same exact experiment on a different population to see if the same result occurs) or reproducibility (i.e. addressing the same research hypothesis in a different study system or with different methodologies to see if similar findings occur). The commenter provides that, to the extent that there is a replication/reproducibility issue in science generally, the solution is additional, different, independent studies on the same general issue, not essentially rechecking the math in previously published studies that have already undergone extensive peer-review.

Commenter (6170) states that it is much more important in our science to replicate results with new data and in new settings than to re-analyze existing data. This is the type of replication that needs to be encouraged and not the type of data sharing the proposed rule would seek. Many such replication studies have been and will be done outside the United States and these data would never become available to EPA – or being made publicly available – but some may represent the best studies worldwide, due to high level human exposures in such countries

(arsenic in Bangladesh and Taiwan) and the national health system records that are available (in Denmark, Sweden, Norway and Taiwan for example) and much more comprehensive than anything currently available for conducting human studies of this kind in the US.

Commenter (6880) states that it is clear that making data publicly available is insufficient to allow someone to replicate findings and, therefore, EPA's insistence that data must be made public in a manner that allows the findings to be replicated is fundamentally unworkable.

Commenter (6893) reports that reanalysis of data may be undertaken at times to increase confidence in particularly unexpected or consequential findings, but typically confidence in findings is strengthened by having evidence from different studies accumulate.

Commenter (6916) states that the Proposal's focus on public release of the underlying data used in studies – particularly “dose response data” and studies, evinces a clear lack of understanding of the way science is conducted and verified. The commenter provides that, while replicating the results of a study with the same data set certainly verifies it, as the *National Research Council* said in 2002, “[f]or large epidemiological studies, repeating a study is seldom either possible or desirable.” According to the commenter, a more effective approach is some combination of new studies testing the same question in different places, and/or an independent analysis with the same data. The commenter asserts that formal peer review, whether or not prior to publication, also validates the outcome of scientific studies.

Commenter (6924) states that, because the proposed rule argues that data and methods should be made available in sufficient detail that one could redo the analysis, the proposed rule appears to be primarily concerned with reanalysis rather than replicating experiments even though the citations for this section of the rule are focused on issues with replication of experimental findings, not reanalysis. The commenter provides that a re-analysis of a study's data alone cannot verify or invalidate scientific findings without the requisite attention to evaluating the research design, methods, uncertainties, biases, and consistency with existing publications.

Commenter (6925) states that our scientific understanding of how air pollution affects health outcomes is based on evaluating a range of high-quality studies conducted in different populations, using a variety of appropriate methods, and evaluating a variety of air pollution mixtures. The commenter provides that the concept of “repeatability” in the evaluation of whether an exposure causes a particular health outcome refers to the notion that many different studies on different populations show consistent findings, and that such studies offer complementary data to draw this conclusion. The commenter contends that this type of repeatability provides a stronger evidence base from which to conclude that there is a link between the exposure (e.g. air pollution) and the health outcome. The commenter asserts that reevaluating the same study using the same data and methods simply helps to confirm that specific analysis but does not help to expand the evidence base and our understanding of the science of how pollution impacts human health.

Commenter (8771-PH56) states that most often, reanalysis only reveals that different levels of precaution are consistent with the available scientific information; the choice among them is not a job for science, but for policy. The commenter provides that if EPA wants to advocate for a

policy of taking more risks with public health in order to impose fewer costs on industry, it should do so forthrightly, rather than hiding the policy change under the banner of “better science.” The commenter asks what if someone did reanalyze a health study and got a very different answer, and one that suggests the first study had exaggerated the harm? According to the commenter, in such a case, the “second” study would be “right” and the first one “wrong” only if both of the following conditions held true:

- (1) The difference in the results was not already acknowledged (or contained but unacknowledged) within the uncertainties inherent in each answer! After all, if the first investigators claimed that banning a chemical would save somewhere between 500 and 1500 lives across the country, and EPA chose to estimate its benefits as the average of 1000 lives saved, a second study estimating only 600 lives saved would not be “different” at all; and
- (2) The first study was not just different, but wrong. Anyone can take the same data and botch the risk analysis of it, making it seem like they have a better answer. Just as there are potential problems with an analysis that doesn’t control for some variable, it can be a mistake to control for a variable that shouldn’t be included—in other words, more pseudo-sophistication doesn’t necessarily mean better.

Commenter (9227) states that reanalyzing a study using publicly available data is not necessary to ensure valid science nor sufficient to ensure against invalid results. The commenter reports that, to ensure the validity of scientific research, the scientific community relies most heavily upon peer review. The commenter reports that studies used by EPA are often evaluated by one of EPA’s scientific advisory boards, such as the *Clean Air Science Advisory Committee* (CASAC) or the *Science Advisory Board*. (SAB) The commenter provides that these types of reviews do not depend on a study’s data being made publicly available.

Commenter (9227) provides that reanalyzing a study is just one of many ways the scientific community ensures integrity, and it is not, in fact a widely used mechanism. The commenter contends that reproducing study results using a different population or method is generally considered a stronger validation than simply reanalyzing the results using the same data, as it shows that the results hold across a different population.

Response: Although the EPA agrees that meaningful insights can be obtained through similar studies in different media or context, the EPA continues to find that independent validation of the study findings and conclusions driving the EPA’s dose-response assessments would provide important information. As detailed in the preamble to the final rule, there is scientific support for the usefulness of reanalyzing data, and the EPA finds this to be especially true for data that drive the quantitative requirements or analyses of EPA significant regulatory actions or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and, thus, increase the opportunity for independent subject matter experts to validate pivotal science, and as the dose-response data are better understood through independent reanalysis the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, particularly concerning “reproducible” vs. “replicable” vs. “re-analysis”, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The EPA is also clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” Therefore, in the final rule the terms “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not used or defined.

3.1.4 Whether the Ability to Reanalyze, Replicate and Reproduce a Study Should Determine the Quality of the Study

Comment: Commenters (6111, 6127, 6144, 6921, 9227) generally argue that, while many environmental studies simply cannot or should not be replicated or reproduced does not determine the quality of the study.

Commenter (6111) states that it is not necessary to reproduce a study to validate it. The commenter provides that many of the studies that cannot be reproduced are valid but would be excluded by the proposed rule.

Commenter (6127) states that, although this rule aims to propose a solution to a replication crisis, there is no mention in the rule, or its citations, or of a study that was shown to be flawed due to a lack of raw data.

Commenter (6144) states that the ability of a study to be reproduced or replicated should not be held as the gold standard for checking the credibility of a study. The commenter asserts that, while it is impossible or simply unethical to recreate certain studies, this lack of recreation does not invalidate the findings in any way. The commenter recommends that EPA should have the flexibility to use its own criteria to judge the rigor and validity of the science informing rules as applicable. The commenter contends EPA already does this well and the rule does not point to any evidence to the contrary.

Commenter (6144) reports that, throughout the proposed rule, EPA argues that part of the reason for the policy is to allow regulators to better determine that key findings are “valid and credible.” According to the commenter, the benchmark upon which validation and credibility are measured for the purposes of this rulemaking are through the relative reproducibility and replication of studies, even though there are certainly other criteria that agency scientists currently use to evaluate a study’s credibility. The commenter asserts that the EPA’s argument that requiring public disclosure is the way to achieve validity and credibility is inconsistent with provisions in OMB’s *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies* that indicate an agency can verify the independence and credibility of a study by evaluating the research design, methods, data summaries, and how closely aligned the study is with similar literature in the field. The commenter also notes that the lack of consideration for sensitive information in the proposed rule

is inconsistent with provisions in the *Guidelines* document that note that, while transparency of data is important, it does not override other compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections.

Commenter (9227) provides that the *Harvard Six Cities Study*²³⁴¹ has been reanalyzed and reproduced—the underlying data is not publicly available because of patient confidentiality protections bound by individual contractual agreements between the scientists and the research participants and by the HIPPA. The commenter asserts that the unavailability of the underlying data is unrelated to the validity, integrity or quality of the *Harvard Six Cities Study*.

Commenter (9227) states that the results of the *Health Effects Institute (HEI)* reanalysis of the *Harvard Six Cities Study*²³⁴² suggests that routine assessment of quality indicators such as methodology, confounding and bias routinely evaluated in the peer review process are generally enough to confirm a study's validity.

Similarly, commenter (8771-PH56) states that the history of calls for reanalysis of major environmental health studies such as the *Harvard Six Cities Study* led to an expensive and independent total reanalysis convened by the *HEI* which found that the Harvard researchers had only slightly underestimated the relative risk of a unit of fine particle exposure.

Response: In the final rule the terms replicate and reproduce (or other forms of the word) are no longer used. In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” In addition, the EPA is modifying the definition of “independent validation” in the final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30.

The EPA is a leader in the evaluation of human and ecological impacts of environmental pollution and methods to cost-effectively mitigate these impacts. The selection and use of quality, peer-reviewed literature is a critical part of this work. However, the strength of the review conducted as part of the study’s acceptance and publication in a scientific journal has received increased attention in the scientific community due to the lack of transparency and consistency, potential for bias, and the difficulty that independent researchers have had in

²³⁴¹ Dockery DW, Pope III CA, Xu X, Spengler JD, et al. 1993. “An Association between Air Pollution and Mortality in Six U.S. Cities.” *N Engl J Med*. 329:1753-1759.

²³⁴² Krewski, D., Burnett, R.T., Goldberg, M. Hoover, K., Siemiatycki, J., Jerrett, M., Abrahamowicz, M. and White, W. H. 2000. “Investigators' report”. In Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of particulate air pollution and mortality. Special report, 7–244. Cambridge, MA: Health Effects Institute. <https://www.healtheffects.org/publication/reanalysis-harvard-six-cities-study-and-american-cancer-society-study-particulate-air>.

reproducing published results.^{2343,2344,2345,2346,2347,2348} Jamieson et al. (2019) state, “Journals play a key role in ascertaining the quality of the evidence in work submitted for publication through peer review. However, that practice is neither uniform nor free of exploitation. While it can select for trustable results, its existence alone is not sufficient to verify the quality of the evidence used to back claims.”²³⁴⁹ Because of the potential impact of significant regulatory actions, independent validation of studies that are pivotal to the EPA’s significant regulatory actions and influential scientific information may increase public confidence in the findings and conclusions presented in those studies. As Jamieson et al. (2019) states, publication alone (including the typical peer review necessary for publication) is insufficient to verify a study’s quality, and additional confidence could be gained from third-party reanalyses that independently validate the study results²³⁵⁰.

The EPA agrees that data transparency is vital for individuals who have not contributed to the study to be able to verify the quality and strength of published studies and agrees with commenters that the opportunity to independently validate the pivotal science that the EPA relies upon is important in furthering scientific understanding and the Agency’s mission. A presenter in a 2016 NAS workshop on Principles and Obstacles for Sharing Data from Environmental Health Research stated more directly that “for environmental policy making to be legitimate, the scientific reasoning behind a given decision—including the data supporting it—must be transparent” (NAS Workshop Report, Ref. 26). When data are widely available, researchers can validate research results and help identify and correct unintended errors, as well as reanalyze the data for new and different purposes, examine novel questions, provide new scientific insights, and improve model development.

This final rule is not intended to address a specific instance but many commenters have provided examples of Agency actions that could have benefited from the provisions of this final rule.

Comment: Commenters (1364, 1973, 6153, 6351, 6874, 8272) assert that replicating findings across similar studies is more informative than reproducing a study using the same data.

²³⁵⁰ Ibid.

According to commenter (1364), support for the findings of studies, especially pivotal regulatory science, is best done if more than one group is studying the same thing, replicating the study simultaneously. The commenter provides that those studies could then be averaged, compared and further analyzed. The commenter inquires that, to zoom the principle of sample size out to the bigger picture, would it not benefit the EPA to have a bigger sample size of studies to amass data from?

Commenter (1973) states that the replication process of science provides protections against inappropriate methods because dozens of studies can be done, in different ways, by different teams of investigators. The commenter provides an example where an analysis includes a wide variability in statistical approaches and concludes that, along with the transparency in methods and with the expert peer review of the CASAC for air and other SAB committees, any reasonable goals of assurance that the standard is set based on valid science can be met with the current process.

Commenter (6351) states that, while many studies cannot be specifically repeated, especially those that examine the impacts of historic events, subsequent, similar studies from around the world have echoed their findings on health impacts.

Commenter (9227) asserts that the ability to replicate a study with very poor scientific quality does not strengthen the scientific belief that any toxicity is present. According to the commenter, studies that attempt to reproduce the same findings must have their quality clearly established before comparisons can be made across the multiple studies. The commenter states that “reproducing” studies is generally viewed as a more informative and resource efficient approach to validation of research.

As an example, commenters (6153, 6874, 8272, 9227) assert that the findings of the *Harvard Six Cities* and *American Cancer Society (ACS)*²³⁵¹ cohorts have been replicated and supported by follow-up research. Commenters (6153, 6874, 8272) state that, since publication of these two landmark studies, dozens of additional peer-reviewed studies, as well as follow-up research involving the *Harvard Six Cities* and *ACS* cohorts, have replicated and expanded upon their findings and provided insights into specific effects of particulate pollution on certain groups. Commenter (9227) states that, through reproduction and reanalysis, the original findings of the *Harvard Six Cities Study* have been validated many times over.

Commenter (6117) states that the goal of repeating a study should be to increase the total amount of evidence.

Response: In the final rule the terms replicate and reproduce (or other forms of the word) are no longer used. In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” In addition, the EPA is modifying the definition of “independent validation” in the final rule by replacing “capable of

²³⁵¹ Pope III CA, Thun MJ, Namboodiri MM, Dockery DW et al. 1995. “Particulate Air Pollution as a Predictor of Mortality in a Prospective Study of U.S. Adults.” *Am J Respir Crit Care Med*. 151: 669-674.

being substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30.

As Jamieson et al. (2019) states, publication alone (including the typical peer review necessary for publication) is insufficient to verify a study’s quality, and additional confidence could be gained from third-party reanalyses that independently validate the study results²³⁵².

Comment: Commenters (6162, 6874, 6875, 6921) agree that any data, methodology, or models produced by EPA should be transparent and available to the public in a reproducible manner. Commenters (6162, 6874, 6921) contend that replication and validation of results (whether the results are reliable and consistent when using different assessment methods) are key to determining whether the science is accurate and of high quality.

Commenter (6921) recommends that, in setting standards, EPA should include consideration of whether the underlying study data is available for review and analysis. The commenter states that current concerns over low replication rates should make EPA hesitate to identify studies as representing the “best available science” if the underlying data and test methods are not released to allow review and replication using the same data or alternative data sets. The commenter asserts that concealing information that would allow the replication and validation of key research findings not only undermines the validity of the results, it also undermines public support for the policies. The commenter concludes that EPA has an obligation to consider transparency in making any judgments on what is the best available science for making policy decisions.

Commenter (6162) states that studies that are reproducible allow independent researchers to evaluate the myriad of choices and assumptions the researchers have made regarding the data and statistical models and the potential introduction of any sources of bias. The commenter reports that bias in research studies can arise from a variety of sources, including publication bias, model uncertainty, model selection issues, lack of adequate control for confounding variables such as other pollutants and weather, and exposure misclassification arising out of the poor correlation between ambient monitors and personal exposure. According to the commenter, privacy concerns with making accessible the data of individuals can be fully addressed using techniques already employed by the U.S. Census Bureau and other agencies, as EPA noted in its proposal.

Response: The Agency agrees that greater transparency is necessary. The scientific significance of reanalyzing and validating study results is not a recent development. McNutt (2014) noted, “Reproducibility, rigor, transparency, and independent verification are cornerstones of the scientific method.”²³⁵³ The National Academies of Sciences workshop on Reproducibility and

²³⁵² Ibid.

²³⁵³ McNutt, M. (2014). Journals unite for reproducibility. *Science* 346(6210): 679.
<https://doi.org/10.1126/science.aaa1724>.

Replicability in Science also noted that “certainly, reproducibility and replicability play an important role in achieving rigor and transparency.”²³⁵⁴

Comment: Commenter (9227) provides that the proposed concepts of replication, reproduction and reanalysis do not include a discussion of the scientific quality of a study. According to the commenter, the proposal also does not address other key aspects of scientific quality such as generalizability and bias; and how these characteristics of any scientific study are assessed by the EPA and directly relate to the transparency of any decisions they might make.

Response: The EPA disagrees with the commenter. Data transparency is vital for individuals who have not contributed to the study to be able to verify the quality and strength of published studies and agrees with commenters that the opportunity to independently validate the pivotal science that the EPA relies upon is important in furthering scientific understanding and the Agency’s mission. A presenter in a 2016 NAS workshop on Principles and Obstacles for Sharing Data from Environmental Health Research stated more directly that “for environmental policy making to be legitimate, the scientific reasoning behind a given decision—including the data supporting it—must be transparent” (NAS Workshop Report²³⁵⁵). When data are widely available, researchers can validate research results and help identify and correct unintended errors, as well as reanalyze the data for new and different purposes, examine novel questions, provide new scientific insights, and improve model development.

3.1.5 Replication-Specific Comments

3.1.5.1 Replication Is Primarily Limited to Laboratory Studies

Comment: Commenter (9227) states that “replicating findings” is essentially limited to laboratory animal and randomized controlled trials and does not capture the vast majority of human epidemiological studies. The commenter reports that even in laboratory experiments, replication can be difficult due to uncontrolled factors like genetic drift in cell lines and animal strains. According to the commenter, if you do have replicate studies and one has a positive finding and another has a negative finding, there would have to be additional criteria used to determine which study was correct; thus, a failure to replicate should not immediately lead to the conclusion that there is no effect. The commenter asserts that rather than replicating a study, it is far better to develop a better study that replicates the results while providing greater insight into the basis underlying any toxicity.

Response: In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.”

²³⁵⁴ The National Academies of Sciences workshop on Reproducibility and Replicability in Science defines “reproducibility” to mean the extent to which a researcher can obtain consistent computational results using the same input data, computational steps, methods, code, and conditions of analysis. The use of “reproducibility” by the National Academies of Sciences is consistent with the intent of the use of “independent validation” in this rule.

²³⁵⁵ NAS (National Academies of Sciences, Engineering, and Medicine). (2016). Principles and obstacles for sharing data from environmental health research: Workshop summary. Washington, DC: The National Academies Press. Available at <https://doi.org/10.17226/21703>

In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.”

3.1.5.2 Replicability Is Not Always Possible

Comment: Commenters (0563, 0671, 1335, 1346, 1364, 1385, 1409, 1481, 1486, 1973, 1999, 2004, 4845, 4848, 4933, 5164, 6046, 6105, 6111, 6114, 6116, 6125, 6127, 6130, 6131, 6132, 6133, 6144, 6153, 6158, 6170, 6196, 6351, 6450, 6932, 6939, 6864, 6874, 6876, 6880, 6895, 6909, 6915, 6916, 6924, 8272, 8801, 9227) that oppose the proposal and report that the replication of studies is not always possible.

3.1.5.2.1 One-Time Events (Accidents, Disasters)

Comment: Commenters (0559, 0563, 1335, 1364, 1385, 1409, 1999, 4840, 5164, 6111, 6114, 6116, 6153, 6158, 6450, 6880, 6924, 6932) provide that it would be unrealistic and unethical to replicate exposure conditions of one-time events (accidents, disasters) that many public health studies have been based on. Most of these commenters also state that not being able to replicate a study because of does not invalidate the scientific research.

Commenter (0563) states that a common objection is that “many public health studies cannot be replicated, as doing so would require intentionally and unethically exposing people and the environment to harmful contaminants or recreating one-time events (such as the Deepwater Horizon oil spill).” According to the commenter, what needs to be replicable in studies of such events are not the events themselves, but the procedures used to collect and analyze data and make inferences from them. The commenter provides that, for a study that used tree-rings as proxy temperature measurements, no one needed to use a time machine to return to the 11th through 20th centuries and regrow trees to recognize that the authors had committed confirmation fallacy by excluding certain data and misused a statistical procedure, resulting in false results. The commenter states that all anyone needed was access to the raw data and the computer code used to analyze it.

Commenter (1409) states that the requirement for replicability could proscribe the use of studies of real-time science during environmental disasters, such as toxic spills, since it would be both unethical and infeasible to replicate such studies.

Commenter (6111) asserts that in some circumstances it would be inhumane, immoral, or physically impossible to replicate studies since some studies involve natural disasters, or one-time events and cannot be reproduced or replicated.

Commenter (6450) provides that many real-world field studies cannot be realistically or ethically replicated because doing so would require recreating unique events or exposing populations to hazardous situations and materials.

Commenters (0563, 1335, 1385, 1364, 1999, 4840, 5164, 6111, 6114, 6116, 6153, 6158, 6450, 6880, 6924, 6932) provide the following examples of one-time events (accidents, disasters) that would be unrealistic and unethical to replicate:

- Studies of Hiroshima and Nagasaki survivors that underlies the SDWA radionuclides regulation. (6111)
- Studies based on the massive oil leak at Deepwater Horizon. (0563, 1385, 5164, 6111, 6158, 6450, 6924)
- Wildfire in the Great Smoky Mountains National Park in 2016. (1364)
- Studies of Minamata residents impacted by contaminated wastewater discharged into Minamata Bay. (6153)
- September 11, 2001 World Trade Center disaster. (6120, 6915, 8913)
- The 1979 Three Mile Island accident. (1335, 6450)
- Hurricanes. (6120, 6915, 8913)
- Studies look at health impacts on people exposed to high levels of smoke from wildfires. (6114)
- The Flint water crisis. (6450)

Response: In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.”

3.1.5.2.2 Exposure Conditions No Longer Exist and Would Be Unethical to Replicate

Comment: Commenters (6111, 6133, 6153, 6170, 6939, 6450, 6153, 6874, 6932, 6939, 8272) contend that in some cases, the original studies cannot be replicated because the exposure conditions no longer exist and/or would be unethical to replicate. Commenter (6111) states that in some circumstances it would be inhumane, immoral, or impossible to replicate studies since some studies involve exposures and conditions that no longer exist and cannot be reproduced or replicated. According to the commenter, such incidents could not be replicated from practical, safety, or ethical points of view, yet the information they provide regarding real time exposure and dose-response interactions is invaluable. Commenter (2004) states that, while many environmental studies cannot be morally or ethically repeated due to further harm to people, these studies are peer reviewed to ensure that the results are both objective and accurate.

Commenters (5178, 6874, 6939, 8272) state that knowledge about impacts of neurotoxicants has often begun with findings of severe impacts in groups exposed to abnormally high levels of a substance – such as developmental delays in babies born to mothers who ate seafood from mercury-contaminated Minamata Bay¹⁷ – and then progressed over future decades as researchers have identified subtler impacts at lower exposure levels.¹⁸ The commenters add that studies that rely on health effect data from “natural experiments,” such as those experienced by Minamata residents because of the contaminated wastewater discharged into Minamata Bay, cannot ethically be replicated and may not have publicly available data, but should not be disregarded given that they can serve as an early signal of the need for regulation.

Commenters (6153, 6939) state that studies that rely on health effect data from “natural experiments,” cannot ethically be replicated and may not have publicly available data but should not be disregarded given that they can serve as an early signal of the need for regulation.

Commenters state that knowledge about impacts of neurotoxins has often begun with findings of severe impacts in groups exposed to abnormally high levels of a substance.

Commenter (6170) provides that the exposures that environmental and occupational epidemiologists investigate are, by definition, considered potentially toxic to humans and thus can and should not be tested experimentally on humans.

Commenters (6111, 6450, 6153, 6932) provide the following examples of studies/exposure conditions of studies that would be unethical to replicate:

- Studies of the effects of lead from 1970s, when blood lead levels were higher than they are now. (6111)
- Studies of worker exposure to polychlorinated biphenyls (PCBs) before PCBs were banned; these studies formed the basis of water quality standards for PCBs under the Clean Water Act (CWA). (6111)
- Long-term cohort studies of benzene exposure in workers which formed the basis of EPA's 2007 CAA regulation for emissions of hazardous air pollutants from mobile sources. (6111)
- Studies that analyze the health impacts resulting from asbestos exposure, exposure to Dichloro-diphenyl-trichloroethane (DDT), and birth defects caused by thalidomide. (6450)
- Studies of developmental delays in babies born to mothers who ate seafood from mercury-contaminated Minamata Bay. (6153)
- The chlorpyrifos risk assessment relied on an epidemiological study that was done while chlorpyrifos was still allowed for household use; this study could not be repeated today, as indoor use of chlorpyrifos is no longer allowed in the U.S. (6133, 6932)

Commenter (1335) states that knowingly allowing similar conditions to continue in spite of the broad consensus of scientists - or promoting rules that would permit the return of similar situations - would be downright murderous.

Commenter (6133) states that the mercury EPA Reference Dose (RfD) is based on recommendations of the National Research Council (NRC) of the NAS, that conducted an extensive analysis and calculations derived from three longitudinal epidemiologic studies: the Seychelles Islands, the Faroe Islands, and the New Zealand studies.²³⁵⁶ The commenter states that the use of these studies to set EPA exposure limits was the result of a years-long transparent process of expert scrutiny, public engagement, inter-agency cooperation, and publication in scientific journals. The commenter notes, however, the studies can no longer be reproduced, particularly the Faroe Islands study in which the exposure to the community was a result of eating whales, a practice that has since declined due to public alerts about the hazards of eating the mercury-tainted meat particularly for children and pregnant and breastfeeding women. The commenter adds that it would take decades to repeat the studies, which took decades to conduct

²³⁵⁶ Rice DC. The US EPA reference dose for methylmercury: sources of uncertainty. Environ Res. 2004 Jul;95(3):406-13. <https://www.ncbi.nlm.nih.gov/pubmed/15220074>.

in the first place. According to the commenter, EPA estimates that more than 75,000 newborns each year may have increased risk of learning disabilities associated with in-utero exposure to methylmercury, based on maternal blood levels exceeding the EPA RfD.

Response: In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.”

3.1.5.2.3 Long Term Epidemiological Studies

Comment: Commenters (0559, 6170, 6880, 6895, 6932, 8801, 9227) assert that long term epidemiological studies cannot be replicated because the temporal exposure conditions of the studies and other variables (e.g., population exposed) would be impossible to replicate. Commenters generally state that epidemiological studies are scientifically rigorous/valid studies.

- Commenter (6880) provides that these long-term studies involve a specific mix of individuals with their own medical histories and chemical exposures (e.g., National Institute of Health’s (NIH’s) Agricultural Health Study) that is not replicable.
- Commenter (6932) states that restricting studies that are not “replicable” is shortsighted because longitudinal epidemiological studies are a primary example of scientific studies that can be scientifically rigorous but are not replicable.
- Commenter (6170) states that by disqualifying high quality longitudinal epidemiological and clinical studies - often the most direct and relevant evidence of chemical impacts on humans - the proposed rule would diminish not strengthen the science underlying regulations.
- Commenter (6170) states that observational epidemiology studies are the only possible setting to gain knowledge about the potential of many agents in the most relevant population: in humans.
- Commenter (8801) states that on moral, ethical, and legal grounds, it is impossible to intentionally expose humans to known or suspected harmful substances; however, it would be absurd for EPA to argue that these types of epidemiological studies should not be considered when developing policies that affect the health of millions of Americans.
- Commenter (9227) notes that in environmental epidemiology, randomized control trials are not feasible or ethical, and replication of observational studies is virtually impossible since it is not possible to create the same conditions as seen in the original study.

Commenter (6895) generally supports the need for replication but states that in terms of epidemiology, replication does not require that every piece of data be available. Rather, based on the principles of scientific research, replicability is achieved when links between environmental pollutants and differing populations are seen in multiple studies by the same or different investigators.

Response: In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.”

3.1.5.2.4 Need to Protect Individual Medical Records/Information and Confidential Business Information

Comment: Commenters (4845, 6116, 6130, 6170, 6450) provide that studies may not be able to be replicated due to ethical and legal reasons protecting individual medical records/information and confidential business information (CBI):

- Privacy protections will often block release of individual medical records, especially for epidemiology and other studies of human cohorts. (4845)
- Industry-conducted studies may contain CBI required to be withheld by law. (4845)
- Studies that contain confidential business information, such as product formulations. (6116)
- The original raw data must be withheld to comply with ethical and legal requirements of epidemiological research (e.g., requirements of an Institutional Review Board (IRB) and/ or the Health Insurance Portability and Accountability Act of 1996 (HIPAA)). (6130, 6450)
- IRBs do not allow for such data to be made publicly available. (6170)

Commenter (6116) states that many studies performed using data from industrial sources would be excluded because they contain CBI. The commenter provides that, under federal law, there are criminal penalties for disclosing CBI – a serious risk of liability for EPA that the agency does not address except to say generically that all such laws will be followed, without demonstrating how compliance will be achieved in tandem with making research data publicly available.

Response: In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” The final rule does not require EPA to obtain, store or disclose dose-response data underlying pivotal science used by the Agency.

3.1.5.2.5 Old Data May No Longer Be Available

Comment: Commenters (6130, 6450) provide that studies may not be replicable because the data may no longer be accessible.

Commenter (4845) reports that, for older studies predating digital technology, retrieving full study records may be difficult or impossible, making it impossible to replicate a study.

Response: In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.”

In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.”

3.1.5.3 Replication of Studies Would be Burdensome

Comment: Commenters (1481, 4848, 4933, 6116, 6127, 6153, 6874, 8272) express concern that replication of studies would be prohibitively expensive and time consuming.

Commenter (1481) states that the required replication of data and longitudinal studies, while worth pursuing and funding, would take decades to confirm results which currently point out significant and likely threats to public health, resulting in preventable danger to and increased health costs to the public. The commenter asserts that seeking to increase replication and longitudinal studies is an excellent goal which should be accomplished through earmarked funding rather than standards which cannot efficiently serve Americans.

Commenter (4848) asserts that EPA is not and has never been in the regular business of replicating studies. The commenter reports that the timing and the cuts in EPA funding makes replicating studies (as a condition of promulgating regulations) an impossibility.

Commenter (4933) reports that the very nature of longitudinal public health studies where health and toxins intersect are by design, large, expensive and require years or decades before results are found. The commenter provides that sample sizes can often number in the tens of thousands to millions of data points and may need to be collected over many years before a statistically significant finding is identified. According to the commenter, because these studies are so big, they are often too expensive to repeat. The commenter asserts that this transparency rule would destroy the confidential nature of research and make the burden of conducting research more difficult and expensive.

Commenters (6153, 6874, 6916, 8272) cite (in part or in total) that in a look back at the evolution of research on the health effects of particulate pollution, lead *Harvard Six Cities* investigator Douglas W. Dockery commented:

True replication requires not reanalyzing existing work but independent investigators producing independent data. The *HEI* process made important contributions in evaluating, advancing, and applying new methods which led to significant additional analyses. But the *HEI* work reanalyzing an existing body of evidence was time consuming and expensive. It would not be a good use of resources to require this approach for all studies contributing to the regulatory actions, or even to a few key studies.

Response: In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.”

3.1.5.4 Other Comments Regarding Replicability

3.1.5.4.1 Public Health/Precautionary Principle Relies on More than Data that can be Replicated

Comment: Commenter (8276) states that the protection of public health relies on more than data that can be replicated. The commenter reports that local health departments are obliged to employ the precautionary principle, which asserts that when health or safety is threatened, preventive steps must be taken even in the face of scientific uncertainty. The commenter asserts that the proposed rule will only perpetuate barriers to the protection of public health. The commenter describes three environmental issues which occurred in Los Angeles County where the *Department of Public Health (DPH)* demonstrated the need to exercise the precautionary principle:

1. In response to a natural gas leak, *DPH* ordered the temporary relocation of over 11,000 residents that were experiencing symptoms, largely related to the sulfur odorants. Available health studies on human exposures to complex mixtures of oil and gas were lacking and insufficient to guide public health interventions. In a major oil or gas release, where toxicity information may be vital yet lacking, action based on the precautionary principle may be the only option to protect the health of nearby residents.
2. The Exide Battery Recycling Plant released harmful toxins, including lead and arsenic, into the surrounding communities for decades. These emissions contaminated the soil of homes across Los Angeles and increased the risk of cancer, respiratory diseases, and learning disabilities in affected families. *DPH* immediately stepped into action and could not wait for the State's large-scale, time-consuming approach to soil sampling to be complete. This experience demonstrated the continued need for *DPH* to make critical program decisions in the absence of complete environmental data.
3. In recent years, *DPH* has responded to an increasing number of community complaints of odors and noise surrounding oil and gas drilling facilities near homes and schools. Peer-reviewed literature remains largely inconclusive regarding health risks of living close to oil and gas operations; however, *DPH* has documented symptoms, such as headaches, nausea, and respiratory irritation, among residents near oil drilling sites. In two cases, *DPH* acted to reduce exposures and associated impacts in the adjoining community.

Response: In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.”

3.1.5.4.2 Issue of Replicability Not Resolved by Making Data Publicly Available

Comment: Commenter (6046) argues that, to assume that just by making data publicly available issues of replicability will be solved is simplistic and a false assumption. The commenter reports

that it may often take researchers with expertise in certain statistical methods and having the appropriate statistical software to do so. According to the commenter, epi analyses may need to evaluate complex inter-relationships between variables using time-series, regression, Markov Chain Monte Carlo, Bayesian analysis, and other techniques. The commenter reports that, in contrast, analysis of non-epi datasets typically is completed using summary statistics, and perhaps basic methods to analyze associations between two variables in which case confidential data is more easily removed without affecting the analysis.

Response: In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.”

3.1.5.4.3 Use of Complex Tools and Materials in Science Can Make Replicability of Studies Infeasible

Comment: Commenter (8913) states that many avenues of inquiry which advance modern science use complex tools and materials (like human cell culture models and specially engineered animals) which are not feasibly replicable.

Response: In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.”

3.1.6 Reproducibility – Specific Comments

3.1.6.1 Reproducibility Is Not Always Possible

3.1.6.1.1 Reproducibility as a Standard is Difficult (and Sometimes Impossible)

Comment: Commenter (6144) states that reproducibility as a standard is difficult, and sometimes impossible, to uphold for many types of studies that are done in the environmental health field and that requiring reproducibility is inconsistent with provisions in the *OMB Guidelines* or *Information Quality Guidelines*.

Commenter (6915) states that, to the extent the proposal seeks to enable third parties to “re-run” an analysis using the same supporting data and the same models, this may not be possible where proprietary models, methods, designs, and/or data were used in the study. The commenter reports that, as EPA points out, based on the *Information Quality Guidelines*, in cases where the Agency relies on proprietary models that cannot be made publicly available, the model applications are subject to EPA’s peer review policy and other validation checks. The commenter provides that the *Information Quality Guidelines* indicate that “[t]hese steps, along with transparency about the sources of data used, various assumptions employed, analytic methods applied, and statistical procedures employed should assure that analytic results are ‘capable of being substantially reproduced.’”

Commenter (6362) states that it is unclear what constitutes a reproducible versus a non-reproducible finding. The commenter asserts that it is important to consider that there are different types of reproducibility, such as methods reproducibility, results reproducibility, and reproducibility of conclusions. The commenter reports, for example, *OMB's Information Quality Guidelines* define “capable of being substantially reproduced” as “independent reanalysis of the original or supporting data using the same methods would generate similar analytical results, subject to an acceptable degree of imprecision.” According to the commenter, however, the inability to reproduce research studies can be related to issues of study design, variability or differences in biological test systems, data integrity, data analyses, and in some cases, scientific misconduct. The commenter asserts that new or novel findings that purport to indicate effects that have little or no biological basis, based on the weight of the evidence coupled to first principles of relevant scientific disciplines, should be subjected to suitable reproducibility requirements, which could include causal analytics.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not used in this final rule.

This final rule establishes how the Environmental Protection Agency (EPA) will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA reproduce or evaluate the reproducibility of a dose-response data.

3.1.6.1.2 Examples Where Reproducibility Is Not Always Possible

Comment: Similar to concerns expressed by many commenters regarding replicability, several commenters (1346, 3131, 4840, 4844, 5170, 6109, 6120, 6144, 6133, 6196, 6868, 6915, 8913) oppose the proposal and assert that the reproduction of studies is not always possible. These commenters generally argue that, while many environmental studies simply cannot or should not be reproduced, the studies provide key insights that should be taken into consideration.

One-Time Events

Commenter (5170) expresses concern that, while emergency events are essentially not reproducible, the information that is gained from studying these events is incredibly valuable to understanding the health impacts of environmental emergencies as well as non-emergency emissions and discharges.

Commenters (0563, 4840, 4845, 5170, 6111, 6114, 6116, 6133, 6144, 6196, 6868, 6915, 6924, 8913) provide the following examples of studies and studied events that are not reproducible or would be unethical to reproduce:

- Unique and catastrophic events, such as the Chernobyl accident. (4840, 6144)
- A steel mill shut down. (6868)
- Natural disasters, power plant closures, changes in traffic patterns during events like the Olympic games. (6868)
- Deepwater Horizon. (0563, 4840, 6111, 6924)
- Studies attempting to capture the impacts of one-time events like spills or plant explosions. (4845)
- Emergency events. (5170)
- Oil spill or volcanic eruptions. (5170)
- High levels of smoke from wildfires or high levels of chemicals resulting from industrial accidents or exposures. (6114, 6116)
- Katrina pollutant disaster, the Hurricane Harvey-related toxic chemical discharges, and the Church Rock uranium mill spill. (8913)

Exposure Conditions No Longer Exist and would be Unethical to Reproduce

Commenters (3131, 6133, 6874, 6932, 6939, 8272) provide the following examples of studies and exposures that would be unethical and immoral to reproduce:

- Public health studies that would subject participants to risk cannot and should not be reproduced. (3131)
- Poor air quality conditions experienced in the past. (6133)
- Epidemiologic studies²³⁵⁷ of chlorpyrifos can no longer be reproduced. (6133, 6932)
- The Mercury EPA Reference Dose (RfD) is based on recommendations of the National Research Council (NRC) of the NAS, that conducted an extensive analysis and calculations derived from three longitudinal epidemiologic studies: the Seychelles Islands, the Faroe Islands, and the New Zealand studies.²³⁵⁸ The commenter states that the use of these studies to set EPA exposure limits was the result of a years-long transparent process of expert scrutiny, public engagement, inter-agency cooperation, and publication in scientific journals. The commenter notes, however, the studies can no longer be reproduced, particularly the Faroe Islands study in which the exposure to the community was a result of eating whales, a practice that

[103] U.S. EPA, Memorandum: Chlorpyrifos: Revised Human Health Risk Assessment for Registration Review, Nov. 3, 2016, Docket ID No. EPA-HQ-OPP-2015-0653-0454.

²³⁵⁸ Rice DC. The US EPA reference dose for methylmercury: sources of uncertainty. *Environ Res*. 2004 Jul;95(3):406–13. <https://www.ncbi.nlm.nih.gov/pubmed/15220074>.

has since declined due to public alerts about the hazards of eating the mercury-tainted meat particularly for children and pregnant and breastfeeding women. The commenter adds that it would take decades to repeat the studies, which took decades to conduct in the first place. According to the commenter, EPA estimates that more than 75,000 newborns each year may have increased risk of learning disabilities associated with in-utero exposure to methylmercury, based on maternal blood levels exceeding the EPA RfD. (6133)

- Knowledge about impacts of neurotoxicants has often begun with findings of severe impacts in groups exposed to abnormally high levels of a substance – such as developmental delays in babies born to mothers who ate seafood from mercury-contaminated Minamata Bay¹⁷ – and then progressed over future decades as researchers have identified subtler impacts at lower exposure levels.¹⁸ Studies that rely on health effect data from “natural experiments,” such as those experienced by Minamata residents because of the contaminated wastewater discharged into Minamata Bay, cannot ethically be replicated and may not have publicly available data, but should not be disregarded given that they can serve as an early signal of the need for regulation. (6874, 6939, 8272)

Observational Research

Commenter (6117) states that “methods reproducibility” may be realistic for laboratory-based studies, where it is possible to implement the exact experimental and computation procedures with the same (or very similar) tools to obtain the same results. However, according to the commenter, new clinical or environmental studies may use procedures that are closely matched, but not identical, to previous evaluations. The commenter reports that when it comes to observational research, it is well known that some weaknesses are unavoidable. The commenter explains that it is often difficult to eliminate all potential sources of confounding, or to adjust for the same confounders, across studies from different time periods. The commenter asserts that therefore, it would be unfair to argue that all aspects of a study, including the design and analyses characteristics, need to be reproduced exactly.

Need to Protect Individual Medical Records/Information

- Exposing the identities of participants in the interest of full transparency would be unethical (3131).
- Researchers cannot ethically randomize people to harmful exposures in order to tackle confounding, nor violate informed consent agreements that prohibit open sharing of private data from past studies (6133).
- Commenter (3131) states that failing to utilize data gathered in responsible studies of health records of anonymous participants would be unethical.

Old Data May No Longer Be Available

Commenters (6196) provide that in some cases data is unavailable because the data is old and predates digital technology where retrieving full study records may be difficult or impossible.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA reproduce or evaluate the reproducibility of a dose-response data.

3.1.6.2 Comments Supporting Reproducibility as Described in the Proposal

3.1.6.2.1 Recent EPA Action(s) Support the Need for the Proposal

Comment: Commenter (6366) states that recent EPA action on the retrospective review of the *Lead Renovation, Repair and Painting Program* further reinforces the need for these actions. The commenter reports that, in finalizing the review, EPA claimed a new economic analysis had been completed, yet the data provided cannot be reproduced and is insufficient to fully evaluate the decisions EPA made. The commenter states that because all of the data used to conduct EPA’s analysis has not been transparently presented in the associated docket, stakeholders have been unable to fully evaluate the report’s underlying economic claims or their resulting impact on the review’s conclusion. According to the commenter, this creates continuing challenges for stakeholders as they seek to work with EPA to ensure the program is effective and robust and that all impacts on small entities have accurately been taken into consideration.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA reproduce or evaluate the reproducibility of a dose-response data.

3.1.6.2.2 Inability to Reproduce 2010 IRIS Assessment of Formaldehyde

Comment: Commenter (6369) states that transparency, reproducibility and application of current scientific knowledge are paramount to providing the foundation required for sound regulation. The commenter reports that, using the data obtained from the *National Cancer Institute* (NCI), in combination with data provided in the draft 2010 *Integrated Risk Information System* (IRIS) assessment for formaldehyde, further detailed analyses were conducted to validate pivotal scientific findings used by EPA's IRIS program to draw conclusions. The commenter provides that the results have been found to disagree with the original study findings and/or the findings cannot be replicated due to methodological issues.

Commenter (6369) states that, using the data obtained from NCI, in combination with data provided in the draft 2010 IRIS assessment for formaldehyde, further detailed analyses were conducted to validate pivotal scientific findings used by EPA's IRIS program to draw conclusions.²³⁵⁹ The commenter notes that the results have been found to disagree with the original study findings and/or the findings cannot be replicated due to methodological issues. The commenter presents the following examples:

- Mundt et al.²³⁶⁰ conducted additional and refined analysis on the underlying data from the Zhang et al. (2010) study provided by NCI and relied upon in the IRIS assessment to identify formaldehyde as a leukemogen. The Mundt et al. analysis found no association between individual formaldehyde exposure estimates and frequency of aneuploidy, which the original study authors suggested were indicators of myeloid leukemia risk.
- Checkoway et al.²³⁶¹ sought to replicate the findings reported by Beane Freeman et al. (2009) using the underlying data provided from NCI via the technology transfer agreement. The findings from this re-analysis failed to support the original study hypothesis that formaldehyde causes acute myeloid leukemia. Specifically, the results indicated that acute myeloid leukemia was unrelated to "peak" or any other formaldehyde metric including the conventional cumulative exposure.

²³⁵⁹ Mundt, K., Gallagher, A., Dell, L., Natelson, E., Boffetta, P., and Gentry, R. 2017. Does occupational exposure to formaldehyde cause hematotoxicity and leukemia-specific chromosome changes in cultured myeloid progenitor cells? *Critical Reviews in Toxicology*, 47(7): 592-602. Checkoway, H., Dell, L.D., Boffetta, P., Gallagher, A.E., Crawford, L., Lees, P.S., and Mundt, K.A. 2015. Formaldehyde exposure and mortality risks from acute myeloid leukemia and other Lymphohematopoietic Malignancies in the US National Cancer Institute cohort study of workers in Formaldehyde Industries. *Journal of Occupational and Environmental Medicine*, 57(7): 785-794. Van Landingham, C., Mundt, K. A., Allen, B. C., and Gentry, P. R. 2016. The need for transparency and reproducibility in documenting values for regulatory decision making and evaluating causality: The example of formaldehyde. *Regulatory Toxicology and Pharmacology*, 81: 512-521

²³⁶⁰ Mundt, K., Gallagher, A., Dell, L., Natelson, E., Boffetta, P., and Gentry, R. 2017. Does occupational exposure to formaldehyde cause hematotoxicity and leukemia-specific chromosome changes in cultured myeloid progenitor cells? *Critical Reviews in Toxicology*, 47(7): 592-602.

²³⁶¹ Checkoway, H., Dell, L.D., Boffetta, P., Gallagher, A.E., Crawford, L., Lees, P.S., and Mundt, K.A. 2015. Formaldehyde exposure and mortality risks from acute myeloid leukemia and other Lymphohematopoietic Malignancies in the US National Cancer Institute cohort study of workers in Formaldehyde Industries. *Journal of Occupational and Environmental Medicine*, 57(7): 785-794.

- Van Landingham et al.²³⁶² conducted an independent analysis of the dose-response models used by the IRIS program in its chemical assessment of formaldehyde, relying upon the documentation provided in the IRIS assessment. The authors specifically noted that the documentation of the methods applied by EPA lacked sufficient detail for duplication of the risk estimates. This lack of transparency and detail could potentially result in different estimates of risks.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA reproduce or evaluate the reproducibility of a dose-response data.

3.1.6.3 Comments Opposing Reproducibility as Described in the Proposal

3.1.6.3.1 Reproducing Effects in Multiple Studies versus Reproducing a Particular Study

Comment: Commenter (9227) asserts that reproduction does not enhance transparency. The commenter reports that the majority of research on the health effects of environmental hazards fall into this category. According to the commenter, a series of studies that address the same hypothesis and give the same basic result does indeed strengthen findings of toxicity. The commenter states that an example of how a study is reproduced is the *Harvard Six Cities* and *ACS CPSII* studies on mortality that were published in 1993 and 1995, respectively.^{2363,2364} The commenter provides that the investigators of the *Harvard Six Cities* study, along with others, reproduced their finding in a separate assessment of the association between fine particle levels and mortality.

²³⁶² Van Landingham, C., Mundt, K. A., Allen, B. C., and Gentry, P. R. 2016. The need for transparency and reproducibility in documenting values for regulatory decision making and evaluating causality: The example of formaldehyde. *Regulatory Toxicology and Pharmacology*, 81: 512-521

²³⁶³ Dockery DW, Pope III CA, Xu X, Spengler JD, et al. 1993. “An Association between Air Pollution and Mortality in Six U.S. Cities.” *N Engl J Med*. 329:1753-1759.

²³⁶⁴ Pope III CA, Thun MJ, Namboodiri MM, Dockery DW et al. 1995. “Particulate Air Pollution as a Predictor of Mortality in a Prospective Study of U.S. Adults.” *Am J Respir Crit Care Med*. 151: 669-674.

Commenter (9227) states that reproducing effects in multiple studies that are not identical is the basis for almost all scientific decisions on environmental issues and should be the focus of the EPA's approach to regulatory science.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: "data," "dose-response data," "independent validation," "influential scientific information," "pivotal science," "publicly available," "reanalyze," "science that serves as the basis for informing a significant regulatory action," and "significant regulatory actions." The terms "pivotal regulatory science", "replication", "reproducible", and "research data" are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA reproduce or evaluate the reproducibility of a dose-response data.

3.1.6.3.2 Articles Cited by the Proposal as Supporting Reproducibility Do Not Support Proposal

Comment: Commenter (6916) states that the articles the Agency cites on the reproducibility of studies do not support its Proposal, and EPA does not explain why it thinks they do. The commenter reports that at least one of the cited articles, by Steven Goodman²³⁶⁵, is entirely irrelevant - it does not demonstrate that there is a problem with the reliability of science in support of Agency decision making, nor does it attempt to; rather, it discusses the confusion in the lexicon about reliability, and attempts to more properly define the term "reproducibility."

According to the commenter (6916), the industry-funded *Mercatus Center* paper cited by the Agency²³⁶⁶ does not support the proposition that it is necessary to limit or forbid EPA's use of scientific studies where the data are not publicly available. The commenter reports that *Mercatus* recommends an avenue for the Agency to follow where there is a need to reproduce or validate study results and the researchers cannot release the underlying data, but the "[A]gency still believes that relying on the results of the study is warranted." Commenter states that, in that situation, the paper recommends that the Agency would provide a more extensive explanation of why it has "sufficient confidence to use the study."

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: "data," "dose-response data," "independent validation," "influential scientific

²³⁶⁵ Steven N. Goodman, et al., What does research reproducibility mean? 8 *SCI. TRANSLATIONAL MED.* 341 (June 1, 2016).

²³⁶⁶ Randall Lutter & David Zorn, *Mercatus Center*. "On the Benefits and Costs of Public Access to Data Used to Support Federal Policy Making", at 32 (Sept. 2016). 66 Id. at 32-33.

information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA reproduce or evaluate the reproducibility of a dose-response data.

3.1.6.4 Reproduction of Studies Would be Burdensome

Comment: Commenter (1346) states that some studies, especially in public health, are so large and long-term that they could not realistically be repeated and, even if they could be repeated, doing so would delay whatever decisions hinge on them by decades or more, potentially risking the health and lives of millions of people.

Commenter (4840) states that, while in theory most studies could be reproduced, they rarely are because it is a waste of resources. The commenter provides that the scientific enterprise involves approaching the same question in different ways to determine if the results support each other.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA to reproduce or evaluate the reproducibility of a dose-response data.

3.1.6.5 Other Comments Regarding Reproducibility

3.1.6.5.1 Standards for Research Reproducibility

Comment: Commenters (5015, 6117) request and suggest recommendations for study reproducibility standards/framework be established.

Commenter (6117) states that, although the proposed regulation outlines the importance of “reproducibility”, it does not provide a framework for how the reproducibility of an individual study can or should be assessed.

Commenter (6117) asserts that it is important to have a clear understanding of research reproducibility, so that different standards (i.e., “case-by-case” decisions) are not applied to individual studies. The commenter suggests there are three key areas of reproducibility:

1. Methods reproducibility
 - This is when a study provides enough information about the experimental and/or computational procedures so that future authors can repeat the study using the same data to obtain the same results.
2. Results reproducibility
 - This is when a new study produces corroborating results using experiment methods that are closely matched to a previous study.
3. Inferential reproducibility
 - This is when a new study draws qualitatively similar conclusions from either an independent replication or re-analyses.

Commenter (5015) states that reproducibility is a critical challenge for science: can the results of an important study be reproduced? The commenter suggests that the most effective way to test the reproducibility and validity of scientific results is not necessarily to simply reproduce the same results in the same data sets --because that also reproduces all the weaknesses and limitations of the original study. According to the commenter, it is most important to answer the following questions:

Are the results consistent when tested in other independent studies...

- That use new and different data not affiliated with the original studies?
- Have different investigators applying the same and/or alternative statistical techniques?
- And test the sensitivity of the results against a wide range of possible other explanations, e.g. smoking behavior, socioeconomic status, access to medical care, and more.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information, the EPA will give greater consideration to studies where the underlying

dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA to reproduce or evaluate the reproducibility of a dose-response data.

3.1.6.5.2 “Reproduced” Epidemiological Study Results

Comment: Commenter (6915) states that, in contrast to the controlled conditions of animal studies, there is more variability among humans than the strains of lab animals and the exact underlying conditions of human studies can rarely be exactly replicated even when the same protocols are followed. The commenter concludes that even a contradictory result in a “reproduced” epidemiological study would not necessarily invalidate an observation from an earlier study, provided that the first study followed valid methods and conducted appropriate statistical analyses.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA to reproduce or evaluate the reproducibility of a dose-response data.

3.1.6.5.3 “Reproduced” Associations/Findings

Comment: Commenter (9227) states that a large body of literature shows that the association of fine particle pollution and mortality has been reproduced in different populations across the globe, over different periods of time, contexts and using different methods. The commenter states that it is this accumulation of evidence of reproducible effects in multiple studies that is critical in determination of causality and validation of an effect and is already an integral part of the EPA process of supporting causality.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA to reproduce or evaluate the reproducibility of a dose-response data.

Comment: Commenter (1346) states that, while not all studies are fully reproducible, we can replicate the results using those data anyway or can use other methods to analyze those data and compare the results.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science”, “replication”, “reproducible”, and “research data” are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA to reproduce or evaluate the reproducibility of a dose-response data.

3.1.7 Replication (or Reproduction) Crisis

3.1.7.1 Replication (or Reproduction) Crisis

Comment: Commenters (0039, 0563, 0844, 1486, 2850, 4541, 6867, 6921) refer to a replication (or reproduction) crisis as evidence that supports the need for the proposed rule.

Commenter (0563) states that the rule is important to the integrity of EPA regulations because of a widely recognized crisis: scientific studies, including those subjected to peer review, frequently are found to be irreproducible or to have false findings because they fail to meet high standards for data archiving, valid statistical analysis, experiment procedures, and other elements of valid research.

Commenter (0039) supports the EPA’s prioritization of the application of reproducibility reforms in the area of dose-response regulation. The commenter states that many supposedly scientific results cannot be reproduced in subsequent investigations. The commenter expresses support for the EPA choosing to address concerns about the irreproducibility crisis of modern science. The commenter refers to a report they have written on how the improper use of statistics, arbitrary research techniques, lack of accountability, political groupthink, and a scientific culture biased

toward producing positive results together have produced a reproducibility crisis that afflicts a wide range of scientific and social-scientific disciplines, from epidemiology to social psychology.²³⁶⁷ The commenter recommends extensive changes to scientific procedures and to the way government judges the science it uses to make policy--including measures such as the proposed rule, to require that government make policy only based on scientific research whose data and procedures are available for other scientists to reproduce. According to the commenter, the larger concerns about reproducibility suggest that this measure should be applied generally within the EPA and across the Federal Government.

Commenter (0844) states that science should be reproducible to be reliable. The commenter cites a February 22, 2017 *British Broadcasting Corporation (BBC) News* report [no other citations], “Most scientists can’t replicate studies by their peers,” that recounted that, “more than two-thirds of researchers have tried and failed to reproduce another scientist’s experiments.” The commenter reports that, according to the article, Dr. Tim Errington, who runs the *Reproducibility Project* at the University of Virginia, attempted to repeat the findings in five landmark cancer studies but was only able to confirm two of the original studies’ findings. The commenter provides that Dr. Errington said, “it’s worrying because replication is supposed to be a hallmark of scientific integrity.” The commenter states that Dr. Errington’s comment does not just apply to cancer research, it also applies to all research, including environmental and climate studies. The commenter further states that, although the *Union of Concerned Scientists (UCS)* letter argued that some of the studies could not be replicated because it would require “intentionally and unethically exposing people and the environment to harmful contaminants or recreating one-time events,” it is conceivable that most, if not all studies could be replicated in the lab with research animals, since this type of research is conducted all the time, or could be duplicated using other scientific models.

Commenter (1486) states that there is a wealth of publicly available information that documents the pervasiveness of irreproducible studies across the spectrum of scientific disciplines. However, the commenter does not provide any examples but suggests the literature be reviewed. The commenter provides that the public health sciences (particularly epidemiology and toxicology) are a notable segment of that problem but are not the only offenders. The commenter states that recent history shows that some decisions regarding national health policy were made based upon questionable science, have not resulted in the desired outcomes, and have eroded the public's trust in the wisdom of its government.

Commenter (2850) states that, in the last 10 years, a terrible crisis in science has come to light that many published research findings are false. The commenter refers to work conducted by John P.A. Ioannidis.²³⁶⁸ The commenter asserts that it is of the utmost importance that the science used by the government to create regulations is transparent. According to the commenter, the time that politicians and scientists were trusted to have the highest integrity so that the population didn't feel the need to check them is long gone.

²³⁶⁷ David Randall and Christopher Welser. “The Irreproducibility Crisis in Modern Science: Causes. Consequences and the Road to Reform.” (National Association of Scholars: New York. 2018).

²³⁶⁸ John P.A. Ioannidis. *Why Most Published Research is False*, 2 *PLoS Medicine* 0696 (2005)

Commenter (4541) states that EPA’s admitted reliance on “secret science” (science that cannot be properly vetted and evaluated for reliability) occurs at a time when *Nature*, *PLOS*, *Science*, *The Economist*, and others report half or more of published research on public health issues cannot be replicated. The commenter states that this “replication crisis” is genuine, and even more broad and critical than the sources cited by EPA for this proposed Rule are willing to admit. The commenter argues that a scientific publishing industry has been created by lavish government funding of politically directed research. The commenter provides examples as including studies finding a human impact on climate, or an association between ambient small particle and ozone levels in the air and public health. The commenter states that it may take generations before the effects of this scientific misconduct can be overcome.

Commenter (4541) believes that the root cause of EPA’s science malfunction has been corruption of EPA’s peer review process and intentional adoption of scientific methods that exaggerate public health and environmental risks. According to the commenter, peer review for EPA has become “pal review,” with insiders funded by EPA grants reviewing the work of fellow EPA-funded scientists. The commenter believes that both sides of this “crony” arrangement, individuals as well as their institutions, are beneficiaries of millions of dollars in government funding. The commenter states that EPA-sponsored reviewers censure and exclude scientists who disagree with the agency’s reigning political agenda. According to the commenter, that perverts the whole point of peer review, turning it into a tool used to shut out anyone who disagrees instead of a process forcing scientists to defend their work against critics. The commenter provides that the widespread replication crisis is a strong argument for the proposed Rule, since unreliable science has affected most of the world’s leading science journals and professional journals as well as national academies of science. The commenter asserts that it is naïve to think such scientific malfeasance does not impact politically hot subject areas that are also hot spots for generous government.

Commenter (6867) states that in the light of overwhelming evidence that a significant portion of studies published in prominent peer reviewed journals are not reproducible, it is dubious to claim that any research is valid and relevant unless—at a minimum—other researchers and the public have access to the underlying data, methodology, and computational code. The commenter asserts that pre-publication peer review is not an adequate substitute for public availability of data, methodology, and computational code. The commenter reports that, in response to the Proposed Rule, some commenters have suggested the Proposed Rule is an attempt to remove valid and relevant scientific evidence from the rule-making process. According to the commenter, that empirical evidence indicates that peer reviewers routinely fail to identify even major errors. The commenter asserts that peer review in less prominent journals may often occur in name only. Commenter argues that the best available metascience—science about science—indicates that pre-publication peer review is not adequate to ensure the validity of published scientific claims.

Commenter (6867) provides that there is strong evidence of widespread, outcome-altering errors in the computational code underlying many scientific studies. The commenter states that outcome-altering errors in computational code have been suggested as a significant contributor to the replication crisis. The commenter reports that high profile retractions, technical comments, and corrections because of coding errors include papers in prominent journals such as *Science*,

PNAS, the *Journal of Molecular Biology*, *Ecology Letters*, *Journal of Mammalogy*, *Journal of the American College of Cardiology*, *Hypertension*, and *American Economic Review*. The commenter expresses concern with the quality of the following published science:

- 2005, when a study of 45 highly-cited articles in *New England Journal of Medicine*, *JAMA*, and *Lancet* concluded that at least 7 articles (16%) were contradicted by subsequent research and another 7 articles (16%) claimed stronger effects than were supported by subsequent research.²³⁶⁹
- A widely-read essay published later that year suggested that most published research findings are false.²³⁷⁰
- Consistent with that suggestion, *Bayer Healthcare* disclosed in 2011 that 43 (65%) of the company's attempts to reproduce 67 published studies resulted in inconsistent data.²³⁷¹
- In 2012, *Amgen, Inc.*, similarly disclosed that it was only able to reproduce 6 (11%) of 53 studies that the company attempted to confirm.²³⁷²
- Consistent with the Bayer and Amgen disclosures, recent estimates for irreproducibility in preclinical and biomedical research range as high as 90% of that research, even for articles published in high-quality journals.^{2373,2374,2375}
- A recent survey of 804 ecologists and evolutionary biologists found that questionable research practices were widespread, with 64% of surveyed researchers reporting they had at least once failed to report results because they were not statistically significant ("cherry picking"); 42% reporting they had collected more data after inspecting whether results were statistically significant (a form of "p-hacking"); and 51% acknowledging they had reported an unexpected finding as though it was hypothesized from the start.²³⁷⁶
- A 2016 survey by the journal *Nature* found that lack of reproducibility is a widespread concern among scientists.^{2377,2378}

Commenter (6921) states that the Proposed Rule appropriately recognizes the importance of reproducibility, especially given concerns over the "reproducibility crisis" affecting many scientific studies. The commenter believes that EPA's rulemaking and focus on increasing transparency is critical given the significance of EPA's reliance on published research and the magnitude of the potential replication problem. The commenter reports that many researchers believe that the reproducibility of published experiments is the foundation of science. According

to the commenter, Federal policies that exhort transparency but that do not materially affect ongoing practices may be more harmful by giving the appearance of increased transparency without the result.

Commenter (6921) reports that the inability to access underlying research data or models has become a source of increasing concern in the wake of recent reports of high replication failures rates. Commenter states that in 2011, *Bayer HealthCare* in Germany published a report reporting that only about 25 percent of 67 published preclinical studies could be validated to the point at which the projects would continue.²³⁷⁹ Commenter states that one year later, a second pharmaceutical firm, Amgen, found the reported scientific findings could only be confirmed in 6 of 53 studies.²³⁸⁰ Commenter states that in 2016, *Nature* published the results of a survey that found that more than 70 percent of researchers have tried and failed to reproduce another scientist's experiments, and more than half have failed to reproduce their own experiments. Commenter states that, while some level of replication failure can be expected simply based on statistical probabilities, the higher than expected failure rates are of concern especially when considering the use of research studies to support policy decisions.²³⁸¹

Commenter (2169) suggests that reproducibility should be assessed alongside its parallel – the “producibility crisis.” The commenter provides that rather than review and consider studies available to it, the EPA has often swept them aside, failing to consider the legitimate concerns raised by these scientific inquiries. The commenter provides information regarding particulate matter (PM) in six attachments and states that every attempt to get EPA to focus on their concerns regarding PM has been met by resistance or have been simply disregarded by EPA, who continues to rely on the now outdated 2005 PM study. The commenter also reports that a request for a copy of the *Agency for Toxic Substances and Disease Registry (ATSDR)* assessment of a class of toxic chemicals that has contaminated water supplies near military bases, chemical plants and other sites from New York to Michigan to West Virginia was recently denied.

Response: Numerous public commenters on this rulemaking and some members of the EPA's SAB noted concern about a “crisis” in science due to such low reported success rates and noted support for the rulemaking as a potential solution.²³⁸² The EPA agrees with commenters that the low success rates published in reanalysis studies are potentially worrisome and also agrees with the National Academies of Sciences and others that the paucity of full data sharing makes it difficult to even systematically evaluate the extent of the problem within or across scientific disciplines. One barrier is having access to enough of the underlying data, models, and methods to be able to conduct the independent validation. Encouraging greater transparency and data and model sharing, then, is vital for individuals outside of the publication of the study to be able to

²³⁸² Science Advisory Board. (2020). Science Advisory Board Consideration of the Scientific and Technical Basis of EPA's Proposed Rule Titled “Strengthening Transparency in Regulatory Science.” EPA-SAB-20-005. [https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebProjectsCurrentBOARD/2DB3986BB8390B308525855800630FCB/\\$File/EPA-SAB-20-005.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebProjectsCurrentBOARD/2DB3986BB8390B308525855800630FCB/$File/EPA-SAB-20-005.pdf).

verify the quality and strength of published studies and to identify and correct suboptimal research and publication practices, such as positive bias, p-hacking, and post hoc reasoning that may influence the results presented in a publication.^{2383,2384,2385,2386,2387,2388,2389,2390}

The EPA disagrees with commenters who believe the rule is unnecessary because there is little evidence of a widespread reanalysis issue in science. Collectively, evidence from published reanalysis studies, retractions, surveys of scientists, and public commenters provides sufficient evidence that additional policies that remove barriers to data availability and reanalysis and create greater transparency are needed. The EPA's SAB, several public commenters, and authors of peer-reviewed literature have noted that data sharing, like that envisioned under this rulemaking, would strengthen science. The scientific benefits of openness in research are well-recognized.²³⁹¹ Open sharing of data and models reduces duplication of effort from different researchers attempting to collect the same datasets and allows for the use and reuse of data and models among the research community. Scientific openness also improves the ability for the scientific community to validate research results, helping to prevent errors and reducing the risk of fraud in science and research. Also, when data and models are made widely available, researchers can re-analyze the data for new and different purposes, examining novel questions and providing new scientific insights. Some studies indicate that data sharing can actually increase the number of citations by third-party researchers, which can indicate higher influence of the original research.^{2392,2393,2394} Collaboration and communication, both within the scientific

community and between researchers and other organizations or individuals, are also enhanced by sharing of data and models.

3.1.7.2 No Evidence to Support the Existence of a Replication (or Reproduction) Crisis

Comment: Commenters (1589, 6127, 6135, 6137, 6158, 6450, 6924, 6925, 6955, 8771-PH56) report that there is no demonstrated evidence or proposed rule record support indicating the existence of a replication (or reproduction) crisis.

Commenters (1589, 6135, 6137, 6158, 6955, 8771-PH56) state there is no demonstrated “replication crisis” in environmental health.

Commenter (6158) states that, while there is some concern, broadly speaking, that scientific findings are often difficult to replicate, the writers of the proposed rule have made no credible case that this issue is particularly severe within the public health or environmental studies used by the EPA.

Commenter (6135) states that the proposed rule fails to provide any evidence of a replication crisis among the types of studies that have traditionally been used as the basis for air quality regulations.

Commenter (6955) points out that the Agency proposal ties its rationale for the access rule to replication problems identified in some scientific fields but has provided no record of a problem in the fields of environmental studies, chemistry, or biochemistry.

Commenter (6137) states that, while there are discussions within certain scientific fields, such as clinical psychology, about inconsistent results that have been obtained when experiments conducted in those fields are repeated, EPA has not explained why these discussions should cast doubt on the dose-response data or models used by the Agency.

Commenter (8771-PH56) argues that, just because the results of some psychological experiments have proven to be accidental or artifactual does not mean EPA faces any kind of “replication crisis”

Commenter (6924) states that there is no documentation to support that there is a replication crisis related to reanalysis of data.

Commenter (6955) states that this rule would make a radical, broad-brush change in agency policy easily challenged in court, particularly when recommendations for improving reproducibility in the beleaguered fields focus, not on public access of data, but on pre-registration of studies, better use of statisticians, an end to sole reliance on statistical significance and p-values as an indicator of merit, and increased incentives to publish null results – measures that the EPA proposal does not address. The commenter notes that the identified problems will not be solved by post-hoc analysis of a study’s data. In fact, the commenter contends that unless careful concern for post-hoc statistics is made part of the analysis, post-hoc studies in regulatory proceedings will make the chances of reaching a good decision worse.

Response: Numerous public commenters on this rulemaking and some members of the EPA’s SAB noted concern about a “crisis” in science due to such low reported success rates and noted support for the rulemaking as a potential solution.²³⁹⁵ The EPA agrees with commenters that the low success rates published in reanalysis studies are potentially worrisome and also agrees with the National Academies of Sciences and others that the paucity of full data sharing makes it difficult to even systematically evaluate the extent of the problem within or across scientific disciplines. One barrier is having access to enough of the underlying data, models, and methods to be able to conduct the independent validation. Encouraging greater transparency and data and model sharing, then, is vital for individuals outside of the publication of the study to be able to verify the quality and strength of published studies and to identify and correct suboptimal research and publication practices, such as positive bias, p-hacking, and post hoc reasoning that may influence the results presented in a publication.^{2396,2397,2398,2399,2400,2401,2402,2403}

The EPA disagrees with commenters who believe the rule is unnecessary because there is little evidence of a widespread reanalysis issue in science. Collectively, evidence from published reanalysis studies, retractions, surveys of scientists, and public commenters provides sufficient evidence that additional policies that remove barriers to data availability and reanalysis and create greater transparency are needed. The EPA’s SAB, several public commenters, and authors of peer-reviewed literature have noted that data sharing, like that envisioned under this rulemaking, would strengthen science. The scientific benefits of openness in research are well-recognized.²⁴⁰⁴ Open sharing of data and models reduces duplication of effort from different researchers attempting to collect the same datasets and allows for the use and reuse of data and models among the research community. Scientific openness also improves the ability for the

²⁴⁰⁴ OECD (Organisation for Economic Cooperation and Development). 2015. Making Open Science a Reality. OECD Science, Technology, and Industry Policy Papers, No. 25, OECD Publishing, Paris. <http://doi.org/10.1787/5jrs2f963zs1-en>

scientific community to validate research results, helping to prevent errors and reducing the risk of fraud in science and research. Also, when data and models are made widely available, researchers can re-analyze the data for new and different purposes, examining novel questions and providing new scientific insights. Some studies indicate that data sharing can actually increase the number of citations by third-party researchers, which can indicate higher influence of the original research.^{2405,2406,2407} Collaboration and communication, both within the scientific community and between researchers and other organizations or individuals, are also enhanced by sharing of data and models.

Comment: Commenters (1589, 6127, 6137, 6450, 6925, 8771-PH56) argue that the citations in the proposed rule provided as support that there is a replication crisis do not support the proposal.

Comment (1589) states that the proposed rule incorrectly and falsely uses data from several primary sources to support its suppositions and conclusions, which does not hold up to the scientific process or any logical scrutiny. The commenter reports that the proposed rule uses several citations concerning the so-called "replication crisis" in science to argue for its requirement. According to the commenter, upon reading those citations, one would find that the citations are to studies that indicate that the critiques are already being addressed by the scientific community (<https://www.nature.com/articles/s41562-016-0021> and <http://science.sciencemag.org/content/343/6168/229.long>), and that published articles respond to articles calling into question the validity of methods and conclusions (<http://journals.plos.org/plosmedicine/article?id=10.1371/journal.pmed.0020124>), to opinion pieces from popular magazines rather than from qualified primary sources involved in the type of scientific work being described (<https://www.economist.com/news/leaders/21588069-scientific-research-has-changed-world-now-it-needs-change-itself-how-science-goes-wrong>), and to articles simply about improving the nomenclature of data reproducibility to improve understanding of uncertainty (<http://stm.sciencemag.org/content/8/341/341ps12.full>).

Commenter (6137) states that the Proposed Rule claims – with no support – that the policies of major scientific journals that purportedly informed the development of the Proposed Rule were “spurred in some part by the ‘replication crisis.’” The commenter reports that the term “replication crisis” does not occur in any of the sources cited by EPA in support of this clause. The commenter contends that the word “crisis” only appears in one of the sources, which refers to a “reproducibility crisis” and they notes that it is “debatable” whether this term is appropriate. According to the commenter, although EPA provides web addresses to three commentaries authored by Dr. John Ioannidis of Stanford University, an editorial in the journal *Science*, and an editorial by *The Economist* newspaper, EPA does not explain why any of the observations made in these commentaries or editorials are relevant to dose-response data and models. The

commenter reports that the authors cited by EPA have sharply criticized the Proposed Rule. The commenter provides that:

- Dr. Ioannidis wrote, “If the proposed rule is approved, science will be practically eliminated from all decision-making processes. Regulation would then depend uniquely on opinion and whim.”²⁴⁰⁸
- *Science* editorialized, “Here, a push for transparency appears actually to be a mechanism for suppressing important scientific evidence in policy-making, thereby threatening the public’s well-being.”²⁴⁰⁹
- *The Economist* has described the proposal as part of “a campaign to stifle science at the EPA.” As they put it, “[a]ir-quality rules and pesticide limits rely on analyses of confidential medical records—which Mr. Pruitt may now label suspect and try to undo.”²⁴¹⁰

Commenter (6450) explains that, while EPA claims that the proposal’s “policies are informed by the policies recently adopted by some major scientific journals, spurred in some part by the ‘replication crisis,’” those same science journals – *Science*, *Nature*, and the *Proceedings of the National Academy of Sciences* – have issued a strong statement in opposition to the proposed rule:

It does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them; rather, it is paramount that the full suite of relevant science vetted through peer review, which includes ever more rigorous features, inform the landscape of decision making.²⁴¹¹

Commenter (6450) states that, while the proposal also cites a 2013 editorial in *The Economist* to argue that there is a “replication crisis” plaguing public health studies, ironically, the author is anonymous. According to the commenter, misinterpreting the data policies of peer-reviewed scientific journals and citing an anonymous editorial from five years ago is not sufficient evidence to justify such a sweeping proposal.

Commenter (6925) reports there is no commonly recognized “replication crisis” in science, and EPA’s casual mention of it in this proposed rulemaking appears a blatant attempt to cast doubt on the current state of peer-reviewed science. The commenter states that the study cited in support of this assertion is a 13-year-old paper that made the sweeping claim that “most current published research findings are false” without much further backing of this claim. The commenter contends that more troubling though is EPA’s stretching the truth regarding its characterization of support of this notion from the recommendations of several third-party organizations advocating for open data. The commenter reports that for at least two of these organizations, the sole author of one of the studies and co-author of the other stated that,

²⁴⁰⁸ Ioannidis J.P.A. “All science should inform policy and regulation.” *PLOS Medicine* 15 at 2 (2018).

²⁴⁰⁹ Berg J. “Obfuscating with transparency.” *Science* 360, 133 (2018).

²⁴¹⁰ “Scott Pruitt embarks on a campaign to stifle science at the EPA,” *The Economist* (Apr. 26 2018), <https://www.economist.com/united-states/2018/04/26/scott-pruitt-embarks-on-a-campaign-to-stiflescience-at-the-epa>.

²⁴¹¹ “Joint statement on EPA proposed rule and public availability of data.” April 30, 2018. <https://www.nature.com/articles/d41586-018-05026-y>.

referring to EPA's proposal, "[t]hey don't adopt any of our recommendations, and they go in a direction that's completely opposite, completely different." The commenter asserts that, in citing these sources, EPA attempts to cast doubt on the scientific method and build support for solving a fabricated "crisis" when there is in fact none.

Commenter (8771-PH56) states that, of the five URLs EPA provides in its Footnote 12 to document its claim that there is a "replication crisis," two are broken links and the other three discuss psychology studies and clinical trials. The commenter states that the endpoints in epidemiology, toxicology, and exposure studies are simply not as subjective as psychology experiments are. The commenter further states that some researchers have found replication problems with clinical trials of drugs and therapies, but (1) these typically have smaller sample sizes than epidemiologic studies; and (2) unmeasured interindividual variability is likely much more important with respect to whether a drug will work than whether a pollutant is harmful. According to the commenter, they would not be surprised if a complicated molecule for cancer immunotherapy would cure 10% of patients and be ineffective in 90% of others—which means that different study groups could easily show widely differing efficacy rates—but adds (for example) that methylene chloride causes carboxyhemoglobin formation in everybody, and we understand how and why and the reasons we would not expect different groups to have different risks if we kept replicating these exposures. The commenter provides that, most importantly, EPA has cited no studies offering even a guesstimate of what percentage of environmental science studies might need replication or reanalysis.

Response: The EPA disagrees with commenters who believe the rule is unnecessary because there is little evidence of a widespread reanalysis issue in science. Collectively, evidence from published reanalysis studies, retractions, surveys of scientists, and public commenters provides sufficient evidence that additional policies that remove barriers to data availability and reanalysis and create greater transparency are needed. The citations discussed in the comments above are no longer referenced in the final rule.

3.1.7.3 Other Comments on the Replication (or Reproduction) Crisis

Comment: Commenter (6135) states that, while the background of the proposed rule does mention a general concern regarding the reproducibility of scientific studies, it fails to acknowledge the extensive efforts that have already been enacted by funding agencies, scientific journals, and scientific societies to ensure the transparency and reproducibility of biomedical research. According to the commenter, given the procedures already in place to ensure scientific integrity it would be redundant and inefficient for the EPA to enact the proposed rule or to act as a clearinghouse for data that are already generally available.

Commenter (2906) states that barriers to reproducibility are not new, and despite them, the pace of discovery has been accelerating decade after decade. The commenter contends that recent increased attention to the challenges in repeating and extending results of individual published papers is giving rise to new tools and practices to further strengthen the scientific endeavor. The commenter provides that over time, given the self-correcting nature of research, science does uncover truth. The commenter states that, while any single result may be difficult to reproduce, with evidence and consensus, novel discoveries are made, and theories are confirmed.

Response: The EPA disagrees with commenters who believe the rule is unnecessary or redundant. Collectively, evidence from published reanalysis studies, retractions, surveys of scientists, and public commenters provides sufficient evidence that additional policies that remove barriers to data availability and reanalysis and create greater transparency are needed.

The EPA is a leader in the evaluation of human and ecological impacts of environmental pollution and methods to cost-effectively mitigate these impacts. The selection and use of quality, peer-reviewed literature is a critical part of this work. However, the strength of the review conducted as part of the study's acceptance and publication in a scientific journal has received increased attention in the scientific community due to the lack of transparency and consistency, potential for bias, and the difficulty that independent researchers have had in reproducing published results.^{2412,2413,2414,2415,2416,2417} Jamieson et al. (2019) state, "Journals play a key role in ascertaining the quality of the evidence in work submitted for publication through peer review. However, that practice is neither uniform nor free of exploitation. While it can select for trustable results, its existence alone is not sufficient to verify the quality of the evidence used to back claims."²⁴¹⁸ Because of the potential impact of significant regulatory actions, independent validation of studies that are pivotal to the EPA's significant regulatory actions and influential scientific information may increase public confidence in the findings and conclusions presented in those studies. As Jamieson et al. (2019) states, publication alone (including the typical peer review necessary for publication) is insufficient to verify a study's quality, and additional confidence could be gained from third-party reanalyses that independently validate the study results²⁴¹⁹.

Many scientific publications do require authors to make a data availability or data access statement, which discloses where and under what conditions the underlying study data are available. Yet the EPA cannot solely rely on data availability statements made in published research because initiatives toward greater data sharing and transparency amongst scientific journals and international organizations are still being implemented, are inconsistently enforced, and the true accessibility of data in a public repository is still limited. For example, Christensen et al. (2019) evaluated 1,072 peer-reviewed articles and "found that rates of data availability for

²⁴¹⁹ Ibid.

empirical articles published after journals adopted data-sharing policies differ widely between journals, from 0 percent to 83 percent, with a mean of 35 percent.”²⁴²⁰

Comment: Commenters (6158, 6448) recommend that EPA better articulate how the proposed rule addresses replication concerns beyond existing practices in support of science-based decision-making.

Commenter (6448) states that, while it is appreciated that EPA is concerned about the “replication crisis,” it is unclear how these concerns are, or even if they should be, incorporated into the proposed rule. The commenter provides that utilization of the “best available science” and expert peer review are processes that EPA has long integrated to minimize the impact of irreproducible results in regulatory decisions.

Response: The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. The EPA will then identify and consider “pivotal science in accordance with the provisions of this rule,” unless the implementation of the rule conflicts with statutory requirements and associated implementing regulations.

3.1.8 Reanalysis – Specific Comments

3.1.8.1 Reanalysis Does Not Require Disclosing Participant Information/Confidential Data

Comment: Commenters (1973, 2336, 5015, 6153, 6874, 6916, 8272, 9227) refer to the *HEI 2000 report*²⁴²¹ which conducted an independent reanalysis of the data from two landmark studies that have informed the NAAQS for fine particulate pollution: the *Harvard Six Cities Study*²⁴²² and the *American Cancer Society (ACS) Study*²⁴²³. The commenters assert that the *HEI report* was a successful reanalysis study which retained the participants’ information confidential.

Commenter (1973), referring to the *HEI study* as well as Needleman’s 1979 study of lead and IQ²⁴²⁴, states that reanalysis of some key studies is something that has already been done, without the damaging requirements for public access that EPA has proposed.

Commenter (6117) states that rigorous reanalysis and replications are possible without mandating public availability of all data.

²⁴²⁴ Herbert L. Needleman, et al., Deficits in Psychologic and Classroom Performance of Children with Elevated Dentine Lead Levels, 300 *NEW ENGLAND J. MED.* 689 (1979).

Commenter (9227) states that, to the extent that specific circumstances justify replicating a study, EPA fails to explain why it is necessary to make a study's underlying data broadly available to the public rather than employing a more secure approach that protects personal privacy, such as the approach taken in the *HEI* reanalysis study.

Commenter (2336) states that when the EPA introduced the new NAAQS standard for PM_{2.5} in 1997, some in Congress, industry and the scientific community debated the advantages and disadvantages of requiring public access to data much like the one that surrounds this proposed rule. The commenter reports that, to address these concerns, *Harvard* and the *American Cancer Society* asked *HEI* to organize an independent reanalysis of the data from these studies, on condition that *HEI* and members of the reanalysis team would agree to keep the study participants' information confidential. Commenters (6153, 6874, 8272) state that, instead of making data public, investigators agreed to supply it to the *HEI*, which used a competitive process to select a team to reanalyze the data.

Commenters (2336, 5015, 6153, 6874, 8272) state that, in 2000, *HEI* reported that the reanalysis "assured the quality of the original data, replicated the original results, and tested those results against alternative risk models and analytic approaches without substantively altering the original findings of an association between indicators of particulate matter air pollution and mortality."

Commenter (9227) contends that the provisions in the proposal appear to preclude EPA from using the *Harvard Six Cities Study* because the underlying data is not publicly available due to patient confidentiality protections bound by individual contractual agreements between the scientists and the research participants and by the HIPPA and that such an exclusion is inconsistent with provisions in the OMB's data quality guidelines that use the *Harvard Six Cities Study* as an example of how data may be validated or corroborated without public release of the underlying raw data.

Commenter (9227) reports that the *HEI* reanalysis example demonstrates that it is possible to undertake a reanalysis without making underlying data broadly available to the entire public. The commenter expresses concern that EPA's proposed rule apparently would bar regulators from relying on these high quality and extensively vetted studies because the underlying data was never made publicly available. The commenter states that EPA does not—and cannot—explain how a rule that would prohibit the agency from considering these seminal, high quality scientific studies comports with its goal of strengthening the agency's use of science in regulatory actions.

Response: The EPA agrees that it is important not to categorically exclude any study because the data underlying a study at the stage required by this rulemaking may not be available for independent validation. Therefore, the EPA is not finalizing the primary proposal in the 2020 SNPRM that would have categorically required that for studies to be considered pivotal science the underlying data would need to be available for independent validation. However, given that transparency is an important aspect of EPA's regulatory actions and assessments, it should be an important consideration in how the Agency considers pivotal science. As described in 40 CFR 30.5 of the final rule, the EPA will rely on the highest quality, most relevant studies available in

determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies— based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science.

Further, the EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (2336) suggests that the rule, in its final form, should provide an avenue for reanalysis of studies employing confidential data by objective third parties who access confidential input data under appropriate protective conditions. The commenter suggests that, only when that approach is taken, and reanalysis uncovers material defects in the data or its modelling, should a study be disqualified for use. The commenter contends that, if the rule takes this form, it might further the overriding objective of applying the best available science to regulatory decision-making.

Response: As described in the final rule, the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. The Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

3.1.8.2 Reanalysis of Studies Would be Burdensome

Comment: Commenters (4542, 5015, 6132, 9227) express concern regarding the cost and time-consuming nature of reanalysis.

Commenter (4542) states that experience with reanalysis shows that simply making data available is insufficient; the participation of the original researchers is often required because of their unique expertise in the design, collection and analysis, especially for large or complex datasets. The commenter expresses concern that such participation could be a substantial time and resource burden on researchers.

Commenter (5015) reports that, in a limited number of cases, where there are not comparable studies in other datasets, it may be useful to gain access to the original study data and analytic codes to allow for independent evaluation. The commenter contends that this is a highly cost-intensive and time-consuming endeavor which should only be applied in cases where there are one or just a few studies in a given area.

Commenter (9227) states that it would be infeasible to undertake expensive and time-consuming reanalysis for the vast majority of studies.

Commenters (6153, 6874, 8272) state that in a look back at the evolution of research on the health effects of particulate pollution, lead *Harvard Six Cities* investigator Douglas W. Dockery commented that “the *HEI* work reanalyzing an existing body of evidence was time consuming and expensive and it would not be a good use of resources to require this approach for all studies contributing to the regulatory actions, or even to a few key studies.”

Response: In the final rule, Part 30.2, the EPA, *Reanalyze* means to analyze exactly the same dose-response data to see if a similar result emerges from the analysis by using the same methods, statistical software, models, or statistical methodologies that were used to analyze the dose-response data, as well as to assess potential analytical errors and variability in the underlying assumptions of the original analysis and *Independent validation* means the reanalysis of study dose-response data by subject matter experts who have not contributed to the development of the study to evaluate whether results similar to those reported in the study are produced.

The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA and thus does not require a third-party to expend resources to reanalyze the dose-response data underlying pivotal science.

EPA continues to find that independent validation of the study findings and conclusions driving the EPA’s dose-response assessments would provide important information. As detailed in Section III.A.1 of the preamble to the final rule, there is scientific support for the usefulness of reanalyzing data, and the EPA finds this to be especially true for data that drive the quantitative requirements or analyses of EPA significant regulatory actions or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and, thus, increase the opportunity for independent subject matter experts to validate pivotal science, and as the dose-response data are better understood through independent reanalysis the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

3.1.8.3 Limitations of Reanalysis

Comment: Commenters (1973, 4840, 6132, 9227) contend that reanalysis of the same data does not strengthen the findings or validity of a study.

Commenter (1973) states that, while it is sometimes argued that the failure to replicate studies is a “crises in science” that necessitates the EPA proposal, the EPA proposal will only facilitate reanalysis.

Commenter (4840) asserts that reanalyzing the same study over and over is little different from checking on a surprising newspaper article by buying additional copies of the same paper to see if it says the same thing.

Commenter (6132) suggests that, if the EPA really wants to evaluate the validity of studies, it should fund more such studies to independently test the study design elsewhere to see if the results are confirmatory (as has already been repeatedly shown for particulate matter air pollution health effects), not by repeatedly reanalyzing the statistics from past studies over and over again.

Commenter (9227) states that, if all credible methods of reanalysis yield effectively the same results as the original analysis, they do not strengthen the original findings. The commenter suggests that the use of differing statistical models be assessed with care and there be a demonstration that the assumptions supporting a new method of analysis is significantly more credible than the original analysis. The commenter provides that it is easy to develop methods of analysis that can demonstrate a different finding but are created solely for that purpose and these should not be given greater weight in evaluating a study.

Response: The EPA disagrees with these commenters. Reanalysis of data can be valuable. Jamieson et al. (2019) state, “Journals play a key role in ascertaining the quality of the evidence in work submitted for publication through peer review. However, that practice is neither uniform nor free of exploitation. While it can select for trustable results, its existence alone is not sufficient to verify the quality of the evidence used to back claims.”²⁴²⁵ Because of the potential impact of significant regulatory actions, independent validation of studies that are pivotal to the EPA’s significant regulatory actions and influential scientific information may increase public confidence in the findings and conclusions presented in those studies. As Jamieson et al. (2019) states, publication alone (including the typical peer review necessary for publication) is insufficient to verify a study’s quality, and additional confidence could be gained from third-party reanalyses that independently validate the study results²⁴²⁶.

Other commenters support the requirement for independent validation by reanalysis and the EPA agrees. Reanalysis is more than just checking for mathematical errors. For example, reanalyzing the underlying dose-response data, independent researchers can evaluate the myriad of choices and assumptions the original researchers have made regarding the data and statistical models and the potential introduction of any sources of bias.

²⁴²⁵ Jamieson, K. H., McNutt, M., Kiermer, V., and Sever, R. (2019). Signaling the trustworthiness of science. *Proceedings of the National Academy of Sciences in the United States of America* 116(39):19231-19236. <https://doi.org/10.1073/pnas.1913039116>.

²⁴²⁶ Ibid.

3.1.8.4 Other Comments Regarding Reanalysis

Comment: Commenter (8771-PH56) asserts that EPA presents no evidence that anyone is hindering anyone from reanalyzing. The commenter reports that any bioassay that EPA would use would have individual tumor data and exposures and could be reanalyzed with any model anyone wanted. The commenter states that, for epidemiology studies, important confounders can almost always be tested if need be. According to the commenter, any failure to reanalyze is not the fault of the original investigators, so they and the public should not be punished for the purported lack of reanalysis.

Response: The EPA disagrees with this commenter. Reanalysis cannot be conducted by just “anyone” if the underlying data is not available. The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA and thus does not require a third-party to reanalyze the dose-response data underlying pivotal science.

3.1.9 Recommends Further Consultation to Develop New Rule Addressing Reproducibility and Replicability Concerns

Comment: Commenters (1742, 4894) recommend that the rule be revised to address reproducibility and replicability concerns in consultation with the *National Academies of Sciences* and scientific Journals.

Commenter (1742) states that this rule should be revised and re-evaluated by scientists from the *National Academy of Sciences*, *Nature*, *Science*, and *Cell* if EPA wants to help reproducibility.

Commenter (4894) recommends the rule be withdrawn and suggests that a new rule addressing concerns about reproducibility and replicability be developed in public, with participation by the scientific community, the environmental community, and industry. The commenter suggests that the rule developers avail themselves of the results of the ongoing *Reproducibility and Replicability* study being conducted by the *National Academies of Sciences*. The commenter provides that the report for this study is expected to be completed in December 2018.

Response: In development of this final rule, EPA considered the public comments on the 2018 NPRM, the 2020 SNPRM, and the advice of the SAB. Numerous scientific organizations provided comment on the NPRM and SNPRM during the public comment periods.

3.2 SNPRM Capable of Being Substantially Reproduced; Replication and Reproduction

3.2.1 Capable of Being Substantially Reproduced; Replication and Reproduction

3.2.1.1 Proposed Definition for Capable of Being Substantially Reproduced

3.2.1.1.1 General Support for Definition

Comment: Commenters (9587, 11401, 12406, 12471) support the use of the term as defined in the SNPRM. Recommendations for modification are provided:

Commenter (12471) proposes the definition to be modified to read:

Capable of being substantially reproduced means that independent analysis of the original **and/or** supporting data using identical **or other validated methods** would generate similar analytic results, subject to an acceptable degree of imprecision or error.

The commenter states the “and/or” to indicate the instance of both original and supporting data being available and that the suggested addition of “or other validated” opens the possibility that there are equally valid methods other than the original researcher used, and reproduced results using other validated methods should also yield substantially similar results.

Response: The EPA found that comments concerning inconsistencies and a lack of clarity with the definition of “capable of being substantially reproduced” have merit and is modifying the definition of “independent validation” in the final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30. As a result, “substantially” will not need to be defined or described in the final rule. The EPA is also modifying the definition of “reanalyze” to specify the use of the same methods because as proposed it specified the use of the “same or different” methods. This change was made so that the definition would be consistent with the final rule’s definition of “independent validation.”

3.2.1.1.2 Issues With the Provided Definition

Generally Confusing

Comment: Commenter (11328) contends that the definition remains confusing due to the term reproducible being used in a manner that directly contradicts the proper definition on the very same page of the Federal Register notice. Due to this, the commenter states that it is clear that the supplemental proposal lacks input from the scientific community.

Response: The EPA found that comments concerning inconsistencies and a lack of clarity with the definition of “capable of being substantially reproduced” have merit and is modifying the definition of “independent validation” in the final rule by replacing “capable of being

substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30. As a result, “substantially” will not need to be defined or described in the final rule. The EPA is also modifying the definition of “reanalyze” to specify the use of the same methods because as proposed it specified the use of the “same or different” methods. This change was made so that the definition would be consistent with the final rule’s definition of “independent validation.”

Comment: Commenter (11479) states that EPA’s draft rule, as modified in the supplemental notice, reveals that the Agency wants to use original data and methods to reanalyze rules and prove that they are reproducible before using them to support a rule. The commenter claims that the supplemental notice still has not clarified what it means by “capable of being substantially reproduced,” and it contradicts itself. The commenter provides that the provided definition is in conflict with the National Academy of Sciences (NAS) workshop report citation that defines reproducibility as “producing something that is very similar to that research, but is in a different medium or context. In other words, a researcher who is reproducing an experiment addresses the same research question from a different angle than the original researcher did.”²⁴²⁷ The commenter believes that EPA is disguising its quest to cherry-pick evidence with unclear definitions of reanalysis, independent validation, and “capable of being substantially reproduced.”

Response: The EPA found that comments concerning inconsistencies and a lack of clarity with the definition of “capable of being substantially reproduced” have merit and is modifying the definition of “independent validation” in the final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30. As a result, “substantially” will not need to be defined or described in the final rule. The EPA is also modifying the definition of “reanalyze” to specify the use of the same methods because as proposed it specified the use of the “same or different” methods. This change was made so that the definition would be consistent with the final rule’s definition of “independent validation.”

The rule does not require the Agency to reanalyze, reproduce, or independently validate pivotal science before using the pivotal science to support a significant regulatory action or influential scientific information.

Provides Insufficient Guidance

Comment: Commenters (11176, 11576, 12443, 12715, 12720) note that aspects of the definition, and related definitions, do not provide for several key aspects that would be required for uniform application. Specifically:

²⁴²⁷ National Academies of Sciences, Engineering, and Medicine. 2016. Principles and obstacles for sharing data from environmental health research: Workshop summary. Online at <https://www.nap.edu/catalog/21703/principles-andobstacles-for-sharing-data-from-environmental-health-research>, Accessed May 14, 2020.

Commenter (11176) states that, to the EPA's credit, the 2002 OMB definition for "capable of being substantially reproduced" is used. However, the commenter notes that the definition contains the words "similar" and "acceptable," which need a standard for meaning or who will make the determination (e.g. scientific staff with oversight of an EPA scientific advisory panel). The commenter similarly raises this concern for the word "substantially" in the term "capable of being substantially reproduced." Additionally, the commenter provides that guidance for these determinations would need to take into account how unlikely it is for two studies to exactly replicate. The commenter provides that in 2015 Ralph Cicerone, then president of the National Academy of Sciences (NAS) addressed this point in a speech, noting that a NAS panel had grappled with the very question: "Because variability across studies is to be expected, how can we assess the acceptable degree of variability and when should we be concerned about reproducibility?" According to the commenter, there should also be guidance to require explanation of whether research has or has not met the sufficient-for-independent-validation criterion.

Commenter (11576) provides that the term is ambiguous and relies on personal judgement. As such, the commenter notes that EPA should specify what an "acceptable degree of imprecision or error" means for specific types of data and models. According to the commenter, without greater specificity, the degree of imprecision or error found to be acceptable will vary between decision-makers. The commenter contends that "capable of being substantially reproduced" could be defined, for instance, relative to the impact of reproducing data on directional outcomes or by providing specific quantitative thresholds for acceptable degrees of imprecision or error.

Commenter (12443) asserts that for any proposal with broad implications, the proposal needs to define what are the constraints under which a study is deemed capable of being reproduced.

Commenter (12715) takes pause with the inclusion of the words "substantially," "similar," and "acceptable degree" as they reflect upon the term's subjectivity. The commenter states that the supplemental proposal does not include any criteria for what would constitute as these, nor does it indicate where in the regulatory process those determinations would be made, who would make them, and whether those determinations would be explained in the public notice process.

Commenter (12720) states that EPA does not define how a "contribution" to a particular study is interpreted, and whether that contribution may be in the form of financial resources or not, nor does EPA define a threshold that would qualify as "substantial" reproduction of study findings, and does not detail how "capable of being substantially reproduced" is interpreted. The commenter adds that it is not clear from EPA's definition of "independent validation" to what degree study findings in all of their forms (e.g., general results, point estimates, confidence intervals, sensitivity analyses, statistical significance) must be "reproduced."

Response: The EPA found that comments concerning inconsistencies and a lack of clarity with the definition of "capable of being substantially reproduced" have merit and is modifying the definition of "independent validation" in the final rule by replacing "capable of being substantially reproduced" with "produced." The EPA will not finalize the proposed 40 CFR 30.2 definition of "capable of being substantially reproduced" because the term is not used in the final rule's definition of "independent validation" or elsewhere in 40 CFR 30. As a result,

“substantially” will not need to be defined or described in the final rule. The EPA is also modifying the definition of “reanalyze” to specify the use of the same methods because as proposed it specified the use of the “same or different” methods. This change was made so that the definition would be consistent with the final rule’s definition of “independent validation.” The EPA did not define “similar” in the regulatory text as this would be overly prescriptive. The EPA intends to issue implementation guidelines and statute-specific rulemakings that will provide further clarity.

Focus on Reanalysis Rather Than Reproduction

Comment: Commenter (11479) asserts that the inclusion of the definition focuses on reanalysis, which clarifies the necessity of underlying data being made available to interested stakeholders to confirm reproducibility. As such, the commenter contends that the goal of the rule is to introduce an avenue for stakeholders with enough time and resources to recalculate study data to better meet deregulatory outcomes rather than to increase transparency.

Response: As described in the preamble to the final rule, the purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information, not to encourage any particular stakeholder outcome. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Having a better understanding of the underlying data will enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information.

The EPA found that comments concerning inconsistencies and a lack of clarity with the definition of “capable of being substantially reproduced” have merit and is modifying the definition of “independent validation” in the final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30. As a result, “substantially” will not need to be defined or described in the final rule. The EPA is also modifying the definition of “reanalyze” to specify the use of the same methods because as proposed it specified the use of the “same or different” methods. This change was made so that the definition would be consistent with the final rule’s definition of “independent validation.”

Comment: Commenter (12727) states that the proposed definition of “capable of being substantially reproduced” attempts to bring the word reproduced into the realm of reanalyzed. According to the commenter, reproducing an experiment addresses the same research question, but approaches the question from a different angle than the original experiment, while a reanalysis is when a person analyzes exactly the same data to see if the same result emerges using the same program and statistical methodologies, or perhaps alternative methodologies. Due to this, the commenter contends that EPA’s definition is inappropriate and would mislead the public into believing that some new scientific insights have been applied to an original set of data

such that the original research findings are made stronger. The commenter provides that instead, the definition highlights a misconception that independent validation is accomplished through reanalysis of study data by other experts; the strength of scientific findings are not determined by endless reanalysis of a single data set, but rather gained over time through the conduct of separate investigations utilizing different methodologies that yield corroborating conclusions around a hypothesis being explored.

Response: The EPA found that comments concerning inconsistencies and a lack of clarity with the definition of “capable of being substantially reproduced” have merit and is modifying the definition of “independent validation” in the final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30. As a result, “substantially” will not need to be defined or described in the final rule. The EPA is also modifying the definition of “reanalyze” to specify the use of the same methods because as proposed it specified the use of the “same or different” methods. This change was made so that the definition would be consistent with the final rule’s definition of “independent validation.”

Reproducibility as Opposed to Replicability

Comment: Commenter (11405) contends that the terms reproducibility and replicability are used as though they were synonymous throughout the supplemental proposal. The commenter asserts that in actuality, reproducibility is a quantitative measure that determines if the outputs of the original analysis and a reproducibility check are quantitatively identical, while replicability is only achieved if the design and findings of the original study and replication attempts are qualitatively similar. According to the commenter, the qualitative nature of replicability can be highly controversial due to the substantive assumptions about which similarities and differences.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science,” “replication,” “reproducible,” and “research data” are not used in this final rule.

What Open Science is Able to Support

Comment: Commenter (11405) states that open science primarily supports reproducibility, by enabling or encouraging researchers to make their data and analysis code available for reproducibility checks. The commenter also provides that because reproducibility and replicability are independent, supporting reproducibility does not necessarily support replicability. Consequently, the commenter asserts that open science does not necessarily address concerns about replicability.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science,” “replication,” “reproducible,” and “research data” are not used in this final rule.

3.2.1.1.3 Relation to Office of Management and Budget (OMB) Guidance

Comment: Commenter (11479) asserts that the Agency has not shown that the current review process based on the 2001 OMB guidance is not sufficient to catch simple calculation errors. The commenter provides that EPA has not provided evidence that there is an epidemic of calculation mistakes plaguing Agency science that would require an impossible requirement of public access to raw data that steps beyond the provisions of current EPA policies and practices and beyond the needs of the Agency.

Response: The purpose of the rule is not to fix prior mistakes. As detailed in the preamble to the final rule, the purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenter (11911) contends that the supplementary proposal is inconsistent with the replication standards of the OMB.²⁴²⁸

²⁴²⁸ See, e.g., Office of Mgmt. & Budget, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies, 67 Fed. Reg. 8452, 8456 (2002); Berg *et al.*, 19 83 Fed. Reg. at 18,771, citing Randall Lutter & David Zorn, On the Benefits and Costs of Public Access to Data Used

Response: The EPA maintains that this rule designed to build upon OMB guidelines. Rather, the rule will complement and augment them and other transparency efforts. The EPA would like to clarify that it does not derive authority for this rule from the OMB Guidelines. The EPA is relying exclusively on its housekeeping authority.

3.2.1.2 Application to EPA Practices

3.2.1.2.1 Expansion of Proposal to Include Reproducibility of Key EPA Decisions

Comment: Commenter (10973) contends that EPA should expand its proposal to include the reproducibility how regulatory and non-regulatory limits are set across many environmental statutes, which is considerably more valuable for stakeholders to engage with the Agency than individual data points.

Response: The EPA does not agree with the recommended expansion of the proposal. As discussed in the preamble to the final rule, the Agency is pursuing an incremental approach to maximizing transparency in the science that it relies upon, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

3.2.1.2.2 No Requirement to Ensure Analytic Results are Reproducible

Comment: Commenter (11381) provides that the Information Quality Guidelines (IQG) transparency requirements apply to derivative information produced by EPA as well as

to Support Federal Policy Making, Mercatus Working Paper, Mercatus Center at George Mason University (2016). The commenter asserts that the cited paper makes unrealistic assumptions about the costs of making data public. The commenter states that the authors assume that the burden placed on EPA staff in tracking down the underlying data of studies and making them public will be akin to the burden placed on chemical manufacturers under EPA's Health and Safety Data Reporting Rule (40 C.F.R. 716). However, the commenter provides that under the Reporting Rule, chemical manufacturers are merely required to provide copies of studies already in their possession and provide lists of other known studies. According to the commenter, this is a far different task than contacting study authors and requesting data provision. Further, the commenter contends that the Mercatus paper assumes that the estimated one hour it takes chemical manufacturers to review each study for confidential business information should "closely correspond" to the amount of time it would take an Agency official "to review study data for confidentiality concerns in preparation for public disclosure under a data access policy." According to the commenter, the authors provide no evidence for the assumption that it will take EPA staffers just one hour to both assess sensitive datasets, such as longitudinal health studies, and amend them so they are sufficiently safe to disclose. Under these assumptions, the commenter provides that the paper concludes that the compliance costs of the rule will amount to a mere \$18 million—far less than the \$250 million predicted in a 2015 report from the Congressional Budget Office analyzing compliance costs of a similar contemplated transparency rule. *See* Congressional Budget Office, Cost Estimate: H.R. 1030 Secret Science Reform Act of 2015 (2015).

derivative information produced by third-parties that the Agency wants to disseminate.²⁴²⁹ According to the commenter, failing to require EPA program offices to comply with this IQG requirement goes against the concept of transparency. As such, the commenter recommends EPA require its offices to demonstrate adherence to the IQG requirement by reproducing the information it intends to disseminate.

Response: The EPA disagrees with the recommended expansion to this rule. This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA to reproduce or evaluate the reproducibility of dose-response data, but instead increases the opportunity for subject matter experts to independently validate pivotal science, if they so choose.

3.2.1.3 Reproducibility and Good Science

3.2.1.3.1 Reproducibility as a Determinant of Good Science

Reproducibility Is Not a Standalone Factor

Comment: Commenter (11103) states that there is no doubt that reproducible studies instill credibility in scientific knowledge, but reproducibility is an inadequate measure to solely judge the rigor of scientific research. The commenter notes that successfully reproducing a result does not prove that the original scientific result is correct, nor does failing to reproduce it definitively negate the original claims. In fact, the commenter provides that the less variation there is in the conditions of a study, the fewer contexts in which the results are true. The commenter references a 2009 study on the effect of environmental variations on reproducibility in animal experiments which found that reducing variation led to results that were only true in the specified conditions, with little external validity.²⁴³⁰ The commenter asserts that when the extent to which the results of a study do not apply in other contexts or populations that differ from the original one, the results cannot be determined to be robust enough, no matter how reproducible they are. According to the commenter, the EPA should not be focusing solely on reproducibility to ensure data is valid, but instead should concentrate on generalizability as well as the effect and size of data. The commenter recommends that EPA revoke its proposal to prioritize scientific studies on

²⁴²⁹ The commenter contends that other governmental agencies – whether international, federal, state, or local – are covered third parties. The commenter notes that any information they produce is subject to the full array of IQG standards if a federal Agency disseminates or relies upon it. According to the commenter, an agency may not assume that information produced by a third party, including another Federal Agency, meets applicable information quality standards, nor may it deem such information exempt. Agencies, the commenter notes, are required to ensure that the information produced by third-parties, if they disseminate it or rely upon it for decision-making, meets the IQG transparency standard. The commenter asserts that the general assessment factors in (U.S. Environmental Protection Agency, 2003 #471) apply irrespective of the source of scientific or technical information.

²⁴³⁰ S Helene Richter, Joseph P Garner and Hanno Würbel, “Environmental Standardization: Cure or Cause of Poor Reproducibility in Animal Experiments?”, *Nature Methods*, no. 6 (2009): 257-261, <https://www.nature.com/articles/nmeth.1312>

the nonscientific basis of public availability of underlying data. Furthermore, the commenter notes this will allow EPA to assess the entire body of research on a subject and gain confidence in the state of scientific knowledge by more accurate benchmarks of quality; namely generalizability, not reproducibility.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science,” “replication,” “reproducible,” and “research data” are not used in this final rule.

The EPA agrees with the commenter in part and provided additional clarifications in the final rule. As explained in 40 CFR 30.5, the EPA will use existing factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) to evaluate study quality. Subsequently, the EPA would identify the highest quality, most relevant studies that would inform a dose-response assessment and evaluate the availability of the dose-response data underlying pivotal science. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations.

Comment: Commenter (11479) contends that the importance of reproducibility in the proposed rule is inconsistent with provisions in the 2002 OMB guidelines that detail the nuance between the reproducibility of a study and other criteria that Agency scientists currently use to evaluate a study’s credibility, that “the objectivity standard does not override other compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections,” and that agencies can apply robustness checks in situations where public access to data and methods

will not occur due to other compelling interests.”²⁴³¹ According to the commenter, the Agency can verify the independence and credibility of a study in other ways, such as by evaluating its research design, methods, data summaries, and degree of alignment with similar studies in the field. The commenter asserts that EPA scientists should have the flexibility to use scientific criteria to judge the rigor and validity of the evidence. Additionally, the commenter states that EPA already does this well, and the rule does not point to any evidence to the contrary.

Response: The EPA agrees with the commenter in part and provided additional clarifications in the final rule. As explained in 40 CFR 30.5, the EPA will use existing factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) to evaluate study quality. Subsequently, the EPA would identify the highest quality, most relevant studies that would inform a dose-response assessment and evaluate the availability of the dose-response data underlying pivotal science. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations.

Reproducibility as a Necessity

Study Validity’s Dependence on Reproducibility

Comment: Commenter (12427) notes that in Dr. Allison’s testimony to the House of Representatives’ Committee on Science, Space, and Technology, it is stated that “reproducibility is neither a necessary nor a sufficient condition for a scientific study or data set to be valid or useful,” as, “a study can be reproducible and transparent and yet completely invalid”. The commenter further agrees with Dr. Allison’s comment that “it would not be appropriate to determine the rigor or the regulatory applicability of a study based solely on its reproducibility as reproducibility is defined in the National Academies’ report for the reasons I have stated above.

²⁴³¹ OMB. 2002. Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies; Republication, February 22, Washington DC. Online at <https://www.federalregister.gov/documents/2002/02/22/R2-59/guidelines-for-ensuring-and-maximizing-the-qualityobjectivity-utility-and-integrity-of-information>, Accessed May 14, 2020.

In short, reproducibility is neither a necessary nor a sufficient condition to determine the validity of a study for in turn determining the truth of a proposition.”

Conversely, commenter (12712) states that science proceeds by replication – and what the rule calls reanalysis – and without data availability, this process cannot happen.

Response: In the final rule the terms replicate and reproduce (or other forms of the word) are no longer used. In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” In addition, the EPA is modifying the definition of “independent validation” in the final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30.

The EPA continues to believe that data transparency is vital for individuals who have not contributed to the study to be able to verify the quality and strength of published studies and agrees with commenters that the opportunity to independently validate the pivotal science that the EPA relies upon is important in furthering scientific understanding and the Agency’s mission. A presenter in a 2016 NAS workshop on Principles and Obstacles for Sharing Data from Environmental Health Research stated more directly that “for environmental policy making to be legitimate, the scientific reasoning behind a given decision—including the data supporting it—must be transparent” (NAS Workshop Report, Ref. 26). When data are widely available, researchers can validate research results and help identify and correct unintended errors, as well as reanalyze the data for new and different purposes, examine novel questions, provide new scientific insights, and improve model development.

While the availability of dose-response data underlying a study in a manner sufficient for independent validation is an important component of determining the level of consideration to afford a study, the EPA agrees that availability by itself is not sufficient to determine study quality and made subsequent modifications to the final rule. As explained in 40 CFR 30.5, the EPA will use existing factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) to evaluate study quality. Subsequently, the EPA would identify the highest quality, most relevant studies that would inform a dose-response assessment and evaluate the availability of the dose-response data underlying pivotal science. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent

validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

Consideration of Information by EPA

Comment: Commenter (11899) contends that all materials must be replicated, reproduced or confirmed by EPA and/or outside independent experts before they can be used or considered by EPA in formulating policies or regulations.

Response: Although the Agency agrees that greater transparency is necessary, the EPA disagrees with the recommended expansion of the rule. The final rule does not require the EPA to reproduce or evaluate the reproducibility of dose-response data, but instead increases the opportunity for subject matter experts to independently validate pivotal science, if they so choose. Future statute-specific rulemakings may be more expansive as the EPA continues to make incremental progress toward maximizing transparency.

Coding Errors and Replicability

Comment: Commenter (11405) notes that in some cases, coding errors might lead to conclusions that are qualitatively different from the results of otherwise similar studies and may lead to replicability problems. The commenter provides that they know of no empirical study that provides evidence that these kinds of coding errors are a widespread problem in epidemiology or any related field, nor does the supplemental proposal appear to cite any such sources.

Response: The EPA disagrees with the assertion that the rule is unnecessary because there is little evidence of a widespread reanalysis issue in science. Collectively, evidence from published reanalysis studies, retractions, surveys of scientists, and public commenters provides sufficient evidence that additional policies that remove barriers to data availability and reanalysis and create greater transparency are needed. The EPA's SAB, several public commenters, and authors of peer-reviewed literature have noted that data sharing, like that envisioned under this rulemaking, would strengthen science. The scientific benefits of openness in research are well-recognized.²⁴³² Open sharing of data and models reduces duplication of effort from different researchers attempting to collect the same datasets and allows for the use and reuse of data and models among the research community. Scientific openness also improves the ability for the scientific community to validate research results, helping to prevent errors and reducing the risk of fraud in science and research. Also, when underlying data are made widely available, researchers can re-analyze the data for new and different purposes, examining novel questions and providing new scientific insights. Some studies indicate that data sharing can actually increase the number of citations by third-party researchers, which can indicate higher influence

²⁴³² OECD (Organisation for Economic Cooperation and Development). 2015. Making Open Science a Reality. OECD Science, Technology, and Industry Policy Papers, No. 25, OECD Publishing, Paris. <http://doi.org/10.1787/5jrs2f963zs1-en>

of the original research.^{2433,2434,2435} Collaboration and communication, both within the scientific community and between researchers and other organizations or individuals, are also enhanced by sharing of data and models.

Replication Is a Matter of Internal and External Validity

Comment: Commenter (11405) asserts that replicability is a matter of generalizability and extrapolation, from the original study's sample to another sample. The commenter states that applying different statistical techniques to the original study's sample will not tell whether and to what extent findings can be generalized. While robustness checks may give some indications of the internal validity of a study, the commenter notes that they tell nothing about how broadly its conclusions can be generalized.²⁴³⁶ Thus, according to the commenter, while open data does promote robustness, this does not do anything to promote replicability. As such, the commenter contends that given a study, the best way to determine whether it is replicable is to attempt to replicate it, not to re-analyze the same data.

Response: Although the EPA agrees that meaningful insights can be obtained through similar studies in different media or context, the EPA continues to find that independent validation of the study findings and conclusions driving the EPA's dose-response assessments would provide important information. As detailed in the preamble to the final rule, there is scientific support for the usefulness of reanalyzing data, and the EPA finds this to be especially true for data that drive the quantitative requirements or analyses of EPA significant regulatory actions or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and, thus, increase the opportunity for independent subject matter experts to validate pivotal science, and as the dose-response data are better understood through independent reanalysis the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

3.2.1.3.2 Alternative Pathways to Attaining Confidence in Science

Comment: Commenter (11360) states that reproducibility and replicability are elements for determining quality science, but are only a part of the overall quality assurance landscape and that there are limits to these metrics as described in the supplemental proposal.

Commenter (11182) contends that the supplemental proposal's assumption that confidence in science can only be attained by reanalysis of the data is mistaken. The commenter notes that the

National Academies of Science notes that “replicability and reproducibility are crucial pathways to attaining confidence in scientific knowledge, although not the only ones.” Additionally, the commenter states that NAS describes other widely accepted methods for improving scientific rigor, including research synthesis, systematic reviews, and meta-analyses and specifically notes that “some research involves nonpublic information that cannot legally be shared, such as patient records or human subject data.”²⁴³⁷

Commenter (12464) provides that it is through the combined operation of peer review, replication, and reproduction that the scientific community typically determines whether the results of a particular study are reliable. The commenter notes that peer review has been a widely-accepted method for ensuring high-quality results for the past three and a half centuries, and EPA has integrated the scientific community’s peer-review standards into its policies since at least 1993.^{2438,2439} In addition, the commenter states that reproduction, especially when it involves the integration of results from multiple lines of inquiry, is particularly important; as NAS recently explained, “[t]he robustness of science is less well represented by the replications between two individual studies than by a more holistic web of knowledge reinforced through multiple lines of examination and inquiry.”²⁴⁴⁰ According to the commenter, all information necessary for these are typically made available by researchers,²⁴⁴¹ and does not entail the data privacy and confidentiality issues raised by the supplemental proposal. Furthermore, the commenter holds the supplemental proposal to be inconsistent with these best practices, especially as EPA has traditionally relied on these best practices under its Framework for Incorporating Human Epidemiologic & Incident Data in Risk Assessments for Pesticides.²⁴⁴² The commenter states that this framework allowed for the basis of EPA’s 2016 Revised Human Health Risk Assessment for chlorpyrifos on the fact that studies from “different investigators, locations, points in time, exposure assessment procedures, and outcome measurements” all reached similar results.²⁴⁴³

Response: In the final rule the terms replicate and reproduce (or other forms of the word) are no longer used. In the final rule the term replicate is not used. The EPA is clarifying that the intent

The EPA’s Proposed Rule on Scientific Data 379 NEW ENGLAND J.MED. 1496, 1497 (2018) (“[T]he ‘gold standard’ of science is not reanalysis, but replication. In the case of PM2.5 mortality studies, a recent meta-analysis found 53 cohorts, indicating that the results have been replicated many times by many groups in many countries.”) (using “replication” in the sense that the SNPRM uses “reproduction”).

²⁴⁴¹ See, e.g., Letter from Marcia McNutt, President of the National Academy of Sciences, C.D. Mote, Jr., President of the National Academy of Engineering, and Victor J. Dzau, President of the National Academy of Medicine, to Acting Administrator Andrew Wheeler 2 (July 16, 2018) (“Individual study quality should be evaluated on the basis of information that is available in standard journal articles, such as the study design elements, analytical techniques, and statistical methods.”)

²⁴⁴² EPA, Office of Pesticide Programs’ Framework for Incorporating Human Epidemiologic & Incident Data in Risk Assessments for Pesticides (2016).

²⁴⁴³ EPA, Chlorpyrifos: Revised Human Health Risk Assessment for Registration Review 12 (2016).

of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” In addition, the EPA is modifying the definition of “independent validation” in the final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30.

While the independent validation is an important component of determining the level of consideration to afford a study, the EPA agrees that availability by itself is not sufficient to determine study quality and made subsequent modifications to the final rule. As explained in 40 CFR 30.5, the EPA will use existing factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) to evaluate study quality. Subsequently, the EPA would identify the highest quality, most relevant studies that would inform a dose-response assessment and evaluate the availability of the dose-response data underlying pivotal science. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

Further, although the EPA agrees that meaningful insights can be obtained through similar studies in different media or context, the EPA continues to find that independent validation of the study findings and conclusions driving the EPA’s dose-response assessments would provide important information. The benefits of greater data transparency and the significance of reanalyzing and validating study results are well-documented in scientific literature. McNutt (2014) noted, “reproducibility, rigor, transparency, and independent verification are cornerstones of the scientific method.”²⁴⁴⁴ The National Academies of Sciences, Engineering, and Medicine (NAS) workshop on Reproducibility and Replicability in Science also noted that “certainly, reproducibility and replicability play an important role in achieving rigor and transparency.”²⁴⁴⁵ Munafò et al. (2017) state, “the credibility of scientific claims is rooted in the evidence supporting them, which includes the methodology applied, the data acquired, and the process of methodology implementation, data analysis and outcome interpretation. Claims become credible by the community reviewing, critiquing, extending and reproducing the supporting evidence. However, without transparency, claims only achieve credibility based on trust in the confidence

²⁴⁴⁵ NAS (National Academies of Sciences, Engineering, and Medicine). (2019). *Reproducibility and replicability in science*. Washington, DC: The National Academies Press. Available at <https://www.nationalacademies.org/our-work/reproducibility-and-replicability-in-science>.

or authority of the originator. Transparency is superior to trust.”²⁴⁴⁶ The 2019 NAS workshop on Reproducibility and Replicability in Science also concluded, “the scientific enterprise depends on the ability of the scientific community to scrutinize scientific claims and to gain confidence over time in results and inferences that have stood up to repeated testing.”²⁴⁴⁷ The EPA agrees that data transparency is vital for individuals who have not contributed to the study to be able to verify the quality and strength of published studies and finds that the benefits of reanalysis are especially important for data that drive the quantitative requirements or analyses of EPA significant regulatory actions or influential scientific information. Implementation of this rule will increase transparency and, thus, the opportunity for independent subject matter experts to validate pivotal science, and as the dose-response data are better understood the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

3.2.1.3.3 Reproducibility Crisis

The Need to Address the Crisis

Comment: Commenters (11401, 11899) highlight the need for reproducibility given reports of the inability to reproduce many scientific studies today. Specific concerns include:

Commenter (11401) supports EPA’s efforts to give greater weight to transparency and reproducibility, two basic components of sound science. The commenter states that peer review is not always an indication that a scientific report has been properly critiqued, and rarely includes independent verification of reproducibility.²⁴⁴⁸ According to the commenter, the Federal Government’s own Information Quality Act guidelines recognize that “there is a significant scholarly literature documenting quality problems with articles published in peer-reviewed research.”²⁴⁴⁹ The commenter also asserts that this runs the risk that regulations are based on faulty science. Additionally, the commenter contends that ensuring EPA holds itself to the highest standards of transparency and reproducibility help to mitigate that risk, and this rulemaking is important in that regard. The commenter references the fact EPA has received comments from some who are invested in a system that enables them to receive grant money and publish research without having to subject their research to the rigors of reproducibility and asserts that EPA should understand the interests behind those comments when evaluating them. According to the commenter, science, like every human endeavor, is subject to human foibles. The commenter states that they have seen clearly biased scientists publish studies that are fatally

²⁴⁴⁸ Peer review: a flawed process at the heart of science and journals, Richard Smith, “*Journal of the Royal Society of Medicine*,” April 2006; Reproducibility, Marcia McNutt, “*Science*,” Vol. 343, Issue 6168, January 17, 2014.

²⁴⁴⁹ Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies, Office of Management and Budget, Fed. Register Vol. 67, No. 36, February 22, 2002, p. 8455.

flawed, funded by activists, purposefully misleading, even containing falsified results. The commenter notes that even when debunked through the peer review process, erroneous studies persist in the public domain and influence rulemaking at every level of government.

Commenter (11899) asserts that the problem of questionable scientific research and government Agency reliance on it has become systemic and systematic, stating the vast majority of studies in numerous scientific arenas cannot be replicated, even those published in “reputable” peer-reviewed scientific and medical journals that the vast majority. The commenter contends that incompetence and outright fraud are primary causes for irreproducibility. In the case of fraud, the commenter states that fraud can likewise arise from politically motivated regulatory actions and biased, secretive, highly selective studies and analyses conducted to support and justify predetermined Agency actions.

Response: The EPA agrees with commenters on the need and importance of greater transparency in science. Numerous public commenters on this rulemaking and some members of the EPA’s SAB noted concern about a “crisis” in science due to low reported success rates and noted support for the rulemaking as a potential solution. The EPA agrees that the low success rates published in reanalysis studies are potentially worrisome and also agrees with the National Academies of Sciences and others that the paucity of full data sharing makes it difficult to even systematically evaluate the extent of the problem within or across scientific disciplines. One barrier is having access to enough of the underlying data, models, and methods to be able to conduct the independent validation. Encouraging greater transparency and data and model sharing, then, is vital for individuals outside of the publication of the study to be able to verify the quality and strength of published studies and to identify and correct suboptimal research and publication practices, such as positive bias, p-hacking, and post hoc reasoning that may influence the results presented in a publication.^{2450,2451,2452,2453,2454,2455,2456,2457} Open sharing of data and models reduces duplication of effort from different researchers attempting to collect the same datasets and allows for the use and reuse of data and models among the research community. Scientific openness also improves the ability for the scientific community to validate research

results, helping to prevent errors and reducing the risk of fraud in science and research. Also, when data and models are made widely available, researchers can re-analyze the data for new and different purposes, examining novel questions and providing new scientific insights.

Scientific Community Initiatives

Comment: Commenter (10974) contends that the supplemental proposal does not integrate, nor does it provide solutions for or improvements to, the current work on data reproducibility within the scientific community. The commenter provides that, similar to how the supplemental proposal does not address an extant need for rulemaking regarding data transparency, the supplemental proposal (and 2018 proposal) do not support nor adequately address the existing efforts by all types of institutions to improve data transparency and availability issues.

Response: As discussed in the preamble to the final rule, the purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information. The requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

Validation as the Next Step to Addressing the Crisis

Comment: Commenter (11381) notes that the reproducibility/replication crisis convincingly shows that the IQG reproducibility requirement was justified in 2002 and is only more so today. In addition, the commenter asserts that reproducing an Agency work product or a third-party study, as that term is understood in the IQG, is not sufficient, and that validation is clearly the next step. However, the commenter provides that the supplemental proposal does not provide a credible basis for such a requirement. According to the commenter, the supplemental proposal

does not define the term, explain what Agency program offices are expected to do, describe how Agency peer review would be modified, or inform the public concerning how to test Agency claims. The commenter contends that new Part 30 needs a rigorous treatment of validation, and this almost certainly requires a second supplemental proposal. The commenter asserts that therefore, the best path forward is to promulgate the IQG in rule form now and commit to propose additional provisions on validation.

Response: The EPA agrees with the commenter on the necessity and importance of independent validation. The EPA would like to clarify that in the final rule the terms replicate and reproduce (or other forms of the word) are no longer used. In the final rule the term replicate is not used. The intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” In addition, the EPA is modifying the definition of “independent validation” in the final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30.

In consideration of these and other comments, the EPA also modified the final rule to provide additional detail and clarity, including text related to process of evaluating studies, identifying pivotal science, determining the consideration to afford pivotal science, and peer review. The EPA believes that the final rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

3.2.1.3.4 Process of Determining if Results Can Be Replicated

Comment: Commenter (11403) asserts that because scientists conduct their own rigorous review of others’ research, scientists do not need raw data to determine if a study was conducted correctly but rather are trained to do so by examining data collection and analysis methods to determine whether the results can be replicated. The commenter provides that when doctors prescribe a medicine, they have deemed effective, it is not because they have reviewed and analyzed the raw data of patients in the clinical trials themselves. Instead, according to the commenter states that they have reviewed the published papers on the medication and have seen both that the trials were done correctly and that the results were significant enough to prescribe the treatment. The commenter contends that this is no different with research scientists.

Response: The EPA disagrees with this commenter. Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule. Jamieson et al. (2019) state, “Journals play a key role in ascertaining the quality of the evidence in work submitted for publication through peer review. However, that practice is neither uniform nor free of exploitation. While it can

select for trustable results, its existence alone is not sufficient to verify the quality of the evidence used to back claims.”²⁴⁵⁸ The authors go on to say that additional confidence could be gained from third-party reanalyses that independently validate the study results.²⁴⁵⁹ In addition, as detailed in OMB’s Final Information Quality Bulletin for Peer Review, “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals²⁴⁶⁰ and the emergence of organizations, such as the Center for Open Science, and international initiatives like Findable, Accessible, Interoperable, and Reusable (FAIR) data principles; Facilitate Open Science Training in European Research (FOSTER); and Guidelines for Transparency and Openness Promotion (TOP) in Journal Policies and Practices that incentivize greater transparency in research.^{2461,2462} The EPA supports these efforts and believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety.

3.2.1.4 Feasibility of Reproducing Certain Studies

3.2.1.4.1 Capability to Obtain Scientific Information

Comment: Commenter (11381) provides that EPA often relies on scientific studies published in peer-reviewed journals. According to the commenter, obtaining and disclosing all information necessary to assure independent reproducibility is required to fulfil the IQG.^{2463,2464} Without a provision to obtain this information, the commenter asserts that EPA program offices will be expected to rely on the limited information disclosed in peer-reviewed journals,²⁴⁶⁵ which would prevent the achievement of the goal of transparency.

²⁴⁵⁸ Jamieson, K. H., McNutt, M., Kiermer, V., and Sever, R. (2019). Signaling the trustworthiness of science. *Proceedings of the National Academy of Sciences in the United States of America* 116(39):19231-19236. <https://doi.org/10.1073/pnas.1913039116>.

²⁴⁵⁹ Ibid.

²⁴⁶¹ NAS (National Academies of Sciences, Engineering, and Medicine). (2019). *Reproducibility and replicability in science*. Washington, DC: The National Academies Press. Available at <https://www.nationalacademies.org/our-work/reproducibility-and-replicability-in-science>.

²⁴⁶² Nosek, B. A. et al. (2015). Promoting an open research culture. *Science* 348, 1422-1425. Available at <https://doi.org/10.1126/science.aab2374>.

²⁴⁶³ Office of Management and Budget, 2002 #39’, p. 8459: “As a matter of good and effective Agency information resources management, agencies shall develop a process for reviewing the quality (including the objectivity, utility, and integrity) of information before it is disseminated.

²⁴⁶⁴ Office of Management and Budget, 2002 #39’, p. 8460

²⁴⁶⁵ In some situations, the commenter contends that the EPA routinely demands that third parties fully disclose information. According to the commenter, examples include FIFRA registration actions and other cases where third parties have information that contradicts or refutes the information that the Agency would, under the SNPRM, deem to be pivotal science. The commenter contends that this results in an obvious asymmetry. The commenter states that information that does support the Agency’s preferred decisions is already covered by a transparency requirement; information that supports such decisions tends to be exempt.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science,” “replication,” “reproducible,” and “research data” are not used in this final rule.

As further described in the preamble to the final rule, based on public comments and other considerations, the EPA is concentrating its efforts in the final rule to increase transparency of dose-response data, as the dose-response data are discrete and the dose-response assessment is a well-defined and impactful step in the quantitative assessment of risk. The EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA’s most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings. The final rule does not require the EPA to reproduce or evaluate the reproducibility of dose-response data. This rule is apart from and not intended to address potential issues with IQG. Future statute-specific rulemakings may be more expansive as the EPA continues to make incremental progress toward maximizing transparency.

Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

3.2.1.4.2 Ethical Issues

Comment: Commenters (11360, 11403, 11479, 11900, 12422, 12546, 12720) note that some public health studies are not reproducible due to ethical concerns. Specific concerns include:

Commenter (12422) queries whether studies on disasters like the Deepwater Horizon or Chernobyl would be discarded as they are not reproducible.²⁴⁶⁶

Commenter (11360) states that certain situations are either impossible to recreate or should not be due to the severity of health outcomes or the circumstances surrounding the exposures. The

²⁴⁶⁶ Michaels D, Burke T. The Dishonest HONEST Act. (editorial) Science 356:989 2017.

commenter provides that emergency responses to the 2010 Deepwater Horizon explosion and oil spill or a decade-long prospective cohort study on lead exposure in drinking water and adverse effects on childhood IQ would be difficult and unethical to replicate or reproduce.

Similarly, commenter (12546) provides that situations such as the 2010 Deepwater Horizon explosion and oil spill, health impacts from exposures during hurricanes such as Katrina and Rita, or a decade-long prospective cohort study on lead exposure in drinking water and adverse effects on childhood IQ would be impossible and unethical to replicate. According to the commenter, considering the severity of the health outcomes, dismissing or downgrading this critical research due to the Agency's proposed rigid transparency rule may result in regulatory delays in EPA's charge to protect human and environmental health.

Commenter (11403) provides that many public health studies—including those focusing on acute environmental impacts—are not reproducible because reproducing them would require intentional, unethical exposure of human beings, other living beings, or the environment to toxins.²⁴⁶⁷ The commenter notes that this is not a limitation, nor does it discount the importance and reliability of those studies. According to the commenter, ignoring or giving low priority to peer-reviewed studies because authors are unable to publish raw data or because it is not reproducible is arbitrary and capricious.

Commenter (11479) notes that in addition to privacy, trade secret, intellectual property, and other confidentiality concerns with the underlying data, certain studies, such as observational studies, must be used and it is often not possible or ethical to recreate the conditions under which people were exposed to a contaminant. The commenter contends that the provisions in the proposed rule that require reproducibility are inconsistent with provisions in OMB guidance that state the reproducibility standard cannot be applied to all science.²⁴⁶⁸

Commenter (12720) states that the reference dose for mercury is based on an extensive analysis and calculations derived from three longitudinal epidemiologic studies: the Seychelles Islands, the Faroe Islands, and the New Zealand studies.²⁴⁶⁹ The commenter notes that the studies can no longer be reproduced, particularly the Faroe Islands study in which the exposure to the community was a result of eating whales, a practice that has since declined due to public alerts about the hazards of eating the mercury-tainted meat particularly for children and pregnant and breastfeeding women. In addition, the commenter provides that it would take decades to repeat the studies, which took decades to conduct in the first place. According to the commenter, if EPA may no longer rely on these studies under the supplemental proposal, the Agency will not have access to the information it needs to ensure its regulations are sufficiently protective of public health.

²⁴⁶⁷ Letter from scientists to Scott Pruitt: <https://s3.amazonaws.com/ucs-documents/science-and-democracy/secret-science-letter-4-23-2018.pdf>.

²⁴⁶⁸ OMB. 2002. Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies; Republication, February 22, Washington DC. Online at <https://www.federalregister.gov/documents/2002/02/22/R2-59/guidelines-for-ensuring-and-maximizing-the-qualityobjectivity-utility-and-integrity-of-information>, Accessed May 14, 2020.

²⁴⁶⁹ Rice DC. The US EPA reference dose for methylmercury: sources of uncertainty. Environ Res. 2004 Jul;95(3):406–13. <https://www.ncbi.nlm.nih.gov/pubmed/15220074>.

Commenter (11900) contends that many foundational human environmental public health studies cannot be replicated because people are no longer exposed to the hazards at high levels—often thanks to public health action taken in response to these same studies. The commenter provides that replicating the high levels of exposure observed in these studies is unethical and impossible, because it would involve intentionally exposing people to a harmful chemical. Even if these studies could be repeated, the commenter states that doing so would be a tremendous waste of time and funds. As such the commenter asserts that research initiated prior to the effective date of this rule be exempt from the requirement of the rule.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science,” “replication,” “reproducible,” and “research data” are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information for which the conclusions are driven by the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA to reproduce or evaluate the reproducibility of dose-response data.

3.2.1.4.3 Availability of Resources

Information from Previous Studies is Unavailable

Comment: Commenter (11576) notes that there are studies for which the availability of information is limited and cannot be replicated.

Response: In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.”

Further, although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal

science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that is unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator as detailed under 40 CFR 30.7.

Certain Studies May Not be Reproducible with Standard Resources

Comment: Commenter (11389) provides that some data, such as the Tropospheric Monitoring Instrument (TROPOMI) methane concentration dataset, are not easily manipulated without significant computing resources unavailable on a typical personal computer. The commenter states that, as a result, studies conducted using these data are not necessarily reproducible by a person without these resources.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science,” “replication,” “reproducible,” and “research data” are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information for which the conclusions are driven by the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA to reproduce or evaluate the reproducibility of dose-response data. Further, the EPA includes the term “subject matter expert” in its definition of independent validation to acknowledge that this work requires some level of expertise.

3.2.1.4.4 Depersonalized Data Does Not Allow for Reproduction

Comment: Commenter (11921) asserts that it is not possible to conduct a high-quality air pollution and health study without knowing the locations of those being studied, i.e. where they live, the sources and levels of their air pollution exposure, as well as their specific covariates, and specific health outcomes. The commenter states that, since the goal should be to find ways to share data that enables full replication and sensitivity analysis of original studies, it is valuable to consider several aspects of large population air pollution studies that have moved them towards utilizing data at smaller spatial scales, including:

- the utilization of land use regression and other methods that can account for the distance of a subject’s home from roadways, industrial facilities, and other sources of

- air pollution and finer-grained community-level covariates to address earlier air pollution study reliance on central air quality monitoring data,
- as well as address two potentially significant sources of uncertainty in results: the so-called “ecological confounding”²⁹ and “spatial autocorrelation.”³⁰, by using data at smaller scales.

The commenter notes that while these have generally enhanced the quality and sensitivity of the studies, these characteristics increase the difficulty of providing a fully “de-identified” data set while also enabling a different investigator to conduct a full replication and sensitivity analysis of the original study results. As such, the commenter asserts that analyses using more limited data sets may well therefore result in incomplete and misleading results.

Response: The Agency recognizes that the 2018 NPRM used terms that were not fully defined or not defined at all. The 2020 SNPRM addressed a number of these comments. To address the concerns expressed by commenters, in this final rule, in Part 30.2, the EPA is defining the following terms: “data,” “dose-response data,” “independent validation,” “influential scientific information,” “pivotal science,” “publicly available,” “reanalyze,” “science that serves as the basis for informing a significant regulatory action,” and “significant regulatory actions.” The terms “pivotal regulatory science,” “replication,” “reproducible,” and “research data” are not used in this final rule.

This final rule establishes how the EPA will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. When promulgating significant regulatory actions or developing influential scientific information for which the conclusions are driven by the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, the EPA will give greater consideration to studies where the underlying dose-response data are available in a manner sufficient for independent validation. The final rule does not require the EPA to reproduce or evaluate the reproducibility of dose-response data. Further, the EPA includes the term “subject matter expert” in its definition of independent validation to acknowledge that this work requires some level of expertise.

3.2.2 Reanalyze

3.2.2.1 EPA’s Position on Reanalysis

Comment: Commenter (12645) states that on a particularly important point, the definition of the science subject to EPA’s new requirement, EPA has a lengthy paragraph in the *Federal Register* notice that is almost word-for-word from the National Academies of Science (NAS) Workshop report’s account of what was said by Dr Lynn Goldman who chaired the workshop. The commenter notes that no citation is given to the speaker. The commenter provides below the wording in the workshop report to which the commenter has added track changes to demonstrate how EPA has edited these remarks to remove any language that would make it seem other than an NAS consensus report. The commenter provides EPA’s language from the *Federal Register* following the statements from the NAS workshop.

[The commenter provides Dr. Goldman's statement with tracked changes from a NAS Workshop on Principles and Obstacles for Sharing Data from Environmental Health Research. The tracked changes are shown here with strikethrough. The *Federal Register* language is provided afterwards and is underlined for comparison.]

~~There are various approaches to testing and validating previous scientific work, she said.~~ "A *reanalysis* is when you conduct a further analysis of data." A person doing a reanalysis of data may use the same programs and statistical methodologies that were originally used to analyze the data or may use alternative methodologies, but the point is to analyze exactly the same data and see if the same result emerges from the analysis.

"*Replication* means that you actually repeat a scientific experiment or a trial to obtain a consistent result," ~~she continued.~~ The second experiment uses exactly the same protocols and statistical programs but with data from a different population. The goal is to see if the same results hold with data from a different population.

~~"And then, finally, When you *reproduce*, you are producing something that is very similar to that research, but it is in a different medium or context," she said. In other words, a researcher who is reproducing an experiment addresses the same research question but from a different angle than the original researcher did. "Most of us, when we are doing systematic reviews, are more convinced that something is going on when we see reproducibility as well as replicability."~~²⁴⁷⁰

[*Federal Register* language]

A *reanalysis* is when you conduct a further analysis of data. A person doing a reanalysis of data may use the same programs and statistical methodologies that were originally used to analyze the data or may use alternative methodologies, but the point is to analyze exactly the same data and see if the same result emerges from the analysis.

Replication means that you actually repeat a scientific experiment or a trial to obtain a consistent result,. The second experiment uses exactly the same protocols and statistical programs but with data from a different population. The goal is to see if the same results hold with data from a different population.

When you *reproduce*, you are producing something that is very similar to that research, but it is in a different medium or context. In other words, a researcher who is reproducing an experiment addresses the same research question but from a different angle than the original researcher did.²⁴⁷¹

Commenter (12645) states further that by removing the quotation marks and "she said" language from the Workshop statement, EPA hides the fact that this was the opinion of an individual

²⁴⁷⁰ National Academies of Science, 2016. Principles and obstacles for sharing data from environmental health research: Workshop summary. National Academies Press, Washington, DC, pg. 6

²⁴⁷¹ Strengthening Transparency in Regulatory Science. EPA-HQ-QA-2018-0259-9322 Regulations.gov, March 18, 2020. Page 6

speaker rather than the consensus of an NAS Committee. The commenter suggests that EPA's omission of the last sentence from the workshop paragraph which clearly is at odds with EPA's goals was also highly misleading. The commenter notes that stated in that summary sentence is that environmental health science inherently moves forward by "reproducibility as well as replicability" which is contrary to EPA's focus on reanalysis of existing data by industry consultants. The commenter notes that had it been known to the readers of the *Federal Register* announcement that it was Dr Goldman who was being directly quoted they could have looked up her views on EPA's transparency proposal where they would have found that she is in fact strongly opposed to this action. The commenter states that the standard way of deciding what influences a decision in both science and law is to look at the references cited which clearly have influence, or they would not have been cited. The commenter suggests that another reasonable inference is that, "pivotal" findings should certainly be among these references, and would likely be among the most highly referenced. The commenter adds that in both science and law, the references chosen to be cited are crucial determinants of the probity and validity of the argument advanced, so it is highly ironic that EPA has misled the public in this disgraceful way.

Commenter (12645) asserts that EPA's heavy reliance on the NAS is also ironic in that the current EPA leadership has steadfastly refused to consult the Academies on any of the issues related to its attempts to change the scientific processes at EPA. The commenter states that, similarly, in violation of congressional mandates, EPA has not involved its external scientific committees in considering the rationale for any of its major proposed changes in EPA's scientific processes.

Commenter (12645) states that it is unclear as to whether this deception is unintentional or intentional. The commenter asserts that if unintentional, it is one more piece of evidence as to how out of touch EPA's policy leadership is with its own scientists, let alone the scientific community.²⁴⁷² The commenter argues that presence of appropriate quotation marks in a footnote in the *Federal Register* notice describing an OMB directive supports the likelihood that the intention was to deceive.

Response: First, EPA disagrees with the commenter's implication that EPA was being misleading. EPA explicitly explained the source of the information it was using for the definitions in the preamble. Indeed, EPA clearly identified it as an NAS workshop report. Further, the document is easily obtainable, so that any reader of the *Federal Register* notice for the supplemental proposal could easily obtain the document. Second, the commenter is correct that anyone could easily retrieve Dr. Goldman's opinions as well as her extensive body of work in this area. In summary, EPA disagrees that the Agency was being deceptive.

As to the commenter's comment about Dr. Goldman's opinions, her participation on the 2016 NAS Workshop predates 2018 proposed rule. Thus, her opinions on the 2018 proposed rule are not relevant to her participation in the 2016 NAS workshop.

²⁴⁷² Bernard D. Goldstein. How EPA Administrator Wheeler completely misinterprets science. The Hill, 6/20/19. <https://thehill.com/opinion/energy-environment/449465-how-epa-administrator-wheeler-completely-misinterprets-science>

The EPA consulted with the Science Advisory Board (SAB) on the 2018 proposed rule in August 2019. In addition to the consultation, the SAB elected to review the scientific and technical basis of the 2018 proposed rule and provided a report to the EPA in April 2020. In the report, the SAB recognized the importance of the purpose of this rule and provided recommendations to improve its technical feasibility. Comments related to EPA's consultation with NAS or SAB on issues unrelated to this rule are outside the scope of this rulemaking.

Finally as to the comment that summary sentence is that environmental health science inherently moves forward by “reproducibility as well as replicability,” EPA agrees. However, the focus of this rule is transparency which does not conflict with this statement from the 2016 NAS workshop report.

Comment: Commenter (11381) suggests that if the Information Quality Guideline (IQG) framework were used as the baseline, reanalyze/reanalysis has no value-added. The commenter states that under the IQGs, it does not matter whether information is original or derivative; it is all covered if it is disseminated by an Agency. The commenter adds that under the IQGs, a “high degree of transparency is required if the information is influential,”²⁴⁷³ again, independent of whether the information is original or derivative.

Response: While this rule builds on the IQG, it is not equivalent. The rule applies to a different stage of data than that covered by the IQG. This rule applies to an earlier stage of data than discussed in the IQG. In particular, see the 2020 SNPRM Section III.B for a discussion of stage of data and Section III.C of the preamble to the final rule. Reanalysis of the earlier stage of data provides for a greater degree of transparency.

Commenter (12699) states that it is unclear why EPA only mentions “data and models” at the start of § 30.5, as this is just a subset of information that underlies pivotal regulatory science and pivotal science. The commenter suggests that EPA appears to recognize this in both versions of § 30.5, when it states, “information is considered ‘available in a manner sufficient for independent validation’ when it includes the information necessary to understand, assess, and reanalyze findings.” The commenter recommends that EPA should be focusing § 30.5 on all information necessary to understand, assess, and reanalyze findings (basically, in plain English, as a general rule, the public should have access to whatever information is necessary to evaluate a study). The commenter states that the list of examples in § 30.5 includes some of the additional information that is necessary, including computer codes and “associated protocols necessary to understand, assess, and extend conclusions.”

Response: This rule applies to dose-response data not data and models. EPA has modified 40 CFR 30.5 to incorporate many of the suggestions by the commenter. This includes by adding the following language to 40 CFR 30.5(b): “The EPA will use the following factors to assess the quality of studies identified in the systematic review: soundness, applicability and utility, clarity

²⁴⁷³ Office of Management and Budget (2002, p. 8460). “‘Influential’, when used in the phrase ‘influential scientific, financial, or statistical information’, means that the agency can reasonably determine that dissemination of the information will have or does have a clear and substantial impact on important public policies or important private sector decisions. Each agency is authorized to define ‘influential’ in ways appropriate for it given the nature and multiplicity of issues for which the agency is responsible.”

and completeness, uncertainty and variability, and evaluation and review”. The information needed to assess these factors are generally included in a study when published and available to the public.

Comment: Commenter (11892) suggests that the proposed rule should consider alternative sites, or methods, rather than the same data for a reanalysis, and these can also be corroborative findings or show limitations or expansion of using results. The commenter notes that this is particularly for field studies in wetlands and waters, where regional site characteristics may provide differing results and that reasons for the difference can be further explored, but some results may be more applicable for certain uses or areas than others and should be considered.

Response: The commenter describes essentially reproducing results as described in the 2016 NAS Workshop report: “When you reproduce, you are producing something that is very similar to that research, but it is in a different medium or context.” While reproducing a study is helpful, it does not result in increasing the transparency of a study that EPA uses as pivotal science which is the purpose of the rule.

Commenter (12712) does not support the modified rule to the extent that it suggests that significant EPA regulations may give "consideration" to studies based on data that is neither publicly available nor available through tiered access. The commenter states that this is too vague. The commenter believes that no such study, by definition unavailable for reanalysis by independent researchers, should even be a factor in an EPA decision to regulate. The commenter believes that the requirement in many of the statutes that EPA administers to the effect that regulations must be based on the "best available science" fully supports, and indeed may be argued to require the transparency rule. The commenter asserts that science proceeds by replication -- and what the rule calls reanalysis -- and without data availability, this process cannot happen.

Response: EPA disagrees that its approach is too vague. EPA has listed factors at 40 CFR 30.5 that it shall consider when determining the consideration to afford pivotal science for which the dose-response data are not available for independent validation. These are:

- (1) the quality of the study relative to other studies for which the dose-response data are available;
- (2) the extent to which there are other studies for which the dose-response data are available;
- (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- (4) the extent to which the study is fit for the purpose or intended use relative to other pivotal science for which the dose-response data are available;
- (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- (6) the extent to which the study is supported by other scientific evidence;
- (7) the extent to which the study accounted for unique scientific considerations;
- (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and

- (9) the study’s consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

Further, as EPA has described in Section III.E of the preamble, only using studies in which the underlying dose-response data are available for independent validation would categorically exclude many valid studies. How EPA and the courts have interpreted the requirement to use best available science under the environmental statutes EPA administers is not consistent with a categorical exclusion of studies that include dose-response data that cannot be made available for independent validation.

Comment: Commenter (12715) provides that in some cases, the data and models used in a reanalysis would not be available to the public. Therefore, the commenter states that the EPA could use a reanalysis, its own or that of another party, which differs from the analysis provided in the original publication of the study, and the data and models underlying this reanalysis would not be available to the public. According to the commenter, this conflicts with EPA’s stated goal of increasing transparency.

Response: Upon consideration of the comments, the EPA agrees that it is important not to categorically exclude any study because the data underlying a study at the stage required by this rulemaking may not be available for independent validation. EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Further, the rule does not require any entity, including EPA, to conduct independent validation.

3.2.2.2 Definition of “Reanalyze” and Related Terms

Comment: Commenters (9587, 11401, 12406) support the clarity achieved by defining “Capable of being substantially reproduced”, “Data”, “Independent validation”, “Influential scientific information”, “Model”, “Pivotal science”, “Publicly available” and “Reanalyze”.

Response: EPA notes the commenters support. However, as described in the preamble to the rule, EPA is not finalizing the definitions of “capable of being substantially reproduced” or “model.”

Comment: Commenter (9587) notes that EPA would be well-served by a systematic reform to provide clear definitions of all terms relevant to policymaking. The commenter suggests that EPA, following government best practices in the Department of Defense,²⁴⁷⁴ institute a formal ontology to establish terminological exactitude in all policymaking.²⁴⁷⁵

²⁴⁷⁴ 3 DM2, DoDAF Formal Ontology, DoD Architecture Framework Version 2.02, DoD Deputy Chief Information Officer, Department of Defense, https://dodcio.defense.gov/Library/DoDArchitecture-Framework/dodaf20_ontology1/.

²⁴⁷⁵ Ontology for Government, National Center for Ontological Research, University at Buffalo, <https://ubwp.buffalo.edu/ncor/quick-start/ontology-for-government/>.

Response: This comment is outside of the scope of this rulemaking.

Comment: Commenter (12454) is concerned the proposed language could be interpreted as excluding subsequent reanalysis of the data used to develop a rule during the period between the proposed rule and the final rule. The commenter requests that EPA include language explicitly addressing data reanalysis in its final rule.

Response: The rule does not require that a reanalysis be done at any time or even at all. The rule requires that EPA give greater consideration to pivotal science where the underlying dose-response data are publicly available in a manner sufficient for independent validation.

Comment: Commenter (12727) suggests that EPA's proposed definition for "capable of being substantially reproduced" attempts to make "reanalysis" synonymous with "reproduce," which is wholly inappropriate. The commenter states that to use the term "reproduced" in this context is to mislead the public into believing that some new scientific insights have been applied to an original set of data such that the original research findings are made stronger. The commenter asserts that this definition highlights a fundamental misconception underpinning the premise of the proposal—that somehow independent validation is accomplished through reanalysis of study data by other experts. The commenter argues that the strength of scientific findings are not determined by endless reanalysis of a single data set, but rather gained over time through the conduct of separate investigations utilizing different methodologies that yield corroborating conclusions around a hypothesis being explored.

Response: EPA has not finalized "capable of being substantially reproduced". In his rule independent validation of pivotal science occurs through the reanalysis of the underlying dose-response data. This rule does not define independent validation as reproducing results of a study in another context or with another population.

Comment: Commenter (12720) states that in the definition for "reanalyze", EPA does not restrict reanalysis to "subject matter experts" as it did for "independent validation." The commenter notes that EPA does not describe any assumptions underlying analyses that may lead a person to fail to arrive at the "same result" despite analyzing "exactly the same data" and does not clarify what the "same result" is to be interpreted as. The commenter states that this definition focuses on using the "same" data but allows for "the same or different statistical software, models, and statistical methodologies," yet expects "the same result" to emerge, which is problematic. The commenter asserts that this definition clashes with the reality that, even using the same underlying data, changes in software, modeling approach, and statistical techniques would reasonably be expected to deliver results that are not exactly "the same" as results produced in an original analyses. The commenter concludes that EPA's definition is unreasonable, illogical, and flawed.

Response: EPA has finalized the definition of "reanalyze" at 40 CFR 30.2 to specify the use of "the same methods, statistical software, models, or statistical methodologies that were used to analyze the dose-response data."

There is no need to restrict “reanalysis” to “subject matter expert” because “reanalysis” is done for purposes of “independent validation.” It is sufficient that the latter definition restricts it.

Comment: Commenter (11381) states that the supplemental proposal definition for “reanalyze” (and its cognate noun, reanalysis) is narrow; to be covered, a reanalysis must use “exactly the same data”. The commenter suggests that this definition is incompatible with one of the Agency’s stated purposes – “to assess potential analytical errors and variability in the underlying assumptions of the original analysis.” The commenter states that such assessments typically require additional data, different data, or alternative formulations of the same data, none of which can be exactly the same. The commenter asks: What would happen under new Part 30 to information that is neither data nor models, or even if within those terms, not exactly the same? The commenter believes such information would be exempt from the provisions applicable to that which is included within reanalyze/reanalysis.

Response: Information that is not dose-response data would be outside the scope of the final rule.

Comment: Commenter (12715) is concerned that the supplemental proposal’s new definition of “reanalyze” could ultimately result in scientific decisions being made based on reanalysis of data with different models and assumptions than those used by the original researcher(s), thereby altering the scientific conclusions presented in the originally published and peer-reviewed scientific study.

Response: The rule does not require that EPA or any other party reanalyze dose-response data before EPA can consider it in its decision making.

Comment: Commenter (11575) states that EPA’s definition of reanalysis should not include the use of different statistical software, models, and methodologies, as it should limit the definition to only the use of the same methods. The commenter notes that the use of different statistical tests to assess the same data is a new analysis rather than a reanalysis. The commenter asserts that EPA has failed to specify the stage of data required for reanalysis and has not considered the implications of this definition on all types of data and models expected to be impacted by the expanded scope of this rulemaking. The commenter states that in the absence of specifying a consistent framework for the types of statistical analyses required for specific types of data to ensure consistency across reanalyses, the ambiguity in the definition of reanalysis invites opportunities for manufacturing uncertainty through conflicting results from alternative statistical tests. The commenter asserts that this approach inherently violates standard scientific process as attempts for reanalysis will disproportionately be targeted towards findings some would like to undermine.²⁴⁷⁶ Commenter (11495) states that EPA has clarified in the supplemental proposal that the proposed actions are no longer premised on “replication” but rather on “reanalysis” of published scientific studies. The commenter adds that the existing discussion of reanalyzing data is problematic, with potentially severe consequences to quality and pragmatism. The commenter suggests that using the same data, program and statistical methodologies should yield similar results to published studies and is a viable definition of what

²⁴⁷⁶ Raymond Richard Neutra, et al., Toward Guidelines for the Ethical Reanalysis and Reinterpretation of Another’s Research, *Epidemiology* (May 2006) (attached to comment letter), available at https://journals.lww.com/epidem/Fulltext/2006/05000/Toward_Guidelines_for_the_Ethical_Reanalysis_and.21.asp.

it could mean to perform a reanalysis of a published study. The commenter notes that using different statistical software while using the same data and methodologies could also be a potentially useful form of reanalysis to ensure that results are not driven by quirks in the specific software used by study authors but this rule goes far beyond that definition.

Commenter (11495) states that in terms of the provided definition in the supplemental proposal, reanalysis using “alternative methodologies” should not necessarily be expected to deliver the same results as the original study. The commenter states that even in cases when alternative methodologies do provide the same results, these results would need to be interpreted differently given that an alternative methodology was employed. The commenter believes this is a far cry from what is traditionally referred to as a reanalysis in which new information or variables are added to a previous analysis to test new research questions. The commenter states that reanalysis studies of this type can be informative, but it has never been the expectation that someone interested in conducting such a study is entitled to having someone else do the majority of the work in preparing all of the data for continued study.

Response: EPA has finalized the definition of “reanalyze” at 40 CFR 30.2 to specify the use of “the same methods, statistical software, models, or statistical methodologies that were used to analyze the dose-response data.”

EPA has explicitly explained the stage of data that should be considered. In particular, see Section III.B. of the 2020 SNPRM which discusses different stages of data. Also, see Section III.C of the preamble to the final rule.

EPA disagrees that reanalysis of data is equivalent to having someone else do the study for them. The study will be conducted and published by the first author(s). The person doing the reanalysis did not conduct the study, generate the data or publish the study. The person doing the reanalysis will use the data from the first study, reanalyze the data and determine if the same results were achieved.

Comment: Commenter (11479) states that EPA’s draft rule, as modified in the supplemental notice, reveals that the Agency wants to use original data and methods to reanalyze rules and prove that they are reproducible before using them to support a rule. The commenter claims that the supplemental notice still has not clarified what it means by “capable of being substantially reproduced,” and it contradicts itself. The commenter states that in the notice, EPA defines “capable of being substantially reproduced” as “independent analysis of the original or supporting data using identical methods would generate similar analytic results, subject to an acceptable degree of imprecision or error” but goes on to cite a NAS workshop report that defines reproducibility as “producing something that is very similar to that research, but is in a different medium or context. In other words, a researcher who is reproducing an experiment addresses the same research question from a different angle than the original researcher did.”²⁴⁷⁷ The commenter believes that EPA is disguising its quest to cherry-pick evidence with unclear

²⁴⁷⁷ National Academies of Sciences, Engineering, and Medicine. 2016. Principles and obstacles for sharing data from environmental health research: Workshop summary. Online at <https://www.nap.edu/catalog/21703/principles-andobstacles-for-sharing-data-from-environmental-health-research>, Accessed May 14, 2020.

definitions of reanalysis, independent validation, and “capable of being substantially reproduced.”

Response: EPA agrees with commenters that “capable of being substantially reproduced” is confusing and inconsistent with the other defined terms. EPA has not finalized a definition of “capable of being substantially reproduced.”

EPA disagrees that its definitions of “reanalyze” and “independent validation” are an attempt to cherry pick evidence. The definition of “reanalyze” is based on and indeed is very close to the definition in the 2016 NAS Workshop report cited and discussed in Section III.B of the 2020 SNPRM. The definition of “independent validation” hinges in large part on the definition of “reanalyze.”

Comment: Commenter (11392) states that the proposed definition for "reanalyze" would introduce the risk of data manipulation into the Agency's regulatory process. The commenter states that by naming "different programs and statistical methodologies" as legitimate methods for the reanalysis of a body of data, the Agency would permit external entities with vested interests to deliberately deploy biased methodologies in order to reach different results from the same data. The commenter states that analyzing data with different methodologies will frequently lead to different results, but the Agency does not explain how the existence of different results would help improve the Agency's policymaking. The commenter suggests that EPA lacks any objective means to evaluate the superiority of one methodology over another as a part of the reanalysis process. The commenter asserts that the proposed definition would therefore result in confusion about how a study should be interpreted and undermine the role of scientific data in the Agency's regulatory process. The commenter recommends that EPA clarify why its proposed definition of "reanalyze" permits different methodologies to be used in reanalyzing study data, describe the process that it will utilize to assess divergent methodologies, and justify how the definition is consistent with the Agency's obligation to consider the best available science.

Commenter (11892) recommends developing different terms for analyzing the exact same data and method vs. different method or model for analysis. The commenter notes that models can be biased toward certain outcomes and recommends measures be in place to prevent rejection or acceptance of results due to bias in analysis.

Commenter (11576) states that the EPA’s definition of reanalysis should not include the use of different statistical software, models, and methodologies, as it should limit the definition to only the use of the same methods. The commenter asserts that the use of different statistical tests to assess the same data is a new analysis rather than a reanalysis.

Response: EPA has taken into consideration the comments and has finalized the definition of “reanalyze” at 40 CFR 30.2 to specify the use of “the same methods, statistical software, models, or statistical methodologies that were used to analyze the dose-response data.”

3.2.2.3 Issues Associated with Reanalysis

3.2.2.3.1 Protocols are Needed for Reanalysis

Comment: Commenter (11495) states that the supplemental proposal only requires data be made publicly available to support reanalysis but does not discuss circumstances in which reanalysis might actually occur and how the Agency would respond to such activities.

Commenter (12617) asserts that the supplemental proposal’s expansion of research that may have to be reanalyzed is unrealistic and vulnerable to manipulation. The commenter notes that when imagining what reanalyzing even a portion of relevant studies would look like, it sounds like a plan to hopelessly bog down the regulatory process. The commenter states that the Agency gets to choose which studies must be reanalyzed—by unknown criteria—by “subject matter experts” and “stakeholders.” The commenter adds that, according to the proposal, reanalysis means not just performing the same data processing as the study authors but also experimenting with adding *additional variables to models* and *additional assumptions and methods* in the statistical analysis. The commenter asserts that a single study could hold up crucial rulemaking for years, perhaps indefinitely, as the Agency’s chosen subject matter experts and stakeholders go through these layers of reanalysis—especially if a stakeholder has an interest in slowing down or preventing a rule that, say, limits pollution.

Commenter (12720) reiterates comments provided in the SAB’s review of the supplemental proposal.²⁴⁷⁸

The SAB finds that requiring the identification of all studies and regulatory science supporting regulatory actions and making them available for reanalysis will be a complex process. As previously discussed, identifying and making “pivotal science data or studies” available could present challenges if some studies were considered in the regulatory decisions but were not used to determine the point of departure (POD) or reference dose (RfD) or other regulatory/technical level. It is not clear how much information and which studies should be included in the requirement to identify and make studies available. As further discussed in Sections 3.2 and 3.3 of this report, if the intent of the rule is to make available for reanalysis “all underlying pivotal science supporting influential scientific information and/or pivotal regulatory science” that contributed to the ultimate regulatory decision, then practical procedures must be established for an independent validation.

Response: The rule does not require that EPA or any other party reanalyze dose-response data and consider it in decision making. Thus, this rule does not include requirements for how a reanalysis should be conducted or how it should be used.

²⁴⁷⁸ EPA Science Advisory Board letter to Administrator Wheeler. EPA-SAB-20-005. 2020. “Science Advisory Board (SAB) Consideration of the Scientific and Technical Basis of EPA’s Proposed Rule Titled Strengthening Transparency in Regulatory Science,” April 24, 2020.
<https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebReportsLastMonthBOARD/44DDFBB49B6E46AD852584430056804E?OpenDocument&TableRow=2.3#2>

EPA will identify the pivotal science that includes dose-response data available for independent validation at the proposed rule stage for significant regulatory action and when influential scientific information is submitted for peer review which will provide the public the opportunity to comment on EPA's characterization and choice.

Comment: Commenter (11186) states that the rule does not provide information on the logistics of reanalysis. The commenter questions who would do the reanalysis and how much would this cost. The commenter notes that to access data, there would need to be a process involving an extensive protocol, servers to store data, and trained and qualified "re-analyzers", which would result in tremendous costs and time that would be better spent in research studying the prevention and treatment of adverse health outcomes.

Response: The rule does not require that EPA or any other party reanalyze dose-response data and consider it in decision making.

This rule does not require that any party either access data or make data available for independent validation.

Comment: Commenter (11496) asserts that re-analysis of studies already peer-reviewed and published in the scientific literature is not justified. The commenter does not consider the reanalysis of peer-reviewed and published data a legitimate purpose since pivotal regulatory decisions are already peer-reviewed and supported by a broad weight and range of evidence. The commenter states that even if distribution of private health information for reanalysis is a valid research proposal, EPA has not articulated how reanalysis requests and plans will be vetted or peer-reviewed and how the results of these exercises will be published or shared in a transparent process.

Response: The rule does not require that EPA or any other party reanalyze dose-response data before EPA can consider it in its decision making.

Comment: Commenter (10339) states that practical details about the implementation of the rule remain unresolved, including many issues raised by the EPA's Science Advisory Board draft report on the scientific and technical basis for the rule. The commenter notes that it is not clear precisely if/how EPA will pursue tiered access to data or make a final determination on whether the level of access is sufficient to be compliant with the rule.

Response: EPA will address how it will determine whether dose-response data are available for independent validation as it develops its implementation processes for the rule. The final rule does not require EPA to obtain, store or disseminate dose-response data nor does it require EPA to conduct independent validation of pivotal science.

3.2.2.3.2 Resources Required for Reanalysis

Comment: Several commenters (11921, 11408, 11492) state that it would be costly to EPA and external parties to reanalyze all the studies given the large number of studies with data and models.

Commenter (11495) states that the Supplemental Notice creates a new, complex and potentially resource- and time-consuming process at EPA without any discussion of parameters by which they would respond to the very activity that they are hoping to enable.

Response: The rule does not require that EPA or any other party reanalyze studies before EPA can consider it in its decision making.

3.2.2.3.3 Conflicting Reanalysis Results

Comment: Commenter (11361) notes that a crucial piece of omitted information in the supplemental proposal and the 2018 proposal relates to what will happen in the event of conflicting reanalyses of data. The commenter states that there is a complete lack of information provided about what could happen if an attempted independent validation conflicted with original study results. The commenter states that EPA provides no metrics for evaluating the appropriateness of methods used in a reanalysis, and conspicuously, provides no information about how a conflicting reanalysis result would impact the EPA's consideration of a study. The commenter observes that this obvious omission introduces another way in which this proposed rule could be manipulated and result in the dismissal of credible scientific studies.

Response: This rule is not intended to address the results of the independent validation through reanalysis. The purpose of the rule is transparency. EPA is increasing the transparency of its significant regulatory actions and influential scientific information by giving greater consideration to more transparent studies.

3.2.2.3.4 Potential for Bias

Comment: Commenter (11479) states that reanalyzing every study used by the EPA is unattainable and setting a goal of reanalysis may give stakeholders excessive power to weaken EPA's regulatory decisions. The commenter suggests that under the supplementary proposal, industry and others could pick apart the modeling done by the agency to assess residual risk of air pollution impacts of industrial facilities on communities and then challenge the agency's assessment of risks to communities.

Commenter (9455) states that allowing regulated industry-funded scientists to flood the regulatory process with "reanalyses", new "studies", and "independent validations" invites corruption of the regulatory process and failure to generate needed standards and policies. The commenter states that rather than introducing greater transparency and better science, this unethical program will muddy the process and introduce biased pseudoscience.

Commenter (9455) states that EPA wants all studies that support public policies and/or standard-setting to be posted for re-analysis and alternative modeling. The commenter is concerned that this opens the regulatory process to infinite delays and infinite debate without any clear scientific advantage. The commenter notes that the regulated industries have large resources to fund analyses and critiques that "prove" there is no need for regulation or other policy-making. The commenter states that in this proposed rule, EPA has failed to develop mechanisms for preventing unnecessary delays in setting needed standards or generating needed policy, as well

as mechanisms to prevent conflict-of-interest bias from entering into data assessment, re-analyses, and alternative modeling. The commenter adds that nothing is said about assessing the quality of the re-analyses, alternative modeling, or independent validations. Commenter (11575) notes that several examples exist within public-health and epidemiological studies where reanalysis funded by industry groups resulted in the emergence of less protective results related to toxicity or mortality estimates for different compounds.²⁴⁷⁹ The commenter concludes that without consistent guidelines for when reanalysis is required and what statistical tests are utilized, the proposal risks introducing bias through “statistical fishing expeditions.”²⁴⁸⁰

Response: EPA disagrees that the rule will lead to the weakening of EPA’s regulatory decisions. The rule does not require EPA or any other party, including stakeholders, to pivotal science based on dose-response data before EPA can use those studies. Stakeholders and other interested parties can raise challenges to the science underlying EPA’s significant regulatory actions and influential scientific information regardless of whether they reanalyze the studies in question.

Comment: Commenter (11495) states that there is a lack of clarity over who the “stakeholders” involved in data reanalysis may be, and the suggestion that they may cherry pick data to force into models that support “alternative assumptions” goes directly against the scientific process and certainly looks at least superficially like exactly the sort of bias the EPA is hoping to avoid with their rule.

Response: It is not necessary or possible for EPA to describe the universe of stakeholders that may decide to conduct independent validation of pivotal science used in significant regulatory actions and influential scientific information. Also, the rule does not require any entity, including EPA, to conduct independent validation before EPA can consider pivotal science based on dose-response data.

Comment: Commenter (12715) states that, although the supplemental proposal requires that data be available in a manner that allows reanalysis, it does not require that EPA perform a reanalysis of the data of every study that is used as the basis for decision-making, and no criteria for determining when a reanalysis would be performed are provided. The commenter states that, therefore, EPA could selectively decide whether to rely on a reanalysis based on how the results of the reanalysis compare with the original analysis performed by the researcher and EPA’s preferred outcome. The commenter notes that it is not clear whether the sitting Administrator—a political appointee—could require independent validation of studies that he or she finds

objectionable. The commenter suggests that all of this is contrary to the proposed rule's stated goal of increasing transparency.

Response: The rule does not require that reanalysis be conducted nor does it designate that a reanalysis be given preferential treatment as pivotal science. Any reanalyses would be considered with other information provided to EPA as it develops significant regulatory actions and influential scientific information.

3.2.2.3.5 Reanalysis Requirements May Restrict Use of the Best Science

Comment: Commenter (11392) states that the proposed definition for "reanalyze" does not address how EPA would incorporate any completed reanalyses into its policymaking. The commenter adds that a number of critical questions remain undiscussed in the supplemental proposal: *Would the Agency be required to consider a reanalysis alongside the original study, or would it pick and choose analyses to consider? Will the Agency publicly explain its decision to incorporate a reanalysis into a work product? How would the Agency compare a reanalysis to the original study? Will a reanalysis be required to go through peer review? If a reanalysis does not undergo peer review, would it receive equal consideration to an original peer-reviewed study, or would the Agency consider the absence of peer review as a factor in determining the value of the reanalysis? Would the Agency be compelled to delay the finalization of a rulemaking until the completion of a relevant reanalysis?* The commenter states that all of these questions represent important practical considerations for the Agency. The commenter observes that if the Agency affords equal weight to any non-peer reviewed reanalysis as it does for a peer reviewed study, it calls into question whether Agency rulemakings are truly considering the best available science. The commenter notes that this also introduces questions about how EPA is satisfying the Information Quality Act, which requires that all significant regulatory information from federal agencies be peer reviewed, as well as EPA's own information quality guidelines.²⁴⁸¹

Response: If a reanalysis of a study were considered pivotal science, it would need to be peer reviewed consistent with 40 CFR 30.6. Nothing in this rule requires independent validation through reanalysis, nor does the rule specify giving greater weight to the reanalysis of studies. Thus, the rule does not require that the timing of a significant regulatory action or influential scientific information be dependent on independent validation through reanalysis of pivotal science. This rule does not require that a reanalysis be considered alongside the original study.

Comment: Commenter (11395) states that reanalysis of data is only one of several mechanisms available for validating studies. The commenter notes that the scientific community uses numerous tools to validate studies, including rigorous peer review, replication of a study using the same methodology but with different data sources, or reproduction of a study's conclusions using different methodologies and data, and notes that many of these tools do not require access to all underlying study data. The commenter states that under the proposed rule, a peer reviewed study that has been replicated many times by different investigators using different data may be

²⁴⁸¹ EPA, "Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency," viewed May 4, 2020, accessed here: https://www.epa.gov/sites/production/files/2020-02/documents/epa-info-quality-guidelines_pdf_version.pdf.

excluded from consideration, while one that uses an inferior database that is publicly available would be included.

Response: There is no categorical exemption for pivotal science for which the underlying dose-response data are not available. Further, as discussed in Section III.E of the preamble to the rule, in determining the consideration to give pivotal science for which the underlying dose-response data are not available, EPA will consider a range of factors in addition to the availability and the quality of the study.

3.2.2.3.6 Tiered Access and Restricted Data Issues Related to Reanalysis

Comment: Commenter (11921) states that although the proposed supplemental proposal acknowledges that personal information may not be able to be protected in all cases, and therefore “tiered access” to these data may be suitable, it is critical to recognize that while “depersonalized” data sets can be created, in many instances they will not allow for full replication and reanalysis – and could lead to incomplete and misleading results. The commenter notes that some have argued that it should be possible to create a “depersonalized” data set by stripping all personal identifiers such as address, date of birth, medical history, etc. and making such a data set widely available. The commenter suggests that it is not possible to conduct a high-quality air pollution and health study without knowing the locations of those being studied, i.e. where they live, the sources and levels of their air pollution exposure, as well as their specific covariates, and specific health outcomes, and unfortunately, should such information be made available at smaller spatial scale, it is possible to disclose extensive personal and medical information for individual study subjects, raising privacy and ethical concerns.

Commenter (12720) states that the claim that publicly available dose response data and models would allow for independent validation stands in direct contradiction to the legal privacy protections that apply to key data necessary for re-analysis. The commenter states that the proposed partial redaction of sensitive information poses a cascading set of problems, because the statistical models characteristic of epidemiologic investigations rely on the inclusion of potentially confounding variables (e.g., age, sex, home address, health status, diet and alcohol consumption, smoking history) in order to properly isolate the pollution-health relationship with precision.²⁴⁸² The commenter states that these studies analyze detailed health, demographic, spatial, and behavioral information from thousands of people to understand the dose-response connection and this information is extremely sensitive and collected at the individual level. The commenter notes that as such, our nation’s health privacy laws and IRB protocols require researchers to keep the data secure and confidential to prevent misuse. The commenter states that collectively, these data points help researchers understand and isolate the cause-effect relationship between exposure to air pollution and risks for various health problems and notes that it would be extremely difficult if not impossible for anyone using partially redacted data sets derived from epidemiologic cohort studies to “validate” the results of the original studies, because such investigators would not be working with complete data sets. The commenter adds that as further demonstration, the 2009 Integrated Science Assessment for PM_{2.5} notes that

²⁴⁸² For example, see confounding variable adjustment in Pope III, C. A., Burnett, R. T., Thun, M. J., Calle, E. E., Krewski, D., Ito, K., & Thurston, G. D. (2002). Lung cancer, cardiopulmonary mortality, and long-term exposure to fine particulate air pollution. *JAMA*, 287(9), 1132–41.

“[a]ppropriate statistical adjustment for confounders requires identifying and measuring all reasonably expected confounders,”²⁴⁸³ and, therefore, exclusion of some potentially sensitive confounding variables from an underlying dataset likely would lead a different team of investigators to a different result. The commenter asserts that causing this wrongheaded and indefensible outcome results from the core approach and conceit in the Proposal, revealing it to be yet again, arbitrary and capricious and an abuse of EPA discretion. The commenter states that, put another way, the quantitative findings of dose-response relationships would almost certainly differ—not as a result of any true difference in the quantitative exposure-effect relationship, but because the original work relied on complete data sets and the new analyses would not—due to the Proposal. The commenter concludes that the resulting discrepancies in quantitative findings could serve as motivation to call the original study results into question due to faulty and incomplete re-analyses.

Response: Nothing in this rule require the disclosure of personally identifiable information (PII) or other sensitive information. Rather, this rule describes how EPA will handle studies based on whether the underlying dose-response data are available. Further, as stated elsewhere, this rule does not require that EPA or any other party conduct reanalysis of the dose-response data underlying pivotal science before EPA can use the data.

Comment: Commenter (11900) questions who will be able to access restricted data. The commenter states that the Supplemental Notice described the restricted access tier as “limited to authorized researchers and not possible for the general public.” The commenter notes that EPA does not define a process for vetting applicants or criteria for granting access. The commenter states that restricted access must be limited to researchers with a legitimate scientific interest in the data, otherwise restricted access is simply ‘accessible to the public by application.’ The commenter states that the Research Data Center (RDC) run by the National Center for Health Statistics (NCHS)/CDC—identified as a possible model by the Supplemental Notice—requires researchers “submit a research proposal outlining the need for restricted-use data.” The commenter notes that a stated primary goal of the Supplemental Notice in making data available is to support reanalysis of study data. The commenter suggests that it is unclear on what basis applications seeking to perform reanalysis would be judged, because reanalysis is not typically considered research. The commenter recommends that EPA clearly define how applications to access restricted-access data will be evaluated.

Response: EPA does not intend to make all dose-response data underlying pivotal science available for independent validation. There may be instances where EPA does not own the dose-response data, lacks access to part or all of the dose-response data or does not have the authority to provide access to part or all of the dose-response data. Rather, this rule describes how EPA will handle studies based on whether the underlying dose-response data are available. Further, as stated elsewhere, this rule does not require that EPA or any other party conduct reanalysis of the dose-response data underlying pivotal science.

²⁴⁸³ U.S. EPA, Integrated Science Assessment (ISA) for Particulate Matter (Final Report, Dec 2009), 1–16, Washington, DC, EPA/600/R-08/139F, 2009.
https://ofmpub.epa.gov/eims/eimscomm.getfile?p_download_id=494959.

Comment: Commenter (12715) states that the supplemental proposal acknowledges that, in some cases, the data and models used in a reanalysis would not be available to the public (e.g., instances where EPA does not own the data and models, lacks access to part or all of the data and models, or does not have the authority to provide access to part or all of the data and models). The commenter suggests that this could result in EPA using a reanalysis, its own or that of another party, which differs from the analysis provided in the original publication of the study, and the data and models underlying this reanalysis would not be available to the public. The commenter states that this conflicts with EPA’s stated goal of increasing transparency.

Response: In determining whether the underlying dose-response data are publicly available in a manner sufficient for independent validation, EPA will consider whether availability is such that a subject matter expert who has not contributed to the development of the study can evaluate whether results similar to those reported in the study are produced.

3.2.3 Independent Validation

3.2.3.1 Definition of “Independent Validation”

Comment: Commenter (11192) states that the definition the EPA introduces for “independent validation” narrows validation by using the same data and the same methods to see if similar results are produced. The commenter suggests that while one can deduce that independent validation is a subtype of reanalysis, that isn’t detailed in the supplemental proposal, and could lead to confusion.

Response: For the purposes of this rule, independent validation is not a subtype of reanalysis. Independent validation may be the result of reanalysis as it is defined in this rule.

Comment: Commenter (11405) states that the term “robustness” is not defined in the supplemental proposal; based on the examples it requires qualitatively similar findings using the same data but different analytical methods. The commenter states that because it involves different analytical methods and only qualitatively similar findings (not quantitatively identical outputs), robustness is not the same as reproducibility; it is closer to replicability. The commenter notes that, as defined in the supplemental proposal, the purpose of “independent validation” is to check reproducibility “using identical methods”. The commenter concludes that, using these definitions strictly, an independent validation should not check for robustness by varying the methods.

Response: While robustness was used in the preambles of the 2018 proposed rule and the 2020 SNPRM, there is no requirement for robustness in this rule. Therefore, a definition of robustness is not included in 40 CFR 30.2.

Comment: Commenter (11381) states that the supplemental proposal’s new term “independent validation”, is unhelpful. The commenter notes that it focuses only on the adjective

(independent) and ignores the noun (validation).²⁴⁸⁴ The commenter adds that it conflates fundamentally different concepts: the “reanalysis of study data” and the independence of such a reanalysis (“by subject matter experts who have not contributed to the development of the study”). The commenter concludes that the definition permits obvious conflicts of interest to be ignored which could occur when the “subject matter experts” involved are not genuinely independent, or when they are employees of the Agency proposing to rely on study data as pivotal scientific information. The commenter states that while internal Agency reanalysis may not be sufficient, there is no rational basis for excluding it from a transparency rule.

Response: EPA disagrees that the definition does not focus on the noun “validation”. The concept of validation is captured by the phrase “to evaluate whether results similar to those reported in the study are produced.” The use of the term “independent” refers to being independent from the original study, that is by subject matter experts who have not contributed to the development of the study.

Comment: Commenter (12471) suggests clarifying the definition of “independent validation” as follows (underlined text is new text and struck out text is deleted text):

Independent validation means the reanalysis of study data by subject matter experts who have not contributed to the development of the original study to demonstrate that the same analytic results observed~~reported~~ in the study are capable of being substantially reproduced.

Response: “Reported” is more appropriate than “observed” because the reanalysis would be conducted by someone other than the one who conducted the original study. The person who conducts the reanalysis can only compare her/his results to what the original researcher(s) reported, not what was observed.

Comment: Commenter (11381) states that the supplemental proposal cites some external authorities approvingly for definitions, including for example National Research Council (NRC) (2007) and NAS (2016). The commenter suggests that the 2007 report offered promiscuous advice on validation but never defined it, and the 2016 report did not address validation at all. The commenter notes that other NRC reports have addressed validation but were not cited in the supplemental proposal, including NRC (2012) and NAS (2017). The commenter states that the 2012 report is a 145-page treatise on verification, validation, and uncertainty quantification

²⁴⁸⁴ U.S. Environmental Protection Agency (2020, p. 15405): “Independent validation means the reanalysis of study data by subject matter experts who have not contributed to the development of the study to demonstrate that the same analytic results reported in the study are capable of being substantially reproduced.” In the IQGs, independence is an attribute of reproducibility for derivative information only: “With respect to analytic results, ‘capable of being substantially reproduced’ means that independent analysis of the original or supporting data using identical methods would generate similar analytic results, subject to an acceptable degree of imprecision or error” (italics added). The IQGs include no requirement that original data be reproducible, or that they must be capable of being independently replicated – unless an agency chose to include requirements for replicability in their agency specific IQGs.

(VVUQ) that contains a definition that EPA could have adopted²⁴⁸⁵ and the 2017 report included a definition of validation that is consistent with the information quality paradigm; it utilizes reproducibility and replicability (as configured in the Information Quality Guidelines (IQGs)) in the pursuit of reliability and accuracy.²⁴⁸⁶ The commenter asserts that it is therefore hardly surprising that the Science Advisory Board (SAB) was spun up about the Agency's proposal to mandate validation without defining it.²⁴⁸⁷

Response: As discussed in the 2020 SNPRM, EPA evaluated the literature in addition to the NAS and NRC reports to aid in developing appropriate definitions. EPA also considered the many public comments received on the terminology used in the 2018 proposed rule, most notably the comment on replicate. Other than noting that there are other documents which have definitions for related terms which EPA could have adopted, this comment does not provide constructive comment on how to improve the proposed definitions.

Comment: Commenter (12720) states that EPA's definition of "independent validation" in the supplemental proposal is inconsistent with the remainder of the proposal because it restricts the concept of "independent validation" to "subject matter experts who have not contributed to the development of the study." The commenter states that EPA restricts "independent validation" to an activity only conducted by "subject matter experts," a distinction in conflict with EPA's definition of "publicly available," which is more expansive and as such, it is unclear whether validation of study data by any member of the public is consistent with EPA's definition. The commenter notes that EPA fails to define "subject matter experts" nor explain how expertise is to be evaluated.

Response: EPA disagrees that there is a conflict. A subject matter expert is not someone who deals only with sensitive data. A subject matter expert is someone who has the education, experience and knowledge of a particular area or subject. The rule does not restrict activities of the public or subject matter experts. The sections cited by the commenter are definitions. The definition of independent validation includes subject matter expert because a subject matter expert would know for the particular type of dose-response study the appropriate methods to use to reanalyze the data to evaluate whether results similar to those reported in the study are produced. The definition of "publicly available" describes the availability of data and not the persons who might conduct independent validation.

Comment: Commenter (12720) states that the SAB's criticism underscores EPA's failure to adequately define terms in the Supplemental Proposal within the context of its scientific activities. The commenter states that, for example, the Supplemental Proposal makes no mention

²⁴⁸⁵ {National Research Council, 2012 #8837, p. 8 and Sec. 1.4.2}: Validation is "[t]he process of determining the degree to which a model is an accurate representation of the real world from the perspective of the intended uses of the model."

²⁴⁸⁶ {National Academies of Sciences, 2017 #8622, p. 158} cited a definition ("Verification, whether as a part of the activity or separate, of the overall replication/reproducibility of results/experiments and other research outputs") that implicitly captures accuracy. {Pelizzari, 2017 #8612, p. 16}, cited approvingly in the SNPRM, defines validation unhelpfully ("Checking that the results of a computer simulation agree with experiments or observations of the phenomenon being studied").

²⁴⁸⁷ {U.S. EPA Science Advisory Board, 2020 #8708}. Not all of the SAB's objections concern definitional ambiguity.

of internal and external validity. The commenter states that the proposal does not make any mention of the need to assess study validity, nor does it distinguish between internal validity (reduction of error and bias) and external validity (applicability of results to other populations, exposure settings, or time periods). Commenter (12720) states that it is highly problematic that EPA has not adequately defined “independent validation” within the proposal nor outlined clear criteria for assessing whether or not a study can be independently validated. The commenter adds that for meta-analyses and other studies that rely on multiple component studies, it is not clear what threshold would have to be met for the overall study to qualify as one that can be independently validated. The commenter asserts that the proposal does not address these difficulties and should be withdrawn.

Response: The determination of whether the dose-response data underlying a study will be available for independent validation will depend upon the specific study and the parameters of that study. Note that the rule does not require any entity to perform independent validation, including EPA. The threshold would be that a subject matter expert would have the dose-response data of the appropriate stage of data to be able to reanalyze the data.

3.2.3.2 Issues Associated with Independent Validation

3.2.3.2.1 Implications for Researchers

Comment: Commenter (12727) states that EPA has not identified what information would be needed for independent validation of different areas of research. For example, the commenter suggests that the Final SAB Report raises additional points regarding the deficiencies in EPA’s proposed definition for independent validation, highlighting the significant ambiguity that remains and insufficient attention to other, related considerations:

EPA’s supplemental proposal indicates that independent validation means the reanalysis of study data by subject matter experts who have not contributed to the development of the study to demonstrate that the same analytic results reported in the study are capable of being substantially reproduced. However, the specific definition of independent validation drives the feasibility of whether EPA can make data and models available for independent validation. For example, the EPA should consider the following questions: How much information is sufficient for independent validation? Will this information consist of equations where reviewers can verify the math, more detailed models where assumptions and limitations are described, or code to allow the public to evaluate and run the models if desired? Is this information simply the dose-response data for the endpoint of concern driving a regulatory limit, or is it availability of all data from a pivotal study to allow reviewers to examine the potential contributions of other variables on the primary endpoint of concern? Endpoint data are seldom evaluated in isolation so providing sufficient study information to allow an independent assessment seems important to meet the goals of the Proposed Rule. For example, an effect on pup body weights in a toxicology study should be examined with knowledge of maternal gestational body

weight gains, litter size, food consumption, maternal/litter clinical signs, etc. Sample size and variability also play a key role in data interpretation.²⁴⁸⁸

Response: The determination of whether the dose-response data underlying a study will be available for independent validation will depend upon the specific study and the parameters of that study. The threshold would be that a subject matter expert would have the dose-response data of the appropriate stage of data to be able to reanalyze the data.

Regarding endpoints, EPA agrees that endpoint data are seldom evaluated in isolation. This rule would not require that the dose-response data be only for the endpoint. It would be the dose-response data underlying the study.

Comment: Commenter (11921) states that a requirement that any pivotal study shall ensure that “data and models are available in a manner sufficient for independent validation” implies a complex and potentially costly and time-consuming set of steps that include making available two detailed and complex sets of information:

- The workflow that was implemented to create the analytical data set used for the analysis (e.g. harmonized in time and space) from the original and often heterogeneous data sets (individual electronic health records, gridded exposure data, confounders etc.), and
- The data analysis (statistical software) that was used to analyze the analytical data set.

The commenter states that creation of both of these in a manner that enables even highly-qualified investigators to reproduce the same results is difficult and time consuming. The commenter suggests based on HEI’s hands-on experience that this is likely to be costly to the researchers and their institutions – both in the creation of the data and methods hubs, and in the continuous requests for further explication from those seeking the data. The commenter notes that in contrast to the proposal’s statement in response to Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs: “This action is not expected to be an Executive Order 13771 regulatory action because it relates to “Agency organization, management or personnel,” the proposal would clearly impose substantial additional costs on a wide range of research institutions.

Response: The EPA disagrees that this rule would impose costs on third-party researchers. This is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA’s position on data availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make data available. Researchers may choose to make more data available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate.

²⁴⁸⁸ Science Advisory Board, EPA-SAB-20-005, Consideration of the Scientific and Technical Basis of EPA’s Proposed Rule Titled *Strengthening Transparency in Regulatory Science*, at 12 (Apr. 14, 2020) (“Final SAB Report”).

Comment: Commenter (12430) asserts that the supplemental proposal would require publishing data so thoroughly redacted as to be effectively useless for validation.

Response: EPA disagrees with the commenter that the rule would require that thoroughly redacted data be published. This rule does not include requirements for publishing studies or data.

Comment: Commenter (12422) states that some of the findings on which our public health protections are based are the result of studies done across the globe. The commenter suggests that it is unlikely that Canadian or European scientists would turn over their raw data to a U.S. Agency for “independent validation.”

Response: Nothing in the rule requires scientists to provide raw data to EPA for independent validation. Further, the rule does not require any entity, including EPA, to conduct independent validation of studies

3.2.3.2.2 Conflicting Conclusions

Comment: Commenters (11192, 11361) state that a crucial piece of omitted information in the supplemental proposal and the proposed rule relates to the complete lack of information provided about what could happen if an attempted independent validation conflicted with original study results. The commenters suggest that this obvious omission introduces another way in which this proposed rule could be manipulated and result in the dismissal of credible scientific studies. The commenters state that EPA omits this pivotal information in the proposed rule and the supplemental proposal.

Response: The rule does not require that EPA or any other entity conduct independent validation before EPA can use pivotal science. Nor does it establish requirements for the use of the independent validation if it is conducted.

3.2.3.3 Current Processes Do Not Need Data to Be Publicly Available for Validation

Comment: Commenter (11479) states that EPA already independently validates the research without using underlying data by asking the following questions:

- a) To what extent has there been independent verification or validation of the study method and results? What were the conclusions of these independent efforts, and are they consistent?
- b) To what extent has independent peer review been conducted of the study method and results, and how were the conclusions of this review taken into account?
- c) Has the procedure, method or model been used in similar, peer reviewed studies? Are the results consistent with other relevant studies?
- d) In the case of model-based information,

to what extent has independent evaluation and testing of the model code been performed and documented?²⁴⁸⁹

The commenter states that these guiding questions ensure that the Agency does not have to fully reanalyze every study and can instead focus on the weight of the evidence approach. The commenter argues that including data availability in the weighting injects an arbitrary parameter, unrelated to study quality and reliability.

Response: The rule complements the activities that EPA currently conducts by giving greater consideration to studies for which the underlying dose-response data are available for independent validation. For studies in which the dose-response data are available for independent validation, this will increase the transparency of EPA decision making in significant regulatory actions and independent scientific information.

Comment: Commenter (12715) states that independent validation and reanalysis can often be conducted with more processed form of data than the stringent stage of data EPA is requesting. Instead, the commenter suggests the EPA justify the rule's requirements in specific contexts and for specific types of data and models to avoid eliminating studies where access to less processed data would jeopardize privacy or lead to logistical challenges for data sharing.

Response: EPA has defined "data" in part to mean "the set of recorded factual material commonly accepted in the scientific community as necessary to validate research findings." Thus, the stage of data that is available for independent validation would be that stage of data necessary to accomplish the independent validation. The rule does not include a categorical exclusion of studies where the underlying data cannot be made available for independent validation.

3.2.3.4 Independent Validation Does Not Imply or Improve Validity or Accuracy

Comment: Several commenters contend that independent validation does not imply or improve validity or accuracy and therefore there is no justification for this rule.

Commenter (11176) states that independent validation as EPA defines the term in the supplement is a rather narrow method of evaluating research and assessing a scientific conclusion that could ultimately hamstring the work of EPA scientists to determine the best science to inform EPA work. The commenter suggests that the focus on independent validation puts undeserved emphasis on an individual study and that such a focus is contrary to the science community's practice of generally not being interested in a specific study but rather on its underlying hypotheses. The commenter states that no hypothesis can be conclusively addressed by an individual study; instead, a hypothesis' validity should be assessed on a body of evidence.

Response: While EPA agrees that the body of evidence is important, this rule does not conflict with the importance of transparency of the dose-response data that EPA uses in significant

²⁴⁸⁹ Science Policy Council. 2003. A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information. EPA 100/B-03/001. Washington, DC: US Environmental Protection Agency. Online at <https://www.epa.gov/sites/production/files/2015-01/documents/assess2.pdf>, Accessed May 14, 2020.

regulatory actions and influential scientific information. The rule does not require any entity, including EPA, to conduct independent validation of studies before EPA can use those studies in significant regulatory actions and influential scientific information.

Comment: Several commenters (11176, 11496, 11399, 12727) contend that independent validation does not imply or improve validity or accuracy and therefore there is no justification for this rule.

Commenter (11176) states that the proposed rule also seems to assume that a study that can be independently validated is of higher quality. The commenter argues that there is no evidence to support such an assertion. The commenter notes that Leek and Peng discussed in further depth the lack of a connection between research that has been reproduced and quality in a 2015 article in Proceedings of the NAS. The commenter states that EPA also acknowledged this point in the document, *Plan to Increase Access to Results of EPA -Funded Scientific Research* where EPA states “Whether research data are fully available to the public or available to researchers through other means does not affect the validity of the scientific conclusions from peer-reviewed research publications.” Commenter (11186) states that independent validation as described is not a sound method for assessing accuracy. The commenter notes that changes in statistical methodologies for the same sample can result in a different research question answered and this practice will undermine an established practice that scientists already use: the peer-review process.

In addition, commenter (11496) states that the need for independent validation is not justified. The commenter states that the most important of its concerns is EPA’s stated desire to exclude any pivotal regulatory science which cannot be “independently validated” beyond the existing and well-established peer review process. The commenter asserts that this is an inherently flawed perspective on how science, peer review and weight of evidence are used to protect public health. The commenter states that if EPA identifies peer-reviewed pivotal science that is insufficient, EPA or partner agencies like the Agency for Toxic Substances and Disease Registry or National Institute of Health should fund follow-up confirmation studies by independent researchers, not seek to disclose personal information to third parties tasked with independently reanalyzing existing datasets. The commenter requests that EPA articulate why independent validation of peer-reviewed science is even necessary for regulatory decisions; this type of redundant statistical analysis has never been a requirement of the OMB or any other federal Agency. Commenter (12727) states that the definition of “independent validation” suffers from EPA inappropriately conflating “validation” with “reanalysis.” The commenter states that validation of scientific data is not accomplished by simply independently reanalyzing the data. The commenter notes that false or inappropriately obtained data will be invalid regardless of whether it can be independently reanalyzed. The commenter suggests that reproducing study results using a different population or method is generally considered a stronger approach to validation, rather than simply reanalyzing the results using the same data, as it shows that the results hold across different populations and different study designs.²⁴⁹⁰

²⁴⁹⁰ See, e.g., Comments of the International Society for Environmental Epidemiology on EPA’s Proposed Rule on Strengthening Transparency in Regulatory Science, Docket ID No. EPA-HQ-OA-2018-0259-1973, at 2 (“However, although data reanalysis has a role to play, ultimately, the key determination of the consistency of scientific evidence

Commenter (11399) states that additional “independent validation” that goes above and beyond the peer review process and EPA existing science advisory infrastructure is not necessary to assure scientific validity and accuracy. The commenter argues that this new procedural hurdle limits the universe of scientific studies that EPA may consider. The commenter asserts that creating such an impediment undermines EPA’s legal obligation to use the best-available science to guide its decision-making processes and portends a weakening of the scientific underpinnings of health-based environmental regulations. Commenter (12427) states that scientific rigor depends on elements of scientific inquiry and judgments regarding the validity, value, and utility of science. The commenter states that the elements of scientific inquiry include data, methods, logic connecting data, and methods to conclusions. The commenter states that to judge validity, value, and utility of science, it is necessary to know how one got the answer. The commenter states that adequacy for “conclusion-making” occurs when scientific evidence supports a sufficient degree of certainty that rules out alternative explanations and that “Transparency” is not a determinant of scientific rigor. The commenter argues that judgments regarding validity, value, and utility of science can be and are made via peer review²⁴⁹¹ not through the approach taken in this rulemaking.

Response: Although the EPA agrees with commenters that meaningful insights can be obtained through similar studies in different media or context, the EPA continues to find that independent validation of the study findings and conclusions driving the EPA’s dose-response assessments would provide important information. The benefits of greater data transparency and the significance of reanalyzing and validating study results are well-documented in scientific literature. McNutt (2014) noted, “reproducibility, rigor, transparency, and independent verification are cornerstones of the scientific method.”²⁴⁹² The National Academies of Sciences, Engineering, and Medicine (NAS) workshop on Reproducibility and Replicability in Science also noted that “certainly, reproducibility and replicability play an important role in achieving rigor and transparency.”²⁴⁹³ Munafò et al. (2017) state, “the credibility of scientific claims is rooted in the evidence supporting them, which includes the methodology applied, the data acquired, and the process of methodology implementation, data analysis and outcome interpretation. Claims become credible by the community reviewing, critiquing, extending and reproducing the supporting evidence. However, without transparency, claims only achieve credibility based on trust in the confidence or authority of the originator. Transparency is superior to trust.”²⁴⁹⁴ The EPA continues to believe that codifying internal procedures aimed at

comes from replication, not reanalysis.”). Note that ISEE uses the term “replicate” to mean what we have defined in these comments as “reproduce.”

prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety.

This rule is designed to build upon OMB M-13-13. It is also consistent with OMB M-19-15, which highlights the need to characterize the sensitivity of an agency's conclusions to analytic assumptions, as well as other federal guidance documents that require greater data transparency. The EPA's attention to data transparency is also responsive to the broader interest in greater data and model transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members of the public, scientific community, and Congress on the transparency of the scientific basis for EPA's decisions in previous influential scientific information assessments and regulatory actions.

The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals (Ref. 15) and the emergence of organizations, such as the Center for Open Science, and international initiatives like Findable, Accessible, Interoperable, and Reusable (FAIR) data principles; Facilitate Open Science Training in European Research (FOSTER); and Guidelines for Transparency and Openness Promotion (TOP) in Journal Policies and Practices that incentivize greater transparency in research.

Chapter 4: Data and Models

Section 30.2 of the notice of proposed rulemaking (NPRM) defines dose response data and models as follows:

Dose response data and models means the data and models used to characterize the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and the magnitude of a predicted health or environmental impact. Such functions typically underlie pivotal regulatory science that drives the size of benefit- cost calculations, the level of a standard, and/or the points of departure from which reference values (reference doses or reference concentrations) are calculated.

Section 30.5 includes the following requirement:

When promulgating significant regulatory actions, the Agency shall ensure that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation. Where the Agency is making data or models publicly available, it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information (CBI), and is sensitive to national and homeland security.

In addition, the NPRM (§30.6) states that, when available, EPA shall consider high quality studies that explore:

- Appropriateness of a linear, no-threshold dose response;
- A broad class of parametric dose-response or concentration-response models;
- A robust set of potential confounding variables;
- Nonparametric models that incorporate fewer assumptions;
- Threshold models across the dose or exposure range; and
- Models that investigate factors that might account for spatial heterogeneity.

The NPRM (§30.6) also requires EPA to describe and document any assumptions and methods used and should describe variability and uncertainty.

In the SNPRM, the EPA proposes revising the NPRM regulatory text at 40 CFR 30.3, 30.5, 30.6, and 30.9 so that the provisions would apply to data, not only dose-response data. The SNPRM also proposes to delete the definition of “research data” and to add a definition for “data” at 40 CFR 30.2 as follows:

Data means the set of recorded factual material commonly accepted in the scientific community as necessary to validate research findings in which obvious errors, such as keystroke or coding errors, have been removed and that is capable of being analyzed by either the original researcher or an independent party.

The SNPRM proposes a broader applicability with this definition as transparency of EPA’s science should apply to other types of data that drive the requirements and/or quantitative analysis of EPA final significant regulator decisions and influential scientific information. The SNPRM specifically requests comment on whether the definition of “data” should apply to another stage of data and on whether there is another definition of “data” that should be considered.

Regarding the NPRM, several comments were received concerning dose response data and model proposal requirements, including the requirements of §30.5 and §30.6. Additionally, several comments were received regarding data and the use of data within the SNPRM. In this Chapter, these comments are organized under sections 4.1 NPRM Data and Models – Related Comments and 4.2 SNPRM Models, Variability/Uncertainty, and Assumptions/Defaults.

Section 4.1: NPRM Data and Models – Related Comments

- Data and Models; Dose response data and models (§30.2), requirements to the use of dose response data and models underlying pivotal regulatory science (§30.5), and additional requirements (§30.6)
- Definitions of Research Data (§30.2) and Data

Section 4.2: SNPRM Models; Variability/Uncertainty, and Assumptions/Defaults

- Modeling Definitions
- Models (General) and Best Science Practices
- Public Availability of Models/Data
- Weighting of Models
- Scope of Models Included
- Assumptions/Defaults-Variability/Uncertainty
- Impacts on Older/Existing Models
- Linear vs Nonlinear Modeling
- Impacts on Specific Models

Section 4.3 SNPRM Data, Variability/Uncertainty, and Assumptions/Defaults

- Clarity of Proposed Definitions
- Application of the Rule in Respect to Data
- Linear vs. Nonlinear Models
- Models (General) and Best Science Practices
- Assumptions/Defaults-Variability/Uncertainty

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in

this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

4.1 NPRM Data and Models – Related Comments

4.1.1 Data and Models; Dose response data and models (§30.2), requirements to the use of dose response data and models underlying pivotal regulatory science (§30.5), and additional requirements (§30.6)

4.1.1.1 Dose Response Data

4.1.1.1.1 Availability of Underlying Data

Support the Proposed Rule Requirements that Data Be Made Publicly Available

Comment: Commenter (6369) asserts that data access is crucial to reproducibility when conducting independent validation of EPA results as outlined in the proposed rule. The commenter adds that public access to information that the Agency deems critical to future or pending regulations is vitally important to the scientific process. The commenter also asserts that timely access to that information is just as important and provides examples to demonstrate how the lack of availability of underlying science used in decision-making can have significant impacts on EPA's chemical assessment conclusions.

For example, commenter (6369) states that they engaged directly with EPA's Integrated Risk Information System (IRIS) program to better understand the scientific information being relied upon to draw conclusions regarding formaldehyde carcinogenicity and had considerable difficulty in not only communicating with the IRIS scientists on the data that supports the program's conclusions regarding the carcinogenicity of formaldehyde and accessing the underlying data from studies that the IRIS program used in its draft chemical assessment. The commenter provides a chronology detailing their efforts and notes that, overall, it took six years to obtain all the necessary underlying data for evaluation/validation of the results from this study. The commenter provides that an evaluation of the study results determined that the changes reported by the study authors to be associated with formaldehyde exposure were not exposure dependent. The commenter contends that this highlights the critical need for public availability of results from studies that are key not only in dose-response modeling, but also in drawing conclusions regarding the potential health effects associated with exposure to formaldehyde. The commenter adds that data obtained via a Technology Transfer Agreement with NCI in 2014 to obtain information related to the Bean-Freeman (2009) study that was relied upon by the IRIS program to conduct dose response modeling to determine the potential for carcinogenic effects following formaldehyde exposure took several years before they were able to obtain the data. The commenter states that it is important to note that, in this case, the scientists gained access to underlying data related to individual subjects in a cohort. According to the commenter, this was accomplished while still allowing the protection of personal identifiers and other confidential

information. Thus, the commenter concludes that, while concerns over confidential information are valid, they can be addressed while allowing transparency of critical scientific data.

Response: Categorically excluding studies because the underlying dose-response data are not publicly available would exclude valid studies. Thus, rather than categorically excluding studies, EPA will give greater consideration to studies where the underlying dose-response data and models are available for independent validation.

Types of Studies and Examples for which Underlying Data May Not Be Available/Accessible

Other Federal Agency Data

Comment: Commenter (6373) suggests that the EPA state whether it will decline to consider scientific studies that are based on data collected by federal agencies that require privacy protection. The commenter notes that EPA research and studies that inform EPA regulatory activities often rely on data collected by other federal agencies, including but not limited to Medicare and Medicaid, the National Institute of Health (NIH), the Census Bureau, and the Social Security Administration. The commenter asserts that the Rule will not bind these agencies' data collection and research policies and practices.

Response: EPA will consider these studies if it determines they are pivotal science but will give them greater consideration if the underlying data and models are available for independent validation.

Old Studies - Original Data Does Not Exist or is No Longer Accessible

Comment: Commenters (1945, 4596, 5176, 6125, 6362, 6873, 6898, 6914, 8317) provide that, for older studies, authors or data and information sources may no longer exist, or may not be accessible.

Commenter (4596) asserts that EPA regulations that reduce exposure to pollutants and chemicals that are toxic to the developing brain have for decades relied on studies that have included data and information that was not made fully public, including longitudinal epidemiologic studies, human clinical studies, and animal toxicologic studies. In many cases, the commenter provides that the original raw data does not exist or is no longer accessible.

Commenter (6914) notes that epidemiological evidence and other accounts related to work-related illnesses and toxic releases often come from older, yet meaningful studies and sources, where the authors or data sources may not be accessible.

Commenters (1945, 5176) contend that there are legitimate reasons why data underlying a study's findings are not readily publicly available but should not be excluded, including reasons related to the technology available at the time of data collection, outdated formats in which data sets from older studies are stored. Commenter (6898) states that the Proposed Rule could allow the elimination of historical data sets that are not stored in currently used electronic formats. The

commenter adds that the availability of historical public data is essential to scientists' understanding of the health impacts of environmental exposures over time.

Commenter (6125) states that, because many of the foundational lead studies analyzed children with higher exposure and blood lead levels than are commonly seen today, it would be unethical to run the same tests today, exposing children to levels of lead that we know are unhealthy. The commenter provides that, due to numerous factors related to their age, it may not be possible to recover the original data. The commenter adds that, if use of those older studies were successfully challenged because they do not meet the data requirement policy, they could not be used. The commenter contends that their exclusion would weaken the scientific support for EPA regulations that have clearly proved their worth in the dramatic declines in blood lead levels in American children.

Response: This rule does not categorically exclude any study. The rule requires that EPA give greater consideration to pivotal science where the underlying dose-response data are publicly available in a manner sufficient for independent validation. Thus, these studies will still be considered.

Confidentiality Requirements Legally Mandated by Institutional Review Boards (IRBs) and the Need for Reconsent of Privacy Agreements

Comment: Commenters (0017, 1999, 2283, 2909, 4591, 4595, 4596, 4848, 5013, 5015, 5115, 5165, 6111, 6351, 6897, 6905, 6919, 6922, 8277, 8281-PH26) state that, as articulated by numerous science and health organizations, many health studies, especially those that uncover the effects of exposure to toxins and pollutants/epidemiological studies, rely on medical records/location information that are sensitive covered information, and are confidential and private based on federal law and other patient privacy policies (i.e., including confidentiality agreements). Commenters (0106, 2259, 4591, 4596, 5015, 5180, 6873, 6905, 6919) provide that, as with all data (historic or otherwise), there may be circumstances where an individual participant's data cannot be made public because of confidentiality requirements legally mandated by IRBs and Health Insurance Portability and Accountability Act of 1996 (HIPAA). Commenter (6897) provides that, epidemiologic data often involves personal identifiers that can make full disclosure challenging – particularly retroactively, if participants have already agreed to be involved under more restrictive disclosure terms.

Commenter (6873) states that IRBs cannot release private data without consent, and getting this consent from study participants where the researcher has long since retired and participants have either died or moved multiple times would be extremely challenging and costly at best, and effectively impossible at worst, therefore possibly rendering “old” studies unusable.

Commenter (6919) provides that current federal and state law both require personally identifiable data to be de-identified due to the HIPAA and Colorado regulations protecting the confidentiality of Vital Statistics birth and death certificate data. The commenter provides that government agencies have a legal responsibility to protect residents from any risks associated with sharing personal health information – this includes discrimination. According to the commenter, researchers can only conduct high-quality and reproducible research by protecting the personal health information of study participants. Likewise, public health professionals must retain private

personal data in their own study records in order to conduct accurate and useful surveillance to inform local, state, and national policies.

Commenter (5015) states that access to private medical information is essential to conducting high quality and reproducible air quality and health research:

- There are of course longstanding federal rules for protecting the privacy of individual medical information of the subjects of studies (HIPAA, Common Rule, etc.)
- Gaining access to data from older studies may be difficult, given the privacy commitments that were made to study subjects in the past.
- However, there are today several means to make such data available to investigators with appropriate privacy protections (e.g. Medicare, Federal Research Data Centers) and many investigators have been taking advantage of these.
- Although it is possible, as some have suggested, to create a "depersonalized" data set by stripping all personal identifiers, such as address, date of birth, etc., it is not possible to conduct a high-quality air pollution and health study without knowing the locations of those being studied, i.e. where they live, and what are the sources and levels of their air pollution exposure?

Commenter (8317) asserts that there is already a lack of scientific information about the occupational and environmental health risks farmworkers face. The commenter notes that because farmworkers used in occupational and environmental research are often migratory, moving for work across domestic and international borders, researchers may be unable to locate farmworkers they last encountered as study participants years ago, and thus unable to re-negotiate privacy agreements struck at the time the research was conducted. The commenter states that the EPA should base its regulatory decisions on the credibility of scientific evidence, not on arbitrary factors like the public availability of research data.

Response: This rule does not categorically exclude any study. The rule requires that EPA give greater consideration to pivotal science where the underlying dose-response data are publicly available in a manner sufficient for independent validation. Thus, these studies will still be considered.

Comment: Commenter (6125) expresses concern that lawsuits filed based on this proposal might force EPA to roll back current drinking water standards and drinking water health advisories for pollutants such as arsenic and nitrate. The commenter also expresses concern that EPA has not assessed how the requirements in the new policy might affect drinking water standards and advisories. The commenter states that both drinking water standards rely on epidemiological data, including confidential patient information, as well as on older studies.²⁴⁹⁵ The commenter

²⁴⁹⁵ Cites for studies supporting arsenic drinking water standards and health advisories: Tseng, W.P. (1977) "Effects and dose-response relationships of skin cancer and blackfoot disease with arsenic." *Environmental Health Perspectives* 19, 109-119. Tseng, W.P., Chu, H.M., How, S.W., Fong, J.M., Lin, C.S., and Yeh, S. (1968) "Prevalence of skin cancer in an endemic area of chronic arsenicism in Taiwan." *Journal of National Cancer Institute* 40 (3), 453-463. Cites for studies supporting nitrate drinking water standards and health advisories: Bosch, H.M., Rosefield, A.B., Huston, R., Shipman, H.R., and Woodward, F.L. (1950) "Methemoglobinemia and Minnesota well supplies." *Journal of American Water Works Association* 42, 161-170. Walton, G. (1951) "Survey

adds that data from such studies may have been discarded or lost or be in an unreadable form. The commenter adds that none of these studies could realistically or ethically be reproduced since they derive from a unique cohort, and it would be unethical to expose people to ingested pollutants.

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Data Reduction Time Limits

Comment: Commenter (6362) states that, invariably there will be circumstances where underlying data no longer exist for studies and/or models that are high quality and reliable. For example, the commenter provides that most organizations have data retention policies that have resulted in the disposal of underlying data. Furthermore, according to the commenter (6362), Good Laboratory Practices (GLP) regulations include defined periods of time to retain data and study records.²⁴⁹⁶ The commenter requests that EPA address how it will continue to use those studies and models considering these policies.

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Proprietary Data

Comment: Commenter (4595) provides that some studies may rely on public and private-sector funding sources that limit access to underlying data for proprietary reasons.

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Studies are Often the Property of Scientific Investigators

Comment: Commenter (6922) notes that the Courts have recognized that raw data underlying studies are often the property of scientific investigators and are often not available because of reasonable confidentiality arrangements with study participants.²⁴⁹⁷

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

of literature relating to infant methemoglobinemia due to nitrate-contaminated water.” American Journal of Public Health 41, 986-996.

²⁴⁹⁶ 40 C.F.R. 160.

²⁴⁹⁷ See, e.g., *Am. Trucking Ass’n v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002) (quoting EPA’s denial of a request for raw data).

Non-U.S. Studies

Comment: Commenter (1973) asserts that if the rule is finalized as proposed, all non-U.S. studies would be legally unable to meet EPA's requirements. The commenter provides that, for example, Canadian Community Health Study data would remain safe behind protected servers at Statistics Canada. Additionally, the commenter states that while the protocols, methods, and all other information necessary to judge the study are available, EPA would nevertheless ignore it. The commenter states that this would be the same for the ESCAPE study, the UK national cohort study, the Netherlands National Cohort study, the Danish National Birth Cohort and the Norwegian Birth Cohort (both funded by NIH), etc. The commenter adds that U.S. cohorts, given a choice between violating their promises in the informed consent documents they signed or their Data Use Agreements, or not making their data public, will choose the latter. The commenter contends that the EPA will achieve no greater "transparency", they will only deny themselves the ability to set standards based on the studies that the rest of the world relies on. The commenter provides that the EPA's own Science Advisory Board (SAB) has commented that this proposed rule "could have the effect of removing legal, ethical, and peer-reviewed studies of health effects as sources to support the agency's regulatory efforts".

Commenter (1657) states that if the proposed rule applies to data on human subjects, it could prevent the EPA from using any human subjects data collected from European Union (EU) member countries because after May 25, 2018 such data will be subject to the EU general data protection regulation (GDPR), which enshrines a "right to be forgotten." According to the commenter, while the results of analyses using EU human subjects data can be archived permanently, after that date the data itself could likely not legally be permanently and immutably archived.

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Comment: Commenter (4593) provides that the U.S. is obliged to accept data generated in accordance with the Organisation for Economic Cooperation and Development (OECD) Test Guidelines and Good Laboratory Practice (GLP) Standards. The commenter notes that the U.S. and other OECD member countries realized that differences in testing requirements among countries meant that companies would in some cases have to retest a chemical in order to market it in other areas. According to the commenter, this was needlessly costly and resulted in a delay in obtaining information needed for regulatory assessment. As a result, the commenters states that OECD member nations agreed to accept for regulatory purposes data generated in accordance with the OECD test guidelines, GLPs and quality assurance program. The commenter adds that GLPs specify the information that must be reported; and underlying data is not one of them. Therefore, the commenter is concerned that the proposed policy which requires underlying data to be made available would run counter to the obligations under the Mutual Acceptance of Data treaty.

Response: If the study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Specific Examples of Studies and Supporting Data Sets Would Be Eliminated from Consideration

Comment: Commenters (6378, 8275) provide two examples of studies that may not be able to be used under the proposed requirements. They are papers from the University of Washington that involved studies that ensure confidentiality of the participants (Miller KA et al, Long-term exposure to fine particulate matter air pollution and cardiovascular events in women. *New England Journal of Medicine* 2007; 356:447-58; and Kaufman JD et al, Association between air pollution and coronary artery calcification within six metropolitan areas in the USA [The Multi-Ethnic Study of Atherosclerosis and Air Pollution]: a longitudinal cohort study. *The Lancet* 2016; 388:696-704). Commenter (8275) notes that both studies contain dose response data and models as anticipated in the proposed rule, and for which the proposed rule creates an expectation that data required to replicate the analysis be made available. In each case, the commenter states that the underlying studies are conducted with strict rules under the auspices of the NIH (National Heart, Lung, and Blood Institute), that preclude any potential identification of subject identity or confidential information. The commenter provides that the NIH and the approving IRBs would not permit release of the data in a way that would adhere to the letter of the rule. According to the commenter, it is possible that limited datasets could be created for replication analysis that would protect participant identity and confidential information, but funds are not available to create these datasets, and the rule is not clear that such a limited dataset would be acceptable. The commenter states that, as a result, the rule would lead to arbitrary exclusion of pertinent scientific evidence.

Commenter (4591) notes that data from the landmark “Six Cities” study that established a link between air pollution and human mortality, could not be made publicly available for several reasons, including promises that were made to the study participants at time of enrollment. Notably, the commenter provides that the outcomes of this study have been validated in several scientifically rigorous ways and by several independent studies. Commenter (8281-PH38) states that when the published landmark Harvard Six Cities Study was challenged, the EPA took a logical step and referred them to an independent third-party, the Health Effects Institute, for a deep dive review. The commenter reports that the autonomous reviewers examined the data and developed a report that confirmed the original findings. The commenter notes that there has been other research since then that has confirmed similar findings, including some studies that use publicly available data sets.

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Comment: Commenters provide and mention specific studies (not including the national ambient air quality standards (NAAQS) Supporting Studies) that would likely be impacted if the Proposed Rule were to apply.

Commenter (6170) provided a list of 50 example science references to some of the publications from their research (out of 265) that would not qualify for use in EPA rule making due to privacy concerns for human subjects if the Proposal is finalized.

Commenter (5012) asserts that the Proposal would eliminate consideration of many major studies on the health impacts of environmental pollutants and cites the Children's Health Study conducted in southern California²⁴⁹⁸ as an example of a study that would probably be eliminated from consideration under the Proposed Rule.

Commenter (6919) notes that Colorado is one of the top-producing states for oil and gas. The commenter provides that, as such, we are observing and recording exposures and possible health effects from oil and gas development that has increased dramatically near residential areas. According to the commenter, under this proposed rule, it is possible that studies derived from data on individual exposures could be suppressed since these studies do or may involve taking water and air quality measurements at people's homes, the use of personal air monitors, possibly even blood and urine samples, and portions of the data collected would need to be redacted to protect the study participants. The commenter asserts that it would be a disservice to public health if valuable information from these types of studies were not considered in rulemaking actions because personally identifiable health data could not be protected under the proposed transparency requirements. The commenter provided one example of a study by the Colorado School of Public Health that evaluated participants ranging in age from 0-24 years to study the rates of childhood hematologic cancer and residential proximity to oil and gas development.²⁴⁹⁹ The commenter contends that, because oil and gas production is proliferating in Colorado, studies like these are critical for understanding the industry's impacts on public health, including the detrimental effects of elevated ozone levels and associated air toxic emissions along the Colorado Front Range.

Commenter (6111) provides a 9-page partial list of studies that may contain protected health information that have been relied on by the EPA and cited in EPA documents. The commenter adds that there are many EPA rulemakings and decisions that have relied on studies that cannot be replicated and whose data likely could not be made publicly available. For example:

- **PCBs:** EPA's regulations establishing water quality standards for polychlorinated biphenyls ("PCBs") under the Clean Water Act (CWA) were based in part on long-term epidemiological studies of cancer rates in workers exposed to PCBs.²⁵⁰⁰
- **Radionuclides:** EPA's SDWA regulation for radionuclides relied on epidemiological studies of survivors from the Hiroshima and Nagasaki atomic bomb attacks.²⁵⁰¹
- **Particulate matter:** EPA's 1997, 2006, and 2012 NAAQS for fine particulate matter all relied on studies using confidential data, such as the Six Cities Study.²⁵⁰²

²⁴⁹⁸ <https://www.nejm.org/doi/pdf/10.1056/NEJMoa040610>

²⁴⁹⁹ McKenzie LM, Allshouse WB, Byers TE, Bedrick EJ, Serdar B, Adgate JL (2017) Childhood hematologic cancer and residential proximity to oil and gas development. PLoS ONE 12(2): e0170423. doi:10.1371/journal.pone.0170423

²⁵⁰⁰ Thomas Sinks et al., Mortality among Workers Exposed to Polychlorinated Biphenyls, 136 AM. J. EPIDEMIOLOGY 389 (1992); Pier Alberto Bertazzi et al., Cancer Mortality of Capacitor Manufacturing Workers, 11 AM. J. INDUS. MED. 165 (1987).

²⁵⁰¹ See Environmental Data and Governance Initiative ("EDGI"), Public Protections Under Threat at the EPA: Examining Safeguards and Programs That Would Have Been Blocked by H.R. 1430 9-10 (2017), <https://perma.cc/3NUU-MDHM>.

²⁵⁰² Douglas W. Dockery, et al., An Association between Air Pollution and Mortality in Six U.S. Cities, 329 NEW ENGLAND J. MED. 1753 (1993).

- **Methylmercury:** EPA's reference dose for methylmercury in fish that will be consumed by humans relied on data from human exposures in the Faroe Islands.²⁵⁰³

The commenter contends that precluding reliance on these and other studies for the sole reason that the underlying raw data has not been or cannot be released to the public is arbitrary, capricious, contrary to professional best practices, and antithetical to protection of public health and safety as required by the statutes.

Commenter (6113) states that scientific evidence concerning the damage caused by pesticides was not generated by studies that were verifiable and public in the sense contemplated by EPA's proposal. (See generally Congressional Research Service, Pesticide Law: A Summary of the Statutes, Nov. 14, 2012 (overview of pesticide law). Little, if any of such evidence was generated by studies that were verifiable and public in the sense contemplated by EPA's proposed Anti-Environment Regulation.) According to the commenter, while much of the data included private medical data protected by privacy laws such as HIPAA, much of the data was private and or difficult to reproduce for other reasons (for example, endangered wildlife surveys may not be able to be repeated without impermissibly harming the wildlife).

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Comment: Commenter (6916) notes there was no analysis of the number of studies that could be affected by the Proposal. According to the commenter, were this rule to be finalized as proposed, it would permit or even require the Agency to disregard certain studies placed in the record in future substantive rulemakings under the Clean Air Act (CAA), among other statutes

Response: The rule as finalized does not categorically exclude any study based on availability of data. If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Comment: Commenters (6153, 6874, 8272) state that a recent example of important non-public data on a neurotoxicant is research on the pesticide chlorpyrifos. The commenters provide that researchers followed a cohort of children exposed to this pesticide before the current ban on residential use and found lower IQ and working memory to be associated with higher levels of prenatal chlorpyrifos exposure.²⁵⁰⁴ The commenters state that, in a rulemaking process regarding agricultural use of chlorpyrifos, EPA requested the underlying data from the Columbia Center for Children's Environmental Health (CCEH). The commenters state that the response from CCEH explained that because of the detailed sociodemographic and health-related elements their data set contains, they did not believe they could submit extensive individual-level data to EPA

²⁵⁰³ P. Grandjean, et al., Cognitive Deficit in 7-Year-Old Children with Prenatal Exposure to Methylmercury, 19(6) NEUROTOXICOL TERATOL 417 (1997).

in a way that would ensure participants' confidentiality.²⁵⁰⁵ The commenters state that such concerns are not uncommon with the kinds of longitudinal data sets that allow identification of long-term consequences of environmental exposures.

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Comment: Commenters (6144, 6174) state that, as EPA continues its review of the insecticide chlorpyrifos, this policy might restrict its ability to consider several critical epidemiological studies conducted by Columbia University that showed that in utero exposure to the chemical was linked to negative neurodevelopmental impacts.²⁵⁰⁶ The commenters note that the health data was collected along with confidentiality pledges to the mothers. The commenters state that cutting out the use of this research would mean that EPA would have little information on the direct human health impacts of chlorpyrifos exposure and could result in a policy decision that is less protective of public health than it otherwise would have been.

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Comment: Commenters (1424, 1529, 4828, 4842, 5981, 6125, 6133, 6137, 6144, 6153, 6174, 6874, 6939, 8272) express concern that supporting studies for the lead rules would not be allowed as scientific evidence under the new transparency ruling since they include private medical records and/or could not be ethically replicated.

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Comment: Commenter (6446) expresses concern that the proposed rule would likely prevent EPA from considering epidemiological studies of children exposed in utero to mercury through maternal consumption of mercury-contaminated fish or marine animals because individual health data could not be made public. The commenter states that EPA used these epidemiological studies in its 2001 report, Water Criterion for the Protection of Human Health: Methylmercury,²⁵⁰⁷ which served as a basis for the California State Water Board's recently adopted mercury water quality objectives.

²⁵⁰⁷ No. EPA-823-R-01-001, available at <https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=20003UU4.TXT>

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Would Limit New Studies

Comment: Commenter (6367) states that their members recognize that subjects in clinical toxicology studies often divulge highly sensitive information regarding the behaviors, occupations, avocational activities, and physical and neurocognitive function of themselves and their communities with the expectation that this information be maintained in a confidential manner. The commenter is concerned that subjects' voluntary participation in clinical toxicology studies, and the willingness of medical toxicologists to undertake such studies, will be constrained if such information will become publicly available if the study is used to advance environmental protection.

Response: EPA will not make personally identifiable information (PII) publicly available.

Invalidating Studies Based Solely on Public Availability of Underlying Raw Data

A Study Should Not be Invalidated Solely Based on the Underlying Data Being Unavailable

Comment: Commenters (0040, 0106, 0107, 0118, 0501, 1203, 1289, 1945, 2020, 2337, 2911, 4591, 4838, 5013, 6111, 6120, 6125, 6144, 6160, 6351, 6791, 6864, 6875, 6897, 6905, 6922, 8317, 9224) state that raw data may not be available for a variety of reasons, having to do with privacy, proprietary, and other issues, that require researchers to keep at least some data out of public view. Commenter (6196) states that, in principle, no one disputes the benefits of improving access to underlying data for research on chemicals and pollutants. The commenter provides that the goals of "open science" have received support from several organizations and leading scientific journals and research institutions have adopted practices and policies to maximize data access. Commenters (0040, 0107, 1011, 0118, 0501, 1203, 1289, 1420, 1945, 1973, 1999, 2020, 2259, 2283, 2337, 2909, 2911, 4591, 4595, 4838, 4848, 4884, 5012, 5013, 5019, 6109, 6111, 6113, 6119, 6120, 6121, 6133, 6144, 6145, 6156, 6159, 6160, 6164, 6195, 6196, 6351, 6355, 6367, 6373, 6791, 6875, 6896, 6898, 6899, 6905, 6906, 6908, 6918, 6919, 6920, 6922, 6928, 8281-PH16, 8281-PH26, 8281-PH38, 8317, 9224) assert, however, that a study should not be invalidated solely based on the underlying data and models being unavailable. The commenters express concern that, under the proposed rule, the available science and evidence that could be used to inform future regulations would be limited (and not reflect the body of the "best available science") by the requirement to make all datasets publicly available, limiting the science base for regulatory decision making and protection of public health.

Commenter (6111) notes that releasing raw data will not improve the quality of the resulting report/study/analysis, and therefore will do nothing to render any individual study "better." The commenter provides that it has long been recognized by the professional public health, medical, and scientific research community—and by EPA itself until now—whether the raw data underlying a study is released does not determine the quality of the study.

Commenter (5180) notes that the Proposed Rule provides that when the EPA develops regulations, the “EPA should ensure that the data underlying those are publicly available in a manner sufficient for independent validation.” The commenter asserts that this approach would allow the EPA to consider only those scientific studies where the underlying data is made publicly available. The commenter states that, under the Proposed Rule, the EPA would have had to reject studies simply because they involved confidential personal data protected under the HIPAA that had not been made public “in a manner sufficient for independent validation.”

Commenter (4838) states that the requirement that significant regulatory decisions be justified only by studies based on dose response data and models that are available to the public limits EPA’s ability to rely on otherwise peer-reviewed, scientifically-valid studies that do not, or cannot, make their data publicly available because of confidentiality concerns. For example, the commenter notes that the EPA used the landmark Harvard Six Cities Study, demonstrating a dramatic link between premature mortality and air pollution, as part of its justification for key clean air regulation.²⁵⁰⁸ The commenter provides that the study has been rigorously, independently peer-reviewed but the subjects were promised confidentiality and the data is not public.²⁵⁰⁹ According to the commenter, EPA should not provide blanket limits on the use of studies that cannot be made public because they contain confidential health or business information. The commenter states that scrubbing studies of such information may be impossible while keeping the study reproducible.²⁵¹⁰

Commenter (0040) notes that, of the 17 publications she is a co-author for, only 5 would meet the proposed requirements that evidence come from publicly available data. The commenter states that the other 12 are from projects where the data are subject to data use agreements and cannot be made public due to confidentiality agreements. The commenter adds that the fact that the underlying data is not available to the public does not make these 12 publications any less trustworthy. The commenter states that data for every study do not need to be publicly-open for the results to be useful.

²⁵⁰⁸ See National Ambient Air Quality Standards for Particulate Matter; Final Rule, 62 Fed. Reg. 38652, 38670, 38676, 38689-90 (July 18, 1997) (discussing the role of the study D.W. Dockery et al., An Association Between Air Pollution and Mortality in Six U.S. Cities, 329 NEW ENGLAND JOURNAL OF MEDICINE 1753–1759 (1993), commonly referred to as the Six Cities study, in setting the 1997 National Ambient Air Quality Standards (“NAAQS”) for Particulate Matter); see also *NRDC v. EPA*, 902 F. 2d 962, 974 (D.C. Cir. 1990) (declining to delay review of the PM10 NAAQS rulemaking due to concerns raised by industry challengers about the integrity of the Six Cities study database).

²⁵⁰⁹ See National Ambient Air Quality Standards for Particulate Matter; Final Rule, 62 Fed. Reg. at 38689-90 (discussing the peer review of the Six Cities study, the scientific debate over it, and why the raw data was not public); see also Memorandum from Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science to Members of the Chartered SAB and SAB Liaisons at 4, [https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/\\$File/WkGrp_memo_2080-AA14_final_05132018.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/$File/WkGrp_memo_2080-AA14_final_05132018.pdf) (last visited July 9, 2018) (discussing the peer review of the Six Cities study).

²⁵¹⁰ See, e.g., Neil Pearce and Allan H Smith, Data Sharing Not as Simple as it Seems, ENVIRONMENTAL HEALTH 10, 107, available at <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3260112/> (last visited July 9, 2018) (describing how removing unique identifiers from a data set may not sufficiently protect confidential personal information).

Commenter (0106) states that studies must be accepted, if the peer review deems them worthy and "real" science, not just a study sponsored by a company or lobbying group with the conclusion written by that sponsor before the study begins.

Commenter (6120) asserts that, while the Proposed Rule cites requirements of major scientific journals for the availability of data, the commenter provides that the editors of those journals have also issued a joint statement discussing the importance of including all relevant studies articulating circumstances where data cannot be fully shared, such as when it includes personal identifiers. Commenter (6896) notes, as editors of leading peer-reviewed journals stated, “[i]t does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them; rather, it is paramount that the full suite of relevant science vetted through peer review, which includes ever more rigorous features, inform the landscape of decision making. Excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes.”²⁵¹¹ Commenter (9227) notes that numerous representatives of the scientific community—including editors of the very scientific journals whose policies EPA cites to in the Proposal, the American Association for the Advancement of Science, members of the SAB, and other scientists cited to by EPA—have already voiced serious concerns about the Proposal.²⁵¹² According to the commenter, as these experts have recognized, it is not consistent with good scientific practice, and certainly not consistent with the Agency’s responsibility to utilize “best available science,” to deem certain scientific studies unworthy of consideration simply because these studies cannot meet an arbitrary public availability requirement.²⁵¹³ Commenter (6109) requests that EPA make use of the best available science, as it always has. The commenter provides that the best available science may include studies that do not have publicly available data and that the EPA should not arbitrarily dismiss these studies. Commenter (1011) states that EPA should avoid insisting on complete release of data if the security of the data would remain in doubt or if the failure to comply with the proposed transparency standard would prohibit EPA’s use of the best available science.

Commenter (8281-PH48) states that, if adopted the Proposed Rule would prevent EPA from considering the scientific studies that Rural Empowerment Association for Community Health (REACH) helps to conduct. The commenter notes that they cannot make all their data publicly available because we cannot risk compromising the confidentiality of the people who contribute

²⁵¹¹ Berg, J., Campbell, P., Kiermer, V., Raikhel, N., & Sweet, D. (2018). Joint statement on EPA proposed rule and public availability of data. *Science*, eaau0116.

Hoy, Scientific Leaders Speak Out on EPA’s Proposed “Transparency Rule,” <https://www.aaas.org/news/scientific-leaders-speak-out-epa-s-proposed-transparency-rule>; Jeremy Berg et al., Joint Statement on EPA Proposed Rule and Public Availability of Data, *Science* (Apr. 30, 2018), <http://science.sciencemag.org/content/early/2018/04/30/science.aau0116>; Letter to Acting Administrator Wheeler from Marcia McNutt, President of the National Academy of Sciences, C.D. Mote, Jr., President of the National Academy of Engineering, and Victor J. Dzau, President of the National Academy of Medicine (July 16, 2018) (Warning that “overly stringent requirements for transparency may cause valid evidence to be discarded and thereby pose a threat to the credibility of regulatory science,” and stating that “The National Academies have developed a long-standing body of work that demonstrates scientific literature can be evaluated in a transparent and objective manner without complete disclosure of the underlying data.”).

²⁵¹³ See John Ioannidis, All science should inform policy and regulation, 15 *PLOS* 5 (May 3, 2018) (“Past collected and analyzed information can and should still be used for decision-making, taking into account any relevant imperfections. While fully transparent and reproducible information should certainly be valued more highly, studies with weaknesses can still offer insights.”).

to our work. According to the commenter, because they live in a rural community it would be relatively easy to identify study participants based on de-identified information like age, sex, occupation and number in households, even if the participants' names were redacted.

Commenter (6864) states that EPA is routinely in receipt of unpublished toxicity studies for chemicals designed for commerce. The commenter states that not all scientific findings are publishable, nor do scientific journals generally have enough space to include all data.

Response: Upon consideration of the comments, the EPA agrees that it is important not to categorically exclude any study because the data underlying a study at the stage required by this rulemaking may not be available for independent validation. Therefore, the EPA is not finalizing the proposal approach that would have categorically required that for studies to be considered pivotal science the underlying data would need to be available for independent validation. However, given that transparency is an important aspect of EPA's regulatory actions and assessments, it should be an important consideration in how the Agency considers pivotal science. As described in 40 CFR 30.5 of the final rule, the EPA will rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies—based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science.

Further, the EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted or tiered access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

No Reason to Prevent Use of Human Health Studies Because Underlying Health Data are Not Available to the Public

Comment: Commenters (0128, 2020, 4848, 6351, 6905, 6914, 6919, 6922) assert that there is no reason to prevent the use of health data simply because the underlying health data are not available.

Response: This rule does not categorically exclude any study because the underlying dose-response data are not available, either publicly or via restricted access, for independent validation.

Comment: Commenter (0128) provides that it is common practice for biomedical scientists to use data from randomized controlled trials published in the clinical oncology literature to inform clinical practice guidelines for the American Society of Clinical Oncology and to inform coverage decisions on emerging treatments and diagnostic tests by medical directors at Blue Cross and Blue Shield health plans. The commenter states that the confidentiality of individual patient data is ALWAYS strictly maintained. Nevertheless, the commenter notes that the aggregated outcomes data fully informed and optimally guided clinical and coverage decisions based on the best available scientific evidence and analysis. The commenter states that maintaining the confidentiality of individual health records is not incompatible with subjecting scientific evidence to rigorous peer review.

Response: Nothing in this comment is incompatible with the requirements of this rule.

Comment: Commenter (4848) asserts that the EPA has presented no scientific reason to prevent use of human health studies simply because the underlying medical records are not available for public inspection and review. Commenter (6137) state that the Proposal only excludes health-based science (dose-response studies, epidemiological studies) where underlying data is not disclosed, generally because it cannot or should not be disclosed to protect individual participants' privacy and confidentiality. The commenter contends that the EPA cannot exclude whole categories of scientific data untethered from a specific context or study, but rather must assess each health study on a case-by-case basis to determine whether or not it should be considered in a particular rulemaking, under EPA's long-standing scientific guidelines and policies and its regular approach in CAA rulemakings. Instead, the commenter states that this Proposed Rule excludes health studies from consideration as a class, up front, before EPA is even in the rulemaking stage under its authority. And it does so not for scientific reasons, but, according to the commenter, simply due to industry preferences – most notably because industry cannot pick them apart by replicating decades of air pollution health effects, or by contacting individuals who shared private medical information to replicate the collection of data.

Response: This rule does not categorically exclude any study because the underlying dose-response data are not available, either publicly or via restricted access, for independent validation.

Comment: Commenter (2020) provides that a long-established approach to developing scientific knowledge is the peer-reviewed process that allows experts to propose logical arguments, test them with data, models and experiments, and determine the best explanations for the outcomes. The commenter notes that when human health is involved, the data required are often personal (names, addresses, illnesses, etc.) and are not needed to make aggregate assessments about the impacts of, for example, living nearer to a road where fine particulate (PM_{2.5}) levels are high and rates of asthma or other health impacts. Thus, according to the commenter, to require that such data are public for EPA to use them is effectively the blocking of established approaches to doing solid science in a manner that also protects privacy.

Commenter (6922) explains that, for decades EPA has relied upon epidemiological studies to help determine what pollutants or chemicals need to be regulated, and how rigorously to do

so.²⁵¹⁴ EPA's reliance on those studies was reasonable – even though the underlying data was not public – because the studies underwent peer review to ensure these studies and their results were sound, replicable, and reliable. The commenter asserts that not having the raw data did not, and does not, make the science unsound. The commenter notes that the studies that include or rely on confidential health information often are among the best science that the Agency has to evaluate the effects of pollutant exposure on humans, and the costs imposed on individuals and society as a result of that exposure.

Commenter (6922) notes that studies that include or rely on confidential health information often are among the best science that the Agency has to evaluate the effects of pollutant exposure on humans, and the costs imposed on individuals and society as a result of that exposure. Similarly, the commenter notes that EPA routinely relies on data provided by regulated industries that is treated as CBI and is therefore protected from public disclosure because it may include customer or other personally-identifiable information, including electric and gas consumption. According to the commenter, this is no different from relying on public health studies that rely on data that is protected from disclosure for various reasons.

Commenter (6121) notes that much of the data showing the connection between chemicals and breast cancer risk comes from laboratory studies. However, epidemiological studies, and longitudinal studies, provide critical insights and important corroboration for these findings. The commenter adds that epidemiological studies also allow researchers to look at numerous factors in the lived experience of women to understand and parse out some of these complexities. According to the commenter, most of these critical epidemiological studies are funded by the federal NIH, which has a strong confidentiality policy intended to “protect the privacy of subjects by limiting the disclosure of identifiable, sensitive information.” The commenter asserts that, forcing EPA scientists to disregard these critical studies because researchers have correctly protected the confidentiality of their participants' data will result in less scientifically sound conclusions and, most importantly, the public health benefits that the inclusion of these studies would provide.

Commenter (6145) asserts that, to have access to the best available science, studies must protect the privacy of those affected by environmental risks. According to the commenter, in its 2016 Plan to Increase Access to Results of EPA-Funded Scientific Research, the EPA recognizes the need to balance the interests of making information available to the public and protecting other interests, like privacy, as follows:

While the Agency strives to increase access to its research results, it recognizes, consistent with the OSTP Memo,²⁵¹⁵ that Federal agencies have a responsibility to protect confidentiality and personal privacy, respect proprietary interests and property rights, and balance between the value of providing long-term access and its associated costs. It is important to recognize that some research data cannot be made fully available to the

²⁵¹⁴ See, e.g., 62 Fed. Reg. at 38660 (describing the epidemiological studies used in developing the 1997 national ambient air quality standards for fine particulate matter).

²⁵¹⁵ Office of Science and Technology Policy, Memorandum for the Heads of Executive Departments and Agencies, Increasing Access to the Results of Federally Funded Scientific Research, February 22, 2013, https://obamawhitehouse.archives.gov/sites/default/files/microsites/ostp/ostp_public_access_memo_2013.pdf.

public but instead may need to be made available in more limited ways, e.g., establishing data use agreements with researchers that respect necessary protections. Whether research data are fully available to the public or available to researchers through other means does not affect the validity of the scientific conclusions from peer-reviewed research publications.²⁵¹⁶

Commenter (6914) notes that under Toxic Substances Control Act (TSCA) and other laws, EPA relies on data and information that labor and public health organizations submit to inform rulemaking records. This data often is in the form of personal health data, exposure monitoring data, information on work practices and personal accounts; much of this data is not and would not be “publicly available in a manner sufficient for independent validation,” as the proposal states. The commenter asserts that this is an unreasonable standard for research in general.

Response: This rule does not categorically exclude any study because the underlying dose-response data are not available, either publicly or via restricted access, for independent validation. If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

No Reason to Prevent Use of Old Studies Because Underlying Data is not Available

Comment: Commenter (1481) asserts that the Proposal is over-broad in its restrictions and would ignore older studies while also setting unrealistic bars for entrance of new evidence. The commenter notes that open data requirements would be a new qualification for the field not in line with prior publication standards. The commenter provides that, as a result, many quality studies would be disregarded due to the old societal standards under which they were published. Furthermore, the commenter states that, until experts in the field decide this is a standard which is necessary to ensure quality research, it seems arbitrary and short-sighted for a non-expert government official to decide this is necessary.

Commenter (6111) notes that the proposal would prevent EPA from relying on studies conducted many years ago for which data are no longer available.

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

No Reason to Prevent Use if Underlying Proprietary or CBI Data is Unavailable to the Public

Comment: Commenter (6448) states that there are and will be situations in which EPA has a statutory requirement to make a determination for which scientific information will not be publicly available in a manner sufficient for independent validation. The commenter provides, for example, that during submission of new chemicals under Section 5 of TSCA, a manufacturer will submit proprietary information to the Agency whom will utilize this information in order to determine a risk finding; the outcome of which will be transparently disclosed but in a generic

²⁵¹⁶ Emphasis added, EPA, Plan to Increase Access to Results of EPA-funded Scientific Research, pp. 4-5, November 29, 2016, <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf>.

manner. The commenter adds that the registration of active ingredients under Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) would follow a similar pathway as well. The commenter recommends that EPA ensure that any guidelines comply with applicable laws and encourage the use of all relevant scientific information, regardless if the underlying data can be publicly disclosed. According to the commenter, this is particularly important when utilizing data and information developed individually or via consortia under the requirements of FIFRA or TSCA.

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation. If there is a conflict between an environmental statute EPA administers and this rule, this rule will yield.

Scientific Mechanisms Intrinsic to the Scientific Process Sufficient to Ensure the Quality of a Study

Comment: Commenters (0040, 0732, 4838,4884, 5013, 6196, 6708, 6906, 6922, 9227) assert that public access to the underlying data is not necessary to ensure the validity of scientific information. Commenter (4591) notes that, in cases where it is not appropriate for data to be made publicly available, there are other mechanisms intrinsic to the scientific process for substantiating the relevance and validity of research results.

Commenter (9227) asserts that the Agency's arbitrary, single-minded focus on considering studies for which certain data and models are publicly available (but only the dose-response studies relevant to health protective regulation, not the ones supporting registration of chemicals) stands in stark contrast to the way the scientific community validates research findings. The commenter provides that the scientific community, and scientific journals look to a range of attributes when assessing the quality of a scientific study, including whether the study has been peer reviewed, whether the scientists used rigorous scientific methods, and whether the study's results have been reproduced or replicated. According to the commenter, while scientific journals and other institutions have encouraged making data and models publicly available, there is widespread recognition in the scientific community that doing so is often legitimately constrained due to legal and ethical protections on the confidentiality and privacy of data, or because the data is unavailable. Moreover, the commenter states that no scientist or scientific organization supports the Proposal's approach of excluding research for which the underlying data cannot be disclosed. The commenter notes that none of the materials EPA cites support such an extreme approach. To the contrary, the commenter provides that the scientific community recognizes that the quality of a study is not determined by whether the underlying data is publicly available and has long utilized a variety of tools for ensuring the integrity and rigor of research findings.

Response: If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation.

Peer Review is Sufficient to Ensure Quality of a Study

Comment: Commenters (0040, 0732, 1203, 2020, 4595, 4838, 4884, 5013, 6108, 6196, 6708, 6875, 6922, 8281-PH16, 9224) suggest that existing peer-review processes are sufficient to ensure the quality of a study.

Commenter (4595) states that the Proposal sets an implied standard that peer-reviewed scientific research data that is not publicly available is not rigorous enough for use in decision making. Commenter (6196) contends that the unspoken premise of the Proposal is that unless EPA can guarantee full public access to a study's underlying data, the study must be deemed unreliable and should play no role in assessing a pollutant or chemical's effects on human health. The commenter states that this premise ignores the many ways in which the scientific community, regulators, and the public have traditionally determined the quality and relevance of study results.

Commenter (8281-PH16) notes that Congress intentionally directed EPA to consider peer reviewed research under the CAA, and mandates regular reviews of the science to ensure that EPA is reviewing and considering the most up to date science.

Commenter (6922) provides that the EPA already utilizes a rigorous peer review process sufficient to ensure that Agency rulemakings are based only on sound, reliable studies, as described in EPA's Science and Technology Policy Council Peer Review Handbook (4th Edition).²⁵¹⁷ For instance, the commenter notes that the primary function of EPA's SAB is to review the quality and relevance of scientific and technical information being used by EPA or proposed as the basis for its regulations. The commenter notes that the Proposed Rule does not explain why the existing processes and tools for vetting scientific research, including epidemiological studies, are insufficient.

Commenter (4884) notes that peer reviewed studies as well as the necessarily cautious, deliberate process by which EPA has developed past regulations has ensured the sound basis of EPA rules. The commenter provides that valid health effect studies are often non-public because they rely upon confidential medical records. The commenter states that other studies useful in the past have relied upon confidential business sensitive industry data. According to the commenter, if the analysis of the raw data is available and correct, such studies must be used to achieve the legislative intent of these environmental laws.

Commenter (2020) provides that most modern scientific journals require that data and models and methods required to reproduce the scientific findings are published when a peer-reviewed paper is published. The commenter states that this standard should be sufficient for EPA going forward. According to the commenter, the fact that past published papers were not held to this standard is something that current practices attempt to remedy, but this does not mean that decades of understanding should be ignored by EPA and EPA should apply best practices as does the scientific community.
