Commenter (11479) refers to four studies and states that a simple anonymization process is inadequate to protect personal data. The commenter states that simple steps like an Internet search³¹⁶⁰ or database query search³¹⁶¹ can re-identify research participants. The commenter states that research using 1990 census data found that around 87 percent of Americans can be identified with just three data points: their zip code, gender, and date of birth.³¹⁶² The commenter states that one paper found that with just 15 characteristics (like age, gender, and marital status), a machine learning program could reidentify 99.98 percent of Americans from an anonymized database.³¹⁶³

Commenter (12405) states that de-identified does not mean unidentifiable. The commenter states that there are many studies where it is impossible to de-identify data to a level where both the data is usable and participants are properly protected. The commenter states that environmental exposure data often must be specific to a particular house, street or neighborhood. The commenter states that, for example, a 2009 study showed that consuming water from a private well located in an area with historical pesticide use is associated with an increased risk of Parkinson's disease.³¹⁶⁴ The commenter states that due to the nature of wells — typically serving a relatively limited number of people within a very small radius — the detail needed to perform the study renders proper deidentification impossible as all one needs to know is that a certain person lives near a particular well coupled with a demographic detail such as their age, gender, race, etc., and that person's privacy is at great risk.

Commenter (12720) states that one study explained that “[b]y linking demographics to public records such as voter lists, and mining for names hidden in attached documents, we correctly

identified 84 to 97 percent of the profiles for which we provided names.”³¹⁶⁵ The commenter states that another explained that “87% (216 of 248 million) of the population in the United States had reported characteristics that likely made them unique based only on [5-digit ZIP, gender, date of birth].”³¹⁶⁶ The commenter states that another explains that “any data that is even minutely useful can never be perfectly anonymous.”³¹⁶⁷

Response: The final rule does not require the release or de-identification of PII or sensitive information. The purpose of the final rule is to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. If dose-response data underlying pivotal science contains PII, the EPA will evaluate whether these data are available in a manner sufficient for independent validation (potentially through restricted access). For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.7.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenters (11360, 11396, 11480, 11576, 11900, 12464, 12546, 12720, 12727) contend that the proposal overlooks the risks to privacy. Commenters (11360, 11396) state that the risks to privacy are well recognized in the research and public health professions.

Commenters (11576, 12720) conclude that the EPA’s proposal poses significant threats to personal privacy and express concern that these are threats the EPA has yet to acknowledge and address. Commenter (12464) asserts that the supplemental proposal says virtually nothing about the risk of re-identification from supposedly anonymized data sets and that, in general, the supplemental proposal expresses too much confidence that de-identification can adequately address privacy and confidentiality concerns.

Commenter (11480) states that the Department of Health and Human Services guidance on De-identification Protected Health Information in Accordance with the HIPAA Privacy Rule acknowledges that, even when properly done, de-identification of data does not eliminate the risk of identification of an individual.³¹⁶⁸

³¹⁶⁵ Sweeney, L., Abu, A., & Winn, J. Identifying Participants in the Personal Genome Project by Name, Harvard University, Data Privacy Lab White Paper at 1, Cambridge 2013, available at <https://dataprivacylab.org/projects/pgp/1021-1.pdf>.

³¹⁶⁸ <https://www.hhs.gov/hipaa/for-professionals/privacy/special-topics/de-identification/index.html>.

Commenter (12710) states that the absence of a classification system for statistical and administrative data based on sensitivity of the data limits the government's ability to describe access restrictions and data security and privacy protocols appropriate for each level of sensitivity, in a way similar to the well-known classification and handling schedules for national security information.

Commenter (12546) asserts that it is implausible for these records to be publicized without risk of re-identification of individuals even if the most current techniques of de-identification are applied; ensuring that even the most pivotal and groundbreaking studies underpinning our current regulations will be downgraded or eliminated.

Commenter (11900) states that this level of privacy risk is not ethically acceptable. The commenter states that, although certain data types pose known threats to privacy, privacy is a moving target: as new data types are collected and new analytical methods are developed, novel privacy risks emerge that cannot always be anticipated. The commenter states that mobility traces (high-resolution location information) are one example of an emerging data type in environmental health studies. The commenter states that these data are increasingly being used to infer co-located environmental data as technological and cost barriers have decreased. These data are known to be extremely vulnerable to re-ID.³¹⁶⁹ Additionally, the commenter states that their research shows that it is not feasible to distinguish between data types that pose re-identification risk and those that do not. The commenter urges the EPA to treat all data associated with human study participants and their homes as potentially containing PII.

Response: The final rule does not require the de-identification of PII. The purpose of the final rule is to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. If dose-response data underlying pivotal science contains PII, the EPA will evaluate whether these data are available in a manner sufficient for independent validation (potentially through restricted access). For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.7.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Siddle J. I Know Where You Were Last Summer: London's public bike data is telling everyone where you've been London. 2014 [Available from: <https://vartree.blogspot.com/2014/04/i-know-where-you-were-last-summer.html>].

Comment: Other commenters (10042, 11381, 11899) contend the anonymization process maintains the privacy of the individual.

Commenter (10042) states that claims that transparency is not possible because of potential or actual violations of privacy of human health information are not true; the claims are readily falsifiable. The commenter states that the privacy argument against transparency is specious because human clinical data are made public without any violations of individual privacy through a widely accepted process called "anonymization".³¹⁷⁰ The commenter states that the anonymization process maintains the privacy of the individual³¹⁷¹ so that the information can be made public and shared various entities for analyses. The commenter states that the practice of anonymization is used by pharmaceutical companies and contractors such as Privacy Analytics, Novartis, and Otsuka where clinical data that are made public are kept private. The commenter states that some regulatory agencies, such as European Medicines Agency require submitted clinical data to support drug registrations to be anonymized. The commenter states that avoiding transparency because of potential violations of privacy rights regarding health information and data of individuals is a clear misrepresentation.

Commenter (11381) states that the EPA should adopt by rule performance standards used elsewhere in the government and private sector to protect the privacy of PII. The commenter states that this information already must be disclosed to comply with the IQGs, so there is no marginal burden involved. The commenter states that this will require tradeoffs in some cases, such as circumstances in which data cannot be fully protected from deidentification, but the protection of privacy, a worthy goal, comes at the opportunity cost of forgone reproducibility and validation, and hence, public legitimacy. The commenter states that this is not a new problem, nor is it unique to EPA.

Commenter (11899) states that, while some have claimed the transparency rule would force researchers to reveal personal or confidential information about participants in health studies, in reality, such information is not needed and can easily be redacted; only the health data, and location by city and state, is required for these studies.

Response: The final rule does not require the de-identification of PII. The purpose of the final rule is to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. If dose-response data underlying pivotal science contains PII, the EPA will evaluate whether these data are available in a manner sufficient for independent validation (potentially through restricted access). For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.7.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not

³¹⁷⁰ Khaled El Eman, et al., BMJ 2015; 350: hl 139. Doi 10.1136/bmj.hl 139.

³¹⁷¹ Janice Branson, et al., BMC 2020; 21:200. Doi 10.1186/s13063-020-4120y.

require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (12692) does not agree with critics who warn that, due to potential hacking, confidential data may not be protected under the proposed rule. The commenter states that, if hacking is the problem, that applies to original investigators no less than to those who audit published studies.

Response: The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

11.2.1.4.3 Participation in Studies

Comment: Commenters (11184, 11377, 11395, 11404, 11479, 11496, 11890, 11900, 12458, 12474, 12540, 12716, 12720, 12727, 12731, 13549) express concern that the proposal will deter individuals from participation in research studies due to the risk of publication of personal health data.

Commenters (11184, 11377, 12435, 12457) express concern that the proposal disadvantages study subjects whose participation and data would be prevented from informing public policy. Commenter (12457) states that the lack of participation by low-income communities and communities of color may impact the long-term accessibility of beneficial treatments or interventions because researchers are unable to understand how these treatments impact low-income communities and communities of color.

Commenter (11377) states that effectively mandating fully-public data leaves potential human subjects of research with an uncomfortable choice: take part in studies that may compromise their privacy and confidentiality, or lose the opportunity to participate in science for the betterment of human health altogether. The commenter states that undermining potential subjects' confidence that their information will be protected skews the already unfavorable ratio of risk to benefit of participation in research. The commenter states that this will likely reduce the population of people willing to participate in research, which will severely hamper the conduct of science.

Commenters (12474, 13549) contend that the proposal will reduce research and data collection needed to protect the health of Tribal communities as individuals are deterred from participation based on the fear their personal information will be released and researchers avoid seeking such information.

Commenter (12540) provides that the SNPRM does not recognize the rigorous process for conducting environmental health research. The commenter notes that when environmental health studies are proposed and conducted, there is close attention paid to privacy of personal

information and protected health data.³¹⁷² The commenter asserts that without protections for the subjects in these studies, EPA is well aware that there would be little, if any participation, and academics would not be allowed to conduct these high quality research studies because of the stringency of the IRB Protections for Human Subjects.

Commenter (12720) contends that the Supplemental Proposal does not consider the negative effects it would have on recruitment for future epidemiological studies if members of the public had to permit access to sensitive personal and health information as a condition for study participation. The commenter provides that many of the peer-reviewed studies EPA uses to set and revise the national ambient air quality standards (NAAQS) through the CAA analyze the relationship between exposure to polluted air over many years and a range of adverse health effects. The commenter notes that these comprehensive studies have enrolled thousands of American volunteers over periods ranging from several years to decades, in order to understand exactly how pollution harms us. According to the commenter, the Supplemental Proposal would have a chilling effect on the study recruitment process because of the onerous data release requirements. The commenter states that EPA's actual creation of these harmful consequences, and failure to consider and account for these harmful consequences, render the Proposal arbitrary and capricious and an abuse of Agency discretion.

Response: This rule does not require any disclosure of PII. The EPA would also like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (12692) does not agree with critics who warn that the rule could deter people from participating in important studies out of fear that they could be identified. The commenter states that, just like epidemiologists, there is no reason why auditors of such studies would not be similarly bound and liable for breaches of confidentiality.

Response: The EPA thanks the commenter.

11.2.1.5 Intellectual Property

Comment: Commenter (12430) expresses concern that the proposed rule does not address intellectual property rights. The commenter states that, for scientists at academic and research institutions, intellectual property protections for innovative analytical tools, models, and computer code are important to the research process. The commenter states that 40 CFR 30.5(c) of the proposed rule, however, would require the publication of the details of such original models and code. The commenter states that the proposal only allows for restricted access to the information if it contains "CBI, proprietary information or personally identifiable information." The commenter states that the intellectual property rights of academic or governmental researchers do not clearly fall into any of these categories.

Response: The purpose of the final rule is to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to

³¹⁷² Public Law 104-191, which became law on August 21, 1996

promulgate significant regulatory actions and develop influential scientific information. The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA and does not direct or require any outside entity or the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (12430) states that industry research might still be protected as CBI, while academic or public interest research would not be entitled to rely on intellectual property protections. The commenter states that the absence of publication exceptions or exemptions for protected intellectual property makes it far more likely that industry research, rather than academic or public interest research, would form the basis of regulatory decision-making. The commenter states that this could build an industry preference into EPA's regulatory process and disseminated information.

Response: The EPA does not agree that the approach included in the final rule will lead to systematic bias towards certain types of stakeholder goals because the EPA is not categorically excluding any studies from consideration with promulgating significant regulatory actions or developing influential scientific information.

Chapter 12: Administrator's Exemptions

The 2018 notice of proposed rulemaking (NPRM) included a provision at 40 CFR 30.9 allowing the Administrator to grant exemptions from the rule on a case-by-case basis if he or she determines that compliance is impracticable because it is not feasible to conduct independent peer review on all pivotal regulatory science because it is not feasible to ensure that dose response data and models underlying pivotal regulatory science are publicly available in a fashion that is consistent with law, protects privacy and confidentiality, and is sensitive to national and homeland security.

In the supplemental notice of proposed rulemaking (SNPRM) the EPA proposed deleting the proposed exemption because EPA does not believe that independent peer review of pivotal regulatory science or pivotal science would be infeasible. The EPA specifically requested comment on whether these exemptions are appropriate, and on whether there are other situations in which specific significant regulatory actions, or specific categories of significant regulatory actions should be exempted.

The SNPRM also proposed to modify the scope of the data and models that can be considered when determining whether to grant an exemption. The EPA proposed to use the age of data and models as a factor in the determination that compliance with the rule is impracticable. The EPA also proposed in the supplemental that a study or studies would be eligible for consideration whether they contain confidential business information (CBI), proprietary information, or personally identifiable information (PII), if the underlying data or models were collected, completed or updated before the effective date of this rule.

The supplemental notice solicited comment on the modified text of 40 Code of Federal Regulations (CFR) 30.9, the applicability of the rule to all data and models, retrospective application of the rule, and whether there are factors other than the age of data and models that should be considered when granting exemptions.

Several comments were received regarding Administrator exemptions. In this section the public comments are organized according to the following topics under sections 12.1 (Exemptions (40 CFR 30.9)(NPRM Comments)) and 12.2 Administrator Exemptions (SNPRM Comments):

Section 12.1: Exemptions (40 CFR 30.9)(NPRM Comments)

- Legality of Proposed Exemption Provision in 40 CFR 30.9 of the Rule
- Case-by-Case Administrator Exemption Authority
- Criteria for Granting Case-by-Case Exemptions
- Requests for Specific Rule Exemptions
- Define "Reasonable Effort"
- Exemption Process Costs
- Notice-and-Comment Principles Should Inform EPA's Implementation of the Exemption Process

Section 12.2: Administrator Exemptions (SNPRM Comments)

- Granting of Exemptions is Subject to Bias
- Rule Would Preclude Consideration of Best Available Science
- Areas Needing Additional Clarity/Specificity
- Transparency
- Retroactivity
- Support for Exemptions
- Other Comments

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

12.1 Exemptions (40 CFR 30.9) (NPRM Comments)

12.1.1 Legality of Proposed Exemption Provision in 40 CFR 30.9 of the Rule

Comment: Commenters (6125, 9227) contend that it is well established that existence of a waiver or exemption mechanism cannot be used to justify a provision otherwise beyond an agency's legal authority. *Dimension Financial Corp. v. Board of Governors of Federal Reserve System*, 744 F.2d 1402, 1410 (10th Cir. 1984) ("The possible exception to the initial impact of Regulation Y (Part 225.21(B)(4)) contains requirements with no objective standard and thus unbounded agency discretion. A device to meet objections to the new regulation cannot cure the exercise of powers denied by Congress or not provided for by Congress. *Public Utilities Comm. of Calif. v. United States*, 355 U.S. 534 (1958); *In re Surface Mining Regulation Litigation*, 627 F.2d 1346 (D.C. Cir. 1980). Commenter (9227) adds *ALLTEL Corp. v. FCC*, 838 F.2d 551, 561 (D.C. Cir. 1988) ("The [Federal Communications Commission] FCC cannot save an irrational rule by tacking on a waiver procedure. 'The very essence of waiver is the assumed validity of the general rule . . .')(citing *WAIT Radio v. FCC*, 418 F.2d 1153, 1158 (D.C. Cir. 1969)); *United States Telecom Ass'n v. FCC*, 359 F.3d 554, 571 (D.C. Cir. 2004) ("Moreover, even if the FCC had adopted some lawful mechanism for making exemptions from its general national rule, it could not necessarily rely on the existence of that mechanism as the sole justification for not adopting a more narrowly tailored rule. . . . [T]he mere existence of a safety valve does not cure an irrational rule.")

Commenter (9277) provides the following points to support their position:

First, while the statutory provisions described above require EPA to consider best available science and other relevant information when making regulatory decisions, see, e.g., Safe Drinking Water Act, 42 U.S.C Section 300g-1(b)(3)(A)(i) ("The Administrator

shall use the best available, peer reviewed science.”), the Administrator has discretion over whether to grant an exception. See Proposed § 30.9 (“The Administrator may grant an exemption to this subpart on a case-by-case basis...”)(emphasis added).[128] Where a statute requires that the agency consider certain information in reaching a decision, EPA cannot promulgate a rule that gives the Administrator discretion over whether to allow such consideration.

Second, the only basis on which the Administrator may grant an exemption under Proposed §30.9 is that it “is not feasible” to “ensure that all dose response data and models underlying pivotal regulatory science is publicly available” as the rule requires. However, the Proposal does not explain how “feasibility” is to be determined in this context—or even whether the term encompasses practical feasibility, cost-effectiveness, or other considerations. Moreover, there can easily be situations where it is theoretically “feasible” to make underlying data publicly available, but this information is nonetheless not publicly available. For example, a scientist who intends to rely on the same data to publish multiple papers may be disinclined to make that data available to competitors. Yet, because it is technically “feasible” to make the underlying data publicly available, the proposed rule would not even provide the Administrator with authority to grant an exemption authorizing such consideration, thus forcing the Administrator to violate the law.

Third, even if it were lawful for EPA to ignore relevant science, the exemption provision is arbitrary, as it does not define enough criteria or process steps by which the Administrator may decide to exempt a study. The provision instructs the Administrator to rely on a handful of broad (and highly manipulable) policy considerations in determining whether it would be infeasible to make data and methods publicly available. These factors could be applied broadly to give the Administrator nearly absolute discretion. From the face of the Proposal, it is not even clear that the Administrator would be required to provide a public, written explanation of his decision to grant (or deny) a waiver. This lack of accountability could lead to the arbitrary exclusion of studies the Administrator unilaterally chooses to not exempt.

Finally, the exemption provision is impractical and likely could not be implemented effectively. According to the Congressional Budget Office, EPA “relies on about 50,000 scientific studies annually to perform its mission,” and at times, relies on thousands of studies for one action. Many of the studies that would be affected by this rule are complex and include large datasets that would lead to an extensive decision-making process under the exemption provision. EPA does not include any rationale in the proposal justifying how the Administrator could reasonably decide to exempt studies on a case-by-case basis given the tens of thousands of studies EPA considers each year. This provision could create a large backlog, which would result in important studies being effectively removed from EPA consideration because of the need to finalize a regulation before an exemption for every relevant study is granted. Accordingly, the exemption provision fails to safeguard against the unlawful exclusion of valid science from EPA’s regulatory process.

Commenter (6117) states that well-established legal precedent frowns upon case-by case determinations where, as here, a general rule would be appropriate.

Commenter (6373) asserts that the ability of the Administrator to apply the Rule arbitrarily is an inherent legal deficiency and renders the exemption process ripe for exploitation.

Response: The EPA is authorized to promulgate this procedural rule under its authority to promulgate housekeeping regulations governing its internal affairs.

EPA notes that the final rule does not categorically exclude studies. The EPA does not agree with the comments regarding the role of the Administrator in determining whether to grant an exemption under 40 CFR 30.7 in the final rule and finds that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator's decision is appropriately transparent and supported, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. Finally, as is normal Agency practice, the quality of all pivotal science is evaluated prior to its use and thus before the need for a possible exemption under this final rule. The exemption factors listed in Part 30.7 contained additional science-based criteria.

40 CFR 30.7 lists the circumstances under which an exemption may be warranted. Specifically, the final rule states the Administrator may grant an exemption to this part for a study on a case-by-case basis if he or she determines that greater consideration of studies for which the underlying data are not publicly available in a manner sufficient for independent validation is nevertheless warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.1.2 Case-by-Case Administrator Exemption Authority

12.1.2.1 Opposition/Support for Allowing the Administrator Authority in Determining Case-By Case Exemptions

12.1.2.1.1 Opposition to Allowing the Administrator Exemption Authority

Comment: Commenters (0562, 0567, 0569, 1006, 1170, 1481, 1945, 2003, 2006, 2023, 2336, 2393, 2429, 2787, 4157, 4420, 4588, 4589, 4595, 4831, 4842, 4878, 4884, 4894, 5011, 5181, 5977, 6046, 6099, 6100, 6103, 6111, 6114, 6116, 6117, 6122, 6131, 6133, 6134, 6135, 6137, 6145, 6157, 6158, 6188, 6191, 6361, 6373, 6378, 6379, 6868, 6894, 6899, 6903, 6909, 6912, 6915, 6940, 8272, 8274, 8281-PH26) disagree with allowing the Administrator to be the sole authority in determining case-by-case exemptions. Commenter (6868) is concerned that delegating the discretionary authority solely to the Administrator would grant excessive authority to one person without accountability. Commenter (6158) urges EPA to reevaluate and alter the means by which exemptions would be acquired. Commenters (4842, 4884) assert that there is no basis for politically appointed administrators to choose which science will be considered and which may not be. Commenter (4420) states that there should be a middle ground for when the EPA determines that the study can be used for regulatory decisions when all supporting data are not available. The commenter recommends, however, that the decision to use a study in absence of an independent review of the original data should not be the responsibility of one individual.

Commenter (6134) expresses concern that the proposal puts the EPA in the position of defining “transparent” and allows the Agency to decide if studies should be included in their rule making process.

Commenters (0567, 0569, 2429, 4894, 6116, 6158, 6378, 6379, 6876, 6899, 6940) assert that allowing the EPA Administrator the ability to exempt/waive (or not waive) provisions of the rule would reduce/weaken transparency, trust and public confidence in EPA rulemaking. Commenter (6351) notes that it is arbitrary decision-making to give authority to the Administrator to determine the fate of research.

Commenters (0569, 2006, 2336, 4588, 4842, 4878, 4884, 5011, 6100, 6103, 6122, 6152, 6157, 6188, 6158, 6378, 6446, 6894, 6909, 8274) express concern that exemption discretion would be in the hands of a political appointee with potential conflicts of interest and broad discretion to waive the rule’s requirements that could result in barring the use of sound science and “best available science”.

Commenter (0569) expresses concern that the proposed language at section 30.9 of the rule would allow the EPA to selectively exclude studies to meet its agenda. The commenter states that while 40 CFR 30.9 gives the EPA Administrator discretion to issue exemptions from the policy on a case-by-case basis, this section is vague on how and by what measures determinations would be made, opening the door for drawing upon studies driven by unknown

interests or by political considerations rather than, as EPA's Mission Statement notes, "...the best available scientific information."³¹⁷³

Commenter (2006) asserts that the EPA's work is politically controversial and allowing the EPA Administrator to make such decisions creates the opportunity for partisan decisions about which studies are and are not allowed to be considered by the EPA.

Commenter (6157) believes that the EPA's proposal inappropriately injects partisanship into the scientific process by granting the EPA Administrator – a political appointee – the sole ownership of exemptions to this policy. The commenter states that obfuscating the process of setting rules to protect public health and the environment with additional political bias defies the very nature of science, which is to remain objective and follow a consensus of the most accurate data.

Commenter (1170) states that it is not the EPA's job to determine what constitutes valid science--that should be left to scientists working in the field who are in a position to assess the validity of the results and methods--not to administrators. The commenter states that, while the EPA certainly must have some ways of determining which scientific studies deserve the most weight, its responsibility is to consider the aggregate scientific evidence, with guidance from experts in the field, and from that develop policies that address potential threats to the American public identified by that research.

Commenter (4589) states that the proposed Rule would allow the Agency, acting as a risk manager, too much latitude in deciding in advance which studies to examine and which to ignore. The commenter states that it creates in effect a list of potential study disqualifiers in advance of rigorous review and contextualization of the results. The commenter states that the strictures created by the proposed Rule will not be seen as a set of guidelines (such as the Daubert Criteria), rather, these strictures could be used to disqualify reasonable studies on superficial and technical grounds when in reality the value of a study may often be to provide context. The commenter states that there are hazards inherent in confining one's attention to a selected body of work while ignoring other studies that may show anomalies or unexpected findings.

Commenter (6122) asserts that there is no statutory authority to suggest that this is a permissible approach to leave such exemption decisions in the hands of a political appointee, and no court of law would ever sanction such an arbitrary, lawless, irrational approach. Commenters (2393, 4884, 6903) provide that allowing the EPA Administrator control of what studies/data that would be exempt from the rule is not supported by the Congressional mandates that have guided the EPA and would force the Administrator into a level of direct control which it has not been given by Congress. Commenters (4884, 6903) state that they doubt the Congressional record underlying environmental laws envisions such a role for the EPA Administrator.

Commenter (5181) asserts that it is unclear why an exemption from compliance with the rule would be needed if the final rule is not excessively burdensome; how that discretionary authority

³¹⁷³ United States Environmental Protection Agency. Our Mission and What We Do. Available: <https://www.epa.gov/aboutepa/our-mission-and-what-we-do>

will be exercised; and what, if any, standards would be applied by the Administrator in determining exemptions.

Commenter (6915) argues that allowing the Administrator to make ad-hoc exemptions for specific studies or models does not cure the proposed rule's fatal defect of requiring EPA to consider factors other than those specified by Congress. See *Alltel Corp. v. Fed. Comm'n Comm'n*, 838 F.2d 551, 561 (D.C. Cir. 1988) (holding that an agency "cannot save an irrational rule by tacking on a waiver procedure" because the "essence of waiver is the assumed validity of the general rule").

Commenter (6046) notes that one person could arbitrarily and capriciously decide which studies the EPA ultimately uses to set standards, health values, and other EPA values. According to the commenter, it is not appropriate that any one person have such control over EPA's work and the health of the public. The commenter notes that it is assumed that the Administrator would be more involved in management decisions and having the Administrator review detailed scientific issues is probably not the best use of the Administrator's time. Further, according to commenter, the Administrator is unlikely to have working knowledge about the complexities of many of the scientific datasets used by EPA. For example, the commenter notes that epi studies often conduct complex analyses of their data and determining if the results can be replicated with the confidential data removed would be difficult unless the Administrator is an epidemiologist. The commenter asserts that the Administrator is often not a scientist. The commenter contends that it is unreasonable to expect the Administrator to understand scientific datasets sufficiently well as to determine whether the confidentiality of people's health and other highly personal information should be made public.

Commenters (2787, 6046, 6133) assert that allowing the EPA Administrator to grant exemptions on a case-by-case basis would enable the Administrator to interfere in the rulemaking process in an arbitrary and capricious manner and could result in the rule being applied unevenly.

Commenters (6137, 6191) argue that the proposed section 30.9 provides the EPA Administrator unfettered discretion to be a case-by-case arbiter of scientific information and does not allow for appropriate oversight and is not subject to notice-and-comment, or any stated standards or principles limiting discretion.

Commenter (6111) states that any decision to consider the study while allowing the data to remain confidential being left to the whim of the EPA Administrator is inconsistent with the Office of Management and Budget's (OMB's) uniform privacy protections.

Commenter (6145) states that allowing the Administrator to determine – separately from the requirements of the proposed rule – when he/she can consider science that does not meet the parameters of the proposed rule is unacceptable. The commenter believes that the exemption provisions will result in a loophole that allows the Agency to consider what is called "secret science: selectively.

Commenter (8281-PH26) states that the case-by-case exemption provision raises serious risk that this or future administrations could selectively waive the policy to build a distorted scientific record that is designed to reach a desired result.

Commenter (6188) asserts that allowing the Administrator broad discretion in exempting studies from consideration creates the potential for significant inconsistency in future regulatory decision-making even when the scientific community has reached consensus on the underlying issue.

Commenter (6135) states that picking and choosing which studies to use as the basis of agency actions is antithetical to both sound scientific analysis and evidence-based rulemaking.

Commenter (0562) asserts that a critical deficit of the rule is that it apparently gives the Administrator the sole authority to determine which studies would be exempt, without any explicit language on the effects of the exemptions on present or future use of those studies for regulatory decisions, or for the checks and balances and science-based criteria needed to ensure those decisions support use of the best available science.

Commenter (2003) expresses that it is problematic that the Administrator would have wide latitude under the proposed rule to exempt studies and datasets from the requirement that they be posted online. According to the commenter, the EPA should be making regulatory decisions based on reviews of all available, relevant, credible science done by its scientists. But if the Administrator can hand-pick the studies that are made available to the scientists, he or she can pre-determine the conclusion of their reviews. Vesting that level of influence over the regulatory process in one individual is likely to make that individual a target for lobbying by those with a vested interest in the outcome and does not seem likely to produce the best outcomes for protecting public health and the environment.

Commenter (6122) states that in any individual rule-making EPA might already decide that there is a sound rationale for excluding a specific study from consideration, while including others. In such a circumstance, the commenter states that the agency would have to provide a reasonable basis for that determination. According to the commenter, under this rule, by contrast, EPA seeks to create an inappropriate presumption that certain studies will not be considered and seeks to leave it up to the Administrator to decide when the agency will make an exception.

Commenter (6868) states that the proposed rule provides no guidance or standards for how exemption discretion should be applied and no public, congressional or administrative oversight process for how this authority is executed. Similarly, commenter (6379) contends that the Proposed Rule does not make clear that the proposed “case-by-case” exemption process would be enough to provide certainty that EPA will utilize the best available CBI. The commenter is concerned that such a process could decrease the consistency with which data are treated and increase the discretion of EPA in making such determinations. In contrast to the stated aims of the Proposed Rule. The commenter is concerned that this could decrease transparency of the rulemaking process by obscuring the basis of and process for taking regulatory actions. Commenter (6188) asserts that the resulting “black box” exemption process would provide no guidance to the scientific community on how to conduct studies that meet the Proposed Rule’s

requirements (or qualify for an exemption) and can thus serve as meaningful tools for EPA under the new regulatory regime.

Response: EPA notes that the final rule does not categorically exclude studies. The EPA does not agree with the comments regarding the role of the Administrator in determining whether to grant an exemption under 40 CFR 30.7 and finds that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. Finally, as is normal Agency practice, the quality of all pivotal science is evaluated prior to its use and thus before the need for a possible exemption under this final rule. The exemption factors listed in Part 30.7 contained additional science-based criteria.

The EPA is including criteria that may be used by the Administrator when considering whether to grant an exemption in 40 CFR 30.7. Specifically, the rule states that greater consideration under this rule may be warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.1.2.1.2 CBI and Non-Industry Sponsored Studies Could be Treated Differently

Comment: Commenters (6114, 6116, 6122, 6131, 6361, 6373, 6868, 6897, 6909, 6912, 6915, 6940) assert that allowing the Administrator to selectively exempt industry studies from the restrictions of this proposal could allow industry to be held to a different standard than academics or regulatory agencies.

Commenter (6373) asserts that the proposed exemption provision makes exceptions for industry-funded or industry-favorable findings while rejecting consideration of studies conducted by established scientific institutions in accordance with scientific best practices. The commenter asserts the EPA's failure to act could undermine the scientific foundation of both past and forthcoming regulations, rendering them insufficiently protective of human health. The

commenter asserts that, because the rejection of research grounded in scientific data that contains private or confidential information is itself inherently arbitrary and capricious, there are no additional parameters that could limit the discretion of the Administrator in a manner that would render the Rule rational.

Commenter (6868) envisions a scenario where an Administrator grants data exemptions to industry studies while requiring academic studies to meet stringent data requirements. The commenter believes that capricious application of the proposed data policy and its lack of transparency would undermine the legitimacy of the EPA rule making process and the public's trust in agency actions.

Commenter (6940) reports that proprietary chemicals and products are protected as CBI. The commenter states that, when safety testing is conducted by private companies using Good Laboratory Practice, there is no requirement for independent validation of the results. Thus, according to the commenter, the case-by-case exemption provision allows the Administrator to make independent regulatory decisions based on data that have not been replicated by the scientific community, and without the input of the Science Advisory Board (SAB). In effect, the commenter asserts this is not the "best available science," nor is it transparent, because the strength of scientific results lies in peer reviewed methods and data that withstands independent replication. The commenter explains that the Administrator is given broad discretion to determine which data will be used in regulatory decisions. According to the commenter, the case-by-case exemption provision may allow EPA to consider significant amounts of information submitted by industry to the Agency, even though the information will be protected as CBI and shielded from the public and independent validation.

Similarly, commenter (6912) states that studies funded by the chemical industry could be exempted from the proposed rule's data publication requirements based on CBI concerns while studies by independent academic researchers *of the same chemicals* might not be, even if underlying health data raised privacy concerns. According to the commenter, it would depend on the whim, and the biases, of the Administrator. The commenter states that, given the strong objections the chemical industry expressed to a blanket data publication requirement and EPA's apparent eagerness to allay the chemical industry's concern, it appears that the exemption provision was specifically designed with the chemical industry in mind. The commenter contends that, providing the Administrator the ability to exempt any study from the proposed rule's requirements addresses industry concerns that the proposed rule's data transparency requirements would exclude many chemical industry-funded studies.

Commenter (6909) asserts that the Administrator would be able to apply this rule to block consideration of studies demonstrating human health impacts from pollutants that would trigger new or additional regulations that industry does not want, but then fail to apply this rule to require transparency in studies of things like the composition of fracking fluid or the confidential information pesticide companies provide in registering pesticides with the EPA.

Commenter (6915) asserts that, without any standardized and objective criteria, the commenter believes that the exemption process could, for example, allow biased determinations by the Administrator that provide an exception for CBI in studies submitted by chemical and pesticide

manufacturers, while excluding academic toxicology or epidemiology studies. Commenter (4831) states that “[d]ecisions about exemptions should be based on formal agency guidance and not according to criteria established by a single EPA employee.”

Commenter (6955) states that, as proposed, and as many other commenters have stressed, it appears that the rule will incorporate double standards. For instance, the commenter explains that those who rely on proprietary information and CBI (industry and for-profit contractors) will apparently be exempted from complying with the rule, while academic studies will be barred from regulatory consideration, if their papers do not include public access to the data. The commenter provides that, because studies funded by industry will also be vulnerable to post-hoc multiple comparisons, if their data were to be made public, there will be strong pressure to develop rhetorical arguments to justify their receiving exemptions.

Response: EPA notes that the final rule does not categorically exclude studies. The EPA does not agree with the comments regarding the role of the Administrator in determining whether to grant an exemption under 40 CFR 30.7 and finds that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator’s decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. Finally, as is normal Agency practice, the quality of all pivotal science is evaluated prior to its use and thus before the need for a possible exemption under this final rule. The exemption factors listed in Part 30.7 contained additional science-based criteria.

40 CFR 30.7 lists the circumstances under which an exemption may be warranted. Specifically, the final rule states the Administrator may grant an exemption to this part for a study on a case-by-case basis if he or she determines that greater consideration of studies for which the underlying data are not publicly available in a manner sufficient for independent validation is nevertheless warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study’s underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7 and will result in

equal consideration of all exemption requests regardless of the entity that produced or sponsored the pivotal science.

Comment: Commenter (1012) asserts that there should be no large-scale exemption of certain types of studies (such as CBI), information, or data. According to the commenter, if a case-by-case exemption is sought, it should be made in a transparent fashion with the request, along with the reasoning behind the Administrator's final determination, made publicly available.

Response: EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

The EPA is including criteria that may be used by the Administrator when considering whether to grant an exemption in 40 CFR 30.7. Specifically, the rule states that greater consideration under this rule may be warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.1.2.1.3 Support for Allowing the Administrator Exemption Authority

Comment: Commenters (0844, , 6126, 6143, 6151, 6162, 6179, 6356, 6360, 6891, 6906, 6921) express support for allowing the EPA Administrator authority in determining case-by-case exemptions to the rule.

Commenter (6126) states that the allowance for exemptions under 40 CFR 30.9 of the proposed rule enables flexibility based on individual study conditions, restrictions, and constraints from Institutional Review Boards (IRBs).

Commenter (6179) provides that the allowance for the EPA Administrator to exempt studies cited in significant rulemakings containing certain information, including that which is private, sensitive, or confidential, from these requirements is reasonable to improve the evidentiary basis for EPA's regulatory policies and improve regulatory outcomes by targeting resources to where they can achieve the largest benefits. The commenter asserts that, rather than rigidly excluding important studies, the Transparency Proposal provides a flexible, case-by-case exemption process. The commenter states the exemption provision in the proposed rule presumes proactive management of private, sensitive, or confidential information and only requires disclosure of dose response data and models in appropriate circumstances.

Commenter (6891) recognizes and supports the need for exemptions to address lawful and reasonable restrictions on underlying data and models. The commenter also supports EPA's clear intent to ensure that the exemption process does not effectively cancel out the general policy of transparency. The commenter advises EPA to undertake all reasonable efforts to provide access to underlying data and models while protecting legal and policy interests in privacy, confidentiality, and national and homeland security. To the extent reasonably possible, the commenter urges the EPA to explore all methods to allow for data access without impinging on privacy and confidentiality concerns.

Commenter (0844) states that, while they agree that the Administrator must have flexibility in such cases, they state that this provision not end up being a loophole to avoid transparency and suggest that it therefore should be used judiciously.

Commenters (6143, 6151, 6360, 6376, 6906, 6918) support the exemption provision in the proposed rule but recommend that the EPA provide clear parameters/criteria to properly constrain the Administrator's use (additional comments provided under section 12.1.5 of this Chapter).

Commenters (6356, 6918) agree that the Administrator should be allowed to make case-by-case exemptions from this rule but believes that the Administrator must document the basis of such a determination.

Commenter (6918) states that the unavailability of underlying data and models should not prevent the Administrator from citing and relying on a study for a proposed or final rule. The commenter asserts that it is therefore appropriate that the Proposed Rule allows the Administrator to grant exemptions and allow consideration of studies for which underlying data and models cannot be made publicly available. 83 Fed. Reg. at 18774 (proposed 40 CFR 30.9). The commenter suggests that the unavailability of these materials should be acknowledged in the proposed or final rule's preamble. The commenter also suggests that the Administrator take the unavailability of underlying data and/or models into account in deciding what weight to give to a study and that EPA should evaluate relevant techniques for protecting data that still enable some public access, such as data-masking or anonymizing methods before granting an exemption.

Response: To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 of the final rule that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

40 CFR 30.7 lists the circumstances under which an exemption may be warranted. Specifically, the final rule states the Administrator may grant an exemption to this part for a study on a case-by-case basis if he or she determines that greater consideration of studies for which the underlying data are not publicly available in a manner sufficient for independent validation is nevertheless warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

Comment: Commenter (6151) reports that industry coalitions and trade associations often aggregate CBI data and present those data in comments to EPA during rulemaking proceedings. The commenter explains that these data often underpin arguments as to whether a proposed regulation should be adopted, or ground truth the economic impact of a proposed regulation. The commenters report that, in these cases, proprietary market or economic data of individual companies are provided to the trade association and then aggregated for submission to EPA with each individual company's legitimate expectation that its own proprietary data will remain protected from disclosure. The commenter states that the proposal notice provides little information on how EPA will treat these data if they are relied upon as "pivotal regulatory science" in a final regulatory decision. The commenter urges EPA to provide clear parameters as to when exemptions would be considered and what would happen in circumstances in which underlying data could not be provided if an exemption were not granted.

Response: EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

40 CFR 30.7 lists the circumstances under which an exemption may be warranted. Specifically, the final rule states the Administrator may grant an exemption to this part for a study on a case-by-case basis if he or she determines that greater consideration of studies for which the underlying data are not publicly available in a manner sufficient for independent validation is nevertheless warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

It should also be noted that in this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such

efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. Furthermore, implementation guidelines are forthcoming.

12.1.2.2 Use of Third-Party Service/Scientists/Appropriate Oversight Body/Other

Comment: Commenters (0562, 1006, 1945, 2006, 2426, 4595, 4878, 4881, 4894, 5011, 6158, 6191, 6940) recommend that case-by-case rule exemption determinations be done through a third-party service/scientists/appropriate oversight body.

Commenters (0562, 1006, 1945, 2426, 4894) support a third-party independent review and agreement among qualified, unbiased experts on the science supporting regulatory decisions and evaluations for case-by-case rule exemption determinations. Commenter (1945) believes that exemption decisions should be made by an independent scientific body based on the value and utility of the data relative to the decision to be made, whether deidentifying the data is possible without compromising the data's value or interpretability. Commenter (2006) believes that case-by-case exemption decisions should be made by a non-partisan group of scientists and other specialists who do not have political or financial motivations for allowing studies that come to one conclusion and not allowing studies that come to another conclusion.

Commenters (2426, 4894) recommend giving governing authority for granting exceptions to the rule to an external entity or entities, and that these external entities should also be given oversight of raw data collection, storage, and access. Commenter (2426) contends that, as with many ethical determinations, organizational independence provides greater trust that decisions were reasonable, objective, and unbiased. The commenter states that the governing entity could keep abreast of upcoming regulations and determine whether the pivotal scientific methods, data, or models used in the regulation's assessment document(s) would be subject to this proposed data transparency rule. Over time, the commenter suggests that the entity could develop a list of pivotal scientific articles, methods, data, or models that could then be available to the public on an open access website. The commenter asserts that documenting pivotal works would help ensure consistent application of the rule and guide researchers in further framing and building their own research agendas. The commenter suggests that, to be successful, the governing entity should be given limited authority to enforce its exclusion determinations. The commenter asserts that balance between data privacy and regulatory transparency would best be respected through both this governing body and the prioritization of regulatory actions that fall under this rule.

Commenter (4595) argues that giving the EPA Administrator sole authority to grant exemptions to the rule does not provide for proper checks and balances with appropriate oversight bodies with relevant scientific advisors that should be playing a role in decision-making. Commenter (1011, 5011, 6126, 6940) states that the process for granting which studies warrant exemption from the transparency standard should require formal consultation with EPA career scientists and/or the SAB and other relevant Agency advisory committees.

Commenters (4878, 6158, 6191) state that, if the proposed rule takes effect, the EPA should require that exceptions decisions be made by subject matter experts, such as a panel of non-partisan, unaffiliated expert scientists. Commenter (6158) states that subject-matter experts who

are most familiar with the particulars of the data and models in question should handle decisions on the feasibility and practicability of data sharing and usage. The commenter (6158) points out that, as with other aspects of the proposed rule, it is worth noting that the National Academy of Sciences recommends against broad discretion to non-subject matter officials.

Commenter (4881) asserts, rather than providing the Administrator with essentially unguided discretion to decide when science is acceptable and when it is not, the decision should be left on whether enough information is provided in publications to allow for independent validation and analysis to the journals publishing the research and to the peer review process controlled by scientists, rather than politicians.

Response: EPA notes that the final rule does not categorically exclude studies. The EPA does not agree with the comments regarding the role of the Administrator in determining whether to grant an exemption under 40 CFR 30.7 and finds that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. Finally, as is normal Agency practice, the quality of all pivotal science is evaluated prior to its use and thus before the need for a possible exemption under this final rule. The exemption factors listed in Part 30.7 contained additional science-based criteria.

When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. To ensure that the Administrator's decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation. The EPA is confident that the criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

Comment: Commenter (6099) suggests that the EPA Administrator receive congressional approval for any exemptions under 40 CFR 30.9 of the rule.

Response: The EPA does not agree with the comment regarding the role of the Administrator in determining whether to grant an exemption under 40 CFR 30.7 and finds that the Administrator is the appropriate decision maker in this context. The EPA is confident that the criteria in 40 CFR 30.7 provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under this rule.

12.1.3 Criteria for Granting Case-by-Case Exemptions

12.1.3.1 The Proposed Rule Does Not Provide Needed Criteria/Rules or Guidance Bounding Administrator Decisions

Comment: Commenters (0562, 1011, 2023, 2171, 2429, 2908, 3135, 4840, 5021, 5165, 6109, 6110, 6117, 6122, 6125, 6137, 6141, 6143, 6163, 6168, 6185, 6188, 6361, 6376, 6894, 6896, 6897, 6912, 6915, 8272) express concern that the proposed rule provisions allow the Administrator to provide case-by-case exemptions in 40 CFR 30.9 if he or she determines that compliance is impracticable without specifying exemption criteria/rules or guidance bounding the Administrator's decisions. Additionally, several of these commenters express that they are also concerned that the Administrator would also not be required to explain or justify why a study was used or not used in a regulatory decision.

Commenters (0562, 1011, 5185, 6112, 6115, 6143, 6855, 6875, 6906, 6918, 6935) assert that the process for granting which studies warrant exemption from the transparency standard must include clear and objective and well-documented a priori guidelines and regulatory criteria that clarifies the extent to which exemptions can be used.

Commenters (1006, 1011, 2171, 2908, 3135, 4894, 5021, 5165, 5181, 5419, 6109, 6110, 6117, 6122, 6125, 6153, 6168, 6185, 6361, 6373, 6376, 6874, 6897, 6906, 6912, 6915, 8272) assert that, without expanded specific criteria/guidance or the requirement to describe how or why studies are included or excluded from a regulatory decision, the Administrator would be unbounded in application and free to act in an arbitrary manner. Commenter (6896) expresses that, because the proposed rule does not provide specific criteria for when exemptions would be granted, it will be uncertain to researchers and stakeholders about what types of information EPA is willing to consider for exemption. Commenters (0569, 2429, 4588, 5165, 6125, 6373) express that this could have the effect of interjecting the appearance of politics/conflicts of interest into what should be a fair and unbiased scientific assessment and may run counter to the mission of the EPA. Commenter (4894, 6125) assert that highly relevant and reliable studies for which data cannot be shared could be excluded - at the Administrator's whim. Commenter (1011) states that this could lead to distorting effects on the scientific foundations of regulatory actions. Commenter (6110) asserts that not requiring the Administrator to present the reasoning behind his or her decisions would result in additional uncertainty in the regulatory process.

According to commenters (6153, 6874, 8272), when the regulatory text of the proposal does not provide specific criteria for exempting studies from the rule's requirements and does not state that all studies meeting these criteria will be exempted, it is impossible for all stakeholders to have full confidence that the Administrator will make case-by-case exemptions appropriately.

According to the commenter (6122), rather than providing some coherent guidance for when the Administrator should consider scientific studies, the proposed rule simply provides that he or she "may" grant an exemption to this rule's requirements whenever compliance is deemed "impracticable." To illustrate their belief of how absurd this is, the commenter provides that, if the Administrator chose to admit a study because he or she deemed it "impracticable" for industry-funded studies to provide underlying scientific data, the Administrator could (at the very same time) refuse to admit a study prepared by universities or other public health officials

because protected health information is unavailable. The commenter explains that would be allowed because the Administrator still would be acting in a manner consistent with this proposed rule. The commenter states that this simply demonstrates the unreasonable and entirely non-scientific nature of EPA's proposal, and the arbitrary and capricious nature of the discretion EPA would bestow upon the Administrator.

Commenter (6918) contends that, to ensure the validity and transparency of the exemption process, EPA should formulate objective criteria for demonstrating the inability to provide the underlying data and models without violating important data access limitations. According to the commenter, objective, identifiable criteria would not only ensure that the process works as intended over time, but it would also build public trust in the exemption process and reinforce EPA's commitment to transparency.

Response: To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

40 CFR 30.7 lists the circumstances under which an exemption may be warranted. Specifically, the final rule states the Administrator may grant an exemption to this part for a study on a case-by-case basis if he or she determines that greater consideration of studies for which the underlying data are not publicly available in a manner sufficient for independent validation is nevertheless warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

Comment: Commenter (6141) requests that EPA establish clear and objective rules for exempting the underlying data from public disclosure requirements under limited circumstances and requiring EPA to document the reasons for the exemption in the particular rulemaking. As the Agency points out in the preamble to the Proposed Rule, the commenter states that there are a number of legal and policy reasons for limiting public access to the underlying scientific data

and modeling information. The commenter notes that these limitations are necessary to protect “privacy and confidential business information and other compelling interests.”³¹⁷⁴ The commenter supports the continued recognition of these reasonable limitations in combination with EPA efforts to allow as much transparency as possible for the release of that underlying scientific data. The following are some important reference points that the commenter suggests that EPA consider in developing reasonable limited exemptions from scientific transparency requirements contained in the Proposed Rule.

- The final transparency rules should recognize that there are other ways to assess and confirm the validity of prior epidemiological studies without public access to data and analytic methods. One notable example is the re-analysis of the Harvard Six Cities and American Cancer Society (ACS) studies that the Health Effects Institute (HEI) conducted in support of the 1997 PM_{2.5} standards. The HEI re-analysis was able to replicate the findings of these studies and, in so doing, also assess the robustness of the studies’ findings through sensitivity analyses, instead of releasing the data to the public.³¹⁷⁵ Furthermore, over time, additional health-effects studies (some of which have used publicly available data) have confirmed the basic findings of the Harvard and ACS studies.
- The final transparency rules should attempt to accommodate legitimate concerns for confidential or private information and analytic models. Such accommodation is especially appropriate for those studies that are already completed or well underway. In such cases, the participation of human subjects in those studies is being undertaken in accordance with terms defined by agreement and that the release of the data set cannot be released simply by redacting portions of the data.
- EPA should give weight to mechanisms available for assessing the findings of the studies through EPA’s expert panels, such as the SAB, the Clean Air Scientific Advisory Committee (“CASAC”), and Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) Scientific Advisory Panel. For example, CASAC routinely reviews and evaluates the epidemiologic and toxicological studies that are the basis for dose-response relationships used in risk and exposure assessments for those criteria air pollutants for which EPA must set national ambient air quality standards (NAAQS) under the Clean Air Act (CAA). These evaluations involve a rigorous review by CASAC that goes beyond the typical journal peer review procedures even though the CASAC review does not typically involve the reanalysis of original data using the same methods used in the original studies.

The commenter contends that, if reasonable exemptions are not provided in the final rule, overly prescriptive requirements for scientific transparency could have the unfortunate effect of removing legal, ethical, and peer-reviewed studies of health effects as sources to support the Agency’s regulatory efforts to adopt important health-based requirements.

³¹⁷⁴ 83 Fed. Reg. at 18,770.

³¹⁷⁵ Health Effects Institute, *Reanalysis of the Harvard Six Cities and the American Cancer Society Study of Particulate Air Pollution and Mortality*, Daniel Krewski, Richard T. Burnett, Mark Goldberg, Kristin Hoover, Jack Siemiatycki, Michael Jerrett, Michael Abrahamowicz, and Warren H. White (2000).

Response: EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

40 CFR 30.7 lists the circumstances under which an exemption may be warranted. Specifically, the final rule states the Administrator may grant an exemption to this part for a study on a case-by-case basis if he or she determines that greater consideration of studies for which the underlying data are not publicly available in a manner sufficient for independent validation is nevertheless warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.1.3.2 Process and Guidance Governing Exemptions

Comment: Commenter (1011) requests that the exemption process adhere to the standards for scientific objectivity found in *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies*.³¹⁷⁶ The commenter adds

³¹⁷⁶ <https://www.federalregister.gov/documents/2002/02/22/R2-59/guidelines-for-ensuring-and-maximizing-the-quality-objectivity-utility-and-integrity-of-information>

that any process to exempt certain scientific studies from the proposed transparency requirements should err toward inclusion of the best available science in EPA deliberations.

Commenter (5419) requests clarification and additional detail related to the exemption provision of the proposed rule. The commenter also requests clarification and additional information on the process by which organizations or investigators can seek to resolve a situation where high-quality scientific data/studies might be excluded.

Commenter (6109) suggests that the rule needs to answer the following questions with regards to the exemption provision: How will EPA apply this exemption with equal consideration to both industry and health studies? How will EPA protect against bias in these exemptions? Will there be a mechanism for researchers to protest the Administrator's exemption decision? Likewise, will there be a mechanism for the public to protest the Administrator's exemption decision?

Commenters (6875, 9224) suggest that the rule needs to answer the following question with regards to the exemption provision: [d]oes the exemption cover the agency's project (as a whole) or just a single study and/or data set?

Commenter (6360) recommends that EPA adopt criteria like those that permit emergency rulemaking and direct final rules under the Administrative Procedure Act (APA).³¹⁷⁷

Commenter (6868) strongly recommends that EPA develop a guidance document regarding how this authority can be applied and seek public input on this document through the public notice and comment process governed by the APA.

Commenter (6180) recommends that the EPA Administrator only be permitted to grant exemptions in cases where he or she has documented the rationale for the exemption. The commenter states that this would ensure that the EPA Administrator grants exemptions only where appropriate and necessary.

Response: EPA notes that the final rule does not categorically exclude studies.

To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

40 CFR 30.7 lists the circumstances under which an exemption may be warranted. Specifically, the final rule states the Administrator may grant an exemption to this part for a study on a case-by-case basis if he or she determines that greater consideration of studies for which the underlying data are not publicly available in a manner sufficient for independent validation is nevertheless warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;

³¹⁷⁷ <https://www.epa.gov/laws-regulations/summary-administrative-procedure-act>

- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation will occur as necessary when a significant regulatory action is proposed or when an influential scientific information is released for public comment. Discussion during the proposal or draft stage will give the public the opportunity to review and comment. These decisions will also be discussed when a significant regulatory action or influential scientific information are made final. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

It should also be noted that in this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Comment: Commenters (0067, 0567, 5170, 6143, 6875, 6356, 9224) express that justification/documentation of decisions regarding exemptions should be made public.

Commenter (6143) asserts that granting an exemption without enough justification and documentation is simply an invitation to ignore the need for regulatory transparency—and would defeat the purpose of the proposal. The commenter recommends that the EPA add regulatory text that allows the public to hold the Administrator accountable for any decision to grant discretionary waivers, including through documentation and judicial review.

Commenter (0567) states that any exemption must be justified in a manner that is understandable to the affected community as well as to knowledgeable non-specialists.

Commenter (5170) recommends that, if an exception is requested, the request and the reasoning for the Administrator's determination should be made publicly available and subject to comment. The commenter reports that the EPA has regularly required states to spell out criteria for exemptions in their rule before, not after, public comment closes and believes that this requirement should apply to EPA's proposed rule.

Commenter (6143) recommends that in all but the most extreme cases, the Administrator's decisions should be made public and subject to judicial review. The commenter adds that, in such extreme cases, the relevant documentation should also be made accessible to appropriate Congressional oversight committees.

Commenter (6356) recommends that, if the Administrator utilizes "impracticability" at §§30.9(a) and (b) or some other justification criteria for not sharing underlying science or other pivotal information such as dose-response curves or models with the public, that he or she should be required to provide written notice to the public in the respective final agency action with regard to the specific reasons and the legal basis for why the information is not being provided to the public, so that the Administrator can be held accountable for his or her decision.

Response: To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

Comment: Commenters (6112, 6115, 6855) recommend that the EPA Administrator be required to certify EPA's adherence to case-by-case exemption requirements when granting exemptions.

Response: To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

Comment: Commenter (4534) states that if this provision is included in the final version of the regulation, the Administrator should not be the only individual to approve the exemption. The commenter recommends that such an exemption should be agreed upon by the Administrator, a representative from OMB, and a representative from the Judicial Branch.

Response: When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

Comment: Commenter (6126) suggests that the rule allow the expansion of the exemption authority. First, the commenter suggests that Associate Administrators or decision-makers in given regulatory actions could be granted authority to determine exceptions, consistent with respective environmental statutes designations of authority and practice for which policy officials sign certain regulations. Secondly, the commenter suggests that a citizen petition mechanism could be instituted through which individuals in the American public, interest groups, and advisory bodies to EPA can request exceptions.

Response: In 40 CFR 30.7 of the final rule, the Administrator remains the individual who grants exemptions under the rule. When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. The EPA shall document the

rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

Comment: Commenter (6143) asserts that exemptions and exclusions related to the requirements should be made only by the Administrator on a case-by-case basis, following clear, objective, and well-documented a priori guidelines and criteria that would be specifically established by the Agency for that purpose and that would encourage transparency while accommodating legitimate, protected privacy interests such as CBI. The commenter states that the EPA's proposed provision at 40 C.F.R. section 30.9, which would allow the Administrator to grant certain exemptions, can serve this purpose if properly cabined by clear, objective criteria for what circumstances may justify an exemption.

The commenter states that, in all but the most extreme cases, the Administrator's decisions should be made public and subject to judicial review. The commenter notes that, in such extreme cases the relevant documentation should be made accessible to appropriate Congressional oversight committees.

Response: 40 CFR 30.7 lists the circumstances under which an exemption may be warranted. Specifically, the final rule states the Administrator may grant an exemption to this part for a study on a case-by-case basis if he or she determines that greater consideration of studies for which the underlying data are not publicly available in a manner sufficient for independent validation is nevertheless warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

12.1.3.3 Requests for Regulatory Changes

Comment: Commenter (6143) suggests that the EPA add the following new paragraph after section 30.9(b) of the rule:

The Administrator shall thoroughly document the justification for granting an exemption according to a specific process and criteria to be developed by EPA. The Administrator's

decision to grant an exemption shall be published in the *Federal Register* and shall be subject to judicial review.

Response: 40 CFR 30.7 of the final rule includes, “The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information.”

Comment: Commenter (0067) provides that 40 CFR 30.9 of the rule does not require EPA to inform the public when the Administrator has granted such an exemption. The commenter recommends that EPA add the following language at the end of 40 CFR 30.9:

EPA shall give notice in the *Federal Register* that the Administrator has granted an exemption with respect to a specified case, unless in that case disclosure of the fact of the granting of the exemption is specifically prohibited by statute or constitutes national security information classified in accordance with Executive Order 13526, as amended.

Response: Title 40 CFR 30.7 of the final rule includes, “The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information.”

12.1.4 Requests for Specific Rule Exemptions

12.1.4.1 Categorical Exemptions

Comment: Commenter (5170) states that the proposed rule allows the EPA Administrator to grant categorical exemptions to the proposed rule, particularly of CBI. The commenter recommends that, if this rule goes forward, given its premise that transparency is paramount, it should apply to all. The commenter states, that if an exception is requested, the request and reasoning for the Administrator’s determination should be made publicly available.

Response: To ensure that the Administrator’s decisions are appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

12.1.4.2 All Regulatory Actions

Comment: Commenter (0671) states that all regulatory actions should be exempted from the proposed rule. The commenter argues that the rule would prevent the EPA from using the best available science. The commenter further argues that the exemption provisions are not workable because it requires researchers to intuit what an Administrator will decide is acceptable and allows the Administrator to determine what qualifies as science (which is outside of the Administrator’s purview).

Response: The EPA does not agree with the comment. The EPA is committed to its mission of protecting human health and the environment through sound policy decisions that are informed

by robust scientific and technical research. Because of the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best scientific information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA fully demonstrate that commitment. The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

40 CFR 30.7 lists the circumstances under which an exemption may be warranted. Specifically, the final rule states the Administrator may grant an exemption to this part for a study on a case-by-case basis if he or she determines that greater consideration of studies for which the underlying data are not publicly available in a manner sufficient for independent validation is nevertheless warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

When making a decision to grant an exemption, the Administrator may consider input from EPA staff and public commenters. The EPA shall document the rationale for exemptions granted by the Administrator in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.1.5 Define “Reasonable Effort”

Comment: Commenter (4831) asserts that it is critical for the EPA to define what “reasonable effort” would be required to make data publicly available before an exemption is granted.

Response: The final rule does not clarify “reasonable effort” any further than in the 2018 notice of proposed rulemaking. In 40 CFR 30.5 it states, “The Agency shall make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making such data and models available before it concludes that doing so in a manner consistent with law and protection of privacy, confidentiality, national security is not possible.” The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. “[R]easonable effort” will likely be clarified during the implementation of the rule. Furthermore, implementation guidelines are forthcoming.

12.1.6 Exemption Process Costs

Comment: Commenters (4845, 6196, 6378) state that the EPA proposal duly notes obstacles to study replication and provides that exemptions may be granted on a case-by-case basis where “compliance is impracticable.” The commenters believe, however, that an exemption process will add to the considerable cost and effort required to implement the proposed rule and may result in disputes and even litigation over whether exemptions are justified.

Response: The Agency may incur administrative costs to perform analyses and evaluations to support activities such as exemption decisions made by the Administrator, and documenting these or other decisions made pursuant to rule requirements. The Agency finds the incremental costs for these activities would be small relative to current administrative costs for developing significant regulatory decisions or influential scientific information. See III.J of the final rule preamble for further discussion of benefits and costs of the rule.

12.1.7 Notice-and-Comment Principles Should Inform EPA’s Implementation of the Exemption Process

Comment: Commenter (6918) recommends that EPA evaluate how to implement its exemption process in a way that allows for more transparency, better public participation, and improved validity of final rules. The commenter provides that notice-and-comment principles are an essential cornerstone of this process. The commenter suggests that, for studies on which EPA relies in formulating a proposed rule, EPA should require that it note in the proposed rule preamble if any such studies have been subject to an exemption and why the exemption was

granted. For studies that are submitted to EPA during the public comment period and that are subject to an exemption, the commenter recommends that the EPA note in the final rule preamble which precise studies are exempted and why they meet the exemption criteria. The commenter believes that this process will serve transparency and public participation values and streamline the process for EPA and the public. Furthermore, according to the commenter, it is consistent with the strict requirements of section 307(d) of the CAA, which apply to many EPA rulemakings, that the proposal contain all the factual data on which the proposed rule is based, along with relevant methodologies, policy decisions, and legal interpretations underlying the proposed rule.

Commenter (0567) recommends that exemptions to transparency requirements follow the rule-making process.

Response: To ensure that the Administrator's decision is appropriately transparent, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information.

12.2. Administrator Exemptions (SNPRM Comments)

12.2.1 Granting of Exemptions is Subject to Bias

Comment: Commenters (10339, 10748, 10749, 11186, 11192, 11332, 11391, 11393, 11395, 11407, 11480, 11482, 11495, 11576, 11894, 11895, 11490, 12403, 12412, 12430, 12431, 12434, 12435, 12442, 12474, 12546, 12707, 12716, 12720, 14397, 198105) express concern that providing the Administrator with sole discretion to grant exemptions will introduce personal or political bias to the political process. Commenters (11391, 11480, 12727) note that this issue was also raised by the SAB. Commenter (12727) adds that failing to include science-based criteria for exemption suggests that "EPA is willing to exempt a study from the rule's requirements despite the lack of mechanisms to ensure the study's reliability."

Response: The EPA does not agree with the comments regarding the role of the Administrator in determining whether to grant an exemption under 40 CFR 30.7 in the final rule and finds that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator's decision is appropriately transparent and supported, the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. Finally, as is normal Agency practice, the quality of all pivotal science is evaluated prior to its use and thus before the need for a possible exemption under this final rule. The exemption factors listed in Part 30.7 contained additional science-based criteria. In total, the Agency believes that Part 30.7 is not subject to bias.

12.2.1.1 Rule Gives EPA Administrator Too Much Discretion

Comment: Commenters (10048, 10748, 10749, 11186, 11192, 11330, 11339, 11354, 11391, 11393, 11400, 11404, 11407, 11480, 11482, 11484, 11490, 11495, 11890, 11894, 11895, 12412,

12430, 12443, 12474, 12546, 12727, 298105D, 12715, 198105) oppose giving the EPA Administrator sole, unlimited discretion regarding exemptions. Commenters (10748, 10749, 11186, 11339, 11393, 11393, 11399, 11403, 11404, 11407, 11480, 11482, 11484, 11894, 11895, 11490, 12412, 12430, 12431, 12434, 12435, 12442, 12474, 12727, 14397, 12715) express concern about placing the authority to grant exemptions in the hands of a political appointee who likely does not possess advanced scientific expertise. Commenter (11482) adds that the National Academy of Sciences (NAS) recommends against broad discretion to non-subject matter officials. Commenters (11498, 11576, 12727) note that giving the Administrator sole discretion makes it difficult to ensure accountability and fails to provide for proper checks and balances with the appropriate scientific oversight bodies.

Commenter (12715) asserts that allowing the Administrator to make ad-hoc exemptions for specific studies or models does not cure the supplemental proposal's fatal defect of requiring EPA to consider factors other than those specified by Congress.³¹⁷⁸ The commenter states that rather, because the supplemental proposal contains no standards requiring the exemptions to be based on the relevance, importance, or scientific validity of the study or model at issue, and public availability is not a criterion that is meaningful for scientific validity and relevance, the Administrator's ability to arbitrarily include certain studies at his or her discretion simply compounds the extent to which the supplemental notice of proposed rulemaking (SNPRM) would allow EPA to deviate from the requirements of the statutes it is charged with implementing.

According to the commenter (12715), the SNPRM narrows the grounds for the exemption to cases where compliance is impractical because: (1) technological barriers make sharing the data or models infeasible; (2) development of the data or model was completed before the date of the rule; or (3) making the data and models publicly available is contrary to law.³¹⁷⁹ The commenter notes that the SNPRM still offers no definition or standards to guide the Administrator's determination of what is "practicable" or "feasible" or what constitutes a "technological barrier," and the waiver process is still wholly discretionary. The commenter provides that without any standardized and objective criteria, the exemption process could, for example, allow the Administrator—a political appointee—to arbitrarily grant exemptions for CBI in studies submitted by chemical and pesticide manufacturers, but fail to give similar exemptions for confidential patient or medical information in academic toxicology or epidemiology studies. The commenter provides that the National Academies also highlighted this concern, noting that "[d]ecisions about exemptions should be based on formal Agency guidance and not according to criteria established by a single EPA employee."³¹⁸⁰ Further, the commenter notes that the proposal does not require the Administrator to spell out the criteria applied in granting an exemption, and, given how severely the supplemental proposal would limit the scientific evidence available for EPA's use, the proposed exemption provisions could become the basis

³¹⁷⁸ See *Alltel Corp.*, 838 F.2d at 561 (holding that an agency "cannot save an irrational rule by tacking on a waiver procedure" because the "essence of waiver is the assumed validity of the general rule").

³¹⁷⁹ 85 Fed. Reg. at 15,406.

³¹⁸⁰ Letter from Marcia McNutt, President, Nat'l Acad. of Sciences, C.D. Mote, Jr., President, Nat'l Acad. of Eng. & Victor J. Dzau, President, Nat'l Acad. of Med., to the Hon. Andrew Wheeler, Acting Adm'r, U.S. Env'tl. Prot. Agency (July 16, 2018), <http://www.nationalacademies.org/includes/EPA%20Proposed%20Rule%20Docket%20EPAHQ-OA-2018-0259%20NASEM%20Comment.pdf>.

upon which most of the science relied on by EPA in its rulemaking is admitted. The commenter contends that the exceptions could thus largely swallow the rule, resulting in greater arbitrariness in EPA regulatory actions rather than EPA's alleged goal of greater transparency.

Response: The EPA does not agree with the comments regarding the role of the Administrator in determining whether to grant an exemption under 40 CFR 30.7 in the final rule and finds that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator's decision is appropriately transparent and supported, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation.. Finally, as is normal Agency practice, the quality of all pivotal science is evaluated prior to its use and thus before the need for a possible exemption under this final rule. The exemption factors listed in Part 30.7 contained additional science-based criteria.

40 CFR 30.7 lists the circumstances under which an exemption may be warranted. Specifically, the final rule states that greater consideration under this rule of studies for which the underlying data are not publicly available in a manner sufficient for independent validation may nevertheless be warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

To assist the Administrator in determining whether to grant an exemption, the EPA program or region responsible for the significant regulatory action or influential scientific information will prepare a memorandum to the Administrator with an evaluation of the criteria. Furthermore, the Administrator may consider public comments in deciding whether to grant an exemption. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

Comment: Commenters suggest the following alternatives to giving the EPA Administrator sole discretion to decide exemptions:

- Exemptions should be decided in consultation with EPA's independent scientific advisory committees, scientific advisors, or independent experts or scientific career staff (10748, 11186, 11399, 11482, 11484, 11490, 11890, 12431, 12435).

- Exemptions should be decided at the level of an Office Assistant Administrator or Deputy Assistant Administrator in consultation with Office staff scientists as well as the Office of Research and Development (ORD) (10038).

Response: The EPA finds that the Administrator is the appropriate decision maker in this context. To assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption. To ensure that the Administrator's decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.2.1.2 Lack of Clear and Objective Criteria/Standards

Comment: Commenters (10339, 11182, 11192, 11354, 11358, 11391, 11397, 11399, 11400, 11490, 11892, 11911, 11915, 12399, 12406, 12422, 12430, 12435, 12546, 12702, 12715, 12720, 12727, 198105) express concern that there are no clearly defined standards, criteria, or processes that will govern the granting of exemptions and suggest that EPA rectify this if it is to promulgate this rule. Commenters (11358, 11391, 12399) note that this concern was also raised by the SAB.

Response: 40 CFR 30.7 lists the circumstances under which an exemption may be warranted. Specifically, the final rule states that greater consideration under this rule of studies for which the underlying data are not publicly available in a manner sufficient for independent validation may nevertheless be warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

12.2.1.2.1 Proposed Criteria/Standards

Comment: Commenters suggest the following changes regarding the process and criteria used when granting exemptions:

- A nondiscretionary, mandatory exemption for all studies which have data that cannot legally, ethically, or efficiently be publicly released (11393, 11407, 12412, 12474, 14397).
- A mandatory exemption for all studies begun prior to the date the proposal is finalized (11393, 11407, 11490, 12412, 12474, 14397).
- An overall exemption for individual level data (10972).
- Using the standards originally listed in the version of the supplemental notice that EPA submitted to Office of Information and Regulatory Affairs (OIRA): “soundness, applicability and utility, clarity and completeness, uncertainty and variability, evaluation and review, and the age of the study” (12430).
- Using standards drawn from the principles of the Grading of Recommendations, Assessment, Development and Evaluations (GRADE) system for evaluating quality of evidence, including “study design, sample size, rigor of analytical methods, and other factors” (11490).
- Reinstating the provision to allow exemptions on a case-by-case basis if compliance is deemed impracticable because it is not feasible to conduct independent peer review on all pivotal regulatory science (11358).
- Exempting “studies and data that have been developed under EPA testing programs, where EPA test guidelines or other validated and accepted test methods such as those developed by Office of Economic Cooperation and Development (OECD), American Society of Testing and Materials (ASTM) have been used, and EPA Good Laboratory Practices have been followed and certified” (12402).
- Tasking each program office within EPA to develop criteria to ensure appropriateness and specificity (12406).
- Explicitly consider Health Insurance Portability and Accountability Act (HIPAA) when granting an exemption for health-related information (11892).
- International studies be considered applicable for the technological barrier clause for exemption from the rule (11892).

Response: EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

This rulemaking applies prospectively to significant regulatory actions and influential scientific information. This rulemaking has no retrospective effect on either final significant regulatory

actions or influential scientific information. For future significant regulatory actions and influential scientific information, it applies equally to all dose-response data underlying pivotal science.

As detailed in 40 CFR 30.5(b), “The EPA will use the following factors to assess the quality of studies identified in the systematic review: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. The EPA will rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence of a relationship between exposure and effect, the EPA will identify those studies based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both of an EPA significant regulatory action or influential scientific information will be identified as pivotal science.”

The EPA is including criteria that may be used by the Administrator when considering whether to grant an exemption in 40 CFR 30.7. Specifically, the rule states that greater consideration under this rule may be warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study’s underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

40 CFR 30.7 of the final rule does not include the exemption on a case-by-case basis if the Agency determined that it was not feasible to conduct independent peer review on pivotal regulatory science, which was removed in the SNPRM.

The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

The HIPAA is not explicitly considered in the final rule with regard to granting an exemption for health-related information.

International studies have not been given a clause in the final rule for exemption due to technological barriers.

12.2.1.2.2 Removal of Infeasibility Criteria for Exemption

Comment: Commenter (11397) supports the SNPRM's proposed removal of 2018 language that would have allowed EPA to grant an exemption on a case-by-case basis if the Agency determined that it was not feasible to conduct independent peer review on pivotal regulatory science. The commenter agrees with EPA's conclusion in this regard and supports the removal of the case-by-case exemption language proposed in 2018.

Response: EPA appreciates this comment. The final rule retains that change to the SNPRM as 40 CFR 30.7 does not include the exemption on a case-by-case basis if the Agency determined that it was not feasible to conduct independent peer review on pivotal regulatory science.

Comment: Commenter (10752) contends that it is outrageous that EPA has removed the provision from the 2018 NPRM that would allow the Administrator to grant exemptions from peer review due to infeasibility. The commenter states that peer review is a laudatory, but inherently expensive process that is not practical for every inquiry. The commenter provides as an example that researchers in the fields of social and environmental sciences may not even have available peer reviewed journals in their field. The commenter suggests that even in fields where a few peer reviewed journals may exist, the journals may not have the ability to examine much of the most important scientific research.

Commenter (12727) states that EPA's claim that there are no circumstances under which peer review would be infeasible is inconsistent with Section VIII of the OMB's Peer Review Bulletin that provides that an agency may defer or waive peer review requirements based on a "compelling rationale."³¹⁸¹ The commenter expects that it is possible that costs, expediency or some other unforeseen circumstance may necessitate that EPA consider a study that has not been peer reviewed. The commenter states that while proposed 40 CFR 30.7 continues to provide that the rule's peer review requirements must be applied in a manner that is "consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the Exemptions described therein,"³¹⁸² EPA's declaration that there will not be circumstances where peer review would be infeasible, combined with EPA's express decision to eliminate the peer review exemption from proposed section 30.9, could be interpreted as overriding the general waiver and deferral authority provided by Section VIII the OMB Peer Review Bulletin. The commenter asserts that eliminating—or even casting doubt upon—the Administrator's flexibility to waive or defer peer review requirements when confronted with unforeseen circumstances and a "compelling rationale" is unwarranted and risky. The commenter requests that if EPA moves forward with finalizing its proposed peer review requirements—which the commenter believes it should not—EPA must add language to proposed section 30.9 clarifying that the Administrator possesses authority to defer or waive peer review requirements based on a compelling rationale.

Response: Title 40 CFR 30.6 of the final rule states, "The EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have

³¹⁸¹ Id. Final Information Quality Bulletin for Peer Review, 70 Fed. Reg. 2664, 2677 (Jan. 14, 2005).

³¹⁸² 85 Fed. Reg. at 15,406.

already undergone peer review.” In this rule, the EPA is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule. Because transparency in pivotal science includes addressing issues associated with assumptions used in analyzing dose-response data, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied and the implications of those assumptions for the results.” The final rule also clarifies the criteria the Administrator would consider in determining whether to grant an exemption. The Agency believes this revised language addresses the commenters concerns about ensuring that the Administrator retains the ability to defer or waive peer review.

12.2.1.2.3 Proposed Process

Comment: Commenter (11399) proposes the following process for granting exemptions:

The rule should provide clear and detailed guidelines and a formal process the agency must follow before deciding to exclude data of any kind from new or old studies. Such guidelines should include a provision that only the portions of data that would trigger violations of privacy or confidential business secrets may be excluded, and that all other data and methodologies should be made transparent and publicly available. Before excluding data, EPA should conduct and make public a systematic review of the scientific literature to determine if there is an alternative study that could be used in place of any study whose data they cannot fully access. If such studies exist and data can be made accessible, EPA should rely on the alternative study or studies in lieu of those whose data is not available. If an alternative study or studies do not exist, then the Administrator should only use the original study if the researchers demonstrate that they explored all scientific methods and tools available to make the data available, but none proved sufficient to protect individual subjects’ privacy and/or confidential business secrets. If after such efforts the Administrator deems the original study essential for agency decision making, the agency should publish its systematic review along with a detailed analysis explaining the specific legal reasons why data must be excluded. The Administrator should further detail why the study authors were unable to provide the data in a format that allows reanalysis and replication without compromising privacy or confidential business secrets. It should also include details on how much of the data fall within the exclusion, since only those specific pieces of information should gain exclusion. Details about study methods, model assumptions, and the like should always be transparent. And before the agency uses the study, this agency justification should be subject to public comment. If after public comment the Administrator still determines that the study is essential and some data cannot be released publicly, then the agency shall set up a system for limited release. The agency would then need to set up a committee of researchers to receive all the data subject to nondisclosure agreement. These researchers should include members with a wide range of perspectives on the issue

to allow independent analysis, validation, and peer review. Should the original study authors refuse to provide the data under this closed, limited-access process, the study should be excluded from EPA decision making.

Response: The EPA would like to clarify that no studies are categorically excluded from consideration under the final rule. In addition, the EPA included criteria that may be used by the Administrator when considering whether to grant an exemption in 40 CFR 30.7. Specifically, the rule states that greater consideration under this rule may be warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

To assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator for his/her consideration. To ensure that the Administrator's decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

12.2.1.2.4 Standards Should Be Established in Guidelines, Not Rule

Comment: Commenter (11395) writes that "data sharing and other study assessment methodologies should be addressed in guidelines rather than in a fixed regulation, and criteria for how the above considerations are evaluated should be delineated in those guidelines."

Response: The promulgation of these internal Agency procedures in this rulemaking provides a more durable, enforceable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data and highlights the Administration's commitment

to maximizing transparency in the EPA's most impactful regulatory actions and influential scientific information. The rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made by this rule provides an important step towards prioritizing transparency in particularly impactful rules and assessments and will inform future statute-specific rulemakings.

12.2.1.3 Standards May Shift Over Time

Comment: Commenter (12720) points out that because the interpretation of “infeasible” is subjective, standards used to decide exemptions may change over time. Commenter (11892) adds that implementation may also vary as EPA leadership changes, which will reduce consistency and accuracy.

Response: The final rule includes criteria that may be used by the Administrator when considering whether to grant an exemption in 40 CFR 30.7. Specifically, the rule states that greater consideration under this rule may be warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

To assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption. To ensure that the Administrator's decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation. The EPA is confident that the above criteria provide sufficient consistency, clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.2.1.4 Politicization of Exemptions

Comment: Commenters (10749, 11182, 11186, 11192, 11339, 11395, 11404, 11480, 11484, 11490, 12434, 12442, 12702, 12720, 12727, 13788) express concern about allowing room for

political considerations to inappropriately influence science-based decision-making by leaving exemptions up to the discretion of the Administrator rather than basing them on criteria grounded in science.

Response: The EPA does not agree with the comments regarding the role of the Administrator in determining whether to grant an exemption under 40 CFR 30.7 and finds that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator's decision is appropriately transparent and supported, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation.

The final rule also includes criteria that may be used by the Administrator when considering whether to grant an exemption in 40 CFR 30.7. Specifically, the rule states that greater consideration under this rule may be warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

To assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption. The EPA will document the rationale for the Administrator's exemption in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.2.1.5 Industry Bias

Comment: Commenters (10339, 11192, 11339, 11344, 11391, 11403, 12430, 12466, 14397, 12715) express concern that the EPA Administrator could choose to exempt studies sponsored or conducted by regulated entities while excluding public health studies, subjecting the process to lobbying and political consideration rather than solely considering a given study's validity or merit. Commenter (12430) specifically notes, "[t]he absence of publication exceptions or exemptions for protected intellectual property makes it far more likely that industry research, rather than academic or public interest research, would form the basis of regulatory decision-

making. This could build an industry preference into EPA’s regulatory process and disseminated information.”

Response: The EPA does not agree with the comments regarding the role of the Administrator in determining whether to grant an exemption under 40 CFR 30.7 and finds that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator’s decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation.

The EPA also disagrees that implementation of the rule would result in a bias toward any stakeholder group. As stated in 40 CFR 30.3, “The provisions of this part apply to science that serves as the basis for informing a final significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.” The rule also ensures the availability of the underlying dose-response data for any subject matter expert, regardless of their affiliation. Further, the final rule dictates that the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or propriety information, available through restricted access in a manner sufficient for independent validation. Restricted access in the context of this rule means that data must be available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. CBI data are not given different or preferential treatment. Finally, because the final rule does not categorically exclude any studies, including human health studies, from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. The final rule also only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations.

12.2.2 Rule Would Preclude Consideration of Best Available Science

12.2.2.1 Provision Fails to Guarantee Consideration of Best Available Science

Comment: Commenters (11393, 11395, 11399, 11482, 11484, 11495, 11890, 11903, 12403, 12430, 12434, 12435, 12457, 12466, 12546, 12707, 12727, 14397, 198105) write that due to the lack of clear criteria/standards, lack of oversight, lack of personal scientific knowledge, personal bias, and other factors, the EPA Administrator may engage in “cherry-picking” and arbitrarily exclude important science or exempt lower quality studies, producing an administrative record that bears little resemblance to the total scientific knowledge relevant to an issue. Commenters

(11576, 11921) add that allowing exemptions for older studies fails to ensure that such studies – which are less likely to be able to obtain and disclose their underlying data – will be included.

Response: The EPA would like to clarify that no studies are categorically excluded from consideration under the final rule. In addition, the EPA included criteria that may be used by the Administrator when considering whether to grant an exemption in 40 CFR 30.7. Specifically, the rule states that greater consideration under this rule may be warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study’s underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

The EPA maintains that the Administrator is the appropriate decision maker in this context. To assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption. To ensure that the Administrator’s decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.2.2.2 Too Difficult to Get Exemptions

Comment: Commenters (10038, 100045, 11361) write that the process of getting an exemption for a given study will take too much time and effort, thus establishing barriers and delays that will prevent EPA from considering all available science. Commenter (12458) adds that “by narrowing the administrator’s ability to grant exemptions, the supplemental notice would effectively exclude an even larger swath of public health research from consideration in a broader range of agency activities.”

Response: The EPA disagrees with commenters that the exemption process will result in barriers and delays that would prevent EPA from considering all available science. The EPA would like to clarify that no studies are categorically excluded from consideration under the final rule.

While this rule does require the Agency to evaluate the availability of dose-response data for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., a small, though highly important, subset of all the studies EPA reviews).

12.2.2.2.1 Exemption Provisions are Too Limited

Comment: Commenters (11388, 12727) write that the provision allowing the Administrator to grant exemptions on a case-by-case basis should be added back into the final rule because it is impossible to foresee every circumstance where an exemption would be warranted.

Response: Title 40 CFR 30.7 in the final rule allows the Administrator to grant exemptions on a case-by-case basis if he or she determines that greater consideration is warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

12.2.2.2.2 Non-Technological Barriers

Comment: Commenter (11393, 11407, 11484, 11490, 12412, 12474, 12720, 12727, 14397) points out that many factors could prevent studies from being able to comply with the disclosure requirements, including legal, institutional, and moral reasons. Commenters argue that these constraints should also be considered when granting exemptions.

Response: As stated in the final rule, the Administrator may grant an exemption on a case-by-case basis if he or she determines that greater consideration is warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

12.2.2.2.3 Intellectual Property Should Be Exempted

Comment: Commenter (12430) writes, “intellectual property is absent from the list of potential exemptions to the data publication requirements in proposed section 30.9. This lack of protection for intellectual property would thwart innovation and/or prevent the consideration of newer tools and models in EPA’s regulatory decision-making.”

Response: EPA notes that the final rule does not require EPA or any other entity to publish data. In any event, if the EPA chooses to make dose-response data publicly available, the final rule requires EPA to do so in accordance with the law. Furthermore, the Administrator may grant an exemption on a case-by-case basis if he or she determines that greater consideration is warranted because, among other factors, technological or other barriers render it infeasible to make the dose-response data publicly available.

12.2.2.3 Legal Mandates

Comment: Commenters (12435, 12466, 12702, 12707, 12727) write that EPA is required by numerous environmental and public health statutes to consider “the best available science” when making regulatory decisions; take into account certain specific factors (such as relevance, importance, or scientific validity) when evaluating a given study; and incorporate input from an independent scientific review committee when considering air quality standards. Commenters write that giving the Administrator discretion to decide exemptions rather than requiring compliance with EPA’s congressional mandates violates those obligations.

Response: This internal procedural rule does not interpret or apply provisions of the environmental statutes that EPA administers. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

12.2.3 Areas Needing Additional Clarity/Specificity

Comment: Commenters identified the following exemption related terms/requirements that they contend are ambiguous in the supplemental notice and need clarification:

- The terms “practicable/impracticable” (12720, 12715)
- The terms “feasible/infeasible” (11381, 198105, 12715)
- What constitutes a “technological barrier” (12430, 12727, 12715)
- Who is authorized to decide whether compliance is impracticable (12720)
- How, when, or by whom requests for exemptions or claims of technological barriers would be submitted to EPA (11399, 12720)
- Whether the presence of barriers would be independently confirmed or what efforts might be required to surmount such barriers (12720)
- Whether non-technical (e.g., legal) barriers would qualify for exemptions (12720)

- Whether a waiver would apply to a study publication, the underlying data and models, or both (12720)
- At what point in the process of reviewing pivotal regulatory science would an exemption be granted (11496, 12720)
- How long would an exemption apply (12720)
- Whether an exemption would only apply to the application of specific data or models in specific regulatory context(s) or not (12720)
- Whether any proposed exemption could be challenged, reviewed, or appealed (11399, 12720)
- How various factors will be weighted when determining exemptions (198105)

Response: The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

12.2.4 Transparency

12.2.4.1 The Process of Granting Exemptions is Not Transparent

Comment: Commenters (10048, 10339, 10749, 11381, 11395, 11399, 11404, 11482, 11495, 11496, 12403, 12434, 12435, 12463) express concern that giving the EPA Administrator sole discretion to grant exemptions without clear criteria, oversight, documentation, or public input will reduce transparency in rulemaking by obscuring which studies are considered or emitted and why.

Commenter (11192) provides that EPA is recommending multiple options for Agency or Administrator discretion without providing the public any details regarding decision-making criteria, much less opportunities for oversight. The commenter contends that for a rule purported to increase Agency decision-making transparency, the EPA has shrouded its proposed decision-making criteria and processes in mystery and thereby opened the door to manipulation and politicization. The commenter strongly opposes these Agency discretions without opportunity for additional input, response, or course-correction.

Response: The EPA maintains that the Administrator is the appropriate decision maker in this context. To ensure that the Administrator's exemption decisions are appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation. To assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption. The EPA will document the rationale for the Administrator's exemption in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide

sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.2.4.2 Granting Exemptions Reduces Transparency in Rulemaking

Comment: Commenter (9362) expresses concern about granting exemptions for studies which rely on private third-party information even if the data are not made public. Commenter argues that such data should not be used, as doing so reduces transparency.

Response: The Administrator may grant an exemption on a case-by-case basis based on criteria provided in 40 CFR 30.7, including if he or she determines that greater consideration is warranted because making the dose-response data publicly available would conflict with laws and regulations governing privacy, confidentiality, CBI, or national security.

EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. These additional considerations are outlined in 40 CFR 30.5(d).

12.2.4.3 Oversight and Documentation

Comment: Commenters (11192, 11332, 11404, 11495, 12422, 12727, 12715) point out that the rule fails to provide mechanisms for oversight (such as panels, petitions, required record-keeping, etc.) and that the Administrator is not required to report the criteria applied in granting exemptions. Commenter (11404) adds that the current requirement to provide a short summary of the decision-making process is insufficient.

Commenters (11397, 11500, 11892, 12422, 12727) write that when an exemption is granted or rejected, EPA should be required to provide a notice to the public identifying the data or studies as well as the specific rationale and legal basis for the decision. Commenter (11892) specifies that this should include “a summary and citations of information used in decision making; entities or persons consulted if outside the agency; sources of the information, unless prohibited for national or homeland security reasons, and reasons for how/why the decision was made.”

Response: To ensure that the Administrator's decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation.

To assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption. The EPA will document the rationale for the Administrator's exemption in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.2.4.4 Public Input

Comment: Commenters (10048, 11404, 11482) write that allowing the Administrator to decide exemptions hampers public involvement in decision-making. Commenter (10048) adds that the process of granting exemptions should be subject to public review and comment.

Response: To ensure that the Administrator's decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation.

To assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption. The EPA will document the rationale for the Administrator's exemption in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.2.5 Retroactivity

12.2.5.1 Support for Retroactive Exemptions

Comment: Commenters (11919, 11490, 11491, 11499, 11919, 12402, 12431) support granting exemptions on the basis of the age of a study if the rule is promulgated and write that this exemption should be mandatory. Commenters (11490, 11491, 12727) oppose all retroactive application of the rule.

Commenter (12402) notes that it is clear that older research and data development that may ultimately be considered pivotal to the development of significant regulatory decisions and influential scientific information may not have been conducted and recorded with the intention or provisions to provide public access to underlying data. Therefore, the commenter supports the need for the Administrator to maintain authority to exempt certain pivotal older studies or data that otherwise meet EPA program standards for acceptable data quality from transparency requirements.

Response: This rulemaking applies prospectively to significant regulatory actions and influential scientific information. This rulemaking has no retrospective effect on either final significant regulatory actions or influential scientific information. For future significant regulatory actions and influential scientific information, it applies equally to all dose-response data underlying pivotal science.

The Administrator may grant an exemption for a study on a case-by-case basis based on criteria provided in 40 CFR 30.7, including if he or she determines that compliance is impracticable because the development of the dose-response data was completed or updated before the effective date of the final rule.

12.2.5.2 Age of Studies/Data Should Not Be Considered When Granting Exemptions

Comment: Commenter (11381) writes that making data and models eligible for exemption because they were produced prior to the effective date of the final rule is unnecessary and undermines transparency. Commenter (12471) also opposes consideration of age on the basis that “the rule would have very little impact for several years since most rules rely on studies completed and peer reviewed several years ago (if not decades earlier).” Commenter (12699) notes that allowing exemptions for older studies is unnecessary because studies can already be exempted on the basis of genuine privacy, confidentiality, and CBI concerns, and the provision would encourage the use of old data while discouraging the use of new data. Commenter (12399) adds that exempting all research conducted before the implementation of the rule would essentially make the rest of the rule meaningless.

Response: This rulemaking applies prospectively to significant regulatory actions and influential scientific information. This rulemaking has no retrospective effect on either final significant regulatory actions or influential scientific information. For future significant regulatory actions and influential scientific information, it applies equally to all dose-response data underlying pivotal science .

The Administrator may grant an exemption for a study on a case-by-case basis based on criteria provided in 40 CFR 30.7, including if he or she determines that compliance is impracticable because the development of the dose-response data was completed or updated before the effective date of the final rule.

Comment: Commenter (11381) writes that the proposed exemption for studies completed or updated prior to the rule being promulgated violates the Information Quality Guidelines (IQGs), which do not exempt information disseminated by EPA prior to when they came into force.

Response: This rulemaking applies prospectively to significant regulatory actions and influential scientific information. This rulemaking has no retrospective effect on either final significant regulatory actions or influential scientific information. For future significant regulatory actions and influential scientific information, it applies equally to all dose-response data underlying pivotal science.

12.2.5.3 Exemptions Should Only Be Available for Older Studies

Comment: Commenter (11922) writes that exemptions should only be available for studies generated prior to the promulgation of the rule to encourage compliance by current researchers.

Response: The EPA would like to clarify that this rule exclusively governs the EPA's internal process for determining the consideration to afford pivotal science with respect to certain actions. If researchers want to increase the likelihood that their studies receive greater consideration by the EPA, they may take steps to ensure that the underlying dose-response data are available to the greatest extent possible. But any such response to this final rule would be purely voluntary.

As stated in the rule, the Administrator may grant an exemption on a case-by case basis if he or she determines that greater consideration is warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.

This rulemaking applies prospectively to significant regulatory actions and influential scientific information. This rulemaking has no retrospective effect on either final significant regulatory actions or influential scientific information. For significant regulatory actions and influential scientific information, it applies equally to all dose-response data underlying pivotal science.

12.2.5.4 Exemptions Based on the Age of a Study

Comment: Commenters (11388, 11386, 11395, 11484, 11490, 11491, 12702, 12710, 12727) provide that any information that originated prior to the finalization of the proposed rulemaking should be excluded from the requirements. Specifics include:

Commenter (11388) supports "grandfathering" completed work, models, and data that have already been used by the Agency and supports implementing this rule in stages to prevent further delay of EPA's work. The commenter recommends ensuring that during this review process,

studies that have historically been used by the Agency to make regulatory decisions are not rejected from use because of this rulemaking.

Commenter (11386) provides that the rule should only apply to data and models that are generated after the effective date. According to the commenter, even if the transparency of data and ability to be reanalyzed did indicate quality of science, then this information was available to EPA when considering past rules. The commenter states that nothing about the science used to make previous rules will be changed as a result of this new rule. Thus, the commenter notes, to suddenly treat previous studies in a way different from how they were previously treated by the EPA would be arbitrary and capricious, as nothing about the studies themselves had changed. Unless new information came to light, the commenter states, then it would be quite reasonable to change how older studies are considered, but to do so due to factors that have nothing to do with the science itself would be arbitrary.

Commenter (11395) notes that the SNPRM asks whether age of data and models should be considered in determining the feasibility of making underlying data and models publicly available and whether additional factors should also be considered in this determination. The commenter supports the consideration of age of data, as well as privacy laws, technology barriers, the nature of confidentiality agreements, and other factors that may preclude data accessibility, in any feasibility determination. The commenter states that an older study should not be excluded or devalued solely because raw data are no longer available or because accessibility to those data are restricted by use agreements in place at the time the study was conducted. The commenter states that, in addition, any other factor that precludes or limits data accessibility, including, as listed in section 30.9 of the SNPRM, technological barriers and conflicts with “laws governing privacy, confidentiality, CBI, or national and homeland security,” should be considered. The commenter states that the criteria should be specified in guidelines, and data availability should be considered as only one factor in weighing the quality of studies.

Commenter (11484) writes that the age of a study “has no direct bearing on the feasibility of publicly sharing the underlying data. Although it can be credibly argued that it is much harder in 2020 to access the data underlying a study published in 1970, the same argument cannot be credibly made for a study published in 2019.”

Commenter (12702) states that EPA confirms that it intends to apply the requirements of the rule to only future rulemakings in the supplemental proposal. This, according to the commenter, would help avoid regulatory uncertainty or potential disruptions for entities that have complied with past rulemakings. Additionally, the commenter encourages that requirements only be applied to future data and models to avoid undermining existing science on which decades of rulemakings rely and thus support consistency in ongoing rulemakings.

Commenter (12710) states that most studies prior to the digital age would not meet the proposed requirements, leading to EPA dismissing most science conducted in the 20th century. The commenter notes that the supplemental proposal would apply the rule to data and models evaluated at the time a significant regulatory action or influential scientific information is developed, regardless of when the data and models were generated," and recommends that the rule only be applied to studies generated after the effective date of the supplemental proposal.

Commenter (12727) asserts the new language in the SNPRM confirms it applies to pre-existing data and studies unless the Administrator exercises their discretion to exempt them due to the inclusion of the exemption criterion of the age of the data. The commenter states EPA must expressly not apply the rule to data completed or updated prior to the rulemaking as technological barriers and costs would prevent a significant number of older studies from being reviewed and brought into compliance.

Response: This rulemaking applies prospectively to significant regulatory actions and influential scientific information. This rulemaking has no retrospective effect on either final significant regulatory actions or influential scientific information. For significant regulatory actions and influential scientific information, it applies equally to all dose-response data underlying pivotal science.

Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. These additional considerations are outlined in 40 CFR 30.5(d).

The Administrator may grant an exemption for a study on a case-by-case basis based on criteria provided in 40 CFR 30.7, including if he or she determines that greater consideration is warranted because the development of the data was completed or updated before the effective date of the final rule.

Comment: Commenter (14397) notes that all studies begun prior to the date the SNPRM is finalized should be given a nondiscretionary, mandatory exemption from the rule.

Commenter (11900) suggests that, rather than pressure researchers into sharing their data in ways that their informed consent could not have anticipated, potentially exposing them to legal liability, the EPA should exempt all research initiated prior to the effective date of the final rule from the requirements of the rule. The commenter states that, to ensure the exemption is applied without bias, it should be applied on a blanket basis to all studies initiated prior to the passage of the rule—and not on a case-by-case basis by the administrator. The commenter states that the exemption should continue in perpetuity, and exempted research should carry equal weight to research that complies with the requirements of the final rule.

Response: This rulemaking applies prospectively to significant regulatory actions and influential scientific information. This rulemaking has no retrospective effect on either final significant regulatory actions or influential scientific information. For future significant regulatory actions and influential scientific information, it applies equally to all dose-response data underlying pivotal science. In addition, the Administrator may grant an exemption for a study on a case-by-case basis based on criteria provided in 40 CFR 30.7, including if he or she determines that greater consideration is warranted because the development of the data was completed or updated before the effective date of the final rule.

This rule does not require any researcher or other outside entity to provide dose-response data to the EPA. If researchers want their studies to receive greater consideration by the EPA, they may take steps to ensure that the dose-response data are available to the greatest extent possible. But any such response to this final rule would be purely voluntary. It is not required by the rule.

12.2.6 Support for Exemptions

12.2.6.1 General Support

Comment: Commenters (11499, 11500) express general support for the version of section 30.9 put forward in the supplemental notice. Commenter (11397) writes that exemptions should be granted only after exhausting all other options for enabling public access to data.

Response: 40 CFR 30.7 in the final rule is similar to the version in the SNPRM except it includes the criteria the Administrator should consider when determining whether to grant an exemption and notes that the rationale for an exemption shall be documented in the significant regulatory action and influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation.

An exemption will only be granted for cases where all options for enabling public access to data have been exhausted.

Comment: Commenter (12402) encourages the EPA to pursue and provide public access to underlying pivotal data whenever possible, even in cases where the data were developed prior to the effective date of this rule. The commenter states that it is clear that older research and data development that may ultimately be considered pivotal to the development of significant regulatory decisions and influential scientific information may not have been conducted and recorded with the intention or provisions to provide public access to underlying data. For this reason, the commenter supports the need for the Administrator to maintain authority to exempt certain pivotal older studies or data that otherwise meet the EPA program standards for acceptable data quality from transparency requirements.

Response: This rulemaking applies prospectively to significant regulatory actions and influential scientific information. This rulemaking has no retrospective effect on either final significant regulatory actions or influential scientific information. For future significant regulatory actions and influential scientific information, it applies equally to all dose-response data underlying pivotal science.

The Administrator may grant an exemption for a study on a case-by-case basis based on criteria provided in 40 CFR 30.7, including if he or she determines that greater consideration is warranted because the development of the dose-response data was completed or updated before the effective date of the final rule.

12.2.6.2 Scope

Comment: Commenters (11358, 11499) support that EPA has modified the scope for exemptions to include instances where data may not be available due to technological barriers.

Commenters (10866, 11397) support the deletion of the provision concerning the granting of exemptions based on impracticability of peer review.

Response: The Administrator may grant an exemption for a study on a case-by-case basis based on criteria provided in 40 CFR 30.7, including if he or she determines that greater consideration is warranted because technological or other barriers render sharing of the dose-response data infeasible.

Title 40 CFR 30.7 of the final rule does not include the exemption on a case-by-case basis if the Agency determined that it was not feasible to conduct independent peer review on pivotal regulatory science, which was removed in the SNPRM.

12.2.7 Other Comments

12.2.7.1 Exemptions Provision Undermines Proposed Rule

Comment: Commenter (12715) writes, “given how severely the supplemental proposal would limit the scientific evidence available for EPA’s use, the proposed exemption provisions could become the basis upon which most of the science relied on by EPA in its rulemaking is admitted. The exceptions could thus largely swallow the rule, resulting in greater arbitrariness in EPA regulatory actions rather than EPA’s alleged goal of greater transparency.”

Response: The EPA would like to clarify that no studies are categorically excluded from consideration under the final rule. Further, as discussed in the preamble to the final rule, although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. These additional considerations are outlined in 40 CFR 30.5(d).

12.2.7.2 Rule Will Reduce Trust in EPA’s Regulatory Decisions

Comment: Commenters (11399, 11482, 12431) write that if this rule is promulgated, allowing the EPA Administrator sole discretion could give the public the impression that decisions are arbitrary or biased, which may result in a loss of trust in EPA’s regulatory decisions.

Response: The EPA maintains that the Administrator is the appropriate decision maker in this context.

To ensure that the Administrator's decision is appropriately transparent, in the final rule the EPA has included a provision in 40 CFR 30.7 that requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. Regardless, the final rulemaking will provide clear documentation.

To assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption. The EPA will document the rationale for the Administrator's exemption in the significant regulatory action or influential scientific information. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.2.7.3 Exemptions Provision Demonstrates Arbitrariness of Larger Rule

Comment: Commenters (11403, 11892, 12727) write that allowing the Administrator to grant exemptions to some studies demonstrates EPA's awareness that public availability of data is not necessarily indicative of quality or validity. Commenter (11892) notes, "It is unclear why an exemption from compliance with the rule would be needed if the final rule is not excessively burdensome." Commenter (12399) also writes that because laws prevail over Agency rules, it is not necessary to state that the rule would not apply in the case of a conflict, and that doing so "appears to do nothing more than give the Administrator an excuse to waive the rule for rather arbitrary reasons."

Response: As more fully discussed in the preamble of the final rule, the Agency is retaining the Administrator's exemption provision because there are conditions under which compliance with the requirements in 40 CFR part 30 might be impracticable. For example, the underlying dose-response data for some studies, particularly older studies, may not be readily publicly available because of the technological barriers to data sharing (e.g., differences in data storage devices or data retention practices) that existed when they were developed. As a result, the EPA is finalizing the Administrator's exemption provision as proposed in the 2020 SNPRM, with additional conditions. The EPA is confident that the above criteria provide sufficient clarity and boundaries for the Administrator to consider when granting an exemption under 40 CFR 30.7.

12.2.7.4 Waiver Cannot Save an Unlawful Rule

Commenter: Commenters (12715, 198105) point to *Alltel Corp. v. Federal Communications Commission*, in which the D.C. Circuit found that an agency "cannot save an irrational rule by tacking on a waiver procedure" because the "essence of waiver is the assumed validity of the general rule." Commenter (198105) writes that because the proposed rule is not authorized by any of the statutory authorities cited in the supplemental notice and it "actively hinders EPA's ability to effectuate the statutes that it is charged with implementing," the rule is unlawful, and thus cannot be rescued by the creation of a waiver provision.

Commenter (12731) states that the EPA's proposal to allow the Administrator to grant exemptions from the rule's disclosure requirements demonstrates the EPA's awareness that a study can be valid and worthy of consideration even if underlying data or models are not publicly available. The commenter states that, where a statute requires that the Agency consider certain information in reaching a decision, the EPA cannot promulgate a rule that prohibits the Agency from considering such information, that automatically downgrades the value placed on such information regardless of its scientific merit, or that gives the Administrator discretion to decide whether the Agency will consider such information. The commenter states that none of the SNPRM's changes to proposed section 30.9 do anything to resolve this fundamental conflict with the relevant environmental and public health statutes. The commenter states that the mere fact that the Administrator might in the future use his or her exemption authority to allow the Agency to consider a particular study does not resolve the rule's unlawfulness.³¹⁸³

Response: EPA notes that this final rule does not categorially exclude any studies. As detailed in the preamble to the final rule, the EPA is authorized to promulgate this procedural rule under its authority to promulgate housekeeping regulations governing its internal affairs. This final rule does not interpret or apply the provisions of any environmental statutes; such efforts will occur in the subsequent rulemakings under the relevant statutes. If implementing this procedural rule would result in conflicts with existing environmental statutes, the procedural rule will yield to the EPA statutes and regulations.

³¹⁸³ Cf. *Sierra Club v. EPA*, 536 F.3d 673, 678 (D.C. Cir. 2008) (where the Clean Air Act required source-specific operating permits to include monitoring sufficient to assure compliance with applicable requirements, the court held that EPA's "vague promises to act in the future" to correct inadequate monitoring in federal regulations was not enough to justify EPA's promulgation of a regulation prohibiting state permitting authorities from supplementing inadequate monitoring in applicable regulations when issuing an operating permit).

Chapter 13: Peer Review

The NPRM (40 CFR 30.7) includes the following requirement:

EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the Office of Management and Budget (OMB) Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

The EPA solicited comment in the notice of proposed rulemaking (NPRM) on whether the exemptions in Chapter 9 of the *OMB's Final Information Quality Bulletin for Peer Review*³¹⁸⁴ are appropriate, and on whether there are other situations in which specific significant regulatory actions, or specific categories of significant regulatory actions should be exempted.

Under the supplemental notice of proposed rulemaking (SNPRM), the EPA clarifies that neither the proposed nor the alternative 40 CFR 30.5 changes would require that EPA, a member of the public or other entity must independently validate a study before it can be considered to be pivotal regulatory science or pivotal science. The EPA also clarifies that independent validation is not required under proposed 40 CFR 30.7 which describes the role of independent peer review.

Related, the 2018 NPRM also included a provision at 40 CFR 30.9 allowing the Administrator to grant exemptions from the rule on a case-by-case basis if he or she determines that compliance is impracticable because it is not feasible to conduct independent peer review on all pivotal regulatory science. The SNPRM proposes to delete that proposed exemption language.

Several comments were received regarding the proposal's reference to and consistency with the OMB Bulletin and issues related to "independent peer review." These comments are organized according to the following topics under sections 13.1 NPRM Peer Review-Related Comments and 13.2 SNPRM Independent Peer Review:

Section 13.1: NPRM Peer Review-Related Comments

- Office of Management and Budget (OMB) Final Information Quality Bulletin for Peer Review
- Independent Peer Review Requirements (40 CFR 30.7)
- Comparison of the Approach in the Proposed Rule to Existing Scientific Review Processes

Section 13.2 SNPRM Independent Peer Review

- Existing Peer Review Processes and Protocols are Sufficient
- Concerns Related to Transparency in EPA's Peer Reviews

³¹⁸⁴ OMB, Final Information Quality Bulletin for Peer Review (Dec. 16, 2004), http://www.cio.noaa.gov/services_programs/pdfs/OMB_Peer_Review_Bulletin_m05-03.pdf; hereafter referred to as the "OMB Bulletin."

- Supplemental Proposal Violates the Principles of the OMB Final Information Quality Bulletin for Peer Review
- Resource Burdens of Peer Review Requirements
- Considerations of Bias and Independence of Peer Reviewers

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

13.1 NPRM Peer Review-Related Comments

13.1.1 Office of Management and Budget (OMB) Final Information Quality Bulletin for Peer Review

13.1.1.1 Statutory Authority to Codify the OMB Bulletin

Comment: Commenters (6133, 9227) argue that the EPA does not have the legal authority to codify the requirements of the OMB Bulletin.

Commenter (6133) states that the EPA proposes to bind itself to conduct a particular form of peer review based on an OMB Bulletin that has never been the subject of notice and comment rulemaking and is not authorized by any federal law. According to the commenter, treating the content of the OMB Bulletin as a binding regulation would violate the federal statutes the EPA implements because those statutes do not codify the Bulletin. In addition, the commenter asserts that the proposal identifies no statutory authority for EPA to conduct independent peer review for any “pivotal regulatory science” consistent with the Bulletin, nor did the proposal identify the statutory authority for the EPA to bind itself to conduct peer review only in this fashion. Further, the commenter says the proposal identifies no Congressional intent for EPA to conduct peer review consistent with the OMB Bulletin, although Congress has known about the OMB Bulletin since 2005. The commenter contends that the EPA has made up proposed § 30.7 and the putative authority for the Proposal out of whole cloth.

Commenter (9227) asserts that there is no statutory authority for EPA to “conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” The federal statutes that EPA lists as putative authority for the Proposal provide no authority for proposed § 30.7. See 83 Fed. Reg. at 18,769/2 (citing Clean Air Act (CAA) sections 103, 301(a), 42 U.S.C. 7403, 7601(a); Clean Water Act (CWA) sections 104, 501, 33 U.S.C. 1254, 1361; Safe Drinking Water Act (SDWA) sections 1442, 1450(a)(1), 42 U.S.C. 300j–1, 300j–9(a)(1); Resource Conservation and Recovery Act (RCRA) sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; Comprehensive Environmental

Response, Compensation, and Liability Act (CERCLA) (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; Emergency Planning and Community Right-To-Know Act (EPCRA) section 328, 42 U.S.C. 11048; Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; and Toxic Substances Control Act (TSCA) as amended, section 10, 15 U.S.C. 2609, and the Administrative Procedures Act (APA)). According to the commenter, the claimed authorities that EPA lists do not mention peer review or even allude to the concept. *Id.* The commenter provides that neither the Proposal nor accompanying docket materials identify any provision of any federal statute that authorizes EPA to promulgate proposed § 30.7 and that their own research revealed no provision of any federal statute that authorizes EPA to promulgate proposed § 30.7. The commenter asserts that Congress writes federal statutes.

Response: The OMB Bulletin provides that “agencies are granted broad discretion to weigh the benefits and costs of using a particular peer review mechanism for a specific information product. The selection of an appropriate peer review mechanism for scientific information is left to the agency’s discretion”. EPA is subject to the OMB Bulletin and its provisions have been incorporated into the Agency’s peer review handbook. EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will lead to consistent implementation of those procedures across the Agency.

As stated in the final rule, EPA is authorized to promulgate this procedural rule under its authority to promulgate housekeeping regulations governing its internal affairs. The final rule does not interpret or apply the provisions of any environmental statutes. If implementing this procedural rule would result in conflicts with existing EPA environmental statutes, and their implementing regulations, the procedural rule will yield to the existing statutes and regulations.

Comment: Commenter (6449) notes that the OMB Bulletin implements the Information Quality Act (IQA) (Pub L. No. 106-554, § 515, Dec. 21, 2000) and that the rule should reference the IQA along with the OMB Bulletin.

Response: EPA references the guidelines³¹⁸⁵ because they provide interpretations of key terms. EPA relied on these guidelines, as well as other federal guidance documents that require greater data transparency, when describing the consistency of this rule’s focus on transparency, the need to characterize the sensitivity of an agency’s conclusions to analytic assumptions.

13.1.1.2 Existing OMB Bulletin Sufficient

Comment: Commenters (6915, 6925) assert that there is an existing and well-established framework in place governing the use of scientific information to ensure that the information informing regulatory actions is the best-available, peer-reviewed science. These commenters

³¹⁸⁵ Office of Mgmt. & Budget, Exec. Office of the President, OMB M-19-15, Improving Implementation of the Information Quality Act (April 24, 2019), *available at* <https://www.whitehouse.gov/wp-content/uploads/2019/04/M-19-15.pdf>.

point to the OMB Bulletin as one of the policy/procedure documents that comprises that existing framework.

Commenter (6895) asserts that the OMB Bulletin states that pivotal research must include information so that agency reviewers can "ensure that scientific uncertainties are clearly identified and characterized." The commenter remarks that this is the task of peer reviews, and there is no need to make anything else available if scientific uncertainties can be quantified.

Response: The EPA would like to clarify that the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that "the intensity of peer review is highly variable across journals" and "prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary" (Ref. 8). Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule.

Comment: Commenter (9227) asserts that the EPA has not provided any information to suggest that EPA is not already following the OMB Bulletin. According to the commenter, the EPA's lack of any supporting rationale or analysis frustrates the public's ability to provide meaningful comment on the 40 CFR 30.7 provision that "EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 Fed. Reg. 2664) and the exemptions described therein,"³¹⁸⁶ and is itself a sign that this requirement is fundamentally arbitrary.

Response: The reference to OMB Final Information Quality Bulletin for Peer Review in the final rule is to ensure that EPA will conduct any peer reviews required under the rule in accordance with this existing policy and procedures.

13.1.1.3 Consistency of Proposal with the OMB Bulletin

13.1.1.3.1 OMB Bulletin Does Not Require Re-review of Adequately Peer-Reviewed Studies

Comment: Commenters (6125, 9227) state that the EPA must clarify that studies that have already been adequately peer-reviewed by third parties do not need to be re-reviewed by the EPA, as provided for in the OMB Bulletin. Commenter (9227) also states that the EPA must clarify that prior peer reviews are not subject to the requirement in §30.7 that reviewers consider the strengths and weaknesses of EPA's justifications.

³¹⁸⁶ See *Connecticut Light & Power Co. v. Nuclear Regulatory Com.*, 673 F.2d 525, 530 (D.C. Cir. 1982) ("The purpose of the comment period is to allow interested members of the public to communicate information, concerns, and criticisms to the agency during the rule-making process. If the notice of proposed rulemaking fails to provide an accurate picture of the reasoning that has led the agency to the proposed rule, interested parties will not be able to comment meaningfully upon the agency's proposals."); *Honeywell Int'l, Inc. v. EPA*, 372 F.3d 441, 445, (D.C. Cir. 2004) ("Under the Administrative Procedure Act, a notice of proposed rulemaking must "provide sufficient factual detail and rationale for the rule to permit interested parties to comment meaningfully.").

Commenter (9227) notes that proposed §30.7 expressly incorporates the OMB Bulletin, which provides that “agencies need not have further peer review conducted on information that has already been subjected to adequate peer review.” The commenter also notes that the language in proposed §30.7 instructs the EPA to “ask peer reviewers to articulate the strengths and weaknesses of EPA’s justifications for the assumptions applied and the implications of those assumption for the results.” The commenter remarks that peer reviews conducted prior to the EPA’s reliance on a study could not have involved a review of the strengths and weaknesses of EPA’s justifications, and this language implies that the EPA is required to re-peer review all influential scientific information.

Commenters (4589, 6137, 9927) state that requiring a re-review of previously peer-reviewed studies would burden the EPA with unnecessary, duplicative and significant costs and would prevent the EPA from fulfilling its statutory mission of protecting public health and the environment by bringing many EPA rulemakings to a standstill.

Commenters (6125, 9227) suggest that in order to prevent stalling rulemakings, the EPA must clarify that the rule will not supersede EPA’s existing authority under the OMB Bulletin to not conduct further peer review where information has already been subject to adequate peer review. Commenter (6137) states that the OMB Bulletin recognizes, “[p]ublication in a refereed scientific journal may mean that adequate peer review has been performed.”³¹⁸⁷ Commenter (6125) specifically requests that the EPA revise the proposed rule language to clarify what is required and what is advised.

Response: The EPA would like to clarify that the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.”³¹⁸⁸ Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule. The EPA is, therefore, finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB’s Bulletin for Peer Review and the EPA’s Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

To address the public comment regarding “unnecessary duplicative and significant costs”, the preamble of the final rule specifies, “given the costs of the current robust process for identifying

³¹⁸⁷ OMB, Final Information Quality Bulletin for Peer Review at 22 (Dec. 16, 2004), http://www.cio.noaa.gov/services_programs/pdfs/OMB_Peer_Review_Bulletin_m05-03.pdf.

³¹⁸⁸ Office of Mgmt. & Budget, Exec. Office of the President, *Final Information Quality Bulletin for Peer Review*, 70 FR 2,664 (Jan. 14, 2005), available at <https://www.federalregister.gov/documents/2005/01/14/05-769/final-information-quality-bulletin-for-peer-review>.

and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small....relative to current administrative costs for developing significant regulatory actions or influential scientific information.”

13.1.1.3.2 The Proposal Will Lead to Undue Delays, Contrary to the OMB Bulletin

Comment: Commenter (6137) asserts that the provisions in the proposed rule requiring independent peer review on all pivotal regulatory science used to justify regulatory decisions is inconsistent with provisions in the OMB Bulletin that exclude time-sensitive health and safety disseminations, which encompasses most of the studies the EPA intends to review, and direct agencies to ensure peer review does not unduly delay the release of urgent findings.³¹⁸⁹ The commenter states that in contrast to the OMB Bulletin, the proposal appears to require another layer of peer review, which would lead to unnecessary delays. The commenter notes that there can be hundreds to thousands of studies supporting a standard, such as the national ambient air quality standards (NAAQS), and it is difficult to see how the EPA could subject all of these to an additional peer review process, which can take months for each study to be reviewed, and still complete scientific assessments in a timely manner. The commenter asserts that the EPA must clearly outline how it will ensure the additional peer review process will not lead to undue delay.

Response: EPA disagrees that the rule adds another layer of peer review that could result in unnecessary delays. EPA clarified in 40 CFR 30.6 that “the EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review.” This should ensure that no unnecessary peer reviews are conducted that could cause undue delay.

13.1.1.3.3 Independent Peer Reviewer OMB Bulletin Guidelines

Comment: Commenter (6120) urges the EPA to follow the OMB Bulletin guidelines for peer review to ensure peer reviewers are independent of industry and include academic scientists. The commenter provides that the OMB Bulletin states that “For scientific assessments relevant to specific regulations, a reviewer's financial ties to both regulated entities (e.g., businesses) and the agency should be examined” and “goes beyond financial investments and business relationships and includes work as an expert witness, consulting arrangements, honoraria and sources of grants and contracts.” The commenter further provides that the OMB Bulletin also clearly states that scientists who receive government research grants are still able to offer “independent scientific advice to the agency on other projects.”

Commenter (1972) requests that EPA clarify the use of peer review in proposed 40 CFR 30.7. The commenter provides that this section states that “EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” The commenter further provides that the OMB Bulletin states that, for more important work, “independent” peer review should involve “[r]eviewers” that “are generally not employed

³¹⁸⁹ Id at 1.

by the agency or office producing the document. As the National Academy of Sciences (NAS) has stated, ‘external experts often can be more open, frank, and challenging to the status quo than internal reviewers, who may feel constrained by organizational concerns.’” Citing Nuclear Regulatory Commission (NRC), Peer Review in Environmental Technology Development Programs: The Department of Energy’s Office of Science and Technology, Nat’l Academy Press (1998) at 3. According to the commenter, the EPA’s own Guidelines similarly note that “[f]or those work products that are intended to support the most important decisions or that have special importance in their own right, external peer review is the procedure of choice.”³¹⁹⁰ The commenter asserts that, given the credibility bestowed by both the courts and the public upon the studies that are “peer reviewed,” the EPA should also clarify the conditions/parameters under which it will use truly independent external peer reviewers.

Response: The final rule language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) clarifies that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB’s Bulletin for Peer Review and the EPA’s Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

Adequate peer review is peer review that is consistent with the requirements of the OMB Peer Review Bulletin and EPA’s Peer Review Handbook. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. The EPA Peer Review Handbook, 4th Edition, describes how peer reviewers are selected by the Agency.

13.1.1.3.4 OMB Bulletin Exemption Criteria

Comment: Commenter (9227) states that the EPA must clarify that the OMB Bulletin waiver provisions will remain in effect. The commenter notes that proposed §30.9(b) provides that the Administrator may grant an exemption from the peer review requirements if he or she determines that “[it] is not feasible to conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions for reasons outlined in OMB Final Information Quality for Peer Review (70 FR 2664), Section IX.” The commenter notes that only two of seven exemptions in Section IX of the OMB Bulletin relate to feasibility, and suggests that the EPA amend its Proposal to clarify that all of the exemptions in the OMB Bulletin remain in effect regardless of whether they pertain to feasibility. The commenter recommends that the EPA clarify what additional effect, if any, is intended by the exemption provision in the proposed §30.9.

Commenter (9227) requests that the EPA amend the proposed rule to confirm that the “Deferral and Waiver” provision of Section VIII of the OMB Bulletin remains in effect for EPA. The commenter contends that this provision allows an agency to waive or defer the peer review requirements of Sections II and III of the OMB Bulletin where warranted by a compelling

³¹⁹⁰ EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency (Oct. 2002) at § 4.2.

rationale to ensure flexibility in unusual and compelling situations that are not otherwise covered by the exemptions in the OMB Bulletin. The commenter contends that without clarifications in proposed §30.9(b), it is possible that it could be read to encompass the entirety of the Administrator's ability to grant exemptions, supplanting Section VIII of the OMB Bulletin.

Commenter (6375) states that the exemptions described in the rule and under OMB's Information Quality Bulletin for Peer Review to ensure compliance with privacy and national security laws and regulations are appropriate. The commenter recommends that the EPA handle these exemptions in a similar manner to the case-by-case exceptions for studies: EPA should provide a robust and transparent explanation in the *Federal Register* early in the rulemaking process to explain why the provisions of this rule do not apply to the rulemaking in question (e.g. which laws would be in conflict). The commenter believes the exemption for "promptness" under OMB's Information Quality Bulletin for Peer Review is appropriate for an exemption except during the implementation after the effective date of this regulation. The commenter states that this rule will initiate a significant change in the way EPA manages pivotal regulatory science and some time will be needed to set up new processes and systems to ensure internal compliance. The commenter suggests that the EPA identify in any rule finalized during the implementation window which dose-response studies used as pivotal regulatory science have not been made publicly available and release a schedule for making those studies available. The commenter states that once those processes and systems are set up, EPA should be evaluating new dose-response studies well in advance of any rulemaking activities such that exemptions for "promptness" should not be needed.

Response: 40 CFR 30.6 in the final rule clarifies that "the EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein."

In the 2020 SNPRM, the EPA did not incorporate the OMB Bulletin for Peer Review Section IX exemptions to peer review, including routine statistical information and financial information. Rather than modify the proposed 40 CFR 30.2 definition of "influential scientific information," the EPA is modifying 40 CFR 30.3 in the final rule to clarify the Agency's intent. As a result, the requirements in 40 CFR 30.3 apply to influential scientific information, unless the influential scientific information is exempted from peer review requirements as described in Section IX of the OMB Bulletin for Peer Review. Consistent with this approach, the EPA is finalizing the definition of "influential scientific information" as proposed in the 2020 SNPRM. The Agency will continue to follow the provisions of the OMB Bulletin for Peer Review.

The basis for all rulemaking is provided for public review and comment in the public docket when the proposed rule is issued or if subsequently added to the docket through a separate opportunity for public comment. The EPA expects the basis for its decisions in proposed significant regulatory actions or external review drafts of influential scientific information, which will allow the public, if they so choose, to provide comment to the EPA.

13.1.1.3.5 EPA Does Not Explain Whether the OMB Bulletin is or is not Consistent with the Proposal

Comment: Commenter (6133) says the regulatory text of the proposal requiring EPA to conduct peer review on pivotal regulatory science consistent with the OMB Bulletin is too vague for the reader to understand what the EPA intends and whether the EPA's regulatory science would be consistent with the OMB Bulletin. Similarly, commenter (9227) asserts that there is some vagueness as to whether the Proposal maintains, expands, or narrows the OMB Bulletin requirements. Commenter (6133) states that it appears that neither the memorandum pointed to in the proposal on the issuance of the OMB Bulletin nor the OMB Bulletin itself supports the EPA's proposal regarding peer review. The commenter notes that the OMB Bulletin does not address standardized test methods or good laboratory practices, which the EPA proposes to use. The commenter also points out that the proposal does not identify any peer-reviewed studies without publicly available data that reached incorrect conclusions, nor does it explain how the current peer review process EPA uses for disseminating information conflicts with the OMB Bulletin. Additionally, the commenter notes that EPA does not present any strategies for dealing with past studies. The commenter asserts that before the EPA adopts any final rule with this requirement, it must propose a new rule with clear regulatory text, justification for its independent peer review requirement, and supporting legal, factual, scientific and technical information.

Response: The EPA disagrees with the commenter and believes that the language at 40 CFR 30.6 in the final rule is clear. The language clarifies that "the EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review. Because transparency in pivotal science includes addressing issues associated with assumptions used in analyzing dose-response data, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied and the implications of those assumptions for the results."

Adequate peer review is peer review that is consistent with the requirements of the OMB Peer Review Bulletin and EPA's Peer Review Handbook. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect.

13.1.1.4 OMB Bulletin Implementation Costs and Benefits Must Be Considered to be Judicially Enforceable

Comment: Commenter (9227) asserts that the proposal would apparently make the requirements of the OMB Bulletin judicially enforceable, and the EPA did not analyze the costs and benefits associated with this action. The commenter notes that the OMB Bulletin requirements are not currently judicially enforceable, and the EPA may become subject to numerous legal challenges to its regulations based on compliance with the OMB Bulletin requirements. The commenter points out that there would be a financial cost related to the litigation and a cost to public health and the environment due to delays in the implementation of regulations. The commenter asserts

that the EPA must evaluate the anticipated costs and benefits from these proposed requirements and explain why they are needed.

Response: This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. Therefore, as detailed in the preamble to the final rule, the incremental burden to the Agency to carry out the requirements of this rule is expected to be small given (1) the extensive scientific review the EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of the studies the EPA would review).

13.1.1.5 EPA Peer Review Handbook

Comment: Commenter (9227) provides that the EPA's Peer Review Handbook incorporates the provisions of OMB's Peer Review Bulletin.³¹⁹¹ In the Handbook, the commenter states that the EPA confirms that it "conducts peer review of its products in accordance with the guidance in the OMB Peer Review Bulletin."³¹⁹² However, the commenter provides that the EPA Peer Review Handbook adds details and specific procedures that are not present in the OMB Peer Review Bulletin. According to the commenter, surprisingly, EPA's proposed peer review regulations do not even mention EPA's Peer Review Handbook, let alone explain how the new proposed regulations would impact EPA's compliance with the Handbook. For example, the commenter states that the EPA's Handbook specifies "exemption criteria" in section 3.3.³¹⁹³ The commenter requests that the EPA clarify whether anything in the proposed peer review regulation would supplant instructions in the Peer Review Handbook, and if so, provide a reasoned explanation for the change. Likewise, the commenter requests that the EPA explain the role of the Peer Review Handbook going forward in administering peer review requirements.

Response: Adequate peer review is peer review that is consistent with the requirements of the OMB Peer Review Bulletin and EPA's Peer Review Handbook. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. If implementing this procedural rule would result in conflicts with the guidance found in the Agency's existing Peer Review Handbook, the conflicting requirements found in the Handbook will yield to this final rule.

13.1.2 Independent Peer Review Requirements (40 CFR 30.7)

13.1.2.1 EPA Shall Conduct Independent Peer Review on All Pivotal Regulatory Science Used to Justify Regulatory Decisions

13.1.2.1.1 Support the Proposed Independent Peer Review Requirements

³¹⁹¹ U.S. EPA, Science and Technology Policy Council Peer Review Handbook, 4th Ed. (2015), https://www.epa.gov/sites/production/files/2016-03/documents/epa_peer_review_handbook_4th_edition.pdf. [Hereinafter: EPA Peer Review Handbook].

³¹⁹² EPA Peer Review Handbook at 26.

³¹⁹³ EPA Peer Review Handbook at 44-45.

Comment: Commenters (0045, 4541, 6150, 6180, 6891, 8281-PH85) support the proposed independent review requirements.

Commenter (0045) states that the public good will be served by the proven discipline of peer review and reproducibility on all sources. Commenter (4541) supports the Proposed Rule and states that it can ensure EPA is protecting public health and the environment in a manner that the public can trust and understand. Commenter (6150) states that independence is important to the peer review process and suggests that the peer review process can be improved.³¹⁹⁴ Commenters (6180, 8281-PH85) support the use of independent expert peer reviews as an additional level of review for pivotal regulatory science.

Commenters (6180, 8281-PH85) state that they have been involved in independent peer reviews of various permitting or related activities which have concluded that the technical basis for EPA's permit limits or water quality targets were scientifically indefensible. The commenters assert that, had no peer reviews occurred, these permits or water quality targets would have imposed hundreds of millions of dollars of wastewater treatment costs to rate payers with no anticipated benefit.

In support of their position that there is a need for independent peer review, commenter (6180) describes a case study involving a Nutrient Criteria document. The commenter provides that this case study highlights the necessity and utility of an independent peer review of EPA regulatory science and raises concerns about EPA's current peer review procedures and charge questions. The commenter notes that it is disconcerting that the findings of an EPA peer review panel of "national experts through the EPA's Nutrient Scientific Technical Exchange Partnership and Support (N-STEPS) program" were entirely contradicted by an independent peer review panel only a few years later. The following is a summary of a case study described by the commenter:

New Hampshire Department of Environmental Services (DES), with support from EPA Region 1, published the Draft 2009 Numeric Nutrient Criteria for the Great Bay Estuary document. In early 2010, the Draft 2009 Nutrient Criteria underwent review by an EPA peer review panel which validated the scientific methods and decision-making used by DES and praised the use of multiple lines of evidence to develop the criteria as a way to enhance confidence in the results. The Great Bay Municipal Coalition (GBMC) formed in 2010 to contest the 2009 Nutrient Criteria. DES and the GBMC agreed to organize a 2013 independent peer review to review the scientific basis of the 2009 Nutrient Criteria. The peer reviewers concluded that the Draft 2009 Nutrient Criteria were not scientifically defensible.³¹⁹⁵ As a result of the 2013 Peer Review conclusions, DES agreed to rescind the 2009 Nutrient Criteria in April 2014.

As further support for their position that there is a need for independent peer review, commenter (6180) states that, historically, more often than not, when the scientific validity of EPA's scientific rationales, methodologies, and derivations has been called into question, even by experts on the specific issue, EPA has refused commenter's requests to conduct independent peer

³¹⁹⁴ Kelly J., Sadeghieh T., Adeli K. (2014) 'Peer Review in Scientific Publications: Benefits, Critiques and a Survival Guide', *EJIFCC*, 25: 227-43

³¹⁹⁵ Available at <https://scholars.unh.edu/cgi/viewcontent.cgi?article=1001&context=rtr>

reviews. The commenter describes three examples which are summarized below.

In 2013, EPA issued a draft permit and fact sheet to the City of Taunton claiming that the City's nitrogen discharge caused or contributed to excessive algal growth and dissolved oxygen (DO) violations. EPA imposed a 3 mg/L (limits of technology) total nitrogen (TN) limit, based on the presumption that nitrogen was a primary factor causing low DO. EPA used a "reference station" approach, without assessing location and site differences that would cause a completely different DO regime and nutrient response to exist at that location. Multiple water quality experts informed EPA that the methodology used to determine the nitrogen limitation was not scientifically defensible. EPA acknowledged that the simplified approach had never been determined to be scientifically defensible but still refused to conduct a peer review of the methodology. Taunton challenged the scientific defensibility of the TN permit limit in multiple venues but the EPA's Environmental Appeals Board (EAB) and the First Circuit Court of Appeals upheld the permit limit derivation and imposition. Both the EAB and the First Circuit also asserted that no cause and effect relationship is required to impose a water quality-based effluent limit. The City requested that the Massachusetts Department of Environmental Protection (MassDEP) reopen the permit based on the updated post-2006 information demonstrating that 1) the assumptions underlying EPA's TN limit derivation were erroneous, and 2) extensive water quality improvements have been documented throughout Narragansett Bay, including Mount Hope Bay (MHB), which would significantly alter, if not completely eliminate, Taunton's TN permit limit. The City's requests have been denied.

EPA has approved water quality standards for Minnesota that include biochemical oxygen demand (BOD) and DO flux as nutrient impairment indicators. Regarding BOD, Standard Methods, the developer of the test used to measure BOD, published a memorandum explaining that BOD and the BOD test could not be used as a nutrient impairment indicator. Moreover, the response to a July 31, 2014 Freedom of Information Act (FOIA) request to EPA seeking the technical basis for the assertion that DO flux alone can cause an aquatic life impairment indicated that EPA had no supporting documentation. EPA Region 5 conducted an anonymous external review (i.e., reviewers' names are redacted) of the water quality standards in which several reviewers raised serious concerns with the water quality standards and their derivations. This constitutes an inappropriate use of a peer review as 1) it lacks transparency and may incorporate bias as the reviewers remain anonymous, and 2) the concerns of the peer reviewers were not adequately addressed in revisions to the water quality standards. While these issues have been repeatedly raised with both EPA and the Minnesota Pollution Control Agency (MPCA), MPCA has continued applying these BOD and DO flux water quality standards throughout the state. The cascading effect of inappropriately listing waters as nutrient impaired can result in hundreds of millions of dollars wasted on unnecessary Publicly Owned Treatment Works (POTW) upgrades which do not have any measurable environmental benefit.

In 2008, EPA Region 3 proposed a group of total maximum daily loads (TMDLs) that regulated total phosphorus. The TMDLs were based on reports prepared by EPA contractor Tetra Tech, Inc. in 2007 (the "Endpoint Report"). The proposed TP endpoint

was then used to derive waste load allocations in the various TMDLs that would impose multi-million-dollar costs on the regulated communities. The Endpoint Report was based on a “weight of evidence” evaluation which included novel statistical evaluations. The Endpoint Report was challenged as not scientifically defensible. EPA agreed to the Science Advisory Board (SAB) review and prepared a draft guidance manual (August 17, 2009). The SAB reviewed the draft manual and provided extensive comments on revisions necessary for the guidance to be scientifically defensible (April 27, 2010). Subsequently, EPA revised the draft guidance to address the SAB comments (November 2010). EPA asked Tetra Tech, Inc. to review and revise its 2007 Endpoint Report with consideration for USEPA’s new guidance. This follow-up analysis (July 18, 2012) concluded that the original evaluation was supported by the revised evaluation. It should be obvious that the original author of the Endpoint Report should not be the arbiter of a follow-up evaluation to address significant scientific deficiencies of the original report. Even if Tetra Tech, Inc. were allowed to author the revised report, an independent scientific evaluation should have been conducted to assess the scientific defensibility of the revised evaluation. In June 2017, the Southeastern Pennsylvania Nutrient Coalition submitted a request for a peer review to EPA, however, this request was also denied.

Response: EPA appreciates the comments supporting the inclusion of independent peer review in the final rule. As provided in section 30.7, the EPA “shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review.” In this rule, the EPA is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin state that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.”

The Agency is not responding to comments not directly relevant to the proposed rule. Any concerns about specific projects should be directed to the appropriate EPA programmatic or regional office

13.1.2.1.2 Do Not Support the Proposed Independent Peer Review Requirements

Independent Review as Proposed by EPA Would Cause a Delay in EPA Actions

Comment: Commenters (6119, 6133, 6137, 6866) express concern regarding EPA's proposed independent peer review requirements because it would be time-consuming and would delay EPA from meeting its responsibilities under statutory deadlines and its mission to protect the public health and environment. Commenter (6137) states that the standard time taken to review scientific manuscripts in the fields of medicine, public health, and natural sciences is, on average, 12-14 weeks.³¹⁹⁶ Commenter (6133) states that EPA already misses an unacceptably high number of congressional deadlines in the statutes it administers, and the Proposal to apply peer review to "all pivotal regulatory science" will only exacerbate that endemic problem and the unlawfulness that it represents. Commenter (6119) states that this proposed rule has the potential to create serious technical gaps in the regulatory process and further burden a process that is already years behind in issuing new or updated science-based regulations. Commenter (6866) adds that slowing down rulemaking in ways that may be detrimental to protecting environmental and public health may invite lawsuits that would further stymie regulatory processes.

Response: EPA disagrees that the rule could result in unnecessary delays. EPA clarified in 40 CFR 30.6 that "the EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review." This should ensure that no unnecessary peer reviews are conducted that could cause undue delay.

Independent Review as Proposed by EPA is Duplicative and/or Unnecessary

Comment: Commenters (2425, 5165, 6119, 6125, 6137, 6142, 6866, 6915) suggest that independent peer review by EPA is duplicative and unnecessary.

Commenter (2425) states that scientific studies used by EPA to make regulatory changes are already rigorously examined prior to being published in peer-reviewed scientific journals. Commenter (6915) states that EPA fails to acknowledge the rigor of existing processes in statutes, policies and federal procedures.

Commenter (6119) states that the process that proposed 40 CFR 30.7 describes is already well established. The commenter states that, for example in December 2009, EPA completed their review of the current research on particle pollution by engaging a panel of expert scientists, and the Clean Air Scientific Advisory Committee, to help EPA assess the evidence. The commenter adds that scientific studies are peer reviewed before being published. According to the commenter, rigorous review practices are already in place for dose response data models used for developing reference values for toxic substances and environmental contaminants, and that

³¹⁹⁶ Janine Huisman & Jeroen Smits, Duration and quality of the peer review process: the author's perspective, *Scientometrics* 113:633 (2017), <https://doi.org/10.1007/s11192-017-2310-5>.

federal regulations already set out review requirements³¹⁹⁷ for research involving human subjects.

Commenter (6137) states that, while it is certainly a best practice to consider only science that has been independently peer reviewed when making regulatory decisions, that does not necessitate independent peer review by EPA. The commenter notes that most scientific bodies – including *Nature*, *Science*, the *Bipartisan Policy Center*, and *Proceedings of the National Academies of Sciences* – employ some of the most robust peer review practices and that they already apply to the types of studies for which the Proposed Rule will require EPA review. The commenter asserts that the additional review by EPA that is mandated under the proposed rule is duplicative, wholly unnecessary, and inconsistent with the provision in the OMB Bulletin that states that “[p]ublication in a refereed scientific journal may mean that adequate peer review has been performed.”³¹⁹⁸

Commenter (6866) believes that, since most EPA decisions involve evaluating sizable scientific literature on a topic – comparing a range of studies – routinely re-peer reviewing each study seems particularly duplicative.

Commenter (6125) states that it is puzzling that section 30.7 is included in the proposed rule, given that external peer review generally already occurs in the cases of significant regulatory actions. The commenter notes that it would appear that the authors of this proposed rule are either not aware of or have never bothered to read the Agency’s Peer Review Handbook.³¹⁹⁹ The commenter adds that, if they have read it, they chose not to cite it. The commenter provides that the Handbook lays out very clearly the levels of peer review expected to be implemented, depending upon the nature and potential impact of a particular scientific product, including risk assessments. According to the commenter, there is no evidence given in the proposed rule to support that EPA is not following these policies and that this rulemaking is necessary.

Response: Adequate peer review is peer review that is consistent with the requirements of the OMB Peer Review Bulletin and EPA’s Peer Review Handbook. The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will conduct independent peer review consistent with the OMB Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone journal peer review. In this rule, the EPA is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble of the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for

³¹⁹⁷ 45 CFR §46.101 Protection of Human Subjects sets out the federal requirements to have an Institutional Review Board (IRB) in any case where subjects are recruited for research purposes. The Food and Drug Administration (FDA) has a separate set of regulations governing human subjects research (- 21 CFR 56 IRBs and 21 CFR 50-Informed Consent).

³¹⁹⁸ OMB, Final Information Quality Bulletin for Peer Review at 22 (Dec. 16, 2004), http://www.cio.noaa.gov/services_programs/pdfs/OMB_Peer_Review_Bulletin_m05-03.pdf.

³¹⁹⁹ U.S. EPA. 2015. Peer Review Handbook. 4th Edition. Science and Technology Policy Council. U.S. Environmental Protection Agency. Washington, DC. EPA/100/B15/001.

determining that no further review is necessary.” Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. If implementing this procedural rule would result in conflicts with the guidance found in the Agency’s existing Peer Review Handbook, the conflicting requirements found in the Handbook will yield to this final rule.

To address the public comment regarding “unnecessary duplicative and significant costs”, the preamble of the final rule specifies, “given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small....relative to current administrative costs for developing significant regulatory actions or influential scientific information.”

The final rule does not interpret or apply the provisions of any environmental statutes. If implementing this procedural rule would result in conflicts with existing EPA environmental statutes, and their implementing regulations, the procedural rule will yield to the existing statutes and regulations.

Independent Review Would Result in Increased Costs

Comment: Commenters (6119, 6137, 6142, 6866, 6868, 6915) express concern that the proposed independent EPA review requirement would be costly. Commenter (6142) states that this rule proposes adding this costly step to the process for developing EPA policy without setting aside resources for its execution. Commenter (6866) asserts that EPA would be better off having its staff assess study quality as it reviews the scientific literature, as recommended in the Science for Policy Project report, rather than putting in place a blanket requirement for an additional outside peer review of all studies. Commenter (6868) states that the proposed rule seeks to create a supplemental--and likely expensive-- peer review process conducted by agency staff.

Commenter (6119) states that, in reviewing this proposal, it appears EPA will either have to spend millions of dollars to format data to make it publicly accessible for review or limit the total number of studies used to make regulatory decisions because of the costs associated with evaluating them. According to the commenter, for those interested in providing EPA with data for regulatory purposes, new administrative requirements will need to be accounted for and potentially make certain types of studies by EPA impractical. The commenter states that some researchers may choose to avoid certain types of research if it appears likely that administrative hurdles will limit their available funding sources or the application of their findings.

Commenter (6137) asserts that the proposal would lead to undue cost if EPA were to conduct its own independent peer review of the underlying data for studies that already have undergone a rigorous scientific review process, which is the case for those studies published in scientific journals or independently evaluated by a scientific body. The commenter provides, for example,

that the NAAQS Integrated Science Assessment and Risk and Exposure Assessments regularly include the review of thousands of scientific studies. According to the commenter, it would be enormously inefficient and costly (if even possible) for EPA to rereview all of these studies.

Commenter (6915) asserts that any requirement for EPA to conduct additional review would entail additional significant costs, contrary to the proposal's assertion. Id. at 18,772. The practical outcome of the proposal is that EPA may end up relying on a much smaller number of studies and/or on a less robust subset of relevant available studies, thus undermining the regulatory decision-making process.

Response: The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA's Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. In this rule, the EPA is not changing the pre-existing requirements of the OMB's Final Information Quality Bulletin for Peer Review. The preamble of the Bulletin states that "the intensity of peer review is highly variable across journals" and "prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary."³²⁰⁰ Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. The final rule does not require the EPA to collect, store, or publicly disseminate dose-response data and models underlying pivotal science.

To address the public comment regarding costs, the preamble of the final rule specifies, "given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small....relative to current administrative costs for developing significant regulatory actions or influential scientific information."

The EPA disagrees that the practical outcome of this rule will be that EPA may end up relying on a much smaller number of studies and/or on a less robust subset of relevant available studies or that the rule will undermine the regulatory decision-making process. The final rule includes sufficient flexibility in terms of the allowance for restricted access, considerations in 40 CFR

³²⁰⁰ Office of Mgmt. & Budget, Exec. Office of the President, *Final Information Quality Bulletin for Peer Review*, 70 FR 2,664 (Jan. 14, 2005), *available at* <https://www.federalregister.gov/documents/2005/01/14/05-769/final-information-quality-bulletin-for-peer-review>.

30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data to minimize such potential unintended consequences.

Independent Review as Proposed by EPA Has No Rationale/Legal Basis

Lack of Rationale Provided for the Proposed Rule

Comment: Commenters (6137, 6142, 6866, 6868, 6915, 9227) express concern that there is no rationale/basis provided for requiring the independent peer review. Commenter (6142) states that these requirements are likely superfluous in the vast majority of cases since all studies that appear in standard scholarly journals are already peer reviewed by several independent experts prior to acceptance and publication. Commenter (6866) states that this requirement is unnecessary since there is no indication that EPA decision-making has been marred by the use of questionable studies. Commenter (6868) states that, without articulating any deficiencies in the existing scientific peer review process, the proposed rule seeks to create a supplemental peer review process conducted by agency staff. Commenter (6915) states that EPA fails to explain how its proposal would provide any added value.

Commenter (6137) states that the requirement in proposed §30.7 that EPA independently peer-review all pivotal regulatory science used to make regulatory decisions is arbitrary. The commenter adds that, as part of the Proposed Rule, EPA injects a new requirement without justification. The commenter contends that a review of the support upon which EPA relies demonstrates that this peer review obligation is contrary to current policy. The commenter states that it is also unnecessary, costly, and unrealistic. According to the commenter, it seems the only things this new peer review process would accomplish is the exclusion of reliable science, increased cost and time for effective reviews, and delay of regulatory decisions that impact public health.

Commenter (9227) states that proposed §30.7 generally appears to be designed to enshrine OMB's existing peer review requirements for "influential scientific information."³²⁰¹ The commenter asserts that the preamble to the proposed rulemaking lacks any explanation whatsoever for why EPA is proposing this new peer review requirement or what its impact might be. The commenter adds that EPA has additionally not provided any information to suggest that EPA is not already following OMB's Peer Review Bulletin. The commenter contends that EPA's lack of any supporting rationale or analysis frustrates the public's ability to provide meaningful comment on this provision,³²⁰² and is itself a sign that this requirement is fundamentally arbitrary.

³²⁰¹ OMB, Final Information Quality Bulletin for Peer Review, 70 Fed. Reg. 2664, 2677 (Jan. 14, 2005)

³²⁰² See *Connecticut Light & Power Co. v. Nuclear Regulatory Com.*, 673 F.2d 525, 530 (D.C. Cir. 1982) ("The purpose of the comment period is to allow interested members of the public to communicate information, concerns, and criticisms to the agency during the rule-making process. If the notice of proposed rulemaking fails to provide an accurate picture of the reasoning that has led the agency to the proposed rule, interested parties will not be able to comment meaningfully upon the agency's proposals."); *Honeywell Int'l, Inc. v. EPA*, 372 F.3d 441, 445, (D.C. Cir. 2004) ("Under the Administrative Procedure Act, a notice of proposed rulemaking must "provide sufficient factual detail and rationale for the rule to permit interested parties to comment meaningfully.").

Response: EPA disagrees that the rule adds another layer of peer review that could result in unnecessary delays. EPA clarified in 40 CFR 30.6 that “the EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review.” This should ensure that no unnecessary peer reviews are conducted that could cause undue delay.

The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. Adequate peer review is peer review that is consistent with the requirements of the OMB Peer Review Bulletin and EPA’s Peer Review Handbook. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. The EPA Peer Review Handbook, 4th Edition, describes how peer reviewers are selected by the Agency. As discussed in the final rule preamble, the EPA is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” If implementing this procedural rule would result in conflicts with the guidance found in the Agency’s existing Peer Review Handbook, the conflicting requirements found in the Handbook will yield to this final rule.

Further, EPA is subject to the OMB Bulletin and its provisions have been incorporated into the Agency’s peer review handbook (Ref. 44). EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will lead to consistent implementation of those procedures across the Agency.

Reliance on Published Studies Without Conducting Independent Analysis/Review of Underlying Data

Comment: Commenter (6119) states that the courts have spoken clearly on the degree to which independent analyses are necessary. The commenter provides that, in *American Trucking Associations, Inc. v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002), the court said, “we agree with EPA that requiring agencies to obtain and publicize the data underlying all studies on which they rely “would be impractical and unnecessary.” The commenter adds that the court then quoted what it called a persuasive EPA argument: “If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment.... [S]uch data are often the property of scientific investigators and are often not readily available because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants].”

Commenter (6125) expresses concern that proposed §30.7 may be trying to revive the argument thoroughly rejected and debunked by the D.C. Circuit in *Coalition for Responsible Regulation v. EPA*, 684 F. 3d 102 (D.C. Cir. 2012) (finding that substantial evidence supported EPA’s finding that emissions of enumerated greenhouse gases endanger public health and welfare and that

vehicular emissions contribute to that endangerment). The commenter provides that the court stated that “EPA simply did here what it and other decision-makers often must do to make a science-based judgment: it sought out and reviewed existing scientific evidence to determine whether a particular finding was warranted. It makes no difference that much of the scientific evidence in large part consisted of ‘syntheses’ of individual studies and research. Even individual studies and research papers often synthesize past work in an area and then build upon it; this is how science works. EPA is not required to re-prove the existence of the atom every time it approaches a scientific question.” 684 F. 3d at 120. According to the commenter, the proposed §30.7 language shows signs of being designed to ‘re-prove the existence of the atom’ by requiring re-peer review. The commenter states that there is no need for doing so and the need for doing so is not provided in the notice, and that the proposed provision appears both substantively and procedurally defective as a result.

Response: This rule does not categorically exclude any study because the underlying dose-response data are not available, either publicly or via restricted access, for independent validation. If a study is identified as pivotal science, EPA will still consider the study but may give it lesser consideration if the dose-response data are not available for independent validation. Further, the final rule does not require EPA to obtain and publish data underlying the studies it uses to support significant regulatory actions and influential scientific information. The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review.

It should also be noted that in this final rule, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as “pivotal science,” the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. If peer review under section 30.7 is warranted, it would be conducted on “pivotal science” and not on every dose-response study considered by the Agency in developing a significant regulatory action or influential scientific information.

Lack of Statutory Authority for Proposed §30.7

Comment: Commenter (6133) states that there is no statutory authority for EPA to “conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” The commenter provides that the federal statutes that EPA lists as putative authority for the Proposal provide no authority for proposed § 30.7. See 83 Fed. Reg. at 18,769/2 (citing CAA sections 103, 301(a), 42 U.S.C. 7403, 7601(a); CWA sections 104, 501, 33 U.S.C. 1254, 1361; SDWA sections 1442, 1450(a)(1), 42 U.S.C. 300j–1, 300j– 9(a)(1); RCRA sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; CERCLA

(as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; EPCRA section 328, 42 U.S.C. 11048; FIFRA sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; and TSCA, as amended, section 10, 15 U.S.C. 2609, and the APA. The commenter states that the claimed authorities that EPA lists do not mention peer review or even allude to the concept. The commenter adds that neither the Proposal nor accompanying docket materials identify any provision of any federal statute that authorizes EPA to promulgate proposed §30.7. According to the commenter, their own research revealed no provision of any federal statute that authorizes EPA to promulgate proposed §30.7.

Commenter (6133) asserts that the Proposal is unlawful, arbitrary and capricious, and an abuse of EPA discretion. The commenter provides that under longstanding federal case law, when Congress authorizes an approach in one section of a statute using specific language but does not do the same in other sections of a statute, the courts presume that Congress acted purposefully and did not mean to address or authorize that approach in those other statutory sections. See, e.g., *Dean v. United States*, 556 U.S. 568 (2009) (“It is generally presumed that Congress acts intentionally when including particular language in one section of a statute but not in another.” (citing *Russello v. United States*, 464 U.S. 16, 23 (1983))). According to the commenter, not only are there no implied grants of authority to an agency in the other statutory sections, but the congressional decisions to authorize the approach elsewhere in the statute give even greater force to the conclusion that the agency has not been given authority where Congress did not use the same or similar authorizing language.

Commenter (6133) states that the EPA approach proposed in §30.7 is even more unlawful than would be the case, independently, under this case law. The commenter notes that the proposed language of §30.7 says “EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” According to the commenter, the EPA proposes to bind itself (“shall”) to conduct a particular form of peer review on “all pivotal regulatory science” based on an unenforceable, non-binding OMB Bulletin that has never been the subject of notice and comment rulemaking and that itself is not authorized by any federal law. The commenter states that treating the content of the unenforceable bulletin as a binding regulation would itself violate the federal statutes that EPA implements, because those statutes do not codify the bulletin, and EPA would be unlawfully codifying a mere policy preference.

Commenter (6133) contends that the Proposal identifies no statutory authority for EPA to bind itself, and future administrations, to conduct peer review only in this fashion, unless and until future notice-and-comment rulemaking is undertaken. The commenter adds that the Proposal identifies no suggestion in statutory language or legislative history that Congress intended EPA to conduct binding peer review consistent with this OMB Bulletin, notwithstanding that Congress has known about this Bulletin since 2005. The commenter expresses that they believe EPA has simply made up proposed §30.7—with its link to the OMB Bulletin, and the putative authority for the Proposal—out of whole cloth.

Response: The OMB Bulletin provides that “agencies are granted broad discretion to weigh the benefits and costs of using a particular peer review mechanism for a specific information

product. The selection of an appropriate peer review mechanism for scientific information is left to the agency's discretion." EPA is subject to the OMB Bulletin and its provisions have been incorporated into the Agency's peer review handbook. EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will lead to consistent implementation of those procedures across the Agency.

As stated in the final rule, EPA is authorized to promulgate this procedural rule under its authority to promulgate housekeeping regulations governing its internal affairs. The final rule does not interpret or apply the provisions of any environmental statutes. If implementing this procedural rule would result in conflicts with existing EPA environmental statutes, and their implementing regulations, the procedural rule will yield to the existing statutes and regulations.

Existing Federal Environmental Statutory Requirements for Peer Review

Comment: Commenter (6915) states that the EPA fails to acknowledge the rigor of existing processes in statutes, policies and federal procedures, or to explain how its proposal would provide any added value and minimize costs.

Commenter (6133) states that the Proposal's peer review provision in §30.7 is contrary to existing requirements for peer review. The commenter states that, when Congress writes federal statutes, Congress knows how to create legal authority for peer review, who shall conduct that peer review, what role, if any, that EPA or other parties will play, and how that peer review may be conducted. The commenter asserts that none of the provisions in the law authorize EPA's Proposal in §30.7. The commenter provides that the statutes require that EPA use peer-reviewed science, regardless of whether it would meet EPA's definition of the term in §30.7. The commenter notes that, in cases where the law requires EPA to conduct the review, the statutes often spell out specifically how that should happen. The commenter provides the following excerpts from differing federal environmental statutes that establish specific peer review requirements.

CAA

§7511b. Federal ozone measures.

(g) Ozone design value study. The Administrator shall conduct a study of whether the methodology in use by the Environmental Protection Agency as of November 15, 1990, for establishing a design value for ozone provides a reasonable indicator of the ozone air quality of ozone nonattainment areas. The Administrator shall obtain input from States, local subdivisions thereof, and others. The study shall be completed and a report submitted to Congress not later than 3 years after November 15, 1990. The results of the study shall be subject to peer and public review before submitting it to Congress.

§7412. Hazardous air pollutants.

(p) Mickey Leland National Urban Air Toxics Research Center.

[...]

(3) Scientific Advisory Panel. The Board of Directors shall be advised by a Scientific Advisory Panel, the 13 members of which shall be appointed by the Board, and to include eminent members of the scientific and medical communities. The Panel membership may include scientists with relevant experience from the National Institute of Environmental Health Sciences, the Center for Disease Control, the Environmental Protection Agency, the National Cancer Institute, and others, and the Panel shall conduct peer review and evaluate research results. The Panel shall assist the Board in developing the research agenda, reviewing proposals and applications, and advise on the awarding of research grants.

CWA

§1321. Oil and hazardous substance liability.

(a) Definitions. (27) the term “best available science” means science that-- (A) maximizes the quality, objectivity, and integrity of information, including statistical information; (B) uses peer-reviewed and publicly available data; and (C) clearly documents and communicates risks and uncertainties in the scientific basis for such projects.

SDWA

§300g-1. National drinking water regulations.

(b) Standards.

[...]

(3) Risk assessment, management, and communication.

(A) Use of science in decision-making In carrying out this section, and, to the degree that an Agency action is based on science, the Administrator shall use--

(i) the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and(ii) data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).

(B) Public information.

In carrying out this section, the Administrator shall ensure that the presentation of information on public health effects is comprehensive, informative, and understandable. The Administrator shall, in a document made available to the public in support of a regulation promulgated under this section, specify, to the extent practicable--

- (i) each population addressed by any estimate of public health effects;
- (ii) the expected risk or central estimate of risk for the specific populations;
- (iii) each appropriate upper-bound or lower-bound estimate of risk;
- (iv) each significant uncertainty identified in the process of the assessment of public health effects and studies that would assist in resolving the uncertainty; and
- (v) peer-reviewed studies known to the Administrator that support, are directly relevant to, or fail to support any estimate of public health effects and the methodology used to reconcile inconsistencies in the scientific data.

[...]

(12) Certain contaminants.

(B) Sulfate.

(i) Additional study. Prior to promulgating a national primary drinking water regulation for sulfate, the Administrator and the Director of the Centers for Disease Control and Prevention shall jointly conduct an additional study to establish a reliable dose-response relationship for the adverse human health effects that may result from exposure to sulfate in drinking water, including the health effects that may be experienced by groups within the general population (including infants and travelers) that are potentially at greater risk of adverse health effects as the result of such exposure. The study shall be conducted in consultation with interested States, shall be based on the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices, and shall be completed not later than 30 months after August 6, 1996.

§300j-2. Grants for State programs.

(d) New York City watershed protection program.

(1) In general. The Administrator is authorized to provide financial assistance to the State of New York for demonstration projects implemented as part of the watershed program for the protection and enhancement of the quality of source waters of the New York City water supply system, including projects that demonstrate, assess, or provide for comprehensive monitoring and surveillance and projects necessary to comply with the criteria for avoiding filtration contained in 40 C.F.R. 141.71. Demonstration projects which shall be eligible for financial assistance shall be certified to the Administrator by the State of New York as satisfying the purposes of this subsection. In certifying projects to the Administrator, the State of New York shall give priority to monitoring projects that have undergone peer review.

RCRA

§6939a. Exposure information and health assessments.

(b) Health assessments.

[...]

(2) Whenever in the judgment of the Administrator, or the State (in the case of a State with an authorized program), a landfill or a surface impoundment poses a substantial potential risk to human health, due to the existence of releases of hazardous constituents, the magnitude of contamination with hazardous constituents which may be the result of a release, or the magnitude of the population exposed to such release or contamination, the Administrator or the State (with the concurrence of the Administrator) may request the Administrator of the Agency for Toxic Substances and Disease Registry to conduct a health assessment in connection with such facility and take other appropriate action with respect to such risks as authorized by section 9604(b) and (i) of this title. If funds are provided in connection with such request the Administrator of such Agency shall conduct such health assessment.

[...]

(e) Periodic reports. The Administrator of such Agency shall issue periodic reports which include the results of all the assessments carried out under this section. Such assessments or other activities shall be reported after appropriate peer review.

CERCLA

§9604. Response authorities.

(i) Agency for Toxic Substances and Disease Registry; establishment, functions, etc.

[...]

Any toxicological profile or revision thereof shall reflect the Administrator of ATSDR's assessment of all relevant toxicological testing which has been peer reviewed. The profiles required to be prepared under this paragraph for those hazardous substances listed under subparagraph (A) of paragraph (2) shall be completed, at a rate of no fewer than 25 per year, within 4 years after October 17, 1986. A profile required on a substance listed pursuant to subparagraph (B) of paragraph (2) shall be completed within 3 years after addition to the list. The profiles prepared under this paragraph shall be of those substances highest on the list of priorities under paragraph (2) for which profiles have not previously been prepared. Profiles required under this paragraph shall be revised and republished as necessary, but no less often than once every 3 years. Such profiles shall be provided to the States and made available to other interested parties.

[...]

(7)(A) Whenever in the judgment of the Administrator of ATSDR it is appropriate on the basis of the results of a health assessment, the Administrator of ATSDR shall conduct a pilot study of health effects for selected groups of exposed individuals in order to determine the desirability of conducting full scale epidemiological or other health studies of the entire exposed population. (B) Whenever in the judgment of the Administrator of ATSDR it is appropriate on the basis of the results of such pilot study or other study or health assessment, the Administrator of ATSDR shall conduct such full scale epidemiological or other health studies as may be necessary to determine the health effects on the population exposed to hazardous substances from a release or threatened release. If a significant excess of disease in a population is identified, the letter of transmittal of such study shall include an assessment of other risk factors, other than a release, that may, in the judgment of the peer review group, be associated with such disease, if such risk factors were not taken into account in the design or conduct of the study.

[...]

(13) All studies and results of research conducted under this subsection (other than health assessments) shall be reported or adopted only after appropriate peer review. Such peer review shall be completed, to the maximum extent practicable, within a period of 60 days. In the case of research conducted under the National Toxicology Program, such peer review may be conducted by the Board of Scientific Counselors. In the case of other research, such peer review shall be conducted by panels consisting of no less than three nor more than seven members, who shall be disinterested scientific experts selected for such purpose by the Administrator of ATSDR or the Administrator of EPA, as appropriate, on the basis of their reputation for scientific objectivity and the lack of institutional ties with any person involved in the conduct of the study or research under review. Support services for such panels shall be provided by the Agency for Toxic Substances and Disease Registry, or by the Environmental Protection Agency, as appropriate.

FIFRA

§136w. Authority of Administrator.

(e) Peer review. The Administrator shall, by written procedures, provide for peer review with respect to the design, protocols, and conduct of major scientific studies conducted under this subchapter by the Environmental Protection Agency or by any other Federal agency, any State or political subdivision thereof, or any institution or individual under grant, contract, or cooperative agreement from or with the Environmental Protection Agency. In such procedures, the Administrator shall also provide for peer review, using the advisory panel established under subsection (d) of this section or appropriate experts appointed by the Administrator from a current list of nominees maintained by such panel, with respect to the results of any such scientific studies relied upon by the Administrator with respect to actions the Administrator may take relating to the change in classification, suspension, or cancellation of a pesticide. Whenever the Administrator determines that

circumstances do not permit the peer review of the results of any such scientific study prior to the Administrator's exercising authority under section 136d(c) of this title to immediately suspend the registration of any pesticide to prevent an imminent hazard, the Administrator shall promptly thereafter provide for the conduct of peer review as provided in this sentence. The evaluations and relevant documentation constituting the peer review that relate to the proposed scientific studies and the results of the completed scientific studies shall be included in the submission for comment forwarded by the Administrator to the advisory panel as provided in subsection (d). As used in this subsection, the term "peer review" shall mean an independent evaluation by scientific experts, either within or outside the Environmental Protection Agency, in the appropriate disciplines.

§136w-8. Pesticide registration service fees.

(a) Definition of costs. In this section, the term "costs", when used with respect to review and decision-making pertaining to an application for which registration service fees are paid under this section, means-- (1) costs to the extent that--(A) officers and employees provide direct support for the review and decision-making for covered pesticide applications, associated tolerances, and corresponding risk and benefits information and analyses; (B) persons and organizations under contract with the Administrator engage in the review of the applications, and corresponding risk and benefits information and assessments; and (C) advisory committees and other accredited persons or organizations, on the request of the Administrator, engage in the peer review of risk or benefits information associated with covered pesticide applications; (2) costs of management of information, and the acquisition, maintenance, and repair of computer and telecommunication resources (including software), used to support review of pesticide applications, associated tolerances, and corresponding risk and benefits information and analyses; and (3) costs of collecting registration service fees under subsections (b) and (c) and reporting, auditing, and accounting under this section.

TSCA

§2625. Administration.

(h) Scientific standards. In carrying out sections 2603, 2604, and 2605 of this title, to the extent that the Administrator makes a decision based on science, the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science, and shall consider as applicable-- (1) the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information; (2) the extent to which the information is relevant for the Administrator's use in making a decision about a chemical substance or mixture; (3) the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented; (4) the extent to which the variability and uncertainty in the information, or in the procedures,

measures, methods, protocols, methodologies, or models, are evaluated and characterized; and (5) the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models.

§2617. Preemption.

(b) New statutes, criminal penalties, or administrative actions creating prohibitions or other restrictions. (1) In general Except as provided in subsections (c), (d), (e), (f), and (g), beginning on the date on which the Administrator defines the scope of a risk evaluation for a chemical substance under section 2605(b)(4)(D) of this title and ending on the date on which the deadline established pursuant to section 2605(b)(4)(G) of this title for completion of the risk evaluation expires, or on the date on which the Administrator publishes the risk evaluation under section 2605(b)(4)(C) of this title, whichever is earlier, no State or political subdivision of a State may establish a statute, criminal penalty, or administrative action prohibiting or otherwise restricting the manufacture, processing, distribution in commerce, or use of such chemical substance that is a high-priority substance designated under section 2605(b)(1)(B)(i) of this title.

[...]

(f) Waivers.

[...]

(2) Required exemptions. Upon application of a State or political subdivision of a State, the Administrator shall exempt from subsection (b) a statute or administrative action of a State or political subdivision of a State that relates to the effects of exposure to a chemical substance under the conditions of use if the Administrator determines that-- (A)(i) compliance with the proposed requirement of the State or political subdivision of the State would not unduly burden interstate commerce in the manufacture, processing, distribution in commerce, or use of a chemical substance; (ii) compliance with the proposed requirement of the State or political subdivision of the State would not cause a violation of any applicable Federal law, rule, or order; and (iii) the State or political subdivision of the State has a concern about the chemical substance or use of the chemical substance based in peer-reviewed science; or (B) no later than the date that is 18 months after the date on which the Administrator has initiated the prioritization process for a chemical substance under the rule promulgated pursuant to section 2605(b)(1)(A) of this title, or the date on which the Administrator publishes the scope of the risk evaluation for a chemical substance under section 2605(b)(4)(D) of this title, whichever is sooner, the State or political subdivision of the State has enacted a statute or proposed or finalized an administrative action intended to prohibit or otherwise restrict the manufacture, processing, distribution in commerce, or use of the chemical substance.

§2605. Prioritization, risk evaluation, and regulation of chemical substances and mixtures.

(b) Risk evaluations.

[...]

(E) Metals and metal compounds. In identifying priorities for risk evaluation and conducting risk evaluations of metals and metal compounds, the Administrator shall use the Framework for Metals Risk Assessment of the Office of the Science Advisor, Risk Assessment Forum, and dated March 2007, or a successor document that addresses metals risk assessment and is peer reviewed by the Science Advisory Board.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. Because this is purely a procedural rule, the EPA is not relying on any substantive environmental statutes as authority. If implementing this procedural rule would result in conflicts with existing environmental statutes and their implementing regulations, the procedural rule will yield to the existing statutes and regulations. This rulemaking is not intended to modify the Agency's interpretations of "best available science." The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. Further, the EPA plans to promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

To address the public comment regarding "added value and minimize cost", the preamble of the final rule specifies, "given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small relative to current administrative costs for developing significant regulatory actions or influential scientific information."

Unlawfully Vague

Comment: Commenters (4838, 6133) suggest that the Proposed §30.7 language is unlawfully vague. The commenters assert that EPA did not provide an explanation or accompanying regulatory text about what §30.7 means. Commenter (4838) states that, for example, it is unclear whether 40 CFR 30.7 requires EPA to conduct its own peer review of all pivotal regulatory science and, if so, whether EPA has the capacity or capability to perform those reviews. Commenter (6133) expresses concern that the Proposal provides no answers to the following questions:

- How will that peer review be conducted?
- By whom?
- Who will select the peer reviewers?

- How many will there be?
- Who will assure their independence and expertise?
- Will peer reviewers be subject to federal conflict of interest rules and policies?
- Will peer reviewers be anonymous?
- Where will the funds come from to conduct EPA peer reviews for “all pivotal regulatory science”?
- Has EPA estimated how many instances of “pivotal regulatory science” it anticipates conducting peer review for in one year? In prior years?
- Will the peer review be conducted openly and publicly?
- Will it be conducted in accordance with the Federal Advisory Committee Act?
- What will the duration of any peer review be?
- What purpose will that peer review serve?
- How will it affect future regulatory decisions? Or will it?
- Will there be an administrative docket?
- Will any product of the peer review be included in the administrative dockets for rulemaking?
- Will peer reviewer comments be part of the certified record for judicial review?
- Will the agency seek deference from future reviewing courts for the views expressed by peer reviewers?
- Does EPA not believe that peer review conducted by professional journals and societies is valid? Or sufficient?
- On what basis does EPA think professional peer review is invalid or insufficient, considering there is not one iota of evidence or support for that belief in the Proposal or the accompanying docket?
- What is the basic justification for proposed § 30.7?

Response: The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA’s Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review.

The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. Adequate peer review is peer review that is consistent with the requirements of the OMB Peer Review Bulletin and EPA’s Peer Review Handbook. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. The EPA Peer Review Handbook, 4th Edition, describes how peer reviewers are selected by the Agency. As discussed in the final rule preamble, the EPA is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” If implementing this procedural rule would result in conflicts with the guidance found in the Agency’s existing Peer Review Handbook, the conflicting requirements found in the Handbook will yield to this final rule.

Censoring of Peer Review Studies/Research and Data

Comment: Commenter (2169) states that the pragmatic impact of rule §30.7 is straight forward: According to the commenter, the EPA proposes to set itself up as the ultimate arbiter of science and, effectively, censor all future peer review studies conducted by the specialists in a given area. The commenter asserts that the reality is that science, not subject to the suffocating and chilling overhang of governmental censorship, is far more likely to develop a robust protocol for enhancing and assessing reproducibility than is a government agency subject to the fickle influence of private industry and its paid representatives who are in the business of producing doubt with respect to any proposal that implies increased cost to, or potentially diminished market share for, the industry affected by a particular EPA proposal.

Commenter (6111) states that it is contrary to good scientific study and practice and the advancement of knowledge for EPA to arrogate to itself the determination of what constitutes useable research and data, and to grant sweeping discretion to the Administrator—who may not even be a scientist—to make those determinations. Commenter states that the proposed rule was announced by EPA without any meaningful consultation with the broad research community despite the fact that it addresses a complex and contentious issue that is not yet ripe for regulatory action.

Response: The EPA is committed to its mission of protecting human health and the environment through sound policy decisions that are informed by robust scientific and technical research. Because of the potential impact of the EPA's significant regulatory actions and influential scientific information on American lives and livelihoods, the American people deserve environmental decisions and policies that are based on the best scientific information. Only through continuous improvement to its procedures, especially those focused on transparency, can the EPA fully demonstrate that commitment.

The final rule does not categorically exclude studies based on the availability of the underlying dose-response data. The EPA would also like to clarify that the final rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science. The EPA would also like to clarify that the Agency is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule.

The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA's Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. The EPA Peer Review Handbook, 4th Edition, describes the process for peer reviews conducted by a Federal Advisory Committee and the National Academy

of Sciences. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

Comment: Commenter (2475) expresses concern that the Administrator could claim there is no budget to support independent peer review, making it infeasible, and justify an exemption.

Response: The EPA is not finalizing the criterion for an Administrator's exemption related to the infeasibility of conducting independent peer review on all pivotal regulatory science used to justify regulatory decisions for reasons outlined in OMB Final Information Quality Bulletin for Peer Review. The EPA is also clarifying that the Agency is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that "the intensity of peer review is highly variable across journals" and "prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary." Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule.

The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA's Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. The EPA Peer Review Handbook, 4th Edition, describes the process for peer reviews conducted by a Federal Advisory Committee and the National Academy of Sciences. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results. The considerations in 40 CFR 30.5, the Administrator's exemption in 40 CFR 30.7, and the EPA's incremental approach to maximizing transparency by first focusing on dose-response data are intended to minimize potential unintended consequences, such as the potential skew toward newer, domestic, and/or industry-funded studies suggested by the commenters. In addition, the EPA is maintaining language from the 2020 SNPRM in 40 CFR 30.3 stating that statutory requirements and corresponding implementing regulations will control in the event of any conflict, and clarifying in this preamble that the requirements in this final rule set the overarching structure and principles for transparency in significant regulatory actions and influential scientific information. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA believes the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

13.1.2.1.3 Process of Independent Peer Review

Recommendations for a Process to Conduct Independent Peer Review

Comment: Commenter (4420) provides the following detailed recommendations and rationale for a process to conduct the independent peer review.

A Call for the Standardization of the Review of an Epidemiology Studies – Establishment of an Agency wide Epidemiology Study Peer Review Council and their product Record of Epidemiological Study Review (ROESR).

Each epidemiology study occurring in the open literature or otherwise needs to have a supporting formal Record of Epidemiological Study Review (ROESR) that clearly delineates the justification for a decision to include or not include the study in the regulatory decisions for the chemical or environmental situation. The production of the ROESR will consist of the separate and independent reports of several Sub-Committees that will be integrated by the Epidemiological Study Peer Review Council and signed by the Council Chairperson and each member of the Council. It is important to have *independent* sub-discipline committees review the study so that the biases of other sub-disciplines are minimized. The committee members should be drawn from the relevant staff throughout the Agency as well as other government agencies as needed.

The roles of the five suggested Sub-Committees are as follows:

Endpoint Evaluation Sub-Committee: Depending upon the lesion/ environmental condition claimed by the epidemiological study, the endpoint evaluation committee would be experts in cancer, behavioral response, or other appropriate discipline for interpretation of the significance of the lesion. This committee need not actually see the supporting data since they will be judging the endpoint itself relative to the plausibility that the lesion is actually in excess of the norms and that all confounds are addressed as well as consistency reported for the subjects in the cohort. Commentary on any known chemicals or environmental factors that also promote the occurrence of the lesion/condition will also be provided. This evaluation would limit its conclusions with regard to how well the character of the endpoint was assessed for and whether or not the increase in the lesion reported is plausibly related to treatment or within normal variation. This Sub-Committee may require additional input from the study authors regarding how the endpoint was characterized in all subjects.

Statistical Evaluation Sub-Committee: The sole role of the statistical evaluation sub-committee is limited to determining if the statistical methods were/were not appropriate and adequately conducted to support the conclusion of the report. A committee of statisticians with expertise in epidemiological studies would need to be established for this evaluation. *This Sub-Committee would be very critical in determining if the original data are needed to do an independent analysis.*

Exposure Assessment Sub-Committee: The role of the exposure assessment committee is limited to determining that the methodology and reliability used to determine the exposure of the cohort is adequate and appropriate. The committee would provide

commentary on whether or not exposure was supported by analytical chemical data or by oral history. Also, if actual persons exposed provided the oral history by direct conversation, survey or by telephone. The committee will determine if second-hand exposure information by a relative (or friend or coworker) provided the exposure information is reliable. *The exposure assessment is always a problematic area and may also be critical in a decision to provide supporting data.*

Analytical Chemistry Assessment Sub-Committee: The role of the analytical chemistry committee is limited to determining if the analytical techniques/ methodology were appropriate and adequate for the study. In some cases where no analytical chemistry data were generated, the committee will comment on the need to have included such data and/or if quantitative analysis of exposure data was even possible. Since the analytical chemistry data such as sample preparation, method of detection, and lower limit of detection are generic, there should be no issue for the study authors to provide this information. *However, this Sub-Committee may still determine that analytical data from the subjects in the cohort be provided.*

Animal Toxicity Assessor or Sub-Committee: An actual Sub-Committee may not be necessary for this evaluation since other committees should already have characterized the toxicity profile based on animal studies. For example, for a pesticide, this assessor would normally be the person most responsible for reviewing the guideline studies or other required studies. If not then a committee that reviews the animal study data may need to be convened. This assessment will also include in addition to the standard set of required studies, reports from the open literature suggesting the association of the lesion with the chemical in animals as well as structure activity relationships (SAR). *However, any publication supporting the association or mechanism of action will need its own Record of Review (ROR) signed by two qualified toxicologists.* If the lesion occurs in animals or has SAR correlates, such information can support the epidemiological findings. If not, it does not automatically dismiss the epidemiological findings since the induction of the lesion may be unique to humans. *There should be no need for this Sub-Committee to require additional data from the epidemiological report.*

Council Chairperson and resulting product: ROESR: Once the five Sub-Committees finish their respective reports, they meet together with the Council members to discuss their findings and conclusions. Each Sub-Committee will assert if additional or original data supporting the study are required or not. The Council Chairperson, with the approval of the Council, makes the final determination in deciding if the epidemiological study provides quality data that can or should not be incorporated into the regulatory decisions. The Council Chairperson with the Council's approval can overrule a request for additional data made by any of the Sub-Committees. However, clear justification for overruling a Sub-Committee's decisions must be provided. For example, the Council may determine that the association between the chemical or environmental condition is otherwise strong enough to support regulatory action to protect the public health. The Council Chairperson (or secretary of the Council) will prepare the ROESR product that contains the decision with supporting justification. The ROESR product would include the report of the Council with the Chairperson and Council members signatures. Separate

attachments for the *signed* Sub-Committee reports and the original epidemiological report (i.e. a publication) will also be attached. The Council Chairperson should not be in the same program that has responsibility for regulating the chemical or environmental condition. That is, if the chemical is a pesticide, the Chairperson cannot be from the Office of Pesticide Programs (OPP). Representatives of OPP may still be on the Council if an epidemiological study with a pesticide is being reviewed.

The purpose of this procedure is to assure that responsible persons for each of the critical sub-disciplines *independently* reviewed the study in terms of their expertise. The resulting ROESR that either determines that the study can be used in the absence of additional original data or the need for critical additional data is determined will be clearly indicated. The Council Chairperson and Council and the sub-discipline committees own their decisions and are responsible for defending them. If industry or any concerned public interest groups object to the conclusions, they can address the conclusions presented in the ROESR and/or the sub-disciplines. Therefore, the decisions in the resulting ROESR should be transparent. The current system renders too much power to individuals that are sometimes not clearly identified who can profit by making career projects for themselves based on the face value of the publication.

Preparing a ROESR for such studies with the several sub-disciplines all independently contributing to the Agency's determination of the conclusions in the report should greatly help to minimize controversies. The ROESR is not a final conclusion (no documents in EPA should be considered final). It is very likely that a Science Advisory Panel will ultimately review the ROESR. Also, as new information is generated, the ROESR can be updated and the recommendations for use (or otherwise) can be adjusted as appropriate.

Response: EPA appreciates this recommendation. However, EPA does not agree that it needs to establish this type of process. The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. All Agency peer review follows the recommended procedures and approaches consistent with the requirements of the OMB Peer Review Bulletin and EPA's Peer Review Handbook, 4th Edition. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect.

Comment: Commenter (4594) recommends that EPA partner with scientific organizations and professional communities to administer and manage these reviews. The commenter states that such outsourcing and partnerships will help to ensure that EPA gains access to independent and highly qualified experts; and will promote greater public confidence in the independence of these peer-reviews. The commenter notes that this kind of process for managing peer-review will also allow EPA to more cost-effectively, nimbly, and rapidly conduct reviews as it will not require EPA to substantially increase staffing for convening reviews. According to the commenter, such a process will also provide EPA with greater capacity to conduct reviews on timescales that do not needlessly delay regulatory and rulemaking schedules.

Response: Thank you for the recommendation. However, EPA does not agree that it should partner with scientific organizations and professional communities to administer and manage the

reviews under this rule. The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. This rulemaking is not intended to modify the Agency's interpretations of "best available science." The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. All Agency peer review follows the recommended procedures and approaches consistent with the requirements of the OMB Peer Review Bulletin and EPA's Peer Review Handbook, 4th Edition. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. Further, the EPA plans to promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Comment: Commenter (6180) supports formal peer reviews, but also alternatively supports rigorous, detailed, and transparent development of pivotal regulatory science which takes into account public comments and input from a wide range of experts and stakeholders. As an example, the commenter refers to EPA's 1991 publication of the Technical Support Document (TSD) for Water Quality-based Toxics Control. The commenter provides that, while no formal peer review took place, the TSD underwent a rigorous and detailed multi-year review by "a diverse group of people from EPA Regions, states, environmental groups, trade associations, academia, private industry, and municipalities."

Response: Thank you for the recommendation. All Agency technical work products go through rigorous internal review and, when appropriate, peer review. The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. In the final rule, the EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. All Agency peer review follows the recommended procedures and approaches found in the EPA's Peer Review Handbook [4th Edition]." The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. Further, the EPA plans to promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Comment: Commenters (6376, 6891) suggest that there should and can be a balance between transparency and the ability to draw from peer-reviewed scientific studies from outside sources.

Commenter (6891) advises EPA to recognize, as it has in the past, that a variety of quality assurance and quality control measures can result in properly validated data that is appropriate for use in justifying regulatory decisions, not just that which has been independently peer reviewed.³²⁰³ The commenter recommends that EPA adopt a broader view of what is necessary

³²⁰³ See, e.g., US EPA, Guidance on Environmental Data Verification and Data Validation (QA/G-8), EPA/240/R-02/004, November 2002, <http://www.epa.gov/quality/qs-docs/g8-final.pdf>.

to ensure validity, rather than require independent peer review in all instances.

Commenter (6376) states that, while EPA needs to evaluate and judge the merits of different data sets, it is impractical to expect the Agency to supplant the role of peer-review. The commenter notes that the Agency is explicit in their intention to rely on internal review of the scientific studies used to make substantial regulatory decisions. The commenter expresses that, theoretically, this practice makes sense for the EPA, but it could be problematic in application. The commenter provides that there is an ongoing downsizing process across the federal government and the EPA, in particular, is currently executing its mission with fewer staff members and is planning on decreasing those numbers even more in the coming years. According to the commenter, practically speaking, this means substantive internal review of the scientific studies used to inform “significant regulatory decisions” could be unrealistic based on the Agency’s workforce. The commenter asserts that the ability to utilize peer-reviewed studies needs to be maintained as EPA moves towards creating more transparency.

Response: All Agency technical work products go through rigorous internal review and, when appropriate, peer review. The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. In the final rule, the EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. All Agency peer review follows the recommended procedures and approaches found in the EPA’s Peer Review Handbook [4th Edition].” The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. Further, the EPA plans to promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA’s Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. Although not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

- (1) the quality of the study relative to other studies for which the dose-response data are available;
- (2) the extent to which there are other studies for which the dose-response data are available;
- (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- (4) the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;

- (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- (6) the extent to which the study is supported by other scientific evidence;
- (7) the extent to which the study accounts for unique scientific considerations;
- (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- (9) the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

Clarification of the Independent Peer Review Process is Needed

Comment: Commenters (4594, 5165, 5419, 6125, 6142, 6185, 6376, 6868, 6915, 6935) express concern that the proposed language of §30.7 is accompanied by inadequate explanation, leaving commenters to speculate about how it would apply, or what problems its implementation might present. Commenter (6142) states that there is no value in this second peer review without guidelines ensuring the review is rigorous and unbiased in nature and conducted by subject matter experts. Commenter (6935) suggests that the regulatory language in the proposed language of §30.7 should be expanded to address these issues. Commenter (6376) believes the proposal would benefit from a clearly outlined process for utilizing peer-reviewed science to ensure regulatory decisions can be based on the best available science. The commenters request clarification and additional detail related to the following questions:

- Who will conduct and manage the peer-review process? (4594, 6142)
- Will these reviews be managed by the Office of Research and Development or by the various regulatory offices within EPA? (4594)
- Does EPA have appropriate staffing, expertise, and resources to manage these peer-reviews? (4594)
- Would EPA need to hire new experts, how many, in what fields and how much would this cost? (5165)
- What are the selection criteria for peer reviewers? (5419)
- What are the decision criteria? (5419)
- How the proposed rule compares to existing processes through the SAB and third-party contractor-managed peer reviews? (5419)
- What scientific standards will be applied? (6142)
- How transparent will the evaluation will be to the study's authors, the scientific community, and the public? (6142)
- Would EPA's staff scientists conduct these validations and reviews, or would EPA contract this out to third parties? (6185)
- How would EPA determine that third parties have the necessary qualifications and resources to perform these validations and reviews? (6185)
- Would peer reviewers be anonymous, or will their names and reviews be made public? (6185)

- How will an EPA agency “independent peer review” process be funded? (6868)
- How will EPA vet reviewers to identify persons who are purportedly more competent than those already used in past or current peer review processes? (6915)
- What is the relationship between EPA’s existing science advisors and the new requirement for independent peer review? (6935)
- If the new independent peer review process will be supported by new external advisors, how will such advisors be identified and selected, and will such a process will be used for each regulatory action on an ad hoc basis? (6935)

Commenter (6915) notes that despite the existing peer review process, EPA apparently proposes to require that EPA itself conduct an additional “independent” review. See 83 Fed. Reg. at 18,774. Yet the commenter states that the proposal nowhere discusses how EPA would vet reviewers to identify persons who are purportedly more competent than those already used in past or current peer review processes, or the level of EPA staffing and associated costs that would be needed for additional review—only stating that EPA will implement the proposed rule in a manner “that minimizes costs.” Id. at 18,774.

Commenter (6185) suggests that EPA needs to describe how the proposed text in §30.7 would affect current practice. The commenter asserts that, without this information, commenters are left to guess at the scope and potential impact of EPA’s proposal as it applies to “independent review.”

Response: In this rule, the EPA is not changing the pre-existing requirements of the OMB’s Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule.

The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA’s Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. The EPA Peer Review Handbook, 4th Edition, describes the process for peer reviews conducted by a Federal Advisory Committee and the National Academy of Sciences. All Agency peer review follows the recommended procedures and approaches found in the EPA’s Peer Review Handbook. This Peer Review Handbook is used as guidance by EPA staff and managers to ensure that the Agency’s Peer Review Policy is implemented objectively and that the integrity of our peer review activities can be demonstrated transparently to the American public. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

It should also be noted that in this final rule, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as “pivotal science,” the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, “pivotal science” includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.

13.1.2.1.4 Other Comments

Comment: Commenter (0045) recommends that deliberations of the EPA include enough time for peer review of all sources to proceed before consideration and action. The commenter states that the ability of all constituents to participate in EPA activity comes with a commitment for an open and respectful process which will maintain the quality of all information used to make decisions at the EPA.

Response: This rulemaking is not intended to modify the Agency’s interpretations of “best available science.” The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. All Agency peer review follows the recommended procedures and approaches consistent with the requirements of the OMB Peer Review Bulletin and EPA’s Peer Review Handbook, 4th Edition. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA’s Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. Further, the EPA plans to promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Comment: Commenter (6143) suggests that EPA replace the proposed text: “EPA shall conduct independent peer review . . .” with: “EPA shall conduct and thoroughly document independent peer review . . .”

Response: EPA appreciates this recommendation. The EPA maintains that all Agency peer review follows the recommended procedures and approaches consistent with the requirements of the OMB Peer Review Bulletin and EPA’s Peer Review Handbook, 4th Edition. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect.

Comment: Commenter (6362) states that the language of 40 CFR 30.7 appears to be missing one or more words in the header to the section: “What role does independent peer review in this

section?” The commenter expresses that they believe the missing word is likely “have,” but suggests EPA should clarify and correct this section in the final rule.

Response: There was a typographical error in the header of Part 30.7 in the April 2018 notice of proposed rulemaking. The mistake was corrected in the supplemental notice of proposed rulemaking and in the final rule to read, “§30.6 What role does independent peer review have in this part?”

Comment: Commenter (6376) states that the ability to utilize peer-reviewed studies needs to be maintained as EPA moves towards creating more transparency. While EPA needs to evaluate and judge the merits of different data sets, the commenter suggests that it is impractical to expect the Agency to supplant the role of peer-review. The commenter adds that there should and can be a balance between transparency and the ability to draw from peer-reviewed scientific studies from outside sources.

Response: The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA’s Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. All Agency peer review follows the recommended procedures and approaches found in the EPA’s Peer Review Handbook.

Comment: Commenter (6362) notes that EPA uses the word “justify” frequently throughout the various sections of proposed regulatory text when referencing the use of regulatory science to make its decisions. The commenter provides, for example, §30.7 states: “EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions.” The commenter suggests that there are more precise words that EPA should use to link “pivotal regulatory science” with “regulatory decisions,” such as “underpin” or constitute the “foundation” of the “scientific basis” of its regulatory decisions.

Response: Part 30.6 in the final rule states, “EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review.” The word “justify” is not used in this provision.

13.1.2.2 EPA’s Review Shall Be Consistent with the Requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the Exemptions Described Therein.

13.1.2.2.1 Time-Sensitive

Comment: Commenter (6137) suggests that, to be consistent with the OMB Bulletin, the independent peer review guidelines “do[] not cover time-sensitive health and safety disseminations, for example, a dissemination based primarily on data from a recent clinical trial that was adequately peer reviewed before the trial began. For this purpose, ‘health’ includes

public health, or plant or animal infectious diseases”.³²⁰⁴ The commenter provides that this encompasses most of the studies that EPA intends to review, including but not limited to, the Integrated Risk Information System (IRIS) assessments, TSCA risk evaluations, and National Emissions Standards for Hazardous Air Pollutants risk assessments.³²⁰⁵ According to the commenter, in each case, EPA utilizes scientific data to make safety determinations for chemical pollutants and impacts on human health and the environment, and thus, timely review is tantamount to protecting public health. The commenter contends that the proposal to add another layer of review is antithetical to the time sensitive nature of these reviews.

Commenter (6137) states that the Bulletin makes clear that agencies should “ensure peer review does not unduly delay the release of urgent findings.”³²⁰⁶ The commenter asserts that, if EPA wants to independently peer review all pivotal science, then it must clearly outline how it will ensure the process will not lead to undue delay. The commenter notes that the Agency has failed to do so. The commenter provides, for example, there is nothing in the Proposed Rule outlining how EPA will conduct an independent review of the studies underlying the NAAQS standard, which will require review of hundreds if not thousands of science documents, within the NAAQS review cycle. The commenter adds that the standard review period in the independent peer review process (i.e., from submission of a manuscript to final review) is time intensive. The commenter states that, if it can take months to review one manuscript,³²⁰⁷ and that it is difficult to envisage how EPA could subject every piece of pivotal regulatory science to the same standard of review and still complete scientific assessments in a timely manner.

Response: The EPA finds that comments received from the 2018 proposed rule and the 2020 SNPRM have merit, in part. However, in this rule, the EPA is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule.

Part 30.6 in the final rule states, “the EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review.” The Agency will follow the requirements by the OMB Final Information Quality

Bulletin for Peer Review ensuring that peer reviews do not unduly delay the release of urgent findings.

13.1.2.2.2 Studies that have Already Been Peer Reviewed

Comment: Commenter (2337) expresses concern regarding the Proposed Rule’s requirement that EPA conduct independent peer review of scientific evidence on which it relies. The commenter states that the Proposed Rule applies this peer review requirement uniformly and does not exempt studies that have already been independently peer reviewed, as many health and scientific studies are. The commenter notes that EPA has not explained why EPA must conduct additional peer review of data that has already been reviewed. The commenter adds that this is of particular concern as many environmental statutes require EPA to periodically review, and where appropriate revise, regulatory standards. The commenter notes that, if EPA were now to add independent peer review to its periodic review of standards, it would be even less able to meet this mandated timeframe.

Comment: Commenter (5165) asks why should scientific literature that has already undergone peer review and been vetted by EPA’s science advisory panels be subjected to an additional layer of government peer review? Commenter states that these key questions should have been considered, and the answers made public, prior to the rule’s proposal.

Comment: Commenter (9227) asserts that EPA must clarify that studies that have already been adequately peer reviewed by third parties need not be re-reviewed by EPA. The commenter notes that, because the proposed language of §30.7 expressly incorporates the OMB Peer Review Bulletin “and the exemptions described therein,” it appears that EPA intends to incorporate the OMB Peer Review Bulletin provision providing that “agencies need not have further peer review conducted on information that has already been subjected to adequate peer review.”³²⁰⁸ According to the commenter, however, there is some ambiguity due to the proposed language in §30.7 instructing that EPA must “ask peer reviewers to articulate the strengths and weaknesses of EPA’s justifications for the assumptions applied and the implications of those assumption for the results.” The commenter provides that peer review conducted prior to EPA’s reliance on a study would not have involved review of the strengths and weaknesses of EPA’s justifications. According to the commenter, if EPA were required to re-peer review all influential scientific information, this rulemaking would burden EPA with needless and significant costs that likely would bring many EPA rulemakings to a standstill, preventing EPA from fulfilling its statutory mission of protecting public health and the environment. The commenter asserts that, to prevent this from happening, EPA must clarify that the proposed rule will not supplant EPA’s existing authority under the OMB Peer Review Bulletin not to conduct further peer review where information has already been subject to adequate peer review—and that such prior peer review is not subject to the requirement in proposed §30.7 that reviewers consider the strengths and weaknesses of EPA’s justifications.

Response: This rulemaking is not intended to modify the Agency’s interpretations of “best available science.” The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. All Agency peer

³²⁰⁸ OMB Peer Review Bulletin 70 Fed. Reg. at 2675.

review follows the recommended procedures and approaches consistent with the requirements of the OMB Peer Review Bulletin and EPA's Peer Review Handbook, 4th Edition. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect.

The EPA finds that comments received from the 2018 proposed rule and the 2020 SNPRM have merit, in part. However, in this rule, the EPA is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that "the intensity of peer review is highly variable across journals" and "prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary." Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule.

The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the EPA's Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. Implementation of this rule may increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

13.1.2.2.3 Prevention of Conflict of Interest in Peer Reviewers

Comment: Commenters (0044, 0844, 2241, 4541, 6180, 6877, 6891, 6927) express concern about how to prevent conflicts of interest in peer reviewers from impacting decision-making.

Commenter (6891) supports EPA's recent policy decision to have external scientific advisory boards be represented by a diverse group of stakeholders, including those representatives from regulated industry.

Commenter (6927) recommends EPA ensure any third-party peer reviewers are truly independent and external from the agency staff, former staff or organizations that receiving EPA funding.

Commenter (6877) states that the proposed rule's statement, "EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions," risks the introduction of potential bias through the selection of the peer reviewers. The commenter notes that the reviewers should be individuals who have the relevant expertise and are impartial with full disclosure of any conflicts of interest. The commenter asserts that, having had industry, government, or other funding for work on the topic at hand should not by itself be disqualifying to serving in peer review of scientific research.

Commenter (0044) asserts that scientists from industries directly impacted by rulemaking on

chemicals must not be involved in the peer review; they could serve as non-voting advisors to a review panel; they have an opportunity to submit their opinions under FIFRA applications. The commenter notes that, otherwise, the potential for conflict of interest is significant. The commenter states that the goal of rulemaking for chemical exposures is to protect the public health; it is not for putting industry concerns first.

Commenters (0844) states that when scientists who receive EPA grants also serve on one of the agency's advisory boards, a conflict is created. According to the commenter, these conflicts were eliminated when Administrator Pruitt issued a new directive in October 2017, that scientists who receive an EPA grant, or reap a substantial benefit from a grant, could not also serve on an advisory committee. The commenter notes that the scientists would be given the option of either ending their grants or to continue to advise EPA, but not both.

Commenter (4541) asserts that EPA needs to conduct its own peer review and remove from its advisory committees and peer review process individuals with conflicts of interest. The commenter states that it is always a concern when reviewers and their institutions are conflicted by their dependence on agency/government funding and yet expected to provide impartial, objective reviews for science that is funded by that same agency/government.

Commenter (6180) states that the proposed rule must require and ensure that peer reviews be comprised of independent experts and not only EPA staff or otherwise biased individuals. The commenter supports the OMB Final Bulletin which notes the importance of the independent nature of peer reviewers and that government employees are subject to federal ethics requirements (70 FR 2664).

Response: EPA is subject to the OMB Bulletin and its provisions have been incorporated into the Agency's peer review handbook (Ref. 44). EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will lead to consistent implementation of those procedures across the Agency. In the final rule, the EPA "shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein." All Agency peer review follows the recommended procedures and approaches found in the EPA's Peer Review Handbook. This Peer Review Handbook is used as guidance by EPA staff and managers to ensure that the Agency's Peer Review Policy is implemented objectively and that the integrity of our peer review activities can be demonstrated transparently to the American public.

Comment: Commenter (1972) requests that EPA clarify the use of peer review in proposed 40 CFR 30.7. The commenter provides that the OMB Bulletin states that, for more important work, "independent" peer review should involve "[r]eviewers" that "are generally not employed by the agency or office producing the document. As NAS has stated, 'external experts often can be more open, frank, and challenging to the status quo than internal reviewers, who may feel constrained by organizational concerns.'"³²⁰⁹ The commenter adds that EPA's own guidelines similarly note that "[f]or those work products that are intended to support the most important

³²⁰⁹ NRC, Peer Review in Environmental Technology Development Programs: The Department of Energy's Office of Science and Technology, Nat'l Academy Press (1998) at 3.

decisions or that have special importance in their own right, external peer review is the procedure of choice.”³²¹⁰ The commenter expresses that, given the credibility bestowed by both the courts and the public upon the studies that are “peer reviewed,” EPA should clarify the conditions under which it will use truly independent external peer reviewers. The commenter recommends that this include some parameters on how external peer reviewers are selected, such as taking care to ensure that reviewers are not those working under, or applying for, EPA grants or otherwise have long-standing relationships with EPA, such as former EPA officials now serving in academia. The commenter suggests that independent external peer review be used for all “significant regulatory actions” as that term is defined under Executive Order 2866. The commenter contends that avoiding internal reviews by other EPA officials for significant regulatory actions will help restore public trust in the quality of information relied upon by EPA.

Response: This rulemaking is not intended to modify the Agency’s interpretations of “best available science.” The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. All Agency peer review follows the recommended procedures and approaches consistent with the requirements of the OMB Peer Review Bulletin and EPA’s Peer Review Handbook, 4th Edition. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect.

The EPA finds that comments received from the 2018 proposed rule and the 2020 SNPRM have merit, in part. However, in this rule, the EPA is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule.

Comment: Commenter (0555) states that, when engaging experts in peer review, EPA should consider the recommendations of recent interdisciplinary efforts regarding scientific advisory panels. The commenter adds that such advisors can provide a necessary and valuable source of information and peer review for agency science, but care should be taken in both the composition of the panels and the charges they are given. According to the commenter, an important 2012 Keystone Center report offers a series of recommendations on “the composition of committees that are empaneled to review the science behind a regulatory decision.”³²¹¹ The commenter notes that the report acknowledges the importance of choosing panelists that “have the knowledge, training, and experience needed to address the charge to the panel,”³²¹² and it encourages agencies “to recognize that all potential panelists will have conscious and unconscious biases.”

³²¹⁰ EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency (Oct. 2002) at § 4.2.

³²¹¹ The Keystone Center. Research Integrity Roundtable. Improving the Use of Science in Regulatory Decision Making: Dealing with Conflict of Interest and Bias in Scientific Advisory Panels, and Improving Systematic Scientific Reviews. Washington (DC): The Keystone Center; 2012: p. 4. <https://www.keystone.org/wp-content/uploads/2015/08/ResearchIntegrityRoundtableReport.pdf>

³²¹² Keystone, 2012. p. 14

The commenter adds that it recommended, “because biases exist, an agency should strive to engage a wide range of perspectives of qualified scientific experts.”³²¹³ The commenter notes that both the Keystone group and a group convened by the Bipartisan Policy Center (BPC) in 2009 recommend that scientific peer reviewers restrict their advice to matters of science, and not be asked to recommend regulatory policies. The commenter states that EPA’s Clean Air Scientific Advisory Committee (CASAC), for example, is tasked with advising on policy choices, which creates incentives to present policy views as scientific recommendations.^{3214, 3215} The commenter recommends, when drafting charge questions for individual peer reviewers and scientific advisory committees, EPA be careful to solicit their scientific expertise without encouraging them to blur the lines between scientific expertise and policy judgment.³²¹⁶ According to the commenter, as both the BPC and Keystone reports emphasized, the questions posed to experts “should be clearly articulated, and ‘explicitly differentiate, to the extent possible, between questions that involve scientific judgments and questions that involve judgments about economics, ethics, and other matters of policy.’”³²¹⁷

Response: This rulemaking is not intended to modify the Agency’s interpretations of “best available science.” The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. All Agency peer review follows the recommended procedures and approaches consistent with the requirements of the OMB Peer Review Bulletin and EPA’s Peer Review Handbook, 4th Edition. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. However, as detailed in OMB’s Final Information Quality Bulletin for Peer Review, “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary”. Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule.

In the final rule, the EPA “shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein.” All Agency peer review follows the recommended procedures and approaches found in the EPA’s Peer Review Handbook. This Peer Review Handbook is used as guidance by EPA staff and managers to ensure that the Agency’s Peer Review Policy is implemented objectively and that the integrity of our peer review activities can be demonstrated

³²¹⁷ The Keystone Center, 2012: 8. (Internal citation to BPC at 5.)

transparently to the American public.

Comment: Commenter (1390) asserts that scientists within government agencies and outside of government agencies should be involved in reviewing scientific information. The commenter states that they should be in continual dialogue about strengths and limitations of available scientific research. According to the commenter, government agencies should not be permitted to submit, approve, or implement policies until it is clear that agencies have exhausted all possible methods to review and dialogue about all scientific information relevant to a policy. The commenter adds that it will be impossible for all public policies to be completely aligned with all relevant scientific information, however, government agencies should not be permitted to submit, approve, or implement policies that are incongruent with relevant scientific information until they have transparently acknowledged the scientific information that pertains to the policy and transparently justified the reasons for which a policy is incongruent with specific scientific information.

Response: All Agency technical work products go through rigorous internal review and, when appropriate, peer review. The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. In the final rule, the EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. All Agency peer review follows the recommended procedures and approaches found in the EPA's Peer Review Handbook [4th Edition]." The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. Further, the EPA plans to promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

Comment: Commenter (2241) recommends that the rule indicate how transparency will be used in the appointment of peer reviewers. The commenter expresses concern that the rule does not describe how this will be implemented. The commenter adds that, in particular, 70 FR 2664 clearly states that reviewers shall be selected for expertise, balancing of perspectives, independence, and freedom from conflicts of interest (which are to be disclosed).

Response: This rulemaking is not intended to modify the Agency's interpretations of "best available science." The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. In the final rule, the EPA "shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein." All Agency peer review follows the recommended procedures and approaches found in the EPA's Peer Review Handbook. All Agency peer review follows the recommended procedures and approaches consistent with the requirements of the OMB Peer Review Bulletin and EPA's Peer Review Handbook, 4th Edition. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect.

The EPA finds that comments received from the 2018 proposed rule and the 2020 SNPRM have

merit, in part. However, in this rule, the EPA is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.”

Comment: Commenter (4595) expresses concern that the proposal does not articulate whether the "peer reviewers" would be the same peer reviewers or scientific advisory committee that conducted the original scientific assessment. The commenter states that this introduces an unnecessary phase of peer review that risks introducing regulatory inertia and the ability of the agency to utilize the best available science in its decision making.

Response: The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. In the final rule, the EPA “shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein.” All Agency peer review follows the recommended procedures and approaches found in the EPA’s Peer Review Handbook. All Agency peer review follows the recommended procedures and approaches consistent with the requirements of the OMB Peer Review Bulletin and EPA’s Peer Review Handbook, 4th Edition.

The EPA finds that comments received from the 2018 proposed rule and the 2020 SNPRM have merit, in part. However, in this rule, the EPA is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” The EPA maintains that all Agency peer review follows the recommended procedures and approaches consistent with the requirements of the OMB Peer Review Bulletin and EPA’s Peer Review Handbook, 4th Edition. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect.

13.1.2.2.4 Other Comments

Comment: Commenter (6375) states that the exemptions described under OMB’s Information Quality Bulletin for Peer Review to ensure compliance with privacy and national security laws and regulations are appropriate. The commenter recommends that EPA handle these exemptions in a similar manner to the case-by-case exceptions for studies: The commenter further recommends that EPA provide a robust and transparent explanation in the *Federal Register* early in the rulemaking process to explain why the provisions of this rule do not apply to the rulemaking in question (e.g. which laws would be in conflict).

Response: All Agency peer review follows the recommended procedures and approaches found in the EPA’s Peer Review Handbook. This Peer Review Handbook is used as guidance by EPA staff and managers to ensure that the Agency’s Peer Review Policy is implemented objectively and that the integrity of our peer review activities can be demonstrated transparently to the

American public. Part 30.6 in the final rule states, “the EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review. As part of promulgating a significant regulatory action or drafting influential scientific information the Agency will document its decisions and reasoning.”

Comment: Commenter (9227) suggests that, if EPA moves ahead with these proposed provisions, EPA revise the proposed regulatory language to clarify that all of the exemptions set forth in section IX of the OMB Peer Review Bulletin remain in effect regardless of whether they pertain to feasibility.³²¹⁸ The commenter further suggests that EPA clarify what, if any, additional effect is intended by the exemption provision in proposed 40 CFR 30.9. The commenter provides that proposed 40 CFR 30.9(b) provides that the Administrator may grant an exemption from the peer review requirements if he or she determines that “[it] is not feasible to conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions for reasons outlined in OMB Final Information Quality for Peer Review (70 FR 2664), Section IX.” The commenter notes, however, only two of the seven enumerated exemptions in Section IX of the OMB Peer Review Bulletin pertain to feasibility—Exemption 1 governing “national security, foreign affairs, or negotiations involving international trade or treaties” and Exemption 3 governing time-sensitive health or safety disseminations.

Response: The requirements in 40 CFR 30.3 apply to influential scientific information, unless the influential scientific information is exempted from peer review requirements as described in Section IX of the OMB Bulletin for Peer Review (Ref. 8). Consistent with this approach, the EPA is finalizing the definition of “influential scientific information” as proposed in the 2020 SNPRM.

Part 30.6 in the final rule states, “the EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review.”

Section 30.7 (formerly 40 CFR 30.9 in the 2018 proposed rule and the 2020 SNPRM) of the final rule requires the Agency to document the rationale for any exemptions granted by the Administrator in the significant regulatory action or influential scientific information. This documentation would typically be provided as part of the proposed rulemaking given this will be part of the decision of what is the pivotal science for the rule. The final rulemaking will also provide clear documentation.

³²¹⁸ OMB Peer Review Bulletin, 70 Fed. Reg. at 2673

13.1.2.3 EPA Shall Ask Peer Reviewers to Articulate the Strengths and Weaknesses of EPA's Justification for the Assumptions Applied and the Implications of those Assumptions for the Results

Comment: Commenter (6150) supports the appropriateness of requesting that peer reviews focus on the strengths and weaknesses of the assumptions and their implications.

Commenter (6927) requests EPA more clearly define and clarify what is meant by asking "peer reviewers to articulate the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for results."

Conversely, commenters (4592, 4595, 6133) express concerns about the requirement that peer reviews focus on the strengths and weaknesses of the assumptions and their implications.

Commenter (4595) expresses concern that the proposed rule requires EPA to ask peer reviewers to articulate the strengths and weaknesses of EPA's assumptions, implying that the agency would be implementing a separate and secondary level of peer review to address assumptions.

Commenter (6133) states that the final paragraph of 40 CFR 30.7 appears to suggest that EPA should conduct peer review of the proposed agency action itself, rather than of the science underlying that action, stating that "EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results." According to the commenter, it is entirely unclear how "peer review" could be applied to EPA's reasoning itself, rather than the cited science, and the Proposal contains no further clarification. The commenter recommends that the EPA abandon the unlawful Proposal altogether but, if EPA does finalize any rule based on the Proposal, EPA still should abandon the unlawful approach reflected in proposed 40 CFR 30.7.

Response: EPA agreed with commenters that the statement in §30.7 of the notice of proposed rulemaking, "implications of the assumptions on the results," is unclear about how peer review could be applied to EPA's reasoning itself, rather than the pivotal science supporting the regulatory decision. Therefore, §30.6 (formerly 40 CFR 30.7 the 2018 proposed rule and the 2020 SNPRM) of the final rule was changed to "Because transparency in pivotal science includes addressing issues associated with assumptions used in analyzing dose-response data, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied and the implications of those assumptions for the results." Further, as detailed in OMB's Final Information Quality Bulletin for Peer Review, "There will be cases in which an agency determines that a more rigorous or transparent review process is necessary. For instance, an agency may determine a particular journal review process did not address questions (e.g., the extent of uncertainty inherent in a finding) that the agency determines should be addressed before disseminating that information. As such, prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary." For these reasons, EPA may determine that additional peer review is necessary.

Comment: Commenter (0560) requests that EPA add the following to §30.7: "EPA shall particularly request that reviewers address alternate models and ignored or contrary evidence."

Response: EPA appreciates the recommendation. The EPA has finalized language in §30.6 (formerly 40 CFR 30.7 the 2018 proposed rule and the 2020 SNPRM) of the final rule to, “Because transparency in pivotal science includes addressing issues associated with assumptions used in analyzing dose-response data, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied and the implications of those assumptions for the results.”

13.1.3 Comparison of the Approach in the Proposed Rule to Existing Scientific Review Processes

13.1.3.1 Existing Peer-Review Mechanisms

13.1.3.1.1 Peer Review is Not Adequate

Comment: Commenter (0040) states that study results need to go through the peer review publication and replication processes so that the conclusions are based on strengths of evidence and are weighed according to their merit. The commenter asserts that it is through this laborious process that science progresses.

Commenters (0563, 2142, 4534, 6045, 6176, 6365, 6867) suggest that peer review, in and of itself, is not sufficient to validate studies.

Commenter (0563) notes that, while some opponents of the proposal argue that peer review ensures the quality of studies published in refereed journals, this widespread perception is false. The commenter quotes Richard Smith:

... almost no scientists know anything about the evidence on peer review. It is a process that is central to science—deciding which grant proposals will be funded, which papers will be published, who will be promoted, and who will receive a Nobel prize. We might thus expect that scientists, people who are trained to believe nothing until presented with evidence, would want to know all the evidence available on this important process. Yet not only do scientists know little about the evidence on peer review but most continue to believe in peer review, thinking it essential for the progress of science. Ironically, a faith based rather than an evidence-based process lies at the heart of science.³²¹⁹

Commenter (2142) asserts that the peer review system is flawed because reviewers do not dig deeply into the data or analysis as they have little incentive to do so. The commenter states that reviewers often do not have access to the data or algorithms, making it impossible to truly check the results. The commenter states that the high percentage of invalidated peer-reviewed studies in the medical field, where one would think the scrutiny to be intense, shows the failure of relying solely on peer review.

Commenter (4534) states that, if the data has been peer reviewed and is available for the regulated parties to validate during the review and comment period, then all parties should be satisfied with the process. According to the commenter, utilizing data that has not been peer

³²¹⁹ “Classical peer review: an empty gun,” published in *Breast Cancer Review*:

reviewed or validated could lead to incorrect conclusions, which impact recommendations to maintain or further improve the environment that we live in.

Commenter (6045) asserts that peer-reviewed scientific research data that are not publicly available are not rigorous enough for use in decision making. The commenter asks why should a secretly “insider-peer-reviewed” elitist group evaluate and approve something for public policy that affects millions of citizens, as well as billions of U.S. dollars in taxpayers’ money?

Commenter (6176) states that journal peer review is not a substitute for making data available to the public. The commenter states that not all peer review processes are the same or of adequate quality. The commenter adds that, unless relevant underlying data and methodology are made available, the public has no way to know whether a specific peer review process has been effective and properly addressed potential problems.

Commenter (6867) asserts that pre-publication peer review is not an adequate substitute for public availability of data, methodology, and computational code. The commenter states that, in light of overwhelming evidence that a significant portion of studies published in prominent peer reviewed journals are not reproducible, it is dubious to claim that any particular research is valid and relevant unless—at a minimum—other researchers and the public have access to the underlying data, methodology, and computational code. The commenter states that empirical evidence indicates that peer reviewers routinely fail to identify even major errors³²²⁰ and peer review in less prominent journals may often occur in name only.³²²¹ The commenter states that the best available metascience—science about science—indicates that pre-publication peer review is not adequate to ensure the validity of published scientific claims.

Commenter (6365) states that the experience of the lead NAAQS rulemaking (73 FR 66964) demonstrates the salutary purpose that transparency would serve in the regulatory process. The commenter provides that, in that rule, EPA relied heavily on Lanphear et al. (2005) although the underlying data were not available to EPA or to stakeholders for replication and validation at the time of publication. The commenter notes that, due to the lack of availability, there was no complete reanalysis of that data for nearly a decade and EPA relied on the study in both the 2008 and 2016 lead NAAQS reviews. The commenter states that the lack of available data has been noted in the scientific literature as preventing alternative statistical analyses to be performed, which is particularly important given that key confounding factors such as parental education, intelligence, birthweight, smoking, and race were not controlled in several of the Lanphear cohorts and may contribute to an overestimation of health effects.³²²² The commenter provides that, when the data underlying Lanphear was reanalyzed³²²³ numerous errors that were not discovered in the peer-review process and that were not previously known to EPA were uncovered and analyzed. According to the commenter, although EPA ultimately determined that these errors did not materially affect the NAAQS review documents that relied on the Lanphear

³²²⁰ S. Schroter et al., What Errors Do Peer Reviewers Detect, and Does Training Improve Their Ability to Detect Them?, 101 J. R. SOC. MED 507 (2008).

³²²¹ J. Bohannon, Who’s Afraid of Peer Review?, 342 SCIENCE 60 (2013).

³²²² See Wilson IH, Wilson SB. 2016

³²²³ Crump, KS et al., “A statistical reevaluation of the data used in the Lanphear et al. (2005) pooled-analysis that related low levels of blood lead to intellectual deficits in children,”

study, the Agency included a memorandum in the subsequent NAAQS rulemaking docket that acknowledged those errors and considered their impact on the regulatory process.³²²⁴

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

The EPA finds that these comments have merit, in part. However, in this rule, the EPA is not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that "the intensity of peer review is highly variable across journals" and "prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary." Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule.

The EPA would also like to clarify that peer review is but one aspect that is considered in evaluating studies for potential use in EPA products. In addition to determining whether a study has been adequately peer reviewed, the EPA also independently evaluates study quality using the following factors: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. The EPA may also consider additional factors based on the purpose of the assessment. For example, when selecting studies for the dose-response assessment, the EPA would evaluate the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints.

Comment: Commenter (6362) highlights the NAS review of the 2010 draft formaldehyde IRIS assessment peer review as an example of where the IRIS assessment failed to reflect the best available science. The commenter expresses that the NAS stated that EPA's claims regarding all leukemias, myeloid leukemia or related hematopoietic cancers were not supported. The commenter also provides that EPA's preliminary conclusions appeared subjective and that no clear scientific framework had been used by EPA to reach its conclusion. The commenter adds that the NAS recommended that EPA revisit its determination of causality for specific cancers, using a methodology that integrates lines of evidence and addresses the specific criticisms in the NAS report. The commenter notes that the NAS also made numerous recommendations for improving the overall process and application of science used in all assessments generated by the IRIS program. Now, according to the commenter, seven years since that NAS report was published, EPA continues to revise its assessment while not disclosing how emerging scientific evidence or modern risk assessment methods are being employed.

³²²⁴ See Memorandum from Ellen F. Kierane et al. to Stephen Dutton, Identification and consideration of errors in Lanphear et al (2005), "Low-Level Environmental Lead Exposure and Children's Intellectual Function: An International Pooled Analysis."

Response: These comments are not directly relevant to this rulemaking. Any concerns about specific projects should be directed to the appropriate EPA programmatic or regional office.

13.1.3.1.2 Appropriate Review Processes Already Exist

Overall Support for Current Review Processes

Comment: Commenters (0061, 1364, 1433, 1773, 1943, 1973, 2249, 2408, 2425, 2905, 2908, 2911, 4842, 4845, 4884, 5164, 5165, 6103, 6122, 6133, 6135, 6149, 6153, 6164, 6171, 6174, 6188, 6191, 6358, 6367, 6379, 6446, 6464, 6868, 6876, 6898, 6915, 6922, 6974, 6901, 6916, 6920, 8272, 8275, 8801, 9227) indicate that, in peer review, appropriate processes and procedures for designing and conducting studies already exist, including existing peer review procedures, binding contracts, science assessments, use of peer-reviewed literature and collaborative methods. Comments include:

- EPA's existing processes, including peer review, already help ensure that studies used by EPA are scientifically sound, the proposed rule is not needed to add credibility or reliability to the development of EPA models and standards. (6915)

Commenters (2425, 5165, 6358, 6868, 8272) state that the process of peer-reviewed research is already sufficiently transparent by design and that there are specific existing rigorous mechanisms already in place, including Institutional Review Board (IRB) review, peer review of funding requests, and peer review by journals before publication:

- Regarding the IRB, commenter (2425) states that EPA requires an IRB to review all scientific studies occurring in an academic institution prior to beginning the study. The IRB closely reviews all study methods to ensure that the methods are sound and study subjects are protected and provides details of requirements. Once a study is complete, data involving human subjects must always be kept for a minimum of five years after study completion and be available for IRB review. (2425)
- Commenters (6358, 8272) state that peer review processes for funding are often highly competitive and involve critiques of study design that, if addressed, can lead to research with fewer potential biases or unmeasured confounders. (6358, 8272)
- Commenters (2425, 5165, 6358, 8272) contend that in order to publish the data in a scientific journal, scientists not associated with the research study must review the study design to ensure that it is scientifically sound and that there are many rigorous aspects of this review.
- Commenter notes that this includes assessing for "good laboratory practices" and "standardized test methods." In this rigorous peer-review process, which is already required for studies to be considered by EPA, the commenter states that experts in the field of study not only assess the study's design and methods, but its statistical analysis and conclusions in an objective manner to determine the study's merit and significance. The commenter asserts that, if any of these areas are deemed to be unsatisfactory, the study will not be published. Additionally, the commenter states that, when studies are published, the authors must detail all methods and statistical tests used and this information is presented to the public. (2425)

- Commenter (5165) notes that when the results of a scientific study are submitted for publication, the uncertainties, assumptions, parameters and theories utilized by the scientists are laid out in the publication; peer review analyzes all these components to establish validity. Thus, commenters (6358, 8272) state that peer reviews for journal publications often involve critiques that lead to more nuanced discussions of a study's limitations and the conclusions that can be drawn given those limitations.
- Study manuscripts go through multiple rounds of rigorous peer review to ensure the validity of study methods, the fidelity of adhering to the scientific methods, and the added value of the findings yielded from the study. The commenter provides that, during the peer review process, scientists are frequently asked to perform additional analyses and present additional results to convince the peer reviewers that the findings are robust, and their conclusions are supported by the data. The commenter states that, for certain types of studies without identifying patient data, such as many clinical trials and basic laboratory research studies, it is becoming the norm among top tier journals to request data as part of the publication process. The commenter adds that many journals also use plagiarism detection software and submit images to manipulation detection software to ensure data integrity. (6868)
- Commenters note that there are also mechanisms for review and comment post-publication of studies in journals. Commenters state that investigators or institutions in possession of data sets often make them available to researchers who meet appropriate criteria, such as demonstrating the ability to safeguard privacy for research participants. The commenters express that other researchers may use the data either to reanalyze findings or to examine additional research questions. (6358, 8272)
- Commenters (6358, 6868, 8272) state that studies that generate unexpected findings and provocative implications provoke discussion. Commenter (6868) states that (1) letters to editors of science journals question the sample size, the study construction, the analytical method, the generalizability and nearly every conceivable aspect of a study; and (2) scientific meetings host pro/con debates about how to interpret provocative data and how far to apply its implications. The commenter (6868) states that this post-publication debate helps generate new questions to ensure that our understanding of the data is correct. Commenters (6358, 8272) state that re-analyses of data may be undertaken at times in order to strengthen confidence in particularly when there are unexpected or consequential findings, but typically confidence in findings is strengthened by having evidence from different studies accumulate.
- EPA already has in place a robust process for determining studies' reliability. The commenter states that EPA has spent decades creating and implementing an elaborate system to ensure the best scientific research serves as the basis for its regulatory actions.³²²⁵ The commenter states that this system already includes vigorous peer-review requirements, ethical standards, and independent review by scientific

³²²⁵ Among the many requirements of this system is a mandate that proposed regulations pursuant to the environmental statutes administered by the EPA be submitted to the Science Advisory Board ("SAB") for review and comment, along with supporting scientific and technical information, if they are provided to another federal agency for review. 42 U.S.C. § 4365(c)(1). On June 28, 2018, the SAB recommended that EPA seek the SAB's consideration of the Proposed Rule's scientific and technical basis. We urge EPA to heed the SAB's recommendation and provide the SAB an opportunity to review and provide scientific advice on the Proposed Rule.

professionals.^{3226,3227} The commenter states that according to EPA’s own IQGs, EPA “maintain[s] a robust quality system that addresses [information collected through contracts with EPA; information collected through grants and cooperative agreements with EPA; and information submitted to EPA as part of a requirement under a statute, regulation, permit, order or other mandate] by including regulatory requirements for quality assurance for EPA contracts, grants, and assistance agreements.” The commenter notes that this includes an Agency-wide Quality System that requires, among other things, a quality assurance manager and Quality Assurance Project Plan (QAPP) for projects and tasks that involve the use of environmental data, and a Peer Review System that requires major scientifically- and technically-based Agency work product to be peer reviewed. (6188)

- Commenters (0061, 1433, 1773, 1943, 6164, 6191, 6358, 6367, 6464, 6868, 6164, 8272, 8801) assert that the peer review process is the gold standard for scientific understanding and advancement for decades and assert that peer review is the integrity and reliability standard for ensuring unbiased, rigorous vetting of research and scholarly content prior to publication. Commenter (6164) states that the peer review process remains the global gold standard of academic achievement and affords the type of informed discourse necessary for the objectivity, rigor, and legitimacy of scientific information. Commenter (9227) states that publication in a peer-reviewed scientific journal is the way that scientists communicate their findings to other scientists and is considered the hallmark of scientific quality. Commenter (6103) contends that the peer review process is more than adequate to ensure studies are reliable to use in the policymaking process.
- EPA already uses collaborative methods to get to the truth of needed environmental protections. The commenter notes that the Volkswagen diesel passenger vehicle transgression was discovered by West Virginia University students operating in a laboratory using methods not then sanctified by the U.S. EPA Auto Emissions Laboratory. (4884)
- EPA has rightly continued to rely on the robust peer-reviewed literature to inform the air quality standard-setting process year after year, incorporating the best available scientific evidence in epidemiology, toxicology, and exposure assessment to set the outdoor air quality standards at levels that protect public health and the environment. (6133)
- Existing procedures and safeguards commonly used to conduct, disseminated, and synthesize scientific research are more than adequate in ensuring the validity and integrity of the science used to inform EPA decision-making. (6135)

³²²⁶ See, e.g., EPA, The NRC Risk Assessment Paradigm, available at <https://www.epa.gov/fera/nrc-risk-assessment-paradigm> (“To estimate potential health impacts associated with environmental exposures, EPA scientists and others have spent more than two decades developing an extensive set of risk assessment methods, tools, and data to estimate environmental health risks.”) EPA follows the risk assessment and risk management paradigm set forth by the National Academy of Sciences’ National Research Council, and its risk assessment methodology “has been extensively peer reviewed.” Id.

³²²⁷ For example, EPA uses the Integrated Risk Information System (“IRIS”) to characterize the health hazards of chemicals found in the environment. The IRIS process applies principles of systematic review to identify pertinent studies; review the studies’ methods and quality; select studies that will be used to derive toxicity values; and subject those values to internal, interagency, and external peer review before arriving at a final assessment. EPA, IRIS Assessment Development Process (2015), available at https://www.epa.gov/sites/production/files/2015-09/iris_process_figure_2015.jpg.

- Existing policy vehicles under established statutory authority have proven effective in providing a consensus scientific basis through open and transparent processes that support a regulatory framework for radiation protection that balances the beneficial uses of ionizing radiation with the health and safety of workers, patients, and the public. (6149)
- The review process currently utilized by EPA in evaluation of scientific research to inform policy is already transparent and involves rigorous peer-review and evaluation by independent experts. (6171)
- EPA has a proven record of using the best available science and research to set standards under its foundational laws that protect public health and the environment, which the scientific peer review process and our transparent and participatory rulemaking process can well ensure. (6174)
- Commenter is confident that longstanding practices of peer review undertaken by leading journals that publish toxicology studies of public health importance have been and will continue to be of sufficient rigor to assure the integrity and reliability of such research. (6367)
- EPA-implemented statutes have established independent scientific oversight and scientific review processes to ensure that EPA standards and regulations are founded in the best available science. (6379)
- Procedures are already in place that assure use of the best available science for EPA's regulatory activity. The commenter states that these procedures include that much of the scientific research considered in the regulatory context, and all research published in reputable journals, has already been subject to extensive peer review. The commenter states that the method that is accepted in the scientific community for assessment of the strength of scientific research is peer review. The commenter notes that, since scientific studies are regularly peer reviewed, including peer review by expert panels such as the SAB, the proposed rule unnecessary. (6446)
- Commenter encourages EPA to continue the current open and science-based development process and continue to actively involve states. (6901)
- Formal peer review, whether or not prior to publication, also validates the outcome of scientific studies,³²²⁸ as reflected in the OMB Guidelines presumption of objectivity and usefulness for scientific studies that have undergone formal peer review. (6916)
- The proposal calls into question established processes such as EPA's IRIS review program and NAAQS program. The commenter states that EPA more-than-adequately explains its decisions and analyses both in recommending NAAQS revisions and in quantifying chemical toxicities in IRIS. (6920)
- The proposed rule is unnecessary as there are processes in place to rigorously review the scientific integrity of the studies that are used in regulatory science. The commenter states that protocols and data analysis plans are published and publicly available. The commenter states that findings are peer reviewed by scientists prior to publication and additional data are available upon request for review. The commenter states that external

³²²⁸ 2002 NRC Report at 7-8 (discussing that the soundness of a study is demonstrated through the “strength of the design, methods, and statistical results,” as well as its consistency with the data “other studies and scientific theories.”).

advisory boards with relevant expertise review the studies that are being considered in the EPA regulatory processes. (6876)

- The processes for developing human health assessments and setting and reviewing standards by EPA have been routinely scrutinized by organizations such as the NAS and the Government Accountability Office (GAO). The commenter states that EPA has incorporated their recommendations and improved its approach over time.³²²⁹ (6920)

Response: The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. EPA does not take the position that studies for which the underlying data are not publicly available are per se invalid. Rather, EPA acknowledges that where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty. As discussed in the final rule preamble, the EPA clarifies that the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that, “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review by either journals or independent advisory committees, such as the EPA’s SAB, is typically conducted without access to the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information). Should peer reviewers have access to the underlying data, they could conduct a more in-depth review that may include independently reanalyzing the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty in the original study. Thus, peer review is not considered a replacement for the data availability requirements of this rule and implementation of this rule could provide independent peer reviewers as well as subject matter experts within the EPA and the public with the opportunity to evaluate pivotal science in ways that otherwise would not have typically occurred with existing EPA or peer review processes.

The EPA is, therefore, finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate additional peer review, consistent with the OMB Bulletin for Peer Review, of individual studies identified as pivotal science if the studies have already undergone peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific

³²²⁹ See for example National Academy of Sciences (NAS), 2018, Progress Toward Transforming the Integrated Risk Information System (IRIS) Program: A 2018 Evaluation, <https://www.nap.edu/catalog/25086/progress-toward-transforming-the-integrated-risk-information-system-iris-program>; National Research Council, 2000, Strengthening Science at the U.S. Environmental Protection Agency: Research Management and Peer-Review Practices, <https://www.ncbi.nlm.nih.gov/pubmed/25077276>.

information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will also increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Advisory Boards

Comment: Commenters (1973, 2336, 5165, 5172, 6046, 6119, 6121, 6164, 6188, 6367, 6373, 6446, 6894, 6920, 6922, 8801, 9227) suggest that advisory boards already provide assessment of the adequacy of the approaches taken in the studies, including the EPA SAB and EPA's CASAC. Commenter (6922) provides that the primary function of EPA's SAB is to review the quality and relevance of scientific and technical information being used by EPA or proposed as the basis for its regulations.

Commenter (6145) states that in addition to all of the already existing laws and guidance under which EPA is directed to review scientific information in its promulgation of regulations, EPA also has "several mechanisms for vetting science through several expert panels, including the EPA SAB, the EPA Clean Air Scientific Advisory Committee, and the EPA FIFRA Scientific Advisory Panel" ³²³⁰

Commenter (2336) asserts there are some aspects of EPA's duties that need to be insulated from political considerations, at least to the extent that the scientific integrity of a study can be judged independently of the political ramifications of using it to formulate regulations. The commenter states that, to fill that need, Congress provided for a 48-member SAB in the CAA. The commenter states that, although the Board's recommendations are advisory, the EPA Administrator, as a practical matter, is obligated to provide a cogent and convincing rationale for rejecting the Board's determinations.

Commenters (5165, 6164, 9227) express concern that the proposal does not acknowledge that EPA already has institutional mechanisms to review and vet scientific information through panels of scientific experts. The commenters assert that these expert panels were established to review the quality and relevance of scientific and technical information being used by EPA or proposed as the basis for EPA regulations. Commenter (5165) states that, by ignoring the existence of these bodies in the proposed rule, EPA suggests that it does not trust its own scientific advisors which tends to undermine public confidence in EPA decision making, rather than to bolster it. Commenter (6164) urges EPA to use these resources and clarify how this

³²³⁰ Memorandum from Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science to Members of the Chartered SAB and SAB Liaisons, Preparations for Chartered Science Advisory Board (SAB) Discussions of Proposed Rule: Strengthening Transparency in Science RIN (2080-AA14), p. 4, May 12, 2018.

expertise will be incorporated into rulemaking under this proposal. Commenter (9227) adds that a SAB workgroup noted:

The proposed rule fails to mention that EPA has mechanisms for vetting science through several expert panels . . . For example, the EPA CASAC routinely reviews and evaluates epidemiologic and toxicological studies that are the basis for dose-response relationships used in risk and exposure assessments for air pollutants regulated under the National Ambient Air Quality Standards. Although such mechanisms do not typically engage in reanalysis of original data using the same methods as the original investigators, they do entail a rigorous review process that goes beyond the typical journal peer review procedures.³²³¹

Commenter (6446) states that procedures are already in place that assure use of the best available science for EPA's regulatory activity. The commenter provides that these procedures include the SAB which is required by its authorizing legislation to make every effort to maximize public participation and transparency, "including making the scientific and technical advice of the [SAB] and any investigative panels . . . publically available in electronic form on the website of the Environmental Protection Agency." The commenter notes that the proposed rule does not mention the SAB, or its important function in providing expert assessments of whether scientific research offered as the basis for regulatory action is, in fact, the best available science.

Commenter (6894) states that the CASAC was established in 1977 to explicitly provide a diverse, independent science peer review of all the considered science so the Administrator would have a direct report on the science and policy options to consider in parallel to those of staff. The commenter states that, along with public comment, this proven process has long provided the credible "process" only vaguely described in the proposal.

Commenter (1973) states that the EPA SAB review process already provides assessment of the adequacy of the approaches taken in the studies considered in setting a standard. The commenter provides the following example regarding the setting of air quality standards:

The process involves a summary of the science by the EPA in the Integrated Science Assessment (ISA), which is reviewed by experts, and then provided to the external EPA Clean Air Science Advisory Committee (CASAC) for review. If, based on how the analysis was done, what confounders were controlled for, or other criteria, the reviewers of the ISA, members of CASAC, or the general public find a study wanting, they are free to raise that issue in public comments to EPA on the draft ISA, which EPA is required to respond to substantively. Subsequently they can again provide comments to CASAC when it reviews the draft ISA. This has happened routinely in the past, where many comments on the adequacy of individual studies, on possible flaws in measurement techniques or analytical methods have been raised and debated in past NAAQS reviews

³²³¹ Memorandum from Chair of the SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science, Alison Cullen, to Members of the Chartered SAB and SAB Liaisons 4 (May 12, 2018), [https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/\\$File/WkGrp_memo_2080-AA14_final_05132018.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/$File/WkGrp_memo_2080-AA14_final_05132018.pdf).

under the current review process for setting the NAAQS. There is no need to exclude most human studies to achieve a goal that is already being met.

Response: Peer review by either journals or independent advisory committees, such as the EPA's SAB, is typically conducted without access to the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information). Should peer reviewers have access to the underlying data, they could conduct a more in-depth review that may include independently reanalyzing the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty in the original study. Thus, peer review is not considered a replacement for the data availability requirements of this rule and implementation of this rule could provide independent peer reviewers as well as subject matter experts within the EPA and the public with the opportunity to evaluate pivotal science in ways that otherwise would not have typically occurred with existing EPA or peer review processes.

The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA's Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results." The EPA Peer Review Handbook, 4th Edition, describes the process for peer reviews conducted by a Federal Advisory Committee and the National Academy of Sciences.

Peer Review is Rigorous

Comment: Commenter (6922) states that the EPA's Peer Review Handbook provides that if a regulation is supported by a scientific and technical work product, the underlying work product should be peer reviewed unless it meets listed exemption criteria.³²³² The Handbook explains that a critical element in ensuring that decisions are based on sound and defensible science is to have an open and transparent peer review process.

Commenters (1459, 1973, 2353, 2425, 2479, 4844, 5170, 5180, 6111, 6874, 6915, 6920, 6925) assert that scientific articles have already been subjected to a high degree of scrutiny and strong filters of quality control during the peer review process.

Commenter (6915) asserts that the existing peer review process ensures the reliability and validity of the scientific information relied upon by EPA in the regulatory process. The commenter states that existing policies and procedures for peer review include the following:

- EPA vets scientific studies through several independent expert panels, including the SAB, the EPA CASAC, the EPA FIFRA Scientific Advisory Panel, and the EPA Chemical Assessment Advisory Committee. The CASAC routinely reviews and evaluates

³²³² U.S. Env'tl. Prot. Agency, *Peer Review Handbook* 28, 44-45 (4th ed. 2015), available at https://www.epa.gov/sites/production/files/2016-03/documents/epa_peer_review_handbook_4th_edition.pdf.

epidemiological and toxicological studies that are the basis for dose response relationships used in risk and exposure assessments for air pollutants regulated under the NAAQS; the Chemical Assessment Advisory Committee reviews toxicological assessments of various chemicals for inclusion in EPA's IRIS database,³²³³ and the NAS has reviewed EPA risk assessment practices numerous times.³²³⁴

- Each of these independent committees or panels is required to be staffed by a “fairly balanced” mix of regulators, academics, and industry/consultant representatives who bring a well-balanced perspective to the process. See Federal Advisory Committee Act, 5 U.S.C. App. 2 § (5)(b)(2), (c).
- OMB bulletin entitled “Final Information Quality Bulletin for Peer Review,” 70 Fed. Reg. 2664-02 (Jan. 14, 2005), is applicable to all federal agencies, including EPA, and establishes government-wide guidance aimed at enhancing the practice of peer review of government science documents. The bulletin was subject to extensive public and agency comment on two prior draft versions. It includes guidance to federal agencies on what information is subject to peer review, the selection of appropriate peer reviewers, opportunities for public participation, and related issues. The bulletin also defines a peer review planning process that provides for public participation whenever possible and permits the public and scientific societies to comment about which scientific reports and studies merit especially rigorous peer review.

Commenter (1459) suggests that whether the data can be made publicly available is not as important as whether the data presented supports the conclusions and whether the experimental design and data analysis were free from error. The commenter states that, as such, the process of peer review by other experts in the field is a far more rigorous evaluation of a study's quality than the publish-ability of its data ever could be.

Commenter (6920) states that the current process is adequate. The commenter provides that the EPA currently uses robust, transparent processes to evaluate the best available scientific research, characterize the health hazards of chemicals and air pollution, and set standards to protect public health and the environment. The commenter adds that EPA relies on peer-reviewed studies that describe the underlying data, methods, assumptions, sensitivity, and uncertainty of the results, and that these studies are cited and are published and available for public review.

Commenter (1973) states that EPA already has in place a detailed review process, that, together with the information already made public about the data and methods used in each study, allows EPA and its external science advisory committees, to reach that judgment.

³²³³ See, e.g., U.S. Env'tl. Prot. Agency, *IRIS Assessment Development Process* (2015), available at https://www.epa.gov/sites/production/files/2015-09/iris_process_figure_2015.jpg (providing a graphical listing of all the rounds of review in the existing IRIS process, which includes internal review, intra-agency review, external review (public comments), and peer-review (SAB)).

³²³⁴ See, e.g., Nat'l Research Council, *Science and Decisions: Advancing Risk Assessment* (2009), available at <https://www.nap.edu/catalog/12209/science-and-decisions-advancing-riskassessment>.

Commenter (6925) states that the longstanding process of peer review includes an evaluation of the methodologies, assumptions, data, and inferences used in a study, which helps to ensure the appropriateness and validity of that study.

Commenters (2425, 4844) assert that scientific studies used by EPA to make regulatory changes are already rigorously examined prior to being published in peer-reviewed scientific journals. The commenters provide that EPA requires an IRB to review all scientific studies occurring in an academic institution prior to beginning the study. The commenters add that the IRB very closely reviews all study methods to ensure that the methods are sound and study subjects are protected. According to the commenters, once a study is complete, data involving human subjects must be kept for a minimum of five years after study completion and must be available for IRB review at all times. The commenters note that, in order to publish the data in a scientific journal, scientists not associated with the research study must review the study design to ensure that it is scientifically sound. The commenters add that this includes assessing for “good laboratory practices” and “standardized test methods.” The commenters assert that, in this rigorous peer-review process, which is already required for studies to be considered by EPA, experts in the field of study not only assess the study’s design and methods, but its statistical analysis and conclusions in an objective manner to determine the study’s merit and significance. According to the commenters, if any of these areas are deemed to be unsatisfactory, the study will not be published, and that when studies are published, the authors must detail all methods and statistical tests used and this information is presented to the public.

Commenter (5170) states that that there are already transparent procedures that include review of research designs and findings by independent scientific experts and making the studies available to the public. The commenter notes that published research findings are evaluated and debated by scientists, health professionals, scientific organizations, industry as well as the public to analyze the appropriate conclusions that may be drawn. The commenter adds that, where studies make use of private data (for example, medical histories), independent scientists review and evaluate the studies.

Commenters (6153, 6874) state that the scientific community has developed robust mechanisms and procedures for designing and conducting studies in ways that minimize bias, drawing appropriate conclusions from research findings, and advancing knowledge. The commenters note that peer review processes for funding are often highly competitive and involve critiques of study design that, if addressed, can lead to research with fewer potential biases or unmeasured confounders. The commenters contend that peer reviews for journal publication often involve critiques that lead to more nuanced discussions of a study’s limitations and the conclusions that can be drawn given those limitations.

Commenter (6111) asserts that there are ample and adequate safeguards in place at the leading journals to ensure “transparency” – the ability of other researchers to question, challenge, and validate the results of published studies. The commenter notes that this would include the journals’ policies on treatment of data from research published years and even decades ago. Similarly, commenter (5180) asserts that the scientific studies published in scientific journals have already been critiqued and validated by experts familiar with the relevant scientific field as part of the scientific peer-review process.

Response: The EPA agrees with commenters that the scientific community and government agencies are making great strides in data transparency; however, improvements can still be made over existing policies and mechanisms. The requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

Further, the EPA would like to clarify that the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review by either journals or independent advisory committees, such as the EPA’s SAB, is typically conducted without access to the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information). Should peer reviewers have access to the underlying data, they could conduct a more in-depth review that may include independently reanalyzing the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty in the original study. Thus, peer review is not considered a replacement for the data availability requirements of this rule and implementation of this rule could provide independent peer reviewers as well as subject matter experts within the EPA and the public with the opportunity to evaluate pivotal science in ways that otherwise would not have typically occurred with existing EPA or peer review processes.

The EPA is, therefore, finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA’s Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

Existing Scientific Review Processes are Effective Even Without Availability of Raw Data

Joint Statement

Comment: Commenters (1306, 6110, 6122, 6876, 6909, 6915, 9227) refer to language in a Joint Statement by editors of several scientific journals and assert that effective peer review of scientific studies does not require that all underlying data be made public.³²³⁵

³²³⁵ Jeremy Berg, Philip Campbell, Veronique Kiermer, Natasha Raikhel & Deborah Sweet, Joint Statement on EPA Proposed Rule and Public Availability of Data, April 30, 2018, available at: <http://science.sciencemag.org/content/early/2018/04/30/science.aau0116>.

Commenters (1306, 6122, 6876, 9227) generally concur with statements from the editors, including the following:

- The merits of studies relying on data that cannot be made publicly available can still be judged.
- Reviewers can have confidential access to key data and as a core skill, scientists are trained in assessing research publications by judging the articulation and logic of the research design, the clarity of the description of the methods used for data collection and analysis, and appropriate citation of previous results.

Commenter (6110) states that the editors noted that many scientific journals already have policies to ensure transparency as much as possible and, in cases where such transparency is not possible, reviewers can be given confidential access to the raw data so that they can check and replicate the findings. The commenter asserts that the EPA proposal does not allow for such situations.

Commenter (6122) states that, because they conduct their own research and extensive review of others' research, scientists do not need the raw data to determine if a study was conducted correctly, but rather are trained to do so by examining data collection and analysis methods and to determine whether the results can be replicated. The commenter notes that when doctors prescribe a medicine that they have deemed effective, it is not because they have reviewed and analyzed the raw data of patients in the clinical trials themselves; instead, they have reviewed the published papers on the medication and have seen both that the trials were done correctly and that the results were significant enough to prescribe the treatment. The commenter states that this is no different with research scientists.

Response: The final rule does not categorically exclude studies based on the availability of the underlying dose-response data. The EPA would also like to clarify that the final rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science. Further, EPA does not take the position that studies for which the underlying data are not publicly available are per se invalid. Rather, EPA acknowledges that where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty.

Further, the EPA would like to clarify that the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that "the intensity of peer review is highly variable across journals" and "prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary." Peer review by either journals or independent advisory committees, such as the EPA's SAB, is typically conducted without access to the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information). Should peer reviewers have access to the underlying data, they could conduct a more in-depth review that may include independently reanalyzing the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty in the original study. Thus, peer review

is not considered a replacement for the data availability requirements of this rule and implementation of this rule could provide independent peer reviewers as well as subject matter experts within the EPA and the public with the opportunity to evaluate pivotal science in ways that otherwise would not have typically occurred with existing EPA or peer review processes.

The EPA is, therefore, finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA's Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

Study Validation is Addressed Through the Peer Review Process

Comment: Commenters (0569, 1481, 1793, 1796, 4590, 5173, 5180, 6103, 6109, 6357) assert that the design, methods, and assumptions of research studies are vitally important for validating scientific results and are typically addressed through peer review prior to publication.

Commenters (0569, 4590, 5173) state that once the results of the research study are published, the scientific community and the public at large may respond to the study and challenge the premises, methodology, analyses, and/or conclusions. Commenters (0569, 4590, 5173) state that such challenges could include other research aimed at testing the validity of the findings. Commenters (0569, 4590, 5173) state that this process is one of the long-standing fundamental checks on the validity of scientific research.

Commenter (5180) asserts that the scientific studies published in scientific journals have already been critiqued and validated by experts familiar with the relevant scientific field as part of the scientific peer-review process.

Commenter (4590) states that current scientific practice recognizes that providing publicly available data and models is desirable, where doing so is consistent with researchers' legal and ethical obligations. The commenter notes that, in contrast, the proposed EPA rule requires public availability of data and models from scientific studies as the basis of decision-making, but does not recognize adequately either the value of peer review and subsequent research in addressing validity, the balancing of privacy concerns against public disclosure, or the importance of other context in evaluating research.

Commenter (1481) asserts that the appropriate use of statistics can be assessed as accurately and more efficiently from the published methodology and statistics than from the overwhelmingly large original data sets. The commenter states that open raw data sets offer no benefit to the public, since proper statistical methodology requires field specific expertise. The commenter adds that, thus, there is no useful transparency added to the studies but the policy comes at the cost of confidentiality.

Commenter (1793) states that decision makers do not need to see raw data that went into studies in order to trust scientific evidence. The commenter notes that they can look at the methods, design, and results in order to assess the quality of the science. According to the commenter, this rule fundamentally misrepresents how science works. The commenter asserts that scientific studies already undergo intense scrutiny and peer-review from experts in the field before they are published in a scientific journal.

Commenter (4838) asserts that studies with confidential data can still be appropriately peer-reviewed through the use of confidentiality agreements, and subject to rigorous scientific scrutiny over their methods and conclusions. Commenter (1796) states that alternate methods exist to ensure that expert reviewers can evaluate the studies for methodological rigor, as well as for obtaining confidential access to data where necessary and appropriate. Commenter (4595) asserts that there are credible procedures for testing results and verifying outcomes with methodologies that do not require access to raw data.

Commenter (6103) asserts that the value of any particular scientific study should be defined by the peer review process, not by whether the raw data are accessible. The commenter states that researchers have legal and ethical obligations to keep personal information private and businesses should not have to compromise their intellectual property. The commenter states that the public already has access to the science EPA relies on and can fully access methods, summary data, results, and interpretation as can all peer reviewers. The need for access to raw data is entirely unnecessary and would cause many problems by precluding the use of critical studies.

Commenter (6109) states that, while EPA appears to suggest that in the absence of publicly available raw data, there is no mechanism to verify a study's validity, this is incorrect. The commenter states that the peer review process is rigorous and allows scientists to examine each other's work and analytical methodologies. The commenter states that, in addition, independent verification and confirmation by other studies can lend credence to studies based on confidential information.

Response: EPA does not take the position that studies for which the underlying data are not publicly available are per se invalid. Rather, EPA acknowledges that where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty.

Further, the EPA would like to clarify that the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review by either journals or independent advisory committees, such as the EPA’s SAB, is typically conducted without access to the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information). Should peer reviewers have access to the underlying data, they could conduct a more in-depth review that may include independently reanalyzing the data to

affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty in the original study. Thus, peer review is not considered a replacement for the data availability requirements of this rule and implementation of this rule could provide independent peer reviewers as well as subject matter experts within the EPA and the public with the opportunity to evaluate pivotal science in ways that otherwise would not have typically occurred with existing EPA or peer review processes.

The EPA is, therefore, finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review (Ref. 8), of individual studies identified as pivotal science if the studies have already undergone peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results. As discussed in the preamble to the final rule, the rule requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Release of Raw Data (Including Privacy Data) is Not Required Under Existing Rigorous Peer Review Processes

Comment: Commenters (1461, 1973, 2910, 5418, 6103, 6111, 6922) contend that existing peer review processes that do not require the release of privacy data are sufficient.

Commenter (1461) states that in cases where data cannot be made available to the public, scientific journals and standards can maintain rigor by careful peer review, including allowing confidential access to key data to reviewers. Commenter (1973) asserts that the existing system has worked well and has provided the EPA with studies of mortality and hospital admissions studies from the same U.S. data by multiple investigating teams, while still maintaining data privacy. Commenter (2910) notes that pooled anonymous data has been used successfully for years to advance medical science. Commenter (5180) states that federal agencies like the EPA do not need to see the raw data that went into studies in order to trust the scientific evidence and consider it in their rulemaking.

Commenter (6111) asserts that the public health, medical, and scientific research community does not regard the public disclosure of all raw data as necessary. The commenter states that, for example, the Committee on Publication Ethics (COPE), which has over 12,100 member journals and editors covering all areas of scholarly inquiry, has established 10 core practices. The

commenter provides that COPE's core practice #5 on data and reproducibility provides that "[j]ournals should include policies on data availability and encourage the use of reporting guidelines and registration of clinical trials and other study designs according to standard practice in their discipline."³²³⁶ The commenter adds that the simplicity and generality of this core practice statement signals that the question of standards for data transparency, data access, data sharing, data peer review, and replication and reproducibility practices are far from settled. The commenter asserts that there is no one-size-fits-all approach to the critical questions of data transparency, data sharing, and reproducibility.

Commenter (5418) notes that the approach advocated in the proposed rule is inconsistent with professional best practices in their respective disciplines for conducting, reviewing, and confirming the results/findings of studies, especially those based on confidential personal health data of study participants. The commenter notes that they publish their research results in the most reliable, highest-quality, peer-reviewed medical and scientific journals, including *Lancet*, *Nature*, *Science*, *New England Journal of Medicine*, *Journal of the American Medical Association*, *Cell*, and *Environmental Health Perspectives* and they conduct peer reviews of the work of other researchers.

Commenters (6915, 9227) assert that, in a letter filed in this docket, the Presidents of the National Academies of Science, Engineering, and Medicine (NASEM) observe that the public availability of data is not necessary to ensure the integrity of regulatory science and is not a sufficient criterion for excluding a particular study from consideration. Commenter (9227) states the Presidents' letter notes: "The National Academies have developed a long-standing body of work that demonstrates scientific literature can be evaluated in a transparent and objective manner without complete disclosure of the underlying data."³²³⁷ Commenter (9227) states the letter goes on to explain: "If the study data are not available, their absence may affect how the study is rated and used in the [agency's] analysis, but the study should not necessarily be eliminated from the assessment."³²³⁸

Commenter (6925) states that the complete public release of data is not necessary to ensure validity or transparency in science nor the regulatory process. The commenter notes that transparency has long been a requirement in science, with the understanding that the methodology is described in a manner that would allow the study to be reproduced.

Response: The EPA clarified 40 CFR 30.5 to give equal consideration to dose-response data that are publicly available or available through restricted access. As discussed in the final rule, underlying dose-response data are considered available if they can be accessed through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other

³²³⁶ Core Practices, COPE, <https://publicationethics.org/core-practices> (last visited August 3, 2018).

³²³⁷ Letter to Acting Administrator Wheeler from Marcia McNutt, President of the National Academy of Sciences, C.D. Mote, Jr., President of the National Academy of Engineering, and Victor J. Dzau, President of the National Academy of Medicine 2 (July 16, 2018), [See docket for rule for comment letter: Docket ID EPA-HQ-OA-2018-0259]

³²³⁸ *Id.*

mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

The final rule is limited to dose-response data and does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. The final rule does not require the EPA to collect, store, or publicly disseminate the dose-response data underlying pivotal science. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA's position on data availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make data available. Researchers may choose to make more data available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate. Further, EPA does not take the position that studies for which the underlying data are not publicly available are per se invalid. Rather, EPA acknowledges that where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty.

Further, the EPA would like to clarify that the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that "the intensity of peer review is highly variable across journals" and "prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary." Peer review by either journals or independent advisory committees, such as the EPA's SAB, is typically conducted without access to the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information). Should peer reviewers have access to the underlying data, they could conduct a more in-depth review that may include independently reanalyzing the data to affirm original research conclusions, check for errors, test alternative assumptions, and better

understand and evaluate the implications of uncertainty in the original study. Thus, peer review is not considered a replacement for the data availability requirements of this rule and implementation of this rule could provide independent peer reviewers as well as subject matter experts within the EPA and the public with the opportunity to evaluate pivotal science in ways that otherwise would not have typically occurred with existing EPA or peer review processes.

The EPA is, therefore, finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA's Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results. As discussed in the preamble to the final rule, the rule requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Radiation Protection Scientific Peer Review

Comment: Commenter (6149) states that optimization of technical resources is critical in evaluating radiation protection scientific bases due to the limited availability of experts in the fields of radiobiology, radiation epidemiology, and radiation health physics. The commenter contends that the current system of review utilizing the National Academies, National Research Council, and National Council on Radiation Protection (NCRP) to leverage radiation protection expertise provides sufficient independent scientific review for regulatory action. The commenter states that, while the field of study is extensive and the breadth of regulatory impact is large, the number of experts in the fields of radiobiology, radiation epidemiology, and related health physics areas is extremely limited. The commenter notes that the National Academies, National Research Council, and NCRP have proven the capability to establish committees and provide qualified independent reviews of the scientific basis for radiation protection within this limited population of technical experts. According to the commenter, the EPA, nor any single agency, lacks adequate expertise of its own necessary to provide a meaningful independent review without engaging the resources available to National Academies, National Research Council, and NCRP. According to the commenter, these organizations are already performing this function,

mandating an additional independent review by the EPA represents an additional regulatory burden without a commensurate benefit.

Response: As described in 40 CFR 30.5 of the final rule, the EPA will continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies—based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science. As described in preamble discussion of costs and benefits, the EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small.

Further, the EPA would like to clarify that the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review by either journals or independent advisory committees, such as the EPA’s Science Advisory Board, is typically conducted without access to the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information). Should peer reviewers have access to the underlying data, they could conduct a more in-depth review that may include independently reanalyzing the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty in the original study. Thus, peer review is not considered a replacement for the data availability requirements of this rule and implementation of this rule could provide independent peer reviewers as well as subject matter experts within the EPA and the public with the opportunity to evaluate pivotal science in ways that otherwise would not have typically occurred with existing EPA or peer review processes.

The EPA is, therefore, finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA’s Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

13.1.3.1.2 Studies Can Be Judged Without Data Being Made Public

Comment: Commenters (0040, 0569, 1433, 1879, 1943, 2477, 2906, 4845, 5173, 6098, 6111, 6133, 6152, 6188, 6194, 6446, 6909, 6922, 8281-PH26, 9227) do not agree with the proposal’s premise that open access to data needs to be included in the Scientific Review process to validate the quality of a scientific study. Some of these commenters provide examples (e.g., American

Cancer Society's (ACS) Cancer Prevention Study II) of reviewed and replicated study results that support their position. Commenters (1973, 2170, 5165, 6046, 6122, 6133) assert that key information about studies is already publicly available under existing peer review and that studies relying on data that cannot be made publicly available can still be judged with regards to the quality and transparency of the interpretation of findings with existing peer review protocols. Comments include:

- While the rule's premise is that availability of individual level data will improve the quality of the science, validation and analysis of data represent only one aspect of the overall criteria used to judge the credibility of science. (0569, 5173)
- Public access to the underlying data is not necessary in order to further EPA's proclaimed interests in ensuring the validity of the scientific information relied upon and "the public's ability to understand and meaningfully participate in the regulatory process."³²³⁹ (6922)
- Transparency is not a key test of the quality and legitimacy of a scientific study. The commenter states that legitimacy and quality is determined through peer review, reliance on the modern scientific method, and robust collaboration and debate within the scientific community. The commenter contends that the fact that the underlying data cannot be made public does not impact the validity of the results of these peer-reviewed studies. (1433)
- While researchers rely heavily and critically on primary research papers, there is no issue whatsoever evaluating the science in those papers without having access to the primary data. (1879)
- The process of good science does not require all data to be available, just a good experimental design to test the hypotheses with a thorough review of the methods used to reach the conclusions. (2477)
- The scientific journals that have implemented data availability policies have found that mere availability of data, without documentation of the methods used to collect, process, and analyze such data, provides little to help the stated aims of promoting reproducibility or public involvement in policymaking. The commenter notes that interoperability standards for collection and reporting must first be agreed upon within the scientific community and the burden of making data available in such a way as to meaningfully advance the goals of the rule must be assessed. (2906)
- The unspoken premise of the proposal is that unless EPA can guarantee full public access to a study's underlying data, the study must be deemed unreliable and should play no role in assessing a pollutant or chemical's effects on human health. The commenter argues that this premise ignores the many ways in which the scientific community, regulators, and the public have traditionally determined the quality and relevance of study results. The commenter provides that study reports typically explain the protocols used to gather data, the methods used for data analysis, the doses or exposure concentrations at which effects were and were not observed, the nature, severity, and incidence of such effects, and any unusual occurrences that may affect interpretation of the results. According to the commenter, this information plays an important role in the peer review process, informing the judgment of independent reviewers as to whether a study is worthy of

³²³⁹ 83 Fed. Reg. at 18,769.

publication in the scientific literature. The commenter states that Agency reviewers likewise consider these indicators of reliability in deciding how much weight a study deserves in making judgments about hazard and risk. The commenter states that, in its narrow focus on a single criterion for study acceptability, the proposal departs from this comprehensive, multi-faceted approach for determining the “best available science” to inform decision-making. (4845)

- Verification of method requires collection of new data, not use of the raw data. The commenter states that independent studies test the same method across many data sets. The commenter asserts that when you validate a protocol you are not testing the raw data within the system you are testing the system for accuracy using new data obtained in the same manner. (6098)
- The professional public health, medical, and scientific research community have long recognized that whether or not the raw data underlying a study is released does not determine the quality of the study. The commenter states that, rather, it is the scientific method that is determinative. The commenter adds that the proposed rule fails to take into account the fact that studies are reliable and constitute the best available science when they comply with professionally-established best practices for describing the methodology, sampling size, sampling procedure and assumptions utilized and the results are consistent with those of other studies. (6111)
- The proposed rule would replace EPA’s existing successful process, which is in step with established scientific procedures,³²⁴⁰ with one driven by the public availability of data, and unconcerned with well-established hallmarks of reliable scientific research, like peer review requirements. The commenter argues that this emphasis is inappropriate, given the courts’ agreement that publicizing the data underlying studies upon which EPA relies “would be impractical and unnecessary.”³²⁴¹ The commenter contends that the proposed rule would reduce, not enhance, the quality of data available to EPA as it considers important regulatory actions. (6188)
- EPA proposed this rule under the false premise that *only* scientific studies for which all underlying data is made publicly available can be adequately evaluated. The commenter states that this is simply not the case, and any discussion about mandating transparency through a bright line rule such as the one currently being proposed should be grounded in this fact. The commenter adds that, in addition, where necessary and appropriate, reviewers (as well as other researchers seeking to reproduce or extend scientific analysis) can have confidential access to key data in conformity with privacy requirements. (6909)
- The Agency’s arbitrary, single-minded focus on considering studies for which certain data and models are publicly available (but only the dose-response studies relevant to health protective regulation, not the ones supporting registration of chemicals) stands in stark contrast to the way the scientific community validates research findings. The commenter states that the scientific community, and scientific journals look to a range of attributes when assessing the quality of a scientific study, including whether the study has been peer reviewed, whether the scientists used rigorous scientific methods, and whether the study’s results have been reproduced or replicated. The commenter states that the scientific community recognizes that the quality of a study is not determined by whether

³²⁴⁰ See, e.g., Wagner and Steinzor, Deconstructing Regulatory Science (June 19, 2018), available at <https://www.theregreview.org/2018/06/19/wagner-steinzor-deconstructing-regulatory-science/>.

³²⁴¹ *American Trucking Ass’n*, 283 F.3d at 372; see also *Coalition of Battery Recyclers Ass’n*, 604 F.3d at 623

the underlying data is publicly available and has long utilized a variety of tools for ensuring the integrity and rigor of research findings. (9227)

- The proposal fails to recognize is that disclosure of data addresses only one method of validating scientific research—and a relatively less important aspect at that. According to the commenter, disclosure of data for a given study—the focus of the proposal—permits independent researchers to determine whether the data and methodology used in that study can be applied to generate the same results. The commenter notes that this may help protect against sources of error or misrepresentation in a particular study, however, both EPA and independent researchers have recognized that such reanalysis does not by itself validate a particular study.³²⁴² The commenter provides that, rather, a study’s evidentiary weight rests both on the strength of its methodology, as well as whether similar results can be obtained by applying the study’s methodology to a relevant, but different dataset or population, or by using a distinct methodology to interrogate the same hypothesis.³²⁴³ (9227)
- Commenters (1973, 6122) assert that scientists already include model selection, assumptions, and uncertainty in work that is peer reviewed. Commenter (1973) adds that studies that have undergone the peer review process required for journal publication have also had to address comments based on review and comment by a group of experts unrelated to the study. Commenter (6122) asserts that the main point of peer review that is addressed under current peer review mechanisms is to validate the methodology and ensure results were interpreted correctly under the given assumptions.
- Commenters (2170, 6133) cite the following from a *Science* magazine article in support of their position that the merits of studies relying on data that is not publicly available can still be judged:
 - Importantly, the merits of studies relying on data that cannot be made publicly available can still be judged. Reviewers can have confidential access to key data and as a core skill, scientists are trained in assessing research publications by judging the articulation and logic of the research design, the clarity of the description of the methods used for data collection and analysis, and appropriate citation of previous results.³²⁴⁴
- Peer-review can and does occur without the study data being made public, including confidential data whereby the researcher can work with the peer-reviewers to provide datasets with study participant confidentiality ensured. (6046)

³²⁴² See EPA, Preamble to the Integrated Science Assessment at 20 (2015) (“An inference of causality is strengthened when a pattern of elevated risks is observed across several independent studies. The reproducibility of findings constitutes one of the strongest arguments for causality. . .”) (emphasis added); National Academies, Principles and Obstacles for Sharing Data From Environmental Health Research 6 (2016) (quoting researcher Lynn Goldman’s observation that reproducibility and replicability across independent studies – as distinct from reanalysis of a single set of data using the same methodology – are the most convincing ways of validating a research finding); Lynn R. Goldman & Ellen Silbergeld, Correspondence on Access to Chemical Data Used in Regulatory Decision Making, 121 Environmental Health Perspectives A111 (Apr. 2013), <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3620747/> (“Replication in science is quite different; it involves performance of an independent study with the same hypothesis and then testing the extent to which this independent study reaches the same conclusions. . . Designing and conducting a replication study does not require access to raw data from the original study; this would abrogate the concept of independence.”)

³²⁴³ See National Academies, Principles and Obstacles at 6

³²⁴⁴ “Joint statement on EPA proposed rule and public availability of data.” *Science*, April 30, 2018: eaau0116. DOI: 10.1126/science.aau0116

- While many peer-reviewed scientific journals have recently adopted policies that support data sharing, these standards recognize the array of workflows across scientific fields and make the case for data sharing at different levels of stringency that consider exceptional circumstances, such as data sets featuring personal identifiers and other data that cannot be shared openly. (6133)
- The scientific community has already adopted several protocols and guidelines specifically designed to improve the reporting and evaluation of studies and to improve the quality and transparency of the interpretation of findings. According to the commenter, these protocols and guidelines, such as CONSORT,³²⁴⁵ ARRIVE³²⁴⁶ and STROBE,³²⁴⁷ do not require public access to all study data but still improve the scientific basis of evaluating studies. (1973)
- The following ESCAPE study as an example where the peer review process is completely transparent, without the need for privacy violations. (1973)
 - For example, the ESCAPE study consisted of 22 cohorts for which the methodology was well documented in papers describing how the recruitment was done, who was eligible to be recruited, who was not eligible to be recruited, how many people were recruited, where the recruitment was done, what kind of data were collected on the people, including medical data and data on risk factors for disease, and they have all produced detailed summary statistics of those data, and their correlations. Separate papers describe in detail how the land use regression models that produced the exposure were fit, what the protocol was for collecting monitoring data, locating the monitors, what land use variables were used and where they were obtained from, etc. The statistical methods for fitting the land use regressions, and what variables were used were similarly described in detail. The papers that matched these two sets of data to examine the association of air pollution with health also described which data were used, how they were used, and what statistical models were fit. This is a completely transparent process, without the need for privacy violations. The same is true for the other cohort studies that EPA has relied on. They are perfectly transparent as to the nature of the population studied, how the recruitment was done, what data was collected on the individuals, and how the analysis was done.

Response: EPA does not take the position that studies for which the underlying data are not publicly available are per se invalid. Rather, EPA acknowledges that where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty.

Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are

³²⁴⁵ Moher D, Jones A, Lepage L, for the CONSORT Group for the C. Use of the CONSORT Statement and Quality of Reports of Randomized Trials. JAMA. 2001 Apr 18;285(15):1992.

³²⁴⁶ Kilkeny C, Browne WJ, Cuthill IC, Emerson M, Altman DG. Improving Bioscience Research Reporting: The ARRIVE Guidelines for Reporting Animal Research. PLoS Biol. 2010 Jun 29;8(6):e1000412.

³²⁴⁷ The PLOS Medicine Editors. Observational Studies: Getting Clear about Transparency. PLoS Med. 2014 Aug 26;11(8):e1001711.

unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

As discussed in the preamble to the final rule, the requirements of the final rule build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty.

This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA's position on data availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make data and models available. Researchers may choose to make more data and models available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate.

The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information.

Comment: Commenter (6922) notes that, for decades, EPA has relied upon epidemiological studies to help determine what pollutants or chemicals need to be regulated, and how rigorously to do so. The commenter states that the EPA's reliance on those studies was reasonable – even though the underlying data was not public – because the studies underwent peer review to ensure these studies and their results were sound, replicable, and reliable. In other words, the commenter asserts that not having the raw data did not, and does not, make the science unsound. To the contrary, the commenter contends that the studies that include or rely on confidential health information often are among the best science that the Agency has to evaluate the effects of pollutant exposure on humans, and the costs imposed on individuals and society as a result of that exposure. Similarly, the commenter provides that the EPA routinely relies on data provided by regulated industries that is treated as confidential business information (CBI) and is therefore protected from public disclosure because it may include customer or other personally-identifiable information, including electric and gas consumption. According to the commenter, this is no different from relying on public health studies that rely on data that is protected from disclosure for various reasons.

Response: EPA does not take the position that studies for which the underlying data are not publicly available are per se invalid. Rather, EPA acknowledges that where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty. As discussed in the preamble to the final rule, the requirements of the final rule build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. In addition, the EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (6133) states that the proposed rule does not require that any information actually be independently validated before EPA may consider it or base regulatory decisions on such verification. Accordingly, there is an irrational disconnect between EPA's insistence that information be "publicly available for independent validation" and the proposal's claim that this ensures EPA will consider and use the "best available science." The commenter notes that the EPA itself has not outlined a process by which "dose response data and models" would be

validated, and the proposal does not seriously consider the methodological complications of partial redaction of underlying study data.

Response: As discussed in the preamble of the final rule, where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenter (6194) states that, where EPA alleges that the proposal is consistent with the focus on transparency in these and other laws, regulations, and policies, the Agency is really conflating standards of quality with public dissemination of data. The commenter states that, rather than recommend foregoing the use of the information based on confidential information, OMB provides agencies mechanisms for validating information when data are not available.³²⁴⁸ The commenter states that, when it comes to its own research, EPA “strives to increase access to its research results” but recognizes that, “[w]hether research data are fully available to the public or available to researchers through other means does not affect the validity of the scientific conclusions from peer-reviewed research publications.”³²⁴⁹

Response: EPA does not take the position that studies for which the underlying data are not publicly available are per se invalid. Rather, EPA acknowledges that where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty.

In addition, the EPA clarified 40 CFR 30.5 to give equal consideration to dose-response data that are publicly available or available through restricted access. As discussed in the final rule, underlying dose-response data are considered available if they can be accessed through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

³²⁴⁹ EPA, Plan to Increase Access to Results of EPA-Funded Scientific Research, at 4-5 (2016), <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf>.

Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

This rule build[s] upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. As discussed more fully in the preamble of the final rule, the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

Comment: Commenter (9227) asserts that the absence of publicly available underlying data does not make the results of a study invalid or even suggest that the study is likely to be invalid, nor has EPA presented evidence to suggest that studies with publicly available underlying data are more likely to represent strong science than studies without such data availability. The commenter states that key reasons why researchers do not make data for some studies publicly available have nothing to do with scientific quality. The commenter states that, while reanalyzing study results using the same data is one way to help validate those results, it is neither the primary nor a sufficient way to do so. The commenter states that EPA's apparent conflation of data availability and best available science is not based on any evidence cited by EPA, is contrary to the evidence before EPA, and is simply arbitrary. The commenter provides the following additional information regarding data availability and study quality:

EPA's Preamble to the Integrated Science Assessments provides another discussion of how EPA evaluates study quality, and similarly, does not call out publicly available data:

- [T]he individual study quality is evaluated by considering the design, methods, conduct, and documentation of each study, but not the study results. This uniform approach aims to consider the strengths, limitations, and possible roles of chance, confounding, and other biases that may affect the interpretation of individual studies and the strength of inference from the results of the study.³²⁵⁰
- A statement by the American Statistical Association on p-Values: Context, Process, and Purpose further emphasizes the multiple considerations related to quality, stating “Researchers should bring many contextual factors into play to derive scientific inferences, including the design of a study, the quality of the measurements, the external evidence for the phenomenon under study, and the validity of assumptions that underlie the data analysis.”³²⁵¹ Similarly, the letter filed by the Presidents of the NASEM in this docket lists multiple reports conducted since 2007 that have examined EPA's scientific assessment processes and “that advise EPA on the scientific bases of regulatory decisions related to human health and the environment.”³²⁵² According to the NASEM Presidents, These reports encourage EPA to consider all available science in the rule-making process and provide guidance about how the agency could be more transparent in describing how evidence is gathered and evaluated. . . . Individual study quality should be evaluated based on information that is available in standard journal articles, such as the study design elements, analytical techniques, and statistical methods. Researchers may be contacted to answer questions about the conduct of the study or be asked to provide additional data. If the study data are not available, their absence may affect how the study is rated and used in the analysis, but the study should not necessarily be eliminated from the assessment.³²⁵³
- The commenter asserts that the proposal conflates transparency with quality, which is inconsistent with OMB's Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies, which does not consider transparency an absolute requirement, provides that the objectivity of information that cannot be made publicly available can be verified through other types of “robustness checks,” and provides an example of the Harvard Six Cities Study where reanalysis was achieved even when underlying data could not be made publicly available.³²⁵⁴

Response: This rulemaking is designed to build upon open data initiatives in the federal government and scientific community and advances the EPA's mission and commitment to the

public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. EPA does not take the position that studies for which the underlying data are not publicly available are per se invalid. Rather, EPA acknowledges that where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information.

As discussed more fully in the preamble of the final rule, the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

13.2.3.2 Consistency with Existing Peer Review Policies

13.2.3.2.1 Proposed Rule is Not Aligned with Existing Review Policies

Comment: Commenters (0559, 6117, 6375, 6464, 9227) express concern that the proposal is not aligned with existing policies.

Commenter (9227) states that *EPA's Peer Review Handbook* acknowledges that "EPA strives to ensure that the scientific and technical bases of its decisions meet two important criteria: (1) they are based upon the best current knowledge from science, engineering, and other domains of technical expertise; and (2) they are credible."³²⁵⁵ The commenter states that this policy clearly impacts EPA's regulatory actions, and thus will be impacted by the Proposal. According to the commenter, the EPA fails to analyze the impact the Proposal will have on its ability to comply with this policy and fails to explain why it is changing course or justify its decision to do so.

Commenter (6375) suggests that EPA consider updating and utilizing its own peer-review policy in addition to that provided in the peer-reviewed scientific literature. The commenter suggests that, for proprietary data/CBI that are submitted to EPA to support new chemical registrations and other regulatory actions, EPA has full data access from which to conduct its own peer reviews in accordance with its own policy.

Commenters (0559, 6464) express that policies should be consistent with standards for determining accepted science that is used by the scientific community and other research agencies. Commenter (6464) states that establishing a different and arbitrary set of standards, would be overstepping the federal government's role.

³²⁵⁵ EPA Peer Review Handbook 4th Edition A-4 (Oct. 2015), https://www.epa.gov/sites/production/files/2016-03/documents/epa_peer_review_handbook_4th_edition.pdf.

Response: As discussed in the preamble to the final rule, the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review by either journals or independent advisory committees, such as the EPA’s Science Advisory Board, is typically conducted without access to the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information). Should peer reviewers have access to the underlying data, they could conduct a more in-depth review that may include independently reanalyzing the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty in the original study. Thus, peer review is not considered a replacement for the data availability requirements of this rule and implementation of this rule could provide independent peer reviewers as well as subject matter experts within the EPA and the public with the opportunity to evaluate pivotal science in ways that otherwise would not have typically occurred with existing EPA or peer review processes.

The EPA is, therefore, finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA’s Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

13.2.3.2.2 Requirements of this Rule as Compared to Peer Review in Environmental Statutes

Comment: Commenter (6133) states that under longstanding federal case law, when Congress authorizes an approach in one section of a statute using specific language but does not do the same in other sections of a statute, courts presume that Congress acted purposefully and did not mean to address or authorize that approach in those other statutory sections. See, e.g., *Dean v. United States*, 556 U.S. 568 (2009) (“It is generally presumed that Congress acts intentionally when including particular language in one section of a statute but not in another.” (citing *Russello v. United States*, 464 U.S. 16, 23 (1983))). According to the commenter, not only are there no implied grants of authority to an agency in the other statutory sections, but the congressional decisions to authorize the approach elsewhere in the statute give even greater force to the conclusion that the agency has not been given authority where Congress did not use the same or similar authorizing language.

Commenter (6133) asserts that the EPA approach proposed in §30.7 is even more unlawful than would be the case, independently, under this case law. The commenter provides that the proposed §30.7 says “EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.” 83 Fed. Reg. at 18,774/2. The commenter adds that the EPA proposes to bind itself (“shall”) to conduct a particular form of peer review on “all pivotal regulatory science” based on

an unenforceable, non-binding OMB Final Information Quality Bulletin for Peer Review that has never been the subject of notice and comment rulemaking and that itself is not authorized by any federal law. To the contrary, the commenter contends that treating the content of the unenforceable bulletin as a binding regulation would itself violate the federal statutes that EPA implements, because those statutes do not codify the bulletin, and EPA would be unlawfully codifying a mere policy preference.

Commenter (6133) asserts that the Proposal identifies no statutory authority for EPA to conduct independent peer review for any, much less all, “pivotal regulatory science” consistent with the dense content (and exceptions) of the OMB bulletin. The commenter provides that the Proposal identifies no statutory authority for EPA to bind itself, and future administrations, to conduct peer review only in this fashion, unless and until future notice-and-comment rulemaking is undertaken. The commenter further provides that the Proposal identifies no suggestion in statutory language or legislative history that Congress intended EPA to conduct binding peer review consistent with this OMB bulletin, notwithstanding that Congress has known about this bulletin since 2005.

Commenter (6133) states that when Congress writes statutes it knows how to create the legal authority for peer review and identify who shall conduct that peer review; including what role, if any, that EPA or other parties will play, and how that peer review may be conducted. The commenter asserts that not only do no provisions in the law authorize EPA’s Proposal in §30.7, but existing environmental statutes require that EPA use peer-reviewed science, regardless of whether it would meet EPA’s definition of the term in §30.7.

Commenter (6133) provides the following examples in support of their assertion:

- CAA.

§7511b. Federal ozone measures.

[...]

(g) Ozone design value study. The Administrator shall conduct a study of whether the methodology in use by the Environmental Protection Agency as of November 15, 1990, for establishing a design value for ozone provides a reasonable indicator of the ozone air quality of ozone nonattainment areas. The Administrator shall obtain input from States, local subdivisions thereof, and others. The study shall be completed and a report submitted to Congress not later than 3 years after November 15, 1990. The results of the study shall be subject to peer and public review before submitting it to Congress.

42 U.S.C. §7511b.

§7412. Hazardous air pollutants.

[...]

(p) Mickey Leland National Urban Air Toxics Research Center.

[...]

(3) Scientific Advisory Panel. The Board of Directors shall be advised by a Scientific Advisory Panel, the 13 members of which shall be appointed by the Board, and to include eminent members of the scientific and medical communities. The Panel membership may include scientists with relevant experience from the National Institute of Environmental Health Sciences, the Center for Disease Control, the Environmental Protection Agency, the National Cancer Institute, and others, and the Panel shall conduct peer review and evaluate research results. The Panel shall assist the Board in developing the research agenda, reviewing proposals and applications, and advise on the awarding of research grants.

42 U.S.C. §7412.

- CWA.

§1321. Oil and hazardous substance liability.

(a) Definitions.

[...]

(27) the term “best available science” means science that-- (A) maximizes the quality, objectivity, and integrity of information, including statistical information; (B) uses peer-reviewed and publicly available data; and (C) clearly documents and communicates risks and uncertainties in the scientific basis for such projects;

33 U.S.C. §1321.

- SDWA.

§300g-1. National drinking water regulations.

[...]

(b) Standards.

[...]

(3) Risk assessment, management, and communication.

(A) Use of science in decision-making. In carrying out this section, and, to the degree that an Agency action is based on science, the Administrator shall use--

(i) the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and(ii) data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data).

(B) Public information. In carrying out this section, the Administrator shall ensure that the presentation of information on public health effects is comprehensive, informative, and understandable. The Administrator shall, in a document made available to the public in support of a regulation promulgated under this section, specify, to the extent practicable--

(i) each population addressed by any estimate of public health effects;

(ii) the expected risk or central estimate of risk for the specific populations;

(iii) each appropriate upper-bound or lower-bound estimate of risk;

(iv) each significant uncertainty identified in the process of the assessment of public health effects and studies that would assist in resolving the uncertainty; and

(v) peer-reviewed studies known to the Administrator that support, are directly relevant to, or fail to support any estimate of public health effects and the methodology used to reconcile inconsistencies in the scientific data.

[...]

(12) Certain contaminants.

[...]

(B) Sulfate.

(i) Additional study. Prior to promulgating a national primary drinking water regulation for sulfate, the Administrator and the Director of the Centers for Disease Control and Prevention shall jointly conduct an additional study to establish a reliable dose-response relationship for the adverse human health effects that may result from exposure to sulfate in drinking water, including the health effects that may be experienced by groups within the general population (including infants and travelers) that are potentially at greater risk of adverse health effects as the result of such exposure. The study shall be conducted in consultation with interested States, shall be based on the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices, and shall be completed not later than 30 months after August 6, 1996.

42 U.S.C. §300g-1.

§300j-2. Grants for State programs.

[...]

(d) New York City watershed protection program.

(1) In general The Administrator is authorized to provide financial assistance to the State of New York for demonstration projects implemented as part of the watershed program for the protection and enhancement of the quality of source waters of the New York City water supply system, including projects that demonstrate, assess, or provide for comprehensive monitoring and surveillance and projects necessary to comply with the criteria for avoiding filtration contained in 40 C.F.R. 141.71. Demonstration projects which shall be eligible for financial assistance shall be certified to the Administrator by the State of New York as satisfying the purposes of this subsection. In certifying projects to the Administrator, the State of New York shall give priority to monitoring projects that have undergone peer review.

42 U.S.C. §300j-2.

- RCRA.

§6939a. Exposure information and health assessments.

[...]

(b) Health assessments.

(2) Whenever in the judgment of the Administrator, or the State (in the case of a State with an authorized program), a landfill or a surface impoundment poses a substantial potential risk to human health, due to the existence of releases of hazardous constituents, the magnitude of contamination with hazardous constituents which may be the result of a release, or the magnitude of the population exposed to such release or contamination, the Administrator or the State (with the concurrence of the Administrator) may request the Administrator of the Agency for Toxic Substances and Disease Registry to conduct a health assessment in connection with such facility and take other appropriate action with respect to such risks as authorized by section 9604(b) and (i) of this title. If funds are provided in connection with such request the Administrator of such Agency shall conduct such health assessment.

[...]

(e) Periodic reports. The Administrator of such Agency shall issue periodic reports which include the results of all the assessments carried out under this section. Such assessments or other activities shall be reported after appropriate peer review.

42 U.S.C. §6939a.

- CERCLA.

§9604. Response authorities.

[...]

(i) Agency for Toxic Substances and Disease Registry; establishment, functions, etc.

[...]

Any toxicological profile or revision thereof shall reflect the Administrator of ATSDR's assessment of all relevant toxicological testing which has been peer reviewed. The profiles required to be prepared under this paragraph for those hazardous substances listed under subparagraph (A) of paragraph (2) shall be completed, at a rate of no fewer than 25 per year, within 4 years after October 17, 1986. A profile required on a substance listed pursuant to subparagraph (B) of paragraph (2) shall be completed within 3 years after addition to the list. The profiles prepared under this paragraph shall be of those substances highest on the list of priorities under paragraph (2) for which profiles have not previously been prepared. Profiles required under this paragraph shall be revised and republished as necessary, but no less often than once every 3 years. Such profiles shall be provided to the States and made available to other interested parties.

[...]

(7)(A) Whenever in the judgment of the Administrator of ATSDR it is appropriate on the basis of the results of a health assessment, the Administrator of ATSDR shall conduct a pilot study of health effects for selected groups of exposed individuals in order to determine the desirability of conducting full scale epidemiological or other health studies of the entire exposed population. (B) Whenever in the judgment of the Administrator of ATSDR it is appropriate on the basis of the results of such pilot study or other study or health assessment, the Administrator of ATSDR shall conduct such full scale epidemiological or other health studies as may be necessary to determine the health effects on the population exposed to hazardous substances from a release or threatened release. If a significant excess of disease in a population is identified, the letter of transmittal of such study shall include an assessment of other risk factors, other than a release, that may, in the judgment of the peer review group, be associated with such disease, if such risk factors were not taken into account in the design or conduct of the study.

[...]

(13) All studies and results of research conducted under this subsection (other than health assessments) shall be reported or adopted only after appropriate peer review. Such peer review shall be completed, to the maximum extent practicable, within a period of 60 days. In the case of research conducted under the National Toxicology Program, such peer review may be conducted by the Board of Scientific Counselors. In the case of other research, such peer review shall be conducted by panels consisting of no less than three nor more than seven members, who shall be disinterested scientific experts selected for

such purpose by the Administrator of ATSDR or the Administrator of EPA, as appropriate, on the basis of their reputation for scientific objectivity and the lack of institutional ties with any person involved in the conduct of the study or research under review. Support services for such panels shall be provided by the Agency for Toxic Substances and Disease Registry, or by the Environmental Protection Agency, as appropriate.

42 U.S.C. §9604.

- EPCRA.

No mentions of peer review.

- FIFRA.

§136w. Authority of Administrator.

[...]

(e) Peer review. The Administrator shall, by written procedures, provide for peer review with respect to the design, protocols, and conduct of major scientific studies conducted under this subchapter by the Environmental Protection Agency or by any other Federal agency, any State or political subdivision thereof, or any institution or individual under grant, contract, or cooperative agreement from or with the Environmental Protection Agency. In such procedures, the Administrator shall also provide for peer review, using the advisory panel established under subsection (d) of this section or appropriate experts appointed by the Administrator from a current list of nominees maintained by such panel, with respect to the results of any such scientific studies relied upon by the Administrator with respect to actions the Administrator may take relating to the change in classification, suspension, or cancellation of a pesticide. Whenever the Administrator determines that circumstances do not permit the peer review of the results of any such scientific study prior to the Administrator's exercising authority under section 136d(c) of this title to immediately suspend the registration of any pesticide to prevent an imminent hazard, the Administrator shall promptly thereafter provide for the conduct of peer review as provided in this sentence. The evaluations and relevant documentation constituting the peer review that relate to the proposed scientific studies and the results of the completed scientific studies shall be included in the submission for comment forwarded by the Administrator to the advisory panel as provided in subsection (d). As used in this subsection, the term "peer review" shall mean an independent evaluation by scientific experts, either within or outside the Environmental Protection Agency, in the appropriate disciplines.

7 U.S.C. §136w.

§136w-8. Pesticide registration service fees.

(a) Definition of costs. In this section, the term “costs”, when used with respect to review and decision-making pertaining to an application for which registration service fees are paid under this section, means—

(1) costs to the extent that—

(A) officers and employees provide direct support for the review and decision-making for covered pesticide applications, associated tolerances, and corresponding risk and benefits information and analyses;

(B) persons and organizations under contract with the Administrator engage in the review of the applications, and corresponding risk and benefits information and assessments; and

(C) advisory committees and other accredited persons or organizations, on the request of the Administrator, engage in the peer review of risk or benefits information associated with covered pesticide applications;

(2) costs of management of information, and the acquisition, maintenance, and repair of computer and telecommunication resources (including software), used to support review of pesticide applications, associated tolerances, and corresponding risk and benefits information and analyses; and

(3) costs of collecting registration service fees under subsections (b) and (c) and reporting, auditing, and accounting under this section.

7 U.S.C. §136w-8.

- **Toxics Substances Control Act (TSCA).**

§2625. Administration.

[...]

(h) Scientific standards. In carrying out sections 2603, 2604, and 2605 of this title, to the extent that the Administrator makes a decision based on science, the Administrator shall use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed in a manner consistent with the best available science, and shall consider as applicable—

(1) the extent to which the scientific information, technical procedures, measures, methods, protocols, methodologies, or models employed to generate the information are reasonable for and consistent with the intended use of the information;

(2) the extent to which the information is relevant for the Administrator's use in making a decision about a chemical substance or mixture;

(3) the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented;

(4) the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized; and

(5) the extent of independent verification or peer review of the information or of the procedures, measures, methods, protocols, methodologies, or models.

15 U.S.C. §2625.

§2617. Preemption.

[...]

(b) New statutes, criminal penalties, or administrative actions creating prohibitions or other restrictions.

(1) In general. Except as provided in subsections (c), (d), (e), (f), and (g), beginning on the date on which the Administrator defines the scope of a risk evaluation for a chemical substance under section 2605(b)(4)(D) of this title and ending on the date on which the deadline established pursuant to section 2605(b)(4)(G) of this title for completion of the risk evaluation expires, or on the date on which the Administrator publishes the risk evaluation under section 2605(b)(4)(C) of this title, whichever is earlier, no State or political subdivision of a State may establish a statute, criminal penalty, or administrative action prohibiting or otherwise restricting the manufacture, processing, distribution in commerce, or use of such chemical substance that is a high-priority substance designated under section 2605(b)(1)(B)(i) of this title.

[...]

(f) Waivers.

[...]

(2) Required exemptions. Upon application of a State or political subdivision of a State, the Administrator shall exempt from subsection (b) a statute or administrative action of a State or political subdivision of a State that relates to the effects of exposure to a chemical substance under the conditions of use if the Administrator determines that—

(A)(i) compliance with the proposed requirement of the State or political subdivision of the State would not unduly burden interstate commerce in the manufacture, processing, distribution in commerce, or use of a chemical substance;

(ii) compliance with the proposed requirement of the State or political subdivision of the State would not cause a violation of any applicable Federal law, rule, or order; and

(iii) the State or political subdivision of the State has a concern about the chemical substance or use of the chemical substance based in peer-reviewed science; or

(B) no later than the date that is 18 months after the date on which the Administrator has initiated the prioritization process for a chemical substance under the rule promulgated pursuant to section 2605(b)(1)(A) of this title, or the date on which the Administrator publishes the scope of the risk evaluation for a chemical substance under section 2605(b)(4)(D) of this title, whichever is sooner, the State or political subdivision of the State has enacted a statute or proposed or finalized an administrative action intended to prohibit or otherwise restrict the manufacture, processing, distribution in commerce, or use of the chemical substance.

15 U.S.C. §2617.

§2605. Prioritization, risk evaluation, and regulation of chemical substances and mixtures.

[...]

(b) Risk evaluations.

[...]

(E) Metals and metal compounds. In identifying priorities for risk evaluation and conducting risk evaluations of metals and metal compounds, the Administrator shall use the Framework for Metals Risk Assessment of the Office of the Science Advisor, Risk Assessment Forum, and dated March 2007, or a successor document that addresses metals risk assessment and is peer reviewed by the Science Advisory Board.

15 U.S.C. §2605.

Response: EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. If implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

Comment: Commenter (1981) states that, where the issue of raw data collection has been raised, the courts have permitted the EPA to use studies like the fish surveys. The commenter notes that in *Coal of Battery Recyclers*, the United States Court of Appeals for the District of Columbia Circuit held that the EPA could use non-public data in order to support its regulation of the

amount of lead in ambient air.³²⁵⁶ The commenter adds that, in another case using non-public data, epidemiological studies protected elderly Americans from cardiopulmonary disease caused by a contaminated respiratory environment.³²⁵⁷ The commenter provides that the Uinta Basin ozone concentrations in Colorado were found by the EPA to exceed the NAAQS on the basis of non-public data.³²⁵⁸

Commenter (1981) states that, occasionally, studies use data that is not publicly available, often because the research focuses on medical issues and patient privacy is protected under other federal laws. The commenter provides that this research is reviewed by experts in the field before it is ever considered for policy development. The commenter states that it is both pragmatic and efficient to recognize that the EPA delegates review of raw data to experts. The commenter states that it was for this reason that in *Coal of Battery Recyclers*, the court made a distinction between the EPA's "reliance on a study's results from its reliance on the raw data underlying such results."³²⁵⁹ The commenter contends that the proposed rule unrealistically suggests that the EPA cannot and will not utilize the peer review that it has delegated in cases like *Battery*.

Response: The rule does not preclude EPA from considering studies with non-publicly available data, so it does not conflict with those decisions.

The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted access in this rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. This rule does not require the EPA to disclose or host data, but to determine if data and models are available and to give greater consideration to those studies for which data and models are available. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Further, although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science are unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, a study with underlying dose-response data that

³²⁵⁶ *Coal. of Battery Recyclers Ass'n v. EPA*, 390 U.S. App. D.C. 305, 315, 604 F.3d 613, 623 (2010) (The Lanphear study studied the relationship between blood lead levels and IQ changes, providing evidence for the effects of lead on IQ at blood lead levels below 10 [mu]g/dL and for the nonlinearity of these effects).

³²⁵⁷ *Am. Trucking Ass'ns v. EPA*, 283 F.3d 355, 370 (D.C. Cir. 2002).

³²⁵⁸ *Miss. Comm'n on Env'tl. Quality v. EPA*, 416 U.S. App. D.C. 69, 86, 790 F.3d 138, 155 (2015).

³²⁵⁹ *Coal. of Battery Recyclers Ass'n v. EPA*, 390 U.S. App. D.C. 305, 315, 604 F.3d 613, 623 (2010).

are not available should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. The EPA could also give pivotal science with underlying dose-response data that are unavailable for independent validation full consideration upon receiving an exemption from the requirements of this rule from the Administrator, as detailed under 40 CFR 30.7. One of the criteria the Administrator may use in his/her determination to grant a waiver is that making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, CBI, or national security. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Comment: Commenter (6194) states that EPA's own SAB, which Congress created in 1978 to provide scientific advice to EPA, 42 U.S.C. § 4365(a), challenged EPA's failure to solicit SAB's input on the proposal—pointing out that it was not even aware of the proposal until it was published in the *Federal Register* and discussed in news articles. According to the commenter, given that EPA should have provided the proposal to another federal agency to review, EPA was also required to make the proposal available to the SAB, along with any relevant scientific and technical information on which the proposal was based. 42 U.S.C. § 4365(c).

Commenter (6916) asserts that EPA failed to confer with its chartered SAB, and seek its input, as required under the Environmental Research Development and Demonstration Authorization Act (ERDDAA), 42 U.S.C. § 4365(c)(1), even though EPA claims authority under the CAA, and admits in the proposal that it is a “significant regulatory action” submitted to OMB for review.³²⁶⁰ The commenter states that, as EPA's SAB recently wrote to the Administrator, a proposal like this, which “focus[es] on the EPA's foundational policies related to the use of science in rulemaking and policy development,” is within the SAB's purview and should have

³²⁶⁰ 42 U.S.C. § 4365(c)(1)(requiring, inter alia, EPA to make available to the SAB any CAA rule that is provided to any other Federal agency for formal review and comment); 83 Fed. Reg. at 18,772; see also Bad Science Fiction, supra note 14 at 79-80 & n. 66 (“Science advisory boards are mandatory for EPA's promulgation of air quality standards and for regulatory action on pesticides. See 7 U.S.C. § 136w(d)-(e) (requiring the scientific advisory panel established under FIFRA to review the scientific basis for major regulatory proposals concerning pesticides and to adopt peer-review procedures for scientific studies carried out pursuant to FIFRA); 42 U.S.C. § 7409(d)(2)(B)-(C) (2000) (establishing the Clean Air Scientific Advisory Committee (CASAC) to review EPA's ambient air quality standards)....D...[S]ee also 42 U.S.C. 4365(c)(1) (2000) (establishing a science advisory board to review scientific and technical information relevant to any proposed action under EPA's authority if EPA is forwarding the proposal to any other federal agency for formal review). The FDA, EPA, and OSHA each has advisory bodies available to them for various regulatory activities, but the agencies are not required to seek their assistance. See, e.g., 42 U.S.C. 4365 (2000) (creating a Science Advisory Board to assist EPA in its research initiatives and science-based regulatory determinations). EPA's SAB “has played an increasingly influential role in reviewing the agency's science....The agencies have also developed, without legislative direction, a variety of peer review and science consensus panels. The NIH, for example, has developed an innovative expert panel to reach consensus on issues of medical import.”).

been submitted to it for review.”³²⁶¹ The commenter states that EPA’s failure even to submit the proposal to SAB review, never mind take account of the SAB review results, is evidence of the arbitrary and capricious nature of this whole undertaking.³²⁶²

Response: The EPA received comments from the SAB on the 2018 NPRM and 2020 SNPRM on April 24, 2020. The EPA considered these comments (EPA-SAB-20-005) in development of the final rule. In brief, the SAB consensus was that it supported the precept of enhancing public access to scientific data and analytical methods to ensure scientific integrity, consistency, and robust analysis and their consensus recommendations were that the EPA develop additional policy and/or guidance documents; further describe how pivotal science would be selected, made available, and peer reviewed; consider establishing an office on data sharing with the support of a peer review panel; provide greater clarity in the definitions of key terms, including data, independent validation, and publicly available; develop specific criteria for the Administrator’s exemptions under the rule; consider applying rule requirements only to information developed after the effective date of the rule; seeking input from experts to identify best practices to ensure efficiency, utility, and protection of data that are made available; and consider funding reanalysis work.

As noted in the preamble for the final rule, this rule sets the overarching structure and principles for transparency of pivotal science in significant regulatory actions and influential scientific information and technical considerations, including those noted by the SAB, could be addressed in subsequent implementation guidelines and/or statute-specific rulemakings. Further, in response to comments from SAB and the public, the EPA clarified and modified several key definitions, including data, independent validation, and publicly available, in the final rule. The EPA also provided criteria for the Administrator’s exemption in 40 CFR 30.7 of the final rule. The EPA would like to clarify that this rule does not direct or require any outside entity or the EPA to establish data sharing mechanisms and does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. Comments related to making data available and future funding opportunities are not within the scope of this rulemaking. Finally, the EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. However, in consideration of instances where data cannot be made available, the EPA amended the rule to provide technical considerations (40 CFR 30.5(d)) that can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability in the absence of maximum transparency and included an exemption criterion—that the development of the dose-response data was completed or updated before the effective date of the rule—to 40 CFR 30.7 to account for the concerns raised by the SAB and other public commenters.

³²⁶¹ Letter from Dr. Michael Honeycutt, Chair, EPA SAB, to Administrator Scott Pruitt, EPA, at 3 (June 28, 2018). See also Memorandum from Alison Cullen, Chair, SAB Work Group to Members of the Chartered SAB (May 12, 2018) (raising numerous and significant concerns with the Proposal).

³²⁶² *Public Employees v. Hopper*, 827 F.3d 1077, 1083 (D.C. Cir. 2016) (holding that where an agency relies “solely on data...roundly criticized by its own experts, [it] fail[s] to fulfill [its] duty” to exercise its discretion in a reasoned manner.).

Comment: Commenter (6916) asserts that the proposal is not consistent with OMB and EPA Guidelines under the Data Quality Act. The commenter states that the Data Quality Act, in force since the early 2000s, directs transparency in analysis and a process for questioning the results of science used in Agency decision making.³²⁶³

Commenter (6916) asserts that longstanding statutory authorities govern the quality, objectivity, utility, and integrity of scientific data relied on by federal agencies, as implemented by policies and formal guidelines in place for decades. The commenter states that these authorities have been effective at ensuring the quality of studies relied on by EPA, offering a process for questioning study results and for the controlled reanalysis or use in new studies of sometimes confidential or proprietary human health data and models. The commenter notes that adding additional regulatory requirements and constraints is both impractical and unnecessary.

Response: The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. This rule is designed to build upon OMB M-19-15, which highlights the need to characterize the sensitivity of an agency's conclusions to analytic assumptions, as well as other federal guidance documents that require greater data transparency.

These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. As described in preamble discussion of costs and benefits, the EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small. Furthermore, as the final rule makes clear, if implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

Comment: Commenters (6119, 6916) assert that the FOIA also offers a pathway for the release of data that have been the basis of Agency decisions. Commenter (6916) states that the FOIA exempts from "public" disclosure are "medical files and similar files the disclosure of which would constitute a clearly unwarranted invasion of personal privacy."

³²⁶³ See generally, Curtis Copeland & Michael Simpson, CRS Report to Congress, The Information Quality Act: OMB's Guidance, and Initial Implementation, (Aug. 19, 2004) (describing the Act's history and the OMB implementing Guidelines).

Response: The rulemaking does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (0844) notes that the EPA proposal is consistent with policies on scientific integrity espoused by previous administrations. The commenter states that, for example, President Obama encouraged, “transparency in the preparation, identification, and use of scientific and technological information in policymaking” in a March 2009 Presidential Memorandum.

Response: The EPA agrees that the Agency and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. The requirements in the final rule build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information.

13.2.3.3 Other Existing Means to Determine the Validity of Studies

13.2.3.3.1 Administrative Procedure Act (APA)

Comment: Commenters (4534, 6108, 6153, 6171, 6358, 6446, 6901, 6922) suggest that the current process is already transparent because EPA rulemaking provides opportunity for public review and comment.

Commenter (4534) asserts that the comment period provides opportunities for industry to validate or challenge the assumptions that have been made based on the data used to develop the regulation. The commenter states that regulations’ quality should also improve as the authors will know that industry will be validating their conclusions from the data provided.

Commenter (6108) states that, if EPA has concerns about whether to use a study because it appears that the conclusions are based on faulty science, it is the EPA’s duty to investigate the study further and make its concerns known in the rulemaking process. The commenter adds that,

if the public has concerns on a study used by the EPA, those concerns and any counter studies may be raised in the rulemaking process.

Commenter (6446) asserts that the ultimate safeguard to assure that EPA regulatory action is based on high quality science is the fact that EPA's regulatory action is subject to the notice and comment requirements of the APA (APA, 6 I.J.S.C. § 553) and ultimately to judicial review. The commenter states that, to the extent that scientific information proposed as a basis for regulatory action falls short, the APA provides members of the public, regulated businesses and other scientists an opportunity to comment to the agency about those shortcomings and to submit contrary studies and information for agency consideration. The commenter notes that, following adoption of a regulation, interested parties may seek judicial review to determine whether it is arbitrary, capricious or lacking in evidentiary support. (5 I.J.S.C. § 706.) The commenter asserts that the APA requirements, and the opportunity for judicial review of EPA's regulatory action, protect against the adoption of regulations that lack high-quality scientific support.

Commenter (6901) notes that states can openly question the validity of studies during the comment period for the proposed rule. The commenter suggests that the rulemaking docket provides open access and transparency now for states to examine the basis for new rules. The commenter contends that states can review what scientific studies were used in the preparation of the proposed rule and enough detail is provided to judge whether these studies support EPA's conclusions. The commenter adds that, during this time, states can also recommend additional studies that they believe EPA should consider in developing the final regulations. The commenter notes that, in the future, EPA can enhance the opportunity for input by consistently allowing a minimum 90-day comment period for new/revised rules. According to the commenter, early involvement by states, as co-regulators, in the early stages of the regulatory development process (pre-proposal) will allow states even more opportunity to provide input on the science used to support the new rules. The commenter adds that, beyond the science, involving states as early as possible in the regulatory development process means the resulting regulations can be effectively implemented and public health protection enhanced.

Commenter (6922) states that the EPA follows a robust public notice and comment process for its significant rulemakings. Where the public has valid reason to doubt the assumptions or data underlying a particular study, or is aware of a study that EPA has not considered, the commenter notes that the public can share conflicting studies and other information with EPA during the public participation process of the rulemaking. The commenter asserts that the EPA is obliged to exercise independent reasoned judgment to disregard information the Agency deems unreliable or biased. The commenter states that this is the traditional, well-settled process of reasoned administrative rulemaking.

Response: The EPA agrees that existing mechanisms within the EPA, the federal government, and in the scientific community are increasingly pushing towards greater data sharing and increasing scientific rigor. The EPA supports these efforts and is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The EPA believes that codifying internal procedures aimed at prioritizing

transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety.

As described in the final rule, the EPA will use existing factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) to evaluate study quality. When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science. Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. In compliance with the rule, the EPA shall give greater consideration to evidence, findings, and conclusions of pivotal science where the underlying dose-response data are available in a manner sufficient for independent validation. When the dose-response data underlying pivotal science are not publicly available in a manner sufficient for independent validation, the EPA will give less consideration to the studies' evidence, findings, and conclusions unless the Administrator grants an exemption request.

Although current methods and processes do allow for public comment and, where appropriate, peer review in the development of significant regulatory actions and influential scientific information, subject matter experts, peer reviewers (including the SAB and other science advisory panels), and the courts generally have not had access to the underlying data necessary to fully evaluate scientific conclusions. EPA does not take the position that studies for which the underlying data are not publicly available are per se invalid. Rather, EPA acknowledges that where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. The EPA is confident that this approach will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

13.2.3.3.2 Bradford Hill Criteria (BHC)

Comment: Commenter (4541) asserts that, given its constrained mission, flawed paradigm, political pressures on it to chase the impossible goal of zero risk, and evidence of actual corruption, there can be no confidence in any science produced by EPA in justification of its regulations. The commenter states that much of the controversy over the impact of air pollution on humans is due to the assumption by policymakers, regulators, and advocates that evidence of an association between a chemical in air or water and a human health effect is evidence that the chemical causes that effect. The commenter states that, because distinguishing between coincidence and correlation, on the one hand, and causal relationships on the other can be very difficult in matters of public health, an English epidemiologist named Sir Austin Bradford Hill (1897–1991) established in 1965 what has become known as the BHC, nine minimal conditions necessary to provide evidence of a causal relationship between a physical cause (in this case an air pollutant) and a health effect (illness or mortality). The commenter suggests that a better way to determine the validity of studies is to consider the BHC and other requirements of the scientific method.

Response: The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety. The EPA’s attention to data transparency is consistent with federal initiatives on open data and responsive to the broader interest in greater data and model transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members of the public, scientific community, and Congress on the transparency of the scientific basis for EPA’s decisions in previous influential scientific information assessments and regulatory actions. The EPA’s continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency’s decisions.

13.2.3.3.3 FOIA

Comment: Commenter (6955) asserts that the proposal does not mention current FOIA procedures for providing access to researcher data from federal research and from privately funded research submitted to EPA for consideration. The commenter states that, hence, there is no discussion of the differences, between the two approaches and no claim that the new proposal offers any added value to the current situation. The commenter contends that, by omitting mention of the OMB and IQA FOIA options, the proposed rule gives the impression it is a public-access rule, rather than a study exclusionary rule.

Response: FOIA processes are not the subject of this rulemaking however, in response to comments received, the EPA is modifying the definition in the final rule to add the following at the end of the “publicly available” definition: “The public must be able to access the information on the date of publication of the proposed rule (or, as appropriate, a supplemental notice of proposed rulemaking, or notice of availability) for the significant regulatory action or on the date of dissemination of the draft influential scientific information for public review and comment.”

13.2.3.3.4 Good Laboratory Practices (GLP)

Comment: Commenter (0044) states that, under its GLP inspection program, EPA already has a program “available to the public for validation in a manner that honors legal and ethical obligations to reduce the risks of unauthorized and re-identification.” The commenter provides that the following is taken from EPA’s Good Laboratory Practices Standards Compliance Program:

EPA conducts inspections as part of its GLP program to monitor compliance with the regulations to assure that studies submitted to the Agency in support of a pesticide registration or under a testing consent agreement for an industrial chemical were done with integrity, are of good quality and valid.

Commenter (6161) recommends the Agency adopt a requirement that studies that warrant consideration as key or pivotal studies conform with GLP or “the spirit of GLP” in order to promote the goal of relying on reproducible data. The commenter states that, whether in the “pure” sciences or regulatory sciences, the principal reason for requiring transparency of scientific data is to enable reproducibility studies and validation. The commenter states that, for the Agency to require transparency but ignore findings of irreproducibility defeats the purpose. The commenter notes that the Agency requires that scientific testing data submitted by industry as the basis for product registrations, hazard evaluations, or other purposes comply with GLP.³²⁶⁴ The commenter states that the reason for the requirement is to ensure that the Agency’s evaluations are based on data of sufficient quality, rigor and reproducibility.³²⁶⁵ The commenter states that, recognizing that not all provisions specified by formal GLP programs can be applied to all studies, the concept of the spirit of GLP is often adopted by regulatory agencies and study sponsors. The commenter provides the following additional information regarding GLP:

The Organization of Economic Cooperation and Development (OECD) defines GLP as ...a quality system concerned with the organizational process and the conditions under which non-clinical health and environmental safety studies are planned, performed, monitored, recorded, archived and reported. The definition of GLP makes clear that the principles of GLP are applicable to all scientific studies, not just to “guideline studies.”³²⁶⁶ In the environmental sciences, the regulated community often adopts a requirement that a laboratory, contractor, or grantee follow “the spirit of GLP” as a condition of funding a study that may serve a regulatory purpose. In practice, conforming with the spirit of GLP involves preparation of a protocol that describes the details of a study. The description includes safety precautions, lists of required equipment, sampling procedures, chains of custody, analytical methods, sample archiving, QA and QC measures, calculating and reporting results, and predefining and documenting criteria for including or excluding data to help avoid bias. As a study progresses, changes may be required. A GLP-compliant protocol describes procedures for amending the protocol to record the changes. In this way, protocols promote successful study replication and assist

³²⁶⁴ <https://www.epa.gov/compliance/policy-good-laboratory-practices-advisories-compliance-monitoring>

³²⁶⁵ <http://www.oecd.org/chemicalsafety/testing/oecdseriesonprinciplesofgoodlaboratorypracticeglpandcompliancemonitoring.htm>

³²⁶⁶ Such as guidelines for pesticide registration studies, <https://www.epa.gov/pesticide-registration/data-requirements-pesticide-registration>

in the types of detailed peer reviews that can (and should) be a feature of regulatory science.

In the environmental sciences, adherence to GLP principles is not uniform. Scientific studies sponsored by the regulated community to meet regulatory requirements are likely to conform with GLP. However, it has been PCTC's experience that studies in the environmental sciences conducted in some academic institutions and non-regulatory government agencies show little or no evidence of conforming with GLP. We have found protocols prepared by government agencies that would be rejected out-of-hand by EPA if submitted by industry in support of product registration or evaluation. Scientist-to-scientist requests and FOIA responses sometimes demonstrate the complete absence of protocols or even something as simple as an outline of a study design. Quality control measures for analytical chemistry are generally in place, but quality management for other aspects of environmental studies seems to be the exception rather than the rule.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information, and does not prescribe conformity with GLP or other laboratory practices. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. Also, the rulemaking does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (2907) states that the proposed regulation directs the EPA to use industry-sponsored studies by requiring it to use studies that follow "standardized test methods" and "good laboratory practices." According to the commenter, these are industry standard practices, not academic research practices which use state-of-the-art methods. The commenter notes that standardized test methods are industry-sponsored studies designed to gain regulatory approval of the test substance. The commenter also notes that industry test studies have been required to follow good laboratory practices since the 1970s after flagrant test violations and fraud were identified.³²⁶⁷ The commenter contends that, in contrast, academic research is the cutting edge of methods development, and must meet IRB approval, which sets high scientific and ethical standards of conduct.

Commenter (6109) notes that the proposal states that where "available and appropriate, EPA will use peer-reviewed information, standardized test methods, consistent data evaluation procedures, and good laboratory practices to ensure transparent, understandable and reproducible scientific assessments." The commenter states that, with this statement, EPA is displaying a bias toward industry-backed research over research from independent and university scientists. The commenter states that GLP, a protocol that federal regulators apply to industrial laboratories, is infrequently used outside of industry because GLP is expensive and does not reflect science quality. The commenter states that GLP regulations mandate methods for archiving data, record

³²⁶⁷ A 2014 National Academies of Sciences report documented limitations in these standards, including that they fail to prevent flawed, unreliable or biased-by-design studies (NAS IRIS report, p.62-63).

keeping, equipment calibration, etc., but they do not influence research design or methodology. The commenter states that academic researchers (who are frequently federally funded), on the other hand, follow scientific processes that are subject to the rigors of peer review and independent replication. The commenter states that, if EPA is to truly use the "best available science," it must focus on studies that use appropriate protocols and techniques, not merely favored record keeping processes.

Commenter (6122) asserts that adoption of "Good Laboratory Practices" would prevent the EPA from using the best available science. The commenter states that independent research that does not follow GLPs could be deemed "qualitative" by the EPA and therefore, by definition under EPA guidance, not valid for use in establishing thresholds. According to the commenter, this "qualitative" research can be fundamental in establishing cause and effect, result in seminal publications, and often funded by the United States government. The commenter asserts that EPA must use the most sensitive study that passes the rigor of independent peer-review in establishing protective thresholds.³²⁶⁸ The commenter contends that GLPs are not an acceptable way of judging scientific quality and should only be used as an inclusion criterion for research where there appears to be some incentive for fraud.³²⁶⁹

Commenter (6122) asserts that, while GLPs became guidelines to prevent fraud in industry science by requiring high numbers of replicates and model test systems, public health studies from universities or other non-industry sources do not need — and would not benefit — from GLPs. The commenter notes that providing raw data or using extensive replicates is rarely a requirement for scientific publication, yet published research is how most scientists communicate their findings and it is the way science is able to progress in every single field. The commenter adds that the precarious funding of most academic and governmental research precludes the inclusion of many GLPs, since following them makes it cost prohibitive to conduct studies but in no way makes conclusions less scientifically valid. The commenter contends that there is no reasonable or rational basis for ignoring a peer-reviewed, published study that does not follow GLPs. The commenter provides that a 2012 Scientific Advisory Panel on atrazine stated that: “

In the view of the Panel, the test design elements [GLPs] should not be applied so strictly to the published literature as to disqualify all studies that do not meet all of these criteria...In the Panel's analysis, the EPA's strict application of the test design elements to the published literature was flawed and many of the test design elements should be relaxed for review of the published literature.³²⁷⁰

³²⁶⁸ U.S. EPA Evaluation Guidelines for Ecological Toxicity Data in the Open Literature https://www.epa.gov/pesticide-science-and-assessing-pesticide-risks/evaluation-guidelines-ecological-toxicity-data-open#_2_1_2.

A Set of Scientific Issues Being Considered by the Environmental Protection Agency Regarding: Problem Formulation for the Reassessment of Ecological Risks from the Use of Atrazine. Document ID EPA-HQ-OPP-2012-0230-0220 Pg. 15. <https://www.regulations.gov/document?D=EPA-HQ-OPP-2012-0230-0220>

“A study could be considered a high-quality study and very useful in risk assessment (even quantitative assessment), even if some of these design elements are not met.”³²⁷¹

Commenter (6940) does not support the proposed requirements to use GLP.³²⁷² The commenter asserts that GLP does not ensure “good” science or use of optimal study design and analyses, while government-supported, peer-reviewed science had evolved to improve reproducibility. The commenter states that optimal regulatory science depends upon both scientifically valid data and credible data. GLP is only designed to generate and analyze data following specific protocols.³²⁷³ The commenter notes that peer-reviewed science, on the other hand, can address both data needs required for regulatory science. The commenter adds that this is true now, more so than ever, given that the National Institutes of Health (NIH)³²⁷⁴ has new requirements for outlining components contributing to rigor and reproducibility. The commenter provides the following are two examples of the lack of scientific (vs. procedural) rigor inherent in GLP:

First, toxicological assessments of bisphenol A (BPA) by scientists following GLP and those conducting experimental toxicology studies came to disparate conclusions over the low dose toxicity of BPA.³²⁷⁵ However, the GLP studies failed to use a sensitive strain of mouse and failed to show effects of a positive control, compromising the scientific validity of the studies. Further, adverse outcomes measured in GLP studies of BPA tend to be of low sensitivity. On the other hand, hundreds of independent studies by multiple experimental toxicologists have confirmed the low dose toxicity of BPA.

Second, GLP is used as an approach in pharmaceutical safety testing, where its shortcomings also have been revealed. Guth and Pugsley³²⁷⁶ present an example of a GLP-compliant study of cardiovascular effects of a therapeutic drug using instrumented dogs (telemetry-based data acquisition). Significant flaws in the experimental design (e.g. use of non-naïve dogs, failure to acclimate the dogs to the instrumentation or the study environment, insufficient power in the study design, insufficient demonstration of the signal quality from the telemetry system) which led to high variability in the data and difficulties in interpreting the data.

Response: The EPA would also like to clarify that the purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information, and does not prescribe conformity with GLP or other standard practices. The EPA is also not categorically excluding

³²⁷¹ Id.

³²⁷² Where available and appropriate, EPA will use peer-reviewed information, standardized test methods, consistent data evaluation procedures, and good laboratory practices to ensure transparent, understandable, and reproducible scientific assessments.

³²⁷⁶ Guth BD and Pugsley MK. (2017). GLP in safety pharmacology studies: report card after 15 years. *Pharmacol Toxicol Methods*. 87:24-26. PMID: 28192184 DOI: 10.1016/j.vascn.2017.02.016

any studies from consideration when promulgating final significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will subsequently consider the availability of underlying dose-response data when evaluating pivotal science and give greater consideration to studies where the underlying dose-response data are available for independent validation. Including this review of dose-response data availability for pivotal science is critical to ensuring confidence in the EPA's decision-making because it supports the scientific reanalysis and scrutiny by independent third parties for pivotal science. This approach will result in final significant regulatory actions and influential scientific information based on the highest quality studies that maximize transparency, leading to human health and environmental protections consistent with the statutes the EPA administers.

13.2.3.3.5 Implement Existing Guidelines, Plans, Policies, and Programs

General

Comment: Commenter (4595) states that there exist federal guidelines that provide access to and ensure the quality of scientific information used for federal policies and regulation which also emphasize the necessity to maintain needed privacy or assurance of suitable confidentiality.³²⁷⁷ The commenter states that there are also procedures for providing protected, limited access to the full raw data to independent researchers for independent validation without making the full data publicly available. The commenter states that these procedures negate the need for this proposed rule, as they respect privacy laws and bona fide practices used by the scientific community.

Response: The EPA is finalizing internal procedural requirements for how the Agency will consider the availability of underlying dose-response data of pivotal science when promulgating a significant regulatory action or developing influential scientific information that relies on dose-response data. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Implementation of this rule, which will occur in forthcoming statute-specific transparency regulations or programmatic regulations, will increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information. The requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards

³²⁷⁷ Part IX OMB Fed Reg 67:36, "Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies."

prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

Comment: Commenter (4839) states the proposed transparency rule is not based on scientific best practices, and it is inconsistent with transparency processes administrated by major business organizations, academia and the federal government. The commenter states that, for example, EPA proposes that "data and models" become publicly available and be subject to additional, time-consuming and expensive validation and analysis; by contrast, the American Petroleum Institute (API) has maintained for decades a transparency policy that enables a university investigator receiving a grant to retain ownership of the scientific data generated in a study it has funded. The commenter states that, similarly, the American Chemistry Council (ACC) has a long-standing policy through its Long-Range Research Initiative that provides external scientific investigators to retain ownership of their data even while encouraging these researchers to publish their results in the open scientific literature. The commenter states that EPA, other federal agencies and universities have long abided by policies with similar principles and practices.

Response: The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. This rule is designed to build upon OMB M-19-15 (Ref. 18), which highlights the need to characterize the sensitivity of an agency's conclusions to analytic assumptions, as well as other federal guidance documents that require greater data transparency (Ref. 18). The EPA's attention to data transparency is also responsive to the broader interest in greater data and model transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members of the public, scientific community, and Congress on the transparency of the scientific basis for EPA's decisions in previous influential scientific information assessments and regulatory actions (Refs. 19, 20, 21, 22, 23). The EPA's continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency's decisions.

Comment: Commenter (6899) states that EPA's goal to strengthen regulatory science transparency is attainable without adding this regulation to the federal collection. The commenter states that EPA must require enforcement of the existing federal rules that strengthen this kind of transparency. The commenter states that, for example, the IRB process and the Health Insurance Portability and Accountability Act of 1996 (HIPAA) Privacy Rule requirements exist to protect privacy, confidentiality, safety and security when conducting scientific studies and reporting scientific results. The commenter states that EPA and other federal agencies already spend a significant amount of taxpayer dollars to enforce these federally required processes.

Response: This is a rule of internal procedure promulgated under the EPA's housekeeping authority. This rule does not direct or require any outside entity or the EPA to establish data sharing mechanisms and does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. This rule does not impact rules developed and overseen

by other federal organizations, including rules governing the IRB process and privacy under HIPAA.

Comment: Commenter (6122) contends that, even where EPA may have some legitimate concern about underlying data, there are existing approaches that address those concerns without this rule, such as allowing EPA itself to examine underlying data in a secure manner. In short, the commenter suggests that the EPA can ameliorate any concerns about underlying data either by continuing to address these issues on a case-by-case basis, or by developing guidance for reviewing underlying data in a manner that both preserves confidentiality and any other legitimate interests.

Response: As discussed in the preamble of the final rule, the EPA, the federal government, and the scientific community are increasingly pushing towards greater data sharing and increasing scientific rigor. The EPA supports these efforts and is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The EPA believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety.

Food and Drug Administration (FDA)

Comment: Commenter (5041) suggests that, instead of requiring all scientific research used to make EPA policy, regulation or guidance be based on publicly available datasets, EPA can adopt the long established and proven processes and procedures used by FDA. The commenter states that this ensures that privacy laws and concerns are met while having the most robust numbers of studies to ensure sound scientific policy/regulation/guidance making where the public may bear the cost or harm of said policy/regulation/guidance. The commenter states that the FDA decision making process to either approve or clear new/changed medical devices has a proven track record in ensuring that good decisions are made using the current regulatory policies, regulations, and/or guidance, i.e., publicly available datasets are not required. The commenter notes that, like the FDA, EPA uses studies that may include participant privacy issues, including ensuring protected health information (PHI), is not disclosed as required by law. The commenter provides that every study using human participants includes participant consent ensuring their privacy is ensured while stating that domestic and/or international regulatory agencies may have controlled/private access to the data when ensuring that the conclusion(s) made by the study sponsor are correct and meet the study objective(s) and endpoint(s). According to the commenter, peer-reviewed and published scientific research has also never required studies to be supported by publicly available datasets. The commenter notes that, while there are examples of conclusions being revised based on further independent review of the data or of researchers dry-labbing (falsifying) the data, we have a substantive history of the peer-review process ensuring reliable evidence is presented to the public.

Response: This is a rule of internal procedure promulgated under the EPA's housekeeping authority. This rule does not impact rules developed and overseen by other federal organizations (e.g., FDA), including rules governing the IRB process and privacy under HIPAA. The EPA is requiring that, when promulgating significant regulatory actions or developing influential scientific information, the Agency will determine which studies constitute pivotal science and give greater consideration to those studies determined to be pivotal science where the underlying dose-response data are available in a manner sufficient for independent validation. Focusing the final rule requirements on the underlying dose-response data is intended to address public comments concerning clarity of the rule, potential unintended consequences, and the potential for far-reaching impacts. The requirements provide a workable framework for EPA to evaluate pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

IRIS

Comment: Commenter (6133) asserts that the EPA chemical assessment program, called the IRIS already uses credible transparent methods to provide the public with reliable, transparent, credible chemical hazard assessments and toxicity values. The commenter states the program received high praise from its last two reviews by the NAS (NAS 2014 and NAS 2018), as well as from the SAB (SAB 2017) for its continuous improvements and successes in its methods for evaluating and integrating scientific evidence from various streams including human studies, animal studies, and mechanistic studies. The commenter contends that the proposed rule would undermine decades of expert work to advance successful data evaluation methods described in the systematic review approach now underway in the EPA IRIS program.

Response: The EPA disagrees that implementation of the final rule requirements would undermine the Agency's work. When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly

available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA may still use pivotal science when the underlying data are unavailable after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

2013 White House Office of Science and Technology Policy (OSTP) Memorandum/EPA's Plan to Increase Access to Results of EPA-Funded Scientific Research

Comment: Commenters (6191, 6924) support implementation of the 2013 White House OSTP memorandum and EPA's Plan to Increase Access to Results of EPA-Funded Scientific Research.³²⁷⁸ Commenter (6924) states that, to increase public access to science funded and used by the government, EPA should ensure it is in full compliance with the provisions of the OSTP memo. Commenter (9224) asks what is the status of the OSTP plan is and what does the proposed rule cover that this document does not regarding data funded and produced by EPA? Commenter (6191) states that the OSTP plan reflects an understanding of the need for maintaining balance between the desire to public access to data and the responsibility to protect data providers and their subjects; however, the proposed rule extends the intent for public access beyond reasonable expectations.

Commenter (6191) provides that two sections of the OSTP plan that address current sharing of information are:

1. "EPA has a long history of collaboration in scientific research and is a leader in providing access to environmental information to encourage better decisions and a more informed public. Transparency is a core EPA value. The Agency already makes publicly available much of the Agency's scientific and technical work, including information that supports regulatory decisions. For example, EPA provides all materials and scientific information supporting each regulation in public dockets, which are publicly available for comment at www.regulations.gov. In addition, the Agency maintains an enterprise dataset metadata catalog (the Environmental Dataset Gateway (EDG) at <https://edg.epa.gov/metadata/catalog/main/home.page>) through which thousands of EPA datasets are publicly available. EPA's Enterprise Information Management Policy (EIMP), adopted March 3, 2015, codifies the Agency's approach to facilitating access to data held in EPA information systems. Appendix D describes, in more detail, a small

³²⁷⁸ Executive Office of the President, Office of Science Technology and Policy. Memorandum for the Heads of Executive Departments and Agencies: Increasing Access to the Results of Federally Funded Scientific Research. February 22, 2013. Available: https://obamawhitehouse.archives.gov/sites/default/files/microsites/ostp/ostp_public_access_memo_2013.pdf

sample of EPA’s extensive ongoing efforts to be transparent and to increase access to environmental information.” (page 4)

2. “While the Agency strives to increase access to its research results, it recognizes, consistent with the OSTP Memo, that Federal agencies have a responsibility to protect confidentiality and personal privacy, respect proprietary interests and property rights, and balance between the value of providing long-term access and its associated costs. It is important to recognize that some research data cannot be made fully available to the public but instead may need to be made available in more limited ways, e.g., establishing data use agreements with researchers that respect necessary protections. Whether research data are fully available to the public or available to researchers through other means does not affect the validity of the scientific conclusions from peer-reviewed research publications.”

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum “Increasing Access to the Results of Federally Funded Scientific Research” and the 2016 EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research.” EPA researchers, grantees and contractors are required to make peer reviewed journal articles and the underlying data resulting from EPA-funded research accessible to the public. This final rule applies to pivotal science that was not funded by the EPA and requires the EPA to evaluate the availability of an earlier stage of data (the data that are ready to be analyzed to extract relevant information) than the stage of data required to be available under the 2016 EPA plan. As discussed more fully in the preamble of the final rule, the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

CONSORT, ARRIVE and STROBE

Comment: Commenter (6924) suggests EPA focus on implementing existing initiatives and guidelines for improving data sharing and transparency at federal agencies. The commenter states that, through collaborative efforts, academia, medical scientists, industry and publishers have developed several protocols and guidelines specifically designed to improve reporting and evaluation of studies that will improve the quality and transparency of the interpretation of findings. The commenter adds that protocols and guidelines, such as CONSORT,³²⁷⁹ Animal Research: Reporting of *In Vivo* Experiments (ARRIVE)³²⁸⁰ and Strengthening the Reporting of Observational studies in Epidemiology (STROBE),³²⁸¹ do not require public access to all study

³²⁷⁹ Moher D, Jones A, Lepage L, for the CONSORT Group for the C. Use of the CONSORT Statement and Quality of Reports of Randomized Trials. JAMA. 2001 Apr 18;285(15):1992.

³²⁸⁰ Kilkenny C, Browne WJ, Cuthill IC, Emerson M, Altman DG. Improving Bioscience Research Reporting: The ARRIVE Guidelines for Reporting Animal Research. PLoS Biol. 2010 Jun 29;8(6):e1000412.

³²⁸¹ Dwan K, Altman D, Clarke M, Gamble C, Higgins J. Observational Studies: Getting Clear about Transparency. PLoS Med. 2014 Aug 26;11(8):e1001711.

data and will still improve the scientific basis of evaluating studies. The commenter suggests that EPA utilize these existing tools to evaluate study quality and build on this work already done by the scientific community.

Response: The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. This rule is designed to build upon OMB M-19-15, which highlights the need to characterize the sensitivity of an agency's conclusions to analytic assumptions, as well as other federal guidance documents that require greater data transparency. As discussed more fully in the preamble of the final rule, the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

NIH Guidelines

Comment: Commenter (6924) suggests that data sharing guidelines from the NIH are applicable to the sharing of final research data for research purposes.³²⁸² The commenter states that, as the NIH guidelines have already undergone an extensive deliberative process with input from the scientific community, EPA should reference these guidelines in its grants and/ or cooperative agreements.

Commenter (6126) suggests that EPA consider the NIH guidance for grantees about protocols and practices for data sharing.³²⁸³ The commenter states that the policy, which has now been in effect for 15 years, reflects another process that EPA could consider as a model for developing a thoughtful and informed regulation about agency and researcher data sharing.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum "Increasing Access to the Results of Federally Funded Scientific Research" and the 2016 EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research." EPA researchers, grantees and contractors are required to make peer reviewed journal articles and the underlying data and models resulting from EPA-funded research accessible to the public. The final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science, nor does it require any researcher or other outside entity to provide data or models to the EPA or the public. Therefore, the Agency will not be developing information or protocols on data sharing.

³²⁸² NIH. Data Sharing Policy and Implementation Guidance. March 5, 2003. Available: https://grants.nih.gov/grants/policy/data_sharing/data_sharing_guidance.htm#app

³²⁸³ National Institutes of Health. (2003). Final NIH Statement on Sharing Research Data. Notice NIH-OD-03-032. Available at: <https://grants.nih.gov/grants/guide/notice-files/NOT-OD-03-032.html>.

National Center for Health Statistics Research Data Centers

Comment: Commenter (6924) suggests that providing secure access to data for research purposes also improves data sharing and is an alternative to requiring publicly available data.³²⁸⁴ The commenter recommends that EPA consider the National Center for Health Statistics Research Data Centers³²⁸⁵ as a model—these centers have successfully provided access to sensitive information without breaches of privacy/ confidentiality.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

13.2.3.3.6 Methodology and Assumptions

Comment: Commenters (1796, 6111, 6121, 6935) suggest that review of a study's scientific methodology and assumptions can be sufficient and is important when validating scientific results.

Commenter (6935) asserts that robust discussions of methodology and assumptions can provide sufficient information for stakeholders to critique and evaluate the validity of studies and models, which may be sufficient for the purposes of determining if the study can and should be relied upon by the Agency in a regulatory context. The commenter states that, accordingly, final rules should reflect that some flexibility may be appropriate if sufficient other information about studies and models is provided or otherwise available. The commenter adds that it may not be necessary for EPA to complete a full, independent validation of a study or model if sufficient information about inputs, assumptions and methodology are made available. The commenter states that such information may provide adequate information for determining whether the study can and should be relied upon in the regulatory context, without the expense, both in terms of resources and time, of independent validation. The commenter states that recognizing this in any final rule could provide the Agency and regulated entities additional flexibility.

Response: The EPA agrees that existing methods of evaluating the methods and assumptions presented in a peer-reviewed study are useful. However, when subject matter experts have access to the underlying data, they could conduct a more in-depth review that may include independently reanalyzing the data to affirm original research conclusions, check for errors, test

³²⁸⁴ National Research Council (2000). Improving Access to and Confidentiality of Research Data: Report of a Workshop. Committee on National Statistics, Christopher Mackie and Norman Bradburn, Eds. Commission on Behavioral and Social Sciences and Education. Washington, D.C.: National Academy Press.

³²⁸⁵ CDC. NCHS Research Data Center (RDC). December 2015. Available: <https://www.cdc.gov/rdc/index.htm>.

alternative assumptions, and better understand and evaluate the implications of uncertainty in the original study.

Further, although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Though not exhaustive or exclusive, the EPA has identified several factors in 40 CFR 30.5(d) that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. Additional discussion on these factors, which include consideration of assumptions and methodology, is provided in the preamble to the final rule.

13.2.3.3.7 Replication, Reproducibility and Reanalysis Processes of Science

Replication

Comment: Commenters (5172, 6046, 6111, 6373) suggest EPA consider replication of scientific studies by different researchers using different data sets to validate studies that may be useful for regulatory purposes. Commenters (6111, 6373) suggest EPA corroborate results of a scientific study by conducting subsequent studies/validation studies.³²⁸⁶

Commenter (1973) states that the publication of similar studies, by other investigating teams, using equivalent data from other countries, also provides the EPA with the assurance it needs that the results they rely on have been replicated, and by different people using different approaches. The commenter notes that, for example, Medicare data was first used to look at air pollution by one investigator, first working at EPA and then at Harvard.³²⁸⁷ The commenter states that then other investigators sought the data and published their own studies.³²⁸⁸ The

³²⁸⁶ The three meta-analyses for ozone-mortality associations facilitated by EPA were Michelle L. commenter adds that, while these data may not be made publicly available as EPA proposes, the data are available to investigators with the will to apply for access and adhere to the data use rules. The commenter provides that, similarly, many studies, by many different teams of investigators have used mortality data from state mortality or national records to examine the acute effects of air pollution.³²⁸⁹ The commenter asserts that there is no reason to risk revealing identified confidential medical information to accomplish a task that is already accomplished.

Commenter (2431) asserts that replication of results using different data, not revelation of personally identifiable health data, is the strength by which we should measure our science. The commenter states that, beyond the HEI reanalysis, the findings of Six Cities have been replicated numerous times in many independent studies using different study designs, larger numbers of enrollees, broader geographical distributions across multiple regions of the world, and increasingly sharp analytical tools. The commenter notes that the number of studies replicating Six Cities' original findings demonstrate the soundness of the scientific process and have established an extensive foundation of literature whose conclusions are just as important to the weight of evidence as Six Cities itself.

Commenters (6153, 6874) contend that true replication requires not reanalyzing existing work but independent investigators producing independent data. The commenters state that the HEI work reanalyzing an existing body of evidence³²⁹⁰ was time-consuming and expensive and that it would not be a good use of resources to require this approach for all studies contributing to the regulatory actions, or even to a few key studies.³²⁹¹

Commenter (6876) states that the proposed rule fails to recognize the power of replication, a key criterion for defining the strength of scientific evidence. The commenter adds that replication

refers to the fact that consistent findings from studies in different populations in different places strengthens the likelihood of an effect.

Commenter (6916) states that the proposal's focus on public release of the underlying data used in studies – particularly “dose response data” and studies, evinces a clear lack of understanding of the way science is conducted and verified. The commenter notes that, while replicating the results of a study with the same data set certainly verifies it, as the National Research Council said in 2002, “[f]or large epidemiological studies, repeating a study is seldom either possible or desirable.”³²⁹² The commenter asserts that more effective, instead, is some combination of new studies testing the same question in different places, and/or an independent analysis with the same data.³²⁹³

Commenter (8801) states that systematic replication by different researchers using different techniques collecting different data sets, yet addressing a similar fundamental health question, provides the strongest possible replication method.

Commenter 6139) states that EPA's transparency proposal is based on the inappropriate grafting of transparency rules appropriate for clinical research onto the much different world of human health environmental research on which regulation is often based. The commenter notes that environmental health studies in communities cannot and should not be held to the same gold standard for clinical research as a double-blind drug and placebo study. The commenter states that, instead we depend upon replication through consistency in the findings when investigated in other populations by different authors using different methodologies, and on biological plausibility in the form of toxicological studies.

Response: Although the EPA agrees with commenters that meaningful insights can be obtained through similar studies in different media or context, the EPA continues to find that independent validation of the study findings and conclusions driving the EPA's dose-response assessments would provide important information. As detailed in the preamble of the final rule, there is scientific support for the usefulness of reanalyzing data, and the EPA finds this to be especially true for data that drive the quantitative requirements or analyses of EPA significant regulatory actions or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and, thus, increase the opportunity for independent subject matter experts to validate pivotal science, and as the dose-response data are better understood through independent reanalysis the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

The EPA also wishes to clarify reanalysis is not required under this rule. The rule requires the EPA to give greater consideration to pivotal science whose underlying dose-response data are

³²⁹² 2002 NRC Report at ch. 2, p. 7.

³²⁹³ Id. at ch. 2, p. 7-8; see also Douglas W. Dockery, Health Effects of Particulate Air Pollution, 19(4) ANN. EPIDEMIOL. 25 (Apr. 2009) [hereinafter “Dockery”] (“True replication requires not reanalyzing existing work but independent investigators producing independent data.”). Notably, the Harvard Six Cities and ACS studies hypotheses have been subject to all kinds of reanalysis at this point, including new studies with new data, similar studies in different areas by independent researchers using the same (but masked) data, as described herein.

publicly available or available through restricted access. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Reproducibility

Comment: Commenter (0040) states that the whole scientific and statistical process of drawing conclusions is based on the idea of reproducibility. The commenter notes that this duplication of research occurs a lot, especially if findings are unexpected, controversial, or groundbreaking. According to the commenter, if results are not duplicated, then the theories are rejected. According to the commenter, only after initial studies are replicated and extended upon, a body of evidence grows and the public policy shifts accordingly.

Commenter (6920) asserts that reproducibility and independent validation are critical aspects of the scientific method and have resulted in significant advancements in our understanding of the health effects of air pollutants at different exposures and thresholds.

Response: In the final rule the terms replicate and reproduce (or other forms of the word) are no longer used. In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” In addition, the EPA is modifying the definition of “independent validation” in the final rule by replacing “capable of being substantially reproduced” with “produced.” The EPA will not finalize the proposed 40 CFR 30.2 definition of “capable of being substantially reproduced” because the term is not used in the final rule’s definition of “independent validation” or elsewhere in 40 CFR 30.

Reanalysis

Comment: Commenters (5172, 6046, 6111, 9227) suggest EPA consider reanalysis of scientific studies to validate studies that may be useful for regulatory purposes.

Commenter (6135) requests that EPA recognize that reanalysis of individual studies is not a replacement for replication of study findings in multiple distinct health studies. The commenter suggests that except in the case of exceptional circumstances, EPA follow the example of past EPA administrators in waiting for additional studies to be completed before taking regulatory action based on a single study finding.³²⁹⁴

Commenters (5017, 6111, 6133, 6137, 6351, 6373, 6916, 9227) assert that scientific results and methods can be questioned and validated without exposing protected underlying data to public

³²⁹⁴ Former Administrator Johnson provides an effective example in how he considered the results of the California Children's Health Study, which at the time was the first of its kind, as part of the 2006 review of the PM NAAQS.

scrutiny. As an example, the commenters point to the series of studies, re-analyses, verifications, and extensions of work begun in 1974 on the prospective “respiratory health effects of respirable particles and sulfur oxides on a sample of adults and children in six U.S. cities.”

Commenter (6351) suggests that, instead of blocking studies, EPA refer studies to an independent third party such as the HEI. The commenter states that autonomous reviewers examined the data from the 1993 Harvard Six Cities Study³²⁹⁵ and the 1995 ACS Study³²⁹⁶ and developed a report on the two studies that confirmed their original findings.³²⁹⁷ The commenter notes that since these studies, other research has confirmed their findings as well, including some studies that used publicly available datasets.³²⁹⁸ The commenter states that similar third-party reviews could readily address concerns about existing or future studies as needed.

Similarly, commenter (9227) states that an important effort began with Harvard’s “Six Cities” study, reported in (Dockery et al., 1993).³²⁹⁹ The commenter explains that the researchers initially sought to reproduce their initial findings using a data base with a much larger number of subjects and cities and did indeed reproduce those findings (Pope et al., 1995).³³⁰⁰ According to the commenter, by 2009 enough new evidence had accumulated for EPA’s integrated assessment for particulate matter to conclude that the number of large U.S. cohort studies, together with supporting evidence from other epidemiology and toxicological studies were sufficient to infer a causal relationship between long-term PM_{2.5} exposures and mortality and cardiovascular effects. The commenter states that this conclusion regarding causality (the strongest finding possible under the causality classification methodology³³⁰¹ based on these studies was endorsed by the external CASAC, which noted: “The five-level classification of strength of evidence for causal inference has been systematically applied; this approach has provided transparency and a clear statement of the level of confidence with regard to causation, and we recommend its continued use in future ISAs.”³³⁰² The commenter provides that the link between particulate matter exposure and mortality that was observed in the Six Cities study has been vetted through multiple mechanisms that have confirmed the validity of the findings without public access to the underlying data—including extensive reanalysis using larger datasets with longer duration of follow up and different statistical methods; reproduction and corroboration with independent

³³⁰¹ The Preamble to the Integrated Science Assessments Sections describes the five-level hierarchy that classifies the weight of evidence for causation and methodology to make the determination, and “causal relationship” is the strongest finding.

³³⁰² Letter from Dr. Jonathan M. Samet, Professor & Chair, Dep’t of Preventive Med, Univ. of S. Cal., to Lisa P. Jackson, Adm’r, EPA (Nov. 2, 2009).

studies using distinct populations and methodologies; and rigorous external review by independent scientists.

Commenters (6111, 6137, 9227) refer to comments of a SAB workgroup which assert that removing confidential information so that it can be publicly disclosed is unnecessary, as studies can be validated without demanding access to confidential data. Commenters (6111, 9227) state that, as explained by the SAB, the HEI's reanalysis of the Six Cities Study, through "an unusually rigorous form of peer review and independent reanalysis, coupled with many follow-up studies, has accomplished a measure of confidence in findings without public access to data and analytic methods."³³⁰³ Commenters (6137, 9227) note the SAB workgroup also states:

The proposed rule fails to mention that there are various ways to assess the validity of prior epidemiologic studies without public access to data and analytic methods. For example, the HEI conducted a re-analysis of the influential Harvard Six Cities and ACS epidemiologic studies and was able to replicate its findings and to assess the robustness of the findings via sensitivity analysis.³³⁰⁴

Response: In the final rule the terms replicate and reproduce (or other forms of the word) are no longer used. In the final rule the term replicate is not used. The EPA is clarifying that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was "reanalyze" rather than "replicate." In the 2020 SNPRM, the EPA proposed using the term "reanalyze" instead of "replicate" and proposed at 40 CFR 30.2 a definition for "reanalyze." In addition, the EPA is modifying the definition of "independent validation" in the final rule by replacing "capable of being substantially reproduced" with "produced." The EPA will not finalize the proposed 40 CFR 30.2 definition of "capable of being substantially reproduced" because the term is not used in the final rule's definition of "independent validation" or elsewhere in 40 CFR 30.

The EPA agrees with commenters on the utility of findings from reanalysis studies. Indeed, one criterion for the Administrator's consideration of an exemption under 40 CFR 30.7 is that a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis.

Finally, although the EPA agrees with commenters that meaningful insights can be obtained through similar studies in different media or context, the EPA continues to find that independent validation of the study findings and conclusions driving the EPA's dose-response assessments would provide important information. As detailed in the preamble of the final rule, there is scientific support for the usefulness of reanalyzing data, and the EPA finds this to be especially true for data that drive the quantitative requirements or analyses of EPA significant regulatory actions or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and, thus, increase the opportunity for

independent subject matter experts to validate pivotal science, and as the dose-response data are better understood through independent reanalysis the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

13.2.3.3.8 Systematic Review

Comment: Commenters (4831, 6125, 6158, 6915) suggest that EPA consider adoption of systematic-review methods. Commenter (6121) suggests that multiple steps of independent scientific review be conducted to ensure the integrity and objectivity of science.

Commenter (4831) notes that the National Academies have carried out numerous studies that advise EPA on the scientific bases of regulatory decisions related to human health and the environment.³³⁰⁵ The commenter states that these reports encourage EPA to consider all available science in the rule-making process and provide guidance about how the agency could be more transparent in describing how evidence is gathered and evaluated. The commenter suggests that systematic-review methods be adopted to ensure objectivity, rigor, and transparency in performing literature-based reviews (IOM, 2011; NRC, 2011, 2014). The commenter provides that NASEM, 2017a, includes four case examples of systematic reviews.

Commenter (6125) asserts that the proposal ignores the existence of “systematic review” methods for review of evidence that are being developed within the agency, most notably within the IRIS program, prompted by criticisms and recommendations from the NAS.³³⁰⁶ The commenter states that the development of such methods is informed by the National Toxicology Program’s Office of Health Assessment and Translation (NTP/OHAT) guidance³³⁰⁷ and other similar tools (UCSF’s Navigation Guide).³³⁰⁸ According to the commenter, no authoritative body of experts has ever recommended requiring “raw data” in order to perform or review dose response assessments.

Commenter (6915) states that recently a rigorous systematic review process has been developed and implemented by EPA’s IRIS program to ensure even greater thoroughness and objectivity in

³³⁰⁵ Application of Systematic Review Methods in an Overall Strategy for Evaluating Low-Dose Toxicity from Endocrine Active Chemicals (NASEM, 2017a), Review of EPA’s Integrated Risk Information System (IRIS) Process (NRC, 2014), Critical Aspects of EPA’s IRIS Assessment of Inorganic Arsenic: Interim Report (NRC, 2013), Review of the Environmental Protection Agency’s Draft IRIS Assessment of Formaldehyde (NRC, 2011), Finding What Works in Health Care: Standards for Systematic Reviews (IOM, 2011), Science and Decisions: Advancing Risk Assessment (NRC, 2009), and Models in Environmental Regulatory Decision Making (NRC, 2007).

³³⁰⁶ National Academies of Sciences, Engineering, and Medicine. 2018. Progress Toward Transforming the Integrated Risk Information System (IRIS) Program: A 2018 Evaluation. Washington, DC: The National Academies Press. <https://doi.org/10.17226/25086>.

³³⁰⁷ Rooney AA, Boyles AL, Wolfe MS, Bucher JR, Thayer KA. 2014. Systematic review and evidence integration for literature-based environmental health science assessments. *Environmental Health Perspectives* 122:711-718.

³³⁰⁸ Woodruff T, Sutton, P. 2014. The Navigation Guide Systematic Review Methodology: A Rigorous and Transparent Method for Translating Environmental Health Science into Better Health Outcomes. *Environmental Health Perspectives* 122(10): 1007-1010. Available at <https://ehp.niehs.nih.gov/doi/10.1289/ehp.1307175>

hazard identification.³³⁰⁹ The commenter asserts that, in this way, EPA already ensures that the studies and data upon which it relies are valid.

Commenter (6158) asserts that systematic review methods are one well-regarded means to develop comprehensive criteria to evaluate and “rank” different scientific studies. The commenter states that data availability is only one criterion considered and the absence of public data is not a worthy justification for the exclusion of any given study. The commenter states that study design, analytical techniques used, and statistical methods applied are all deemed to be *more important criteria by which to evaluate the strength and utility of a scientific study*.³³¹⁰

Response: When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices, which may include systematic review, and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science.

Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA may still use pivotal science when the underlying data are unavailable after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. Because the final rule does not categorically exclude any studies, including human health studies, from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations

Agency, National Academy of Sciences Committee to Review Advances Made to the IRIS Process: A Workshop (Feb. 1-2, 2018), available at <https://www.epa.gov/sites/production/files/2018-02/documents/nas020118final.pdf>.

³³¹⁰ National Academies of Sciences, Medicine and Engineering. Application of systematic review methods in an overall strategy for evaluating low-dose toxicity from endocrine active chemicals. 2017.

Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty in the assessment. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information.

13.2.3.3.9 Transparency and Openness Promotion (TOP)

Comment: Commenters (1306, 5120, 6119, 6360) suggest that EPA consider the TOP standards and assert that the scientific community already supports TOP Standards which are able to accommodate research using strict confidentiality and private guidelines.³³¹¹ Commenter (1306) states that these standards recognize the array of workflows across scientific fields and make the case for data sharing at different levels of stringency; and in cases where all data cannot be fully shared.

Commenter (6360) recommends that EPA draw from (or adopt) existing transparency screening tools developed by consensus in the scientific community to further define the scope and applicability of the rule's requirements. The commenter states that one important, open source system, the TOP guidelines,³³¹² have been recently adopted by over 5,000 major scientific organizations and journals. The commenter notes that, published in *Science* in 2015, the TOP guidelines include eight standards, each with three levels of increasing stringency. The commenter provides that claims made in a journal requiring Level III disclosure are more likely to be recognized as scientific facts than those published to Level I standards. The commenter states that, since TOP and other systems are widely adopted now and are growing in their reach, scientists understand their obligations under these systems if they want to be published in certain journals. According to the commenter, if they must turn in their data to be published in *Science*, for example, turning it over to EPA for public review is not a significant additional burden.

Commenter (6360) recommends that EPA require TOP Level III transparency for all significant regulatory actions and all other EPA policy decisions have at least Level II standards for transparency to the public. The commenter states that, by "significant regulatory actions," they mean "regulatory actions" as defined in Executive Order 13771 and "significant" as defined in Executive Order 12866, OMB's Good Guidance bulletin, and other relevant guidance regarding regulatory planning and review. The commenter adds that, if researchers must comply with Level III procedures to receive one publication in *Science*, it seems reasonable to require the same level of disclosure for EPA decisions with millions (or billions) of dollars of annual economic impact. The commenter notes that, as EPA takes comment on a proposed decision and notes that the underlying judgements in the applied science meet Level II criteria, the public could evaluate the claims and provide valuable feedback to EPA regarding the appropriate rigor of its data transparency procedures. The commenter adds that, based on these comments, EPA could decide that the final agency action requires Level III transparency. According to the commenter, the Level II and Level III requirements mirror somewhat the applicability of the

³³¹¹ Berg, J., et al., Joint statement on EPA proposed rule and public availability of data. Proc Natl Acad Sci U S A, 2018. 115(24): p. 6098.

³³¹² <https://cos.io/our-services/top-guidelines/>

proposed standards in EPA's rulemaking. The commenter suggests that the tiered levels and specific requirements in TOP offer an existing, widely used approach for EPA to consider that would allow it to prioritize its resources and its requirements with respect to applied science developers. The commenter states that EPA can calibrate the transparency requirements of particular science applications with the magnitude of the policy decision in question.

Commenter (6360) states that the TOP criteria require researchers to post data, analytic methods, and research materials to a trusted depository. The commenter states that, for EPA applications of science, this depository should be the public docket of a proposed rule or the accompanying administrative record associated with a proposed decision. The commenter recommends that, for sensitive information, EPA adopt the depository standards in common use by other federal agencies, journals, and EPA itself. According to the commenter, for example, the Census Department has established stringent criteria for researchers seeking to review data that could allow individual responses to be identified. The commenter notes that similar procedures are in place to protect data from new drug trials in journal depositories. The commenter adds that EPA has procedures for its contractors to review CBI – procedures that could be modified for non-government public commenters to use to review applied science that relies on sensitive data.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are publicly available or available through restricted access. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The EPA agrees that the scientific community and government agencies are making great strides in data transparency; however, improvements can still be made over existing policies and mechanisms. As discussed more fully in the preamble of the final rule, the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

13.2.3.3.10 Other Available Approaches

Comment: Commenters suggest EPA consider other available approaches that can ensure the validity of scientific studies that may be useful for regulatory purposes, including the following:

- Collaborative studies, where the original study authors employ data use agreements to share the data with other researchers, who can validate and expand upon the analysis. (6925)

- Comparisons of research findings with the results of other peer-reviewed research efforts, including through meta-analyses and literature reviews that are designed to shed light on consistent findings across studies. (9227)
- Competitive grant process and grant application review. (6121, 6373)
- Confidential sharing of data with independent research teams that are able to validate results. (9227)
- Data-use agreement application review. (6373)
- Detailed description of research methods, code and non-confidential data in their published articles. (6111)
- Expertise and judgment of career EPA scientists when considering the strength and relevance of studies included in EPA decisions. (6121)
- Federal regulations that include review requirements³³¹³ for research involving human subjects. (6119)
- IRB requirements. (6121, 6373)
- Risk assessment drafts are made public and can be commented on. (6046)
- Single research questions require multiple trials. (6373)
- Solicitation of expert opinion. (6153, 6358)
- Statutory requirements.³³¹⁴ (6373)

Response: Although the EPA agrees with commenters that meaningful insights can be obtained through similar studies in different media or context, the EPA continues to find that independent validation of the study findings and conclusions driving the EPA's dose-response assessments would provide important information. As detailed in the preamble of the final rule, there is scientific support for the usefulness of reanalyzing data, and the EPA finds this to be especially true for data that drive the quantitative requirements or analyses of EPA significant regulatory actions or influential scientific information. . Implementation of this rule will more effectively share pivotal science for external consideration and, thus, increase the opportunity for independent subject matter experts to validate pivotal science, and as the dose-response data are better understood through independent reanalysis the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Further, although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a

³³¹³ 45 CFR §46.101 Protection of Human Subjects sets out the federal requirements to have an Institutional Review Board (IRB) in any case where subjects are recruited for research purposes. The Food and Drug Administration (FDA) has a separate set of regulations governing human subjects research (- 21 CFR 56 IRBs and 21 CFR 50-Informed Consent).

³³¹⁴ Additionally, EPA's guiding statutes may proscribe distinct standards for the data EPA considers in promulgating regulations. For example, TSCA requires EPA to take into account a variety of factors that ensure the quality and rigor of the science it uses, including "the degree of clarity and completeness with which the data, assumptions, methods, quality assurance, and analyses employed to generate the information are documented," "the extent to which the variability and uncertainty in the information, or in the procedures, measures, methods, protocols, methodologies, or models, are evaluated and characterized," and "the extent of independent verification or peer-review of the information or of the procedures, measures, methods, protocols, methodologies, or models." See TSCA § 26(h)(3)-(5); 15 U.S.C. § 2625(h)(3)-(5).

strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Though not exhaustive or exclusive, the EPA has identified several factors in 40 CFR 30.5(d) that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. Additional discussion on these factors is provided in the preamble to the final rule.

Finally, the EPA would like to clarify that the approach in the final rule gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access.

Comment: Commenter (6357) states that data from clinical trials are often not publicly available but are made available for confidential safety-monitoring and peer-review. The commenter states that policies for in-depth federal agency review also exist, as exemplified by the Food and Drug Administration's (FDA's) ability to audit clinical trials.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (6357) states that the validity of scientific evidence is based not only on individual studies, but also on a collection of multiple sources of data that may confirm or refute individual findings. The commenter encourages EPA to consider multiple legitimate paths for validation of scientific findings to ensure that the science most relevant to the protection of human health is included in the decision-making process.

Response: Although the EPA agrees with commenters that meaningful insights can be obtained through similar studies in different media or context, the EPA continues to find that independent validation of the study findings and conclusions driving the EPA's dose-response assessments would provide important information. As detailed in the preamble of the final rule, there is scientific support for the usefulness of reanalyzing data, and the EPA finds this to be especially true for data that drive the quantitative requirements or analyses of EPA significant regulatory actions or influential scientific information. Implementation of this rule will more effectively share pivotal science for external consideration and, thus, increase the opportunity for independent subject matter experts to validate pivotal science, and as the dose-response data are better understood through independent reanalysis the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Further, although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Though not exhaustive or exclusive, the EPA has identified several factors in 40 CFR 30.5(d) that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. Additional discussion on these factors is provided in the preamble to the final rule.

Comment: Commenter (6941) states that the TSCA identifies independent verification as one of five scientific standards that EPA must consider (also the intended use of the information, its relevance for use in making regulatory decisions, the clarity and completeness of its documentation, and the extent to which variability and uncertainty are evaluated and characterized). The commenter notes that even when underlying data is not publicly available in a manner sufficient for independent verification, EPA's use of such information, methods, or models can be consistent with the best available science if these other standards are met.

Response: This final rule does not interpret or apply the provisions of any environmental statutes; such efforts will occur in the subsequent actions under the relevant statutes described in the preamble of this rule. As this rule makes clear, if implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

13.1.3.4 Overall Comparison to Existing Transparency Mechanisms

13.1.3.4.1 Are Existing Mechanisms Adequate?

Comment: Commenters (1905, 2472, 5170, 6135, 6152, 6194, 6446, 6894, 6915, 6916, 6920, 9227) express concern that the rule fails to analyze whether existing mechanisms for vetting science without publicly releasing subjects' personal data are adequate. Comments include:

- The proposed rule does not make a persuasive case for replacing the well-established and successful processes for determining scientific validity. The commenter asserts that, while there have been cases of intellectual fraud or non-replicable results, it is the scientific process and the scientific community itself that has discovered and corrected these problems. (5170)
- The proposed rule does not identify any deficiencies in the long-established approach of using scientific studies to inform agency decisions. (6135)
- The proposal does not justify the need for a change to its current transparency or reproducibility practices that include peer review and existing access to the science that EPA relies upon. (6152)
- EPA has not explained why existing federal and professional rules, standards, and policies, many of which promote the objective of transparency, cannot be used to attain

the purported objective of the proposal. The commenter adds that the proposal also ignores, or presents no argument for rejecting, scientific practices embodied in the host of nongovernmental methods and best practices established and adhered to by the research community to ensure the transparency, objectivity, and validity of studies, analyses, models, and reports, including by reproduction and/or replication where appropriate.³³¹⁵ (6194)

- Commenter asserts that the lack of any explanation for a need for the proposed rule is doubtless because procedures are already in place that assure use of the best available science for EPA's regulatory activity. The commenter states that these procedures include that much of the scientific research considered in the regulatory context, and all research published in reputable journals, has already been subject to extensive peer review. (6446)
- Commenter contends that there are significant and viable and obvious alternatives to this proposal³³¹⁶ which the Agency has failed adequately to consider and explain why it believes such alternatives are not sufficient. (6916)
- While the proposed rule cites the need for increased transparency, it provides little evidence that this need is not being met. The commenter states that EPA models, for example, that serve as the basis for predicting cancer risk and blood lead levels in children are well presented, explained and supported. The commenter asserts that debate continues on the accuracy of such models but there is little debate that they are transparent. (6920)
- Commenter asserts that EPA fails to explain why EPA's existing mechanisms are inadequate to ensure the scientific integrity of its actions. The commenter states that the proposal ignores both the available approaches embraced by the scientific community and the record of past EPA assessments, which reveal alternative methods for ensuring the credibility of potentially useful scientific studies.³³¹⁷ The commenter notes that the proposal says virtually nothing about the level of confidence those mechanisms afford in EPA's regulatory science. (9227)

Response: The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. This rule is designed to build upon OMB M-19-15, which highlights the need to characterize the sensitivity of an agency's conclusions to analytic

³³¹⁵ For a detailed explanation of this point, see the separate comment letter submitted by the Emmett Environmental Law & Policy Clinic on August 7, 2018 on behalf of the President of Harvard University, the Presidents and a number of Department Chairs and Chiefs of four of the world's foremost research and teaching hospitals (Beth Israel Deaconess Medical Center, Brigham and Women's Hospital, Massachusetts Eye and Ear, and Massachusetts General Hospital), the Deans of Harvard's T.H. Chan School of Public Health and Harvard Medical School, preeminent faculty at the Harvard T.H. Chan School of Public Health, the Harvard Medical School, and the Harvard School of Engineering and Applied Sciences, and numerous esteemed research and clinical doctors affiliated with Harvard and its research hospitals

³³¹⁶ *Nat'l Shooting Sports Found. v. Jones*, 716 F.3d 200, 215 (D.C. Cir. 2013).

³³¹⁷ See, e.g., Letter to Acting Administrator Wheeler from Marcia McNutt, President of the National Academy of Sciences, C.D. Mote, Jr., President of the National Academy of Engineering, and Victor J. Dzau, President of the National Academy of Medicine 2 (July 16, 2018) ("The National Academies have developed a long-standing body of work that demonstrates scientific literature can be evaluated in a transparent and objective manner without complete disclosure of the underlying data.").

assumptions, as well as other federal guidance documents that require greater data transparency. The EPA's attention to data transparency is also responsive to the broader interest in greater data and model transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members of the public, scientific community, and Congress on the transparency of the scientific basis for EPA's decisions in previous influential scientific information assessments and regulatory actions. The EPA's continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency's decisions. The EPA also agrees with commenters that the scientific community and government agencies are making great strides in data transparency; however, improvements can still be made over existing policies and mechanisms.

Comment: Commenter (9227) states that the proposal fails to offer a reasoned explanation for its departure from EPA's Scientific Integrity Policy that broadly requires the agency to consider all available scientific information when undertaking rulemakings. The commenter provides that EPA's own existing Scientific Integrity Policy states:

To support a culture of scientific integrity within the Agency, this policy. . . [r]ecognizes . . . policy makers within the Agency weigh the best available science, along with additional factors such as practicality, economics, and societal impact, when making policy decisions.³³¹⁸

The commenter adds that the proposal conflicts with this policy by restricting what may be the best available science on a given topic from EPA's consideration solely because the underlying data cannot be made public. The commenter contends that public availability of data is neither necessary nor sufficient to ensure that studies constitute "best available science."

Commenter (9227) states that the proposal fails to offer a reasoned explanation for its departure from EPA's which require EPA to ensure the objectivity of influential scientific information it disseminates by using "the best available science and supporting studies conducted in accordance with sound and objective scientific practices."³³¹⁹ The commenter provides that EPA considers information to be disseminated when EPA prepares and distributes information to support an Agency decision or regulation or when EPA distributes information in a way that suggests EPA agrees with it, that it supports EPA's viewpoint, or if in the distribution EPA proposes to use it to support or formulate a regulation or agency decision.³³²⁰ According to the commenter, thus, the proposal conflicts with the Guidelines by restricting scientific studies that EPA may use to support regulations, which may cause it to disseminate other information to support its regulations that is not based on the best available science.

Commenter (9227) expresses that the proposal fails to offer a reasoned explanation for its departure from EPA's Peer Review Handbook which acknowledges that "EPA strives to ensure

³³¹⁸ EPA, Scientific Integrity Policy 3-4.

³³¹⁹ EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency 21-22 (2002), <https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf>.

³³²⁰ Id. at 15-16.

that the scientific and technical bases of its decisions meet two important criteria: (1) they are based upon the best current knowledge from science, engineering, and other domains of technical expertise; and (2) they are credible.”³³²¹ The commenter notes that EPA’s Science Policy Council Handbook on Risk Characterization also requires reasonableness in the agency’s risk assessments, which is achieved when “the characterization is based on the best available scientific information.”³³²² The commenter asserts that these policies clearly impact EPA’s regulatory actions, and thus will be impacted by the proposal. According to the commenter, EPA completely fails to analyze the impact the proposal will have on its ability to comply with these policies and fails to explain why it is changing course or justify its decision to do so. The commenter contends that the proposal fails to even acknowledge that the agency is changing positions.

Response: In the final rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. The EPA may still use pivotal science when the underlying data are unavailable after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator. Title 40 CFR 30.5(d) provides additional factors that the Agency shall use when determining the consideration to afford pivotal science with data that is unavailable for independent validation. Because the final rule does not categorically exclude any studies from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety.

Comment: Commenter (6915) states that a fundamental premise of the proposed rule is that only studies for which the underlying data are publicly available are valid for decision-making. The commenter notes that this premise is inconsistent with generally accepted practices for conducting and evaluating scientific research. The commenter asserts that the rationale for the premise is not provided:

EPA presents no evidence for the conclusion that its current criteria for selecting studies result in scientifically invalid conclusions or overly stringent regulations.

³³²¹ EPA, EPA Peer Review Handbook 4 th Edition A-4 (Oct. 2015), https://www.epa.gov/sites/production/files/2016-03/documents/epa_peer_review_handbook_4th_edition.pdf.

³³²² EPA, Sci. Policy Council, Risk Characterization Handbook 18 (2000), https://www.epa.gov/sites/production/files/2015-10/documents/osp_risk_characterization_handbook_2000.pdf.

The commenter adds that the D.C. Circuit has already rejected EPA's proposed approach of excluding studies relying on non-public data as "impractical and unnecessary" when raised by a trade association as part of a challenge to an air quality standard. *Am. Trucking*, 283 F.3d at 372.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. The rule does not categorically exclude studies—even studies where the underlying dose-response data are not available for independent validation and only applies to dose-response data. The rule requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

13.1.3.4.2 How Would the Proposal Remedy Any Existing Deficiencies?

Comment: Commenters (6125, 6135, 6152, 6194, 6446, 6894, 9227) express concern that the proposed rule does not provide any rationale for how the proposed rule, if promulgated, would remedy any specific deficiencies. Comments include:

- Both the discussion of purportedly desirable attributes in studies to be used for assessment and how the agency should use alternative low dose models are far less detailed and nuanced than either EPA's voluminous existing guidance on risk assessments or recommendations on these topics contained in several NAS reports relating to risk assessment, including the 2007 "Silver Book."³³²³ According to the commenter, it is impossible to tell from reading the proposal what the real problems, if any, might be, nor how commenters should respond to EPA's proposed fixes. In short, the proposal's description of the "fix" is as inadequate and off the mark as its description of the "problem." (6125)
- EPA has not pointed to a single regulatory action over the thousands it has implemented that was based on faulty science and that this proposal would remedy. The commenter

³³²³ National Research Council. 2009. *Science and Decisions: Advancing Risk Assessment*. Washington, DC: The National Academies Press. <https://doi.org/10.17226/12209>.

states that, historically, EPA has stated that a review of raw data would be warranted “[o]nly in extreme cases—for example where there are credible allegations of fraud, abuse or misconduct.”³³²⁴ The commenter notes that EPA has advocated this position in court proceedings. (6194)

- EPA does not explain why the proposal is preferable to existing recommendations and methods vetted and supported by the scientific community, which endeavor to promote transparency through open science policies and secure data-sharing systems.³³²⁵ (6194)
- The proposed rule advances no reason why the accepted methods used in the scientific community to evaluate scientific research should be replaced with the single, threshold requirement in the proposed rule. (6446)
- The proposed rule seems not to trust the present process but offers no alternative or specific critique. (6894)
- EPA’s proposal does not question whether this rule would add anything to the current efforts, or whether it would have any effect whatsoever in increasing public accessibility of data. (9227)

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes.

Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information. The EPA’s attention to data transparency is consistent with open data initiatives in the federal government and responsive to the broader interest in greater data and model transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members of the public, scientific community, and Congress on the transparency of the scientific basis for EPA’s decisions in previous influential scientific information assessments and regulatory actions. The EPA’s

³³²⁴ National Ambient Air Quality Standards for Particulate Matter, 62 Fed. Reg. 38,652, 38,689 (Jul. 18, 1997).

³³²⁵ *Id.*

continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency's decisions.

13.1.3.4.3 Existing Transparency Efforts

Comment: Commenters (2492, 6188, 9227) express concern that the proposal does not address the existing steps being taken by the scientific community to make underlying data publicly available where feasible.

Commenter (2492) states that there are now many effective protocols and technologies for making human subjects research highly transparent while protecting private data. The commenter states that EPA should consult with scientists and scientific institutions to learn more about the current best practices in promoting transparent research.

Commenter (9227) states that there are already various ongoing initiatives to make scientific data and models more commonly publicly available, including those noted by EPA.³³²⁶ The commenter also refers to the ongoing implementation of the 2016 Plan to Increase Access to Results of EPA-Funded Scientific Research. The commenter states that this Plan aims to maximize access to “research data underlying a publication” resulting from EPA-funded research.³³²⁷ The commenter states that it is worth emphasizing the Plan also exempts “research data [that] cannot be released due to one or more of constraints, such as requirements to protect confidentiality, personal privacy, proprietary interest, or property rights.”³³²⁸ The commenter states that the Plan also explicitly indicates that:

[i]t is important to recognize that some research data cannot be made fully available to the public but instead may need to be made available in more limited ways, e.g., establishing data use agreements with researchers that respect necessary protections. Whether research data are fully available to the public or available to researchers through other means does not affect the validity of the scientific conclusions from peer reviewed research publications.³³²⁹

Response: The EPA agrees with commenters that the scientific community and government agencies are making great strides in data transparency; however, improvements can still be made over existing policies and mechanisms. The rule requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven

³³²⁶ 83 Fed. Reg. at 18,770 (stating that the policies and recommendations EPA considered were “informed by the policies recently adopted by some major scientific journals and cites to “related policies from the Proceedings of the National Academy of Sciences, PLOS ONE, Science, and Nature.”); 83 Fed. Reg. at 18,771 n. 20 (claiming the “policies or recommendations of publishers Taylor & Francis, Elsevier, PLOS, and Springer Nature” support the Proposal because they require authors to deposit the data underlying their studies in public data repositories).

³³²⁷ EPA, Plan to Increase Access to Results of EPA-Funded Scientific Research 11 (Nov. 29, 2016), <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf>.

³³²⁸ Id.

³³²⁹ Id.

decisions in future rulemakings or in revisions to existing rules or influential scientific information. The EPA's continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency's decisions.

13.1.3.5 Parallel Scientific Process at Odds with the Current Process

Comment: Commenter (1409) argues that this regulation reduces the methods of scientific research--often peer-reviewed research that has stood the test of time--and thus would diminish the EPA's understanding of science and its knowledge in making regulations.

Commenter (6125) states that the proposed rule opens the door to EPA's scientific practices being determined by politically appointed regulators, and not scientists. The commenter asserts that, by contrast, EPA's current science policy guideline-based approach provides the agency with the flexibility to move forward to incorporate new science information in a timely manner, whether it is developed by industry, the academic community, or the agency itself.

Commenter (6125) asserts that the proposed rule approach is a breach of the fundamental principle of separating risk assessment from risk management, as championed in the 1983 NAS report.

Commenter (6924) suggests that risk assessment and other scientific methods utilized by the agency should not be the subject of rulemaking, which would freeze those methods in time and prevent EPA from staying abreast of rapidly advancing scientific methods and thus access to the best available science.

Response: As more fully discussed in the preamble of the final rule, the EPA disagrees that this rule is politically motivated, as transparency assumes no political ideology, nor would this rule result in decreased human health or environmental protections, as the benefits of greater data transparency and the significance of reanalyzing and validating study results are well-documented in scientific literature. The EPA believes that data transparency is vital for individuals who have not contributed to the study to be able to verify the quality and strength of published studies and that the opportunity to independently validate the pivotal science that the EPA relies upon is important in furthering scientific understanding and the Agency's mission. When data are widely available, researchers can validate research results and help identify and correct unintended errors, as well as reanalyze the data for new and different purposes, examine novel questions, provide new scientific insights, and improve model development. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety.

Comment: Commenter (6133) asserts that EPA, other federal agencies, EPA scientific advisory bodies, the NAS, and EPA's SAB have repeatedly and consistently relied upon the best available, peer-reviewed, independent, credible scientific studies—for which the underlying data are not publicly available—and found that science to be valid, reliable, trustworthy, and a

reflection of the “best available science” that EPA claims as its concern in the proposal. The commenter states that the proposal arbitrarily excludes prior research, studies, and data that do not meet its applicability criteria based on concerns that were never announced to researchers or the public, or deemed necessary by any government agency, at the time the research, studies, or data-gathering were undertaken. The commenter asserts that the proposed rule is strikingly at odds with those scientific practices and their history, with nothing in the rulemaking docket to support casting aspersions on the practices or history sufficient to prohibit EPA from considering such science.

Response: Because the final rule does not categorically exclude any studies, including human health studies, from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations.

13.2 SNPRM Independent Peer Review

13.2.1 Existing Peer Review Processes and Protocols Are Sufficient

Comment: Commenters (10748, 10866, 11193, 11330, 11332, 11350, 11358, 11381, 11400, 11403, 11404, 11495, 11479, 11892, 11920, 12719, 12727, 13788, 14397) point out that there are already existing peer review methods in place and/or that the EPA already employs a number of methods for evaluating the quality of studies it uses in rulemaking and assuring that the Agency relies on the best available science; these include formal peer review, review by the SAB and other advisory committees and external bodies, systematic frameworks that govern the Agency’s review and evaluation of scientific studies that inform its work, Data Quality Objective (DQO) requirements and other stipulations for grantees, quality assurance plans, and the public comment process. Commenters (11330, 12727, 13788) argue that EPA has failed to justify why these mechanisms are insufficient and/or are failing. Commenter (12727) adds that the EPA has also not sufficiently explained how the proposed rule would “improve transparency and the scientific integrity of the regulatory outcomes in an effective and efficient manner.”

Commenter (10748) states that peer review processes are already in place as all published scientific studies must undergo a rigorous peer-review process to ensure sound science and the government should let scientific journals and experts continue to decide the quality of studies.

Commenter (11193) states that the scientific community has long established rules for evaluating science using processes like independent peer review, independent advisory boards, and institutions like the National Academies to review issues of scientific importance. The commenter asserts that these independent peer review methods have, over the decades, led to the greatest scientific advancements in the history of the world and notes that this has happened largely due to the efficacy and thoroughness with which this process evaluates all the available science, including the participation of agency, academic, and industry scientists meeting and using a thorough process for review.

Commenter (12719) states that publications in peer reviewed journals have had their protocols, data, and statistical analyses assessed during the peer review process leading up to publication. The commenter states that the EPA’s current process for reviewing such data already allows for stakeholders to challenge the use of the studies in decisions without making the data publicly available for “independent validation.”

Commenter (12727) states that EPA has developed a well-earned reputation for grounding its decisions in rigorous science over approximately five decades of operation spanning administrations of both parties. The commenter notes that this reputation has not come by accident—rather, it has resulted from deliberate efforts by EPA to utilize time-tested tools including formal peer review; close scrutiny of agency policies, decisions, and studies by the agency’s advisory committees and external bodies such as the National Academies; and systematic frameworks that govern the agency’s review and evaluation of the scientific studies that inform its work (such as the Preamble to the Integrated Science Assessment and systematic review protocols accompanying IRIS toxicological reviews). The commenter adds that on top of these well-established mechanisms, the ability of the public to comment on the Agency’s use of science—and seek judicial review of arbitrary actions—constitutes a further safeguard to ensure the Agency acts on the basis of the best available science.³³³⁰ The commenter states that, like the original proposal, the Supplemental Notice fails to explain why these existing mechanisms are insufficient—or to address other information that has emerged since the publication of the original proposal that underscores this basic flaw in the rule. The commenter notes that EPA’s own SAB issued a final report on this proposal in April 2020 that sharply criticized EPA’s failure to consider the effectiveness of existing transparency mechanisms—and warned that the proposal could “reduce scientific integrity” and “decrease efficiency.”³³³¹

Commenter (11330) states that EPA presents no evidence at all that peer review, a system that has literally built American scientific might, is failing. In fact, the commenter notes that only two out of ten thousand papers are retracted in the United States. The commenter believes the system is strong, fair, and leads to positive scientific and public health outcomes.

Commenter (11350) states that EPA science assessments generally include an exhaustive and critical review of relevant studies and a full explanation of how they are being interpreted. The commenter notes that extensive information about each study is typically part of the public record even if all underlying data may not be included. The commenter adds that EPA assessments are normally subject to public comment and independent peer review and members of the regulatory community are free at any time to replicate studies they deem flawed, or to independently seek access to underlying data and reanalyze them. The commenter concludes that the so-called problem that the proposed seeks to fix is largely imaginary and that the stakes for

³³³⁰ EDF, Comments on the Environmental Protection Agency’s Proposed Rule: Strengthening Transparency in Regulatory Science, Docket ID No. EPA-HQ-OA-2018-0259-9227, at 65. (Aug. 16, 2018) (“EDF 2018 Comments”).

³³³¹ Science Advisory Board, EPA-SAB-20-005, Consideration of the Scientific and Technical Basis of EPA’s Proposed Rule Titled Strengthening Transparency in Regulatory Science, at 18 (Apr. 14, 2020) (“Final SAB Report”).

EPA science and the protection of public health are simply too high to finalize this deeply problematic and unnecessary proposal.

Commenter (11479) notes that “evaluation and review” is where the agency already independently validates the research without using underlying data by asking the following questions:

a) To what extent has there been independent verification or validation of the study method and results? What were the conclusions of these independent efforts, and are they consistent? b) To what extent has independent peer review been conducted of the study method and results, and how were the conclusions of this review taken into account? c) Has the procedure, method or model been used in similar, peer reviewed studies? Are the results consistent with other relevant studies? d) In the case of model-based information, to what extent has independent evaluation and testing of the model code been performed and documented?³³³²

The commenter (11479) states that these guiding questions ensure that the Agency does not have to fully reanalyze every study and can instead focus on the weight of the evidence approach, which “considers all relevant information in an integrative assessment that takes into account the kinds of evidence available, the quality and quantity of the evidence, the strengths and limitations associated with each type of evidence and explains how the various types of evidence fit together.” The commenter concludes that including data availability in the weighting injects an arbitrary parameter, unrelated to study quality and reliability.

Commenter (11920) states that access to raw data at the stage described in the supplemental notice is typically not a requirement even for peer-review, as scientists can evaluate the robustness and accuracy of findings based on the presentation of processed data and description of the methods and analysis used. The commenter notes that the editors-in-chief of leading scientific journals, including Science, Nature, Proceedings of NAS, Public Library of Science, and Cell, have denounced the original proposed rule noting that “the merits of studies relying on data that cannot be made publicly available can still be judged...As a core skill, scientists are trained in assessing research publications by judging the articulation and logic of the research design, the clarity of the description of the methods used for data collection and analysis, and appropriate citation of previous results.”³³³³

Commenter (11911) states that EPA does not assess the rule’s redundancy given that many peer-reviewed journals have already updated their data transparency policies to encourage data availability.³³³⁴

³³³⁴ Over 1000 journals have implemented policies in line with the Transparency and Openness Promotion Guidelines developed by the Center for Open Science. These guidelines promote the sharing of data while also

Commenter (10866) states that truly transparent regulatory procedures should be identical or similar to the principles utilized by virtually all medical professional associations, utilizing a structured multi-step process that EPA could readily adopt. The commenter summarizes these steps as follows:

- a. Develop the question. Find all of the relevant evidence based on pre-established criteria for reviewing the literature; identify the methodologic characteristics of each publication—e.g., anecdote (lowest form of evidence), randomized controlled trial with appropriate blinding (very high level of evidence). Determine risk of bias: high bias from industry-funded studies; low bias from NIH-funded clinical trials.
- b. Interpret the evidence. Understand association between variables and statistical precision. Synthesize evidence. Formulate evidence-based conclusion.
- c. Create rule in accordance with established procedures including substantial opportunities for public hearings and comments.

Commenter (11892) suggests that independent peer review would be impractical for some specific wetland data, as much of the data used to influence wetland management and regulatory decisions has undergone some sort of peer review through a journal or university committee, or was collected with approved quality control plans, often already approved by EPA. Therefore, the commenter asserts, independent peer review of wetland-related data is not necessary for all wetland data as current procedures and practices are sufficient. The commenter recommends that EPA provide written justification of its findings after EPA conducts an independent peer review to justify significant regulatory decisions.

Commenter (11403) states that there is no need for EPA to impose additional measures to ensure the reliability of science. The commenter states that peer review is a central component of the scientific process that creates transparent and valid science.³³³⁵ The commenter notes that when leading scientific bodies and journals such as NAS, Public Library of Science, Science, and Nature expressed opposition to this type of rulemaking in 2018,³³³⁶ EPA should have immediately scrapped this proposal in its entirety. The commenter states that the proposed rule has not addressed the core issue of undermining peer-reviewed science. The commenter notes that the editors of the esteemed journals said in a 2018 statement that the merits of research can still be judged without the sharing of raw data because scientists that conduct peer review are trained “as a core skill” to assess “research publications by judging the articulation and logic of the research design, the clarity of the description of the methods used for data collection and analysis, and appropriate citation of previous results.” The commenter adds that in other words, because they conduct their own rigorous review of others’ research, scientists do not need raw

Re: Strengthening Transparency in Regulatory Science (2018), <https://www.regulations.gov/document?D=EPA-HQ-OA-2018-0259-4831>.

data to determine if a study was conducted correctly but rather are trained to do so by examining data collection and analysis methods to determine whether the results can be replicated. The commenter states that when doctors prescribe a medicine they have deemed effective, it is not because they have reviewed and analyzed the raw data of patients in the clinical trials themselves, but instead, they have reviewed the published papers on the medication and have seen both that the trials were done correctly and that the results were significant enough to prescribe the treatment. The commenter states that this is no different with research scientists.

Commenter (11404) states that the scientific community has its own process that has been thoroughly developed and extensively vetted. The commenter states that Dr. Nancy Cartwright, through her research, presents a list of criteria used to define “credible science”: it is credible because 1) of the scientific method, 2) science is rigorous, 3) science produces general truths by generalizing from well-tested results, 4) science is objective 5) because of the integrity of the scientific community and 6) because interplay between overlapping areas of scientific research serves as an invaluable feedback mechanism. The commenter suggests that the six defining characteristics, at a high level, encompass the rigorous, multi-year processes of feedback and peer review, discussion with colleagues, replication, and publication³³³⁷ and adds that science that meets the criteria is therefore credible and trustworthy. The commenter notes that this list does not include a requirement to make all data “publicly available in a manner sufficient for independent validation,” nor is such a requirement included in the Strengthening the Reporting of Observational Studies in Epidemiology (STROBE) guidelines³³³⁸ either, as that would be overly burdensome and unnecessary.

Commenter (13788) states that EPA has long relied on peer review and already has extensive policies in place regarding influential scientific information to assess the quality of the scientific research.³³³⁹ The commenter states that EPA provides no explanation as to why those policies are not sufficient to allow validation of scientific studies and information relied on by the Agency. The commenter suggests that simply stating that “EPA shall conduct independent peer review on all pivotal regulatory science used to justify significant regulatory decisions and on all pivotal science underlying influential scientific information, consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review,”³³⁴⁰ fails to explain why this does not already occur under the Agency’s past and current practice. The commenter concludes that if validation is truly the aim of this rulemaking, EPA must explain why existing practices for peer review are insufficient to validate scientific studies as EPA has failed to do so, indeed, the supplemental proposal contains very little discussion of peer review at all.

Response: The EPA agrees with the comments, in part. All Agency technical work products go through rigorous internal review and, when appropriate, peer review. The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. Adequate peer review is peer review that is consistent with

³³⁴⁰ 85 Fed. Reg. at 15,406.

the requirements of the OMB Peer Review Bulletin and EPA's Peer Review Handbook. The EPA is subject to the OMB Bulletin and its provisions have been incorporated into the Agency's peer review handbook (Ref. 44). The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will lead to consistent implementation of those procedures across the Agency.

The EPA will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. As discussed in the final rule preamble, the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that "the intensity of peer review is highly variable across journals" and "prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary." Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule. Therefore, as detailed in the preamble of the final rule, EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the EPA's Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

If implementing this procedural rule would result in conflicts with the guidance found in the Agency's existing Peer Review Handbook, the conflicting requirements found in the Handbook will yield to this final rule. The EPA disagrees that the rule adds another layer of peer review that could result in unnecessary delays. EPA clarified in 40 CFR 30.6 that "the EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review." This should ensure that no unnecessary peer reviews are conducted that could cause undue delay.

This rulemaking is not intended to modify the Agency's interpretations of "best available science." The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. Further, the EPA plans to promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

13.2.2 Concerns Related to Transparency in EPA's Peer Reviews

Comment: Commenter (11381) states that the absence of provisions requiring the Agency to obtain third-party information and ensure that their own work is reproducible undermines the

effectiveness of EPA's highly developed peer review program. The commenter states that a key element in the supplemental proposal is continued reliance on peer review of pivotal science,³³⁴¹ but peer review of all types is shackled by a lack of transparency. The commenter states that EPA's own peer review program includes no expectation or requirement that Agency documents submitted for review will be transparent³³⁴² and the supplemental proposal maintains these deficiencies intact, doing nothing to ensure that the Agency will affirmatively comply with its own final rule with respect to even its own peer reviewers. The commenter notes that, instead, new Part 30 would assign to peer reviewers a limited and much less important task: "articulat[ing] the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results," which is what Agency peer reviewers have done for years and does nothing to enhance transparency.

Commenter (11381) states that governments use peer review to show that the science behind their policy decisions is correct and notes that government peer review is always owned by the sponsoring agency and that agency chooses the reviewers, writes their charge, and decides whether to respond to their comments. The commenter states that government peer review panels often have limited expertise. The commenter adds that a panel consisting of 15 members may seem to be rich in expertise, but that expertise is rapidly diluted when the review task before them is broad or the available time is short.³³⁴³ The commenter states that government-wide peer review guidelines require agencies to limit peer review to scientific and technical matters and avoid asking peer reviewers to opine on policy.³³⁴⁴

Commenter (11381) recommends that the quality of Agency-sponsored peer review be enhanced by ensuring that the information they provide reviewers is fully transparent. The commenter states that peer reviewers, such as members of EPA's SAB, are a scarce resource and their limited time would be much better spent if the Agency demonstrated compliance with the final transparency rule before seeking peer review. The commenter also recommends that the Agency should strengthen its peer review program by requiring Agency offices to comply with the IQG before seeking peer review. The commenter states that EPA's Peer Review Handbook includes no such requirement,³³⁴⁵ a deficiency that has been as persistent as it is unjustifiable. The

³³⁴¹ See {U.S. Environmental Protection Agency, 2018 #8611', p'; 18774 [Sec. 30.7]} and the critique given by {U.S. EPA Science Advisory Board, 2020 #8708}.

³³⁴² {U.S. Environmental Protection Agency, 2015 #3945}.

³³⁴³ The SAB review of the Transparency NPRM was performed by a 13-member workgroup, whose work was reviewed, revised, and approved by the 44-member chartered SAB. The minutes do not reveal the relative intensity of workgroup members' participation. See {U.S. EPA Science Advisory Board, 2020 #8848}. The text of the report, {U.S. EPA Science Advisory Board, 2020 #8708}, indicates that the SAB also reviewed the SNPRM, but published records of the minutes do not include any references to it, identify which SAB members performed this review, or reveal the intensity of their participation.

³³⁴⁴ {Office of Management and Budget, 2005 #268', p. 2669}: "[R]eviewers should be asked to provide advice on the reasonableness of judgments made from the scientific evidence. However, the charge should make clear that the reviewers are not to provide advice on the policy (e.g., the amount of uncertainty that is acceptable or the amount of precaution that should be embedded in an analysis). Such considerations are the purview of the government." But see {U.S. Environmental Protection Agency, 2015 #3945}, which does not make a clear distinction between science and policy.

³³⁴⁵ {U.S. Environmental Protection Agency, 2015 #3945}.

commenter recommends that the Handbook, and the policy on which it is based, should be immediately revised to make IQG compliance a prerequisite for peer review.

Response: The EPA is subject to the OMB Bulletin and its provisions have been incorporated into the Agency's peer review handbook (Ref. 44). The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will lead to consistent implementation of those procedures across the Agency.

It should be noted that in this final rule, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as "pivotal science," the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect. Thus, "pivotal science" includes only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). These are the studies that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information. If peer review under section 30.7 is warranted, it would be conducted on "pivotal science" and not on every dose-response study considered by the Agency in developing a significant regulatory action or influential scientific information. The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the OMB Bulletin for Peer Review and the EPA's Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review. If the Agency conducts peer review on pivotal science, the EPA shall ask peer reviewers to articulate the strengths and weaknesses of the justification for the assumptions applied in analyzing dose-response data and the implications of those assumptions for the results.

13.2.3 Supplemental Proposal Violates the Principles of the OMB Final Information Quality Bulletin for Peer Review

Comment: Commenter (12715) states that the supplemental violates the principles of OMB Memorandum M-05-03, Final Information Quality Bulletin for Peer Review, which establishes government-wide guidance "aimed at enhancing the practice of peer review of government science documents." The commenter states that contrary to this OMB memorandum, the SNPR would prevent or limit EPA's reliance on peer-reviewed research unless the underlying data can be made available for public review. The commenter notes that for studies with restricted data that would require a tiered access system to achieve public availability, EPA does not state how such systems will work in practice other than to note that it is conducting a pilot study using the Research Data Center's "secure data enclave" to host EPA datasets in a restricted use environment. The commenter states that development of standard data repositories "is still ongoing," and that EPA itself "does not intend to make all data and models underlying pivotal regulatory science and pivotal science publicly available. The commenter notes that it is not clear if EPA will make data and models publicly available via some tiered access system where it does have access to data and models, or if EPA intends that scientists and other researchers must themselves establish and maintain a tiered access system that ensures privacy protections for

sensitive data. The commenter states that despite all these uncertainties regarding the mechanisms for public access, the supplemental proposal claims, with no support, that studies where the data is publicly available—through a complex tiered access system or otherwise—are superior to studies where the data is not publicly available, regardless of the rigor of the underlying science and the thoroughness of the peer review process. The commenter asserts that disregarding or giving less weight to studies simply because the underlying data is not publicly available undermines OMB principles of peer review. Rather than excluding evidence from consideration absent the raw data’s availability and pursuing adoption of a tiered access system that has yet to be developed or shown to be workable, the commenter recommends that EPA should continue to adhere to existing, time-tested, and well-established peer review requirements and guidelines to ensure that a consistent method is used to evaluate the quality of any data utilized by the agency for finalizing influential scientific information and significant regulatory decisions.

Response: The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. Adequate peer review is peer review that is consistent with the requirements of the OMB Peer Review Bulletin and EPA’s Peer Review Handbook. The EPA is subject to the OMB Bulletin and its provisions have been incorporated into the Agency’s peer review handbook. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will lead to consistent implementation of those procedures across the Agency. The EPA disagrees that the final rule violates the principles of OMB’s Bulletin for Peer Review (Ref. 8). The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to initiate peer review, consistent with the EPA’s Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review.

Although not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

- the quality of the study relative to other studies for which the dose-response data are available;
- the extent to which there are other studies for which the dose-response data are available;
- the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
- the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- the extent to which the study is supported by other scientific evidence;
- the extent to which the study accounts for unique scientific considerations;

- the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

The EPA would like to clarify that the final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available for independent validation. As discussed in the final rule, underlying dose-response data are considered available if they can be accessed through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The rule does not prescribe a type of data sharing mechanism. By placing greater emphasis on the availability of dose-response data underlying pivotal science, the rule will allow for greater scientific scrutiny as EPA decision makers are developing significant regulatory actions and influential scientific information and increases the likelihood that any errors will be identified and corrected. Greater transparency is also inherently valuable as a principle of good government and provides benefits to the public at large, including reducing the risk of errors in EPA analyses and in the science such analyses rely upon. The ability for independent subject matter experts to validate pivotal science will facilitate more effective comment and engagement with the public during development of future significant regulatory actions and influential scientific information.

13.2.4 Resource Burdens of Peer Review Requirements

Comment: Commenter (11193) suggests that if every comment made by a member of an advisory panel or every comment made by a peer reviewer required that the underlying data, models, and analysis for that comment to be made publicly available, this long-established process would grind to a halt, weakening the foundations of scientific decision-making.

Commenter (11919) asks that, as states rely on EPA research, EPA consider how it will meet the additional workload required in the proposed regulatory text at 40 CFR 30.7, calling on EPA to conduct independent peer review, without impacting the important work of EPA research scientists.

Commenter (11388) states that the proposal implies that EPA will have to conduct additional Agency-led peer review for every applicable study. The commenter does not agree with this provision as most of these studies have already undergone expert, independent peer review and creating an additional level of peer review to be conducted by the agency adds unnecessary hours and labor to EPA's decision-making procedures. The commenter recommends this requirement be removed from the final rule.

Commenter (12430) notes that as a result of the changes in the supplemental proposal, EPA would effectively have to conduct independent review for all regulatory or influential science, regardless of the peer review process to which that science has already been subjected, which comprises a comprehensive and highly burdensome new task for the agency. The commenter states that EPA would have to coordinate the peer review (or perhaps conduct the peer review itself), pay for it, wait for it to be completed, and ensure that it complied with the mandate under the supplemental proposal to “articulate the strengths and weaknesses of U.S. EPA’s justification for the assumptions applied and the implications of those assumptions for the results.” The commenter states that the supplemental proposal fails to acknowledge this burden or explain where EPA would find the resources and staff to perform these tasks. The commenter notes that California statute requires “external scientific peer review of the scientific basis for any rule proposed for adoption by any board, department, or office within” CalEPA.³³⁴⁶ The commenter adds that in California statute, however, “scientific basis” means “those foundations of a rule that are premised upon, or derived from, empirical data or other scientific findings, conclusions, or assumptions establishing a regulatory level, standard, or other requirement for the protection of public health or the environment”³³⁴⁷ The commenter states that in contrast, the supplemental proposal would require EPA to independently peer review, not the foundations of a science-based rulemaking, but the actual studies, data, and models underlying both every rule and every piece of “influential scientific information.”

Commenter (10748) recommends that providing technical and financial support is essential for this rule, but states that it would also be costly to the Agency and is duplicative since there is already a peer review process in place within the scientific community that is trustworthy.

Response: The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. Adequate peer review is peer review that is consistent with the requirements of the OMB Peer Review Bulletin and EPA’s Peer Review Handbook. The EPA is subject to the OMB Bulletin and its provisions have been incorporated into the Agency’s peer review handbook. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will lead to consistent implementation of those procedures across the Agency.

Further, the EPA would like to clarify that the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble of the bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule.

Therefore, the EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will evaluate whether or not to

³³⁴⁶ Cal. Health & Saf. Code § 57004(b).

³³⁴⁷ Id. at § 57004(a)(2).

initiate peer review, consistent with the the EPA's Peer Review Handbook, of individual studies identified as pivotal science if the studies have already undergone journal peer review.

The preamble of the final rule specifies, "given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small relative to current administrative costs for developing significant regulatory actions or influential scientific information."

13.2.5 Considerations of Bias and Independence of Peer Reviewers

Comment: Commenter (11193) asserts that putting the authority of the peer review process in the hands of a political appointee, who would have the authority to waive requirements for the data to be public on a case-by-case basis, rather than in the hands of an apolitical team of scientists is, itself, indefensible scientifically, as this would allow politics, and not science, to determine the basis for regulatory policies designed to protect the environment and the American people.

Commenter (10866) suggests that an additional pertinent consideration and criteria, if EPA were to adopt procedures similar to the principles utilized by medical professional associations, includes whether the study is published in a peer-reviewed journal. The commenter observes that in this sphere it should be noted that there are industry-sponsored journals that are peer reviewed; these studies should not be considered because of the risk of bias. The commenter also suggests that the impact factor of the journal should be considered, noting that in general, the highest impact factor journals are the sources of the most carefully reviewed and reliable studies. The commenter recommends that these studies should receive careful attention but should not be immune to the deficiencies noted above.

Commenter (11920) asserts that this rulemaking must also be considered in the context of the Administration's broader assault on science.³³⁴⁸ The commenter suggests that this supplemental notice is designed to cast unjustified doubt on science that has gone through the independent peer-review process, while promoting unscientific criteria for evaluating science. The commenter states that EPA has failed to show any compelling need or justification for the proposed regulation, nor has it demonstrated that the purported benefits of this regulation would outweigh the substantial costs in compliance as well as increased risks to human health and the environment. The commenter supports the language requiring independent peer review in §30.7, adding that it is imperative that the "peer review" be truly independent and that there is transparency as to the peer review process (i.e., who are the peer reviewers, do they have a direct or indirect interest in the subject matter being reviewed, do they have established positions that they have already taken on the "science/subject matter" that they are reviewing, etc.). The commenter recommends that EPA strengthen the "independence" and transparency of the peer

³³⁴⁸ As an example, U.S. Department of the Interior, in an unprecedented action, recently published in the Federal Register a notice of public comment on a peer reviewed and validly published paper that appeared in the Journal of Wildlife Management: Endangered Species; Marine Mammals; Seismic Survey Design and Impacts to Maternal Polar Bear Dens. <https://www.govinfo.gov/content/pkg/FR-2020-02-18/pdf/2020-03132.pdf>.

review process by identifying who does the peer review, whether they have a direct or indirect interest in the subject matter, previous positions the reviewer may have taken on the matter being reviewed, and affiliation of the reviewer, including any connections between the reviewer and his/her organization and the subject matter.

Commenter (11381) asserts that government peer review panels often include stakeholders who have key policy interests, but little or no expertise with respect to the scientific or technical issues under review and that this practice is inconsistent with government-wide peer review guidance.³³⁴⁹ The commenter states that stakeholders are essential for advisory groups chartered to give policy advice, but they do not belong on scientific peer review panels.³³⁵⁰

Commenter (11381) suggests that government peer review focuses inordinately on a select group of potential conflicts of interest, typically restricted to financial interests related to for-profit enterprises while other financial interests, such as financial interests related to non-profit enterprises and financial interests with respect to non-profit or agency funding, are ignored. The commenter states that conflicts of intellectual interest are desirable, for it is where such interests arise that peer review can be expected to be most rigorous. The commenter adds that on the other hand, scientists with intellectual interests aligned with an agency, or with researchers whose pivotal science is involved, are least likely to perform a review with care and are also most likely to defend the scientific information under review for nonscientific reasons. The commenter concludes that the primary conflict of interest in government peer review is provided by employees of the sponsoring agency as they are by far the most personally invested in obtaining specific outcomes.

Response: This rulemaking is not intended to modify the Agency's interpretations of "best available science." The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. Adequate peer review is peer review that is consistent with the requirements of the OMB Peer Review Bulletin and EPA's Peer Review Handbook. The Agency will continue conducting peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. The EPA Peer Review Handbook, 4th Edition, describes how peer reviewers are selected by the Agency. As discussed in the final rule preamble, the EPA would like to clarify that the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that "the intensity of peer review is highly variable across journals" and "prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary." If implementing this procedural rule would result in conflicts with the guidance found in the Agency's existing Peer

³³⁴⁹ {Office of Management and Budget, 2005 #268', p. 2676}: "Peer reviewers shall be selected based on expertise, experience and skills, including specialists from multiple disciplines, as necessary. The group of reviewers shall be sufficiently broad and diverse to fairly represent the relevant scientific and technical perspectives and fields of knowledge." Agencies are directed to examine potential conflicts of interest between reviewers and stakeholders, but nothing in the Guidance suggests that stakeholders themselves should ever be appointed.

³³⁵⁰ To make this point concrete, the author of this public comment is a stakeholder with respect to the question whether benefit-cost analysis should be performed, but a candidate peer reviewer with respect to a specific benefit-cost analysis.

Review Handbook, the conflicting requirements found in the Handbook will yield to this final rule.

The EPA appreciates the recommendation related to selecting a balanced peer review panel; however, the recommendation is not relevant to this rule and will not be considered in finalizing the rule. The EPA will continue to conduct peer reviews according to the peer review policies and practices that were in place before the rule goes into effect. The EPA Peer Review Handbook, 4th Edition, describes how peer reviewers are selected by the Agency.

The EPA is finalizing the language at 40 CFR 30.6 (formerly 40 CFR 30.7 in the 2018 proposed rule and the 2020 SNPRM) to clarify that the Agency will conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone journal peer review.

Although not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

- the quality of the study relative to other studies for which the dose-response data are available;
- the extent to which there are other studies for which the dose-response data are available;
- the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
- the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- the extent to which the study is supported by other scientific evidence;
- the extent to which the study accounts for unique scientific considerations;
- the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

Further, the EPA plans to promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

The preamble of the final rule specifies, “given the costs of the current robust process for identifying and reviewing scientific studies and documentation that are existing Agency practice, as well as that the determination of dose-response data availability is limited to pivotal science underlying significant regulatory actions and influential scientific information, the EPA anticipates that the incremental costs of this rule will be small....relative to current administrative costs for developing significant regulatory actions or influential scientific information.”

Chapter 14: Implementation (Including Implementation Benefits and Costs)

The Agency states in the notice of proposed rulemaking (NPRM) that it believes the benefits of this proposed rule justify the costs. The proposal provides that the net benefits from wrongful cost estimations and greater reproducibility would cover the costs of implementation.

While the supplemental notice does not expand the benefits and costs discussion from the original rule, the expansion of the scope established by the supplemental notice of proposed rulemaking (SNPRM) drew many additional comments on the anticipated benefits and costs.

Several comments were received on both the NPRM and the SNPRM on the benefits and costs that would be incurred from the rule's implementation. In this section, implementation topics are organized under sections 14.1 NPRM Implementation and 14.2 SNPRM Implementation.

Section 14.1: NPRM Implementation

- Lack of Clarity How the Rule Would be Implemented
- Incorporating Stronger Data and Model Access Requirements in Grants and Cooperative Agreements
- Building Upon Other Federal Agencies' Policies Regarding Grantee and Cooperator Requirements
- Platform for Increasing Public Access to EPA-Funded Data
- Methodologies and Technologies Designed to Provide Protected Access to Data
- Other Implementation Issues that May Require Special Consideration
- Timing of Implementation
- Impacts on Other Federal Agencies, States and Tribes
- Communications
- Implementation Costs

Section 14.2: SNPRM Implementation

- Inter-organizational Efforts
- The EPA's Readiness to Implement the Rule
- Implementation Timing/Process
- Implementation Costs and Benefits
- Implementation Bias
- Rule Includes Insufficient Implementation Detail/Clarity

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised

in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

14.1 NPRM Implementation

14.1.1 Lack of Clarity How the Rule Would be Implemented

14.1.1.1 No Part of the Agency Should Be Responsible for Implementing Rule Requirements

Comment: Commenter (0671) contends that no part of the Agency should be responsible for implementing this proposed regulation because it runs counter to the text and intent of the Clean Air Act (CAA) and amendments. Commenter (8281-PH20) asserts that EPA should focus on implementing existing initiatives and guidelines for improving data sharing and transparency at the federal government.

Response: The EPA is authorized to issue this rule under its authority to promulgate housekeeping regulations governing its internal affairs. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. Some of these subsequent actions will be substantive rules issued under the associated environmental statutes and will be subject to judicial review.

14.1.1.2 General Lack of Specificity of Implementation and Implementation Responsibilities

Comment: Commenters (5165, 6126, 6144, 6147) express concern regarding the lack of specificity of implementation responsibilities within the EPA in the proposed rule. Commenters (5165, 6144, 6351, 6909) assert that there is little detail on how EPA itself would implement this rule and/or how it would coordinate with other entities on shared responsibilities to review the best available science to protect public health and the environment.

Commenter (6351) states that the proposal fails to discuss how EPA would implement the proposal. The commenter notes that the proposal offers no process for public hearing or even consultation with the SAB over implementation.³³⁵¹ As written, the commenter suggests that the proposal would require review and assessment of volumes of existing research and revisions to internal processes yet to be determined. It also, according to the commenter, seems to give arbitrary decision-making authority to the Administrator to determine the fate of such research.

Response: Implementation guidelines are forthcoming. Further, the EPA plans to promulgate either statute-specific transparency regulations or programmatic actions implementing this

³³⁵¹ Memo from Cullen A, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science to Members of the Chartered SAB and SAB Liaisons. May 12, 2018. Accessed at [https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/\\$File/WkGrp_memo_2080-AA14_final_05132018.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/$File/WkGrp_memo_2080-AA14_final_05132018.pdf)

procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

14.1.1.3 Disclosure Avoidance and De-Identification of Confidential Data

Comment: Commenter (6126) states that the proposed rule does not specify who will be responsible for disclosure avoidance and de-identification of identifiable, confidential data. The commenter provides that some research subjects have been promised confidentiality as a condition of participation in studies, and researchers may be legally and ethically obligated to provide it. The commenter asserts that there is no current organizational structure at EPA that is well-suited to implement this regulation and manage the important privacy and confidentiality issues that may arise. The commenter states that, similar to the recommendations of the Commission on Evidence-Based Policymaking (Commission)³³⁵², EPA currently lacks a leadership structure well-suited for providing oversight and coordination of data resources. The commenter makes the following recommendations:

- EPA should assign responsibilities to senior leaders for data and evidence activities.
- EPA should develop a Confidential Information Protection and Statistical Efficiency Act³³⁵³ (CIPSEA)-approved statistical unit capable of managing the relevant de-identification and other confidentiality issues. If EPA were to be approved for a CIPSEA unit by Office of Management and Budget (OMB) and the agency was willing to meet the requirements of CIPSEA for a unit within the agency, strong confidentiality protections could be in place.

Commenter (6126) notes the following recommendations of the Commission and encourages EPA to identify individuals or develop a statistical unit that can perform the functions:

- Recommendation 3-3 suggests that a senior official in agencies be identified to ensure sufficient data stewardship and implementation of privacy-protective measures.
- Recommendation 5-1 suggests that agencies should identify a chief evaluation officer to help coordinate evidence-building activities.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject

³³⁵² U.S. Commission on Evidence-Based Policymaking (CEP). (2017). The Promise of Evidence-Based Policymaking. Washington, D.C.: Government Printing Office. Available at: <https://cep.gov/cep-final-report.html>

³³⁵³ Confidential Information Protection and Statistical Efficiency Act, or "CIPSEA" refers to Title V of the E-Government Act of 2002, Public Law 107-347. Following are the major purposes of the law: (1) Strengthen confidentiality protections, (2) Limit use of information collected under CIPSEA to statistical purposes only, (3) Permit controlled access to data collected under CIPSEA through a Designated Agent Agreement (DAA), and (4) Establish strong penalties for willful violation.

matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose obligations on the EPA or any other party to make data available or requirements to ensure that personally identifiable information (PII) and confidential business information (CBI) are not disclosed. The Agency will continue to follow existing procedures for protecting PII and CBI as appropriate. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

14.1.1.4 Review and Enforcement of Confidentiality Agreements or Memoranda of Understanding Established for Data Access

Comment: Commenter (6126) states that the proposed rule does not specify who will review and enforce any confidentiality agreements or memoranda of understanding established for data access. The commenter expresses concern that EPA's existing organizational infrastructure may be insufficient to fulfill such obligations and necessary activities to protect privacy and confidentiality.

Response: The final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available.

14.1.1.5 Adjudication of Issues that May Arise

Comment: Commenter (6362) suggests EPA may also want to consider establishing an office similar to that of National Institutes of Health (NIH) Office of Research Integrity to adjudicate any issues that may arise in the administration of its practices under this rule.

Response: The EPA has a Scientific Integrity Official who implements the Agency's scientific integrity policy. The Scientific Integrity Official also adjudicates any allegations of violation of the Agency's scientific integrity policy.

Comment: Commenter (4534) states that the process to deny a request for data should be substantial. The commenter states that, in recent years we have witnessed several branches of the government not release data or records that were requested by the public or other governmental agencies for political reasons. The commenter provides that the denial was framed that the release of information would be a national security risk.

Response: This is a rule of internal procedure and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

14.1.1.6 Establishment of an Epidemiological Study Council

Comment: Commenter (6862) proposes that an Epidemiological Study Council be established with the goal of creating a transparent document reflecting a thorough review of the study. The commenter suggests there should be a middle ground where the Agency determines that the study can be used for regulatory decisions when all supporting data are not available. The commenter asserts that the decision to use the study in the absence of an independent review of the original data should not be the responsibility of one individual. The commenter provides that the responsible individuals would be identified and would defend their decisions from objections from either industry or public interest groups. The commenter suggests the following proposal to justify the use of an epidemiological study when not all of the supporting data are available or to otherwise state clearly why the study cannot be used without the submission of additional data:

Each epidemiology study occurring in the open literature or otherwise needs to have a supporting formal Record of Epidemiological Study Review (ROESR) that clearly delineates the justification for a decision to include or not include the study in the regulatory decisions for the chemical or environmental situation. The production of the ROESR will consist of the separate and independent reports of several Sub-Committees that will be integrated by the Epidemiological Study Peer Review Council (ESPRC) and signed by the Council Chairperson and each Council member. It is important to have independent Sub-discipline committees review the study so that the biases of other sub-disciplines are minimized. The Sub-committee members should be drawn from the relevant staff throughout the Agency as well as other government agencies as needed. Each member of the Sub-committees will sign their respective Sub-committee reports. The roles of the six suggested Sub-Committees and Council Chairperson are as follows:

1. Ethics Evaluation Sub-Committee. This sub-committee will evaluate all aspects of the ethical treatment of the individuals in the cohorts. This includes that it will identify how additional data can be provided to the Agency in a manner that will assure the identities of the individuals are protected.
2. Endpoint Evaluation Sub-Committee. This evaluation would limit its conclusions with regard to how well the character of the endpoint itself was assessed for and whether or not the effect reported is plausibly related to treatment or within normal variation. The latter includes how many subjects in a cohort are needed to make a meaningful statistical difference for the particular lesion in question.

This Sub-committee will provide commentary on the consistency of characterization of the endpoint, resolution of confounds as well as any known other chemicals or conditions that affect the normal distribution of the endpoint.

The experts in this Sub-committee will vary depending upon the endpoint claimed by the epidemiological study and consist of experts in cancer, behavioral response, or other appropriate discipline for interpretation of the significance of the endpoint.

3. Exposure Assessment Sub-Committee. The role of the exposure assessment Sub-committee is limited to determining that the methodology and reliability used to determine the exposure of the cohort is adequate and appropriate. The Sub-committee would provide commentary on whether or not exposure was supported by analytical chemical data, by oral history or otherwise. Also, if the actual persons exposed provided oral history by direct conversation, survey or by telephone. The committee will determine if indirect exposure information was provided by a relative (or friend or coworker) is reliable.

4. Statistical Evaluation Sub-Committee. In the initial review of the study, the sole role of the statistical evaluation sub-committee is limited to determining if the statistical methods were/were not appropriate and adequately conducted to support the conclusion of the report. This committee would not redo the statistics at this time since the original data would be needed. Input from Sub-committees 1 (ethics), 2(3ndpoint evaluation) and 3(exposure assessment) that clarifies all issues that are the responsibility of their respective disciplines would be needed before statistical reanalysis could be conducted. Thus, receipt of the original data in a manner that satisfies Sub-committees 1, 2 and 3 and well as any requests by the Statistical Evaluation Sub-committee before any statistical reanalysis would be conducted.

5. Analytical Chemistry Assessment Sub-Committee. The role of the analytical chemistry committee is limited to determining if the analytical techniques/ methodology were appropriate and adequate for the study. In some cases where no analytical chemistry data were generated, the committee will comment on the need to have included such data and/or if quantitative analysis of exposure data was even possible.

6. Animal Toxicity and Structure Activity Relationship (SAR) Assessment Sub-Committee. In most cases with chemicals, the Agency should already have a battery of standard animal toxicity studies that were required for the registration of that chemical. There may also be studies in the open literature attempting to define the toxicity of the chemical. Thus, the person(s) responsible for evaluating the animal toxicity studies would be a member of this Sub-committee. In addition, this Sub-committee will have individuals that can address the SAR issues in relation to the possibility that the chemical could affect the endpoint in question.

It should be noted here that a Record of Review (ROR) signed by at least two qualified toxicologist is needed for any publication supporting a mechanism of action for the chemical.

If the endpoint occurs in animals or has SAR correlates, such information can support the epidemiological findings. If not, it does not automatically dismiss the epidemiological findings since the effect on the endpoint may be unique to humans.

7. Council Chairperson, Council meetings and resulting product: ROESR.

The Council Chairperson should not be in the same program that has responsibility for regulating the chemical or environmental condition. That is, if the chemical is a pesticide, the Chairperson cannot be from the Office of Pesticide Programs (OPP). Representatives of OPP may still be on the Council if an epidemiological study with a pesticide is being reviewed.

At the initial Council meeting, the Council will discuss the conclusions of each the six Sub-committees. In some cases, the Council may determine that the association between exposure and the endpoint is otherwise strong enough to support regulatory action to protect the public health and no additional information is needed from the study authors.

During the initial meeting the Council can overrule a request for additional data made by any of the Sub-Committees. However, clear justification for overruling a Sub-Committee's decisions must be provided.

In other cases, the Council may determine that there is a definite need to require additional data supporting the study methodologies and conclusions are required. The Council would then notify the authors articulating of the need for the specific additional information.

The Council will also determine if the authors of the epidemiological report should be requested to attend a closed meeting with the Council and Sub-committee members. The purpose of the meeting will be an opportunity for the study authors to address any concerns that the Sub-committees have. This will include problems with providing any additional information that the Sub-committees requested. If the study authors refuse to attend a requested meeting, the Council will determine if the study should be rejected outright.

The Council Chairperson (or secretary of the Council) will prepare the ROESR product that contains the decision with supporting justification. The ROESR product would include the report of the Council with the Chairperson and Council members' signatures. Separate attachments for the signed Sub-Committee reports and the original epidemiological report (i.e. a publication) will also be attached. An executive summary of any meeting(s) with the study authors will also be appended.

Purpose. The purpose of this procedure is to assure that responsible persons for each of the critical Sub-disciplines independently reviewed the study in terms of their expertise. The Council Chairperson and members of the Council and the sub-discipline committees own their decisions and are responsible for defending them. If industry or any concerned public interest groups object to the conclusions, they can address the conclusions presented in the ROESR and/or the sub-disciplines. Therefore, the decisions in the resulting ROESR should be transparent.

The ROESR is not a final conclusion (no documents in EPA should be considered final). It is very likely that a Science Advisory Panel will ultimately review the ROESR. Also,

as new information is generated, the ROESR can be updated and the recommendations for use (or otherwise) can be adjusted as appropriate.

Response: EPA will continue conducting reviews according to the existing peer review policies and practices, including any programmatic specific processes.

14.1.1.7 Oversight of Data Storage and Sharing

Comment: Commenter (2426) suggests that, depending upon the identity and role of the governing entity [in determining exemptions], the same body or a separate third-party entity should oversee the storage of the data and grant access to qualified researchers. The commenter states that the independence of the entity that would grant access to the data also ensures that the EPA is not put in the paradox of collecting data to ensure data transparency and then possibly having to reject requested access to that data.

Response: The final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available.

Comment: Commenter (6117) suggests that the EPA focus on creating a data sharing system for long term human subject studies where privacy concerns exist. The commenter suggests that, in order to make data available to external researchers for scientific purposes, the EPA follow previous efforts to facilitate the sharing of data.³³⁵⁴ The commenter recommends:

1. An independent intermediary group should be created and should partner with the EPA to oversee data requests. By allowing an independent group to have full jurisdiction to make decisions regarding data access, potential political motivations can be avoided.
2. The independent group should ensure that data are made available for scientific research that is aimed at advancing knowledge. Data requestors should provide basic information about the principal investigators, all study personnel and funders, and submit a detailed proposal outlining specific aims and specifying study methodology. All data requests should undergo external review, to facilitate feedback from independent experts in the field to verify scientific merit. To ensure transparency, the independent group should make all of the data requests publicly available, along with the reasons for granting or denying data requests.
3. All requestors should be required to sign a Data Use Agreement (DUA), which states that access to the data will be used to enhance knowledge and that all findings will be made publicly available through publications and meetings.

³³⁵⁴ Krumholz HM, Ross JS. A Model for Dissemination and Independent Analysis of Industry Data. JAMA.2011;306(14):1593–1594. doi:10.1001/jama.2011.1459; Yale Open Data Access Project, Welcome to the YODA Project. 2018. <http://yoda.yale.edu/welcome-yoda-project>. (last accessed Aug. 10, 2018). [19] Institute of Medicine (IOM). Sharing Clinical Trial Data: Maximizing Benefits, Minimizing Risk. Washington, DC: The National Academies Press; 2015, p. 42.

4. The independent group should ensure that the scope of the analyses is limited to the specific aims set out in the proposal and that additional objectives are outlined in new submissions.

Response: The final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available.

The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying data or models are publicly available or available through restricted access. Restricted or tiered access in this rule means that the underlying data or models are be available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

14.1.2 Incorporating Stronger Data and Model Access Requirements in Grants and Cooperative Agreements

14.1.2.1 Support Stronger Data and Model Access Requirements/Cooperative Agreement and Grant Requirements

14.1.2.1.1 Encourage and Ensure that More Data and Models be Publicly Available

Comment: Commenter (6918) supports efforts EPA can reasonably undertake to encourage and ensure, as a general matter, that more data and models underlying EPA decisions are available for the public to use and independently verify, while respecting lawful restrictions on data access. The commenter states that EPA currently underutilizes certain tools it has. The commenter states that, as an agency of the federal government, EPA currently possesses the authority to obtain data produced by federal grants. 2 C.F.R. § 200.315(d)(1) (“The Federal Government has the right to: (1) Obtain, reproduce, publish, or otherwise use the data produced under a Federal award. . . .”). The commenter further states that EPA also has the authority to authorize others to use such data. Id. § 200.315(d)(2) (“The Federal Government has the right to: . . . (2) Authorize others to receive, reproduce, publish, or otherwise use such data for Federal purposes.”).³³⁵⁵ The commenter states that current regulations recognize the importance of public access to data generated by federal grants and that research data produced from federal grants are subject to the Freedom of Information Act (FOIA) in a specific way. The commenter notes that when a federal agency uses research findings produced from federal grants “in developing an agency action that has the force and effect of law,” if a FOIA request is made for the research data relating to these findings, the agency that issued the grant “must request, and the [grantee] must provide, . . . the research data so that they can be made available to the public” through the FOIA process. Id. § 200.315(e)(1). The commenter states that these regulations also recognize

³³⁵⁵ EPA has explicitly adopted 2 C.F.R. Part 200 regulations. See 2 C.F.R. § 1500.1.

that release of certain research data may be inappropriate, specifically, the definition of “research data” for FOIA purposes exempts the following from requirements for public release:

- (i) Trade secrets, commercial information, materials necessary to be held confidential by a researcher until they are published, or similar information which is protected under law; and
- (ii) Personnel and medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study.

Response: EPA has implemented the public access requirements for grantees and contractors as required by the February 22, 2013, OSTP memorandum “Increasing Access to the Results of Federally Funded Scientific Research” and the 2016 EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research.” Grantees and contractors are required to make their data and models underlying any peer-reviewed journal articles resulting from EPA-funded research accessible to the public. This requirement went into effect for any funding granted as of September 26, 2019. EPA’s Environmental Dataset Gateway provides metadata records stating where those data will be available. PII and CBI are still protected under the public access requirements.

The EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research” requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

14.1.2.1.2 National Academy of Sciences (NAS) Guidance

Comment: Commenter (3971) notes that the NAS has issued guidance on this matter and suggests that transparency, as well as privacy can be achieved if carefully executed. Commenter (6356) states that, with regard to Grants and Cooperative agreements, EPA should stipulate that methodologies and technologies designed to provide protected access to sensitive information on personal identities should be based on criteria adopted by the National Academies for “masking” personal identity, or similar, policies for masking personal information.³³⁵⁶

Response: The public access requirements for grants and cooperative agreements requires that data undergo quality review before they are made publicly accessible to safeguard against the release of personally identifiable or proprietary data.

³³⁵⁶ 83 FR 18771/col.1

14.1.2.1.3 Data Sharing Provisions

Comment: Commenters (6102, 6150, 6179, 6360, 6362, 6375, 6918) suggest EPA establish new contracting and grant requirements with data sharing provisions.

Commenters (6102, 6150, 6179) suggest that EPA can establish new contracting requirements to include data and model access requirements.

Commenters (6102, 6150) suggest that EPA establish new contracting requirements to include data sharing provisions, create new interagency data sharing agreements, implement protocols to de-identify data with personal information, and ensure protected data sharing mechanisms where complete de-identification is not possible. Commenter (6102) states that the increased transparency will spur new research and increase the value of federal research investments. The commenter provides that data sharing will allow testing of new ideas on existing data sets. The commenter also recommends that new causal analytical techniques be used to test validity of existing data thereby increasing public confidence in results.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum “Increasing Access to the Results of Federally Funded Scientific Research” and the 2016 EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research.” Grantees and contractors are required to make their data and models underlying any peer-reviewed journal articles resulting from EPA-funded research accessible to the public. This requirement went into effect for any funding granted as of September 26, 2019. EPA’s Environmental Dataset Gateway provides metadata records stating where those data will be available. PII and CBI are still protected under the public access requirements.

The EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research” requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

14.1.2.1.4 Study Design Requirements

Comment: Commenter (6179) suggests EPA could incorporate “transparency by design” requirements into its research grants by conditioning funding on accounting for transparency throughout studies’ lifecycles. The commenter provides that, rather than employing after-the-fact de-identification protocols, it would be far easier to achieve the proposal’s replicability and verification goals if transparency were incorporated into studies from the outset. The commenter suggests that EPA go beyond the proposal to develop methods that encourage transparency early in studies’ development. The commenter states that EPA should borrow from the well-known privacy policy, “privacy by design,” which calls for privacy to be taken into account throughout

an entire developmental process. The commenter states that EPA could incorporate “transparency by design” requirements into its research grants by conditioning funding on accounting for transparency throughout studies’ lifecycles. The commenter suggests that EPA could conduct further research on “transparency by design” protocols, such as anonymous coding methods, to be incorporated in these requirements. According to the commenter, such forward-looking planning can most efficiently accomplish the proposal’s goal of better informing public comments in significant EPA rulemakings.

Commenter (6911) encourages EPA in the Final Rule to create “Transparency by Design” in its research requirements. Commenter states that this would be much more helpful than employing after-the-fact de-identification protocols. Commenter states that such a policy would encourage transparency early in study or a series of studies development.

Similarly, commenter (6918) states that, when EPA carries out its own studies or other data generating activities, EPA has the ability to take care, at that time, to avoid using or generating data and models with access issues, can design data-masking procedures into the process, or can undertake other reasonable actions to enhance the public’s ability to use and independently verify the underlying data and models at a later point, should the study or data be used to justify regulatory action. The commenter states that EPA’s role as the generator of the data should allow for increased access as a general principle. According to the commenter, EPA should be held to a higher standard when it has the opportunity from the start to require that the study design include appropriate measures to allow for transparency without violating relevant legal and policy limits on data access.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum “Increasing Access to the Results of Federally Funded Scientific Research” and the 2016 EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research.” EPA researchers, grantees and contractors are required to make their data and models underlying any peer-reviewed journal articles resulting from EPA-funded research accessible to the public. This requirement went into effect for any funding granted as of September 26, 2019. EPA’s Environmental Dataset Gateway provides metadata records stating where those data will be available. As part of the grant applications, grantees are required to develop a scientific data management plan (SDMP), which includes information on where the data underlying any journal publications resulting from the project will be made publicly accessible. Contractors will also need to develop SDMPs for any projects that could result in journal articles.

The EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research” requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

14.1.2.1.5 Require Level II or Level III Transparency and Openness Promotion (TOP) Guideline Requirements

Comment: Commenter (6360) recommends EPA require Level II or Level III Transparency and Openness Promotion (TOP) Guideline Requirements standards for all its research to be consistent with the best and the current standards of science, regardless of whether the researchers are EPA employees, other federal agency employees, or private researchers employed by companies, universities, or other organizations. According to the commenter, by adopting these standards in EPA's research enterprise, EPA's application of the funded science is ready to support policy judgements.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum "Increasing Access to the Results of Federally Funded Scientific Research" and the 2016 EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research." EPA researchers, grantees and contractors are required to make peer-reviewed journal articles and the underlying data and models resulting from EPA-funded research accessible to the public.

The EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research" requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

14.1.2.1.6 Require Open-Access/Public Availability

Comment: Commenters (0671, 6362) suggest that EPA implement requirements that all EPA-funded data, models and results be open-access.

Commenter (0671) states that EPA can increase public access to EPA-funded data by requiring publications based on EPA-funded data to be open-access (or open-access after 12 months).

Commenter (6362) suggests that EPA can implement requirements that all models and results developed under EPA Cooperative Agreements and Grants be open access and not proprietary.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum "Increasing Access to the Results of Federally Funded Scientific Research" and the 2016 EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research." EPA researchers, grantees and contractors will be required to make peer-reviewed journal articles and the underlying data and models resulting from EPA-funded research accessible to the public. All peer-reviewed journal articles that were funded by EPA are posted on NIH's PubMed Central within one year of publication. The data and models underlying those journal articles are to be made publicly accessible.

The EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research” requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

Comment: Commenter (6375) recommends that EPA clearly stipulate in cooperative agreements and grant terms that data used by researchers receiving funding from EPA must be made publicly available to the extent possible after consultation with EPA. The commenter also suggests that EPA require as part of the cooperative agreement or grant that the data be placed into EPA’s designated system to allow access to the underlying data and models.

Commenter (6449) states that, if the models and data are generated from government funds, EPA should require that they be publicly available on EPA’s website or by request to EPA. Commenter states that, in some cases where compelling reasons are given and publicly available, a time delay might be justified, which should also be identified.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum “Increasing Access to the Results of Federally Funded Scientific Research” and the 2016 EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research.” Grantees and contractors are required to make their data and models underlying any peer-reviewed journal articles resulting from EPA-funded research accessible to the public. This requirement went into effect for any funding granted as of September 26, 2019. EPA’s Environmental Dataset Gateway provides metadata records stating where those data will be available. For intramural research, the data underlying journal publications are posted on EPA’s ScienceHub and are available to the public via data.gov.

The EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research” requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

14.1.2.1.7 Data Management Plan

Comment: Commenter (6362) recommends that EPA require all grant proposal applicants to include as part of any grant proposal a data management plan, similar to those required by the NIH.³³⁵⁷ The commenter suggests that EPA may elect to exclude from these requirements grants/agreements of some specified annual amount, but that annual amount should be

³³⁵⁷ https://grants.nih.gov/grants/policy/data_sharing/data_sharing_guidance.htm

reasonable and ensure that the vast majority of models and results developed under grants/agreements is shared.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum “Increasing Access to the Results of Federally Funded Scientific Research” and the 2016 EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research.” Grantees and contractors will be required to make their data and models underlying any peer-reviewed journal articles resulting from EPA-funded research accessible to the public. This requirement went into effect for grants as of September 26, 2019. As a part of grant application, applicants are required to provide a scientific data management plan (SDPM) for their proposed project. Part of the SDMP requires applicants to specify how they will make their scientific research results publicly accessible.

The EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research” requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

14.1.2.1.8 Common Data Templates and Digital Platforms

Comment: Commenter (6362) states that EPA should develop common data templates and digital platforms for the most common types of research studies to be used by entities subject to Cooperative Agreements and Grants to facilitate public use and validation.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum “Increasing Access to the Results of Federally Funded Scientific Research” and the 2016 EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research.” Grantees and contractors are required to make their data and models underlying any peer-reviewed journal articles resulting from EPA-funded research accessible to the public. This requirement went into effect for any funding granted as of September 26, 2019. EPA’s Environmental Dataset Gateway provides metadata records stating where those data will be available.

The EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research” requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

14.1.2.1.9 Anonymize or Mask Data to the Extent Necessary to Facilitate Data Sharing

Comment: Commenter (6918) states that when EPA funds research, there are opportunities to maximize both transparency and privacy. The commenter recommends that, to facilitate increased access without forcing grant or award recipients to bear unforeseen costs to achieve it, EPA consider adding a new condition to its grants and awards that requires recipients of federal funding through grants or agreements to “anonymize” or mask the data, to the extent necessary to facilitate the sharing of data with EPA and others. The commenter asserts that EPA’s role as the funder allows EPA to require the grantee to consider transparency values at the beginning of the process. The commenter notes that recognition from the outset that EPA may request the underlying data will encourage the grantee to put into place, at the start of the study, appropriate data-masking or anonymizing procedures. According to the commenter, this will efficiently allow for increased data access without running afoul of legal limits on data access or policy reasons for limiting access.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum “Increasing Access to the Results of Federally Funded Scientific Research” and the 2016 EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research.” Grantees and contractors will be required to make their data and models underlying any peer-reviewed journal articles resulting from EPA-funded research accessible to the public. This requirement went into effect for any funding granted as of September 26, 2019. EPA Order 1000.17B “Policy for Increasing Access to Results of EPA-Funded Extramural Scientific Research” states, “. . . data should undergo quality review before they are made publicly accessible to safeguard against the release of personally identifiable or proprietary data.”

The EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research” requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

14.1.2.2 Do Not Support Stronger Cooperative Agreements and Grants

Comment: Commenters (0671, 1011, 4595, 5181, 6895) do not support establishment of stronger contracting requirements with data sharing provisions.

Commenter (6895) asserts that the issue of incorporating stronger data and model access into the terms and conditions of cooperative agreements and grants has been previously and adequately addressed in the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664). This document states that pivotal research must include information so that agency reviewers can “ensure that scientific uncertainties are clearly identified and characterized.” The commenter states that this is the task of peer reviews. The commenter notes that there is no need to make

anything else available if scientific uncertainties can be quantified. (See, discussion above related to EPA's Peer Review Handbook.)

Commenter (0671) states that EPA should not incorporate stronger data and model access requirements into the terms and conditions of cooperative agreements and grants. Commenter states that such requirements are already very strong and strengthening them will add to the regulatory burden on scientists doing research of potential regulatory import without improving the reproducibility of science underlying regulation. Commenter states that, if incorporating these requirements prevents the EPA from entering into cooperative agreements or funding grants involving human subjects then the EPA will have prevented itself from using the best available science, or, even worse, prevented the highest quality science from being done in the first place, which is counter to the text and intent of the CAA and its amendments.

Commenter (1011) states that, when EPA funds research activities through grants or cooperative agreements, the agency should seek to minimize administrative burdens on researchers.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum "Increasing Access to the Results of Federally Funded Scientific Research" and the 2016 EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research." Grantees and contractors will be required to make their data and models underlying any peer-reviewed journal articles resulting from EPA-funded research accessible to the public. This is requirement went into effect for any funding granted as of September 26, 2019 through EPA Order 1000.17B "Policy for Increasing Access to Results of EPA-Funded Extramural Scientific Research."

The EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research" requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

Comment: Commenter (4595) states that it would be premature to introduce additional changes to the terms of research grants until the full impacts of any proposed EPA transparency policy are understood. Commenter (5181) recommends that the sufficiency of existing approaches be fully considered before making substantive changes. Commenter (5181) also recommends that adequate safeguards be considered in any proposed rules to protect personal information of relevant parties.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum "Increasing Access to the Results of Federally Funded Scientific Research" and the 2016 EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research." Grantees and contractors will be required to make their data and models underlying any peer-reviewed journal articles resulting from EPA-

funded research accessible to the public. This requirement went into effect for any funding granted as of September 26, 2019. EPA Order 1000.17B “Policy for Increasing Access to Results of EPA-Funded Extramural Scientific Research” states, “. . . data should undergo quality review before they are made publicly accessible to safeguard against the release of personally identifiable or proprietary data.”

The EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research” requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

14.1.3 Building Upon Other Federal Agencies’ Policies Regarding Grantee and Cooperator Requirements

Comment: Commenter (9227) expresses concern that, while EPA claims that the proposal builds on the “experience of other federal agencies in this space,” EPA simply lists other federal agencies without referring to any policies, documents or actions by those agencies, except for one particular Census Bureau database that allows federal Census data to be shared securely. The commenter states that an uncited statement that other federal agencies have “experience in this space” is far too vague to allow meaningful comment by the public on EPA’s rationale for its action, much less provide any support or rationale for the proposed policy.

Commenter (9227) states that the Census Bureau database cited in the Proposal is an example of how an agency can provide secure access to its own data, but it does nothing to explain or justify EPA’s proposal to exclude third party studies with nonpublic data from consideration in rulemaking. The commenter provides that the U.S. Census Bureau operates the Federal Statistical Research Data Centers (FSRDCs), which are secure facilities providing authorized access to restricted-use microdata for statistical purposes only. The commenter states that to gain access, researchers must obtain Census Bureau Special Sworn Status—passing a moderate risk background check and swearing to protect respondent confidentiality for life. The commenter explains that this approach meets the U.S. Census Bureau’s needs by allowing access to confidential information only to researchers whose proposals meet certain criteria, who go through a vetting process, and who agree to protect the information. According to the commenter, this is a structure designed to protect data collected by the government, not third parties, and there are substantial costs to this approach, which are borne by the Census Bureau. The commenter contends that it is clearly not directly transferable to the context of the proposal.³³⁵⁸ The commenter asserts that it is also unclear whether such a structure, even if it

³³⁵⁸ See Letter to Acting Administrator Wheeler from Marcia McNutt, President of the National Academy of Sciences, C.D. Mote, Jr., President of the National Academy of Engineering, and Victor J. Dzau, President of the National Academy of Medicine 3 (July 16, 2018). (“There are several differences in the confidential microdata collected from individuals and businesses by federal statistical agencies through surveys, versus data and results

were practical (which it is not), would be sufficient to satisfy EPA's requirement to make data and models "publicly available."

Response: The Census Bureau, the NIH and the National Science Foundation are not cited in the final rule.

Comment: Commenter (1012) states that the National Science Foundation (NSF) has long required data sharing as a condition of funding. The commenter provides that, since 2007, the NIH has required public access to publications for all of its funded research after 12 months. The commenter notes that an interagency committee set up by OSTP to develop and coordinate federal policies for long term data stewardship and dissemination of federally funded research has seen at least 17 agencies phase in such data policies. The commenter notes that all of the Agency plans exempt data that is legally protected from disclosure.

Commenter (0556) states that the Federal Government already has rules about sharing data that is developed in federally-funded research. The commenter notes that in some ways this proposed rule looks like a natural extension of the existing requirement for a Data Management Plan. The commenter states that these rules are part of what is called "Public Access," a program which began in 2013 and requires every federal science agency to have a Public Access Plan mandating that research data be shared. The commenter states that EPA's proposed rules extend the Public Access Program from research that is federally-funded to research that is federally-used.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum "Increasing Access to the Results of Federally Funded Scientific Research" and the 2016 EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research." EPA requires all journal articles resulting from Agency-funded research be made available to the public within 12 months of publication. Also, data underlying those journal articles are to be made publicly available while still protecting CBI and PII according to existing requirements.

Under 40 CFR Part 30, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent. This is for pivotal science regardless of whether or not it is funded by EPA.

This final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

from the kinds of studies that are within the scope of the EPA proposed rule. These differences have important implications about making data publicly accessible. What works well in the federal statistical environment may not translate effectively to EPA, where stakeholders might be strongly motivated to discount study results that run counter to their regulatory preferences.").

The EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research” requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

14.1.4 Platform for Increasing Public Access to EPA-Funded Data

14.1.4.1 Do Not Support Development of a Platform for Increasing Public Access to EPA-Funded Data

Comment: Commenters (0671, 1012, 6895) do not support development of a platform for increasing public access to EPA-funded data.

Commenter (0671) states that if EPA is considering purchasing or developing a software platform that would magically encompass any and all data used in scientific studies potentially used in rulemaking, the EPA should not waste taxpayer money on what they believe would be “a colossal boondoggle.”

Commenter (1012) states that, with a reduced number of EPA-funded research studies conducted, a platform to increase access to the data collected is likely to be irrelevant. The commenter states that, if this rule is to be implemented as written, it is likely that fewer scientists or research institutions will want to participate in EPA-funded research if they are concerned that the personal health information they collect may have to be publicly-disclosed. The commenter notes that scientists and researchers may also find it difficult to recruit participants for long-term, large-scale studies that are needed to understand air and water quality issues if the participants are concerned that their medical records may be made publicly-available.

Commenter (6895) contends that a platform to house data from different studies is not necessary. The commenter states that corresponding authors are required to respond to public requests and should be responsible for requests for data necessary to replicate study results. According to the commenter, EPA's request for comment on possible exceptions to the proposed rule, specifically exceptions that would be made on a case-by-case basis, underscores that even EPA has doubts as to the necessity and validity of the proposed rule.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum “Increasing Access to the Results of Federally Funded Scientific Research” and the 2016 EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research.” Researchers are required to make their data and models underlying any peer-reviewed journal articles resulting from EPA-funded research accessible to the public. For intramural research, the data underlying journal publications are posted on EPA’s ScienceHub and are available to the public via data.gov. The public access requirements under the 2013 OSTP memorandum only concern EPA-funded research and was prospective upon implementation.

Under 40 CFR Part 30, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent. This is for pivotal science regardless of whether or not it is funded by EPA.

This final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

The EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research" requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

Comment: Commenter (1012) states that OMB Circular A-110 limits the kind of data produced under a federally funded award that is required to be made public, in order to strike a balance between preserving the integrity of the research process and the need for public access to data. The commenter provides that this is accomplished by permitting such access through the procedures established under FOIA, and including appropriate exemptions such as "personnel, medical, or similar files whose release would constitute an unwarranted invasion of privacy." The commenter states that much of the data from the previously cited air pollution studies would fall under this exemption. The commenter is concerned that this proposed rule could potentially contradict these protections by requiring sensitive data that would have previously been exempted to be made "publicly available in a manner sufficient for independent validation." The commenter states that this requirement stipulated in the proposed rule is particularly concerning as "publicly available" is further defined as "information necessary for the public to understand, assess, and replicate findings."

Commenter (2427) states that there are already various means for public access to studies that EPA uses, and in some cases their underlying data, without the release of confidential information, including the FOIA, which provides an avenue to request raw data, including a process ensuring that sensitive data is protected.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject

matter expert access to enough data to support independent validation while still protecting sensitive information.

14.1.4.2 Support Development of a Platform for Increasing Public Access to EPA-Funded Data

Comment: Commenters (1941, 6126) suggest that EPA should work to set up data-housing capabilities and protocols at a Research Data Center (RDC). Commenter (1941) states that an RDC or another suitable data-storage/analysis site could facilitate the receipt and centralized management of pivotal study data in a manner that can streamline third-party access to data, while also providing safeguards and Agency oversight to protect confidentiality concerns.

Commenter (6126) suggests EPA establish a strong culture and practice of protecting such data with a sufficiently secure data infrastructure. The commenter asserts that EPA's data infrastructure and use of authorities to protect such data appear to be limited. The commenter recommends that EPA explore the availability of the FSRDCs as an option for making confidential data available for approved research projects and statistical activities. The commenter states that the FSRDCs have existing protocols about the de-identification of data and disclosure review processes on which EPA could reasonably build. The commenter provides that FSRDCs may also be useful for EPA to make sensitive, de-identified data available in a secure manner that reduces the risk of re-identification.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum "Increasing Access to the Results of Federally Funded Scientific Research" and the 2016 EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research." Researchers are required to make their data and models underlying any peer-reviewed journal articles resulting from EPA-funded research accessible to the public. For intramural research, the data underlying journal publications are posted on EPA's ScienceHub and are available to the public via data.gov. Also, data underlying those journal articles are to be made publicly available while still protecting CBI and PII according to existing requirements. The public access requirements under the 2013 OSTP memorandum only concern EPA-funded research and was prospective upon implementation.

The EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research" requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible. However, in the final rule, the EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. The step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

14.1.4.3 Consider Various Existing Data Management Platforms/Requirements

Comment: Commenters (0556, 2171, 2426, 2479, 6375, 6449, 6908) suggest EPA consider the use of various existing data management platforms/requirements. Commenter (2426) notes that other organizations already have infrastructure and policies in place to handle sensitive

information, and it makes sense to use these existing capabilities, rather than attempting to re-create them at the EPA. Commenter (6375) states that EPA should study existing systems and adopt, adapt or set up new online data repositories similar to those that already exist that allow public access to data on which agency actions rely that do not contain personal or confidential information.

Commenter (6375) notes that various government agencies, such as the Centers for Disease Control and Prevention (CDC), the Centers for Medicare & Medicaid Services (CMS) and the U.S. Census Bureau maintain online databases and data repositories to allow public data access or restricted access to identifiable data. The commenter provides that CDC and CMS both provide restricted and secured access to health data that contain potentially identifiable and privacy information, such as name, residential address, vital status, birth date, and disease diagnosis. The commenter notes that EPA could also implement additional background screening processes and security measures for access to data that may contain identifiable or proprietary information, similar to those employed by the CDC and CMS for access to research identifiable data.

Commenter (6449) encourages EPA to cooperate with other federal agencies to generate common data access, management and storage standards. Commenter also encourages EPA to participate with the PubChem and the National Toxicology Program databases. Commenter states that the same types of legally binding documents that EPA needed to sign to obtain such data, e.g., non-disclosure agreements, would be expected to be sufficient for other parties. The commenter states that EPA could consider requiring data acquisition and analysis by parties independent of the stakeholder. The commenter suggests, for example, if CBI were requested by an industrial competitor, EPA might require that a non-affiliated consulting firm or academic be the entity that signs the NDA and receives the data for analysis.

Commenter (2479) states that policies vary based on the type of research and the confidential information researchers gather, but the NIH maintains several online databases, like the National Cancer Institute Data Catalog, that qualified researchers can access for free. Commenter (6144) asserts that the NIH system is not publicly accessible and requires significant resources to manage and share with researchers.

Commenter (2171) states that Minnesota agencies are at the forefront of making environmental and health surveillance data available, providing technical assistance for using data, and engaging partners across communities and research institutions around effective dissemination and data utilization. The commenter notes that their agencies host multiple platforms for accessing high-quality health surveillance and environmental monitoring data, while protecting privacy and providing essential risk communication and prevention strategies.

Commenter (2479) states that many scientific journals, like *Science*, already require study authors to publish their data in online databases, but at *Science*, for example, the policy allows exceptions for studies that contain sensitive details like medical information.

Commenter (6908) states that Bayer is uniquely positioned to provide information on the efforts to make data transparent. The commenter notes that Bayer has submitted nearly 50,000 volumes

of research to the agency in support of regulatory actions related to their products and nearly the full set is currently available to almost everyone upon demand. The commenter provides that beginning in 2016 Bayer made the decision to make the safety data underlying its products available to interested parties and began the process of developing a platform to accomplish this. The commenter states that in late 2017 Bayer's transparency platform was launched and may be accessed at <https://www.cropscience-transparency.bayer.com/>.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (9224) suggests EPA should encourage authors to submit their data to public repositories as well as considering giving preference, when possible, to studies where the data is publicly available in this manner.

Response: This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government.

14.1.4.4 Issues Related to the Development of a Data Sharing Platform

Comment: Commenters (6144, 6191, 6909, 6915) express concern that the proposed rule does not address numerous issues related to the development of a platform. The commenters assert that ensuring all this extra information is received, stored, and made publicly accessible would be no small undertaking. Commenter (6144) inquires where the raw data collected will reside, how will the resources to manage the data be obtained, and how will the agency deal with legally and ethically protecting data that is confidential or sensitive.

Commenter (6191) states that guidelines would need to be established as to how long the data would be held and a repository would need to provide mechanisms for file format migration that ensures that data remain un-corrupted and readable. According to the commenter, aggregating sensitive health data onto one platform would unnecessarily increase risks to human subjects. The commenter asserts that data breaches at the Office of Personnel Management (OPM) (<https://www.opm.gov/cybersecurity/cybersecurity-incidents/>) and other commercial organizations (e.g., Equifax, Yahoo) demonstrate that no platform can ever be completely secure.

Commenter (6909) states that, even where privacy issues do not exist, insufficient infrastructure can present a substantial barrier to uniform public sharing of data. The commenter asserts that this is a reason why, in seeking to increase data sharing and improve transparency in science, EPA should take a measured and nuanced approach, consulting closely with the relevant stakeholders rather than swiftly imposing a bright line rule. According to the commenter, existing infrastructure is often still insufficient for hosting and sharing large data sets. The commenter notes that, for example, mechanisms for aggregating information about associated research projects together (rather than having them distributed across numerous repositories), and for properly and usefully identifying and tracking related resources – all of which are central to improving openness and reproducibility of studies – are often lacking. The commenter provides that some groups are developing such services and integrations, but these capabilities need significant improvement. The commenter states that, in addition, sharing of data increasingly means processing large amounts of data stored not in one location but rather on a distributed database. The commenter states that existing technologies are sometimes unable to process such large-distributed datasets efficiently.

Response: The final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

14.1.5 Methodologies and Technologies Designed to Provide Protected Access to Data

14.1.5.1 Consultation with and Consideration of Methodologies and Technologies Designed to Provide Protected Access to Data Already Developed and Used by Agencies and Organizations

Comment: Commenter (6915) expresses concern that, while the proposal says EPA “should collaborate” with other agencies (“to identify strategies to protect confidential and private information in any circumstance in which it is making information publicly available”), there is no timeframe for this process, no explanation of what will happen until such strategies are formed, and no indication of what these strategies will be.

Response: The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science. The final rule does not mention collaborating with other agencies to identify strategies to protect confidential and private information.

Comment: Commenters (0039, 4537) recommend that EPA, as it determines how best to implement the methodologies and technologies of a “reproducibility architecture” to facilitate the adoption of a best available science/best available reproducible science (BARS) standard, consult with representatives or the Center for Open Science, the Meta-Research Innovation Center at Stanford (METRICS), and the Laura and John Arnold Foundation Research Integrity Initiative.³³⁵⁹ The commenters also recommend that the EPA consult with the American

³³⁵⁹ Center for Open Science. <https://cos.io/>; Meta-Research Innovation Center at Stanford METRICS. <https://metrics.stanford.edu/>; Laura and John Arnold Foundation Research Integrity Initiative, <https://www.arnoldventures.org/work/research>

Statistical Association about how to institute standard procedures that will ensure that all scientific research used or funded by the EPA is conducted according to the highest standards of statistical practice.

Commenter (5185) encourages work to protect and de-identify sensitive information to allow for its continued use in regulatory decision-making. The commenter suggests that coordination with other federal agencies could assist; for example, the Department of Health and Human Services (DHSS) and National Institute of Standards and Technology (NIST) have developed tools and guidance to de-identifying PII. According to the commenter, drawing on the expertise and experience of other agencies across the federal government through active and ongoing coordination will improve EPA's ability to make this effort a success. Commenter suggests that, such an effort would be undertaken in concert with the OMB Office of Information and Regulatory Affairs.

Commenters (3971, 6126, 6375) suggest EPA should seek inter-agency advice and technical support on this matter. Commenter (6126) suggests that, regarding EPA's inquiries about nondisclosure avoidance protocols, EPA should consult with the Federal Committee on Statistical Methodology and the federal statistical agencies that have developed much of the research and practice regarding de-identification approaches for confidential data. Commenter (6375) states that multiple government agencies provide restricted and secured access to data that contain privacy or confidential information.

Commenter (6921) states that for sensitive data sets that are otherwise protected due to personal information or CBI, EPA should work with other federal agencies to develop: (1) de-identification protocols that will allow an increasing number of data sets to be fully released to the public; and (2) protected data sharing platforms that will allow the release of more sensitive data sets to researchers subject to confidentiality agreements.

Commenter (6362) states that several agencies and organizations, in addition to NIH, have successfully addressed the issue of data access while maintaining confidentiality that should be considered by EPA. For example:

- The existing rule requiring federally-funded research to be made available to other researchers. This standard could be adopted and applied to third-party funded researchers.
- Health care claims and related data are now being made available to researchers in de-identified form by some health insurance companies, such as Optum, which offers a "proprietary research database of health care and administrative data that links patient, physician, and treatment attributes from millions of geographically diverse individuals in the U.S." Optum appears to have developed methods and procedures to appropriately address confidentiality concerns.
- Medicare claims data are already available to researchers in de-identified form. Algorithms and methods developed by the Center for Medical Services should be examined by the EPA.

- Several professional societies have guidance on the protection of health data and de-identification, such as the Institute of Electrical and Electronic Engineers and the International Association of Privacy Professionals.³³⁶⁰

Commenter (9224) encourages EPA to consult with entities, including the journals that EPA references, that have implemented similar efforts in order to better inform the methods and protocols that should be in place for a rule of this nature.

Response: The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science. The final rule does not mention collaborating with other agencies to identify strategies to protect confidential and private information.

14.1.5.2 Methodology and Technology Limits to Protection of Data

14.1.5.2.1 De-identification Methods and Technologies are Limited and Can Potentially Lead to Re-identification

Comment: Commenters (0569, 2746, 5173, 6046, 6110, 6126, 6132, 6135, 6357, 6446, 6868, 6924, 6937, 9227) caution that there are limits as to how much an individual's identity can be protected based on commonly used de-identification methods and technologies. Therefore, they do not believe the proposed rule can be effectively implemented.

Commenters (0569, 6446) assert that researchers could redact and anonymize personal health data but there are limits as to how much an individual's identity can be protected, especially in small communities where basic identifiers may be enough to recognize an individual.

Commenters (5173, 6110, 6446, 6924) assert that, while the proposal references simple data masking, coding, and de-identification techniques, these methods will not sufficiently protect patient identity in studies such as those in which personal health information is integral to the study. Commenter (6868) suggests that sharing data on animal research or controlled exposure of healthy people can be relatively straight-forward but sharing medical data about real people with diseases at work and at home is much more challenging. The commenter states that full de-identification of the study participants in studies that use dates and addresses to estimate pollution exposure would be impossible.

Commenters (5173, 6126, 6132, 6153, 6191, 6924, 9227) cite several studies to demonstrate that de-identified and anonymous data can be re-identified.

³³⁶⁰ <http://www.ehealthinformation.ca/wp-content/uploads/2014/08/2010-Risk-based-de-identification-of-health-data.pdf> and https://iapp.org/media/pdf/knowledge_center/Perspectives_on_Health_Data_De-Identification_final.pdf (iapp.org)

Commenter (5173) asserts that the need to protect sensitive information would make compliance with the proposed rule impossible³³⁶¹ but discarding such studies from the regulatory decision-making process would exclude relevant and important science, thereby compromising public health. Commenters (6126, 9227) assert that, as the Commission on Evidence-Based Policymaking described in its final report, simply removing direct identifiers is often insufficient to minimize the risk of re-identification.³³⁶² Commenter (6132) states that, in a time of “big data”, it is all too easy to crack any de-identification process, especially when lots of publicly available spatial environmental data are matched to people in the study. Commenter (6153) states that, although public release of data collected on individuals has relied on anonymization to protect privacy, researchers have demonstrated the potential of “reidentification” techniques, which combine seemingly innocuous data from multiple publicly available sources, to identify individuals.^{3363, 3364} Commenter (6191) references two studies and concludes that de-identified and anonymous data can be re-identified.^{3365, 3366} Commenter (6924) states that, according to an NAS Workshop report re-identification of respondents may be increasingly possible because of high-speed computers, external data files containing names and addresses or other direct identifiers as well as information about a variety of individual characteristics, and sophisticated software for matching survey and other files.³³⁶⁷ Commenter (6924) states that re-identification is not hypothetical; study participants, including children, have been identified from data sets which were thought to be sufficiently masked.³³⁶⁸

Commenter (9227) cites additional studies that show the reality and scope of the re-identification threat.^{3369, 3370, 3371, 3372} The commenter states that the Commission on Evidence-Based Policymaking, which EPA also cites in the proposal, also stresses the dangers of re-identification of data that has been stripped of direct identifiers: “No existing statistical disclosure limitation method. . . is able to completely eliminate the risk of re-identification,” despite increasingly

³³⁷² Commission on Evidence-Based Policymaking, *The Promise of Evidence-Based Policymaking*, 54 (2017), <https://cep.gov/cep-final-report.html>.

complex techniques that have been developed since the 1970s. The commenter provides that the Commission also notes the threat posed by the “cumulative amount of information available about individuals and businesses that could be used for reidentification,” with the threat increasing as available information grows and technology to allow re-identification improves.

Commenter (9227) states that while EPA suggests de-identification and redaction of sensitive information can be used to protect privacy when study data is made public, EPA ignores the real concerns, based in empirical evidence, about reidentification of individuals through cross linking with existing public datasets and the ensuing breach of privacy.³³⁷³ Commenter states that experts have observed that even the disclosure of redacted or “de-identified” data sets has become more fraught as public health studies have become more rigorous, because these studies are relying upon greater quantities of ever more granular personal information.³³⁷⁴

Commenter (2746) states that the proposed rule does not address or define the required data set granularity that must be made publicly available; that is, would data presented in aggregate be sufficient for independent validation or would only raw data be sufficient? The commenter states that depending upon the data set, inference and other methods can often be used to deanonymize data, which would result in compromised privacy for study subjects.

Commenter (9227) asserts that, while EPA states that “[o]ther federal agencies have developed tools and methods to de-identify private information,” the Agency then cites to only one source,³³⁷⁵ which does not address the concerns raised here. The commenter states that this guidance provides two methods for de-identifying data: (1) expert determination method, where an expert determines that, after application of statistical and scientific principals and methods, the risk is very small that the information alone or with other available information could be used to identify the subject; and (2) the safe harbor method, requiring that a number of identifiers are removed. The commenter notes that the first method requires case-by-case work, and EPA has provided no information regarding how EPA or others could potentially implement it or how much it might cost. The commenter states that there is no indication of how broadly this technique might be applicable to adequately de-identify data. i.e., EPA must provide its views on whether this technique is likely to be applicable to the majority of studies relevant to EPA with non-public data, some studies, or only a handful. The commenter provides that the second method requires removal of much information that may be necessary to be able to reanalyze or reproduce the research results, so it is unclear whether it would satisfy EPA’s requirements in the

³³⁷³ Sweeney L, Yoo JS, Perovich L, Boronow KE, Brown P and JG B., Re-identification Risks in HIPAA Safe Harbor Data: A study of data from one environmental health study, Technology Science (2017) and Sweeney L., Only You, Your Doctor, and Many Others May Know, Technology Science (2015)).

³³⁷⁴ See Letter from Daniel S. Greenbaum, Health Effects Institute, to Lek Kadeli, Environmental Protection Agency 3 (Aug. 27, 2013) (describing the use of increasingly fine-grained community-level and zip code-level data in public health studies, and noting that “these characteristics – which have in general enhanced the quality and the sensitivity of the studies – increase the difficulty of providing a fully “de-identified” data set while also enabling a different investigator to conduct a full replication and sensitivity analysis of the original study results.”).

³³⁷⁵ Department of Health and Human Services’ Guidance Regarding Methods for De-identification of Protected Health Information in Accordance with the Health Insurance Portability and Accountability Act (HIPAA) Privacy Rule

proposal. According to the commenter, even the safe harbor method has been shown to provide potentially insufficient privacy protections due to the mosaic effect.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying data are publicly available or available through restricted access. Restricted or tiered access in this rule means that the underlying data are be available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The rulemaking does not require the EPA to collect, store, or publicly disseminate data underlying pivotal science.

Comment: Commenter (9227) takes issue with the suggestion in the proposal that the National Academies are of the opinion that simple data masking, coding, and de-identification techniques have been developed over the last half century so that data can easily be modified to address privacy concerns. The commenter notes that the National Academies in fact recognizes that complex, evolving, and yet undeveloped techniques are needed to resolve these concerns, that there are limitations of producing restricted data that sufficiently limit identifiability to allow it to be made publicly available in useful form, and that more work is needed to allow high quality public-use files that still assure inferential validity of the data while safeguarding confidentiality.^{3376,3377,3378,3379} The commenter adds that the National Academies note, “data that are most useful to legitimate researchers typically have characteristics that pose substantial risk of disclosure” and there is increased vulnerability in “[d]ata with geographic detail, such as census block data” and longitudinal data obtained in panel surveys, which is often salient in environmental research.³³⁸⁰

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

³³⁷⁷ *Id.* at 28.

³³⁷⁸ *Id.* at 2.

³³⁷⁹ *Id.*

³³⁸⁰ *Id.* at 21.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (9227) states that ongoing developments in data analytics make data de-identification more difficult to conduct and less likely to adequately protect privacy and confidentiality. The commenter expresses concern that EPA fails to mention, let alone address, the increasing risk of re-identification through data analysis using multiple data sets. According to the commenter, the so-called “mosaic effect” makes even very limited, redacted releases of data to the public a threat to the privacy of study subjects. The commenter provides that OMB has recognized the threat to privacy from the mosaic effect, which it describes as “when the information in an individual dataset, in isolation, may not pose a risk of identifying an individual (or threatening some other important interest such as security), but when combined with other available information, could pose such risk.”³³⁸¹ The commenter notes that OMB specifically highlighted the complicated nature of this threat and the need for agencies to address it carefully, particularly as they may not possess the needed expertise.³³⁸²

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenters (6191, 6357, 6446, 9227) express concern that EPA fails to recognize the risks to privacy that remain even if these methods are employed. Commenter (6191) states that government systems and public sector organizations with highly personal data have been breached and there is no reason to believe any system could be completely secure. Commenter (6357) states that making certain types of data public carries substantial privacy risks and may not always be necessary or sufficient to achieve transparency. Commenter (6357) states that, with advancing computational methods and increasing types of data collected on individuals in multiple domains, re-identification of de-identified human subjects becomes more likely without evolving protections. Commenter (6446) states that the fact that the public would be able to de-anonymize much epidemiological data, after de-identification processes have been applied,

³³⁸¹ OMB Memorandum M-13-13, Memorandum for the Heads of Executive Departments and Agencies on Open Data Policy—Managing Information as an Asset 4-5 (May 9, 2013).

³³⁸² Id. at 9-10 (“Agencies should note that the mosaic effect demands a risk-based analysis, often utilizing statistical methods whose parameters can change over time, depending on the nature of the information, the availability of other information, and the technology in place that could facilitate the process of identification. Because of the complexity of this analysis and the scope of data involved, agencies may choose to take advantage of entities in the Executive Branch that may have relevant expertise, including the staff of Data.gov.”)

would almost certainly have a chilling effect on voluntary public participation in important research.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

14.1.5.2.2 De-Identification Methods and Technologies Could Potentially Make Datasets Unusable

Comment: Commenters (6135, 6924, 9227) suggest that another limitation of de-identification efforts is that they may make data sets unusable for reanalysis purposes.

Commenter (6135) asserts that it is disingenuous that the proposed rule suggests that health datasets can be sufficiently de-identified in the public domain in a way that would simultaneously allow for reanalysis while also preventing the illegal disclosure of protected information. Since there is no way to provide de-identified data in the public domain that would allow for secondary reanalysis of both the exposure assessment and health analysis in studies assessing the health impacts of air pollution, the commenter recommends EPA should instead continue to focus on assessing results across multiple studies to evaluate the veracity and general applicability of scientific findings.

Commenter (6924) states that often, identifying information is a metric key to a study's data analysis and conclusions, such as when home addresses are used as a basis to estimate exposure measures for pesticides³³⁸³ or other pollutants. The commenter states that, in this case, no meaningful analysis could be conducted with de-identified data where home addresses have been removed to ensure participant privacy. According to the commenter, for these types of studies, data de-identification and masking do not provide a viable solution that would both allow re-analysis and protect participant privacy.

Commenter (9227) states that work by other experts in this area suggests that de-identification can be carried out and help protect privacy, but it may produce datasets that have lost vital

³³⁸³ Shelton JF, Geraghty EM, Tancredi DJ, Delwiche LD, Schmidt RJ, Ritz B, et al. Neurodevelopmental Disorders and Prenatal Residential Proximity to Agricultural Pesticides: The CHARGE Study. *Environ Health Perspect.* 2014 Jun 23;122(10):1103–9.\

information needed for specific analyses.³³⁸⁴ The commenter states that the Health Insurance Portability and Accountability Act (HIPAA) guidelines document states: “Of course, de-identification leads to information loss which may limit the usefulness of the resulting health information.”³³⁸⁵ According to the commenter, such results limit the utility of de-identified data sets and would not meet the requirements of the proposed rule which state that “EPA will ensure that the data and models underlying the science is publicly available in a manner sufficient for validation and analysis.”

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Due to limits in the ability to protect data, commenters (6110, 6446, 9227) express concern that EPA may not be able to rely on the best science. Commenter (6110) expresses concern that the proposed rule has oversimplified the issue at hand, which will lead to difficulties in implementing this rule while maintaining EPA's commitment to using the best available science in its regulatory actions. Commenter (6446) states that the inability to de-anonymize much epidemiological data would also prevent EPA from relying on the "best available science" in carrying out its work.

Commenter (9227) states that some researchers might respond to the rule by choosing to work only on public administrative datasets, but this would harm rather than strengthen science quality by curtailing scientific inquiry. The commenter states that the effects of EPA's proposed approach would cause some researchers to choose not to pursue research with human subjects, stifling scientific discovery, while others would forgo compliance with EPA's regulatory requirements and have their research ignored by EPA. The commenter contends that, as a result, EPA's rule would both discourage the development of best available science as well as EPA's use of it.

³³⁸⁴ Simson L. Garfinkel, De-Identification of Personal Information (NISTIR 8053), NIST (Oct. 2015) (saying the goals of allowing data to be used while providing privacy protections “are antagonistic, in that there is a trade-off between the amount of de-identification and the utility of the resulting data.”).

³³⁸⁵ HHS, Guidance Regarding Methods for De-identification of Protected Health Information in Accordance with the Health Insurance Portability and Accountability Act (HIPAA) Privacy Rule, <https://www.hhs.gov/hipaa/for-professionals/privacy/special-topics/de-identification/index.html>.

Response: The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

14.1.5.2.3 Concerns About Access to Confidential or Private Information Being Addressed by Common Solutions

Comment: Commenters (6110, 6114, 6046, 6448, 6937, 9227) do not agree with the statement in the proposal (which includes footnote 16) that “EPA believes that concerns about access to confidential or private information can ... be addressed through the application of solutions commonly in use across some parts of the Federal Government.”

Commenter (9227) notes that EPA claims that there are examples of common solutions from the Department of Health and Human Services (DHHS), the NIST, the Department of Education, and the Census Bureau. Commenter states that, apart from a reference to DHHS guidance on data de-identification, EPA does not actually identify or cite to any specific examples from these agencies in the proposed rule itself, making it impossible to discern what examples EPA believes exist or to meaningfully comment upon the degree to which such examples, if they exist, might suggest that these issues are manageable. The commenter states that the additional hyperlinks added to the docket on May 25, 2018, weeks into the comment period, also link to examples that provide no further assurance that this proposal can be implemented without implicating privacy concerns, and the vaguely referenced other agencies’ “solutions” are unlikely to be of much help.

Commenters (6110, 9227) assert that the proposed rule addresses privacy issues only in a vague sense and does not state what those “solutions” would be. Commenters (6114, 6448) assert that this statement is not supported by any information in the proposal. Commenter (6046) states that, with respect to footnote 16 in the proposal, confidential data are not easily accessible and to make them so would require resources and planning not provided for or outlined in the proposed rule. Commenter (6937) states that the examples cited in footnote 16 are difficult to transfer because of differences in the nature of the data involved, the sample sizes (and thus the degree to which anonymity can be guaranteed through aggregation), and the nature of incentives and preexisting trust between the parties that access the data. Commenter (6937) asserts that, while the proposal claims that science using protected/private health data will still influence public policy (because viable protections are available), this is not true.

Commenter (9227) states that the Proposal ignores or assumes away real and significant issues, suggesting that existing mechanisms and techniques can be used to protect privacy and

confidentiality while making underlying research data publicly available. According to the commenter, the evidence (including several of the sources that EPA cites) indicates that the potential mechanisms alluded to by EPA would only have the potential to address some of the barriers, have serious limitations even for those, and are actually becoming less effective as it becomes easier to combine and manipulate public data sets. The commenter provides that EPA's own SAB voiced concerns that EPA was discounting the challenges to making even limited releases of data, saying:

The proposed rule oversimplifies the argument that “concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions commonly in use across some parts of the Federal government.” For studies already completed or underway, the participation of human subjects is undertaken according to terms approved by the cognizant IRB [Institutional Review Board]. These terms can vary from study to study. In some cases, the data cannot be released simply by redacting portions of it. For example, data may have been collected with an assurance to the participating individuals that their data would be kept confidential.³³⁸⁶

Commenter (9227) states that the “solutions” EPA might have in mind do not address the issues raised by the Proposal because no other agency has tried to implement a requirement such as the one EPA proposes. The commenter states that other agencies provide guidance and techniques to protect privacy during data collection and disclosure to allow more use of data collected by the government, not to mandate that data collected by academic or industry researchers be publicly available for purposes of replicating analyses. For example, the commenter provides that the Department of Education has shared techniques for institutions to provide data on students and schools to meet reporting requirements without compromising privacy.³³⁸⁷ The commenter states that they recognize that each technique “requires some loss of information.”³³⁸⁸ According to the commenter, while de-identified information may still be useful, e.g., to show overall school progress, in the context of the Education Department, it is not clear these techniques are transferable to other contexts.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

³³⁸⁶ Memorandum by Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science (May 12, 2018).

³³⁸⁷ National Center for Education Statistics, SLDS Technical Brief: Statistical Methods for Protecting Personally Identifiable Information in Aggregate Reporting (Dec. 2010).

³³⁸⁸ Id. at 27.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (9227) states that EPA links to a document of the Privacy Technical Assistance Center, Data De-identification: An Overview of Basic Terms, which provides a high-level overview of key terms and practices to help educational agencies and institutions comply with the Family Educational Rights and Privacy Act (FERPA).³³⁸⁹ The commenter provides that this document addresses concerns with data disclosure that occurs “when schools, districts, or states publish reports on student achievement or share students’ data with external researchers” and not to make underlying data publicly available for independent validation, thus, it is unclear that methods used to de-identify but preserve data for those purposes would be adequate in this context.

Response: The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (9227) states that EPA links to a NIST document entitled De-Identification of Personal Information by Simson L. Garfinkel (NISTIR 8053), which discusses de-identification, but not in the context of making research data publicly available for independently validating scientific studies. The commenter states that the document instead notes that “that there is a trade-off between the amount of de-identification and the utility of the resulting data” and that “[i]t is thus the role of the data controller, standards bodies, regulators, lawmakers and courts to determine the appropriate level of security, and thereby the acceptable trade-off between de-identification and utility.”³³⁹⁰ The commenter adds that it further notes that “de-identification approaches based on suppressing or generalizing specific fields in a database cannot provide absolute privacy guarantees, because there is always a chance that the remaining data can be re-identified using an auxiliary dataset.”

Response: The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access.

³³⁸⁹ Privacy Technical Assistance Center, Data De-identification: An Overview of Basic Terms (2001).

³³⁹⁰ Simson L. Garfinkel, De-Identification of Personal Information (NISTIR 8053), 11-12 NIST (Oct. 2015), <https://nvlpubs.nist.gov/nistpubs/ir/2015/NIST.IR.8053.pdf>.

Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (9227) states that EPA’s reference to the U.S. Census Bureau is similarly unhelpful. The commenter notes that EPA provides a link to a website titled Data Ingest and Linkage that details the U.S. Census Bureau’s approach to linking data across many records they hold. The commenter provides that the Website links to a working paper that describes the method by which the Census assigns a unique person identifier that enables it to link records together to create the final file.³³⁹¹ According to the commenter, it is totally unclear how this process on linking together records is a solution that EPA could implement to protect privacy of individuals when disclosing data as it concerns how to identify data with specific people—not protecting privacy.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (9227) states that, while other agencies are clearly grappling with the issue of how to make government-collected data available, they have also highlighted the many challenges in protecting privacy and confidentiality while doing so—such as the ability for de-identified data to be re-identified—and these agencies accept that there is more work to be done before these concerns are fully addressed.³³⁹² The commenter provides that the letter filed in this docket by the Presidents of the National Academies of Science, Engineering and Medicine underscores these difficulties, specifically noting the National Academies’ previous work finding that “statistical analyses of data sets that generate highly precise results—such as geographic specificity or other characteristics that identify respondents—may result in privacy breaches . . .

³³⁹¹ Deborah Wagner & Mary Layne, The Person Identification Validation System (PVS): Applying the Center for Administrative Records Research and Applications’ (CARRA) Record Linkage Software, CARRA Working Paper Series, Working Paper # 2014-01, U.S. Census Bureau (July 1, 2014).

³³⁹² See, e.g., Simson L. Garfinkel, De-Identification of Personal Information (NISTIR 8053), NIST (Oct. 2015) (detailing methods of re-identification and challenges to de-identifying information, concluding “there is comparatively little known about the underlying science of de-identification” and “there is a clear need for standards and assessment techniques that can measurably address the breadth of data and risks described in this paper.”).

The commenter states that this presents a new challenge that federal statistical agencies are just beginning to address.”³³⁹³ The commenter contends that EPA does not even acknowledge, much less try to address, these gaps in agencies’ abilities to protect sensitive data.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (9227) states that EPA cursorily mentions a range of options for facilitating secure access to confidential data, including: “[r]equiring applications for access; restricting access to data for the purposes of replication, validation, and sensitivity evaluation; establishing physical controls on data storage; online training for researchers; and nondisclosure agreements.” The commenter expresses concern that EPA does not indicate whether it would deem providing access with these types of controls in place sufficient to meet EPA’s proposed requirement “publicly available in a manner sufficient for independent validation.”

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted or tiered access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (6875) states that, while it is reassuring that EPA believes that concerns about access to confidential information or private information issues can be addressed by common solutions, it is important that the agency outline a clear protocol that is transparent and

³³⁹³ Letter to Acting Administrator Wheeler from Marcia McNutt, President of the National Academy of Sciences, C.D. Mote, Jr., President of the National Academy of Engineering, and Victor J. Dzau, President of the National Academy of Medicine at 4 (July 16, 2018) (citations removed).

clear. The commenter recommends that EPA solicit public comment on this protocol before implementing it agency-wide.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science. Further details regarding implementation of the rule will be developed before the publication in the *Federal Register* when the final rule is effective.

14.1.5.2.4 Legal, Ethical, and Practical Barriers to Making Data Publicly Available

Comment: Commenter (6915) states that the generally accepted professional practice for the collection of human data requires IRB review and informed consent from the individuals from whom the data are collected. Although the proposal states that “concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions commonly in use across some parts of the Federal government,” 83 Fed. Reg. at 18,770, the commenter asserts that this will not be possible for many studies because IRBs dictate the specific terms of this informed consent, including that the conditions of collection and analysis of human data be specified before initiation of the study. The commenter notes that these a priori conditions include the types of analyses that will be performed, how the data will be used, and whether and how the data can be shared. In general, the commenter asserts that a priori conditions preclude sharing raw data with entities not included in the original IRB approval and performing analyses not specified in the original IRB approval, even if portions of the data are redacted. Furthermore, the commenter adds that clinical data collected from physicians, hospitals, clinics, etc., may also be subject to restrictions under HIPAA, over and above IRB restrictions.

Commenter (9227) states that there are legal and ethical requirements that restrict making public the data underlying studies, including rules to shield private personal information, requirements to maintain CBI, situations where obtaining the necessary permissions to release data are logistically difficult or impossible, and situations in which researchers have made significant investments in developing datasets that they intend to continue to work with for future studies. The commenter states that not all of these barriers can be overcome, nor can they be overcome in every case. The commenter contends that, while there are ways potentially to address some of them, they can be extremely costly and burdensome, and/or may harm the prospects for further research.

Commenter (9227) states that, with respect to human subjects, there are strong legal and ethical privacy and confidentiality protections, which researchers are bound to respect.³³⁹⁴ The commenter notes that, in some cases, researchers would be subject to civil or criminal penalties for violations.³³⁹⁵ According to the commenter, in some cases, de-identification techniques are simply not applicable or still leave significant risk of breach of privacy. The commenter states that, for studies that had received IRB approval prior to finalization of this proposed rule, there may be no practical opportunity to make the data publicly available. The commenter contends that even for new studies going forward, it may be extremely difficult, require additional (often unavailable) funding for elaborate protective measures, or simply impossible to obtain IRB approval for protocols that would allow the data to be made publicly available.

Commenter (9227) states that, with respect to studies that have already been completed, there are additional formidable barriers to public release of underlying data and models. The commenter notes that, with older studies, simply finding the data sets and determining ownership may be expensive or impossible. According to the commenter, for older studies with human subjects, obtaining consent to release of data may be practically impossible, and the data may have been collected in ways that would make protecting privacy with release difficult or impossible.³³⁹⁶

Commenter (9227) states that, for some studies, administrative issues related to the data could be the most difficult barrier to overcome in providing for public release. The commenter states that larger and more costly studies are often performed by groups of researchers within a university, across multiple institutions, or across multiple individual companies. The commenter provides that over time, the data itself may become lost or misplaced, or it may become unclear who actually owns and controls access to the data. The commenter adds that academics move among institutions, companies merge and spin off, and the initial agreements were not always clear in the first instance. According to the commenter, obtaining consent from multiple institutional players takes extensive time and resources, at minimum, and simply may no longer be possible in some instances.³³⁹⁷ The commenter contends that these problems are exacerbated with respect to human subject studies. Additionally, the commenter states that researchers are legally and ethically obliged either to protect the privacy of the individual study subjects or attain each subject's consent to share data. The commenter provides that this can be impractical for older studies and virtually impossible for larger studies, and extremely burdensome. For example, the commenter states that the ACS CPSII extended analysis by Krewski in 2009, which is central to PM2.5 national ambient air quality standards (NAAQS), was initiated in 1979 and encompassed data from 500,000 study participants who lived in 116 metropolitan areas. The commenter

³³⁹⁴ See, e.g., The National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research, The Belmont Report (Apr. 18, 1979), <https://www.hhs.gov/ohrp/regulations-and-policy/belmont-report/index.html>; Federal Policy for the Protection of Human Subjects; Final Rule, 82 Fed. Reg. 7,149 (Jan. 19, 2017); HIPAA Privacy Rule, 45 C.F.R. §§ 160, 164.102-06, 164.500-534.

³³⁹⁵ See, The Health Insurance Portability and Accountability Act of 1996 (HIPAA), Public Law 104-191 (enacted Aug. 21, 1996) (providing for criminal and civil penalties for violations).

³³⁹⁶ See, e.g., National Academies of Sciences, Engineering, and Medicine, Principles and obstacles for sharing data from environmental health research: Workshop summary, 61-63 The National Academies Press (2016), <https://www.nap.edu/catalog/21703/principles-and-obstacles-for-sharing-data-from-environmental-health-research>.

³³⁹⁷ Id. at 45.

asserts that, for these types of situations, tracking down participants (or where the participants have passed away, their family members) to get consent is simply not realistically possible.

Commenter (9227) states that studies conducted on behalf of industry or with industry cooperation may contain CBI, the release of which could jeopardize a company's competitiveness. The commenter provides that, in some instances, researchers cannot make their data sets public without losing much of the value to the researcher of these laboriously and meticulously collected sets of information.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

14.1.5.3 Support the Development of Methods and Technologies

Comment: Commenters (5165, 6141, 6150) support the development of methods and tools for making underlying confidential and private information publicly available while ensuring protection of that information. Commenter (6141) recommends that tools and methods include the following: requiring applications for access; restricting access to data for purposes of replication, validation, and sensitivity evaluation; establishing physical control on data storage; requiring the use of nondisclosure agreements.

Commenter (6877) states that a "one-size-fits-all" approach for access to regulatory data does not work and that a framework for providing varied levels of access to regulatory research data is essential. The commenter states that, as has been learned from confidential data centers providing access to data in a secure environment for some statistical agencies, such access is administratively complex, takes considerable time to implement, and is costly to both agencies and the scientists who use it. The commenter supports the use of such access to data across the federal government, but recommends it be implemented and developed independent of this proposed rule.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data

enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (6918) suggests that, for data that EPA neither generates nor funds, additional measures may be necessary to reflect EPA's values and achieve good governance. The commenter supports efforts, by EPA or others, to develop data-masking measures that lawfully and responsibly increase availability of data and models. The commenter provides that, as EPA acknowledges in the Proposal, there are currently available tools that EPA underutilizes in its rulemakings. The commenter states that there may be new or modified methods that may be appropriate and should be further investigated. The commenter suggests that EPA recognize that, in certain limited cases, the most appropriate approach may be to make the data and related information available to third-party, neutral investigators.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

14.1.5.4 Do Not Support the Development of Methods and Technologies

Comment: Commenter (0671) does not trust any methodology and asks if EPA would retain legal liability for a data breach.

Commenter (1006) states that there is no good way to provide transparent data while still protecting the identity of those in the study. The commenter states that there are plenty of studies that show a person's identity can be revealed with a set of a few data points. The commenter asserts that it seems counter intuitive that by making the data public, it helps make better science.

Commenter (1012) states that the methodology and technology used to provide access to the underlying data would be irrelevant if the overarching policy precludes the use of certain data sets that would provide the most comprehensive information.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted

access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

14.1.5.5 Recommended Methodologies and Technologies to Provide Protected Access to Data

Commenters request that EPA make efforts to make underlying data available and make several recommendations for methodologies and/or technologies to provide protected access to data.

14.1.5.5.1 General

Comment: Commenter (6155) agrees with EPA's goal of making data, as well as the underlying assumptions and options used in the modeling of data, both transparent and available. Commenter (6935) states that in any final rule, EPA also should balance strict adherence to new transparency requirements against the need for regulatory certainty and efficiency.

Response: The purpose of this rule is to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information.

Comment: Commenter (6375) recommends that EPA clearly define data processing/scrambling/analytical measures that are deemed sufficient for protection of privacy and confidentiality of study participants, protection of proprietary data and CBI, and other compelling interests. The commenter suggests that EPA, for example, could consider whether certain analytical processes can be compartmentalized to allow further de-identification of the participants and better protection of the privacy information.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (5185) states that additional guidance explaining how agency officials should advance transparency goals while ensuring protection of sensitive information under varied circumstances would be beneficial.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (4534) states that data released to the public should be published in a way that is easy for members of industry to obtain and understand. The commenter suggests EPA establish standards for how to publish data so users are able to easily understand how EPA arrived at their conclusions.

Response: This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. This rule does not require any researcher or other outside entity to provide data to the EPA. Further, the final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (6155) supports a process for protecting data if release of such data may impair privacy, confidentiality, or national security. The commenter states that this can be accomplished in part by doing the following:

- (a) clearly detailing an objective and consistent process that would determine when release of data underlying pivotal studies would be deemed inappropriate in order to protect privacy, confidentiality, and national security, and
- (b) specifying conditions under which EPA could rely on studies for which the underlying data cannot appropriately be released, or released in ways that will protect privacy, confidentiality, or national security.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data

enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (6362) states that EPA might consider an approach followed under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) where Data Evaluation Records of studies are made publicly available, but not full studies.³³⁹⁸

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (0560) recommends that EPA's policy and regulations address each of the issues detailed by Noble Laureate Richard Feynman in "Cargo Cult Science" (1974).³³⁹⁹ According to the commenter, the idea is to try to give all of the information to help others to judge the value of your contribution; not just the information that leads to judgment in one particular direction or another.

Response: The rule does not categorically exclude studies, even studies where the underlying dose-response data are not available for independent validation, and therefore any impact on researchers who are developing science and deciding whether to voluntarily make the underlying dose-response data available is incidental. Instead, it governs internal agency procedures for determining the consideration to afford various studies according to factors that include data availability.

14.1.5.5.2 Privacy Data

Protection of Health Data

Comment: Commenter (6362) recommends that EPA ensure that it implements its final rule in a manner that enables it to use confidential health records that may exist with certain kinds of studies, such as long-term air pollution and workplace exposure studies that involve confidential health records.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted

³³⁹⁸ See, e.g., <https://archive.epa.gov/pesticides/chemicalsearch/chemical/foia/web/pdf/010501/010501-050.pdf>. See, e.g., [US EPA Dicofof \(Pc Code 010501 | US EPA ARCHIVE DOCUMENT](#)

³³⁹⁹ Feynman, R.P., 1974. Cargo cult science. *Engineering and Science*, 37(7), pp.10-13. <http://calteches.library.caltech.edu/51/2/CargoCult.htm>

access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (6362) states that, when protecting data while also promoting data access, NIH guidelines should be consulted.³⁴⁰⁰ The commenter believes many of these guidelines could be applied in EPA's implementation of this proposed policy under each of the statutory programs EPA administers to ensure the guidelines adopted suit the specific needs of each statute.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (2479) recommends that, when researchers disclose their datasets, they should not black out personal health information; instead, they should group the results and the databases should then be accessed through a strict ID and password system.

Response: This rule does not regulate researchers or anyone outside of the EPA.

The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (6942) requests that EPA provide clarification and guidance for implementing the proposed regulation when human data are utilized for dose-response modeling

³⁴⁰⁰ See <https://osp.od.nih.gov/2016/05/02/protecting-data-promoting-access-improving-our-toolbox/>; <https://www.niaid.nih.gov/research/data-security>; and <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5302472/>

and development of a chemical-specific cancer slope factor, reference dose, or reference concentration (e.g., risk assessments by the Integrated Risk Information System (IRIS)).

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Institutional Review Board (IRB) Approval of Disclosure of De-identified Data

Comment: Commenter (6942) recommends that, for human data, information available to researchers be limited to individual-level, de-identified data, to ensure that the privacy and confidentiality of the study participants is maintained. Commenters (1006, 2171) state that detailed data are similarly available for research uses, under the approval and guidance of IRBs that help regulate and evaluate studies that use important data so identity can be preserved. The commenter recommends that any disclosure of de-identified data should require approval by an IRB.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

14.1.5.5.3 Confidential Business Information

Comment: Commenter (6362) recommends that, in circumstances where company CBI and other intellectual property may be implicated, EPA should confer with the CBI data owner to determine how to make that data available to the greatest extent possible without disclosing the CBI within that data, study, or model. The commenter states that how this is handled will likely be impacted by the type of regulatory decision and statute involved. Commenter provides the following example:

For example, under TSCA, while the summarized study results, analysis, and final report may be publicly available, the underlying data in a health and safety study may qualify as CBI when the underlying data are not in the public domain and that data provides a commercial value to its owner.³⁴⁰¹ In such circumstance, it is the availability of the underlying data that determines whether or not an unpublished study can be used by a competitor to support its notification or registration of a substance overseas without obtaining ownership or citation rights to use such data, depriving the data owner of the value of its investment in the underlying data. Current EPA regulations require chemical manufacturers to submit health and safety studies under some circumstances. However, it is noteworthy that none of these regulations routinely require study submitters to submit underlying data along with a final report. This indicates that the final report likely communicates sufficient information about the potential health and environmental effects to the public when a company has submitted health and safety studies in which it has a commercial interest in protecting.³⁴⁰²

Commenter (6362) believes that making a final study report publicly available where the underlying data are CBI would, in most circumstances, be an effective way to make relevant information publicly available about studies and data EPA may rely on, but which must be protected as CBI in circumstances triggering this policy. The commenter provides that, in these situations, EPA can access the underlying data to confirm the methods, models, and approaches are based on validated procedures, accessible data, etc. According to the commenter, if necessary, when specialized expertise is needed, EPA could contract with an independent third-party science reviewer to confirm those findings, although we believe this would likely only be necessary in unusual circumstances.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The EPA will continue to follow existing requirements/guidance for handling CBI.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed.

³⁴⁰¹ See, e.g., *Cohen v. Kessler*, No. 95-6140 (D.N.J. Nov. 25, 1996).

³⁴⁰² 40 C.F.R. §720.50(a)(3)(i) requires that if data do not appear in the open scientific literature, the submitter must provide a full study report, including the experimental methods and materials, results, discussion and data analysis, conclusions, references, and the name and address of the laboratory that developed the data.

Comment: Commenter (6130) states that the proposed rule establishes increased protections for CBI, diminishing the amount of information available to the public to inform policy, whether from the scientific community or from the business community.

Commenters (0559, 6120) assert that CBI may be necessary in some cases for scientific experts to evaluate the potential for hazards due to chemical exposures e.g., in consumer products. The commenters suggest that responsible authorities, including state agencies, the EPA, and independent scientific reviewers should be able to request and have access to CBI when necessary to evaluate these hazards.

Commenter (5170) states that because CBI may be necessary to evaluate health risks from exposures to some products, EPA and independent scientific reviewers should be able to access CBI in assessing these risks. The commenter states that, given the recent apparent scientific fraud committed by the founder of Theranos, it would seem that CBI and industry-based science are due substantial scrutiny and transparency.

Commenter (6120) asserts that one significant way to improve transparency is to increase access to CBI; this would give the public confidence that this information is independently reviewed by experts in relevant fields. The commenter recommends that EPA establish a group of independent scientists who could serve as scientific reviewers of CBI data. The commenter provides that this review could be done under strict confidentiality agreements and would ensure more confidence in the scientific vigor of the data submitted. The commenter urges the EPA to follow the OMB guidelines for peer review to ensure peer reviewers are independent of industry and include academic scientists and allow scientists who receive government research grants to offer "independent scientific advice to the agency on other projects."

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenters (6126, 6906, 6935) support the need for CBI provisions/standards to protect data from disclosure.

Commenter (6906) commends the Agency for acknowledging the importance of CBI and simultaneously establishing that while transparency is key, data transparency must be conducted in a way where CBI and intellectual property are retained. The commenter states that industry heavily relies upon the use of CBI provisions in various EPA programs to help retain competitive

advantage between companies. According to the commenter, this could be especially pertinent when addressing industry-sponsored testing data, modeling and risk assessments. The commenter provides that, additionally, many studies (especially dose response data and models, which are the focus of this rule) have a significant amount of personal information that would need to remain confidential as well. The commenter states that, for both instances, EPA needs to determine a standard to either sanitizing certain aspects of the data, so that they can be made publicly available, or a procedure regarding selective publication so that certain aspects of these studies can also be made publicly available.

Commenter (6935) suggests that any final rule should include a detailed, objective and consistent process for safeguarding CBI and that fits seamlessly with the Administrator's potential exemption process after it is expanded to provide additional information on criteria to be considered and procedures for exemptions.

Commenter (6126) urges EPA to incorporate Recommendation 3-4 of the U.S. Commission on Evidence-Based Policymaking which encourages the adoption of activities that protect public trust for confidential data.³⁴⁰³

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed.

Comment: Commenters (6112, 6115, 6855) support the Agency's proposal and state that its policy and guidance documents sufficiently address concerns about unauthorized access to confidential personal and business information. Commenter (6162) states that, to allay concerns regarding the disclosure of CBI, the Alliance supports the proposed regulatory text of §30.5:

Where the Agency is making data or models publicly available, it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, CBI, and is sensitive to national and homeland security.

³⁴⁰³ Nick Hart. (2017). Improved Data Coordination and Use Required for Evidence-Based Policymaking. Washington, D.C.: Bipartisan Policy Center. Available at: <https://bipartisanpolicy.org/blog/improved-data-coordination-and-use-required-for-evidence-based-policymaking/>.

Commenters (6448, 6918) supports EPA's efforts to balance appropriate protection for copyrighted or CBI, including where protected by law, with requirements for increased transparency of pivotal regulatory science. Commenter (6448) notes that there will be situations in which CBI cannot be shared publicly but this should not preclude its inclusion in regulatory decisions. Commenter (6918) states that EPA must, and should, continue to recognize limits on data access and modify, as appropriate, efforts to enhance transparency to reflect these lawful, reasonable limits.

Response: Section 30.5 in the final rules states, "The Agency shall also give greater consideration to pivotal science based on dose-response data that include confidential business information, proprietary information or PII if these data are available through restricted access in a manner sufficient for independent validation." It also states, "For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.9."

Comment: Commenter (6379) urges EPA to establish a process to maintain confidentiality through a peer review process to ensure EPA can continue to rely on CBI even though it is not publicly disclosed while also ensuring that scientific rigor is applied to consideration and use of this information.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed.

14.1.5.5.4 Proprietary Data

Comment: Commenters (6150, 6191, 6375) provide recommendations on how to balance protection and transparency with regards to proprietary data.

Commenter (6150) asserts that the protection of proprietary data, models and methodologies should not apply to research that is funded by EPA or was developed under EPA contract. The commenter states that utilization of private models or failure to disclose methodologies should be discouraged, if not deemed a disqualifier, as such actions fail to meet minimum transparency requirements.

Commenter (6191) requests that intellectual property considerations be noted and that data with intellectual property or confidentiality concerns should not be shared. The commenter states that the sharing of data containing patentable information or trade secrets should not be required due to the potential negative economic implications of such a requirement.

Commenter (6375) suggests EPA solicit input from EPA Offices (such as the Office of Pesticide Programs) or other federal agencies (such as FDA) that rely heavily on copyrighted information, proprietary studies, and CBI for strategies to balance these concerns with transparency. The commenter states that, for example, EPA Offices (e.g. Pesticides) that rely heavily on proprietary studies/CBI apparently have already devised mechanisms that balance protection with transparency of pivotal regulatory science. The commenter provides that one mechanism is Data Evaluation Records (DERs) that summarize proprietary studies.³⁴⁰⁴ The commenter provides that another is human health risk assessments that integrate findings in DERs such that stakeholders can assess the impact of a particular endpoint (e.g. health effect) in a particular study (pivotal regulatory science) on the overall risk assessment. The commenter states that both DERs and risk assessments have been made available in the docket or by other means. According to the commenter, while not as transparent as making the underlying data and models fully available, sufficiently detailed DERs and risk assessments are arguably as detailed and transparent as many health studies and risk assessments published in the peer-reviewed scientific literature. The commenter states that, regarding copyright protection, a potential alternative for copyrighted works that use data that are federally funded may be to solicit from the authors the raw data (which often isn't copyrighted) that were used to produce the copyrighted work. The commenter notes that these raw data, along with EPA's analysis of these raw data, could then be made publicly available.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed.

Section 30.5 in the final rules states, "The Agency shall also give greater consideration to pivotal science based on dose-response data that include confidential business information, proprietary information or personally identifiable information if these data are available through restricted access in a manner sufficient for independent validation." It also states, "For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still

³⁴⁰⁴ <https://www.epa.gov/pesticide-registration/oecd-data-evaluation-record-templates>

consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.9.”

In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule.

14.1.5.5.5 Non-CBI Animal Studies

Comment: Commenter (6942) recommends that the Hexavalent Chromium Mode of Action Research study serve as a model for other research programs that desire to foster collaboration in the research community and promote transparency and validity of the scientific data used in regulatory risk assessment. The commenter provides that similar approaches, using the internet and web-based repositories, could be implemented for both government-funded and stakeholder-funded research. The commenter states that additional resources may be needed to accommodate the proposed rule, but with regard to animal research data, they do not anticipate that significant hurdles would arise, unless the pivotal study is highly dated, or the best available science. The commenter provides the following information regarding their experience:

For recent research and risk assessment projects, we have used confidential, personal identifying information, with Institutional Review Board (IRB) approval, including data collected at the federal level (e.g., Social Security and National Death Index records), and we have also used de-identified personal information generated by the National Institute for Occupational Safety and Health (NIOSH) and the Institute of Medicine (IOM) for research projects related to the development of pivotal data for risk assessment. Therefore, we believe we offer highly informed comments to the proposed regulation based on specifically-relevant experience.

In that regard, we offer the example of our Hexavalent Chromium Mode of Action (MOA) Research study. During this nine-year project, ToxStrategies created a vast repository of *in vitro* and experimental animal data, including original toxicology data, modeling code, and toxicogenomics, and that body of data has been made freely available for use by other scientists and regulators seeking to analyze the raw data (<https://cr6study.info>). Both U.S. EPA and California EPA have accessed and downloaded the raw data sets. The Hexavalent Chromium Mode of Action Research study was developed to better understand how hexavalent chromium caused cancer in rodents from drinking-water exposures. Key objectives of the research study were to (i) evaluate the MOA, (ii) develop and make assessable physiologically based pharmacokinetic (PBPK) data and models allowing for inter- and intra-species extrapolations in risk assessment, and (iii) ultimately to provide data that will improve upon the science used for risk assessment and setting drinking-water standards for Cr(VI). This research study has been conducted as a collaborative effort among multiple organizations, universities, and government researchers, and full disclosure of the original data has always been our objective.

Response: The final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

14.1.5.6 Definition, Guidance, Standards and Training are Needed

Comment: Commenters (1008, 1011, 6126, 6362) recommend that EPA provide training/guidance to researchers to support making research data publicly-accessible. Commenter (1008) states that, should this proposed rule place transparency requirements on EPA-funded researchers, these researchers must be provided appropriate training and support to make research data created in future research studies publicly accessible. Commenter (6126) states that, if the intent of EPA is to rely solely on de-identified data, some researchers may lack the appropriate expertise to sufficiently de-identify data without additional training, support, and guidance on techniques and approaches for doing so. Commenter (6362) suggests EPA develop guidance on protecting privacy, de-identifying data, and settling disputes should a breach occur. Commenter (1011) suggests that EPA provide researchers guidance regarding proper channels for data dissemination.

Response: The final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA or any other entity to collect, store, or publicly disseminate dose-response data underlying pivotal science.

14.1.6 Other Implementation Issues that May Require Special Consideration

14.1.6.1 Consideration of Differing Regulations and Requirements

Comment: Commenter (6191) states that, as research is increasingly the product of international collaboration, they recommend that differing regulations and requirements worldwide be considered.

Response: In section 30.9 of the rule it states, “The Administrator may grant an exemption to this part for a study on a case-by -case basis if he or she determines that greater consideration is warranted because: (1) technological or other barriers render sharing of the dose-response data infeasible; . . .”

14.1.6.2 Consideration of Secondary Data Analysis Data Use Agreements

Comment: Commenter (6191) states that where secondary data analysis is being conducted, data use agreements prohibit broader dissemination of data, which would also prohibit data from being released publicly.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data

are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

14.1.6.3 Regulatory Determinations Should be Based on More than One Study

Comment: Commenter (6875) encourages EPA to not base any regulatory determination on a single study, regardless of whether or not the data is publicly available. The commenter suggests that relying on a single study, no matter how robust it may be, can bring bias to a model or regulatory decision. If EPA must base a decision off of a single study, the commenter recommends that the data be publicly available as well as the reasoning and methodology behind why the study was chosen, how it is being used and why no other studies were deemed sufficient to be included.

Response: The rule will apply to the pivotal science underlying significant regulatory actions and influential scientific information. Section 30.2 states, “Pivotal science means the dose-response studies or analyses that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.” Pivotal science is not necessarily a single study or analysis.

14.1.7 Timing of Implementation

14.1.7.1 Do Not Delay Implementation of Proposal

Comment: Commenter (6150) encourages EPA to not delay implementing core components of this proposal until the Final Rule is issued. The commenter asserts that it is appropriate and consistent with federal statutes for EPA to immediately begin to identify key studies that are likely to be pivotal in significant upcoming rulemakings immediately. The commenter provides that EPA could seek public comment on a list of these potential studies/models, allowing the public to nominate other studies or models. The commenter states that identification now would allow time for EPA to contact researchers and develop appropriate data sharing approaches. The commenter adds that such early action could also assist in identifying research used by EPA in the past that may need additional disclosures.

Commenter (6867) suggests that the EPA should not delay implementation of this rule unless required to do so by statute. The commenter states that certain commenters claim the EPA has not complied with specific statutory obligations. The commenter notes that they do not have a position on the EPA’s statutory obligations, but they encourage the EPA to carefully comply with applicable procedural requirements so as to minimize the risk of dilatory litigation.

Response: The final rule is effective on the date of publication in the *Federal Register*. The final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available.

Also, the rule does not require any researcher or other outside entity to provide data to the EPA. Researchers may choose to make more data available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate.

30.7 of the final rule states, “To assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption.” Forthcoming guidance/substantive rulemakings subject to notice and comment could be further opportunity for input from the public.

14.1.7.2 Request for Implementation to be Delayed Until After Proper Procedures and Infrastructure are Established

Comment: Commenter (6908) suggests that EPA not implement all or portions of the regulations until the proper procedure and infrastructure, such as IT systems and databases, are in place and functional.

Response: The final rule is effective on the date of publication in the *Federal Register*. However, the Agency plans to have implementation guidance available by the date of publication in the *Federal Register*. However, as outlined in 40 CFR 30.3, the provisions of the rule apply to significant regulatory actions for which a proposed rule was published in the Federal Register after the effective date of the rule and influential scientific information submitted for peer review after the effective date of the rule. Further, EPA intends to issue implementation guidelines and statute-specific rulemakings that will provide further clarity.

14.1.7.3 Ensure Data Access Early in the Rulemaking Process

Comment: Commenter (6375) suggests EPA should ensure that data access occurs early enough in the rulemaking process so that the public has sufficient time to analyze the data.

Response: The rule requires the EPA to identify and make publicly available the science that serves as the basis for informing a significant regulatory action at the proposed or draft stage to the extent practicable. The definition of publicly available in the final rule includes, “The public must be able to access the information on the date of publication of the proposed rule (or, as appropriate, a supplemental notice of proposed rulemaking, or notice of availability) for the significant regulatory action or on the date of dissemination of the draft influential scientific information for public review and comment.

14.1.8 Impacts on other Federal Agencies, States and Tribes

14.1.8.1 State and Tribal Implementation

Comment: Commenter (6125) expresses concern that the proposal does not describe how it will be implemented in regard to states and tribes. The commenter states that federal standards may govern the level of environmental protection within states and on tribal lands. According to the

commenter, those levels of protection would be reduced under a new regulation that ignores evidence because of the new rule. The commenter asks the following related questions:

- Would states or tribes have any recourse when this happened, or could they keep the old standards?
- Under what circumstances would or could EPA disapprove a program for failing to adhere to the new federal law requirement?
- Does EPA believe that a state with an authorized program based on actual science would still meet federal standards after the program becomes regulated under censored science providing for reduced federal standards?
- Would EPA disapprove a state program if the state failed to relax its standards to reflect new federal requirements?
- What kind of oversight would there be when states make permitting or enforcement decisions, actions that are not covered by the proposal but possibly implementing regulations that are covered.
- Has EPA considered whether it would be consistent with the federal trust responsibility to tribes to relax requirements or standards, and thus reduce protection for tribal lands solely because of a new regulation based on ignoring reliable and relevant science?
- Would such a reduction in protection on tribal lands be consistent with principles of environmental justice?

Response: EPA plans to issue implementation guidelines and statute-specific transparency regulations or programmatic regulations. The final rule states, “The action imposes no enforceable duty on any state, local or tribal governments or the private sector.” The EPA does not agree that this rulemaking would weaken human health protections. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety.

14.1.8.2 Relationship Between EPA-Funded Research and Research Funded by Other Agencies

Comment: Commenter (6126) suggests that EPA has ill-considered the relationship between EPA funded research relevant for regulatory actions, and the vast amount of research funded by other agencies (e.g., NSF and NIH) or through non-federal funding sources (e.g., many universities, states, foundations, private firms). The commenter asks:

- Would EPA request data when needed or would researchers be expected to provide it unsolicited or on-demand?
- What obligations would researchers have to provide such information?
- What would be the consequences for not doing so?
- If EPA cannot obtain data from studies and thus excludes those studies from consideration, how can EPA ensure use of the “best available science?”

Response: This final rule does not regulate any entity outside the EPA. Rather, the requirements modify the EPA’s internal procedures regarding the transparency of pivotal science underlying significant regulatory actions and influential scientific information.

14.1.9 Communications

Comment: Commenter (6126) suggests that government agencies develop a “learning agenda,” which would be operationalized as a strategic plan for evidence-building activities.³⁴⁰⁵ The commenter states that, to the extent EPA is planning regulatory activities well in advance, the learning agenda is intended to signal to researchers inside and outside government what the priorities are and could also be used to indicate data priorities.

Response: The final rule does not regulate any party outside of the EPA but rather exclusively governs the EPA’s internal process for determining the consideration to afford pivotal science with respect to certain actions. This rule does not require any researcher or other outside entity to provide data or models to the EPA. Nor does the rule categorically exclude studies—even studies where the underlying dose-response data are not available for independent validation—and therefore any incidental impact on researchers who are developing science and deciding whether to make the underlying dose-response data available is negligible. Instead, it governs internal agency procedures for determining the consideration to afford various studies according to factors that include data availability. In doing so, the final rule provides greater transparency on the consideration the EPA will give pivotal science where the underlying dose-response data are or are not available for independent validation.

If researchers want to increase the likelihood that their studies receive greater consideration by the EPA, they may take steps to ensure that the underlying dose-response data are available to the greatest extent possible. But any such response to this final rule would be purely voluntary. It is not required by this rule.

Comment: Commenter (5185) suggests that EPA ensure that relevant transparency information is incorporated into public communications and marketing materials associated with regulatory initiatives. For example, if the claimed benefits of a proposed action are based on non-transparent information, the commenter recommends that the Agency adopt a practice of disclosing this in press releases and fact sheets. The commenter states that, paired with an enhanced focus on risk communication, this practice will lead to greater public understanding of the scientific and other inputs that drive important EPA policies.

Response: Section 30.4 of the final rule states, “The EPA shall clearly identify all science that serves as the basis for informing a final significant regulatory action. The EPA shall make all such science that serves as the basis for informing a significant regulatory action publicly available to the extent permitted by law”

³⁴⁰⁵ Nick Hart. (2018). Will the Trump White House Hold Agencies Accountable for Performance Improvements? Washington, D.C.: Bipartisan Policy Center. Available at: <https://bipartisanpolicy.org/blog/will-the-trump-white-house-hold-agencies-accountable-for-performance-improvements/>.

14.1.10 Implementation Costs

14.1.10.1 Inclusion of Cost Analyses in the Proposal

14.1.10.1.1 More Robust Analyses of Implementation Costs Are Need

Proposal Fails to Adequately Consider the Costs of Implementation

Comment: Commenters (1012, 1281, 1346, 1388, 2024, 2787, 3135, 5021, 5022, 5165, 5579, 6109, 6111, 6122, 6126, 6133, 6185, 6233, 6168, 6373, 6375, 6925, 8272, 9227) generally assert that EPA has failed to adequately consider the costs of implementation.

Commenter (1388) states that in its proposal, the EPA has not fully accounted for the cost and consequences of excluding valuable information. Commenter (5579) provides that data transparency comes at costs which the EPA does not elaborate on in this rule and which leads the current rule as it stands to be incomplete. Commenter (6109) states that EPA does not explain how it will pay for compliance with the proposed rule or where the personnel hours will come from. Commenter (6375) suggests EPA should assign designated personnel and allocate sufficient funds to facilitate data access.

Commenter (6126) states that, in the absence of incentives to provide information as requested by EPA for regulatory actions, researchers that are not funded or mandated by EPA appear to have no direct incentive to comply with EPA's regulation. Commenter (6133) states that EPA does not confront the financial dimensions or the need for financial incentives to support the unprecedented data release requirements in the rule.

Commenter (9227) contends that the proposed rule fails to acknowledge or provide for costs of the rule related to data masking, de-identification, deposition in public data repositories, and controlled access in federal RDCs. The commenter states that there are various costs to the agency of administering the regulation, which include contacting researchers, gathering data, and ensuring that patient confidentiality and CBI are not disclosed. The commenter states that additional costs could also be incurred because of the need to conduct additional peer reviews required by proposed §30.7 and any additional analyses imposed by proposed §30.6's requirement that "EPA shall clearly explain the scientific basis for each model assumption used and present analyses showing the sensitivity of the modeled results to alternative assumptions."

Response: The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs or benefits to the Agency. The final rule acknowledges that the EPA will incur some administrative costs associated with the rule, but the EPA finds that these costs are likely to be small given that the additional requirements are limited to pivotal science, and that EPA already conducts extensive review of the science when promulgating regulations or publishing influential scientific information. See III.J of the final rule preamble for further discussion of benefits and costs of the rule.

The rule does not require any action by any party other than the EPA and imposes no costs on other parties. The rule also does not require EPA or any party to disseminate scientific data and incur associated costs. The final rule does not require additional peer review, though the EPA

will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review.

Comment: Commenter (6915) expresses concern that, despite the existing peer review process, EPA apparently proposes to require that EPA itself conduct an additional “independent” review. See 83 Fed. Reg. at 18774. Yet, the commenter notes that the proposal nowhere discusses how EPA would vet reviewers to identify persons who are purportedly more competent than those already used in past or current peer review processes, or the level of EPA staffing and associated costs that would be needed for additional review—only stating that EPA will implement the proposed rule in a manner “that minimizes costs.” Id. at 18774. The commenter adds that the EPA fails to acknowledge the rigor of existing processes in statutes, policies and federal procedures, or to explain how its proposal would provide any added value and minimize costs.

Response: The EPA is clarifying that 40 CFR 30.6 does not require *de novo* peer review on studies that have already undergone adequate peer review. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review. The EPA’s determination of what constitutes adequate peer review is made consistent with the EPA’s 2015 *Peer Review Handbook*.³⁴⁰⁶

Paperwork Reduction Act, Executive Orders, and OMB Guidance

Comment: Commenter (2024) states that EPA should do a burden estimate under the Paperwork Reduction Act (PRA).

Commenter (6125) states that the proposal mentions cost-effective strategies for providing public or restricted access to shared data and methods in repositories that might involve collaboration with other federal agencies, but never commits to any path, nor indicates that the agency would bear the cost in time and effort for researchers who would be willing to use them. The commenter states that, instead, EPA claims that the proposal “does not contain any information collection activities and therefore does not impose an information collection burden under the PRA.” According to the commenter, EPA cannot have it both ways: either researchers are compelled by a new requirement to expend significant resources on arrangements to ensure the implications of their research for policy are considered or they have no burden because EPA will pay for it.

Response: The rule does not require any action by any party other than the EPA and imposes no paperwork collection burdens or other costs on other parties. The rule also does not require EPA or any party to disseminate scientific data and incur associated costs. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

Response: In the final rule the EPA has identified and described some incremental costs that the Agency may incur as a result of the rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

³⁴⁰⁶ <https://www.epa.gov/osa/peer-review-handbook-4th-edition-2015>

Comment: Commenter (6137) states that EPA’s proposal will have serious implications on public health, privacy, the environment, and the judicial review process, and thus the costs will be significant. The commenter asserts that there is no evidence that EPA evaluated any of these adverse impacts, quantitatively or qualitatively. According to the commenter, the EPA cannot ignore these harms in its cost-benefit analysis, even if the costs are not readily quantifiable. See, e.g., *Michigan v. EPA*, 135 S. Ct. 2699, 2707 (2015) (costs include “harms that regulation might do to human health or the environment”); Executive Order 12866, 58 Fed. Reg. 51,735, 51,735 (Oct. 4, 1993) (it is “essential to consider” the “qualitative measures of costs and benefits that are difficult to quantify”); see also Food Labeling: Nutrition Labeling of Standard Menu Items in restaurants and Similar Retail Food Establishments; Extension of Compliance Date; Request for Comments, 82 Fed. Reg. 20,825, 20,828 (May 4, 2017) (acknowledging that delaying a nutrition labeling requirement would lead to millions of dollars in lost health benefits).

Response: The EPA disagrees that the proposal will have the serious implications described by the commenter. As described in the rule, the EPA is maintaining language in 40 CFR 30.3 stating that the statutes EPA administers, or their implementing regulations, will control in the event of any conflicts with the requirements of this rule. The Agency will continue to comply with and abide by the requirements in those statutes and implementing regulations.

Comment: Commenters (6125, 9227) assert that Agencies are encouraged to weigh the costs and benefits of developing higher information quality in OMB’s Information Quality Guidelines.³⁴⁰⁷ The commenters note that costs that the Guidelines encourage agencies to consider include costs attributable to agency processing effort, respondent burden, maintenance of needed privacy, and assurances of suitable confidentiality. Commenter (9227) states that EPA’s existing information quality guidelines track the OMB Guidelines closely. Commenter (6125) states that the proposal contains no evidence that the EPA has conducted such an assessment; instead the proposal simply states the belief that the benefits of the rule will be greater than the monetary costs (and potential disbenefits), without providing any quantitative evidence to support that belief. Commenter (9227) argues that EPA’s disregard of the Guidelines’ recommended weighing of costs and benefits further contributes to the arbitrariness of EPA’s failure to consider the costs of the proposal.

Response: The EPA agrees that the benefits and costs of the rule were not fully characterized in the 2018 proposed rule or the 2020 SNPRM. However, in the final rule the EPA has identified and described the benefits of the rule and some of the incremental costs that the Agency may incur as a result of the rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

³⁴⁰⁷ OMB, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies; Republication, 67 Fed. Reg. 8452, 8453 (Feb. 22, 2002).

Mercatus Paper

Comment: Commenters (6111, 6916, 9227) express concern that the proposal inappropriately relies on the Mercatus Paper.³⁴⁰⁸

Commenter (6111) argues that EPA cannot abdicate its responsibility to conduct its own analysis of the costs and benefits of this regulation by relying on the paper by Randall Lutter and David Zorn for the Mercatus Center cited in the proposal, which arrives at a lower cost estimate than the Congressional Budget Office (CBO), to support its conclusion that “the benefits of this proposed rule justify the costs.”

Commenters (6916, 9227) assert that the only thing EPA relied upon in discussing the costs and benefits of the proposal was the industry-funded Mercatus working paper which rejects a CBO projection that proposed legislation, with terms like the Proposed Rule here, would cost the country \$250 million a year. Commenter (6916) states that the Mercatus Paper does not find the new policy to be cost-free; instead it reports that compliance with the proposed legislation would add \$2,558 to the costs of each study.

Commenter (9227) states that the working paper of the Mercatus Center asserts that improvements in reproducibility “can be thought of as increasing the net benefits of regulation because they would avoid situations in which costs or benefits are wrongly estimated to occur or in which regulatory costs are imposed without corresponding benefits.” The commenter asserts that, setting aside the lack of substantiation for this assertion, it entirely omits situations in which costs and benefits are wrongly estimated because the relevant science is not used—and the costs that would be imposed on society if EPA inadequately protects communities from harmful pollution or toxic exposures.

Commenter (9227) states that even the Mercatus working paper notes that “[t]he cost of providing access to data has been one of the primary concerns about requiring access to data used by the federal government.”³⁴⁰⁹ The commenter states that, far from concluding, as the proposal suggests, an increase in net benefits from greater reproducibility, the Mercatus working paper simply explained a figure the authors were suggesting could be calculated (the point where net benefits would be positive); the authors do not themselves calculate the benefits, and admit that their “estimates of the benefits of public access to data supporting federal regulatory decisions fall short of proving that the benefits outweigh the associated costs.”³⁴¹⁰ The commenter asserts that, while the Mercatus working paper disagrees with CBO’s cost estimates, it does not argue that requiring access to data is cost-less; as it discusses the “costly activities and services that need to be performed,” including activities related to “data collection and data accessibility.”³⁴¹¹ The commenter states that, according to that working paper, data collection requires “correspond[ing] with researchers and publishers to obtain the data, review[ing] the data for confidentiality concerns, format[ing] the data for public access, publicly post[ing] the

³⁴⁰⁸ Lutter & Zorn, Mercatus, *supra* note 65, at 32 (citing CBO, Cost Estimate: S. 544, Secret Science Reform Act of 2015 (June 5, 2015)).

³⁴⁰⁹ *Id.* at 19.

³⁴¹⁰ *Id.* at 27-29

³⁴¹¹ *Id.* at 20

computer code and models used in each study's analysis, and provid[ing] descriptions and documentation on how to obtain the data.”³⁴¹² The commenter states that data accessibility requires “computer processing services to construct and maintain data bases to store study-related information.”³⁴¹³ According to the commenter, while the actual calculations put forward by the Mercatus working paper appear faulty (for example, it entirely omits the cost to researchers to compile and make their data public, does not include the costs of ensuring patient privacy is protected, and makes assumptions about the similarity of a chemical manufacturer collecting its own studies and EPA collecting and disseminating information of other researchers), the working paper acknowledges that there are costs, which the commenter states the EPA's proposal ignores.

Response: The final rule does not draw upon or characterize the findings of the Mercatus working paper. The EPA acknowledges that the benefits and costs of the rule were not fully characterized in the 2018 proposed rule or the 2020 SNPRM. However, in the final rule the EPA has identified and described the benefits of the rule and some of the incremental costs that the Agency may incur as a result of the rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

Costs Related to Deidentifying/Redacting Data

Comment: Commenters (1008, 2477, 2479, 4591, 5176, 6103, 6114, 6116, 6158, 6361, 6772, 6915, 9227) assert that proposal fails to identify the substantial costs related to the time, effort and resources required to make research data involving PII publicly accessible.

Commenters (1395, 2171, 6133, 6915) state that the CBO estimated the cost of redacting data at \$100 million per year. Commenter (6915) states that these costs would encompass obtaining the underlying data, review of the data to address confidentiality concerns, formatting the data for public access, providing computer codes and models used, and providing directions for accessibility of the data, but would not include the additional costs related to the potential need for contractors due to EPA staffing issues to assist with this work.

Commenters (1433, 2249, 6464) state that the process for removing confidential personal and business information before making it public would be virtually impossible, especially considering smaller Agency budgets. Commenter (4878) states that, even if there was an acceptable way to mask personal data while maintaining enough information to comply with the rule, costs of such anonymizing are prohibitively expensive.

Commenter (1008) states that the deidentification process is even more time consuming for data gathered in the past, where research subjects did not consent to public access of information gathered about them. Commenter (2477) states that one cannot ignore that the cost to protect privacy by anonymizing all data is substantial. Commenter (4591) states that de-identification to maintain privacy is not simply a matter of redacting names from documents, but a complex and resource-intensive process. Commenters (6114, 6116, 6361) state that it is hard to imagine that these extra costs could be borne in an era where EPA funding has been cut, or at best has

³⁴¹² Id.

³⁴¹³ Id. at 20-21 (quoting CBO, “Cost Estimate, S. 544, Secret Science Reform Act of 2015,” June 5, 2015).

remained stagnant. Commenter (6915) states that redacting confidential data from large studies is a huge job that can take thousands of hours, at commensurately high cost.

Commenters (5176, 9227) assert that, in proposing to redact private information, the proposed rule fails to acknowledge the enormously burdensome and costly complexities involved in redacting such information in a way that both protects individuals' privacy and ensures that the data is still useful for future analysis. Commenter (9227) states that while EPA mentions a range of options for facilitating secure access to confidential data, EPA fails to recognize the significant costs associated with implementing most of these options or the risks to privacy that remain even if these methods are employed.

Response: The rule does not require any action by any party other than the EPA and imposes no costs on other parties. The rule also does not require EPA or any party to disseminate scientific data and incur associated costs. The analysis by CBO noted by the commenter is not applicable to this rule because the analyses were not for this rule and the requirements analyzed are not the same as those in this rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

Comment: Commenter (2006) expresses concern that, while the proposal suggests that access to private data may be addressed through a RDC, RDCs are not for casual users or the general public and have serious limitations and costs, even for researchers. The commenter states that the proposal in footnote 16 refers, in part, to the U.S. DHHS, which is responsible for the National Health and Nutrition Examination Survey (NHANES). The commenter states that confidential data are available only through an RDC. According to the commenter, public access to confidential NHANES data at RDCs requires payment of "management fees" (i.e. fees to have the data made available at the RDC, ranging from \$1,800 to \$15,000 per project, skills with specific statistical software (usually SAS), and statistical expertise. The commenter states that access is contingent upon approval of a research proposal, which takes time for the approval as well as to schedule a date to visit the RDC. The commenter states that additional costs would also include transportation and lodging costs for RDCs which are not in one's home town. According to the commenter, no hard copy materials are to be brought into or removed from the RDC which means that analyses must be thoroughly designed before the visit and one must be able to interactively analyze the data as findings are made during the analysis.

Commenter (9227) states that deidentification is complicated and costly. The commenter asserts that, while EPA states that "[o]ther federal agencies have developed tools and methods to deidentify private information," the EPA cites only one source, the U.S. DHHS' Guidance Regarding Methods for De-identification of Protected Health Information in Accordance with the HIPAA Privacy Rule. According to the commenter, this guidance provides two methods for de-identifying data: (1) expert determination method, where an expert determines that, after application of statistical and scientific principals and methods, the risk is very small that the information alone or with other available information could be used to identify the subject; and (2) the safe harbor method, requiring that a number of identifiers are removed.³⁴¹⁴ The

³⁴¹⁴ HHS, Guidance Regarding Methods for De-identification of Protected Health Information in Accordance with the Health Insurance Portability and Accountability Act (HIPAA) Privacy Rule, <https://www.hhs.gov/hipaa/for-professionals/privacy/special-topics/de-identification/index.html>

commenter states that the first method requires case-by-case work, and EPA has provided no information regarding how EPA or others could potentially implement it or how much it might cost. The commenter states that the second method is also costly (which EPA disregards) and requires removal of much information that may be necessary to be able to reanalyze or reproduce the research results, so it is unclear whether it would satisfy EPA's requirements in the proposal.

Response: The EPA recognizes that there may be costs associated with accessing data through RDCs and conducting research. However, the rule does not require any action by any party other than the EPA and imposes no costs on other parties. The rule also does not require EPA or any party to disseminate scientific data and incur associated costs. See III.J of the preamble for further discussion of benefits and costs of the rule.

Data Management and Acquisition Costs Should Be Addressed

Comment: Commenters (1008, 1012, 2006, 2472,3135, 5419, 6046, 6126, 6127, 6144, 6449, 9227) express concern that the proposed rule offers no information on where the raw data collected would reside, how the resources to manage the data would be obtained, or how the agency would deal with legally and ethically protecting data that is confidential or sensitive. Commenter (1008) states that EPA should allocate resources to develop the digital infrastructure necessary to publicly share research data, especially sensitive data.

Commenters (6046, 6449, 9227) express concern that the rule needs to take into consideration the cost of establishing and maintaining the electronic infrastructure necessary for obtaining and storing data and models. Commenter (6046) recommends that, while the proposed rule does not estimate EPA's cost for an RDC (including space, costs for storage, ongoing maintenance costs to assure security, and staff to manage the data), nor assign responsibility for such a center to any EPA division, the EPA should investigate all options, including the options' feasibility, costs, etc, for keeping data confidential if the data are to be made public. Commenter (6449) states that the cost of safeguarding integrity of the data also needs to be considered.

Commenters (2006, 6046, 6127, 9227) state that the expense of data storage in a public repository can be significant. Commenter (9227) provides that even smaller costs could be prohibitive for many researchers.

Commenters (1011, 2006, 6126, 9227) suggest EPA needs to provide funding for data infrastructure. Commenter (1011) states that EPA should provide sufficient funding to cover the indirect costs associated with preparing and disseminating data generated by researchers funded through grants or cooperative agreements. Commenter (2006) suggests EPA should set aside money to grant to scientists for public data storage. Commenter (6126) states that EPA must ensure resources are available to enable a data infrastructure and responsible use of evidence, consistent with the principles for evidence-based policymaking.

Commenters (0039, 4537) provide the following recommendations regarding EPA funding:

- EPA prioritize its funding toward upgrading existing research data so that it may meet the standard of best available science; e.g., by anonymizing research data so as to preserve privacy, confidentiality, etc.
- EPA should provide substantial funding for a "reproducibility architecture" of hardware and software to facilitate the production of reproducible science by all American scientists whose research informs the EPA's decision-making.
- EPA should provide substantial funding so as to make it possible and then required for all EPA notices, proposed rules, regulations, etc. to include easily accessible links to all scientific materials used to justify these EPA actions. These links should include all relevant scientific research that meets the BARS standard. but that does not support the proposed EPA action.
- EPA's granting program should establish a funding category, with funding priority over all other categories, for meta-analysis and research into publication bias.

Commenter (6144) states that, while EPA's proposed rule references a system used by the NIH to collect health data, there are barriers and questions to how such a system could apply to EPA. The commenter states that, while the administration asserts that the proposal is about transparency, the NIH system is not publicly accessible and requires significant resources to manage and share with researchers. The commenter expresses concern that, at a time when EPA's budget and capacity continues to decrease, it seems unreasonable for the Agency to initiate such an undertaking.

Response: The EPA recognizes that there are costs associated with hosting data for public access. However, this rule does not require EPA or any party to disseminate scientific data and incur associated costs. The rule does not require any action by any party other than the EPA and imposes no costs on other parties. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

Comment: Commenters (1941, 5419) recommend that EPA take the steps necessary to ensure that future efforts to gain access to the data underlying pivotal study data are streamlined and cost-effective.

Commenter (1941) describes the Diesel Exhaust in Miners Study (DEMS) study conducted by National Institute for Occupational Safety and Health (NIOSH) and National Cancer Institute (NCI) published in 2012 and the burdensome processes and expenses incurred by the Truck & Engine Manufacturers Association (EMA) to obtain access to full DEMS data sets. The commenter states that EMA's efforts to help facilitate independent investigators' access to the full DEMS data sets in a manner allowing for replication and reanalysis of the DEMS results took well over three years and well over \$200,000.

Commenter (5419) encourages EPA to work with the Centers for Medicare and Medicaid Services (CMS) to streamline and simplify the data acquisition process and make the data available to the public free of charge. The commenter states that, otherwise, the cost and security requirements of obtaining these data may place an undue burden on stakeholders seeking to replicate analyses. The commenter provides that data accessed for an Electric Power Research Institute (EPRI) project were acquired at a significant cost (> \$100,000) and a comprehensive

data management plan that outlined rigorous security protocols was required. The commenter contends that these requirements would make replication of the work untenable for many researchers. The commenter expresses concern that the challenges of making these data available in an equitable fashion may result in the data and insights from this study being removed from consideration in standard-setting activities for PM_{2.5}, ozone, and NO₂.

Response: The EPA first notes this rule does not require EPA or any party to disseminate scientific data and incur associated costs. However, the EPA may opt to undertake activities to gain access to data or to disseminate data when it is in the public interest to do so and will take the points from the commenters into consideration when applicable.

Costs to Researchers Need to Be Addressed - Overview

Comment: Commenters (0671, 1011, 2024, 4542, 4840, 4933, 6127, 6133, 6181, 6373, 6877, 6894, 6924, 6937, 6942, 9227) express concern that the rule will increase costs for researchers and thus have a burdensome effect on them. Many of these commenters contend that this will decrease the resources available for new research.

Commenters (0671, 2024, 1011) assert that EPA's proposed regulation will require a lot of work by researchers, especially the labor necessary to post all their data in a publicly accessible manner no matter what form the data take and to certify to EPA that their work is properly available, such that EPA can use it. One commenter (6133) notes that scientists do not typically receive funding to make the data underlying peer-reviewed studies available for public inspection (6133). Other commenters (6181, 6894, 9227) contend that the cost of sanitizing such data would be immense and would be borne by researchers who do not necessarily have the resources or institutional support to complete the process. Thus, as commenter (6937) notes highly-trained researchers and public health officials would need to spend time complying with the regulation rather than doing research. Commenter (6373) asserts that the level of effort required to prepare a public version of confidential data, including in the manner described in section 30.5 of the proposed rule, can be enormous. The commenter further states that the onerous requirements and expensive processes that the proposed rule would require most likely would put smaller laboratories conducting academic research at a disadvantage. Another commenter (4542) contends that even for purposes of reanalysis, simply making data available is insufficient; the participation of the original researchers is often required because of their unique expertise in the design, collection and analysis, especially for large or complex datasets. This is burdensome.

Several of these commenters contend that unless the EPA pays the compliance costs of researchers, this action will have a significant economic impact on small entities such as researchers. Several of these commenters also suggest that EPA should increase Federal grant funding to off-set this increased burden.

Response: The rule does not require any action by any party other than the EPA and imposes no costs on other parties. The rule also does not require EPA or any party to disseminate scientific data and incur associated costs. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

Comment: Commenter (0844) states that the rule “does not directly regulate any entity outside the federal government” and would be of interest “to entities that conduct research and other science activity relevant to EPA’s regulatory activity.” The commenter notes that researchers should be prepared to release their underlying data if they want their research to be considered by the EPA to promulgate regulations.

Response: The rule does not require any action by any party other than the EPA and imposes no costs on other parties. The rule also does not require EPA or any party to disseminate scientific data and incur associated costs. As described in the rule EPA will continue to consider all relevant and appropriate science regardless of data availability but will give greater consideration to studies where dose-response data are available in a manner sufficient for independent validation.

Costs to EPA

Comment: Commenters (0061, 1012, 4845, 5011, 6125, 6915, 8281-PH84, 9227) express concern that this rule would place a substantial new burden on the Agency and further hamstring the regulatory decision-making process to protect public health and the environment.

Commenter (6125) states that EPA officials told the CBO that the Agency would likely greatly reduce the number of studies it relied on and would not take on the cost of disseminating the underlying data.³⁴¹⁵

The commenter (6915) suggests that any requirement for EPA to conduct additional review would entail additional significant costs, contrary to the proposal’s assertion. 83 Fed. Reg at 18772. The commenter states that the practical outcome of the proposal is that EPA may end up relying on a much smaller number of studies and/or on a less robust subset of relevant available studies, thus undermining the regulatory decision-making process.

Commenter (9227) expresses concern that the proposal includes no discussion of whether funds would be made available to implement the rule, whether other EPA activities would be sacrificed, how these tradeoffs would be justified, and what the overall impacts might be on public health and the environment. The commenter states that with respect to the potentially very large costs that would accrue to EPA, EPA’s proposal provides no indication that any funding to support such activities would be available. The commenter asserts that EPA funding is at its lowest level since the 1980s and, absent a significant change in Congressional priorities, any EPA expenditures for the purposes of supporting making data publicly available would necessarily require cutbacks in other critical areas of environmental protection, which might include supporting additional research, conducting inspections, issuing permits, setting standards, or many other activities.

Commenter (6125) believes that EPA is not staffed to reanalyze the number of pivotal studies that could reasonably arise for all of its significant rules under all statutes, and EPA provides no

³⁴¹⁵ This CBO estimate is “based on information from the EPA’s Office of Research and Development and other federal agencies, as well as feedback from organizations and researchers in the scientific community that publish in peer-reviewed journals.”

reason to believe that staffing levels would be adequate. Therefore, the commenter suggests that the agency might need to enlist external analysts. The commenter contends that this would take substantial time and money. As a point of comparison, the commenter provides that the reanalysis of the American Cancer Society (ACS) and Six-City Studies, which included analysis of alternative model specification, cost the Health Effects Institute (HEI) approximately one million dollar.³⁴¹⁶ If just half of recent cohort studies were to submit their data through some limited use agreement, it could cost EPA on the order of \$10 million to hire outside analysts to do the work. The commenter notes that if this level of analysis were required for even one or two studies in every major regulation, it would likely impair significantly the agency's ability to meet regulatory deadlines for the NAAQS or other programs, among other things precluding the agency from meeting its avowed goal of completing NAAQS reviews for particulate matter (PM) and Ozone by 2020.³⁴¹⁷

Commenter (6144) suggests that it is clear that the current proposal would create a tremendous time and resource burden on EPA and on scientists outside of the agency, as they would scramble to track down, collect, compile, and post (including any statistical methods needed to conceal private information) all the data, models, code, etc. for each of the hundreds of studies EPA cites on any given decision.

Response: The rule does not require EPA nor any other party to reanalyze data, only that EPA determine whether dose-response data for pivotal science are publicly available in a manner sufficient for independent validation. The final rule acknowledges that the EPA will incur some administrative costs associated with the rule, but the EPA anticipates that these costs are likely to be small given that the additional requirements are limited to pivotal science, and that EPA already conducts extensive review of the science when promulgating regulations or publishing influential scientific information. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule. The analysis by CBO noted by the commenter is not applicable to this rule because the analyses were not for this rule and the requirements analyzed are not the same as those in this rule.

Comment: Commenter (2561) expresses concern that this rule will open the EPA to numerous state and locality lawsuits, at the expense of the American taxpayer.

Commenters (4839, 4845, 6196) express concern that the **proposed regulation includes a** case-by-case exemption process for data in significant regulatory decisions. The commenters contend that the result will be more cost, more bureaucracy, and may result in litigation over whether exemptions are justified.

Response: The EPA does not agree that this rule will lead to more and more costly litigation. The EPA does acknowledge the Agency will incur some administrative costs associated with the rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

³⁴¹⁶ This extensive and expensive reanalysis did not result in a different estimate for the health risks of PM pollution.

³⁴¹⁷ Pruitt, E.S. 2018. Memorandum: Back-to-Basics Process for Reviewing National Ambient Air Quality Standards, May 9. Online at <https://www.epa.gov/sites/production/files/2018-05/documents/image2018-05-09-173219.pdf> Accessed May 18, 2018.

Who Is Responsible for Covering Implementation Costs?

Comment: Commenters express concern that EPA has not identified who will pay for rule implementation. Commenters (5419, 6142, 6125, 6446) state that EPA should develop a plan and either provide the resources to compensate researchers for the burdens imposed by this rule or identify who will pay specifically for which aspect of the rule, including, (1) who is responsible for the collection, de-identification, storage, and dissemination of sensitive data (2429, 2746, 2906, 6158, 6447), (2) who is going to compensate researchers for the increased compliance costs (0671, 6909, 6915, 6924), (3) how will EPA fund its activities (6125, 6126, 8274, 9227), and (4) who will be responsible for implementation of the rule and associated costs within the agency (6868).

Commenter (6909) states that many improvements to existing technologies and infrastructure are necessary before uniform data sharing can become a universal reality. Commenter states that it is not at all clear who will pay for these improvements. Commenter states that this proposed rule implicitly requires all these associated costly investments in improved technology and infrastructure without providing any funding for them. Commenter states that this is a huge unfunded mandate that researchers will not be able to cope with quickly, and the inevitable result will be sound science being ignored by EPA regulators who should be paying close attention to it.

Commenter (6125) states that the proposal mentions “cost-effective” strategies for providing public or restricted access to shared data and methods in repositories that might involve collaboration with other federal agencies, but never commits to any particular path, nor indicates that the agency would bear the cost in time and effort for researchers who would be willing to use them. The commenter states that, by not offering any support for the process, the proposal betrays its real motive namely to reduce the availability of scientific information that the agency now sees as inconvenient in view of its policy goal to retreat from environmental rules that have provided significant public health benefits.

Response: The rule does not require any action by any party other than the EPA and imposes no costs on other parties. The rule also does not require EPA or any party to disseminate scientific data and incur associated costs. The EPA acknowledges that the Agency will incur some administrative costs associated with the rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

Costs will Result in Delays in Necessary Environmental/Public Health Standards

Comment: Commenter (5120) expresses concern that the agency will not be able to support the proposal’s requirements within a timely manner, given that the Agency has been targeted for a twenty-three percent decrease in its budget.

Commenter (9227) states that, if EPA complies with the regulation not by spending the money to make data publicly available, and if the research community does not bear those costs itself, then it appears that EPA would simply ignore studies that do not comply with the regulation (EPA is proposing to exercise its discretionary authority to establish a policy that would preclude it from

using such data in future regulatory actions). The commenter states that course of action has its own significant costs, and EPA provides no analysis in the proposal of the magnitude of studies that it has previously relied upon that it could no longer rely upon in regulating.

Commenter (6872) states that it is critical that the impacts of the proposed rule on EPA resources and capacities to complete toxicity assessments, and their downstream impacts on the states, be evaluated and addressed. The commenter asserts that EPA completing assessments of chemical toxicity and health effects are critically needed by the states to protect public health and the environment. The commenter states that a delay in EPA action on completing toxicity assessments and standards as a result of the proposed rule will necessitate state resources to complete these toxicity assessments and standards in order to protect public health and the environment.

Response: The final rule EPA will consider all appropriate and relevant science consistent with the Agency's statutory obligations. Greater consideration will be given to pivotal science where dose-response data are available in a manner sufficient for independent validation. EPA acknowledges that the Agency will incur some administrative costs associated with the rule, but finds that these costs are likely to be small given that the additional requirements are limited to pivotal science, and that EPA already conducts extensive review of the science when promulgating regulations or publishing influential scientific information. The Agency believes the incremental burden of assessing the availability of data and models for pivotal science is unlikely to result in significant delays in promulgating regulations or publishing influential scientific information. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

Comment: Commenters (6163, 6358, 8272) suggest that EPA should assess the cost of eliminating science from consideration.

Commenters (6358, 8272) state that the proposal should include an examination of the studies that have previously informed regulation and the extent to which they will meet the proposed criteria; an analysis of regulations that would not have been promulgated, would have included less-protective limits, or that could be weakened in the future under the proposed criteria; an analysis of the time and costs required to bring all relevant studies into compliance with the criteria; and a calculation of the foregone public-health benefits and associated costs to the U.S. economy when regulations are delayed or are less protective due to this rule.

Response: The final rule states that the EPA will consider all appropriate and relevant science consistent with the Agency's statutory obligations. Greater consideration will be given to pivotal science where dose-response data are available in a manner sufficient for independent validation. The Agency does not believe it is feasible or necessary to attempt an analysis of how past regulatory decisions may have been made differently. The rule does not require EPA nor any other party to change relevant studies or bring them into compliance with any standard. The EPA disagrees with commenters that requirements of this rule will result in any meaningful delay in promulgating regulations. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

14.1.10.2 Proposal Fails to Adequately Consider Public Health-Related Costs

Several comments express concerns that there will be an increase in public health-related costs as a result of the proposed rule due to: (1) the delay of necessary regulations to protect public health, (2) the inability to use the best available science when making regulatory decisions, and (3) because persons will choose not to participate in studies because of confidentiality concerns. The commenters state that these public health costs were not adequately considered in the development of the proposed rule. An overview of these comments is provided below.

14.1.10.2.1 Public Health-Related Costs as a Result of the Delay of Regulations Needed to Protect Public Health

Comment: Several commenters (3135, 5579, 6358, 6373, 6872, 6915, 6920, 8274) express concern that the added costs and efforts to comply with this rule may significantly delay the development of EPA regulations that improve public health. The commenters assert that the result of delaying the development of EPA regulations that improve public health will be the imposition of significant healthcare costs on American citizens.

Commenters (0671, 6122, 6358, 6373, 6872, 6920, 8272, 8274) assert that this proposed rule does not include the foregone public health benefits that would result when regulations are delayed. Commenters (6358, 8272) state that the proposal should include a calculation of the foregone public-health benefits and associated costs to the U.S. economy when regulations are delayed due to this rule.

Response: The EPA disagrees with commenters that requirements of this rule will result in any meaningful delay in promulgating regulations. Further, with this final rule, the EPA is maintaining language in 40 CFR 30.3 stating that the statutes EPA administers, or their implementing regulations, will control in the event of any conflicts with the requirements of this rule. The Agency will continue to comply with and abide by the requirements in those statutes and implementing regulations, including regulatory deadlines.

14.1.10.2.2 Health Costs Because of the Inability to Use Studies that Represent the Best Available Science

Comment: Commenters (2336, 6125, 6137, 8281-PH63) express concern that the costs to public health from implementation of this rule could be significant due to the inability of the EPA to use the “best available science” under the proposed rule which could result in a weakening of regulations. Commenter (2336) explains, for example, if the “six cities” and “150 cities” studies had been rejected, and, consequently, the NAAQS for PM_{2.5} had not been tightened in 1997, the harm to public health would have amounted to several hundred billion dollars.

Commenter (6125) states that the CBO analysis does not tell the whole story as it did not assess the disbenefits to the regulatory process and to public health of being unable to base regulations on numerous influential studies for which data could not be made available. The commenter asserts that considering only the science policy value of the information in multiple original studies that are likely to be lost (e.g. cohort epidemiology studies, which must limit access to

protect privacy), it is reasonable to conclude that their loss would almost certainly outweigh the value of any information gained by subsequent re-analyses of a more limited set of studies, which rely on publicly available databases that are often inferior to those that contain more relevant information.

Commenter (6137) states that, in a recent report on rulemakings related to health, EPA and OMB quantified some of the benefits of various regulations that would be dramatically weakened under the new rule.³⁴¹⁸ The commenter states that these recent studies show health rulemakings, particularly air rulemakings, create significant benefits (including health and protection of life, reductions in the need for health care and health care costs, as well as job creation, and other economic values in avoiding days lost at work and school) that are quantitatively larger and more qualitatively valuable than the costs of pollution controls or other economic costs of the regulations.

Commenters (5021, 6163, 6185, 6188, 6916, 8281-PH63, 9227) express concern that the EPA offers no accounting of the public health costs that would inevitably result if EPA is constrained in its ability to use the best research to support its future decision-making.

Response: The EPA disagrees with commenters that requirements of this rule will result in any meaningful delay in promulgating regulations. The final rule states that the EPA will consider all appropriate and relevant science consistent with the Agency's statutory obligations. Greater consideration will be given to pivotal science where dose-response data are available in a manner sufficient for independent validation. The EPA is maintaining language in 40 CFR 30.3 stating that the statutes EPA administers, or their implementing regulations, will control in the event of any conflicts with the requirements of this rule. The Agency will continue to comply with and abide by the requirements in those statutes and implementing regulations, including regulatory deadlines.

14.1.10.2.3 Public Health-Related Costs Associated with Reduced Participation of Persons in Studies Due to Confidentiality Concerns

Comment: Commenter (9227) states that the proposed rule does not disclose the cost that would be associated with the resulting reduced study participation due to perceived risks to privacy and confidentiality. The commenter states that NAS explains that this “threatens the research enterprise itself, because concerns about privacy and confidentiality are among the reasons often given by potential respondents for refusing to participate in surveys, and those concerns have been shown to affect behavior as well.”^{3419,3420} The commenter provides that the NAS panel emphasized: “Any confidentiality breach that became known would be likely to heighten such concerns and, correspondingly, reduce survey response rates.” According to the commenter,

³⁴¹⁸ See, e.g., OMB, 2017 Draft Report to Congress on the Benefits and Costs of Federal Regulations, https://www.whitehouse.gov/wp-content/uploads/2017/12/draft_2017_cost_benefit_report.pdf; EPA, Benefits & Costs of the Clean Air Act from 1990 to 2020, the Second Prospective Study (Apr. 2011), <https://www.epa.gov/clean-air-act-overview/benefits-and-costs-clean-air-act-1990-2020-second-prospective-study>, https://www.epa.gov/sites/production/files/2015-07/documents/fullreport_rev_a.pdf.

³⁴¹⁹ National Research Council, *Expanding Access to Research Data: Reconciling Risks and Opportunities*, vii National Academies Press (2005).

³⁴²⁰ *Id.* at 51; see also *id.* at 52-54 (describing the research supporting this risk).

efforts to increase researchers' access to data must, therefore, take into account the need to avoid increasing the actual and perceived risks of confidentiality breaches.³⁴²¹ The commenter states that the proposal does not take into account this potential cost and that this confidentiality risk has a further cost: it affects the quality of the data collected, as the NAS explained:

The reason for confidentiality pledges and for stringent procedures to prevent disclosure is that they improve the quality of data collected from individuals, households, and firms. It is essential that respondents believe they can provide accurate, complete information without any fear that the information will be disclosed inappropriately. Indeed, if the information was disclosed, harm might come to an individual respondent.³⁴²²

Commenter (9227) asserts that the proposal's only acknowledgment of this complex problem and cost is its statement that "EPA believes that concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions commonly in use across some parts of the Federal government." The commenter states that EPA does not cite a single example of these common solutions, nor does it include an analysis of these alleged solutions and their costs and benefits, it does not even explain what the solutions are that EPA believes address this concern.

Response: The rule does not require EPA or any party to disseminate scientific data, nor does the rule does not require any action by any party other than the EPA. EPA anticipates that researchers will abide by any agreements regarding confidentiality that they have made with participants or other parties. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA's position on data and model availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make dose-response data available, weighing their own benefits and costs and make choices that they deem appropriate. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

14.1.10.3 The Rule May Be Prohibitively Expensive

Comment: Commenters (1433, 2249, 6111, 6126, 6464) express concern that the proposal would be unrealistically expensive.

Commenter (6126) states that EPA will not likely have the resources or capability to assess the entire suite of regulations and the evidence-base retrospectively. The commenter states that, for example, EPA is technically required to evaluate every regulation promulgated under the Resource Conservation and Recovery Act (RCRA) on a triennial basis; recent research suggests that statutory requirement has been largely unfulfilled due to a lack of resources to comply with the decades-old mandate. The commenter states that, in the absence of a major influx of new resources, EPA would be unlikely to engage in such meaningful and transparent reviews while also complying with statutory obligations. The commenter recommends that, if implemented as stated, the regulation should be applied prospectively.

³⁴²¹ Id. at 51.

³⁴²² Id.

Several commenters (0061, 1102, 1395, 1433, 2171, 2249, 2336, 2787, 2906, 2907, 4840, 4845, 4878, 5022, 6103, 6114, 6116, 6122, 6125, 6132, 6133, 6137, 6144, 6158, 6185, 6188, 6196, 6450, 6464, 6937, 6915, 8274, 9227) express concern over the potential cost to implement the proposal. The commenters point out the HONEST Act CBO ^{3423, 3424} and EPA estimates of similar measures introduced in Congress indicate that the rule could cost millions of dollars a year to implement.

Commenters (0061, 1012, 1433, 2336, 2787, 2906, 2907, 4840, 4845, 5022, 6114, 6116, 6122, 6132, 6133, 6137, 6158, 6196, 6464, 6937, 8274) state the HONEST Act CBO indicates that the proposed rule could cost \$250 million initially to implement, and \$1 million to \$100 million (depending on the approach taken by EPA in assessing studies) per year thereafter; at an estimated cost of \$10,000-\$30,000 per study, but some studies may cost closer to \$1 million. Commenters (2907, 6133) state that when EPA staffers in 2017 considered the potential effects of the HONEST Act that mirrors the approach of the proposal, they calculated ³⁴²⁵ that efforts to anonymize health data and CBI could top \$1 million per study.

Commenter (9227) states that the CBO concluded, just with respect to the costs to EPA, that “based on information from the EPA and other federal agencies, as well as organizations and researchers in the scientific community that publish in peer-reviewed journals,” EPA “could spend between a few million dollars per year to more than one hundred million dollars per year ... to ensure that data and other information underlying studies are publicly available in a format sufficient to allow others to substantially reproduce the results of studies.”³⁴²⁶ The commenter states that, in the 2017 estimate, the CBO concluded that “[i]f the EPA continued to rely on as many scientific studies as it has used in recent years ... then the CBO estimates that the agency would need to spend at least \$100 million dollars per year to upgrade the format and availability of those studies’ data,” “on average, \$10,000 per scientific study.”³⁴²⁷ According to the commenter, such costs would cover the costs of “obtaining all the underlying data used in a study, reviewing the data to address any confidentiality concerns, formatting the data for public access, providing access to the computer codes and models used in the study’s analysis, and providing descriptions and documentation on how to access the data.”³⁴²⁸ The commenter states that, as Deputy Assistant Administrator Nancy Beck noted, during the development of the proposal, requiring “a huge amount of data to be submitted to the agency” would “be incredibly burdensome” and “not practical.”³⁴²⁹

³⁴²⁸ *Id.*

³⁴²⁹ Email from Nancy Beck to Richard Yamada (Jan. 31, 2018 2:51 PM).

Response: The cost analyses referred to by the commenter are not analyses of this rule and assume costs of disseminating information. The rule does not require EPA or any party to disseminate scientific data and incur associated costs. The rule does require EPA to determine if dose-response data for pivotal science are publicly available in a manner sufficient for independent validation and the EPA acknowledges that the Agency will incur some administrative costs associated with the rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

14.1.10.4 Costs of Replicating, Reproducing, or Reanalyzing a Study (§30.5)

Comment: Commenters (1012,4848, 4933, 5015, 6196, 6373, 6925, 9227) express concern that replicating, reproducing, or reanalyzing a study (especially epidemiological studies) is a highly cost-intensive and time-consuming endeavor and resources spent trying to recreate a study identically expends time and resources that might otherwise be used to conduct new research.

Commenter (4848) states that timing and the cuts in EPA funding makes replicating studies (as a condition of promulgating regulations) an impossibility. Commenter (4933) states that the very nature of longitudinal public health studies where health and toxins intersect are by design, large, expensive and require years or decades before results are found. Commenter (4933) states that because these studies are so big, they are often too expensive to repeat.

Commenter (9227) asserts that it is critically important to note that reanalysis projects are not simple or inexpensive. The commenter states that the reanalysis of just the Harvard Six Cities Study and the ACS CPSII took three years to complete and cost \$899,046 in direct expenditures, without accounting for costs incurred by Health Effects Institute for oversight and review as well as staff compensation.

Response: The rule does not require EPA nor any other party to perform or conduct any reanalysis or replication of a study. The rule does require EPA to determine if dose-response data for pivotal science are publicly available in a manner sufficient for independent validation and the EPA acknowledges that the Agency will incur some administrative costs associated with the rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

Comment: Commenter (6941) expresses concern that, under the proposed rule, chemical manufacturers or importers could be forced to incur the cost of unnecessarily repeating the use of vertebrate animals in the testing of chemical substances. The commenter states that the Toxic Substances Control Act (TSCA) directs EPA to reduce and replace the use of vertebrate animals in the testing of chemical substances to the extent practicable, scientifically justified, and consistent with its policies. According to the commenter, TSCA identifies the formation of industry consortia to develop information as one means to advance this goal by reducing duplicative animal testing. The commenter states that, for some chemical substances, testing may already have been conducted under other regulatory initiatives, such as the European Union's Registration, Evaluation, Authorization and Restriction of Chemicals program. The commenter asserts that, while full study data may not be publicly available, robust summaries of the

objectives, methods, results and conclusions of such testing can provide sufficient information to independently assess its value.

Response: The rule does not require EPA nor any other party to perform or conduct any reanalysis or replication of a study. Further, with this final rule, the EPA is maintaining language in 40 CFR 30.3 stating that the statutes EPA administers, or their implementing regulations, will control in the event of any conflicts with the requirements of this rule. The Agency will continue to comply with and abide by the requirements in those statutes and implementing regulations.

14.1.10.5 Costs to Describe Assumptions, Methods, Variability and Uncertainty (§30.6)

Comment: Commenter (6125) states that the most puzzling, and perhaps costly requirement in the rule (§30.6) appears only in the wording of a specific requirement in the actual proposed rule regarding use of dose-response data and models from pivotal studies: “EPA shall clearly explain the scientific basis for each model assumption used and present analyses showing the sensitivity of the modeled results to alternative assumptions.” The commenter expresses that this appears to require the agency not only to explain the basis of each model-related assumption in the original study but also to provide an analysis of the original data using alternative assumptions. The commenter states that EPA is not staffed to reanalyze the number of pivotal studies that could reasonably arise for all its significant rules under all statutes, and EPA provides no reason to believe that staffing levels would be adequate. Therefore, the commenter suggests that the Agency might need to enlist external analysts, which would take substantial time and money. The commenter states that, as a point of comparison, the reanalysis of the ACS and The Harvard Six Cities Study, which included analysis of alternative model specification, cost HEI approximately one million dollars. According to the commenter, if just half of recent cohort studies were to submit their data through some limited use agreement, it could cost EPA on the order of \$10 million to hire outside analysts to do the work. The commenter states that, if this level of analysis were required for even one or two studies in every major regulation, it would likely impair significantly the Agency’s ability to meet regulatory deadlines for the NAAQS or other programs, among other things precluding the Agency from meeting its avowed goal of completing NAAQS reviews for PM and Ozone by 2020.

Response: The EPA has removed proposed 40 CFR 30.6 and transferred some of the requirements to 40 CFR 30.5(e). The EPA has revised requirements and limited their application to dose-response assessments. The final rule requires EPA to describe and document only critical assumptions and methods and to characterize variability and uncertainty of the assessment. It requires an explanation of the scientific basis for critical assumptions used in the dose-response assessment. These changes from the proposed requirements result in only small incremental costs for the EPA. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

14.1.10.6 Costs of Independent Peer Review (§ 30.7)

Comment: Commenters (1012, 4839, 4931, 6125, 6142, 6866, 6868, 6915) express concern that having the Agency conduct an “independent peer review on all pivotal regulatory science used to justify regulatory decisions” would be time-consuming, duplicative of current practice and costly

to implement, without adding commensurate environmental and public health value. Commenter (6125) states that independent peer review is a cost and impact which the Agency has failed to acknowledge or account for.

Commenter (1012) states that having the Agency conduct an "independent peer review on all pivotal regulatory science used to justify regulatory decisions" would likely hamstring the Agency if additional resources and staff are not provided for this express purpose. Commenter (6866) asserts that implementing independent Agency peer review of all such studies would significantly slow down rulemaking and may invite lawsuits that further stymie regulatory processes.

Commenter (6142) states that there is no value in this second peer review without guidelines ensuring the review is rigorous and unbiased in nature and conducted by subject matter experts. The commenter states that this rule proposes adding this costly step to the process for developing EPA policy without setting aside resources for its execution. According to the commenter, the rule is likely to hinder the application of potentially important scientific findings to public and environmental health without improving the quality of data used to guide EPA regulatory policy.

Commenter (6915) states the proposal nowhere discusses how EPA would vet reviewers to identify persons who are purportedly more competent than those already used in past or current peer review processes, or the level of EPA staffing and associated costs that would be needed for additional review—only stating that EPA will implement the proposed rule in a manner “that minimizes costs.” The commenter states that the practical outcome of the proposal is that EPA may end up relying on a much smaller number of studies and/or on a less robust subset of relevant available studies, thus undermining the regulatory decision-making process. According to the commenter, the EPA fails to acknowledge the rigor of existing processes in statutes, policies and federal procedures, or to explain how its proposal would provide any added value and minimize costs.

Response: This rule requires that the EPA shall conduct independent peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review and the exemptions described therein. The EPA will evaluate whether or not to conduct additional peer review of individual studies identified as pivotal science if the studies have already undergone peer review. The EPA anticipates that the incremental peer review costs to the Agency will be small. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

14.1.10.7 Do Benefits Justify the Costs of the Rule?

14.1.10.7.1 EPA Needs to Quantify the Costs and Benefits of the Rule

Comment: Commenters (1012, 2171, 2787, 5022, 6046, 6125, 6137, 6143, 6168, 6196, 6358, 6874, 6925, 8272, 9227) assert that, while EPA claims benefits outweigh costs, there is no published record or analysis to demonstrate that this claim is valid and that the EPA should commit to quantify these costs and benefits (including foregone health benefits) and implement the rule in a manner that optimizes the costs and benefits.

Commenter (2787) states that EPA only stated that the Agency will implement the provisions "in a manner that minimizes cost." Commenter (6046) states that it is unclear who bears the burden of the cost and who benefits, by how much and how. Commenter (6137) states that, despite the lack of evidence in the regulatory docket, the costs of this Proposed Rule are far-reaching and substantial, while EPA has failed to identify any alleged benefits at all, other than vague and unsupported references to improved transparency. Commenter (6874) states that the theoretical – but undemonstrated – benefits of EPA’s proposal must be weighed against the extensive and unequally distributed costs of such an approach.

Commenters (6916, 9227) argue that EPA makes unsupported statements about its “belie[f that] the benefits of the proposed rule justify the costs.” Commenters (6916, 9227) assert that EPA’s finding is not consistent with the conclusions of the National Academies, as the proposal suggests. Commenter (9227) states that the NAS report³⁴³⁰ highlighted both the risks and benefits of making data publicly available and nowhere concluded that there were benefits to excluding data from the agency’s regulatory decisions simply because the underlying data was not publicly available. Commenter (6916) states that the NRC explicitly states that its work does not “weigh the potential harm posed by disclosure against the benefits potentially foregone.”³⁴³¹

Commenter (9227) states that EPA has included only a cursory mention of the expected qualitative benefits of the proposal, with no discussion of the anticipated likelihood, scope, or impact of the suggested benefits, let alone any effort to quantify them, much less monetize them. Commenter states that EPA simply assumes that the proposal will “improve the data and scientific quality of the Agency’s actions and facilitate expanded data sharing an exploration of key data sets” without any analysis or evidence.

Commenter (6137) notes that, in performing certain CAA and other rulemakings, EPA may not consider the economic implications of considering or excluding certain science. The commenter asserts that EPA’s failure to provide any lawful or rational justification for its costs/benefits statement for the proposed rule suggests that economic costs may have impermissibly played a role in its analysis. According to the commenter, had EPA focused on health rather than cost, EPA could not possibly find that the benefits of ignoring health science outweigh the costs for public health rulemakings.

Commenter (9227) states that there is no reason to think that excluding relevant science merely because the underlying data is not publicly available would increase the net benefits of a regulation. According to the commenter, for example, it appears that under the proposed rule EPA would exclude a peer-reviewed, published study whose conclusion had been reproduced based upon numerous different datasets (and whose underlying data, though not publicly available, had been reevaluated by outside experts), while including a study that had had no peer review, was not published, had no corroborating studies, and had not actually been replicated or reproduced, merely because the underlying data was made publicly available. The commenter asserts that is simply not a recipe for more accurate decision making.

³⁴³⁰ National Research Council, *Expanding Access to Research Data: Reconciling Risks and Opportunities*, vii National Academies Press (2005).

³⁴³¹ 2005 NRC Report at viii.

Response: The EPA agrees that the benefits and costs of the rule were not fully characterized in the 2018 proposed rule or the 2020 SNPRM and has described these briefly in the final rule. The EPA acknowledges that the Agency will incur some administrative costs associated with the rule, but the EPA finds that these costs are likely to be small given that the additional requirements are limited to pivotal science, and that EPA already conducts extensive review of the science when promulgating regulations or publishing influential scientific information. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

Comment: Commenter (0671) states that the proposed rule will impose compliance costs without providing any meaningful benefit to the EPA, to the regulatory process, or to the American people. Commenters (6450, 8272) argue that, considering there is no evidence that current data transparency policies are deficient, this added cost to the American taxpayer is neither necessary nor appropriate.

Response: The EPA acknowledges that the Agency will incur some administrative costs associated with the rule, but the EPA finds that these costs are likely to be small given that the additional requirements are limited to pivotal science, and that EPA already conducts extensive review of the science when promulgating regulations or publishing influential scientific information. The EPA believes that greater transparency is inherently valuable as a principle of good government and provides benefits to the public at large, including reducing the risk of errors in EPA analyses and in the science these analyses rely upon. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

Comment: Commenter (1346) states that the rule talks about the costs of compliance but it does not talk about the benefits of compliance appropriately. The commenter asserts that, for example, the carbon rules have a cost to power companies but a clearly defined benefit to the health of human beings living near power plants. According to the commenter, it is more ethical to weigh the benefits to the lives and well-being of people higher than the benefits to a company.

Response: The Agency agrees that there are important and valuable health benefits for many regulations. The EPA follows its own peer-reviewed guidance, as well as government-wide guidance from OMB, when estimating both benefits and costs of regulations.

14.1.10.7.2 Benefits of the Strengthening Transparency Proposal

Comment: Commenter (3971) states that, if rigorous and transparent analyses underlie future proposals, there should be fewer legal challenges, and passing this regulation should permit the Agency to implement rules more quickly, not less expeditiously.

Commenter (4534) states that increasing transparency by using peer reviewed data and publishing data for public review may increase the time and cost to bring a new or modified rule package into practice. The commenter states that the additional time and cost to develop a new regulation is small compared to the time and cost for regulated parties to comply with the regulation. The commenter asserts that many of the rule packages cost industry more than \$100 million to comply and require several years to develop engineering solutions. According to the

commenter, the EPA and industry both have incentive for the rule package to be right the first time.

Response: The EPA agrees that rigorous and transparent analysis has significant value and improves the regulatory process. EPA also agrees that the incremental time and costs associated with implementing the requirements of this rule are small. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

14.1.10.7.3 EPA Must Re-Propose After Analyzing its Costs

Comment: Commenter (9227) states that the proposal's failure to analyze and disclose costs and benefits cannot be cured in a final regulation. The commenter states that, should EPA not abandon this misguided proposal, it must re-propose it after first analyzing its costs (both to public health, to researchers, and to the agency itself) and benefits, and providing the requisite opportunity for public comment on its analysis. According to the commenter, the public cannot meaningfully comment on the proposed rule without understanding the actual costs and benefits of the proposal, the alternatives EPA considered, and the analyses underlying EPA's assessments.

Response: The EPA agrees that the benefits and costs of the rule were not fully characterized in the 2018 proposed rule or the 2020 SNPRM. However, in the final rule the EPA has identified and described the benefits of the rule and some of the incremental costs that the Agency may incur as a result of the rule. The EPA disagrees that it must re-propose this rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

14.1.10.8 Minimization of Subpart Implementation Costs (§30.8)

14.1.10.8.1 What Costs Will Be Minimized and How?

Comment: In order to achieve the goals of the proposal in a streamlined and cost-effective manner, commenter (1941) recommends the following:

- EPA should develop standardized data-sharing and data-security agreements (including non-disclosure agreements) to utilize with the authors/investigators of pivotal studies to facilitate and streamline the receipt and transfer of study data to the RDC or to EPA's other approved datahousing site(s);
- EPA should develop standardized data-access and confidentiality agreements that third-party investigators can use to gain authorized access to the pivotal-study data that will be housed at the RDC or at other EPA-sanctioned data-housing site(s); and
- EPA should work to ensure that any fees for gaining authorized access to pivotal study data at EPA's authorized data-housing site(s) are kept to a minimum to enhance the prospects that qualified third-party investigators will be able to conduct their reviews and reanalyses in a timely and cost-effective manner.

Commenters (6125, 6373) express concern that, while the proposal states that costs will be low because EPA will "implement" the rule "in a manner that minimizes costs", there is no

explanation of what specific types of costs may be incurred, much less how they will be minimized. Commenter (6125) states that this type of vague and unsupported pronouncement does not provide an adequate basis for public comment.

Commenter (6158) states that, in suggesting that the potential costs of the rule would be minimal, the EPA ignores the costs to researchers (who would have to pay to set up and maintain data sharing for their previously published studies to be considered), to the EPA (for presumably conducting the multiple re-analyses required in section 30.6 of the rule), and to the public's health (for the very real costs in dollars and human lives of undermining existing regulations by limiting access to science).³⁴³²

Response: The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs or benefits. In the final rule the EPA has identified and described the benefits of the rule and some of the incremental costs that the Agency may incur as a result of the rule. The rule does not require any action by any party other than the EPA and imposes no costs on other parties. The rule also does not require EPA or any party to disseminate scientific data and incur associated costs. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

14.1.10.8.2 Will EPA Consider Fewer Studies?

Comment: Commenters (2336, 5021, 6125, 6137, 6158, 6163, 6185, 6358, 6874, 6916, 8272, 9227) generally express concern that the cost of this rule will be less science — not better science — and weaker public and environmental health decision making.

Commenters (2336, 4840, 4845, 6109, 6114, 6116, 6122, 6137, 6181, 6188, 6196, 6915) express concern that the proposal does not address the possibility that EPA would reduce the number of studies used in developing policies and regulations because of the cost of complying with this rule's requirements. Commenter (6181) states that, if the EPA restricts the science it relies upon to only those studies that publish open datasets, the outcomes and data from key areas of scientific inquiry related to EPA's decision-making will be put beyond the reach of Agency staff.

Commenters (2336, 4840, 6109, 6133) assert that CBO analysis³⁴³³ suggests that EPA may rely on significantly fewer studies each year in support of its mission. Commenters (4840, 9227) state that the cost estimate made by the current administration for a substantially similar law dropped to \$1 million annually because EPA officials explained to the CBO that the Agency would implement the legislation with minimal funding and generally would not disseminate information for the scientific studies that it uses to support covered actions.³⁴³⁴

³⁴³² Singla, Veena et al. "Comments from academics, scientists and clinicians on the EPA proposed rule "strengthening transparency in regulatory science", May 30, 2018. 16 pp

³⁴³³ Congressional Budget Office Cost Estimate. HR 1430 Honest and Open New EPA Science Treatment (HONEST) Act of 2017. March 29, 2017.

³⁴³⁴ Id

Commenters (6114, 6116) state that an EPA staff study³⁴³⁵ predicted that this policy would reduce by half the number of studies the EPA would rely upon in developing policies and regulations because of the cost of complying with its requirements.

Commenter (6137) states that the exclusionary intent of the Proposed Rule is demonstrated by proposed 40 CFR §30.8, which requires that the rule be implemented to “minimize costs.” The commenter suggests that, if EPA must minimize costs, the exclusion of science, rather than taking complicated and expensive steps to hide confidential medical data, is likely to be the approach followed.

Response: The final rule EPA will consider all appropriate and relevant science consistent with the Agency’s statutory obligations. Greater consideration will be given to pivotal science where dose-response data are available in a manner sufficient for independent validation. The EPA is maintaining language in 40 CFR 30.3 stating that the statutes EPA administers, or their implementing regulations, will control in the event of any conflicts with the requirements of this rule. The Agency will continue to comply with and abide by the requirements in those statutes and implementing regulations, including regulatory deadlines.

Comment: Commenter (2478) requests that the EPA quantify how much this proposed rulemaking would result in a reduction in sponsored research in climate science. The commenter inquires how the EPA defines climate science, how much funding is allocated from the federal government to climate science, and how much will this proposed rule impact funding allocated from the federal government to climate science?

Response: Funding for climate science varies and EPA does not have at its disposal total funding across the federal government. The EPA does not foresee any meaningful connection between this rule and funding allocated from the federal government to climate science.

14.1.10.8.3 Regulatory Decisions on Cost Inconsistent with Statutory Mandates

Comment: Commenter (6137) states that proposed Section 30.8, which would require EPA to implement the provisions of the Rule “in a manner that minimizes cost,” is unlawful and arbitrary, for the following reasons.

First, because EPA has only the authority conferred to it by statute, the Agency must identify the statutory authority upon which it bases its regulatory decisions about what data and models to consider on the minimization of cost. *Clean Air Council v. Pruitt*, 862 F.3d 1, 9 (D.C. Cir. 2017) (quoting *Verizon v. FCC*, 740 F.3d 623, 632 (D.C. Cir. 2014) (“It is ‘axiomatic’ that ‘administrative agencies may act only pursuant to authority delegated to them by Congress.’”) (alteration and citations omitted)). The Agency has failed to do so here.

Second, EPA’s proposal to base these decisions on cost is inconsistent with statutory mandates requiring the Agency to base regulatory decisions on the best available science.

³⁴³⁵ Union of Concerned Scientists. “Administrator Pruitt Ignores EPA Staff Analysis of HONEST Act Crisis.” Last Revised Date March 20, 2018.

See, e.g., 42 U.S.C. § 300g-1(b)(1)(B)(ii)(II) (directing EPA to base its determination about whether to regulate any contaminant “on the best available public health information”); 15 U.S.C. § 2625(h) (requiring EPA to act “consistent with the best available science”). Plain meaning and common usage confirm that “best available science” does not refer to whatever science is least costly. See also *supra*, Section IV.A.

Third, EPA’s proposal to base its data quality decisions on cost is inconsistent with applicable statutory mandates requiring EPA to make regulatory decisions based on considerations of public health. *Whitman v. Am. Trucking Ass’ns*, 531 U.S. 457, 469 (2001) (cost “is both so indirectly related to public health and so full of potential for canceling the conclusions drawn from direct health effects that it would surely have been expressly mentioned . . . had Congress meant it to be considered.”). If anything, EPA’s proposal to base decisions on consideration of cost here is even more irrational than it was in *Whitman*, because in this case, decision-making about the science used to inform EPA’s regulatory decisions will result in a proliferation of costs and benefits that resist quantification, monetization, and comparison. These include substantial and important non-market values, including privacy, transparency, health and environmental considerations, and even the value of scientific knowledge itself.

Fourth, section 30.8 is also unlawfully vague. As the Supreme Court has explained, “‘cost’ includes more than the expense of complying with regulations; any disadvantage could be termed a cost.” *Michigan v. EPA*, 135 S. Ct. at 2707. Yet the provision does not specify to what types of costs it refers. And even though various types of costs would necessarily need to be weighed against one another when applying this provision, the Proposed Rule is notably silent as to how that will be done. As proposed, it appears to confer nearly limitless discretion on EPA to decline to collect and utilize relevant science on grounds of cost, in contravention of applicable statutory mandates and reasoned decision-making. See *U.S. Sugar v. EPA*, 830 F.3d 579, 644 (D.C. Cir. 2016) (“in light of the unambiguous statutory command [to regulate toxic pollution sources] . . . [t]he Agency was obligated to collect the data it needed”).

Finally, even if EPA had authority to base its data quality decisions on cost, it would be irrational and arbitrary for EPA to ignore all the costs and benefits to the public – including public health and environmental costs and benefits and privacy-related costs and benefits –that may flow from its decisions. EPA must treat costs and benefits alike and may not “put a thumb on the scale by undervaluing the benefits and overvaluing the costs of more stringent standards.” *Ctr. for Biological Diversity v. Nat’l Highway Traffic Safety Admin.*, 538 F.3d 1172, 1198 (9th Cir. 2008). And it may not ignore the public health, environmental, and privacy-related costs of its action or inaction of its decision just because they are not quantified. See, e.g., Exec. Order No. 13,563 § 1, 76 Fed. Reg. at 3821; Exec. Order No. 12,866 § 1, 58 Fed. Reg. at 51,735 (it is “essential to consider” the “qualitative measures of costs and benefits that are difficult to quantify”). OMB Circular A-4 cautions agencies against ignoring the potential magnitude of unquantified benefits, because the approach with the “largest quantified and monetized . . . estimate” is not necessarily the most cost-justified. Under all these authorities, a “full accounting” of

the costs and benefits of a rule requires that indirect benefits be counted “equivalently” with other costs and benefits.

Response: The EPA acknowledges that the Agency will incur some administrative costs associated with the rule and will implement the rule in a manner that minimizes costs while fully complying with the rule EPA’s other statutory obligations. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule. The EPA will continue its current practice of conducting extensive review of scientific studies during the development of significant regulatory actions and influential scientific information. The final rule EPA will consider all appropriate and relevant science consistent with the Agency’s statutory obligations. Greater consideration will be given to pivotal science where dose-response data are available in a manner sufficient for independent validation. The EPA is maintaining language in 40 CFR 30.3 stating that the statutes EPA administers, or their implementing regulations, will control in the event of any conflicts with the requirements of this rule.

14.1.10.9 Costs May Lead to Study Selection Biases

Comment: Commenters (6168, 6446, 6924, 9227) are concerned that the implementation costs of this rule may lead to selection biases regarding which studies EPA will include in its analyses.

Commenter (9227) states that, at a time when federal funding for research in environmental and public health-related fields has largely flat-lined, academic researchers are likely to have few additional funds available to undertake these activities. Commenters (6168, 6446, 6924) assert that, the lack of any commitment by EPA to fund implementation of procedures to protect privacy, confidentiality, security and other interests would privilege industry science, where funds would be available to comply with the proposed rule's requirements and could result in the exclusion of robust academic and other science from EPA's consideration only because of insufficient funds to comply with the proposed rule's onerous and unnecessary requirements. Commenter (6924) states that this would create a situation in which data EPA considers in decisions would be heavily skewed towards industry studies – and it is well documented that financial sponsorship (i.e. source of funding) introduces a risk of bias in the results and conclusions in favor of the regulated industry’s interests.^{3436, 3437, 3438, 3439} The commenter asserts that an influx of industry-funded studies with financial conflicts of interest would likely bias the final results of EPA’s analysis, leading to less stringent regulations and policies than with consideration of unbiased studies—with the ultimate result of reducing protections for the health of families. The commenter expresses concern that EPA’s proposed approach could institutionalize a dangerous bias in the source of studies that EPA can use for regulatory activity.

³⁴³⁹ Barnes DE, Bero LA. 1998. Why review articles on the health effects of passive smoking reach different conclusions. *JAMA* 279:1566–1570. 29 62 FR 19885, April 23, 1997. 30 59 FR 7629; February 16, 1994

Response: Under the final rule EPA will consider all appropriate and relevant science consistent with the Agency’s statutory obligations. All such studies will be subject to extensive review for scientific quality. Though greater consideration will be given to pivotal science where dose-response data are available in a manner sufficient for independent validation, the Agency does not agree that this necessarily institutionalizes biases in the source of studies or would reduce protections for the health of families. The EPA notes that it is maintaining language in 40 CFR 30.3 stating that the statutes EPA administers, or their implementing regulations, will control in the event of any conflicts with the requirements of this rule. The Agency will continue to comply with and abide by

14.2 SNPRM Implementation

14.2.1 Inter-organizational Efforts

Comment: Commenter (11479) points out that other federal and state agencies are involved in EPA’s decision-making, yet there is little detail about how this rule would impact that coordination. Consequently, the commenter suggests that there is the possibility that this rule would hamper EPA’s ability to quickly and effectively coordinate with other agencies during a disease outbreak, such as COVID-19. For example, the commenter notes that key studies which rely on confidential medical information may be excluded, “derailing any interagency effort to incorporate the study’s findings into a federal pandemic response. In other words, the commenter contends that the EPA’s proposed rule could, in times of crisis, slow or stifle life-saving discoveries in public health.”

Commenter (12727) states that the SNPRM expansion of the 2018 proposal, has inadvertently and irrationally hampered its ability to cooperate with other agencies in conducting joint or coordinated rulemakings, beyond the examples noted previously.³⁴⁴⁰ The commenter references the finalized emission standards for greenhouse gases from light-duty vehicles, which EPA intended to harmonize with the National Highway Traffic Safety Administration’s (NHTSA) corporate average fuel economy standards (CAFE). The commenter notes that both sets of standards are based on scientific analysis for which underlying data or models are not available,³⁴⁴¹ and that EPA could not have relied on this analysis in setting greenhouse gas standards had the proposal’s requirements been in place, even if the analysis did not alter the level of the standards.³⁴⁴² The commenter conceives that there would be instances in which discrepancies in the rulemaking records considered by EPA and NHTSA, respectively, would result in different standards and that it would be bizarre if, going forward, EPA and NHTSA were to attempt another harmonized rulemaking and be prevented from doing so by the fact that

³⁴⁴⁰ See Environmental Defense Fund 2018 Comments at 80-81.

³⁴⁴¹ See, e.g., The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks, 85 Fed. Reg. 24,174, 24,551 (Apr. 30, 2020) (noting that the agencies modeled aerodynamic improvement technologies partly “based on confidential business information submitted by the manufacturers”); see also *id.* (using updated cost estimates from the National Academy of Sciences in the same modeling).

³⁴⁴² See 83 Fed. Reg. at 18,773 (defining “[p]ivotal regulatory science” as “the specific scientific studies or analyses that drive the requirements and/or quantitative analysis of EPA final significant regulatory decisions” (emphasis added)); see also 85 Fed. Reg. at 24,271 (“The purpose of the analysis is not to determine the standards, but rather to provide information for consideration in doing so.”).

NHTSA relied on studies without publicly available underlying data or models while EPA would not.

Relatedly, the commenter (12727) contends that the proposal could impede any EPA rulemaking, or joint rulemaking, for which the National Environmental Policy Act (NEPA) requires an environmental impact statement (EIS). The commenter contends that the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule is a case in point. The commenter asserts that there, NHTSA prepared an EIS examining the emissions, air quality, and health impacts of weakening fuel economy standards, with EPA as a cooperating Agency in the preparation of the EIS, where NHTSA averred that it prepared the EIS “[t]o inform its development of the final CAFE standards.”³⁴⁴³ Thus, to the extent that EPA’s Greenhouse Gas (GHG) standards in the SAFE Vehicles Rule conform to NHTSA’s CAFE standards in the same joint rule, the commenter notes that the studies considered in the EIS also qualify as “pivotal regulatory science” that “drive[s] the requirements and/or quantitative analysis of [an] EPA final significant regulatory decision.”³⁴⁴⁴ The commenter states that NEPA requires the Agency to take a “hard look” at the relevant data and, in some cases, gather more data,³⁴⁴⁵ and at the very least, the Agency must explain why data it omitted “would not alter its conclusions in the EIS or the approval of [the action].”³⁴⁴⁶ According to the commenter, the SNPRM here would summarily rule out data that NEPA requires the Agency to include and consider in an EIS.

Response: The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. Some of these subsequent actions will be substantive rules issued under the associated environmental statutes and will be subject to any applicable procedural and analytical requirements under those statutes and judicial review.

14.2.2 The EPA’s Readiness to Implement the Rule

Comment: Commenter (10974) assert that there is no evidence that EPA is prepared to implement this rule. The commenter states that the SNPRM continues to leave a void around the process for implementation, thereby leaving their comments original 2018 unaddressed.

Response: This final rule is effective upon publication in the *Federal Register*. As outlined in 40 CFR 30.3, the provisions of the rule apply to significant regulatory actions for which a proposed rule was published in the Federal Register after the effective date of the rule and influential scientific information submitted for peer review after the effective date of the rule. The

³⁴⁴³ NHTSA, SAFE Rule for Vehicles Rule for Model Year 2021–2026 Passenger Cars and Light Trucks Final Environmental Impact Statement S-1 (Mar. 2020); see also *Baltimore Gas & Elec. Co. v. NRDC*, 462 U.S. 87, 100 (1983) (“As a general proposition, the commenter can agree with the Court of Appeals’ determination that an agency must allow all significant environmental risks to be factored into the decision whether to undertake a proposed action.”).

³⁴⁴⁴ 83 Fed. Reg. at 18,773 (proposed 40 C.F.R. § 30.2).

³⁴⁴⁶ *Vill. of Bensenville v. FAA*, 457 F.3d 52, 71 (D.C. Cir. 2006).

implementation guidelines are forthcoming. The comments on the 2018 were considered in the development of the SNPRM and all the comments were considered in the development of the final rule.

14.2.3 Implementation Timing/Process

Comment: Commenter (12399) contends that Section 30.3's exclusions of drafts and preliminary analyses are too vague and may exclude exceptionally important research. The commenter provides that it might make sense to exclude preliminary analyses that are not publicly available, however, anything the Agency releases or discusses publicly as a possible justification for a regulatory standard or for educational purposes should meet the transparency rule. The commenter notes that draft risk assessments, for example, may have profound market impacts, including impacts on litigation, and hence, should not be exempt from the rule.

Response: EPA notes that this final rule does not categorically exclude studies. Section 30.3 of the final rule states, "The provisions of this part do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses, and influential scientific information or pivotal science that meet one or more of the exemptions identified in Section IX of the OMB Final Information Quality Bulletin for Peer Review. In the event the procedures outlined in this part conflict with statutes the EPA administers, or their implementing regulations, the statutes and regulations will control."

Implementation guidance and statute-specific transparency regulations or programmatic regulations are forthcoming.

Comment: Commenter (11499, 12397) requests EPA clarify that the statement "at the time [a rule] ... is developed" means that EPA will apply the transparency rule to the proposed rulemaking stage, if not sooner, that is, data and models underlying any pivotal regulatory science or pivotal science that EPA might use in promulgating a significant regulatory decision or making influential scientific information final will be made available for analysis and comment in connection with the notice of proposed rulemaking. The commenter asserts that if this interpretation is incorrect, EPA should revise the rule to make clear that the proposed 40 C.F.R. Section 30.5 applies at the proposed rule stage as well as to the final Agency action.

The commenter (11499) states that, as noted in their comments on the 2018 proposal, the proposed rulemaking stage is when public stakeholders will need to weigh in on potential concerns related to the scientific basis for EPA's proposal and when efforts at independent validation of the relevant data might occur. The commenter contends that deferring public access to the "pivotal regulatory science" or "pivotal science" until the final rulemaking is issued is inappropriate, as it will be too late for active public engagement. The commenter also provides their concern that the statement could be interpreted as excluding subsequent reanalysis of the data used to develop a rule during the period between the proposed rule and the final rule. Therefore, the commenter requests that EPA include language explicitly addressing data reanalysis in its final rule. As currently proposed, the commenter provides that EPA has not specified how or when the public will be able to engage in the reanalysis of data or independent validation. The commenter notes that obtaining and reanalyzing data that are made public

through this rule could take more time than has traditionally been provided to submit comments on a proposed rule and EPA must account for this step in the public comment process to allow meaningful engagement.

Response: The final rule states that the EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Also, to assist the Administrator in determining whether to grant an exemption, the EPA program or Region responsible for the significant regulatory action or influential scientific information and public commenters can provide input when the Administrator is considering an exemption. The EPA will document the rationale for the Administrator's exemption in the significant regulatory action or influential scientific information.

This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on existing significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data.

14.2.4 Implementation Costs and Benefits

Comment: Commenters (11192, 11354) contend that there are no analyses regarding costs, the types of research affected, or the existing rules that may be called into question when their underlying scientific basis is dismissed.

Response: The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs to the Agency. The EPA emphasizes that this is a rule of internal procedure promulgated under the EPA's housekeeping authority. However, the EPA has identified some incremental costs that the Agency may incur as a result of this final rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

This internal procedural rule does not interpret or apply provisions of a particular statute or statutes that EPA administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. The final rule provides that if implementing the rule results in any conflict between this rule and the environmental statutes that the EPA administers, and their implementing regulations, this rule will yield and the statutes and regulations will be controlling.

14.2.4.1 Assessing Costs and Benefits

Comment: Commenters (11176, 11894) state that this rule should not be finalized without a full cost-benefit analysis.

Comment (9372) notes that they do not yet know all of the costs of pollution and accompanying benefits of regulation. The commenter states that pollution is actually far more costly in lost years of life, health-related costs, human capital costs, lost wages (Borgschulte, Molitor and Zou, 2017; Isen, Rossin-Slater and Walker, 2017), lost tax revenue, and crime (see Feigenbaum and Muller, 2016; Aizer and Currie, 2017; Billings and Schnepel, 2017) than they ever guessed. The commenter contends that ignoring the indirect costs and benefits means that new research on the costs and benefits of pollution would not be taken into consideration, which could have disastrous effects on public policy.

Commenter (11911) notes that purporting to comply with executive orders that require economic impact analysis of regulations, EPA claimed that “the benefits of [the Strengthening Transparency in Regulatory Science (STRS) Rule] justify the costs.”³⁴⁴⁷ The commenter contends that in reaching this conclusion, however, the Agency both drastically underestimated the costs of compliance with the Rule,³⁴⁴⁸ and more importantly, neglects to consider how the “[e]xclusion of relevant studies... will adversely affect decision-making processes,”³⁴⁴⁹ imposing serious costs on the health and well-being of the American people.

³⁴⁴⁷ 83 Fed. Reg. at 18,772; see Exec. Order No. 12,866, 58 Fed. Reg. 51,735 (Oct. 4, 1993); Memorandum: Implementing Executive Order 13,771, Titled “Reducing Regulation and Controlling Regulatory Costs” (Apr. 5, 2017), available at <https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/memoranda/2017/M-17-21-OMB.pdf>, (referring to Executive Order 12,866 as “the primary governing [Executive Order] regarding regulatory planning and review”).

³⁴⁴⁸ 83 Fed. Reg. at 18,771, citing Randall Lutter & David Zorn, On the Benefits and Costs of Public Access to Data Used to Support Federal Policy Making, Mercatus Working Paper, Mercatus Center at George Mason University (2016). The commenter provides that the cited paper makes unrealistic assumptions about the costs of making data public. According to the commenter, the authors assume that the burden placed on EPA staff in tracking down the underlying data of studies and making them public will be akin to the burden placed on chemical manufacturers under EPA’s Health and Safety Data Reporting Rule (40 C.F.R. 716). The commenter notes that however, under the Reporting Rule, chemical manufacturers are merely required to provide copies of studies already in their possession and provide lists of other known studies. The commenter asserts that this is a far different task than contacting study authors and requesting data provision. The commenter states that further, the Mercatus paper assumes that the estimated one hour it takes chemical manufacturers to review each study for confidential business information should “closely correspond” to the amount of time it would take an Agency official “to review study data for confidentiality concerns in preparation for public disclosure under a data access policy.” The commenter provides that the authors provide no evidence for the assumption that it will take EPA staffers just one hour to both assess sensitive datasets, such as longitudinal health studies, and amend them so they are sufficiently safe to disclose. According to the commenter, under these assumptions, the paper concludes that the compliance costs of the rule will amount to a mere \$18 million—far less than the \$250 million predicted in a 2015 report from the Congressional Budget Office analyzing compliance costs of a similar contemplated transparency rule. *See* Congressional Budget Office, Cost Estimate: H.R. 1030 Secret Science Reform Act of 2015 (2015).

³⁴⁴⁹ Jeremy Berg, Philip Campbell, Veronique Kiermer, Natasha Raikhel, & Deborah Sweet, Joint Statement on EPA Proposed Rule and Public Availability of Data, 360 SCIENCE 6388 (2018) (an open response to the proposed rule by the editors-in-chief of five leading scientific journals).

The commenter (11911) states that for support of its conclusion, EPA cites to a single working paper issued by the Mercatus Center at George Mason University.³⁴⁵⁰ The commenter notes that this paper estimates the economic impacts of a policy with a very different scope: it assumes that while 80 percent of studies will fail to meet transparency criteria, these studies will nevertheless continue to be relied upon in Agency rulemaking. According to the commenter, under the proposed STRS Rule, however, such studies would be excluded entirely from Agency consideration. According to the commenter, the Mercatus paper, therefore, fails to capture the STRS Rule's far-reaching costs.³⁴⁵¹

The commenter (12430) provides that the purpose of regulatory impacts analyses—to help the public and the Agency itself understand the costs and benefits of a significant rule—is thwarted when impacts are not critically assessed, yet EPA did not estimate the increased resources necessary for the Agency to implement the SNPRM, even though, complying with the rule would considerably burden Agency resources. The commenter notes that EPA did not attempt to quantify the purported benefits of providing tiered access to restricted data and models or the profound impacts to Agency protection of public health and the environment.³⁴⁵² The commenter contends that not only does this failure violate Executive Order 12866, it precludes fully-informed public comment on this highly-consequential and far-reaching set of proposals.

Commenter (12727) asserts that the SNPRM would effect a major change in how EPA establishes public health protections without any consideration of the impacts or burdens that the policy would inflict upon the Agency, the research community, vulnerable populations, or the public at large. The commenter states that in comments on the 2018 proposal, they and others demonstrated that EPA failed to provide any assessment of the costs and benefits—either quantitatively or qualitatively—and thus fell gravely short of basic requirements for reasoned decision-making.³⁴⁵³ The commenter contends that far from correcting that fatal shortcoming, the Supplemental Notice exacerbates the problem by conjuring an even more expansive policy from

³⁴⁵⁰ 83 Fed. Reg. at 18,771, citing Lutter & Zorn, *supra* note 18

³⁴⁵¹ According to the commenter the Mercatus working paper does not “prove” that the STRS Rule would be net-benefit positive, it merely calculates that “net benefits” of all new regulations promulgated in accord with the Rule would need to increase by 0.02 to 2.08 percent overall in order for the rule to justify EPA’s compliance costs of \$18 million (which are themselves grossly understated). Lutter & Zorn, *supra* note 34. The commenter states that the paper calculates the costs of compliance with a data-sharing mandate, it does not calculate the burden on the rulemaking process that would result from excluding studies that do not have publicly available data.

³⁴⁵² The commenter states that similarly, the SNPRM fails to meet the standards of OMB Circular A-4, the OMB guidance to federal agencies on analyses in regulatory decision-making that was heralded in President Trump’s E.O. 13783, “Promoting Energy Independence and Economic Growth” (March 28, 2017). The commenter provides that as E.O. 13783 noted, Circular A-4 “was issued after peer review and public comment and has been widely accepted for more than a decade as embodying the best practices for conducting regulatory cost-benefit analysis.” 82 Fed. Reg. 16093 (March 31, 2017), § 5(c), citing Circular A-4, September 17, 2003. Circular A-4 requires agencies to quantify anticipated benefits and costs of proposed rulemakings as accurately as possible using the best available techniques, and to ensure that any scientific and technological information or processes used to support their regulatory actions are objective. 58 Fed. Reg. 51735 (October 4, 1993); Circular A-4, September 17, 2003. The commenter notes that not only did U.S. EPA fail to quantify the NPRM and SNPRM’s costs and benefits, but the proposed rule would force future rulemakings out of compliance with these guidelines by precluding objective use of scientific information based solely on its public availability.

³⁴⁵³ EDF 2018 Comments at 101-108.

the same deficient record; the word “cost” appears nowhere in the Supplemental Notice, except in titles of two documents cited for other purposes.

According to the commenter (12727), it is arbitrary and capricious to “‘entirely fai[l] to consider an important aspect of the problem’ when deciding whether regulation is appropriate.”³⁴⁵⁴ The commenter provides that as in *Michigan*, EPA’s present failure to consider the costs and benefits of a regulation where there is no statutory bar to doing so is arbitrary and capricious.³⁴⁵⁵

Furthermore, the commenter (12727) states that EPA’s failure to characterize costs and benefits necessarily precludes the Agency from assessing whether the costs are disproportionate to the benefits, a finding that could render the proposal arbitrary and capricious.³⁴⁵⁶ The commenter notes that this failure extends to harms that the proposal would inflict upon the public at large, vulnerable populations, the research community, and the Agency.³⁴⁵⁷ The commenter asserts that EPA does not identify any statutory authority that could justify its failure to assess the costs and benefits of the proposed rule, and it is certain that the Agency could not rely on a radical use of a generally applicable statute like the Housekeeping Act in order to evade well-established requirements of administrative law.

Commenter (12731) states that an underlying assumption of the tiered access approach is that researchers involved in the development of pivotal science or pivotal regulatory science will participate. The commenter states that, however, the EPA has provided no analysis indicating the extent to which the Agency believes compliance could or would occur. The commenter states that, instead, it is reasonable to assume that many researchers would not engage in a tiered access approach for a variety of reasons, the significant anticipated costs being just one for which EPA has utterly failed to provide any analysis.

Response: The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs to the Agency. The EPA emphasizes that this is a rule of internal procedure promulgated under the EPA’s housekeeping authority. However, the EPA has identified some incremental costs that the Agency may incur as a result of this final rule. See III.J of the preamble for further discussion of benefits and costs of the rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government.

14.2.4.1.1 Conducting Assessment at a Later Date

³⁴⁵⁴ *Michigan v. EPA*, 135 S. Ct. 2699, 2707 (2015) (quoting *State Farm*, 463 U.S. at 43).

³⁴⁵⁵ *See id.* (“Consideration of cost reflects the understanding that reasonable regulation ordinarily requires paying attention to the advantages and the disadvantages of agency decisions.”).

³⁴⁵⁶ *See id.* at 2710

³⁴⁵⁷ *See id.* at 2707 (“‘[C]ost’ includes more than the expense of complying with regulations; any disadvantage could be termed a cost.”).

Comment: Commenter (12727) provides that EPA might analyze costs and benefits of future rulemakings that implement this policy is no substitute for analyzing costs now.³⁴⁵⁸ The commenter contends that moreover, in future rulemakings, the methodology of this policy would already be baked into the process, and disentangling its specific impacts would be virtually impossible. The commenter notes that to do so, EPA would have to identify which studies it would have relied on (or weighted differently) but for this rule, the difference in the standards or other outcome that would have resulted, and the costs and benefits the counterfactual standards would have yielded, and even then, this rule would have been long since finalized, so any assessment of costs and benefits would come far too late to influence EPA’s decision-making. The commenter also asserts that analyzing the costs of this rule only as-applied in future rulemakings would be unlikely to capture costs imposed on the research community or resulting from the public’s reluctance to participate in studies as a result of this policy.³⁴⁵⁹ The commenter provides that, as explained in their previous comments,³⁴⁶⁰ the influential scientific information to which this proposal would apply may be utilized in processes other than EPA rulemakings—such as to inform decisions by state and local health agencies—that would not provide even a theoretical opportunity for EPA to assess the costs and benefits of this proposal.

Response: This is a rule of internal procedure promulgated under the EPA’s housekeeping authority. The EPA has identified some incremental costs that the Agency may incur as a result of this final rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

14.2.4.1.2 Assessment is Necessary for Meaningful Public Participation

Comment: Commenter (11480) states that the SNPRM does not include any feasibility or cost analysis for either approach to data or the implementation of any portion of the proposal. The commenter provides that the proposal does not specify the means by which it will establish a system for tiered access, instead citing only the Research Data Center at the National Center for Health Statistics as a model.

According to the commenter (11480), the policies contained in this proposal, particularly if they include making massive amounts of raw data publicly available, may be very costly to the American people via the Agency’s budget. The commenter contends that EPA may require those costs to be borne by researchers who (1) would be forced to account for these costs in budgeting for future research projects or (2) would be forced to find funding for this disclosure for current or completed studies. The commenter provides that EPA cannot and should not move forward with implementing a broad reaching policy in which roles and responsibilities are unclear and the costs and benefits have not been analyzed, disclosed, and available for public comment.

Response: This is a rule of internal procedure promulgated under the EPA’s housekeeping authority. The EPA has identified some incremental costs that the Agency may incur as a result

³⁴⁵⁸ See *Michigan v. EPA*, 135 S.Ct. at 2709 (“Cost may become relevant again at a later stage of the regulatory process, but that possibility does not establish its irrelevance at this stage.”).

³⁴⁵⁹ See *id.* at 2710 (noting lack of assurance “that the consideration of cost at subsequent stages will ensure that the costs are not disproportionate to the benefits”).

³⁴⁶⁰ EDF comments, Section III.A

of this final rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government.

Comment: Commenter (11894) states that EPA fails to provide any information on such basic matters as potential impacts of the expanded proposal under each of EPA's substantive statutes; the potential social costs in the form of decreased protection to public health; the economic costs (the tiered access option could be very costly); and any benefits of the supplemental proposal. The commenter contends that EPA does not discuss the need for and implications of fundamental changes in position from such things as EPA's own peer review guidance. According to the commenter, commenters can only guess as to each of these matters; it is not their responsibility to have to guess. The commenter maintains that EPA thus has failed to provide any notice of issues of fundamental import, and failed to provide adequate notice and opportunity for comment. According to the commenter, the Agency has also completely failed to meet the rulemaking standards required under *FCC v. Fox Television*, 556 U.S. 502 (2009).³⁴⁶¹ The commenter notes that these errors deprive commenters of the most basic information needed to formulate reasoned comments and so are prejudicial.

Response: The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs to the Agency. The EPA emphasizes that this is a rule of internal procedure promulgated under the EPA's housekeeping authority. However, the EPA has identified some incremental costs that the Agency may incur as a result of this final rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government.

Comment: Commenter (14397) contends that EPA does not appear to have conducted a cost-benefit analysis on either the original proposal or the supplement, nor has a Regulatory Impact Assessment been done. According to the commenter, the lack of proper analysis leaves commenters, and the EPA itself, in the dark as to what the results of this action will be.

Response: The EPA agrees that neither the 2018 proposed rule nor the 2020 SNPRM included a characterization of costs to the Agency. The EPA emphasizes that this is a rule of internal procedure promulgated under the EPA's housekeeping authority. However, the EPA has identified some incremental costs that the Agency may incur as a result of this final rule. See Section III.J of the final rule preamble for further discussion of benefits and costs of the rule.

³⁴⁶¹ See *Physicians for Social Responsibility v. Wheeler*, F. 3d, (slip op. at pp. 13-17) (D.C. Cir. April 21, 2020) (rebuking EPA for announcing a changed policy while failing to acknowledge and explain why it was differing from long-standing past EPA policies, including its peer review guidance). And see Clean Air Act §§307 (d) (3) (A) and (B) detailing specific requirements for proposals, including factual data and methodologies underlying a proposal).

This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government.

14.2.4.2 Costs to the Agency

Comment: Several commenters (11350, 11395, 11408, 11478, 11484, 11492, 12715, 12405, 12422, 12720, 12727) state that analyzing similar house legislation, notably the 2015 Secret Science Reform Act and the 2017 HONEST Act, that would impose similar obligations on EPA reveals that the cost of implementation would be between \$100-250 million annually, resulting in a significant burden on the Agency’s current activities.^{3462,3463,3464,3465,3466,3467,3468, 3469} Specific comments on the overall cost of the rulemaking include:

- Commenter (11408) contends that expanding the scope to include “influential scientific information” will only further direct resources toward unnecessarily scrutinizing nearly every study the Agency considers due to the extensive review process this SNPRM would entail.
- Commenter (11484) states that the SNPRM comes at a potentially significant cost without contributing to any serious effort to improve the transparency and validity of scientific information.
- Commenter (11492) states that the expansion will impede both the speed and accuracy of EPA decision-making, something that is particularly important during a pandemic.
- Commenter (12720) notes that it is not practical for EPA to arbitrarily screen specific studies, and EPA has not articulated in the supplemental proposal how such requirements will be implemented without significant interference in the Agency’s work. According to the commenter, the supplemental proposal does not engage with the complexity and cascading ramifications of the requirements it spells out and should be withdrawn.
- Commenter (11479) contends it is clear that the current proposal would create a tremendous time and resource burden on EPA and on scientists outside of the Agency,

³⁴⁶² Congressional Budget Office. Cost Estimate: H.R. 1030 Secret Science Reform Act of 2015. March 11, 2015. Available: <https://www.cbo.gov/sites/default/files/114th-congress-2015-2016/costestimate/hr1030.pdf>.

³⁴⁶³ See, e.g., CBO Estimate for H.R. 1430; see also CBO Estimate for S. 544, (estimating that another, similar bill would cost up to \$250 million per year, even if EPA halved the number of studies it relied upon); Ben Levitan, Public Records Confirm EPA’s “Censored Science” Proposal Was an End-Run Around Congress, EDF Climate 411 Blog (Nov. 12, 2019) (describing public records showing that the proposal was expressly intended to implement the HONEST Act), <http://blogs.edf.org/climate411/2019/11/12/public-records-confirm-epas-censored-science-proposal-was-an-end-run-around-congress/>.

³⁴⁶⁹ Union of Concerned Scientists, Administrator Pruitt Ignores EPA Staff Analysis of HONEST Act Costs (May 20, 2018), <https://www.ucsusa.org/resources/attacks-on-science/administrator-pruitt-ignores-epa-staff-analysis-honest-act-costs>.

who would be forced to track down, collect, compile, and post (including any statistical methods needed to conceal private information) all the data, models, code, and other analytical tools for each of the hundreds of studies EPA cites on any given decision.

- Commenter (12720) maintains that despite this significant cost estimate, EPA does not confront the financial dimensions or the need for financial incentives to support the unprecedented data release requirements in the rule.³⁴⁷⁰ The commenter asserts that it also does not consider the fact that scientists do not typically receive funding to make the data underlying peer-reviewed studies available for public inspection.
- Commenter (12727) notes that alternatively to the \$100-250 million cost estimate, Congressional Budget Office (CBO) estimated that EPA might reduce those costs to \$5 million over a five-year period, but only by “significantly reduc[ing] the number of studies that the Agency relies on.”³⁴⁷¹ The commenter asserts that EPA failed to address these costs—including the effects of potentially relying on fewer studies—in the 2018 proposal, and it has failed to do so again in the Supplemental Notice, even though commenters provided these figures in their 2018 comments. The commenter contends that EPA’s present failure to address the CBO estimates is even more arbitrary than in 2018—and not only because the estimates are now clearly in the record. The commenter provides that in addition, the Supplemental Notice more closely parallels the bills that CBO reviewed due to the expanded scope of Agency actions and studies it would encompass.

Response: While this final rule requires the Agency to evaluate the availability of dose-response data for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review the EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of the studies the EPA would review).

Comment: Commenter (11408) provides that the rulemaking would do little, if anything, to improve the quality of EPA’s decision-making and enhance the scientific integrity of its program implementation, as documented in detail above. The commenter notes – without necessarily endorsing – that the Supreme Court has suggested that a hallmark of rational regulatory decision-making is that the costs created by a regulation not grossly outweigh the benefits it produces.³⁴⁷²

Response: EPA disagrees that this rule would do little to improve the quality of its decision-making and the scientific integrity of its programs. The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-

³⁴⁷⁰ Ioannidis, J. P., “All science should inform policy and regulation,” PLoS Medicine 15(5) (May 3, 2018), <http://journals.plos.org/plosmedicine/article?id=10.1371/journal.pmed.1002576>.

³⁴⁷¹ CBO Estimate for H.R. 1430.

³⁴⁷² *Michigan v. EPA*, 576 U.S. ___, 135 S. Ct. 2699, 2707 (2015) (“One would not say that it is even rational, never mind ‘appropriate,’ to impose billions of dollars in economic costs in return for a few dollars in health or environmental benefits.”).[Commenter provided incomplete court case citation]

response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenter (11403) states that a study using epidemiological data would require independent validation by EPA scientists even though it has already undergone the peer-review process. The commenter states that this is duplicative and wastes Agency resources.

Commenter (14397) states that this expanded proposal would mean that the EPA would either have to spend hundreds of millions of dollars to have private information redacted or move ahead without the benefit of the dozens of valid studies that cannot legally, ethically or efficiently publicly release all of their data.

Commenter (12715) states that, although data may technically be "available," it is likely to be costly to obtain.

Response: As was noted in the SNPRM, "Although the ability to independently validate pivotal regulatory science or pivotal science is a key component of this rulemaking, EPA would like to clarify that neither the proposed nor the alternative 40 CFR 30.5 would require that EPA, a member of the public or other entity must independently validate a study before it can be considered to be pivotal regulatory science or pivotal science."

The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA to disclose, redact, or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data

are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (12720) asserts that if the final rule applies only prospectively to new Safe Drinking Water Act (SDWA) advisories and benchmarks and toxicity values used in Superfund cleanup, EPA will still need to replace the current methodologies for these recommended values and revise the hierarchy of human health toxicity values in order to incorporate the new requirements, incurring significant costs and time lost to replacing these methodologies.

Response: The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. Some of these subsequent actions will be substantive rules issued under the associated environmental statutes and will be subject to judicial review.

Comment: Commenter (12715) asserts that EPA ignores the large costs that would be associated with the complex process and fails to identify who would pay for these procedures. The commenter notes that as scientists from the Union of Concerned Scientists has discussed, redacting confidential data from large studies “‘isn’t just blocking out a line’ It’s a huge job that can occupy entire offices for thousands of hours,” at commensurately high cost.³⁴⁷³ Furthermore, the commenter notes that in a 2018 article discussing this same issue with respect to the HONEST Act, the Union of Concerned Scientists also said that:

EPA career staff argue that the HONEST act would incur additional costs and time to implement, would limit research that gets conducted, and would deter industry and academics from working with the agency. In their comments to the CBO, [EPA] staff said that, “In addition to spending dollars and staff time on requesting and getting data from study authors, creating [information technology] infrastructure and a data management system to manage, store, and archive large volumes of data, and making the data available in a format that is useful and accessible to the public, EPA would also have to spend dollars and staff time combing through these extensive datasets to find and redact Personally Identifiable Information and Confidential Business Information.”³⁴⁷⁴

Response: While this final rule requires the Agency to evaluate the availability of dose-response data for pivotal science, the incremental burden to the Agency to carry out these requirements is

³⁴⁷³ See Ed Yong, The Transparency Bills That Would Gut the EPA, The Atlantic (Mar. 15, 2017), <https://www.theatlantic.com/science/archive/2017/03/how-to-gut-the-epa-in-the-name-of-honesty/519462/>.

³⁴⁷⁴ Union of Concerned Scientists, Administrator Pruitt Ignores EPA Staff Analysis of HONEST Act Costs (May 20, 2018), <https://www.ucsusa.org/resources/attacks-on-science/administrator-pruitt-ignores-epa-staff-analysis-honest-act-costs>.

expected to be small given (1) the extensive scientific review the EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of the studies the EPA would review).

The final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (12727) states that EPA has not estimated the proportion of valid, relevant research that it would disregard under the supplemental proposal.³⁴⁷⁵ The SAB, according to the commenter also noted that “[i]t is not clear: (1) how many of the studies EPA currently relies upon to take important regulatory actions would meet the public disclosure standards stated in the Proposed Rule.”³⁴⁷⁶ According to the commenter, the CBO has estimated the number of studies that legislative proposals similar to EPA’s rule would affect, both overall and at the level of individual actions, such as reviews of the NAAQS.³⁴⁷⁷ The commenter asserts that EPA presumably has better information than CBO does about the volume of scientific information it relies on across its programs as CBO relied on information from EPA on how the Agency would implement the legislation, as well as the cost of complying with it, in developing the CBO estimate.³⁴⁷⁸ Using updated information, the commenter contends that EPA must conservatively estimate both the absolute numbers and the proportion of studies it would rule out through this SNPRM—overall and in each foreseeable individual action—reasonably assuming that tiered access and de-identification are not feasible. The commenter states that, similarly, the Agency must conservatively estimate the number of studies that would be given lesser consideration under the alternative approach described in the supplementary proposal. The commenter provides that the omission of any such analyses renders the proposed rule arbitrary.³⁴⁷⁹

Response: The final rule is limited to dose-response data and, as no studies are categorically excluded from consideration, the EPA will continue to rely on the full body of the highest quality, most relevant studies available in determining the potential for hazard due to exposure to

³⁴⁷⁵ See Final SAB Report at 15 (“It is not clear: (1) how many of the studies EPA currently relies upon to take important regulatory actions would meet the public disclosure standards stated in the Proposed Rule, and (2) . . . what the impact of precluding . . . studies would be on EPA’s decision making and its ability to protect public health/environment.”).

³⁴⁷⁶ SAB Final Report at 15.

³⁴⁷⁷ See Jon Sperl & Amy Petz, Cong. Budget Office, Cost Estimate for H.R. 1430: Honest and Open New EPA Science Treatment (HONEST) Act of 2017 at 2-3 (Mar. 29, 2017) (“CBO Estimate for H.R. 1430”); CBO Estimate for S. 544, supra note 4, at 2-3.

³⁴⁷⁸ See CBO Estimate for H.R. 1430, supra note 271, at 2-3.

³⁴⁷⁹ See *State Farm*, 463 U.S. at 43 (“Normally, an Agency rule would be arbitrary and capricious if the Agency has . . . entirely failed to consider an important aspect of the problem.”); *Process Gas Consumers Grp. v. USDA*, 694 F.2d 778, 790-91 (D.C. Cir. 1982) (en banc) (faulting FERC for failing to “assess the consequences of fully incorporating a current requirements methodology” in implementing USDA’s certification of essential agricultural uses of natural gas).

a pollutant, contaminant, or substance. Consistent with the requirements of this rule, the EPA will identify a subset of those studies based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints that would inform a dose-response assessment, and will give greater consideration to pivotal science for which the underlying dose-response data are available.

The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. Some of these subsequent actions will be substantive rules issued under the associated environmental statutes and will be subject to judicial review.

14.2.4.3 Costs to the Research Community

Comment: Commenter (11361) states that publicly available datasets, especially those created under federal research grants, enable more researchers to utilize data that has already been collected and broadly increases research efficiency. The commenter provides that primary data collection is often extremely expensive and time-consuming, while secondary data analysis can often be accomplished more rapidly and on a much leaner budget.

Commenter (11395) provides that the proposed regulation would impose significant costs on research scientists. The commenter notes that formatting, preparing and de-identifying datasets and associated materials to be publicly available or to conform with EPA's proposed tiers of data availability would be extremely time and resource intensive. Further, the commenter states that according to a 2002 report from the National Academy of Sciences (NAS), re-analyses of studies almost always require the participation of the original researchers to provide additional information and support, at an additional cost of personnel time and resources.³⁴⁸⁰

Commenter (11482) notes that EPA fails to define or consider the financial costs required to implement the proposed rule and queries who will fund the collection, de-identification, storage, and dissemination of such an enormous amount of sensitive data? The commenter asserts that the Agency has not formally announced who would pay for rule implementation, and no new federal money for the Agency or outside scientists has been proposed. The commenter maintains that in suggesting that the potential costs of the rule would be minimal, the EPA ignores the costs to researchers (who would have to pay to set up and maintain data sharing for their previously published studies to be considered), to the EPA (for presumably conducting the multiple re-analyses required in section 30.6 of the rule), and to public's health (for the very real costs in dollars and human lives of undermining existing regulations by limiting access to science).³⁴⁸¹

³⁴⁸⁰ National Research Council. 2002. Access to Research Data in the 21st Century: An Ongoing Dialogue Among Interested Parties: Report of a Workshop. Washington, DC: The National Academies Press.
<https://doi.org/10.17226/10302>.

³⁴⁸¹ Singla, Veena et al. "Comments from academics, scientists and clinicians on the EPA proposed rule "strengthening transparency in regulatory science," May 30, 2018. 16 pp.

The commenter (11482) contends that had EPA adequately considered costs, it would have determined that the collection, deidentification, storage, and dissemination of sensitive data in a manner sufficient for independent validation are likely to cost millions of dollars. The commenter states that the proposed rule fails to offer any guidance on how these strategies can be achieved with zero funding and upon whose shoulders this cost burden should fall.

The commenter (11482) provides that commenters must rely on the only applicable estimates that currently exist — two CBO reports on (failed) federal legislation that was substantially similar to the proposed rule.³⁴⁸² The commenter notes that in 2015 and 2017, CBO estimated that a similar science program would cost \$1 million dollars per year to implement; however, a 2017 cost estimate from the EPA itself placed that number at as much as \$250 million.³⁴⁸³ The commenter asserts that one thing is certain: the “public availability” requirement in this proposed rule would cost a great deal of money to carry out. The commenter contends that if EPA is not covering this cost, scientists and scientific institutions will bear the lion’s share of this burden at a time of shrinking budgets, resulting in less science — not better science — and weaker public and environmental health decision making.

Response: The final rule does not regulate any party outside of the EPA but rather exclusively governs the EPA’s internal process for determining the consideration to afford pivotal science with respect to certain actions. This rule does not require any researcher or other outside entity to provide data or models to the EPA. Nor does the rule categorically exclude studies, even studies where the underlying dose-response data are not available for independent validation, and therefore any incidental impact on researchers who are developing science and deciding whether to make the underlying dose-response data available is negligible. Instead, it governs internal agency procedures for determining the consideration to afford various studies according to factors that include data availability. In doing so, the final rule provides greater transparency on the consideration the EPA will give pivotal science where the underlying dose-response data are or are not available for independent validation.

This is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA’s position on data availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make data and models available. Researchers may choose to make more data and models available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate.

If researchers want to increase the likelihood that their studies receive greater consideration by the EPA, they may take steps to ensure that the underlying dose-response data are available to

³⁴⁸² Congressional Budget Office, Cost Estimate, H.R. 1030, Secret Science Reform Act of 2015 (March 11, 2015); Congressional Budget Office, Cost Estimate, H.R. 1430, Honest and Open New EPA Science Treatment Act of 2017 (March 29, 2017).

³⁴⁸³ CBO Questions for EPA regarding H.R. xxxx, the HONEST Act of 2017.

the greatest extent possible. But any such response to this final rule would be purely voluntary. It is not required by this rule.

Comment: Commenter (11487) provides that because Research Data Center (RDC) contains data collected by Centers for Disease Control and Prevention (CDC) and other federal agencies, not by independent academic researchers, a great deal of additional work and infrastructure would be necessary before it could host the full range of data that should be informing EPA work. The commenter notes that fact that RDC charges researchers \$3,000 to access a single year's data³⁴⁸⁴ hints at the substantial costs associated with the enterprise. The commenter states that EPA does not appear to have calculated the costs that the Agency and outside researchers would incur in order to create a system that evaluates researchers' proposals and provides them with access to the appropriate level of data. The commenter contends that EPA also has not explained who would be in charge of making those determinations—a crucial issue given that communities disproportionately harmed by pollution might not trust EPA to make them.

Response: The final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (12546) notes that the CBO's analyses were underestimates, as they did not include the costs to research/ academic scientists. The commenter provides that making datasets publicly available along with "associated protocols...and detailed descriptions of how to access and use such information" would entail significant time and costs to format, prepare and, in the case of human data, attempt to de-identify individual results from the men, women and children who participated in the study. The commenter notes that such re-analyses almost always require the participation of the original researchers to provide additional information and support, which costs personnel time and resources.³⁴⁸⁵ The commenter provides that a 2013 memo from the Office of Science Technology and Policy on increasing data access acknowledges these costs and directs agencies to "Allow the inclusion of appropriate costs for data management and access in proposals for Federal funding for scientific research."³⁴⁸⁶

The commenter (12546) asserts that in contrast, the supplemental proposal contains no provisions that address the funding needed for academic scientists to make their datasets publicly

³⁴⁸⁴ National Center for Health Statistics, Centers for Disease Control and Prevention. (no date). Fees and Invoicing. <https://www.cdc.gov/rdc/b5aprovproj/AP540.htm>

³⁴⁸⁵ National Research Council. 2002. Access to Research Data in the 21st Century: An Ongoing Dialogue Among Interested Parties: Report of a Workshop. Washington, DC: The National Academies Press. <https://doi.org/10.17226/10302>.

³⁴⁸⁶ Executive Office of the President, Office of Science Technology and Policy. Memorandum for the Heads of Executive Departments and Agencies: Increasing Access to the Results of Federally Funded Scientific Research. February 22, 2013. Pg. 5.

available and support re-analyses— and if the data are not publicly available, EPA may downgrade or fail to incorporate it in relevant policymaking.

Response: This is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA’s position on data availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make data and models available. Researchers may choose to make more data and models available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate.

Comment: Commenter (12291) states that creation of both the workflow implemented to create the analytical data set used and the statistical software used to analyze the data set in a manner that enables even highly-qualified investigators to reproduce the same results is difficult and time consuming. The commenter notes that that this is likely to be costly to the researchers and their institutions – both in the creation of the data and methods hubs, and in the continuous requests for further explication from those seeking the data.

Response: This is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA’s position on data availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make data and models available. Researchers may choose to make more data and models available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate.

14.2.5 Implementation Bias

14.2.5.1 Rule Favors Certain Stakeholders

Comment: Commenters (10055, 11330, 12522, 12727) contend that the SNPRM provides for implementation in favor of industry stakeholders and/or special interests. These concerns include:

Commenter (10055) asserts that the SNPRM would open up the process of standard-setting to lengthy debates arising from the “reanalyses” and “alternative” models funded by the regulated industries. Further, the commenter states that the proposed supplement to the Transparency Rule gives immense power to regulated industries in the development of policy and regulation. According to the commenter, there are no provisions for controlling conflicts of interest in the “reanalysis” of data, the “alternative models”, or the “independent validation”.

Commenter (11330) contends that the rulemaking is not about transparency, nor about protecting human health or protecting our environment. The commenter states that this emperor simply has no clothes and must again ask EPA to put science and public interest ahead of political and special interests and withdraw this rule based on its negative impacts on science, and its negative impacts on our public health.

Commenter (12422) notes that polluting corporations, attempting to defend their products and emissions, will no doubt be able to provide whatever data and materials supporting their positions in any format the EPA might demand. The commenter states that this rule could impose an onerous and burdensome requirement on independent researchers so that much environmental science, particularly epidemiologic studies, would be excluded from the evidence base and become irrelevant to efforts by EPA to protect the public and the environment.

Commenter (12727) provides that not all funders would be equally disinclined to support research meeting EPA's requirements. The commenter notes that for instance, research backed by industry that profits from pollutants or toxicants might be adequately resourced to adapt to EPA's new requirements, since such funders would have a financial interest in which studies the Agency considers. The commenter states that the proposal could thereby skew the research landscape in favor of studies whose funders hope to reap a monetary benefit from the outcome of the research.³⁴⁸⁷

Conversely, commenter (12692) states that conflicts of interest in the rulemaking process are ubiquitous. The commenter notes that although participants may be honest people, few are honest brokers—persons without an interest or stake in the outcome. The commenter provides that stakeholders include not only the industries subject to the Agency's regulations but also the advocacy groups that gain influence and contributions by supporting or opposing the Agency's agenda, the researchers who receive Agency grants to study issues of regulatory interest, and the Agency itself, whose scientific assessments drive the scale and scope of its regulatory activity.

According to the commenter (12692), although every stakeholder is an interested party, disclosure requirements that bring conflicts of interest to light can help make the process more competitive, nothing in the Transparency Rule would change any conflict of interest disclosure regulations or any part of EPA's scientific integrity policy.³⁴⁸⁸

Response: The EPA does not agree that its approach will lead to systematic bias towards certain types of stakeholder goals.

The final rule does not regulate any party outside of the EPA but rather exclusively governs the EPA's internal process for determining the consideration to afford pivotal science with respect to certain actions. This rule does not require any researcher or other outside entity to provide data or models to the EPA. Nor does the rule categorically exclude studies, even studies where the underlying dose-response data are not available for independent validation, and therefore any

³⁴⁸⁷ See SAB Consultation at B-25 (comments of Robert W. Merritt) (raising the possibility that "only organizations producing results favorable to deep-pocketed industrial concerns will easily find funding to participate").

³⁴⁸⁸ EPA, Scientific Integrity Policy for Transparent and Objective Science, 2012, https://www.epa.gov/sites/production/files/2014-02/documents/scientific_integrity_policy_2012.pdf

incidental impact on researchers who are developing science and deciding whether to make the underlying dose-response data available is negligible. Instead, it governs internal agency procedures for determining the consideration to afford various studies according to factors that include data availability. In doing so, the final rule provides greater transparency on the consideration the EPA will give pivotal science where the underlying dose-response data are or are not available for independent validation.

14.2.6 Rule Includes Insufficient Implementation Detail/Clarity

14.2.6.1 Need for Implementation Clarity

Comment: Commenter (10042) provides that there are two distinct ways transparency is used, and understanding the distinction between the two conditions of transparency gives clarity for the EPA in their direction and guidance for the respondents to make substantive and meaningful comments to the EPA's proposed rulemaking.

The commenter (10042) states that the first way transparency is used is to understand that it is woven into the fabric of science and how scientific processes are carried out. The commenter asserts that the key attribute of this transparency is there is no choice. According to the commenter, one cannot choose to eliminate transparency from a scientific endeavor and still have a scientific activity; if there is no transparency, there is no science.

Although, the commenter (10042) provides that there are conditions and circumstances where transparency is a choice. The commenter notes that situations where individuals or groups are allowed to see a decision-making process across a spectrum of levels from non-participative observation to active and participative contribution in the final decision; this is transparency by choice.

Response: This rulemaking is one incremental step to increased transparency. The EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Comment: Commenter (11495) indicates several specific areas where they assert there is a lack of clarity on the proposed balance of the new shared responsibilities, including:

- How will an investigator know if their study is being considered as part of an Agency action that would fall under this rule? Will the EPA directly contact individual researchers or is it expected that individuals must preemptively be aware of these requirements and act accordingly?
- Who will determine what comprises a complete data set sufficient to meet the requirements of this new rule?

- Who will determine what is adequate with regards to the tiered access proposed in the supplement?
- Who will be responsible for hosting the data, and providing funding for data hosting, so that it can be made available to the public?
- Who is responsible for screening those that request the data to determine which tiered level of data should be made available to them?
- Who is responsible for interactions between those requesting data and those hosting the data in order to ensure those requesting the data can access only those tiers that they are eligible to receive?
- Who is responsible for mitigating any dispute between those requesting data and those hosting the data with regards to data access based on the proposed tiered system as well as the sufficiency of the provided data to enable the proposed reanalysis in the new rule?
- When will data be required to be available in order to be included in informing EPA actions?

The commenter (10042) contends that the reality is that the answer to all these questions is the same: the EPA proposes to wield capricious authority to determine if researchers have complied with these new requirements without providing any resources, clear guidance, or accountability for how this new rule will be applied as part of future Agency actions.

Response: This procedural rule does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. Rather, it exclusively pertains to the internal practices of the EPA. The rule does not require the EPA to disclose or host data, but to determine if data and models are available and to give greater consideration to those studies for which data and models are available. Hence, this rule does not impose costs on the EPA or any other party to make data and models available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the rule.

The EPA will not identify a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying data or models are publicly available or available through restricted access. Restricted or tiered access in this rule means that the underlying data or models are be available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

This rulemaking applies prospectively to final significant regulatory actions and influential scientific information. This rulemaking has no retrospective effect on either final significant regulatory actions or influential scientific information. For future final significant regulatory actions and influential scientific information, it applies equally to all the data and models underlying studies used as pivotal science.

Implementation guidance and statute-specific transparency regulations or programmatic regulations are forthcoming.

Comment: Commenter (11576) states that EPA has failed to articulate clearly what the proposed rule would even require, obscuring the implications of the regulation with vague language and broad grants of discretion. According to the commenter, the SAB repeatedly emphasized this problem in its comments on the proposal, noting, for example, that:

- “[C]ertain key terms and implementation issues have not been adequately defined or described” in the proposed rule;³⁴⁸⁹
- “Given the relatively skeletal nature of the Proposed Rule, it is not possible to define the implications of the rule with confidence”;³⁴⁹⁰
- “To ensure that the rule is evidence-based EPA must provide greater clarity regarding details of the rule and how it will be implemented, as well as example analyses of how it would be deployed”;³⁴⁹¹
- “The lack of specific criteria for what might satisfy the [proposal’s availability] requirement makes it difficult for the SAB to understand the implications”;³⁴⁹²
- “Given the lack of clarity in the Proposed Rule, it is difficult to understand how this regulatory action could be accomplished in a standardized and consistent manner”;³⁴⁹³
- “[T]he lack of criteria for what data might satisfy the requirements of the Proposed Rule makes it difficult to understand the implications for protection of [personally identifiable information]”;³⁴⁹⁴ “[G]reater clarity is needed in definitions of ‘data and models’ and ‘pivotal regulatory science[,]’” as “[t]he definitions provided in the Proposed Rule are not adequate”;³⁴⁹⁵
- “Case-by-case exceptions [to the proposal’s requirements] without criteria may create public concerns about inappropriate exclusion of scientifically important studies”;³⁴⁹⁶
- “The requirement in the Proposed Rule that ‘data’ be made publicly available is vague and, as a result, can be interpreted in different ways”;³⁴⁹⁷ and

³⁴⁹⁷ *Id.*

- “More clarity is ... needed to define the nature of the ‘data’ that must be publicly available.”³⁴⁹⁸

The commenter maintains that under the Administrative Procedures Act (APA), a rulemaking proposal “must describe the range of alternatives being considered with reasonable specificity. The commenter states that otherwise, interested parties will not know what to comment on, and notice will not lead to better-informed Agency decision-making.”³⁴⁹⁹

Response: The definitions in section 30.2 of the final rule are data, dose-response data, independent validation, influential scientific information, pivotal science, publicly available, reanalyze, science that serves as the basis for informing a significant regulatory action, and significant regulatory actions.

“Data” is defined as, “the set of recorded factual material commonly accepted in the scientific community as necessary to validate research findings in which obvious errors, such as keystroke or coding errors, have been removed and that is capable of being analyzed by either the original researcher or an independent party.”

“Pivotal regulatory science” has been replaced with “pivotal science” in the final rule and is defined as, “the specific dose-response studies or analyses that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.”

Section 30.7 of the final rule states, “The Administrator may grant an exemption to this part for a study on a case-by-case basis if he or she determines that greater consideration is warranted because:

- technological or other barriers render sharing of the dose-response data infeasible;
- the development of the dose-response data was completed or updated before the effective date of the final rule;
- making the dose-response data available would conflict with laws and regulations governing privacy, confidentiality, confidential business information, or national security;
- a third-party has conducted independent validation of the study’s underlying dose-response data through reanalysis; or
- the factors used in determining the consideration to afford to the pivotal science indicate full consideration is justified.”

“Publicly available” is defined as, “lawfully available to the general public from federal, state, or local government records; the internet; widely distributed media; or disclosures to the general

³⁴⁹⁸ *Id.* at 5.

³⁴⁹⁹ *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 549 (D.C. Cir. 1983). *See also, e.g., Shell Oil Co. v. EPA*, 950 F.2d 741, 751 (D.C. Cir. 1992) (noting that “[i]nterested parties cannot be expected to divine the EPA’s unspoken thoughts”); *Home Box Office*, 567 F.2d at 36 (noting that a federal agency “has an obligation to make its views known to the public in a concrete and focused form so as to make criticism or formulation of alternatives possible”).

public that are required to be made by federal, state, or local law. The public must be able to access the information on the date of publication of the proposed rule (or, as appropriate, a supplemental notice of proposed rulemaking, or notice of availability) for the significant regulatory action or on the date of dissemination of the draft influential scientific information for public review and comment.”

The EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

Implementation guidance and statute-specific transparency regulations or programmatic regulations are forthcoming.

Comment: Commenter (12464) notes that the SAB highlighted the multiple ambiguities in the Proposal in its recent report. The commenter provides that, as the SAB put it, “key considerations that could inform the Proposed Rule are not present in the proposal, or presented without analysis, and certain key terms and implementation issues have not been adequately defined or described.”³⁵⁰⁰ The commenter maintains that moreover, the SAB concluded that, “[g]iven the relatively skeletal nature of the Proposed Rule, it is not possible to define the implications of the rule with confidence.”³⁵⁰¹ According to the commenter, if even EPA’s expert science advisors cannot determine the implications of the Proposal, it is impossible for the public to understand and provide meaningful comment on the Supplemental Notice.

Response: Section III. A. Purpose and Effect of the Action in the preamble of the final rule attempts to address these concerns. This final rule is effective at publication in the *Federal Register*. The implementation guidelines are forthcoming.

Comment: Commenter (11496) contends that the rule and SNPRM do not address how the rule may work in practice. In addition, the commenter objects that the SNPRM deems comments that are not directly “addressed, altered, or replaced by the SNPRM” as out of scope when the rule has been issued in pieces and without a full analysis of its impacts. The commenter provides that the SNPRM significantly modifies the effect of the rule and creates an untenable standard where research scientists, clinicians, and peer reviewers must collect and store protected personal data so their work can be utilized by EPA.

More broadly, the commenter (11496) notes that EPA’s own SAB described the rule as “skeletal” and stated that the full implications of the rule remain undefined. The commenter concurs with the SAB’s conclusions. The commenter adds that EPA’s supplement provides

³⁵⁰⁰ Science Advisory Board Consideration of the Scientific and Technical Basis of EPA’s Proposed Rule Titled “Strengthening Transparency in Regulatory Science” (Apr. 24, 2020) at 1

³⁵⁰¹ *Id.* at 2.

additional definitions and exemptions that only serve to add ambiguity about how the rule will be implemented.

Additionally, the commenter (11496) provides that the proposed changes in the SNPRM revise many critically important definitions such as “reanalyze,” “independent validation,” and even such basic terms as “data” and “models,” along with a new use and interpretation of the term “substantially reproduced.” The commenter asserts that these new definitions do not resolve the numerous conflicts between this rule and other existing regulations. The commenter is also concerned that the rule language places the financial costs of action above human and environmental health costs. The commenter states for example, the definition of a “highly influential scientific assessment” puts a significant amount of weight on whether an impact of regulation is greater than \$500 million in any one year, but does not describe how those costs may be outweighed by health benefits to people and the environment through regulatory action.

Response: Section III. A. Purpose and Effect of the Action in the final rule preamble of the final rule attempts to address these concerns. This final rule is effective at publication in the *Federal Register*. The implementation guidelines are forthcoming.

The definitions in section 30.2 of the final rule are data, dose-response data, independent validation, influential scientific information, pivotal science, publicly available, reanalyze, science that serves as the basis for informing a significant regulatory action, and significant regulatory actions.

Comment: Commenter (11894) notes that EPA sponsors some studies through grants, some through contracts for various purposes, conducts some studies itself, and yet other studies are submitted to the Agency in response to regulatory requirements. The commenter provides that all these activities take place on a decentralized basis in many different offices. The commenter queries: At what point in the process would studies be selected for the data bar? At what stage in their preparation would the bar apply? Who would enforce it, and under what standards? What rights of appeal would exist? And what would happen to disapproved studies? Would they be withdrawn from the public and burned? If not, what would be their fate?

The commenter (11894) states that the proposal’s only approach to addressing these questions states that the data bar would apply before “finalizing” of affected studies by EPA, an undefined term that is too general to be any answer at all.

Response: The Agency will not be removing studies funded by EPA through grants, contracts, and intramural research.

This rule governs internal agency procedures for determining the consideration to afford various studies according to factors that include data availability. In doing so, the final rule provides greater transparency on the consideration the EPA will give pivotal science where the underlying dose-response data are or are not available for independent validation.

Comment: Commenter (12457) contends that EPA should not exclude studies from policy considerations, but rather include all available literature to obtain a better understanding of

relevant science. The commenter continues in stating that while transparency and data sharing are important in science, it should be considered whether the proposed rule is the best method for advancing these initiatives. The commenter notes that other methods for increasing transparency and the availability of data are already underway in the scientific community, including work currently being done by academic institutions, local government, and federal institutes including the CDC, the Committee on National Statistics, and the National Research Council.³⁵⁰²

According to the commenter, EPA should consider the proposed rule in light of these efforts and decide whether there may be better ways to encourage transparency in the science considered in policy decisions. The commenter maintains that if the EPA believes this proposed rule does represent the best methods to accomplish increased transparency, any proposed revisions to the rule should include a detailed explanation of how the EPA reached that conclusion, as well as a description of how this rule will operate in the context of ongoing transparency and privacy protection efforts.

Response: EPA notes that the final rule does not categorically exclude studies. The purpose of this rule is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenter (12467) urges the Agency to clarify that the proposed rule applies to all stages of the notice and comment rulemaking process. According to the commenter, this would ensure the consistency, transparency and predictability called for by the proposal extends to those stages of the regulatory process at which impacted stakeholders are afforded the opportunity to evaluate and respond to not only the data presented, but also the regulatory and policy actions they influence.

³⁵⁰² Improving Access to and Confidentiality of Research Data: Report of a Workshop (2000). Retrieved from: <https://www.nap.edu/catalog/9958/improving-access-to-and-confidentiality-of-research-data-report-of>.

The commenter (12467) states that when impacted stakeholders and the public are provided an opportunity to comment on federal proposals, they must have access to all relevant data to ensure they fully understand the Agency's justification for the proposed rule, and their comments are clearly in response to the selected regulatory option(s) being proposed. The commenter contends that if the Agency does not make clear a full range of options and the data that informed them, including cost benefit data, those seeking to offer public comment cannot hope to be able to respond to the range of actions being considered. The commenter notes that if EPA only applies the provisions of this proposal to final regulatory actions, it is possible that impacted stakeholders will be cut off from responding to critical data that may significantly alter the outcome of regulatory policy decisions.

Response: Section 30.3 of the final rules states, "The provisions of this part apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science."

The final rule states that the EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Comment: Commenter (12546) notes that EPA's SAB issued a report earlier this year outlining that it was: "concerned that key considerations that should inform the rule appear to be omitted or presented with no analysis - for example, it is not clear how many of the studies EPA currently relies upon to take important regulatory actions would meet the public disclosure standards in the proposal, whether EPA has assessed how many of those studies would be feasible to provide underlying information, or what the impact of precluding those studies would be on EPA's decision making and its ability to protect public health / environment."³⁵⁰³

The commenter (12546) also states that the SAB had concerns about the scientific and technical challenges and feasibility of implementing some of the rule's requirements, recommending that the Agency provide more detail on how it can meet the requirement to clearly identify and make publicly available all studies relied upon when it takes "significant final agency action," among other recommendations.³⁵⁰⁴ According to the commenter, the SAB has also not been additionally consulted, even though they have identified important flaws in the proposal.

Response: The preamble of the final rule addresses some of the concerns from the SAB report on the proposed rule. See sections III.A.1., III.C.6. and III.G. of the preamble of the final rule.

³⁵⁰³ EPA. (2019). Science Advisory Board (SAB) Draft Report (10/16/19). Pg. 31. Available: [https://yosemite.epa.gov/sab/sabproduct.nsf/WebBOARD/8A4DABC3B78F4106852584E100541A03/\\$File/Science+and+Transparency+Draft+Review_10_16_19_.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/WebBOARD/8A4DABC3B78F4106852584E100541A03/$File/Science+and+Transparency+Draft+Review_10_16_19_.pdf)

³⁵⁰⁴ *Id.* Pg. 6.

The EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

There may be pivotal science for which the underlying dose-response data are not publicly available due to technological feasibility or cannot be made available in a secure environment that still allows for independent analysis. For example, dose-response data underlying older pivotal science may no longer be available or may not exist in a currently usable format. In these cases, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator.

Comment: Commenter (12645) provides that the increasing number of co-authors in published studies raises the question of unanimous consent to data sharing. The commenter questions would all authors need to agree to data-sharing and only one refusal would prevent the study's data from being provided? The commenter states that EPA could find out by sampling the scientific community represented in cited publications underlying its regulatory decisions. According to the commenter, like so many other aspects of the initial transparency rule and this Supplement, EPA has not bothered to do any preliminary analyses or to have such analyses done by the NAS or the SAB.

Response: The final rule does not regulate any party outside of the EPA but rather exclusively governs the EPA's internal process for determining the consideration to afford pivotal science with respect to certain actions. This rule does not require any researcher or other outside entity to provide data or models to the EPA. Nor does the rule categorically exclude studies, even studies where the underlying dose-response data are not available for independent validation, and therefore any incidental impact on researchers who are developing science and deciding whether to make the underlying dose-response data available is negligible. Instead, it governs internal agency procedures for determining the consideration to afford various studies according to factors that include data availability. In doing so, the final rule provides greater transparency on the consideration the EPA will give pivotal science where the underlying dose-response data are or are not available for independent validation.

Comment: Commenter (12720) contends that Agency staff would need to conduct large information gathering assessments to determine the degree to which any study previously considered by the Agency in science reviews met the new requirements-- itself a huge task, given that each study would have to be assessed individually. The commenter states that it would be unreasonable at this stage in the process for the Agency not to contact the study authors and inform them of the new data requirements in place at EPA.

According to the commenter (12720), such communications will need to be comprehensively documented and coordinated for Agency use and public reference. The commenter notes that in many cases, it will be difficult to contact the primary study author, since in some cases years (or decades) have elapsed since study publication. The commenter queries: Would additional authors

be contacted in this case? What if, upon communication of the new requirements, there arises disagreement amongst the study authors, study funders, or academic institutions about how and whether to make all underlying data available for public inspection?

Response: While the final rule requires the Agency to evaluate the availability of dose-response data for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review the EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of the studies the EPA would review).

The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (12720) states that EPA has not explained in the proposal how the requirement to make the studies publicly available could be practically achieved. The commenter asserts that EPA does not identify any phasing-in period for the requirement, which would significantly complicate EPA's science review process. Additionally, the commenter provides no criteria have even been established by EPA to understand. The commenter notes that the lack of criteria at this stage in the process is problematic because it does not allow researchers--whose work can take many years to plan, fund, conduct, and publish-- adequate opportunity to understand the proposed requirements and submit comments to EPA.

Response: The final rule does not regulate any party outside of the EPA but rather exclusively governs the EPA's internal process for determining the consideration to afford pivotal science with respect to certain actions. This rule does not require any researcher or other outside entity to provide data or models to the EPA. Nor does the rule categorically exclude studies, even studies where the underlying dose-response data are not available for independent validation, and therefore any incidental impact on researchers who are developing science and deciding whether to make the underlying dose-response data available is negligible. Instead, it governs internal agency procedures for determining the consideration to afford various studies according to factors that include data availability. In doing so, the final rule provides greater transparency on the consideration the EPA will give pivotal science where the underlying dose-response data are or are not available for independent validation.

Implementation guidelines and statute-specific transparency regulations or programmatic regulations are forthcoming.

Comment: Commenter (12720) states that in EPA's memo to the House Committee on Science, Space, and Technology, "EPA's envisioned implementation – absent from the text of the Supplemental Proposal – would be as follows:

- The researchers would be responsible for managing the logistics of making the data and models publicly available in a manner that complies with the rule, in consultation with EPA staff.
- The researchers would be responsible for judging the sensitivity of the study's data and models and what information can or cannot be made publicly available through tiered access.
- The researchers would decide what tier of access should be designated for different types of information.³⁵⁰⁵

First, the commenter (12720) maintains that EPA burdens researchers with the obligation for managing complicated and costly logistics of making underlying data and models available to the public. The commenter notes that it is not clear how EPA would assure that these researchers actually carried out these logistical details, and no hint of this major burden to researchers is mentioned in the proposal; the logistics themselves are nowhere spelled out in the Supplemental Proposal.

Second, the commenter (12720) states that EPA evidently expects researchers to assess the sensitivity of study data but provides no criteria for doing so. The commenter provides that the expectation that researchers evaluate their own data and models conflicts with the Agency's plan to independently assess whether the research has indeed been made publicly available or whether EPA should grant a waiver from the requirements identified in the Supplemental Proposal. Similarly, the commenter notes that in the third bullet, EPA now says that it expects researchers to ascertain what data access tier is important for the underlying data and models used in their studies. The commenter states that no details are provided to assist researchers in making such important determinations. Further, the commenter contends that EPA's inability "to say how conflicts between the researcher's judgment and the Agency's judgment would be handled" is further indication that the rule is arbitrary and capricious and fails to provide fair notice or any reasoned explanation about this key implementation concern.

Commenter (12720) provides that, under the current iteration of the Supplemental Proposal, the public is left with gaping questions about how the Supplemental Proposal will be implemented. The commenter queries: How would EPA handle a reanalysis conducted by a third party? What procedures will EPA follow for assessing a reanalysis during a rulemaking? How might the absence of peer-review for a reanalysis influence the incorporation of those findings into influential scientific information or a rulemaking? How would EPA balance the timeline of a rulemaking with the timeline of a reanalysis, given that a reanalysis of a major study can take years and may not be completed before a regulatory deadline? The commenter contends that all of these critical questions have not been raised, let alone addressed, by the Agency.

The commenter (12720) notes that EPA seemed to acknowledge as much in its meeting with House staff, where the Agency "was largely unable to address these issues and frequently declined to answer questions, admitting that the Agency had simply not considered the issue this

³⁵⁰⁵ Johnson, Eddie Bernice. 2020. "Letter from Chairwoman Eddie Bernice Johnson to House Committee on Science, Space, and Technology, Summary of Staff-Level Briefings from the Environmental Protection Agency on the 'Strengthening Transparency in Regulatory Science' Supplemental Proposed Rule," May 6, 2020.

far into the rulemaking process.”³⁵⁰⁶ The commenter contends that not only are the substantive aspects of the rulemaking arbitrary and capricious, but also EPA’s glaring failure to notify parties and include information on the content of the rulemaking in the Supplemental Proposal text renders the Proposal arbitrary and capricious and a truly egregious abuse of discretion. The commenter provides that as the memo notes, “the public comment period is no substitute for a well-reasoned, deliberative policymaking process. EPA’s inability to answer basic questions about the rule’s operation and implementation reflects the ill-conceived nature” of the Supplemental Proposal.³⁵⁰⁷

Commenter (12720) considers the situation where a single study examining several distinct health endpoints is consulted in different ways. The commenter questions whether EPA would make a single determination on such a study, regardless of its application in specific regulatory decisions. If so, the commenter contends the supplemental proposal would arbitrarily prevent a study from being considered in different ways for different contexts and regulatory decisions (*e.g.*, in the case where a study examines both commonly and less-commonly studied health endpoints).

Response: The final rule does not regulate any party outside of the EPA but rather exclusively governs the EPA’s internal process for determining the consideration to afford pivotal science with respect to certain actions. This rule does not require any researcher or other outside entity to provide data or models to the EPA. Nor does the rule categorically exclude studies, even studies where the underlying dose-response data are not available for independent validation, and therefore any incidental impact on researchers who are developing science and deciding whether to make the underlying dose-response data available is negligible. Instead, it governs internal agency procedures for determining the consideration to afford various studies according to factors that include data availability. In doing so, the final rule provides greater transparency on the consideration the EPA will give pivotal science where the underlying dose-response data are or are not available for independent validation.

This rule imposes no costs on researchers or their institutions, and the EPA will consider and evaluate all relevant and appropriate science in its significant regulatory actions and influential scientific information. The EPA recognizes that researchers and other third parties may voluntarily consider the EPA’s position on data availability, as described in this rule, as they make their own decisions about how to conduct research and the extent to which they make data and models available. Researchers may choose to make more data and models available, but the EPA recognizes that these parties will weigh their own benefits and costs and make choices that they deem appropriate.

As was noted in the SNPRM, “Although the ability to independently validate pivotal regulatory science or pivotal science is a key component of this rulemaking, EPA would like to clarify that neither the proposed nor the alternative 40 CFR 30.5 would require that EPA, a member of the

³⁵⁰⁶ Johnson, Eddie Bernice. 2020. “Letter from Chairwoman Eddie Bernice Johnson to House Committee on Science, Space, and Technology, Summary of Staff-Level Briefings from the Environmental Protection Agency on the ‘Strengthening Transparency in Regulatory Science’ Supplemental Proposed Rule,” May 6, 2020.

³⁵⁰⁷ *Id.*

public or other entity must independently validate a study before it can be considered to be pivotal regulatory science or pivotal science.”

Comment: Commenter (12727) argues that the vagueness of the proposed definition creates problems regardless of how widely or narrowly the rule is applied. Attempting to apply the rule to all studies involved in the development of influential scientific information “would be entirely infeasible, effectively paralyzing the development of influential scientific information and with it the work of the agency.” On the other hand, a narrow interpretation “introduces incredible risk for selective and biased application with no accountability.”

Response: The definition of “influential scientific information” at proposed 40 CFR 30.2 in the 2020 SNPRM is the same definition as in OMB Bulletin for Peer Review. The EPA proposed to adopt this definition because it intended the scope to be consistent with how that term has been interpreted and applied in the context of peer review. Given that the definition is both established and has been routinely applied by the EPA, the EPA disagrees that the term is inherently too narrow or too broad. Rather than modify the proposed 40 CFR 30.2 definition of “influential scientific information,” the EPA is modifying 40 CFR 30.3 in the final rule to clarify the Agency’s intent that the requirements in 40 CFR 30.3 apply to influential scientific information, unless the influential scientific information is exempted from peer review requirements as described in Section IX of the OMB Final Information Quality Bulletin for Peer Review.

Comment: Commenter (13788) notes that the SAB warned EPA that changing transparency requirements could have negative consequences:

It is plausible that in some situations, the Proposed Rule will decrease efficiency and reduce scientific integrity, determining if in fact that will be the case requires a thorough and thoughtful examination that is currently absent in the Proposed Rule. Moving forward with altered transparency requirements beyond those already in use, in the absence of such a robust analysis, risks serious and perverse outcomes.³⁵⁰⁸

According to the commenter (13788), the SNPRM does not include the additional “robust analysis” of the need for the changed policy called for by the SAB, and instead continues to leave important details regarding implementation of the rule undecided. The commenter maintains that at the very least, EPA must provide a response to the problems raised by the SAB, including some explanation and justification for this rule.

Additionally, the commenter (13788) provides that EPA in the SNPRM proposes to apply its data release requirements across the board, without distinguishing between types of studies and the data they rely on, which may or may not include confidential information. Additionally, the commenter notes that while the 2018 Proposal was limited to dose-response data and models, the

³⁵⁰⁸ Science Advisory Board (SAB) Consideration of the Scientific and Technical Basis of EPA’s Proposed Rule Titled Strengthening Transparency in Regulatory Science, at 18 (Apr. 24, 2020), [https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebReportsLastMonthBOARD/2DB3986BB8390B308525855800630FCB/\\$File/EPA-SAB-20-005.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebReportsLastMonthBOARD/2DB3986BB8390B308525855800630FCB/$File/EPA-SAB-20-005.pdf)

SNPRM expands that to all data and models broadly and without justification. The commenter references the SAB's report on the 2018 Proposal that stated:

the requirement to make data available for public inspection will be more easily implemented for some datasets than others (e.g., [certain] studies include individual sample data as part of standard reporting). The expectation that data and methods will be available for all endpoints may be unrealistic.³⁵⁰⁹

The commenter (13788) contends that the SAB was clearly concerned that the rule's requirements could not even be put into practice, never mind whether they are lawful or rational or adequately justified. Additionally, the commenter states that although the SNPRM allows the Administrator to grant an exception to the requirements, the SNPRM provides no reason to believe that provision will sufficiently address the concern identified by the SAB, nor is there any safeguard included to ensure that the EPA Administrator, in exercising his discretion, will not bring extra-statutory political considerations into the decision-making process.

Response: Section III. A Purpose and Effect of the Action in the preamble of the final rule attempts to address these concerns. This final rule is effective at publication in the *Federal Register*. The implementation guidelines are forthcoming.

Comment: Commenter (11176) states that the supplement introduces a new process that lacks description and that uses language requiring judgement calls for which no protocols are provided. The commenter provides that the supplement calls on EPA staff to determine, for example, what studies are "sufficient for independent validation" and what studies should be given "greater consideration."

The commenter (11176) notes that, starting with the first phrase, "sufficient for independent validation", the EPA's supplement does introduce a definition for the term, independent evaluation: "the reanalysis of study data by subject matter experts who have not contributed to the development of the original study to demonstrate that the same analytic results are capable of being substantially reproduced." The commenter contends that the concern is that there is insufficient guidance or standards for what the terms, "sufficient" and "substantially", mean or who will make the determination (e.g., scientific staff with oversight of an EPA scientific advisory panel). The commenter states that to its credit, EPA is using the 2002 OMB definition for "Capable of being substantially reproduced". The commenter notes that the definition however uses the words, "similar" and "acceptable," which are subject to the same concerns as "sufficient" and "substantially". The commenter asserts that standards for these terms and determination should be included before this proposed rule is finalized and should include sufficient guidance to, for example, take into account how unlikely it is for two studies to exactly replicate. The commenter provides that in 2015 Ralph Cicerone, then president of the NAS addressed this point in a speech, noting that a NAS panel had grappled with the very question: "Because variability across studies is to be expected, how can we assess the acceptable degree of variability and when should we be concerned about reproducibility?" According to the

³⁵⁰⁹ *Id.* at 19.

commenter, there should also be guidance to require explanation of whether research has or has not met the sufficient-for-independent-validation criterion.

Additionally, the commenter (11176) highlights the importance of meta-analyses as a research standard and states the fact that the supplement does not reference this well-known and valued scientific practice, which EPA staff regularly uses, reinforces the point that EPA has much work to do in laying the foundation for accomplishing the stated goal of the proposed rule.

According to the commenter (11176), these two issues—ambiguity of terms and lack of process and transparency—risk the introduction of bias, if not improper influence, into the EPA process. The commenter states that specifically, the two issues risk “arbitrary and capricious decisions as to what evidence to include or exclude” and “would also often result in regulatory analyses that suffer from biased selection and inadequate statistical power,” among other issues.

The commenter (11176) contends that before the EPA implements the rule, it should design and explain its process for considering different studies. Additionally, the commenter provides EPA should also acknowledge the risk of bias in the process and explain how it will work to minimize such risk. The commenter notes that a highly regarded site is that of the Cochrane Collaboration's revised risk of bias framework available at the following url: <https://www.riskofbias.info/>.

Response: The EPA is not identifying a specific step in a multi-step analysis as the stage of data that would be sufficient for independent validation through reanalysis because this would be overly prescriptive and not informative. As noted by commenters, the step at which the final clean data set will be generated will vary from study to study. The level of detail required would be that needed for a separate party to reanalyze the study. The appropriate step is where the data are ready to be analyzed to extract relevant information.

Section 30.5 of the final rule states, “The EPA will use the following factors to assess the quality of studies identified in the systematic review: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. . . . The Agency will identify the pivotal science that was given lesser consideration and provide a short description of why lesser consideration was given.”

The EPA does not agree that its approach will lead to systematic bias towards certain types of stakeholder goals.

Comment: Commenter (11894) asserts that EPA’s alternative proposal on study and model acceptability does not set out any truly binding standards for making decisions. The commenter provides that the factors it mentions are so numerous and poorly articulated that the Agency would remain free to do whatever it wants.

Response: Section 30.5 of the final rule states, “The EPA will use the following factors to assess the quality of studies identified in the systematic review: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. . . . The Agency

will identify the pivotal science that was given lesser consideration and provide a short description of why lesser consideration was given.”

14.2.6.2 Added Definitions

Comment: Commenter (12715) The commenter provides that the supplemental proposal both fails to address many of the technical problems identified in the 2018 Comments on the initial proposal and creates several new problems. The commenter states that for example, the clarifications, modifications, and additions to the proposed rule³⁵¹⁰ raise significant additional concerns regarding the intent, applicability, and implementation of the rule, as discussed above. The commenter notes that the expansion of the scope of studies that would now be excluded or given less weight is particularly problematic not only because the manner in which EPA proposes to evaluate data and studies for consideration defies basic scientific principles, but also because there is a complete lack of transparency regarding how the Agency will apply the rule.

Additionally, the commenter (12715) notes that the narrative section of the supplemental proposal states that EPA is “modifying, deleting and proposing new regulatory text” in the definitions section, including “deleting the first paragraph of the 2018 proposed rulemaking regulatory text” and the definition of research data,³⁵¹¹ but in the proposed rule section, EPA states that it is “[r]evis[ing] § 30.2 by *adding* the [listed] definitions . . . to read as follows.”³⁵¹² The commenter provides that unlike other sections of the supplemental proposal where EPA appears to have included the full revised provision, the proposed rule text for section 30.2 appears to include only the added definitions. The commenter asserts that it is thus unclear which, if any, portions of the original proposed rule text are being “modif[ied]” or “delet[ed]” as the narrative description indicates. The commenter states that EPA’s unclear presentation of the changes it is making to this section of the supplemental proposal deprives the public of the opportunity to provide meaningful feedback on this portion of the rule.

Further, the commenter (12715) contends that the definitions are also problematic because the proposed rule repeatedly refers to “significant regulatory decisions,”³⁵¹³ but the proposal fails to provide any definition of the terms “significant regulatory decisions” or “significant.” The commenter notes that even more confusingly, “regulatory decisions” are defined in the original proposal as “final regulations determined to be ‘significant regulatory actions’ by the Office of Management and Budget.”³⁵¹⁴ According to the commenter, the confusion throughout the definitions section infects the entire proposal, because understanding whether and how EPA has defined key terms is critical to understanding how the other substantive provisions of the rule would operate.

Response: The definitions in section 30.2 of the final rule are data, dose-response data, independent validation, influential scientific information, pivotal science, publicly available,

³⁵¹⁰ 85 Fed. Reg. at 15,396.

³⁵¹¹ 85 Fed. Reg. at 15,398.

³⁵¹² *Id.* at 15,404 (emphasis added).

³⁵¹³ *Id.* at 15,405-06.

³⁵¹⁴ 83 Fed. Reg. 18,768, 18,773 (Apr. 30, 2018).

reanalyze, science that serves as the basis for informing a significant regulatory action, and significant regulatory actions.

The Agency is changing the term from “regulatory decisions” to “significant regulatory actions” in the final rule. “Significant regulatory actions” is defined as, “final regulations determined to be ‘significant regulatory actions’ by the OMB pursuant to Executive Order 12866.”

14.2.6.3 Section 30.5 Alternatives

Comment: Commenter (11192) notes that EPA proposes two alternatives to outright dismissal of studies that can’t make their underlying data public for legal or ethical reasons: tiered access to the data (which doesn’t ameliorate privacy considerations) and a weighting scheme to devalue those studies. According to the commenter, the EPA provides no accompanying details about how these measures would be implemented, leaving either or both open to manipulation for political ends.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Implementation guidelines and statute-specific transparency regulations or programmatic regulations are forthcoming.

Comment: Commenter (12427) provides that the proposed rule and SNPRM have a:

- Lack of development, demonstration, and evaluation of alternative approaches prior to arriving at proposals for a regulation
- Lack of a detailed evaluation of whether, and if so how, the proposed rule could conflict with existing statutes
- Lack of development of experience with proposed measures by testing them prior to attempting

Response: As discussed in the final rule preamble at I. C. “What is the Agency’s authority for taking this action?,” this internal procedural rule does not interpret or apply provisions of a statute that EPA administers. If implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

Alternative approaches were discussed in the March 2020 Supplemental Notice of Proposed Rulemaking, and commenters were specifically asked to comment on the alternative approaches proposed.

This final rule is effective at publication in the *Federal Register*. The implementation guidelines are under development and statute-specific transparency regulations or programmatic regulations are forthcoming.

Comment: Commenter (12715) contends that in the words of EPA’s own SAB, “[g]iven the relatively skeletal nature of the Proposed Rule, it is not possible to define the implications of the rule with confidence.”³⁵¹⁵ The commenter states that in particular, it is unclear which definitions are included in the proposed rule, EPA fails to define key features of the two “options” proposed for determining which data and models may be used, and the proposed rule’s exemptions provision contains insufficient standards to guide the Administrator’s discretion. According to the commenter, the supplemental proposal thus runs afoul of the APA’s substantive and procedural requirements due to its vagueness as well as its arbitrariness, thus depriving the public of a meaningful opportunity to comment. Accordingly, the commenter asserts that if EPA does not abandon the proposal altogether, it should reclassify the proposal as, at most, an Advance Notice of Proposed Rulemaking.

Response: The definitions in section 30.2 of the final rule are data, dose-response data, independent validation, influential scientific information, pivotal science, publicly available, reanalyze, science that serves as the basis for informing a significant regulatory action, and significant regulatory actions.

Section 30.5 of the final rules states, “The EPA shall give greater consideration to pivotal science where the underlying dose-response data are publicly available in a manner sufficient for independent validation. The Agency shall also give greater consideration to pivotal science based on dose-response data that include CBI, proprietary information or PII if these data are available through restricted access in a manner sufficient for independent validation.”

Section 30.7 of the final rule provides the aspects of a study the Administrator can consider when determining whether to grant an exemption.

Comment: Commenter (10972) asks how the weighting of studies will be determined. Commenters (9362, 10972, 11484, 12715) question who is responsible for determining that “other things are equal” when deciding which studies should be given greater consideration. Commenter (12715) states that neither approach in section 30.5 address concerns regarding the arbitrary exclusion or down-weighting of relevant scientific studies. According to the commenter, Option 1 unlawfully and arbitrarily excludes studies from consideration while Option 2’s weighting approach is also arbitrary due to no inclusion of criteria for discretion.

³⁵¹⁵ Science Advisory Board Consideration of the Scientific and Technical Basis of EPA’s Proposed Rule Titled “Strengthening Transparency in Regulatory Science” (Apr. 24, 2020) at 2

Additionally, the commenter points out that the clause “other things equal” is vague and fails to provide criteria to bound the Agency’s discretion.

Furthermore, the commenter (12715) contends that the arbitrariness of both alternatives for section 30.5 raises troubling conflict of interest concerns regarding the types of studies that EPA would be able to consider. The commenter provides that studies for which the underlying data are or could likely be made available for independent validation are typically Good Laboratory Practice (“GLP”) studies performed by industry. The commenter notes that while EPA has requested comment on “how to ensure that, over time, more of the data and models underlying the science ... are available to the public,” as well as “how to provide sufficient incentives and support to researchers to increase access to the data,” there is no indication of how this would be accomplished. The commenter states that accordingly, either version of section 30.5 would strongly favor the Agency’s consideration of scientific studies conducted by or on behalf of the very industries and special interest groups that will ultimately be regulated by EPA’s standards. The commenter maintains that these are the entities whose studies are more likely to have underlying data that is currently available for public validation or who can, going forward, afford to comply with the proposed rule’s public availability requirements.

Response: The final rule is limited to dose-response data and, as no studies are categorically excluded from consideration, the EPA will continue to rely on the full body of the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Consistent with the requirements of this rule, the EPA will identify a subset of those studies based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints that would inform a dose-response assessment, and will give greater consideration to pivotal science for which the underlying dose-response data are available.

Section 30.5 of the final rule states, “The EPA will use the following factors to assess the quality of studies identified in the systematic review: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. . . . The Agency will identify the pivotal science that was given lesser consideration and provide a short description of why lesser consideration was given.” EPA did not finalized the “other things being equal” concept from the 2020 SNPRM.

The EPA agrees that additional clarification is needed regarding the other factors that the EPA will consider. Although the EPA is prioritizing transparency in pivotal science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability, even in the absence of maximum transparency. Though not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

- (1) the quality of the study relative to other studies for which the dose-response data are

- available;
- (2) the extent to which there are other studies for which the dose-response data are available;
 - (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
 - (4) the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
 - (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
 - (6) the extent to which the study is supported by other scientific evidence;
 - (7) the extent to which the study accounts for unique scientific considerations;
 - (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
 - (9) the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

These factors are intended to assist the EPA in determining the consideration to afford to pivotal science with underlying dose-response data that are not available for independent validation. The final rule requirements and the consideration of these factors apply to any data used in characterizing the relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, regardless of the direction of that effect. Because study quality factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) would have already been evaluated at an earlier stage in the assessment process, the studies evaluated with these additional factors are presumed to be of the highest quality available.

The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Comment: Commenter (12720) contends that EPA does not adequately describe the process by which “greater consideration” will be given to specific studies, and whether the characteristics of specific studies (*e.g.*, sample size, confidence intervals of results, or overall methods validity) may compensate for any lack of full data transparency. The commenter provides that for example, the Agency typically considers thousands of studies in compiling integrated science assessments as part of the NAAQS.³⁵¹⁶ The commenter notes that each of these studies may satisfy the new data requirements proposed in the rule to differing degrees, and it is not clear

³⁵¹⁶ U.S. Environmental Protection Agency. (2015, January 29). Integrated Science Assessments (ISAs) [Collections and Lists]. US EPA. <https://www.epa.gov/isa>

whether or not any Agency-perceived shortcomings in meeting these data requirements may be compensated by other criteria that help EPA to determine the overall degree of study quality.

Response: The final rule is limited to dose-response data and, as no studies are categorically excluded from consideration, the EPA will continue to rely on the full body of the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Consistent with the requirements of this rule, the EPA will identify a subset of those studies based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints that would inform a dose-response assessment, and will give greater consideration to pivotal science for which the underlying dose-response data are available.

Section 30.5 of the final rule states, “The EPA will use the following factors to assess the quality of studies identified in the systematic review: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. . . . The Agency will identify the pivotal science that was given lesser consideration and provide a short description of why lesser consideration was given.”

14.2.6.4 Agency Programs

Comment: Commenter (11894) provides that the proposal is thoroughly ambiguous on what Agency activities will be covered. The commenter states that on the one hand, it states that the new provisions would “not apply to any type of agency action” other than “significant” rules,³⁵¹⁷ however, it does not define the term “agency action.” According to the commenter, “action” could mean literally everything an Agency does in the course of its work; it could mean “agency action” as defined in the APA,³⁵¹⁸ but it does not say that. In any event, the commenter maintains that even that term is notably ambiguous and regularly generates difficult administrative law questions.³⁵¹⁹ On the other hand, the rule’s requirements would extend to all “influential scientific information,” which is defined as:

scientific information the agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions.³⁵²⁰

The commenter (11894) contends that given the scope of the expressed concerns, it would seem unreasonable to exempt the majority of EPA activity from its scope by a broad definition of “agency action.” The commenter states that a broad definition of “agency action” would make the new restrictions applicable to studies in their less important uses, and inapplicable to studies used for the more consequential task of supporting Agency decisions, seemingly inconsistent with the policy behind the SNPRM.

³⁵¹⁷ 85 Fed. Reg. 15405.

³⁵¹⁸ See 5 U.S.C. § 551(13),

³⁵¹⁹ The commenter notes that under that definition, “‘agency action’ includes the whole or a part of an agency rule, order, license, sanction, relief, or the equivalent or denial thereof, or failure to act.”

³⁵²⁰ 85 Fed. Reg. 15405

One such program lacking clarity according to the commenter (11894) are the “advisories” and “benchmarks” for state and local water supply systems detailing the potential hazards of pesticides and other chemicals in drinking water. The commenter states that this information has no binding legal effect, but state agencies rely on it to shape their efforts to protect public health. The commenter contends that EPA’s proposal, however, does not discuss whether the issuance of these advisories and benchmarks would be regarded as “agency action,” exempt from the new requirements, or the impact on the program and how EPA would address that impact, if they are not exempt.

Additionally, the commenter (11894) provides a review of the process of assessment in the Existing Chemicals program that would be impacted should the rule apply retroactively. With only one study used in the most recent trichloroethylene (TCE) assessment in which its raw data was available, the process would essentially shut down, according to the commenter.

Response: The EPA is finalizing the applicability of the rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities. Implementation guidelines and statute-specific transparency regulations or programmatic regulations are forthcoming.

Comment: Commenter (12399) states that 40 CFR 30.3 of the proposed rule excludes anything not considered a “significant regulatory action,” such as adjudications, enforcement actions, and permit proceedings. The commenter contends that some provision may be necessary to ensure the Agency does not needlessly delay permits and the like, but the rule should apply to Agency-produced science, including risk assessments and research that could have impacts in the marketplace.

Response: The EPA is finalizing the applicability of the rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

Comment: Commenter (12720) provides that in briefings to the House Committee on Space, Science, and Technology on April 2, 2020, EPA staff have stated that the proposed rule “would open up existing regulations to being reworked” by confirming to staff that the rule’s application to “prospective rulemaking” includes statutorily mandated reviews of existing standards.³⁵²¹ The commenter states that in the April 2 briefing, EPA noted that such “prospective rulemaking” includes statutorily mandated reviews of existing standards, such as the NAAQS.

The commenter (12720) contends that is highly inappropriate for EPA to make this clarification in a private setting, rather than engaging with the issue within the SNPRM itself, a setting that

³⁵²¹ Johnson, Eddie Bernice. 2020. “Letter from Chairwoman Eddie Bernice Johnson to House Committee on Science, Space, and Technology, Summary of Staff-Level Briefings from the Environmental Protection Agency on the ‘Strengthening Transparency in Regulatory Science’ Supplemental Proposed Rule,” May 6, 2020.

would provide members of the public an opportunity to comment on the issue. The commenter provides that beyond making this clarification in the briefing, EPA has not explained how the ongoing NAAQS reviews for fine particulate matter and ozone air pollution would proceed in the drastically altered scientific review context envisioned by the SNPRM.

Additionally, the commenter (12720) states that according to the memo, “EPA’s envisioned implementation – absent from the text of the Supplemental Proposal – would be as follows:

EPA staff would reach out to the researchers involved in a study that the Agency wants to consider during the development of significant regulatory actions or Influential Scientific Information.³⁵²²

The commenter (12720) asserts that these implementation details (none of which are included in the SNPRM), raise several glaring problems. The commenter first notes that EPA regularly consults thousands of scientific studies for influential scientific information like the Integrated Science Assessments for criteria air pollutants under the CAA NAAQS program. The commenter contends that it is not feasible for EPA staff to contact research authors in such a way, particularly because many studies involve multiple authors and conceivably permission would need to be obtained from all co-authors for any new plan to share data with EPA or the public.

Response: The EPA is finalizing the applicability of the rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. If implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

Comment: Commenter (11495) notes that it is not specified which specific Agency actions will actually be covered under this rule, which individual(s) will be responsible for deciding if an action will be covered, and at which point in the process can this decision be made or revised. To this end, the commenter states that this lack of clarity is likely to lead to inconsistent application of these new requirements.

Commenter (12453) asserts this exclusion has long been recognized by EPA.³⁵²³ As such, the commenter wishes to confirm that the supplemental proposal, and any promulgated final rule, does not include individual adjudications or permit proceedings, such as FIFRA or Federal Food,

³⁵²² *Id.*

³⁵²³ See, e.g., EPA Science and Technology Policy Council, “Peer Review Handbook” (4th Ed. Oct. 2015), at 44 (identifying registration determinations among those “influential work products” that do not need to be peer reviewed, even if they might otherwise be considered “influential scientific information” or “highly influential scientific assessments”)

Drug, and Cosmetic Act (FDCA) decisions on individual pesticide registrations or tolerances. The commenter notes that the scope would more broadly be applicable to rulemakings under FIFRA or FDCA that do meet the definition of “significant regulatory action.”³⁵²⁴

Conversely, Commenter (12399) commends the definition for “influential information” because it indicates that the rule could also apply to research that impacts both policy decisions *and private sector decisions*. The commenter asserts that this is important due the marketplace impacts Agency science can have. According to the commenter, it only makes sense that Agency science – including “nonregulatory activities” such as research studies or risk assessments – complies with the best available scientific standards and transparency requirements.

Response: The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. Influential scientific information is defined as the “scientific information the Agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions,” consistent with the definition of “influential scientific information” provided in the OMB Peer Review Bulletin. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. If implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

Comment: Commenter (12467) states that the inclusion of influential scientific information is limited when compared to the full extent of regulatory and policy statements issued by the Agency and does not ensure impacted stakeholders will be afforded the full benefit of the rulemaking. As such, the commenter recommends that the requirements also be applied to Agency guidance documents due to their potential for impact on the regulated community at the same level as “significant regulatory actions”.

Response: The EPA is finalizing the applicability of the rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities. The rule also does not apply to guidance documents.

The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a

³⁵²⁴ See CLA’s August 16, 2018 public comments at pp. 4-5 (providing detailed citations and examples).

particular statute or statutes that it administers. If implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

Comment: Commenter (11892) asks whether individual permits would be considered significant regulatory actions, as attempting to apply this rule would place a large burden on state agencies. The commenter notes that “the statement in Section §30.5 ‘except where explicitly stated otherwise that provisions of this subpart do not apply to any other type of Agency action, including individual party adjudications, enforcement activities or permit proceedings’ should be interpreted to mean that that individual permits are not covered by this rule” because there are already “adequate appeal processes and public involvement steps in place for challenging the validity of an agency’s decision without adding the additional steps and criteria in the proposed rule.”

Response: The EPA is finalizing the applicability of the rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. If implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

Comment: Commenter (12727) asserts that there are many circumstances under which EPA develops [Influential Scientific Information (ISI)] with broad applicability to multiple programs or varying governmental actions that have yet to be identified. The commenter provides that such products include IRIS chemical reviews by EPA’s Office of Research and Development (ORD) (e.g., the 2019 “IRIS Toxicological Review of Ethyl Tertiary Butyl Ether (ETBE)”³⁵²⁵ and “IRIS Toxicological Review of Tert-Butyl Alcohol (TBA)”³⁵²⁶), and reports by EPA’s Office of Chemical Safety and Pollution Prevention (e.g., “Continuing Development of Alternative High-Throughput Screens to Determine Endocrine Disruption, Focusing on Androgen Receptor, Steroidogenesis, and Thyroid Pathways”³⁵²⁷). Additionally, the commenter states that EPA’s application of the proposed public disclosure regulations to such products is especially pernicious because it would likely be impossible—or at least, immensely burdensome—to determine at the time that the ISI is utilized in Agency decision-making whether, in developing the ISI, EPA omitted from consideration (or gave lesser weight to) valid scientific studies that EPA is obligated to consider fully under the relevant statutory or regulatory provisions.

³⁵²⁵ EPA, Science Inventory,

https://cfpub.epa.gov/si/si_public_record_report.cfm?Lab=NCEA&dirEntryID=326410.

³⁵²⁶ EPA, Science Inventory,

https://cfpub.epa.gov/si/si_public_record_report.cfm?Lab=NCEA&dirEntryID=322481.

³⁵²⁷ EPA, Science Inventory, https://cfpub.epa.gov/si/si_public_record_report.cfm?Lab=OSCP&dirEntryID=338571

For example, the commenter (12727) provides that the purpose of ORD's IRIS chemical reviews is to support EPA's mission of protecting public health and the environment by identifying and characterizing the health hazards of chemicals found in the environment.³⁵²⁸ Among other things, the commenter states the EPA uses this information to help set national standards under TSCA,³⁵²⁹ the CAA,³⁵³⁰ the SDWA,³⁵³¹ and the Emergency Planning and Community Right-to-Know Act,³⁵³² and to clean up hazardous sites under Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA).³⁵³³, but none of these statutes allow EPA to ignore valid, pivotal scientific studies based solely on the fact that underlying data or models are not publicly available. According to the commenter, if the ORD is forced to exclude consideration of such studies when developing its IRIS chemical reviews, EPA's reliance on these reviews when taking actions under these statutes would be unlawful and arbitrary unless EPA combs through the report and available science to confirm that all valid studies have been considered.³⁵³⁴ Additionally, the commenter notes that the need to undertake such a comprehensive review of ISI before relying upon it would fundamentally undermine the purpose of preparing ISI for general use by EPA's various programs, offices, and regions.

Conversely, commenters (11499, 12454) promote the application of the rule to EPA's IRIS program. Specific comments include:

Commenter (11499) states that the lack of full transparency in the IRIS program's development of toxicity values, as well as the inability to independently reproduce some of those values, continues to present obstacles to ensuring sound scientific decisions. The commenter asserts that applying the principles of the transparency rule to IRIS assessments and allowing the public early access to the data and methods used by the Agency is essential to safeguarding transparency in significant regulatory actions that rely upon IRIS toxicity values. According to the commenter, the EPA should make clear that the final transparency rule applies to data and models underlying pivotal science in IRIS assessments.

Commenter (12454) urges EPA to apply the transparency rule to EPA's IRIS program and clearly states as such when it promulgates the final rule. The commenter provides that EPA acknowledges that IRIS assessments "[a]re the preferred source of toxicity information used by EPA" and are used in "set[ting] national standards and clean[ing] up hazardous sites" even though the IRIS program was not established by statute. Due to this use, the commenter

³⁵²⁸ See, e.g., 82 Fed. Reg. 7432, 7446 (Jan. 19, 2017).

³⁵²⁹ See, e.g., 79 Fed. Reg. 60,238, 60,246 (Oct. 6, 2014).

³⁵³⁰ See, e.g., 79 Fed. Reg. 62,716, 62,735-36 (Oct. 20, 2014).

³⁵³¹ See, e.g., 59 Fed. Reg. 61,432, 61,444-45 (Nov. 30, 1994).

³⁵³² See, e.g., 53 Fed. Reg. 51,962 (Dec. 23, 1988) (§ 2.2.1.1).

³⁵³³ The commenter asserts that this outcome is especially likely if EPA succeeds in promulgating the proposed rule solely under the Housekeeping Statute and deferring any analysis of whether the rule violates the requirements of federal environmental and public health statutes until EPA takes an action specifically under one of these statutes. Unfortunately, the commenter states that by the time EPA is taking action that relies upon ISI like an IRIS report, it would be extremely difficult to remedy the violation, since the entire report would need to be reviewed and likely redone.

³⁵³⁴ See Physicians for Soc. Responsibility, 2020 U.S. App. LEXIS 12727, at *27 ("[I]n failing to grapple with how EPA's policy affected its statutory scientific mandates, the Directive 'failed to consider an important aspect of the problem.' State Farm, 463 U.S. at 42.").

presumes that IRIS assessments and the toxicity values derived in those assessments would be considered “influential scientific information” within the meaning of the proposed 40 C.F.R. Section 30.2, since EPA “reasonably can determine [that IRIS assessments and toxicity values] will have ... a clear and substantial impact on important public policies or private sector decisions.” The commenter states that the lack of full transparency in the IRIS program’s development of toxicity values, as well as the inability to independently reproduce some of those values, continue to present obstacles to ensuring sound scientific decisions and warrant application of the transparency rule.

Response: The EPA is finalizing the applicability of the rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. If implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

Comment: Commenter (11894) notes that despite the ambiguity of the definition of “agency action,” it seems clear that EPA would regard pesticide registration as one of the “agency actions” to which its new rules would not apply. The commenter questions the legality of this.

According to the commenter (11894), first, under FIFRA, an applicant has the burden of showing that a pesticide meets the standard for registration. The commenter asserts that the stakes in that decision are great, since approval of a pesticide is approval for the release into the environment of a chemical specifically designed to kill living things. The commenter provides that EPA never explains how it can justify letting an applicant support licensing of such a chemical by submitting data that the Agency could not rely on for its own regulatory decisions often aimed at much smaller potential hazards. Second, the commenter states that given the scope of the information that must often be reviewed to grant or sustain a registration, it may well be that applicants will rely - directly or indirectly - on studies or models that EPA has already found do not meet the new disclosure requirements, or that would clearly fail to meet them.

The commenter (11894) notes that they are provided no indication of how EPA would react: Would a study that EPA has barred from use in other contexts still qualify to support a pesticide registration? Would any special waiver proceedings be required? Would that affect its acceptability in other contexts?

The commenter (11894) contends that these are important questions of general significance to *all* EPA regulatory decisions that rest in part on studies with broad social impact, some of which may be impacts on regulation, but most of which are not. The commenter maintains that such studies are relevant to EPA decisions far beyond pesticides.

Response: The EPA is finalizing the applicability of the rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. If implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

Comment: Commenter (11491) states that the TSCA §5 requires EPA to review the likelihood that a new chemical will present an unreasonable risk to human health or the environment before it can be marketed. At present, much of the information that EPA reviews rests on CBI or otherwise would not meet the requirements of the proposal. To fill some of these gaps, EPA relies on models that likewise would often not meet those requirements.

Commenter (11894) states that TSCA requires the EPA to review the safety of all chemicals deemed “High Priority” now on the market and to do so by set deadlines. The commenter states that this is a formidable task, as the current number is approximately 45,000. To accomplish this, the commenter provides that the EPA has established a three-stage process designed to review and evaluate all the scientific information relevant to a chemical, and then gradually narrow the number to those that might warrant regulatory action. The commenter notes that comprehensive surveys that EPA is undertaking would inevitably rely in part on studies and models that will not meet EPA’s proposed new requirements. Accordingly, the commenter states that whether, and to what extent, EPA’s proposals would apply to this program is of obvious critical relevance to its successful operation. According to the commenter, that question cannot be answered from the proposal, which does not discuss that impact in any way. In all those cases where the review does not result in formal regulatory action, the new rules would presumably apply unless EPA adopted a very broad definition of “agency action.” The commenter states that such a broad definition would have to be broad enough to cover studies performed for completely non-regulatory purposes - perhaps as part an independent university research program or studies done in other countries - that became part of EPA’s review. Under that approach, the commenter suggests that such a study would be covered by the new rules in some circumstances, but not in others. The commenter asks: Does EPA intend this? Is it even workable?

According to the commenter (11894), if the new rules would apply, EPA has a legal obligation to evaluate the new burdens it would place on the program, the resources that would be available to bear them, and the impact on EPA’s ability to meet the statutory deadlines. To do this, the commenter states that the EPA would have to define exactly how the new requirements would work in practice. The commenter asks: At what point in this multi-stage process of evaluation would the restrictions on the studies and models that can be considered be applied? What would be the specific reason for that application point? How could that application point be defended given the clear desire of Congress for a comprehensive survey of all data relevant to a chemical?

Response: The EPA is finalizing the applicability of the rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. If implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

14.2.6.5 Other Government Data Sharing Policies

Comment: Commenter (11479) notes that the 2018 proposed rule claimed that it “builds upon prior EPA actions in response to government-wide data access and sharing policies,” citing EPA’s 2016 *Plan to Increase Access to Results of EPA-Funded Scientific Research*, the EPA’s Scientific Integrity Policy, the *Open Data Implementation Plan*, the *EPA Open Government Plan 4.0*, and the *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency*. The commenter provides that in EPA’s proposed rule and supplemental notice, no details on how this policy will expand upon those established internal policies, nor justifies why this policy is going through the formal rulemaking process when all these efforts to improve transparency and access to data are already underway. According to the commenter, these existing policies largely govern science and policy procedures within EPA; in contrast, this proposed rule attempts to dictate how science is produced outside the Agency, clearly stepping beyond the provisions of current EPA policies and practices.

Response: This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government.

The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality

guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenter (12720) states that the Agency also fails to provide notice to other agencies within the federal government of new obligations placed on them as a result of the Supplemental Proposal's tiered access regime. The commenter provides that EPA evidently envisions that the CDC will play a major role in implementing the Supplemental Proposal—a role which goes essentially unmentioned in the rulemaking according to its memo to the House Committee on Space, Science, and Technology.³⁵³⁵ According to the commenter, the memo notes that EPA staff were “inconsistent concerning how the data and models would be managed,” and discussed a pilot project the Agency is conducting with the CDC.³⁵³⁶ Further, the commenter provides that the memo notes that EPA “raised the possibility that the data could be stored on multiple outside “secure enclaves,” managed by CDC or another third party, who would also be responsible for reviewing research proposals” and that “this is the first time the Agency has described an implementation scenario that would potentially place such a large responsibility on an outside agency.”³⁵³⁷

Response: This internal procedural rule does not place obligations on any federal government agency besides EPA. The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (12546) provides that the supplemental proposal differs from the 2016 EPA Plan³⁵³⁸ in its ability to be applied to previously generated data while the 2016 EPA Plan only applies to information generated after its implementation. Of the two applications, the commenter contends that the 2016 EPA Plan's limitation to prospective studies is appropriate.

³⁵³⁵ Johnson, Eddie Bernice. 2020. “Letter from Chairwoman Eddie Bernice Johnson to House Committee on Science, Space, and Technology, Summary of Staff-Level Briefings from the Environmental Protection Agency on the ‘Strengthening Transparency in Regulatory Science’ Supplemental Proposed Rule,” May 6, 2020. <https://science.house.gov/chairwoman-johnson-letter-to-science-committee-democratic-caucus-on-epa-transparencyrule> (“House Staff Memo”)

³⁵³⁶ House Staff Memo

³⁵³⁷ House Staff Memo

³⁵³⁸ EPA (2016) Plan to increase access to results of EPA-funded scientific research. Available: <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf>

Response: The EPA Plan to Increase Access to Results of EPA-funded Scientific Research, requires that the Agency make the peer-reviewed journal articles and underlying data resulting from EPA-funded research available to the public.

The final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedure and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

The final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on existing significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data.

14.2.6.6 Inability for Public to Adequately Comment

Comment: Commenter (12720) contends that the “clarifications” provided to House staff by EPA all but guarantee the arbitrary effect of the Proposal.³⁵³⁹ According to the commenter, researchers, scientists, and fellow executive agencies are certainly entitled to receive notice that EPA intends the burden of compliance with the Proposal to fall on them and to incorporate their concerns about that approach into their comments on the rule. The commenter states that EPA’s failure to disclose these elements of the Proposal has foreclosed that possibility. The commenter provides that the fact that details were provided to congressional staff during closed-door briefings, and memorialized in a non-binding House staff memorandum, is certainly insufficient to allow for statutorily-required public comment, and Agency consideration of those public comments.

The commenter (12720) asserts that neither the research community (nor the CDC) can be expected to meaningfully comment on this proposal and its imposition on their research practices without such detail. The commenter states that the fact that this emerging element of the Proposal imposes requirements on third parties—researchers, scientists, as well as the CDC—makes clear that the Proposal is not merely a “a proposed internal rule of agency procedure,” to which the so-called Housekeeping Statute on which EPA relies might apply.

Commenter (12727) provides that by failing comprehensively to describe the scope of its proposal, EPA has denied the public the information it needs to comment in an informed way.

Response: EPA disagrees that the public was deprived of the opportunity to provide meaningful comments. The comment period for the proposal and supplemental totaled 168 days and the EPA received over 993,000 public comments.

³⁵³⁹ *Id.*

The rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. Any incidental impacts on voluntary behavior outside of the EPA do not render this a substantive rule.

14.2.6.7 Implementation Guidance

Comment: Commenter (11358) encourages EPA to follow the advice outlined in the SAB’s April 24, 2020 comments³⁵⁴⁰ to EPA suggesting the Agency develop a guidance document before implementing the final rule. The commenter agrees with the board’s suggestion to include further context for the definitions included within both the proposal and supplemental notice and that it “may be beneficial for EPA to develop a guidance document with case studies based on past risk assessments to clarify some scenarios and how the requirement to make data and models publicly available in a manner sufficient for independent validation would be managed (p. 13).” The commenter also supports the SAB’s recommendation that EPA

consider seeking input from experts in library science, data curation management, and data retention to identify best practices and tools to ensure efficiency and utility of data that are made available (p. 14).

Response: This final rule is effective at publication in the *Federal Register*. The implementation guidelines are forthcoming.

Comment: Commenter (11381) states that Proposed 40 CFR 30.1 in the NPRM “directs EPA to ensure that the regulatory science underlying its actions is publicly available in a manner sufficient for independent validation.”³⁵⁴¹ According to the commenter, the SNPRM is not as clear because it includes only those circumstances “where the Agency is making data or models publicly available”.³⁵⁴²

The commenter (11381) maintains that elsewhere in proposed new Part 30 there is no text that would ensure that this rule, regardless of its final text, is ever implemented. The commenter provides that rules without means of enforcement generally are hortatory or aspirational, not regulatory. The commenter notes that it is possible, of course, that the public could persuade a court to vacate and remand a substantive regulation on the ground that EPA had failed to comply with new Part 30. The commenter states that on the other hand, courts have only once interpreted the Information Quality Guidelines (IQG) as binding³⁵⁴³ even though there typically is an ample administrative record on which a determination of noncompliance with the IQGs could be based.

Comment: Commenter (11894) maintains that as with EPA’s initial proposal, EPA did not provide any analysis explaining how a bar on influential studies would work in the context of

³⁵⁴⁰ Environmental Protection Agency’s Science Advisory Board. Consideration of the Scientific and Technical Basis of EPA’s Proposed Rule Titled Strengthening Transparency in Regulatory Science. (2020, April 24). Retrieved from

³⁵⁴³ *Prime Time v. Vilsack* (2010)

specific EPA programs. The commenter states that EPA does not discuss how its proposal might actually work in practice. The commenter contends that EPA has not examined the extent of any additional resource needs or the impact on statutory deadlines, nor has EPA examined even the most obvious of the conceptual problems that would arise. The commenter provides that for example, if an exempt Agency action relied on a scientific study that, in any other context, would be classified - or perhaps had already been classified - as “influential scientific information,” how would that data be handled? Similarly, the commenter notes that EPA often relies on states to take regulatory actions that would be exempt from coverage if EPA undertook them itself and asks how would the rule treat any guidance that EPA might issue to advise states on how to take these actions?

Response: This final rule is effective at publication in the *Federal Register*. The implementation guidelines are forthcoming.

Under the final rule no studies are categorically excluded from consideration and the EPA will continue to assess the full body of science to evaluate the quality and transparency of available science for final significant regulatory actions and influential scientific information. The EPA will also consider the degree to which pivotal science is available and give greater consideration to those studies with greater data and model availability, as described in this rule.

This final rule does not interpret or apply the provisions of any environmental statutes. If implementing this procedural rule would result in conflicts with existing environmental statutes, the procedural rule will yield to the existing statutes.

Comment: Commenter (12720) quotes the SAB’s 2020 Letter to Administrator Wheeler concerning the proposal and supplemental proposal in its call that “the EPA clarify the definitions of “data and models” and “pivotal regulatory science.” The commenter suggests that it would be useful to develop a guidance document that includes examples of the types of data and models of interest and requirements for reporting this information. The commenter adds that it would also be useful to clarify specific requirements for reporting information from animal toxicity and/or environmental epidemiology studies. In this statement, the commenter asserts that the definition of data fails to clarify what is covered by the supplemental proposal, leading to difficulties ascertaining the rule’s effects.

Response: In the final rule the EPA is removing the term “pivotal regulatory science” and combining the definitions of “pivotal science” and “pivotal regulatory science” under the single term “pivotal science”. *Pivotal science* means the specific dose-response studies or analyses that drive the requirements or quantitative analyses of EPA significant regulatory actions or influential scientific information.

In the final rule, “*Data* means the set of recorded factual material commonly accepted in the scientific community as necessary to validate research findings in which obvious errors, such as keystroke or coding errors, have been removed and that is capable of being analyzed by either the original researcher or an independent party.” The definition of model has been removed from the final rule.

This final rule is effective at publication in the *Federal Register*. The implementation guidelines and statute-specific transparency regulations or programmatic regulations are forthcoming.

Comment: Commenter (10042) urges EPA to codify its approach for how, when and under what circumstances it will use human health data and information in and for rulemaking and setting standards. The commenter adds that EPA should also adopt and develop standard operating procedures (SOPs) for managing human health data and information which will likely have a strong anonymization component that can or will be used to make human health risk assessments.

Response: The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available.

Comment: Commenter (12699) states that the EPA should develop objective criteria to determine when a study should be excluded. The commenter states that these criteria are in effect a means to determine when there are not genuine privacy, confidentiality, and CBI concerns; these criteria should include:

- The authors simply do not want to provide the underlying information.
- The authors have already disclosed the underlying information to third parties.³⁵⁴⁴ This should be prima facie evidence that the information can be made available to the public.
- The EPA has disclosed the underlying information to a third party. This too should be prima facie evidence the information should be made available to the public. If the disclosure was only made because the third party is an agent (e.g. contractor) of the EPA, then the EPA should make comparable arrangements for other third parties to review the underlying information.
- The study authors or the EPA have not exhausted all available commonly used practices to de-identify information (if such de-identification is required).

Response: The final rule is limited to dose-response data and, as no studies are categorically excluded from consideration, the EPA will continue to rely on the full body of the highest quality, most relevant studies available in determining the potential for hazard due to exposure to

³⁵⁴⁴ The commenter notes that there might be some unlikely situation where the disclosure to the third party or third parties was legally authorized but future disclosures are not authorized.

a pollutant, contaminant, or substance. Consistent with the requirements of this rule, the EPA will identify a subset of those studies based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints that would inform a dose-response assessment, and will give greater consideration to pivotal science for which the underlying dose-response data are available.

Section 30.5 of the final rule states, “The EPA will use the following factors to assess the quality of studies identified in the systematic review: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. . . . The Agency will identify the pivotal science that was given lesser consideration and provide a short description of why lesser consideration was given.”

Comment: Commenter (12715) states that, if the EPA adopts this proposal, it should at least make its process for excluding studies transparent; any final rule should require that in any future rulemaking or standard setting, the EPA will clearly identify each study that it rejected based on the present rule and fully explain that the basis for the rejection.

Response: The final rule is limited to dose-response data and, as no studies are categorically excluded from consideration, the EPA will continue to rely on the full body of the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Consistent with the requirements of this rule, the EPA will identify a subset of those studies based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints that would inform a dose-response assessment, and will give greater consideration to pivotal science for which the underlying dose-response data are available.

Comment: Commenter (11473) states that the EPA proposed rule does not account for conflicts of interest (and in particular financial conflicts of interest) by those requesting access to data, opening the possibility for research data that are to be used for regulatory purposes to be accessed by anyone, regardless of their affiliation. The commenter states that, thus, it will not prevent agents of vested interests from obtaining the publicly available data demanded by this proposed rule, and then running their own studies with the intention of discrediting science. The commenter states that there is already empirically based evidence that results of studies conducted by the pharmaceutical and tobacco industry favor those industries; indicating that the commenter anticipates self-serving biased analyses of EPA provided data by vested interest funded analysts under this proposed EPA approach (White and Bero, 2010; Bero, 2017; Lundh et al., 2017). The commenter states that it has been previously documented in an extensive review of a similar proposal (upon which this EPA proposal is based) made by a vested interest (a tobacco company): when such data have been accessed using a similar provision in the state of Georgia, the data were abused in an attempt to discredit the research they did not like, but the original research was later replicated by other researchers (Thurston, 1998) (attached). The commenter states that this new attempt to implement the tobacco company-inspired data release proposal will undoubtedly have similar inappropriate and untoward damage to scientific research if this so-called “Transparency” rule is implemented.

Commenter (12546) states that, considering that EPA as of yet has failed to detail a strategy on monitoring and accounting for financial conflicts of interest, a potential influx of industry-funded studies with such conflicts of interest may bias the final results of EPA's analysis, leading to less stringent regulations and policies—with the ultimate result of reducing protections for the health of families.

Response: The EPA does not agree that its approach will lead to systematic bias towards certain types of stakeholder goals. The final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available.

Chapter 15: Statutory and Executive Order Reviews

The EPA provides documentation of their consideration of several Executive Orders in the development of the proposal in Section IV of the notice of proposed rulemaking (NPRM) preamble and Section VII the supplemental notice of proposed rulemaking (SNPRM). Comments provided on EPA's consideration and/or compliance with Executive Orders are organized as follows:

Section 15.1: NPRM Executive Orders

- Executive Order 12291, Federal Regulation
- Executive Orders 12866, Regulatory Planning and Review, and 13563, Improving Regulation and Regulatory Review
- Executive Order 12898 - Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations
- Executive Order 13045 – Protection of Children
- Executive Order 13132, Federalism
- Executive Order 13175 Consultation and Coordination with Indian Tribal Government
- Executive Order 13556, Controlled Unclassified Information
- Executive Order 13771, Reducing Regulation and Controlling Regulatory Costs
- Executive Order 13777, Enforcing the Regulatory Reform Agenda
- Executive Order 13783, Promoting Energy Independence and Economic Growth

Section 15.2: SNPRM Statutory and Executive Order Requirements

- Executive Orders
- Paperwork Reduction Act
- Additional Related Comments

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

15.1 NPRM Executive Orders

15.1.1 Executive Order 12291: Federal Regulation

Comment: Commenters (6924, 8281-PH20) assert that EPA does not present any analysis of cost-benefit in support of the rule which is required under Executive Order 12291. Commenter

(6924) states that Executive Order 12291 requires Agencies to complete a benefit-cost analysis for any major rule which has an annual impact of \$100 million or more.³⁵⁴⁵

Response: Executive Order 12291 was revoked in 1993 by President Bill Clinton (D), who issued a modified regulatory review program under Executive Order 12866.

15.1.2 Executive Orders 12866: Regulatory Planning and Review, and 13563: Improving Regulation and Regulatory Review

15.1.2.1 Executive Order 12866: Regulatory Planning and Review

15.1.2.1.1 Costs and Benefits

Comment: Commenters (2171, 5181, 6133, 6137, 6168, 6188, 6916, 6919, 9227, 11408) assert that EPA has failed to meet Executive Order 12886 requirements to analyze and provide an assessment of the proposed rule's costs and benefits. Commenters (6916, 9227) state that Executive Order 12866 requires agencies to assess the costs and benefits of proposed regulations and propose or adopt a regulation only upon a reasoned determination that the benefits justify the costs.³⁵⁴⁶

Response: This is a rule of internal procedure promulgated under the EPA's housekeeping authority and imposes no enforceable duty on any state, local, or tribal governments or the private sector. Additionally, this rule does not require the EPA or other parties to disclose or host data. Hence, this rule does not impose costs on the EPA or any other party to make such data available. As described in Section III.J of the final rule preamble, the EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small.

15.1.2.1.2 Need for New Regulation

Comment: Commenter (9227) states that EPA's failure to identify a problem or inadequacy that new regulations are needed to address is contrary to Executive Order 12866. The commenter states that, before proceeding with this proposal, EPA should clearly identify the problem it is trying to solve, provide evidence that there is a problem and allow for public comment on whether a problem exists that could be addressed through EPA regulation. The commenter states that Executive Order 12866 provides that "[f]ederal agencies should promulgate only such regulations as are required by law, are necessary to interpret the law, or are made necessary by compelling public need, such as material failures of private markets to protect or improve the health and safety of the public, the environment, or the well-being of the American people." The commenter states that Executive Order 12866 directs each agency to "identify the problem that it intends to address (including, where applicable, the failures of private markets or public institutions that warrant new agency action) as well as assess the significance of that problem."

³⁵⁴⁵ Executive Order 12291. 46 FR 13193, 3 CFR, 1981.

³⁵⁴⁶ EO 12866 § 1(b)(6)-(7) (Oct. 4, 1993)

Response: This is an internal housekeeping rule that does not impose an enforceable duty on any state, local, or tribal governments or the private sector. The purpose of the rule is detailed in the preamble of the final rule. In brief, the transparency provisions in this final rule are intended to build upon existing efforts and provide incremental progress toward the Agency's overarching goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals and the emergence of several international organizations and initiatives focused on increased transparency and data sharing in science. The EPA supports these efforts and believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. The incremental progress made by this rule provides an important step towards prioritizing transparency in particularly impactful rules and assessments and will inform future statute-specific rulemakings.

15.1.2.1.3 Regulatory Impact Analysis

Comment: Commenters (0568, 2171, 6446, 6916, 6919) express concern that EPA failed to prepare a Regulatory Impact Analysis (RIA), which is necessary to determine the impacts of the proposal. Commenters (2171, 6919) state that this action is correctly identified as a "significant regulatory action" under Executive Orders 12866 and 13563 which then requires an RIA.

Response: This is a rule of internal procedure promulgated under the EPA's housekeeping authority and imposes no enforceable duty on any state, local, or tribal governments or the private sector. Additionally, this rule does not require the EPA or other parties to disclose or host data. Hence, this rule does not impose costs on the EPA or any other party to make such data available. As described in preamble discussion of costs and benefits, the EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small.

15.1.2.2 Executive Order 13563: Improving Regulation and Regulatory Review

Comment: Commenters (6133, 6188, 9227) state the EPA did not provide cost-benefits analysis for the proposal, which violates Executive Order 13563. Commenter (9227) states that Executive Order 13563 reaffirms the principles and requirements of Executive Order 12866, explaining that agencies "must take into account benefits and costs, both quantitative and qualitative."³⁵⁴⁷

Response: This is a rule of internal procedure promulgated under the EPA's housekeeping authority and imposes no enforceable duty on any state, local, or tribal governments or the private sector. Additionally, this rule does not require the EPA or other parties to disclose or host data. Hence, this rule does not impose costs on the EPA or any other party to make such data

³⁵⁴⁷ Executive Order 13563 § 1(a) (Jan. 18, 2011).

available. As described in preamble discussion of costs and benefits, the EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small.

Public input was also an important part of shaping the final rulemaking. The EPA accepted public comment on the proposed rule from April 30, 2018 to August 16, 2018, and held a public hearing on July 17, 2018. In response to public comments, the EPA released a supplemental notice of proposed rulemaking and took public comment from March 18, 2020 to May 18, 2020. In addition, the EPA's SAB provided advice and comments on mechanisms for secure access to personally identifying information (PII) and confidential business information (CBI) under the proposed rule on September 30, 2020, and the proposed and supplemental rulemakings on April 24, 2020. All of these comments were considered in developing the final rule.

Comment: Commenters (6125, 6133, 6137, 9227) assert that, while EPA states in the preamble that “[t]he best available science must serve as the foundation of EPA’s regulatory actions,” under Executive Order 13563, the proposed rule actually hinders EPA’s use of the best available science.

Commenter (6125) states that, while Executive Order 13563 states that EPA shall base its regulations on the best available science, EPA’s proposal would make this impossible by making wide areas of such science unavailable to regulatory decision makers.

Commenter (6133) asserts that, while the proposal cites and quotes from Executive Order 13563,³⁵⁴⁸ the Executive Order not only does not support the proposal, it directly undermines the proposal. The commenter states that there is no suggestion in the cited Executive Order that “best available science” means or meant that science underlying an agency’s actions must be publicly available in a manner sufficient for independent validation, nor that “pivotal regulatory science” has any meaning akin to the proposed uses in proposed 40 CFR 30.3. The commenter states that, to the contrary, no previous administration has conditioned any notion of “best available science” on the public availability of underlying data, or on the concepts behind the invented term, “pivotal regulatory science.” The commenter states that EPA previously routinely used and considered science and studies for which the underlying data was not publicly available as examples of the “best available science.” The commenter states that EPA did so for proposed and final regulations, along with other final agency actions, reports, studies and the like. EPA’s use and consideration of such science was validated by EPA’s science advisory bodies, the National Academy of Sciences (NAS), the SAB, and other scientific organizations. The commenter states that the proposal does not provide sufficient explanation for its departure from this past practice.

Commenter (6137) states that the proposal has the purpose and effect of precluding the use of some of the best available science, that is, all science based on non-public data, simply because the underlying data is not publicly available. The commenter states that best available science means “all existing scientific evidence relevant to the decision,” and agencies simply “cannot ignore existing data.”³⁵⁴⁹ The commenter states that, however, the proposed rule requires EPA to

³⁵⁴⁸ 83 FR 18769 n.1

³⁵⁴⁹ *Ecology Ctr., Inc. v. U.S. Forest Serv.*, 451 F.3d 1183, 1194 n.4 (10th Cir. 2006) (quoting *Heartwood Inc. v. U.S. Forest Serv.*, 380 F.3d 428, 436 (8th Cir. 2004))

ignore existing data if it is not available for public release. The commenter concludes that the proposed rule is inconsistent with Executive Order 13563, as well as those statutes or principles that require EPA to consider the best available science.

Commenter (6137) asserts that an Executive Order cannot override a statute, limit the delegated authority and the legal responsibilities provided to the EPA Administrator by federal law, add factors that are impermissible under the statute, or delay statutorily required agency action.³⁵⁵⁰

The commenter states that weakening or delaying public health protections based on an executive order would be unconstitutional, violating separation of powers and the requirement to follow duly enacted laws passed by Congress and signed by the President. The commenter states that it would likewise be unlawful, contrary to the public health obligations and rulemaking requirements of EPA's governing statutes. The commenter states that EPA cannot consider or apply any other executive order in any way in this rulemaking without providing the requisite public notice and opportunity for comment that the Clean Air Act (CAA) and Administrative Procedure Act (APA) or proposal for why EPA believes this policy would further the goal of best available science. The commenter states that the Executive Order only states that agencies should make available to the public the scientific or technological findings or conclusions on which rules rely, as opposed to underlying raw data that EPA has targeted with this proposal.

Response: As further detailed in the preamble of the final rule, the transparency provisions in this final rule are intended to build upon existing efforts and provide incremental progress toward the Agency's overarching goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals and the emergence of several international organizations and initiatives focused on increased transparency and data sharing in science. The EPA supports these efforts and believes that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. The incremental progress made by this rule provides an important step towards prioritizing transparency in particularly impactful rules and assessments and will inform future statute-specific rulemakings.

This rulemaking is not intended to modify the Agency's interpretations of "best available science." The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. The EPA will then identify and consider pivotal science in accordance with the provisions of this rule, unless the implementation of the rule conflicts with statutory requirements and associated implementing regulations. As this rule makes clear, if implementing this procedural rule would result in conflicts with existing environmental statutes, the procedural rule will yield to the existing statutes.

³⁵⁵⁰ See, e.g., In re: *United Mine Workers of Am. Int'l Union*, 190 F.3d 545, 551 (D.C. Cir. 1999)

The final rule requires EPA to follow best practices to evaluate potential links between exposure to a pollutant, contaminant, or substance and the effect and the nature of the dose-response relationship. EPA will continue to use the following, well-established factors when assessing study quality: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. As further detailed in the preamble to the final rule, only when characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, will the EPA identify pivotal science and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation. Title 40 CFR 30.5 also provides additional considerations for instances when underlying dose-response data are not available for independent validation. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

15.1.3 Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations

Comment: Commenters (2171, 2337, 5178, 6122, 6133, 6137, 6144, 6166, 6188, 6194, 6373, 6874, 6915, 6916, 6920, 6924, 6939, 8272, 8281-PH20) assert that the proposed rule is subject to Executive Order 12898 and needs an environmental justice analysis. Commenter (6920) urges the EPA to consider the environmental justice implications of the rule and examine ways to further protect vulnerable people and disadvantaged communities, in accordance with Executive Order 12898.

Commenters (2171, 2337, 6133, 6137, 6144, 6188, 6194, 6373, 6915) do not agree with the proposal's statement that it does not need to address Executive Order 12898 because "it does not establish an environmental health or safety standard."

Commenters (2337, 6133, 6137, 6373, 6915) assert that Executive Order 12898 by its terms applies to Agency policies and Agency conduct of programs as well as to Agency adoption of regulatory standards. Commenter (2337) states that EPA's determination that the proposed rule is not subject to Executive Order 12898 because "it does not establish an environmental health or safety standard" too narrowly construes the scope of the Executive Order and the potentially broad impact of its proposed rule.

Commenters (2171, 6133) state the implementation of this rule would indirectly impact the rules and guidelines that are set to protect children, people of color, the elderly, low-income, and other underserved populations. Commenter (6133) asserts that, as the proposed rule concerns the scientific evidence EPA will consider in its regulatory decision making, including epidemiological and clinic research on the health impacts of pollutants, it has the potential to directly implicate the concerns addressed by Executive Order 12898.

Commenter (6137) asserts that EPA's claim that this proposed rule does not require an environmental justice assessment is clearly at odds with what the Agency itself recognizes it must do to comply both with Executive Order 12898, as well as its own policies. The commenter states that EPA has regularly and purposefully focused on the need for environmental justice assessments of its rulemakings. The commenter states that EPA consistently performs this sort of assessment when acting under the CAA, Clean Water Act (CWA), and other statutes.³⁵⁵¹ The commenter states that this information unquestionably has been relevant to public health rulemakings in the past. The commenter states that EPA's refusal to consider the environmental justice consequences of the proposed rule – consequences that are certainly “relevant” under *State Farm* – and its departure from its long-standing pattern and practice of considering such data without a reasoned explanation for changing course are therefore arbitrary and capricious.

Response: This action is not subject to Executive Order 12898 because it does not establish an environmental health or safety standard. This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. In addition, the EPA does not agree that its approach will lead to systematic bias towards certain types of stakeholder goals of any party. As described in the preamble, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

Comment: Commenter (6122) states that the proposal directly violates Executive Order 12898, which directs every federal agency to “...collect, maintain, and analyze information assessing and comparing environmental and human health risks borne by populations identified by race, national origin, or income. To the extent practical and appropriate, Federal agencies shall use this information to determine whether their programs, policies, and activities have disproportionately high and adverse human health or environmental effects on minority populations and low-income populations.”³⁵⁵² The commenter states that, in 2011, the EPA also signed and Memorandum of Understanding to implement the environmental justice goals of Executive Order 12898.³⁵⁵³ The commenter states that EPA must ensure that high quality data analyze environmental justice impacts in order to protect vulnerable populations. The commenter states that requiring public availability of raw data is not a rational metric for deciding whether a study is of high enough quality to be used for setting thresholds or enacting regulatory protections.

³⁵⁵¹ See, e.g., 78 Fed. Reg. 3086, 3267 (2013) (describing the goal of Executive Order 12898 and EPA's actions to comply with these goals, noting that it “conducted an outreach and information call with environmental justice organizations” and “identified potential disproportionately high and adverse effects on minority and/or low-income populations related to PM_{2.5} exposures,” and “identified persons from lower socioeconomic strata as an at-risk population for PM-related health effects,” and noting that “the EPA has carefully evaluated the potential impacts on low-income and minority populations. . . .”); see also EC/R Inc., Risk and Technology Review - Final Analysis of Socio-Economic Factors for Populations Living Near Secondary Lead Smelting Facilities, prepared by EC/R Inc. for EPA (Dec. 2011); EC/R Inc., Risk and Technology Review - Analysis of Socio-Economic Factors for Populations Living Near Petroleum Refineries, prepared by EC/R Inc. for EPA (Jan. 2014).

³⁵⁵² Executive Order 12898, § 3-302 (Feb. 11, 1994). “Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations.”

³⁵⁵³ Memorandum of Understanding on Environmental Justice and Executive Order 12898. 2011. Available here: <https://www.epa.gov/sites/production/files/2015-02/documents/ej-mou-2011-08.pdf>.

Commenter (6373) asserts that that Executive Order 12898 specifically addresses federal human health and environmental research and analysis, requiring federal agencies to ensure that epidemiological and clinical research activities represent “segments at high risk from environmental hazards, such as minority populations, low-income populations and workers who may be exposed to substantial environmental hazards.” The commenter states that Executive Order 12898 explicitly contemplates that agencies will use epidemiological data collected from at-risk communities, which necessarily relies on private information of members from those communities, to promulgate regulations to protect those at risk.

Commenter (6194) states that EPA has not addressed how the proposal would affect the agency’s fulfillment of the human health and environmental data collection and analysis obligations imposed by Executive Order 12898 (§ 3-302).

Commenter (6133) expresses concern that the proposal makes no mention of the EPA Guidance on Considering Environmental Justice During the Development of Regulatory Actions.³⁵⁵⁴ The commenter states that the proposal directly conflicts with many of the Guidance document’s provisions. The commenter states that to achieve Executive Order 12898’s goals, the Guidance directs rule-writers and decision-makers to respond to three core Environmental Justice questions throughout the process:

1. How did the public participation process provide transparency and meaningful participation for minority populations, low-income populations, tribes, and indigenous peoples?
2. How did the rule-writers identify and address existing and/or new disproportionate environmental and public health impacts on minority populations, low-income populations, and/or indigenous peoples?
3. How did actions taken under #1 and #2 impact the outcome or final decision?

Commenter (6137) asserts that the proposal violates the environmental justice requirements of Executive Order 12898 because it ignores EPA’s own environmental justice plan – promulgated pursuant to Executive Order 12898 – the ultimate vision of which is for EPA to “integrate[] environmental justice into everything” it does.³⁵⁵⁵ The commenter states that to accomplish this vision, EPA sets forth eight different priority areas, the first of which is rulemaking. The commenter states that EPA aims to “institutionalize environmental justice in rulemaking,” including performance of “rigorous assessments of environmental justice analyses in rules,” in order to “deepen environmental justice practice within EPA programs to improve the health and environment of overburdened communities.” The commenter states that, recognizing that “[r]ulemaking is an important function used by the EPA to protect human health and the environment for all communities,” EPA devotes the second chapter of the plan to “Rulemaking,” and through this chapter, aims to “ensure environmental justice is appropriately analyzed, considered, and addressed in EPA rules with potential environmental justice concerns, to the extent practicable and supported by relevant information and law.” The commenter states that

³⁵⁵⁴ Guidance on Considering Environmental Justice During the Development of Regulatory Actions, May 2015, at ii, <https://www.epa.gov/environmentaljustice/guidance-considering-environmental-justice-during-development-action>

³⁵⁵⁵ EJ2020 Action Agenda at iii

consistent with its environmental justice plan and with Executive Order 12898, EPA issued its own Guidance on Considering Environmental Justice During the Development of Regulatory Actions, recognizing how “vital” it is “that Agency rule-writers identify and address potentially disproportionate environmental and public health impacts experienced by minority populations, low-income populations, and/or indigenous peoples,”³⁵⁵⁶

Response: This action is not subject to Executive Order 12898 because it does not establish an environmental health or safety standard. This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government.

Public input was also an important part of shaping the final rulemaking. The EPA accepted public comment on the proposed rule from April 30, 2018 to August 16, 2018, and held a public hearing on July 17, 2018. In response to public comments, the EPA released a supplemental notice of proposed rulemaking and took public comment from March 18, 2020 to May 18, 2020. In addition, the EPA’s SAB provided advice and comments on mechanisms for secure access to PII and CBI under the proposed rule on September 30, 2020, and the proposed and supplemental rulemakings on April 24, 2020. All of these comments were considered in developing the final rule.

Comment: Commenter (5178) states that reproductive justice is the human right to maintain personal bodily autonomy, have children, not have children, and parent children in safe and sustainable communities. The commenter states that we cannot fully achieve reproductive justice when environmental exposures make it harder for parents to give birth to healthy children and raise them in safe homes. The commenter states that, in order for women and families to thrive, they must be able to choose to parent without fear of pollution and contamination interfering with their health and well-being. The commenter states that a reproductive justice perspective also recognizes the inequitable environmental burdens placed on communities composed of people of color and those with fewer economic advantages, and that these burdens will continue accumulating over generations if not corrected. The commenter states that EPA has oversight over numerous exposures that pose particular dangers during pregnancy and infancy, including neurotoxins and endocrine disruptors.

Response: This action is not subject to Executive Order 12898 because it does not establish an environmental health or safety standard. This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government.

Public input was also an important part of shaping the final rulemaking. The EPA accepted public comment on the proposed rule from April 30, 2018 to August 16, 2018 and held a public hearing on July 17, 2018. In response to public comments, the EPA released a supplemental notice of proposed rulemaking and took public comment from March 18, 2020 to May 18, 2020.

³⁵⁵⁶ Guidance at 1 (May 2015), <https://www.epa.gov/sites/production/files/2015-06/documents/considering-ej-in-rulemaking-guide-final.pdf>, as well as a Technical Guidance for Assessing Environmental Justice in Regulatory Analysis. Technical Guidance (June 2016), https://www.epa.gov/sites/production/files/2016-06/documents/ejtg_5_6_16_v5.1.pdf.

In addition, the EPA's SAB provided advice and comments on mechanisms for secure access to PII and CBI under the proposed rule on September 30, 2020, and the proposed and supplemental rulemakings on April 24, 2020. All of these comments were considered in developing the final rule.

Comment: Commenter (5178) states that, in the absence of substantial new resources, efforts to replicate studies and prepare data for public release would reduce the resources available for new research and delay the regulatory process. The commenter states that the consequences of this proposal would fall most severely on groups not adequately protected by current rules, which include racial and ethnic minorities, those with low socioeconomic status, the elderly, and pregnant individuals and their eventual children. The commenter states that the theoretical – but as yet undemonstrated – benefits of EPA's proposal must be weighed against the extensive and unequally distributed costs of such an approach.

Commenter (6373) asserts that, if EPA disregards findings from certain studies because of the proposed rule, and as a result adopts less protective national ambient air quality standards (NAAQS) for any of the criteria pollutants, then EPA will have violated Executive Order 12898.³⁵⁵⁷

- EPA's failure to use data collected from at-risk communities in the promulgation of NAAQS itself would be a violation of Executive Order 12898.
- Certain populations (often low-income, minority groups) are frequently subject to higher exposure to regulated chemicals, and should regulations be weakened because they are not grounded in the best science available, the exposures those communities face may increase and disproportionately burden these communities, which would result in additional adverse health consequences.
- Even when exposed to the same levels of a pollutant, communities with a higher level of disease prevalence (*e.g.*, asthma) may suffer a higher burden if that disease is exacerbated by pollution. Therefore, EPA would fail its mandate to address the disproportionately high human health impact of air pollution.

Commenters (6133, 6137, 6188, 6373) express concern that the proposal does not address public participation of minority and low-income populations, as required under Executive Order 12898.

Commenter (6373) states that Executive Order 12898 requires that "[f]ederal agencies shall provide minority populations and low-income populations the opportunity to comment on the development and design of research strategies undertaken pursuant to this order." The commenter states that, despite the clear applicability of Executive Order 12898 to this action, there is no evidence in the record that EPA solicited input from the environmental justice community when promulgating the rule.

³⁵⁵⁷ Throughout this comment letter, the City provides concrete examples of the effect that the Rule may have on research related to air pollution and efforts to regulate air pollution pursuant to the CAA. However, the concerns expressed in this comment letter are all equally applicable to research related to other pollutants and toxic and hazardous substances and wastes that are regulated under other statutes administered by EPA. These statutes include, but are not limited to, FIFRA, TSCA, CWA, SDWA, RCRA, CERCLA, and the Food Quality Protection Act.

Commenter (6133) asserts that, because minority and low-income populations have historically been underrepresented in agency decision making, Executive Order 12898 aims to improve public participation of these populations in the decision-making process. The commenter states that, with the single English language hearing EPA held in Washington DC, EPA has not provided for meaningful participation of minority populations, low-income populations, tribes, and indigenous peoples.

Commenter (6137) asserts that, when promulgating rules “that substantially affect human health or the environment” – which this proposed rule does – EPA must “provide minority populations and low-income populations the opportunity to comment on the development and design of research strategies undertaken pursuant to this order.”³⁵⁵⁸ Commenter (6188) states that minority populations and low-income populations are guaranteed an opportunity to comment on the development and design of research strategies undertaken per the Order’s direction.

Response: This is a rule of internal procedure promulgated under the EPA’s housekeeping authorities, and imposes no enforceable duty on any state, local or tribal governments or the private sector. In addition, the EPA does not agree that its approach will lead to systematic bias towards certain types of stakeholder goals of minority and low-income populations. As described in the preamble, the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

Public input was also an important part of shaping the final rulemaking. The EPA accepted public comment on the proposed rule from April 30, 2018 to August 16, 2018, and held a public hearing on July 17, 2018. In response to public comments, the EPA released a supplemental notice of proposed rulemaking and took public comment from March 18, 2020 to May 18, 2020. In addition, the EPA’s SAB provided advice and comments on mechanisms for secure access to PII and CBI under the proposed rule on September 30, 2020, and the proposed and supplemental rulemakings on April 24, 2020. All of these comments were considered in developing the final rule.

15.1.4 Executive Order 13045: Protection of Children

Comment: Commenters (2171, 5178, 6130, 6133, 6188, 6373, 6915, 6916, 6920, 8281-PH20) assert that the proposed rule is subject to Executive Order 13045 and requires analysis of environmental health risks and safety risks that may disproportionately affect children. Commenters (6133, 6188, 6194) assert that Executive Order 13045 requires that federal agencies “shall make it a high priority to identify and assess environmental health risks and safety risks that may disproportionately affect children....” Commenters (6133, 6373, 6915) assert that Executive Order 13045 requires that every agency shall ensure that its policies, programs, activities, and standards address disproportionate risks to children that result from environmental health risks or safety risks.

³⁵⁵⁸ Id. at 7631.

Commenters (6133, 6188, 6194) assert that, in the case of a “significant regulatory action” such as the proposed rule, the promulgating agency must provide an evaluation of health or safety effects of the planned regulation on children.

Commenters (6133, 6188, 6194) assert that Executive Order 13045 requires an explanation of why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the agency (Executive Order 13054, § 5-501). Commenter (6188) states that EPA has not provided any such analysis of the proposed rule.

Commenter (6373) states that the proposed rule is in direct contravention of Executive Order 13045—complying with the rule will prevent EPA from effectively “ensure[ing] that its policies, programs, activities, and standards address disproportionate risks to children that result from environmental health risks or safety risks.” The commenter states that when EPA regulates a substance pursuant to any one of its governing statutes or sets a standard for remedial work on property that presents a risk of exposure to children, Executive Order 13045 requires EPA to identify and assess health risks to children and ensure that its standards and actions protect children. The commenter states that, to do this effectively, EPA must consider scientific studies that include private information about children, however, should the proposal be finalized, EPA would have the discretion to discount scientific studies of exposure risks to children that rely on personal data or confidential information, contrary to Executive Order 13045’s mandate. The commenter states that EPA cannot regulate in a matter compliant with both Executive Order 13045 and the proposed rule.

Response: The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of “covered regulatory action” in section 2-202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk.

Comment: Commenters (2171, 6130, 6133, 6194, 6373, 6920) do not agree with the proposal’s statement that it does not need to address Executive Order 13045 because “this action does not concern an environmental health risk or safety risk” (83 FR 18773).

Commenters (6130, 6133, 6920) assert that the claim that this action “is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk” to children is not supported by scientific evidence. Commenters (6130, 6920) state that there is a substantial body of research showing children are more sensitive than adults to environmental pollution. Commenter (6373) states that EPA’s determination that the proposed rule is not subject to Executive Order 13045 because it is not a regulatory action that “concern[s] environmental health or safety risks that the EPA has reason to believe may disproportionately affect children” is arbitrary and is a tragic relinquishment of EPA’s obligation to protect our children.

Commenter (6133) states that, while EPA asserts that the proposal is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk, EPA does not explain how it reached this conclusion. The commenter states that EPA also does not characterize children’s risk to the extent data are available. The commenter states that the

proposal applies to “Pivotal regulatory science” and the proposal defines regulatory science as “scientific information, including assessments, models, criteria documents, and regulatory impact analyses, that provide the basis for EPA final significant regulatory decisions.” The commenter states that the proposal explains that “‘Pivotal regulatory science’ is the studies, models, and analyses that drive the magnitude of the benefit-cost calculation, the level of a standard, or point-of-departure from which a reference value is calculated; in other words, they are critical to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, risks and other impacts on which a final regulation is based.” The commenter states that, by its terms, the proposal will impact (and therefore concern) all environmental health and safety risks, including many that EPA knows disproportionately affect children.

Commenter (6194) states that the proposal would affect risk assessment analyses across a variety of environmental statutes. The commenter notes that studies that in the past informed regulations that address public health risks with disproportionate effects on young children, such as asthma from exposure to particulate matter and neurological damage from exposure to lead, could be precluded from consideration today by the proposal. The commenter states that the proposal is “intended to apply prospectively to final regulations that are determined to be ‘significant regulatory actions’ pursuant to Executive Order 12866.” The commenter states that, therefore, the proposal itself should be construed as an action subject to the review requirements of Executive Order 13045. The commenter states that this would not present a double-bite at the apple in terms of review under Executive Order 13045; rather it presents the only meaningful opportunity to consider the impact of the proposal on the protection of children. The commenter states that, once the proposal is adopted, it would preclude the use of certain science, so any analysis of feasible alternatives under Executive Order 13045 would already be limited in a way that precludes consideration of the impacts of the proposal.

Response: The EPA maintains that this action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers.

Comment: Commenter (6133) states that EPA created a Guide to help Agency staff involved in developing actions determine whether Executive Order 13045 applies to an Agency action and, if so, how to implement the Executive Order.³⁵⁵⁹ The commenter states that the Guide includes “a set of questions EPA staff involved in action development can ask risk assessors to ensure that the various types of information relevant to the assessment of risks to children are considered and may be useful in addressing the issue of disproportionate risks.” The commenter states that the Guide explains: “[i]f a rulemaking is not covered by Executive Order 13045, but it discusses environmental health or safety, it is advisable to characterize children’s risk to the extent the data are available.”

³⁵⁵⁹ Guide to Considering Children’s Health When Developing EPA Actions, at 1 Oct. 2006, <https://www.epa.gov/children/guide-considering-childrens-health-when-developing-epa-actions-implementing-executive-order>.

Response: The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of “covered regulatory action” in section 2-202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk. In addition, the EPA’s approach will not lead to systematic bias towards certain types of stakeholder goals of any party. As described in the preamble, the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions and finalizing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

15.1.5 Executive Order 13132: Federalism

Comment: Commenter (6915) does not agree with the statement in the proposal that this rule would not affect any states, and therefore has no federalism implications. The commenter states that the adoption of this proposed rule would very likely affect the protectiveness of the standards that EPA sets, which would significantly impact federal and state efforts to protect the quality of our air, water, and land, and the health and welfare of the American people. The commenter notes that some states’ environmental laws and regulations explicitly adopt EPA standards in all or some instances, or at the very least require an express justification for any deviation. The commenter states that, therefore, it is clear a fundamental change in how EPA develops standards would most certainly affect state standards, and therefore would affect the health of our residents and our natural resources.

Commenter (6915) states that the proposal fails to explain whether or how the proposed rule would apply to EPA’s review and approval of state standards, and, accordingly, deprives commenters of a full and fair opportunity to assess and comment on the proposal’s federalism implications.

Response: This action does not have federalism implications as it imposes no enforceable duty on any state, or local governments. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

15.1.6 Executive Order 13175: Consultation and Coordination with Indian Tribal Government

Comment: Commenters (0565, 6123, 6130, 6920) disagree with the statement in the proposal that this action does not have tribal implications as specified in Executive Order 13175 and does not require consultation with tribes. Commenters (0565, 6130, 6920) assert that this conclusion is not adequately supported and urge additional analysis of the probable impacts of the proposed rule on Tribal Nations.

Commenter (0565) points out that EPA’s own Policy on Consultation and Coordination with Indian Tribes (May 4, 2011), adopted to implement its responsibilities under Executive Order 13175, begins with the following sentence: “EPA’s policy is to consult on a government-to-

government basis with federally recognized tribal governments when EPA actions and decisions may affect tribal interests.” The commenter states that this is based on the 1984 EPA Policy for the Administration of Environmental Programs on Indian Reservations, reaffirmed by Administrator Pruitt last year, by which EPA, in keeping with its federal trust responsibility, commits in Principle 5 to “assure that tribal concerns and interests are considered whenever EPA’s actions and/or decisions may affect reservation environments.”

Commenter (0565) asserts that there is no question that the nature and scope of scientific studies and underlying data that form the basis of EPA’s regulations have a bearing on the level of human health and environmental protections afforded by those regulations. The commenter states that tribal communities suffer the same affects as other communities from pollution of the nation’s air, land and water; but are also disparately impacted in a variety of ways, reflected by the significantly higher instances of environmentally-based diseases that tribal communities experience compared with non-Indian populations. The commenter states that this disparity results from factors such as socio-economic conditions, lack of adequate infrastructure, and our fundamental relationship with the natural environment and reliance on a variety of plants, wildlife and habitats for subsistence and cultural practices. The commenter states that, in these circumstances, it is critically important to Tribal Governments to ensure in particular that data regarding the disparate impacts to Tribal community health from various pollution sources regulated by EPA, as well as Traditional Ecological Knowledge that can inform regulatory approaches, can continue to be taken into account in crafting and maintaining appropriate human health and environmental protections. The commenter states that, for these reasons, the proposed rule certainly has the potential to impact Tribal interests and must therefore be the subject of a meaningful consultation process.

Commenter (6125) states that, because few federally recognized Indian tribes operate their own regulatory programs, federal requirements and standards apply to most Indian lands. The commenter asks the following questions

- Has EPA considered whether it would be consistent with the federal trust responsibility to tribes to relax requirements or standards, and thus reduce protection for tribal lands solely because of a new regulation based on ignoring reliable and relevant science?
- Has EPA considered whether such a reduction in protection on tribal lands is consistent with principles of environmental justice?
- As this rule is implemented in regard to states and tribes, who may comment or have consultation roles in developing major regulations?
- Would states or tribes have any recourse if levels of protection are reduced under this new regulation that ignores evidence or could they keep the old standards?

Response: This action imposes no enforceable duty on any state, local or tribal governments or the private Sector. Therefore, this action does not have tribal implications as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to this action.

15.1.7 Executive Order 13556: Controlled Unclassified Information

Comment: Commenter (4591) asserts that, in some instances, this proposed rule will directly conflict with Executive Order 13556 and the accompanying National Archives and Records Administration implementing directive, which place limitations on the release of specific non-classified information involving privacy, security, proprietary business interests, and law enforcement investigations. The commenter questions whether controlled unclassified information (CUI) categories limiting the release of information relating to health, genetic information, proprietary business information, pesticide producers and railroad safety analysis records might prevent valid scientific studies based upon these CUI categories from being released and as a result, prevent the best possible scientific evidence from being used to develop regulations aimed at protecting public health and safety.

Response: This rule does not require the EPA or other parties to disclose or host data. In addition, the EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. As discussed more fully in the preamble of the final rule, the rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making.

15.1.8 Executive Order 13771: Reducing Regulation and Controlling Regulatory Costs

Comment: Commenter (6915) does not agree with the proposal's assertion that it does not amount to an Executive Order 13771 regulatory action. The commenter states that, rather than acknowledging costs, the only place where the proposed rule even mentions costs is in section 30.8, which states that "EPA shall implement the provisions of this subpart in a manner that minimizes costs"—a misleading and fatally vague projection of the impacts of the proposed rule.

Response: This final rule does not regulate any entity outside the EPA. Rather, the requirements modify the EPA's internal procedures regarding the transparency of pivotal science underlying final significant regulatory actions and influential scientific information. In addition, because this rule would not change the process by which the EPA already evaluates studies for scientific merit, the incremental costs of the rule would be for EPA to determine data availability for the limited subset identified as pivotal science. This is a small increment in effort relative to the Agency's extensive existing scientific review process. As described in preamble discussion of costs and benefits, the EPA finds that the incremental costs of this rule related to the additional review of data availability are anticipated to be small.

15.1.9 Executive Order 13777: Enforcing the Regulatory Reform Agenda

Comment: Commenter (6362) supports EPA’s demonstrated commitment in this proposal to build upon the principles underlying Executive Order 13777. Commenter (6927) agrees with the statement in the proposed rule that the proposal is consistent with Executive Order 13777.

Response: The EPA appreciates this comment.

Comment: Commenter (6103) notes the proposal relies on Executive Order 13777, which provides that regulation reform efforts shall attempt to identify regulations that rely on non-publicly available data or are not transparent enough to meet the standards of reproducibility. The commenter states that this Executive Order does not justify the rule; it merely identifies the studies this proposal will target once enacted. The commenter states that the intent of this proposal is not to make data more publicly available but to exclude studies from the rule-making process to pave the way for deregulation. The commenter states that it would be a breach of confidentiality and personal security to release the private health data of research participants and entirely unethical to repeat studies that have shown harm to humans.

Commenter (1791) asserts that, as the EPA cites Executive Order 13777 in support of this proposed rule, so too does that order guarantee the preservation of air-quality measures surrounding soot and other chemicals less than 2.5 microns in diameter. The commenter states that the text from the order "or insufficiently transparent to meet the standard of reproducibility" applies because those epidemiological studies have met the standard of reproducibility; they have been repeatedly validated.

Commenters (6125, 6133, 6137, 9227) do not agree with the statement in the proposed rule that the proposal is “consistent with Executive Order 13777.

Commenter (6125) states that Executive Order 13777 calls on agency regulatory reform efforts to attempt to identify “those regulations that rely in whole or in part on data, information, or methods that are not publicly available or that are insufficiently transparent to meet the standard for reproducibility.” The commenter states that this language calls for individual examination of rules for future unspecified action. The commenter contends that it in no way supports EPA’s proposal to impose a blanket bar on all studies relying on undisclosed data.

Commenter (6133) states that Executive Order 13777 requires Regulatory Reform Task Forces to evaluate existing regulations and “make recommendations to the agency head regarding their repeal, replacement, or modification, consistent with applicable law.” The commenter states that the Executive Order requires the task force to identify regulations that, among other things, “impose costs that exceed benefits,” and “create a serious inconsistency or otherwise interfere with regulatory reform initiatives and policies.” The commenter states that, in contrast, the proposal does not identify any regulations that it believes should be repealed, replaced, or modified, consistent with applicable law. The commenter states that, instead, the proposal creates a new burdensome regulation. The commenter states that, notwithstanding EPA’s unsupported assertion that it “believes the benefits of this proposed rule justify the costs,” the proposed rule will impose costs that exceed benefits. The commenter states that, rather than being consistent with the Executive Order, the proposed rule contradicts it.

Commenter (6137) asserts that Executive Order 13777 seeks to reduce regulation, and in no way authorizes EPA to promulgate new rules. The commenter states that this Executive Order establishes a task force to “evaluate existing regulations . . . and make recommendations to the agency head regarding their repeal, replacement, or modification.” The commenter states that EPA’s assertion that the proposed rule is consistent with an Executive Order focused on deregulation is tantamount to an admission that the rule’s purpose and effect is to limit the development of rules that are critical to the protection of public health and the environment.

Commenter (6137) asserts that the proposed rule is contrary to the stated purpose and policy of Executive Order 13777, which is to “lower regulatory burdens on the American people by implementing and enforcing regulatory reform.” The commenter states that the proposed rule will do just the opposite as it will preclude EPA from considering certain data regarding health and environmental impacts of pollutants, contaminants, and other substances in its rulemaking process. The commenter states that the overall impact of such limitations on rulemaking aimed at protecting public health and the environment will be increased burdens on the American people.

Commenter (9227) states that Executive Order 13777 is targeted at eliminating regulations including those that are “unnecessary” and “ineffective,” which the proposal clearly would be.

Response: The EPA authority for this rule is not derived from Executive Order 13777. As stated in the preamble, the EPA is authorized to promulgate this procedural rule under its authority to promulgate housekeeping regulations governing its internal affairs under 5 U.S.C. App., and Pub. L. 98–80, 84 Stat. 2086. Additionally, this action is consistent with Executive Order 13777, and the focus on transparency in the OMB Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies.

In addition, as described in the preamble, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. Consistent with existing Agency practice, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information. Further, the final rule only applies to dose-response data; studies informing other aspects of the EPA’s evaluations are unaffected by this rule.

15.1.10 Executive Order 13783: Promoting Energy Independence and Economic Growth

Comment: Commenter (6141) states that Executive Order 13783 supports the adoption of clear, even-handed, and effective rules for ensuring scientific transparency. Commenter (6362) supports EPA’s demonstrated commitment in this proposal to build upon the principles underlying Executive Order 13783. Commenter (6927) agrees with the statement in the proposed rule that the proposal is consistent with Executive Order 13783.

Conversely, commenters (4591, 6103, 6114, 6116, 6131, 6361) assert that Executive Order 13783 does not justify the proposed rule.

Commenter (6103) states that Executive Order 13783 states that environmental regulations should be developed through "transparent processes that employ the best available peer-reviews science and economics." The commenter states that, to achieve this, the EPA should continue to rely on the peer-review process, as it ensures transparent processes for the best available science.

Commenters (6114, 6116, 6131, 6361) state that Executive Order 13783 calls for transparency in process but does not address the issue of transparency in publication of studies. The commenters state that Executive Order 13783 simply calls for the use of the best available peer reviewed information.

Response: EPA appreciates the comments that this rule is consistent with Executive Order 13783. However, EPA authority for this rule is not derived from Executive Order 13783, as stated in the preamble, the EPA is authorized to promulgate this procedural rule under its authority to promulgate housekeeping regulations governing its internal affairs under 5 U.S.C. App., and Pub. L. 98–80, 84 Stat. 2086. The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency’s goal of greater transparency.

Comment: Commenters (4591, 6125, 6133, 6137, 9227) do not agree with the statement in the proposed rule that the proposal is consistent with Executive Order 13783.

Commenters (6133, 6137) state that, in an effort to show the proposed rule’s consistency with this Executive Order, EPA quotes the following part of the Order: “It is also the policy of the United States that necessary and appropriate environmental regulations comply with the law, are of greater benefit than cost, when permissible, achieve environmental improvements for the American people, and are developed through transparent processes that employ the best available peer-reviewed science and economics.” Commenter (6133) asserts that Executive Order 13783 contradicts the proposal because the proposal would prevent EPA from promulgating regulations that comply with the law, would cost more than any benefit it could achieve, and would preclude the use of the best available peer-reviewed science.

Commenter (6137) states that the proposed rule contravenes this policy in a number of ways: it fails to comply with a number of statutes and executive orders; the costs of the rule far outweigh the benefits; it will cause substantial and far-reaching harm to public health and the environment; and it has been developed through a process that lacks transparency. The commenter states that, if implemented, the proposed rule will lead to future rulemakings that likewise will be inconsistent with this Executive Order, as it will preclude EPA from considering the best available peer reviewed science and economics, which in turn will impact the cost-benefit analysis, and may violate notice-and-comment and judicial review procedures.

Commenter (9227) states that Executive Order 13783 says nothing more than that environmental regulations should be developed through transparent processes that employ the best available peer-reviewed science. The commenter states that Executive Order 13783 calls for agencies to consider the costs and benefits “that are based on the best available science and economics” to ensure sound regulatory decision making. The commenter provides that the proposal provides no analysis of the costs and benefits of implementing this new policy, despite there likely being high

costs to making research data public with little evidence of significant benefits achieved from this policy alone. The commenter states that, by arbitrarily excluding scientific information that EPA may use in its regulatory analyses, the proposal conflicts with the executive order's command to employ the best available science and economics.

Commenter (4591) states that EPA is bound through Executive Order 13783 to develop regulations through "transparent processes that employ the best available peer-reviewed science." The commenter states that the proposed rule presumes that peer-reviewed, otherwise credible scientific studies do not merit consideration in the agency's decision making, unless data supporting the study are made publicly available within the agency's specifications. The commenter states that this presumption is not in keeping with the spirit of data transparency as understood by the scientific community. The commenter states that science does not depend on the public availability of underlying data to indicate quality and reliability of evidence, and public availability of research data is not a proxy for the reproducibility of science. The commenter states that the trend toward data transparency championed by foundations and science agencies around the world is predicated on the view that peer-reviewed, published studies already have presumptive scientific merit.

Response: This is a rule of internal procedure promulgated under the EPA's housekeeping authorities, and imposes no enforceable duty on any state, local or tribal governments or the private sector. Additionally, this rule does not require the EPA or other parties to disclose or host data. Hence, this rule does not impose costs on the EPA or any other party to make such data available. As described in preamble discussion of costs and benefits, the EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small.

The EPA disagrees that this action is inconsistent with Executive Order 13783. This rulemaking is not intended to modify the Agency's interpretations of "best available science." The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. The EPA will then identify and consider pivotal science in accordance with the provisions of this rule, unless the implementation of the rule conflicts with statutory requirements and associated implementing regulations. As this rule makes clear, if implementing this procedural rule would result in conflicts with existing environmental statutes, the procedural rule will yield to the existing statutes.

The final rule requires EPA to follow best practices to evaluate potential links between exposure to a pollutant, contaminant, or substance and the effect and the nature of the dose-response relationship. EPA will continue to use the following, well-established factors when assessing study quality: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Comment: Commenter (6137) states that Executive Order 13783 provides that greenhouse gas impact estimates should be consistent with guidance in OMB Circular A-4 (Sept. 17, 2003), which specifically requires that this analysis be based on "the best reasonably obtainable

scientific, technical, and economic information available.” The commenter states that, though the Circular states that, where available, peer-reviewed, transparent, and reproducible studies should be used, it neither requires nor authorizes the preclusion of consideration of scientific studies based on data that cannot be made publicly available. The commenter states that, instead, it recognizes that there will be circumstances “[w]here other compelling interests (such as privacy, intellectual property, trade secrets, etc.) prevent the public release of data or key elements of the analysis,” and provides in those cases that, rather than precluding the data, the use of “especially rigorous robustness checks to analytic results” should be applied and documented. The commenter states that, for this reason, the proposed rule is inconsistent with Executive Order 13783.

Response: This rule will not preclude information from consideration. Consistent with existing Agency practice, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information. The final rule requires EPA to follow best practices to evaluate potential links between exposure to a pollutant, contaminant, or substance and the effect and the nature of the dose-response relationship. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. As further detailed in the preamble to the final rule, only when characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, will the EPA identify pivotal science and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation. Title 40 CFR 30.5 also provides additional considerations for instances when underlying dose-response data are not available for independent validation. Because the final rule does not categorically exclude any studies from EPA’s consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA’s evaluations. In addition, as this rule makes clear, if implementing this procedural rule would result in conflicts with existing environmental statutes, the procedural rule will yield to the existing statutes.

15.2 SNPRM Statutory and Executive Order Requirements

15.2.1 Executive Orders

15.2.1.1 Executive Order 12291: Federal Regulation

Comment: Commenter (11183, 12719, 12546) provides that Executive Order 12291 requires executive agencies to perform a cost-benefit analysis for all major rules.³⁵⁶⁰ The commenters note that this proposed rule—which will limit EPA’s use of a vast compendium of existing and

³⁵⁶⁰ “Presidential Executive Order 12291 (Ronald Reagan, 1981),” Ballotpedia, accessed May 2, 2020, [https://ballotpedia.org/Presidential_Executive_Order_12291_\(Ronald_Reagan,_1981\)](https://ballotpedia.org/Presidential_Executive_Order_12291_(Ronald_Reagan,_1981)).

forthcoming research—does not include an analysis to illicit how this rule’s costs compared to its benefits. Thus, according to the commenter, the EPA has failed to comply with this requirement.

Response: Executive Order 12291 was revoked in 1993 by President Bill Clinton (D), who issued a modified regulatory review program under Executive Order 12866.

15.2.1.2 Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

Comment: Commenters (3788, 11479, 11903, 12464, 12715, 12727, 12751) state that the supplemental proposal violates the principles of Executive Order 12866, Regulatory Planning and Review, 58 Fed. Reg. 51,735 (Oct. 4, 1993). Commenters provide that EPA has failed to estimate the costs the Agency would incur to implement the proposal, despite the availability of information upon which to base such estimates.

Commenter (12727) provides that EPA has failed to estimate the costs the Agency would incur to implement the proposal, despite the availability of information upon which to base such estimates. The commenter notes that Executive Order 12866 specifically includes costs “to the government” among the costs the Agency “shall consider.”³⁵⁶¹ The commenter maintains that it again references costs “to the government” when describing the required assessments for significant regulatory actions.³⁵⁶² The commenter states that moreover, the costs of administering a regulation are plainly relevant to the reasonableness of an Agency’s interpretation of the statutes supposedly authorizing the regulation.³⁵⁶³

Commenter (11479) asserts that EPA suggests that the rule apply to “significant regulatory actions” under Executive Order 12866, which governs regulatory planning and review, is overly broad, and would allow for even more politicization of science in EPA rulemaking. Executive Order 12866 defines “significant regulatory action” as having an annual economic effect of \$100 million or more; interfering with actions taken by other agencies; altering the budgetary impact of entitlements, grants or user fees; or raising “novel legal or policy issues arising out of legal mandates, the President’s priorities, or the principles set forth in this Executive order.”³⁵⁶⁴ According to the commenter, this elastic clause would grant the Agency or OMB’s Office of Information and Regulatory Affairs (OIRA) the discretion to categorize any rule as significant, depending on an administration’s priorities.

Response: This is a rule of internal procedure promulgated under the EPA’s housekeeping authority, and imposes no enforceable duty on any state, local or tribal governments or the private sector. Additionally, this rule does not require the EPA or other parties to disclose or host data. Hence, this rule does not impose costs on the EPA or any other party to make such data available. As described in the preamble discussion of benefits and costs, the EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates

³⁵⁶¹ E.O. 12,866 § 1(b)(5).

³⁵⁶² *Id.* § 6(a)(3)(C)(ii).

³⁵⁶³ *See Util. Air Regulatory Grp. v. EPA*, 573 U.S. 302, 322-24 (2014).

³⁵⁶⁴ Clinton, W. 1993. Executive Order 12866: Regulatory planning and review. Washington, DC.

these will be small. The analysis by CBO noted by the commenter is not applicable to this rule because the analyses were not for this rule and the requirements analyzed are not the same as those in this rule.

15.2.1.3 Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations

Comment: Several commenters (10974, 11183, 11184, 11403, 11918, 12412, 12458, 12474, 12546, 12715, 12719, 13549, 14397) state that the EPA inadequately addressed environmental justice in minority populations and low-income population impacts of the rule as required under Executive Order 12898. Commenters state that the supplemental proposal does not address the potential environmental justice implications of the research restrictions it would impose and therefore fails to meet the requirements of Executive Order 12898. These comments include the following:

Commenter (11183) provides that Executive Order 12898 directs agencies, including EPA, to identify and address “disproportionately high and adverse human health or environmental effects of their actions on minority and low-income populations, to the greatest extent practicable and permitted by law.”³⁵⁶⁵ The commenter notes that that proposed rule does not identify or address the potential impacts it may have on environmental justice communities with restriction to regulatory science that excludes private data. Thus, EPA has failed to comply with this requirement.

Commenter (12715) states that while EPA states that the supplemental proposal is not subject to Executive Order 12898 because it does not establish an environmental health or safety standard, 85 Fed. Reg. at 15,404, Executive Order 12898 is not so limited in its application. Rather, the commenter notes that it broadly applies to all Agency “programs, policies, and activities,” Exec. Order 12898 at 1, and, in any event, the commenter adds that the supplemental proposal would affect countless environmental health and safety standards. In addition, the commenter states that to the extent EPA looks to existing environmental statutes as its authority for the proposed rule, those statutes generally require EPA to consider protection of human health and the environment in taking any regulatory action, which includes potential environmental justice concerns. See, e.g., Resource Conservation and Recovery Act (RCRA), 42 U.S.C. § 6981(a).

Commenter (12719) expresses that the EPA states that Executive Order 12898 does not apply to the proposed rule because “it does not establish an environmental health or safety standard.” The commenter states that this statement is not accurate. As this proposal addresses how EPA will consider data that informs environmental health or safety standards, the commenter contends it is therefore relevant to environmental justice communities. The commenter asserts that

³⁵⁶⁵ OA US EPA, “Summary of Executive Order 12898 - Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations,” Overviews and Factsheets, US EPA, February 22, 2013, <https://www.epa.gov/laws-regulations/summary-executive-order-12898-federal-actions-address-environmental-justice>.

disproportionately impacted communities are affected by every decision that EPA makes--including how EPA considers or analyzes its data. EPA should consider the Transparency in Science proposal as subject to Executive Order 12898.

Commenters (11184, 12412, 12474, 13549, 14397) state that they are disheartened by the supplemental proposal's lack of consideration and analysis relating to the proposal's impact on Environmental Justice communities: the supplemental proposal merely states, without further explanation, that "this action does not have tribal implications as specified in Executive Order 13175," and "EPA believes that this action is not subject to Executive Order 12898 (59 FR 7629, February 16, 1994) because it does not establish an environmental health or safety standard." 85 Fed. Reg. at 15,404.

Commenter (10974) notes that Executive Order 12898 was promulgated to guide "each Federal agency" to "make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations in the U.S. ..." (59 FR 7629)

As with children, the commenter (10974) states that decades of epidemiological health research has found that Indigenous people, people of color, and those with low income are disproportionately exposed to, and impacted by, pollution. The commenter notes that this puts those individuals and communities at a higher risk of side effects from drastic changes in health research or policy making. According to the commenter, the claim that Executive Order 12898 does not apply because the supplemental proposal "does not establish an environmental health or safety standard", misses the spirit of environmental justice considerations.

Commenter (12458) expresses that, while excluding important public health data from rulemaking has the potential to harm all people, it would disproportionately harm environmental justice communities. The commenter states that the EPA has an explicit legal obligation to avoid these kinds of harms under Title VI of the Civil Rights Act and the Environmental Justice Executive Order 12898. Title VI of the Civil Rights Act requires EPA to ensure that the programs and activities it funds do not use criteria, methods, or practices that discriminate on the basis of race, color, or national origin.³⁵⁶⁶ By restricting the consideration of some public health research, the commenter states that the proposed rule would have an adverse disproportionate impact on people of color in downstream programs and activities.

The commenter (12458) states that the Agency's own Environmental Justice and Community Revitalization Priorities memorandum pledges to "improve EPA science to better understand the needs of underserved and overburdened communities...with an emphasis on public participation

³⁵⁶⁶ 42 U.S.C.A. § 2000d-1.

to identify solutions.”³⁵⁶⁷ Yet the commenter notes that the EPA now seeks to expand a proposed rule that environmental justice groups overwhelmingly opposed in 2018.³⁵⁶⁸ Moreover, the commenter provides that the EPA Environmental Justice 2020 Action Agenda specifically prioritizes ensuring that environmental justice is appropriately analyzed, considered and addressed in EPA rules.”³⁵⁶⁹ The commenter concludes that environmental justice cannot be appropriately analyzed, considered, or addressed in rulemaking if large swaths of public health data are excluded from the rulemaking process.

Commenter (12715), the EPA must—but has altogether failed to—contend with the fact that the supplemental proposal would have significant and impermissible environmental justice implications. Specifically, the commenter notes that by limiting the scientific studies and data that EPA may consider in both crafting environmental regulations and finalizing “influential scientific information,” the SNPRM and the original proposal are Agency actions that could have disproportionately high and adverse human health or environmental effects on environmental justice communities. Scientific evidence plays a crucial role in addressing the various sources of environmental pollution and reducing the public health burden attributable to environmental factors. The commenter adds that the role of such evidence is particularly important to environmental justice communities, which are disproportionately affected by environmental risk.³⁵⁷⁰ The commenters provides as an example a recent study by EPA scientists that found that facilities emitting dangerous particulate air pollution—like soot—disproportionately impact low-income communities and communities of color.³⁵⁷¹ The commenter contends that if EPA can now ignore or give less weight to epidemiological or other studies where the underlying data is not publicly available, this could lead to even more disparities in the burdens that air pollution and other toxics impose on environmental justice communities.

Commenter (11403) states that the proposed rule’s arbitrary inclusion criteria will create unnecessary and harmful biases against epidemiological studies that are the only source of data designed to protect overburdened and vulnerable populations. The commenter notes that this directly violates Executive Order 12898, which directs every federal Agency to “. . . collect, maintain, and analyze information assessing and comparing environmental and human health risks borne by populations identified by race, national origin, or income. To the extent practicable and appropriate, Federal agencies shall use this information to determine whether their programs, policies, and activities have disproportionately high and adverse human or

environmental effects on minority populations and low-income populations.”³⁵⁷² The commenter provides that in 2011, EPA also signed a Memorandum of Understanding to implement the environmental justice goals of Executive Order 12898.³⁵⁷³

Response: This action is not subject to Executive Order 12898 because it does not establish an environmental health or safety standard. The final rule will not lead to systematic bias towards certain types of stakeholder goals of any party. The final rule requires EPA to follow best practices to evaluate potential links between exposure to a pollutant, contaminant, or substance and the effect and the nature of the dose-response relationship. EPA will also use the following, well-established factors when assessing study quality: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. The EPA will continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. As further detailed in the preamble to the final rule, only when characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, will the EPA identify pivotal science and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation. Title 40 CFR 30.5 also provides additional considerations for instances when underlying dose-response data are not available for independent validation.

15.2.1.4 Executive Order 13045: Protection of Children from Environmental Health Risks and Safety Risks

Comment: Several commenters (10974, 11183, 12430, 12540, 12546, 12719) cite Executive Order 13045 in part or whole as stating that EPA has reason to believe that environmental or safety risks we encounter in “the air we breathe, the food we eat, water we drink or use for recreation, the soil we live on, and products we use or are exposed to” may disproportionately impact children, and therefore EPA must evaluate the effects of planned regulation on children and explain why this regulation is preferable to others.³⁵⁷⁴ The commenters express concern that the proposed rule does not consider the disproportionate impacts on children that may occur with the restriction to regulatory science based on publicly available data. Thus, according to the commenters, the EPA has failed to comply with this requirement.

Commenter (12719) states that since the proposed rule concerns all environmental and health data that would contribute to rulemaking, the EPA should provide an analysis on how the proposal would affect data used to make decisions on children’s environmental risks. The commenter provides that as children are known to be uniquely vulnerable to environmental

³⁵⁷² Executive Order 12898, § 3-302 (Feb. 11, 1994). “Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations.”

³⁵⁷³ Memorandum of Understanding on Environmental Justice and Executive Order 12898 (2011), available at <https://www.epa.gov/sites/production/files/2015-02/documents/ej-mou-2011-08.pdf>.

³⁵⁷⁴ OA US EPA, “Summary of Executive Order 13045 - Protection of Children From Environmental Health Risks and Safety Risks,” Overviews and Factsheets, US EPA, February 22, 2013, <https://www.epa.gov/laws-regulations/summary-executive-order-13045-protection-children-environmental-health-risks-and>.

exposures (lead exposures are just one example)³⁵⁷⁵, it is difficult to understand how EPA can state that Executive Order 13045 would not apply to this proposed rule.

Commenter (12430) expresses that the proposed regulation could disproportionately affect children by preventing U.S. EPA from considering children's health studies, thereby increasing risks and negative health outcomes for American children. The commenter adds that the U.S. EPA recognizes the supplemental proposal as significant (and submitted it to OIRA, as discussed below), but failed to conduct the evaluation of health impacts to children required by Executive Order 13045.

Commenter (10974) states that section 2-202 part (b) of the Executive Order is what EPA bases their statement that the supplemental proposal does not apply, since the proposal was deemed "economically significant" under Executive Order 12866 and was submitted to OIRA for review. The commenter notes that it has also been made plain that EPA does not consider this rulemaking to be substantive. Interestingly, the commenter states that the EPA failed to make the claim that it was not a "substantive action" under Executive Order 13045, as they attempted with the review of the housekeeping authority. In either case, the commenter does not believe that (b) applies: this is a substantive rule and, thus, a substantive action.

The commenter (10974) states that, if promulgated, this rule would have broad-reaching implications on entire fields of research. The commenter adds that the power vested in the administrator to make determinations about which studies could be used – without any defined criteria guiding such decisions – is alarmingly inappropriate. If entire fields of environmental health (and all) research are impacted by this rulemaking, the commenter contends that it follows that those more at-risk from environmental pollution – those who have the greatest need for stringent, health-protective pollution standards – will fare worse than healthy populations. According to the commenter, the EPA's statement that this would not disproportionately affect children is naïve and inept.

The commenter (10974) notes that, as stated in Executive Order 13045 itself, "...scientific knowledge demonstrates that children may suffer disproportionately from environmental health risks and safety risks." Since the signing of Executive Order 13045 over 20 years ago, the commenter states that epidemiological and other environmental health research has consistently demonstrated that children can be, and are, disproportionately exposed to, and impacted by, a variety of environmental pollutants. The commenter adds that research is among the multitudinous amount of literature currently available for consideration while EPA is conducting policy making actions.

By broadening the applicability of this rule to all data and models collected – not just epidemiological data and models – the commenter (10974) contends that the EPA is further endangering the lives of healthy and at-risk children. The commenters believe that Executive

³⁵⁷⁵ Hauptman M., et al. 2017. "An Update on Childhood Lead Poisoning." *Clinical Pediatric Emergency Medicine*, 2017;18(3):181-192. doi:10.1016/j.cpem.2017.07.010

Order 13045 applies to this rulemaking, and that EPA has not done enough to address anticipated health and safety impacts on children as the Executive Order recommends.

Commenter (12546) failed to consult with critical stakeholders on the impacts of the Science Transparency Rule on children's health. The commenter notes that environmental health regulatory and science actions impacted by this rule and supplemental proposal may disproportionately affect children's health. For example, NAAQS for pollutants such as PM_{2.5} (fine particulate), ozone and lead all have highly relevant and important studies showing that children can be more sensitive and susceptible to these pollutants. Therefore, the commenter strongly asserts that EPA is required to conduct an analysis under Executive Order 13045: Protection of Children from Environmental Health Risks and Safety Risks.³⁵⁷⁶

Response: The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of "covered regulatory action" in section 2-202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk.

In addition, the final rule will not lead to systematic bias towards certain types of stakeholder goals of any party. The final rule requires EPA to follow best practices to evaluate potential links between exposure to a pollutant, contaminant, or substance and the effect and the nature of the dose-response relationship. EPA will continue to use the following, well-established factors when assessing study quality: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. The EPA will continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. As further detailed in the preamble to the final rule, only when characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, will the EPA identify pivotal science and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation. Title 40 CFR 30.5 also provides additional considerations for instances when underlying dose-response data are not available for independent validation. In addition, as this rule makes clear, if implementing this procedural rule would result in conflicts with existing environmental statutes, the procedural rule will yield to the existing statutes.

15.2.1.5 Executive Order 13132: Federalism

Comment: Commenters (12430, 12435, 12715) contend that the supplemental proposal violates the principles set forth in Executive Order No. 13132, Federalism, 64 Fed. Reg. 43,255 (Aug. 4, 1999).

³⁵⁷⁶ 62 FR 19885, April 23, 1997.

Commenter (12715) provides that Executive Order 13132 provides that agencies must have an accountable process to ensure meaningful and timely input by state and local officials in the development of regulatory policies that have federalism implications. Federalism implications are defined as including regulations and actions that have substantial direct effects on states or local governments (individually or collectively). *Id.* at 1. The commenter contends that, contrary to EPA's unsupported, cursory assertion, 85 Fed. Reg. at 15,404, the supplemental proposal indisputably has substantial federalism implications because, as explained herein, states and local communities are directly and significantly impacted by health and risk-based standards established by EPA.

The commenter (12715) notes that standards adopted by EPA under the supplemental proposal's directive to exclude or demote relevant and valid scientific studies will have substantial direct effects on states and cities. The commenter provides that states may be statutorily required to adopt EPA standards or to obtain EPA approval of state-set standards and may lack the resources or institutional capacity to deviate from EPA standards. The commenter adds that states, counties and cities are also significantly impacted through incorporation of EPA standards into the regulations or programs of other federal agencies that rely on EPA standards and/or modeling. The commenter provides that this includes, *inter alia*, fuel economy standards set by the National Highway Transportation and Safety Administration, which have an impact on vehicle emissions of harmful air pollutants. Despite the substantial impact EPA's supplemental proposal would have on states and local governments, the commenter states that the EPA did not seek any input from states and local governments in developing the supplemental proposal, in violation of Executive Order 13132. The commenter asserts that the EPA must engage in the required consultation with state and local officials, as required by the Executive Order, before proceeding further.

Similarly, commenter (12430) states that the supplemental proposal would disrupt the cooperative relationship between the federal government and California to implement federal environmental laws, including potentially undercutting state-level air quality standards under the CAA.

The commenter (12430) provides that the CAA represents a hallmark example of cooperative federalism, as U.S. EPA and state air agencies partner to protect public health from harmful effects of air pollution. The commenter notes that an essential aspect of this relationship includes basing federal and state-level implementation decisions on the best available science. According to the commenter, this includes U.S. EPA setting of NAAQS at a level requisite to protect the public health, while states meet the standards through development and implementation of State Implementation Plans (SIP). The commenter provides that the NAAQS must be based on air quality criteria developed using the "latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare," and updated at least every five years following a thorough review by an independent scientific review committee. The commenter adds that the CAA sets out specific actions for this committee to advise U.S. EPA on

areas where additional knowledge is required for reviewing NAAQS and the research efforts necessary to obtain that information, among related topics.

The commenter (12430) (representing California) notes that they rely on the legitimacy of this scientific review process for purposes of commenting on the NAAQS-setting process and developing and implementing its SIPs. The commenter states that the supplemental proposal does not address how the proposal would affect this scientific review process. If a finalized supplemental proposal prevents U.S. EPA and its CAA Advisory Committee from considering the best available science, the commenter contends that it would severely restrict U.S. EPA's decision-making when establishing, reviewing, or revising air quality criteria and NAAQS. According to the commenter, the resulting effect is likely to be confusion and disagreements between the California Air Resources Board (CARB) (and its counterparts in other states) and U.S. EPA about what studies can and should be considered. The commenter states that this is likely to harm the cooperative relationship between U.S. EPA and state air agencies, in addition to hindering the ability of U.S. EPA and CARB to meet the obligations of the CAA, and, ultimately, harming public health through the setting of substandard NAAQS.

The commenter (12430) states that the same dynamic would likely play out under other environmental laws that depend upon cooperative federalism, such as the CWA. Similarly, the commenter contends that this would risk damaging the cooperative federalism framework devised by Congress for these laws. The commenter asserts that the U.S. EPA's failure to consult with the states on the impact of this rule is also inconsistent with U.S. EPA's own primary goal set forth in its 2018-2022 Strategic Plan to create more effective partnerships with the states, among others, in carrying out shared responsibilities and communicating results to all Americans.³⁵⁷⁷ Given the potentially significant impacts, the commenter states that the U.S. EPA's failure to analyze the cooperative federalism impacts of the SNPRM under E.O. 13132 further demonstrates the arbitrariness of U.S. EPA's rulemaking process.

Commenter (12435) states that this action will have substantial direct impact on the state's ability to use the best available scientific information to protect human health and the environment. The commenter adds that this action could also impact the state's ability to ensure more stringent cleanup requirements are used at EPA-lead Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) sites when state standards and/or cleanup levels are based on best available science, but EPA standards and/or cleanup levels may be based on a limited set of data and models. Furthermore, the commenter states that the action could impact previous and forthcoming rules involving interstate air pollution flow and impede states with NAAQS nonattainment areas such as Colorado from legally addressing emissions in upwind states.

³⁵⁷⁷ U.S. EPA, Working Together, FY 2018-2022 U.S. EPA Strategic Plan, February 2018 (Updated: September 2019), available at <https://www.epa.gov/sites/production/files/2019-09/documents/fy-2018-2022-epa-strategic-plan.pdf>.

Response: This action does not have federalism implications as it imposes no enforceable duty on any state or local governments. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

In addition, this final rule will not impact EPA's ability to rely upon best available science and does not establish an environmental health or safety standard. The final rule requires EPA to follow best practices to evaluate potential links between exposure to a pollutant, contaminant, or substance and the effect and the nature of the dose-response relationship. EPA will also use the following, well-established factors when assessing study quality: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. The EPA will continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. As further detailed in the preamble to the final rule, only when characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, will the EPA identify pivotal science and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation. Title 40 CFR 30.5 also provides additional considerations for instances when underlying dose-response data are not available for independent validation. In addition, as this rule makes clear, if implementing this procedural rule would result in conflicts with existing environmental statutes, the procedural rule will yield to the existing statutes.

15.2.1.6 Executive Order 13175: Consultation and Coordination with Indian Tribal Governments/Tribal Community Implications

Several comments (11407, 11895, 12415, 12423, 12474,) were submitted on the supplemental proposal related to Executive Order 13175, tribal government consultation requirements and tribal community implications of the proposal. This comments are provided below.

Comment: Commenters (11407, 12423, 12474, 13549, 14397) cite Executive Order 13175 legal obligations. According to commenters, the rule has potentially far-reaching and substantial impact on tribes and it should have triggered a tribal consultation process under the Executive Order.

Commenters (11895, 12474, 13549) states that they are disheartened by the supplemental proposal's lack of consideration and analysis relating to the proposal's impact on Indian Tribes and Environmental Justice communities: the supplemental proposal merely states, without further explanation, that "this action does not have tribal implications as specified in Executive Order 13175," and "EPA believes that this action is not subject to Executive Order 12898 (59 FR 7629, February 16, 1994) because it does not establish an environmental health or safety standard." 85 Fed. Reg. at 15,404. The commenters note that it is well deduced that the proposed rule will have a cascading effect on all future rules and as Tribes they will see it and will feel its repercussions.

Given the over-arching nature of the proposed rule's purview and particular impact on tribes, commenters (11895, 12423, 12474, 13549, 14397) state the Agency should have included a justification for not consulting with tribal governments under the Executive Order.

Response: This action imposes no enforceable duty on any state, local or tribal governments or the private Sector. Therefore, this action does not have tribal implications as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to this action.

Comment: Commenters (12423, 13549) express that tribal communities are likely to experience disproportionate adverse impacts as a result of the proposed rule/supplemental. Specific comments include:

Commenter (12423) states that many reservations are disproportionately impacted from higher levels of chemicals, pesticides, and contaminants, as well as from National Priority List Superfund Sites that release contaminants in the soils, water, and air, thus impacting tribal health.

The commenter (12423) asserts that tribal specific data are needed for tribes to be represented and protected by the EPA regulations that are intended to protect the environment tribes depend on for their very lifeways. According to the commenter, if this rule is enacted, tribes would need to alter their laws concerning data rights and management. For example, the commenter notes that some tribes only allow researchers access to tribal data for the duration of the study and require that, once the study concludes, the data be returned to the tribal nation. Additionally, the commenter adds that there are tribal sovereignty implications in protecting proprietary knowledge and substantial tribal member privacy concerns because of the relatively small populations sizes.

Commenters (12474, 13549) notes that it is well established that Tribal communities are likely to experience disproportionate exposure to harmful pollutants and chemicals.³⁵⁷⁸ The commenters state that the proposal seeks to preclude the use of scientific research critical to establishing safeguards against this disproportionate exposure. Before finalizing any version of the proposed rule and/or supplemental proposal, the commenters assert that the EPA must listen to, analyze, and address Tribal concerns and impacts via public comments and government-to-government consultations.

Commenter (12415) contends that the rule's impact on tribes would be potentially significant and far-reaching, yet the EPA did not consult with the Confederated Tribes of the Umatilla Indian Reservation (CTUIR) (or any other tribe to our knowledge) about it. Furthermore, the commenter notes that given current circumstances regarding Coronavirus/COVID-19, particularly its acute, debilitating effects on Indian Country, there has not been adequate time nor

³⁵⁷⁸ See, e.g., EPA, Tribal Air and Climate Resources <https://www.epa.gov/tribal-air> ("Tribal citizens are often disproportionately affected by air pollution, while their governments play an increasingly valuable role in controlling and reducing pollution and its adverse health effects. Tribes are also particularly vulnerable to the impacts of climate change and are taking steps to prepare for and become more resilient to these changes.").

resources available to fully engage in this rulemaking process, in addition to EPA's pervasive failures and shortcomings in terms of proper and meaningful government-to-government consultation.

Commenter (12474) states that they recently learned that the EPA is refusing Tribal consultation on this rulemaking. According to the commenter, one reason given is that this rule is being proposed under the EPA's housekeeping authority and is an internal rule. As they state in other comments on the proposal, the commenter states that this authority is not an appropriate vehicle to address a rule of this importance. The commenter asserts that this proposal will change the way scientific analyses are performed at the EPA. The commenter contends that it is wholly insufficient for EPA to force Tribes to save our comments for future rulemakings, which will be constrained by these problematic rules. The commenter notes that the proposed new rules will cite back to this proposed rule and will not have any recourse. The commenter states that another reason given by EPA for refusing consultation is the claim that this proposal does not have Tribal implications. According to the commenter, while this proposal may not impose direct regulatory requirements on Tribes, it will most certainly have implications on the ability of Tribes to protect the health of their citizens and therefore it has Tribal implications. The commenter asserts that if the EPA moves forward with this rulemaking, it must reverse its ill-conceived refusal to undertake the necessary and essential government-to-government Tribal consultations on this rulemaking. The commenter concludes that the EPA's refusal to offer Tribal consultation is a failure to uphold the 1984 Indian Policy.

Commenter (14397) states that in 2013, a two year review by the Department of the Interior's Secretarial Commission on Indian Trust Administration and Reform resulted in the recommendation that the U.S. government clarify that: all federal agencies have a trust responsibility to Indians; that this trust responsibility demands a high standard of conduct; and each Agency should place Indian interests before those of the Agency and outside parties.³⁵⁷⁹ The commenter contends that, quite clearly, the EPA has not followed this doctrine.

Commenter (12423) urges the EPA to correct this by postponing any rulemaking until meaningful tribal consultation has been conducted.

Commenter (12415) states that the EPA has yet to explain how the proposed rule would implicate Treaty Rights, Treaty-secured resources, trust assets, how they would be safeguarded, and how they would or could be affected if the rule is adopted. The commenter notes that the fundamental question is, how will the EPA ensure that Treaty Rights are honored, and can be exercised, if you are less able to protect the resources on which those rights depend because you have adopted less-protective rules that excluded legitimate (although nonpublic) science and data?

³⁵⁷⁹ Modernizing the Trust: Redefining The United States-Tribal Government-to-Government Relationship And Advancing Trust Asset Reform - Key Principles of Indian Trust Modernization. (October 2015). National Congress of American Indians.

The commenter (12415) encourages the EPA to follow its own Guidance, which to their knowledge has not been rescinded. This Guidance, “EPA Policy on Consultation and Coordination with Indian Tribes: Guidance for Discussing Tribal Treaty Rights,”³⁵⁸⁰ merits closer scrutiny, stating in part:

EPA recognizes the importance of respecting tribal treaty rights and its obligation to do so. . . . EPA will . . . consider all relevant information obtained to help ensure that EPA’s actions do not conflict with treaty rights, and to help ensure that EPA is fully informed when it seeks to implement its programs and to further protect treaty rights and resources when it has discretion to do so. [Footnote omitted]

The Guidance summarizes the significance of treaties:

The U.S. Constitution defines treaties as part of the supreme law of the land, with the same legal force as federal statutes. Treaties are to be interpreted in accordance with the federal Indian canons of construction, a set of long-standing principles developed by courts to guide the interpretation of treaties between the U.S. government and Indian tribes. As the Supreme Court has explained, treaties should be construed liberally in favor of tribes, giving effect to the treaty terms as tribes would have understood them, with ambiguous provisions interpreted for their benefit. Only Congress may abrogate Indian treaty rights, and courts will not find that abrogation has occurred absent clear evidence of congressional intent. [Footnote omitted]

The Guidance specifically notes as an example that “. . . protecting fish may involve protection of water quality in the watershed[,],” and that:

. . . [T]reaty rights most likely to be relevant to an EPA action are rights related to the protection or use of natural resources, or related to an environmental condition necessary to support the natural resource, that are found in treaties that are in effect. . . . “Treaties also may contain necessarily implied rights. For example, *an explicit treaty right to fish in a specific area may include an implied right to sufficient water quantity or water quality to ensure that fishing is possible. Similarly, an explicit treaty right to hunt, fish, or gather may include an implied right to a certain level of environmental quality to maintain the activity or a guarantee of access to the activity site.* [Emphasis added.]

A suggested question for EPA to explore is:

How are treaty rights potentially affected by the proposed action? This question is designed to help EPA understand how a treaty right may be affected by the proposed action. EPA should explain the proposed action, provide any appropriate technical information that is available, and solicit input about any resource-based treaty rights. It is

³⁵⁸⁰ https://www.epa.gov/sites/production/files/2016-02/documents/tribal_treaty_rights_guidance_for_discussing_tribal_treaty_rights.pdf.

also appropriate to ask the tribe for any recommendations for EPA to consider to ensure a treaty right is protected.

The commenter (12415) states that they are not aware if EPA has addressed this question in this rulemaking process; if so, we do not feel that we have been provided a satisfactory answer to it.

The Guidance continues:

EPA's next steps typically will involve conducting legal and policy analyses in order to determine how to protect the rights. These analyses are often complex and depend upon the context and circumstances of the particular situation. Issues that may arise often involve precedent-setting questions or warrant coordination with other federal agencies. It is expected that the EPA lead office or region that engaged in the tribal consultation about the potentially affected treaty rights will coordinate with the Office of International and Tribal Affairs, the Office of General Counsel, and appropriate Offices of Regional Counsel to conduct these analyses. Although the details of how to conduct such legal and policy analyses are not addressed by this Guidance, the EPA process may warrant continued or additional consultation with tribes.

Again, the commenter (12415) states that it is unclear whether EPA has performed such analyses for the proposed rule, which they contend that the EPA should.

Response: This is a rule of internal procedure promulgated under the EPA's housekeeping authority, and imposes no enforceable duty on any state, local or tribal governments or the private sector. In addition, the EPA does not agree that its approach will lead to systematic bias towards certain types of stakeholder goals of any party. As described in the preamble, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. Statute-specific transparency regulations or programmatic regulations are forthcoming and EPA will conduct required analyses and consultations as appropriate in the course of those rulemakings.

Comment: Commenter (111407) provides the EPA with specific examples of ways the EPA must use best available science to fulfil its trust responsibilities to the Ute Mountain Ute Tribe to protect public health and the environment of the Ute Mountain Ute Tribe:

1. EPA has a trust responsibility to intervene in disputes between delegated jurisdictions on surface water pollution and water quality standards issues, as well as approval of water quality standards. Much of the science behind those standards is peer reviewed science that goes back decades in time. How can water quality managers cook up quick new science that complies with this proposed rule to properly regulate water quality? Is EPA going to reinvent that scientific wheel when the Ute Mountain Ute Tribe objects to a neighboring jurisdiction's standards or when an upstream entity objects to a regulatory

action by the Tribe? These studies require years of research and complex formulas to protect human health and complex ecosystems from pollution in a way based on sound science.

2. The Ute Mountain Ute Tribe has the only operating privately-owned conventional uranium mill in the U.S. next to its Reservation. The groundwater under and around the mill are being polluted. Innovative scientific research was undertaken in partnership with the U.S. Geologic Survey, Lawrence Livermore National Laboratory, U.S. EPA, and the Tribe to better understand the age and quality of the groundwater and to use the research as a baseline into the future for best available science in protecting the groundwater and identifying the sources of the pollution. Is EPA going to fund a new study? Is EPA going to debunk the peer-reviewed work of its own scientists and those from other leading scientific agencies with this rule making?"

Response: As described in the preamble, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions and developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. Additionally, this rule does not require the EPA or other parties to disclose or host data. Hence, this rule does not impose costs on the EPA or any other party to make data available.

15.2.1.7 Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

Comment: Commenters (12715, 12291) assert that pursuant to Executive Order 13771, agencies must assess and consider the costs of regulatory actions when making regulatory decisions. The commenter states that the supplemental proposal fails to assess costs to EPA and to researchers. Instead, the commenter notes that the EPA claims the supplemental proposal is not expected to be an Executive Order 13771 regulatory action because it relates to "agency organization, management or personnel." 85 Fed. Reg. at 15,404. Yet, the commenter asserts that EPA's proposed action does not fall within this category.

Response: This final rule does not regulate any entity outside the EPA. Rather, the requirements modify the EPA's internal procedures regarding the transparency of pivotal science underlying final significant regulatory actions and influential scientific information.

In addition, because this rule would not change the process by which the EPA already evaluates studies for scientific merit, the incremental costs of the rule would be for EPA to determine data availability for the limited subset of dose-response studies identified as pivotal science. This is a small increment in effort relative to the Agency's extensive existing scientific review process. Therefore, as described in the preamble discussion of costs and benefits, the EPA finds that the incremental costs of this rule related to the additional review of data availability are anticipated to be small.

15.2.1.8 Executive Orders Require that the EPA Quantify Costs and Benefits of Regulatory Actions and Ensure the Public's Right to Participate in the Process

Comment: Commenter (11903) contends that the Trump Administration has assured the public, repeatedly, that it is committed to reduce the regulatory costs they will bear.³⁵⁸¹ The commenter provides that moreover, executive orders issued by previous Presidents address EPA's duty to identify and quantify the costs and benefits of its regulatory actions, and the public's right to participate in the process by which EPA does so. According to the commenter, those orders include Executive Order No. 12866, "Regulatory Planning and Review", 58 FR 51735 (1993), and Executive Order No. 13563, "Improving Regulation and Regulatory Review", 76 FR 3821 (2011).³⁵⁸²

The commenter (11903) provides that as Executive Order No. 13563 indicates, our regulatory system "must identify and use the best, most innovative, and least burdensome tools for achieving regulatory ends", and "[i]t must take into account benefits and costs, both quantitative and qualitative." The commenter notes that to that end, the order directs that

to the extent permitted by law, each agency *must*, among other things: (1) propose or adopt a regulation only upon a reasoned determination that its benefits justify its costs (recognizing that some benefits and costs are difficult to quantify); (2) tailor its regulations to impose the least burden on society, consistent with obtaining regulatory objectives, taking into account, among other things, and to the extent practicable, the costs of cumulative regulations; (3) select, in choosing among alternative regulatory approaches, those approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity);; and

"In applying these principles, each agency is directed to use the best available techniques to *quantify* anticipated present and future benefits and costs *as accurately as possible*."³⁵⁸³

Additionally, the commenter (11903) notes that the Order specifically addresses the public's rights to participate in the process by which an Agency makes its "reasoned determination" that a

³⁵⁸¹ See, e.g.: Executive Order No. 13777, Enforcing the Regulatory Reform Agenda, 82 FR 12285 (2017) ("It is the policy of the United States to alleviate unnecessary regulatory burdens placed on the American people."); Executive Order No. 13771, Reducing Regulation and Controlling Regulatory Costs, 82 FR 9339 (2017) ("It is the policy of the executive branch to be prudent and financially responsible in the expenditure of funds, from both public and private sources. ... it is essential to manage the costs associated with the governmental imposition of private expenditures required to comply with Federal regulations."); and Executive Order No. 13893, Increasing Government Accountability for Administrative Actions by Reinvigorating Administrative PAYGO, 84 FR 55487 (2019) ("This policy includes ensuring that agencies consider the costs of their administrative actions, take steps to offset those costs, and curtail costly administrative actions."; and "Before an agency may undertake any discretionary administrative action, the head of the agency shall submit the proposed discretionary administrative action to the Director for review. Such submission shall include an estimate of the budgetary effects of such action.").

³⁵⁸² The commenter states that until such time as the President revokes them, those orders remain in effect.

³⁵⁸³ Executive Order No. 13563, "Improving Regulation and Regulatory Review", 76 FR 3821, sec. 1 (2011) (commenter added emphasis)

rule's benefits justify its costs, tailors its rule "to impose the least burden on society", quantifies the benefits and costs "as accurately as possible", and chooses the approach that will "maximize net benefits":

According to the commenter (11903), the duties imposed by the Executive Orders do not exhaust the duties that EPA owes to the public, nor the duties EPA owes to the commenters in this rulemaking. The commenter notes that in the years since *Chenery I*, *Overton Park*, *Industrial Union*, and *State Farm*,³⁵⁸⁴ the Federal courts have made amply clear that, when an Agency like EPA intends to promulgate a rule, it must meet the law's demands for reasoned justification. The commenter states that an Agency must provide: reasonable notice of its proposal; opportunity to comment on it; consideration of the comments received; appropriate response to comment; and a satisfactory justification for its final decision, including determinations based on evidence. The commenter contends that in sum, agencies such as EPA are obligated to avoid pretext and administrative evasiveness, and must instead engage in reasoned decision making, with comparative assessment to justify its choices, and develop a record showing that it did so. The commenter also maintains that accordingly, the law requires reasons, not just action, from EPA. The commenter asserts that the Agency's current managers should be fully familiar with the law's requirements by now, in part because they received frequent instruction from the Federal courts finding that EPA has, during the last three years, violated them.

Response: EPA has provided meaningful opportunities for input during the public comment period for both the 2018 proposed and the 2020 supplemental proposed rulemaking. The preamble for both these proposals includes a discussion of the importance of scientific integrity. The final rule further elaborates and provides the rationale for this action. In addition, EPA is providing a response to comments to address all the comments received during both the initial proposal and the supplemental.

This is a rule of internal procedure promulgated under the EPA's housekeeping authority, and imposes no enforceable duty on any state, local, or tribal governments or the private sector. Additionally, this rule does not require the EPA or other parties to disclose or host data. Hence, this rule does not impose costs on the EPA or any other party to make such data available. As described in the preamble discussion of benefits and costs, the EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small.

15.2.2 Paperwork Reduction Act

Comment: Commenters (11894, 12464) contend that the EPA has also failed to comply with the Paperwork Reduction Act (PRA), 44 USC §§ 3501 et seq. Commenter (11894) contends that the PRA imposes obligations on every federal Agency whenever the Agency proposes measures that will lead to the submission to the Agency of information from 10 or more individuals (or

³⁵⁸⁴ *SEC v. Chenery Corp.*, 318 U.S. 80 (1943), *Citizens to Preserve Overton Park v. Volpe*, 401 U.S. 402 (1971), *Industrial Union Dept. v. API* (The commenter notes: frequently identified as "The Benzene Case"), 448 U.S. 607 (1980), and *Motor Vehicle Manufacturers Ass'n v. State Farm Mutual Automobile Insurance Co.*, 463 U.S. 29 (1983). See also, *Dept. of Commerce v. New York*, 588 U.S. ___, No. 18-966 (2019), noting that the Trump Administration's explanation for adding a census question "appears to have been contrived" and a pretext.

entities) and that the PRA requirements apply even when the submission of information by the public is voluntary. The commenter states that the proposed rule would plainly impact the practices and actions of scientists, economists, and a wide range of others with respect to the amount of information submitted to EPA.

According to commenter (12464), the proposal would create new reporting requirements that would apply to multiple persons who would have to make the underlying data available, either to the public in general, or through a tiered access system. According to the commenter, such reporting and data management procedures are costly and, in some instances, inconsistent with other federal policies governing information use and dissemination.

Commenter (11894) states that EPA should be required to prepare and submit an Information Collection Request (ICR) that estimates the burden expected to result from the proposed rulemaking. Further, the commenter states that the ICR should be available for public comment. The commenter (11894) contends that the proposed rule totally ignores how it would impact existing reporting and recordkeeping practices. According to the commenter, if the current practices for reporting and recordkeeping of scientific research important for environmental regulation were deemed adequate, this proposed rule would be unnecessary; if they are not, EPA must intend the proposal to change those practices. The commenter notes that the PRA requires agencies to address how its proposal would modify those practices and to show why the proposal makes as little change as considered absolutely necessary. The commenter asserts that the EPA's proposal does not even begin to address this requirement.

Response: This action does not contain any information collection activities and therefore does not impose an information collection burden under the PRA. Further, as stated in the preamble, this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. The EPA is only required to determine if such a mechanism was available, should a subject matter expert decide to use it.

15.2.3 Additional Related Comments

Comment: Commenter (12720) states that there is no legal authority under 5 U.S.C. 301; 5 U.S.C. App.; Pub. L. 98–80, 84 Stat. 2086 to adopt regulation under the proposed definition of “[i]nfluential scientific information”, “data.”, or capable of being substantially reproduced”.

Response: As explained in the final rule preamble, EPA is not relying on 5 U.S.C. 301 in promulgating this internal procedural rule. Rather, EPA is promulgating this rule in accordance with its authority to promulgate regulations governing its internal affairs, as conferred upon EPA in the Reorganization Plan No. 3, 84 Stat. 2086 (July 9, 1970), which established the EPA.

Comment: Commenter (11482) notes that EPA's lack of analysis may constitute a violation of the APA and Executive Order requirements for promulgation of Agency rules.³⁵⁸⁵

Response: This is a rule of internal procedure promulgated under the EPA's housekeeping authority, and imposes no enforceable duty on any state, local, or tribal governments or the private sector. Hence, this rule does not impose costs on any party other than EPA. As described in the preamble discussion of benefits and costs, the EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small.

³⁵⁸⁵ 5 U.S.C. § 553; Executive Order 12866: Regulatory Planning and Review (E.O. 12866) (1993) (as amended by E.Os. 13258 (2002) and 13422 (2007)); Executive Order 13563: Improving Regulation and Regulatory Review (2011); Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations (1994); Executive Order 13045: Protection of Children from Environmental Health Risks and Safety Risks (1997).

Chapter 16: Federal Transparency and Data Integrity Laws

The 2018 proposal states that:

The best available science must serve as the foundation of EPA’s regulatory actions.³⁵⁸⁶ Enhancing the transparency and validity of the scientific information relied upon by EPA strengthens the integrity of EPA’s regulatory actions and its obligation to ensure the Agency is not arbitrary in its conclusions. By better informing the public, the Agency in enhancing the public’s ability to understand and meaningfully participate in the regulatory process.³⁵⁸⁷ In applying the best available science to its regulatory decision-making, EPA must comply with federal transparency and data integrity laws, and must also ensure that its decision-making is marked by independence, objectivity, transparency, clarity, and reproducibility. (83 FR 18769, April 30, 2018)

The EPA solicited comment on the proposal and how it can best be promulgated and implemented in light of existing law and prior Federal policies that already require increasing public access to data and influential scientific information used to inform federal regulation. (83 FR 18768, April 30, 2018)

This section provides responses to comments on existing transparency and data integrity laws. These comments are organized according to the following topics:

- Federal Laws and Law-Related Policies Already Address Data Concerns
- Information Quality Act (IQA), EPA’s Information Quality Guidelines
- OMB Circular A-110, Freedom of Information Act (FOIA)
- OMB Memorandum 3-13
- Safe Drinking Water Act Regulations Have a Strong Scientific Basis and the Act Outlines How the Information is to be Shared

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

³⁵⁸⁶ See Exec. Order No. 13563, 76 FR 3821 (Jan. 21, 2011). “Our regulatory system must protect public health, welfare, safety, and our environment while promoting economic growth, innovation, competitiveness, and job creation. It must be based on the best available science.”

³⁵⁸⁷ See Memorandum for the Heads of Executive Department and Agencies on Scientific Integrity (Mar. 9, 2009). “If scientific and technological information is developed and used by the Federal Government, it should ordinarily be made available to the public. To the extent permitted by law, there should be transparency in the preparation, identification, and use of scientific and technological information in policymaking.”

16.1 Federal Laws and Law-Related Policies Already Address Data Access Concerns

Comment: Several commenters (2908, 6111, 6145, 6188, 6194, 6915, 6916, 9227) contend that federal laws and law-related policies already govern the quality of and access to raw data, including the Information Quality Act (IQA), Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity, or Information Disseminated by the Environmental Protection Agency (Oct. 2002) (EPA’s Information Quality Guidelines),³⁵⁸⁸ Office of Management and Budget (OMB) Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards (“OMB Uniform Guidance”), Data Access Act, OMB Circular A-110,³⁵⁸⁹ Freedom of Information Act (FOIA), and OMB Memorandum 13-13.³⁵⁹⁰

Response: The EPA also agrees with commenters that government agencies are making great strides in data transparency pursuant to the laws and guidance cited by the commenters. However, EPA promulgated this rule because improvements can still be made over existing policies and mechanisms. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions.

Commenters (2249, 2908, 2906, 4931, 5120, 6145, 6147, 6149, 6168, 6194, 6373, 6899, 6925, 9227) suggest that the proposal is unnecessary, inconsistent and/or redundant considering existing laws, regulations, guidance or ongoing work by the scientific community that advance transparency-related goals. It is unclear to what extent this proposed rule would be redundant to or conflict with these existing initiatives. Commenters also assert that the proposed rule would unnecessarily add another layer of federal oversight to the vast collection of existing federal regulations.

Response: The EPA agrees with commenters that government agencies are making great strides in data transparency pursuant to the laws and guidance cited by the commenters. However, EPA promulgated this rule because improvements can still be made over existing policies and mechanisms. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most

³⁵⁸⁸ U.S. Env’tl. Prot. ³⁵⁸⁹ See OMB, Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, 78 Fed. Reg. 78,590, at 78,631, 2 C.F.R. § 200.315(e)(3) (Dec. 26, 2013) (guidance incorporated from OMB, OMB Circular A-110, Uniform Administrative Requirements for Grants and Agreements With Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations § 36(d) (as amended Sept. 30, 1999)) [hereinafter “OMB, Uniform Guidance”].

³⁵⁹⁰ Memorandum from Sylvia M. Burwell, Dir., Steve VanRoekel, Fed. Chief Info. Officer, Todd Park, U.S. Chief Tech. Officer & Dominic J. Mancini, Acting Administrator of the Office of Info. & Regulatory Affairs, Exec. Office of the President, Office of Mgmt. and Budget, Open Data Policy—Managing Information as an Asset (May 9, 2013), available at <https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/memoranda/2013/m-13-13.pdf>.

impactful of EPA's assessments and regulatory actions. The provisions of the final rule will not prevent consideration of the best available science and build upon, and do not supersede, existing executive orders and other policies that focus on transparency. Further, as stated in the preamble, this rulemaking is not intended to develop the Agency's interpretation of best available science. The EPA will continue to consider all peer-reviewed science evaluated in the EPA's influential scientific information and significant regulatory actions, consistent with existing study quality assessment factors and the statutory mandates specific to that rulemaking. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Commenter (6133, 6194, 6880) state that the provisions in the proposed rule that would exclude consideration of relevant scientific findings and conclusions if the underlying data is not publicly available are inconsistent with the 2009 Presidential Memorandum for the Heads of Executive Departments and Agencies on Scientific Integrity³⁵⁹¹ cited in the proposal.

Commenter (6133) states that the sentences quoted from the 2009 Presidential Memorandum in footnote 2 of the proposal are inaccurately used to support the proposed rule.

Response: In consideration of public comments, the EPA made several modifications of the original proposed text to more fully consider data privacy concerns. The EPA agrees that it is important not to categorically exclude any study because the data underlying a study at the stage required by this rulemaking may not be available for independent validation. Therefore, rather than finalizing an approach that would provide for a categorical exclusion of these studies, the EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The EPA is also including consideration of privacy concerns in the Administrator's exemption in 40 CFR 30.7. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations. The requirements in this final rule provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule

³⁵⁹¹ 2009 Presidential Memorandum for the Heads of Executive Departments and Agencies on Scientific Integrity, 74 Fed. Reg. 10,671 (Mar. 9, 2009)

provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings. The EPA disagrees with the commenter's suggestion that implementation of the final rule would lead to suppression or alteration of scientific findings by political officials.

16.2 Information Quality Act (IQA) and Implementation Guidelines

16.2.1 Information Quality Act

Comment: Commenters (6126, 6194, 6916, 9227, 12727, 12430, 13788) state that the rule provisions are inconsistent with the IQA, FOIA, and OMB and EPA guidelines implementing the. The commenters contend that adding additional regulatory requirements and constraints is both impractical and unnecessary to achieve those goals.

Response: EPA disagrees that the final rule is inconsistent with the IQA. Implementation of the final rule will help to maximize both the quality, objectivity and utility of the pivotal science underlying the Agency's significant regulatory actions and influential scientific information. EPA's implementation of the final rule will be consistent with the Agency's obligations under the statutes cited by the commenter because the final rule does not require that the Agency disseminate information that is subject to limitations on disclosure such as confidentiality and privacy. The final rule also does not require the categorical exclusion of studies which was included in the 2018 proposal. The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

16.2.2 Proposed Rule Consistency with OMB Information Quality Guidelines

Comment: Commenters (0555, 0844, 6141) support EPA's position that the proposal is consistent with or not radically different from the OMB Guidelines. Commenters (6102, 6150) assert that previous Administration commitments to improve transparency have included several policies that support increased transparency, including the OMB Guidelines, and that the proposed rule will help ensure that the policy goals reflected in the OMB Guidelines and memoranda are implemented as part of EPA's rulemakings.³⁵⁹²

Commenter (6364) emphasizes that EPA's regulatory science should be guided by and consistent with the OMB Guidelines, and they urge the EPA to reference this point in §30.10 of the rule to ensure that peer review satisfies the rigor of "independently validating key findings and ensuring

³⁵⁹² e.g. OMB's Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies; OMB's Memorandum, Open Data Policy – Managing Information as an Asset; The White House's 2009 Memorandum for the Heads of Executive Department and Agencies on Scientific Integrity; and OMB Circular A-110.

that the quality of published information meets the standards of the scientific and technical community.”³⁵⁹³

Response: EPA agrees that this rule is designed to build upon various guidelines on transparency and appreciates these comments. The role of independent peer review is addressed in 40 CFR 30.6 and it specifically directs the EPA to conduct peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review. The rule also gives the EPA discretion to conduct additional peer review of individual studies identified as pivotal science.

Comment: Commenters (1011, 4595, 6125, 6133, 6137, 6168, 6188, 6194, 6880, 6916, 9227, 12727) provide that EPA’s assertion that the cited OMB Guidelines are consistent with the proposal is incorrect nor does the Agency explain why it believes the rule is consistent with these guidelines.

Response: EPA does not agree that this rule is inconsistent with the OMB Guidelines, rather it will complement and augment them and other transparency efforts. As discussed in the preamble to the final rule, the rule requirements are not changing the pre-existing requirements of the OMB Final Information Quality Bulletin for Peer Review. The preamble to the Bulletin states that “the intensity of peer review is highly variable across journals” and “prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary.” Peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule. Therefore, the EPA is finalizing the role of independent peer review in 40 CFR 30.6. The provision directs the EPA to conduct peer review consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review. In order to account for the instances when the EPA determines that prior peer review was adequate, as defined by OMB, 40 CFR 30.6 gives the EPA discretion to conduct additional peer review of individual studies identified as pivotal science.

Additionally, in consideration of public comments, the EPA made several modifications of the original proposed text to more fully consider data privacy concerns. The EPA agrees that it is important not to categorically exclude any study because the data underlying a study at the stage required by this rulemaking may not be available for independent validation. Therefore, rather than finalizing an approach that would provide for a categorical exclusion of these studies, the EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The EPA is also including consideration of privacy concerns in the Administrator’s

³⁵⁹³ 67 Fed. Reg. 8453 (Feb. 2002).

exemption in 40 CFR 30.7. Because the final rule does not categorically exclude any studies, including human health studies, from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Also, in consideration of public comments, the EPA provided a discussion of the costs and benefits of this rule in the preamble to the final rule. Briefly, this is a rule of internal procedure promulgated under the EPA's housekeeping authority and imposes no enforceable duty on any state, local, or tribal governments or the private sector. Additionally, this rule does not require the EPA or other parties to disclose or host data. Hence, this rule does not impose costs on the EPA or any other party to make such data available. The EPA recognizes there will be some incremental review and administrative costs to the Agency but anticipates these will be small.

Codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety. The rule requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical and privacy considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

Finally, the EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. This final rule does not interpret or apply the provisions of any environmental statutes, nor does it modify the Agency's interpretations of "best available science." It therefore cannot conflict with the Data Quality Act. The EPA will continue to consider all peer-reviewed science, consistent with existing study quality assessment factors and corresponding statutory mandates. The EPA will then identify and consider "pivotal science in accordance with the provisions of this rule," unless the implementation of the rule conflicts with statutory requirements and associated implementing regulations. As this rule makes clear, if implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

16.2.3 EPA Information Quality Guidelines-Specific Comments

Comment: Commenter (5374) states that the proposed requirements are consistent with the EPA Guidelines³⁵⁹⁴ and support for the proposed rule. The commenter provides that the EPA issued

³⁵⁹⁴ EPA, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency, at 21-23 (2005) (EPA Information Quality Guidelines), <https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf>.

these guidelines to formalize and maximize the quality of disseminated information, particularly with respect to the objectivity, utility, and integrity of scientific data. The commenter asserts that no matter who conducts the work, the EPA should have access to all raw data so that it has the opportunity to review and independently verify data, results and conclusions before relying upon them in a pesticide risk assessment.

Response: EPA agrees that this rule is consistent with and augments EPA Guidelines on transparency. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. As this rule makes clear, if implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations.

As discussed in the preamble to the final rule, the EPA maintains that the appropriate stage of data is the stage consisting of the raw data modified to remove obvious errors. The EPA disagrees with the commenter that the raw data are the appropriate stage of data because third parties who are not familiar with the data collection process may not be able to appropriately identify errors in a raw dataset, which may inadvertently produce a skewed analysis.

Comment: Commenter (6903) asserts that the proposed rule is unnecessary because the EPA has already addressed the question of public data in its policies and guidelines. The commenter provides that the EPA Guidelines establish the Agency’s culture and practice to ensure the quality of data used and disseminated by EPA and delineate clearly the Agency’s commitment to public access to data. The commenter further states that the EPA Guidelines also establish a clear and effective policy that considers making data publicly available. For example, the commenter states that the EPA Guidelines provide that “[i]n cases where the Agency relies on proprietary models, these model applications are still subject to our Peer Review Policy.”³⁵⁹⁵

Response: EPA does not agree that this rule is unnecessary. As detailed in the preamble to the final rule, the rule requirements for the EPA’s independent evaluation of the availability of data are necessary and critical to prioritizing data transparency in the pivotal science underlying its significant regulatory actions and influential scientific information. The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency’s goal of greater transparency.

Comment: Commenters (6111, 6133) provide that the EPA Guidelines took the position that the standard set forth in the Safe Drinking Water Act (SDWA)— “the best available, peer-reviewed science”³⁵⁹⁶ – should apply to all the Agency’s risk assessments.

³⁵⁹⁵ EPA, *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency* (Oct. 2002), available at

<https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf>, at 47.

³⁵⁹⁶ 42 U.S.C. § 300g-1(b)(3)(A)(i).

Commenters (6160, 6137) assert that, according to the EPA Guidelines (2005), EPA uses a “weight-of-evidence” approach that “considers all relevant information and its quality, consistent with the level of effort and complexity of detail appropriate to a particular risk assessment.” EPA Guidelines 6.4. According to commenter (6137), the proposed rule contravenes these requirements and will prevent EPA from considering relevant information by precluding consideration of certain data. The commenter further states that, pursuant to the EPA Guidelines, EPA must ensure that the information it disseminates “is accurate, reliable and unbiased.” EPA Guidelines 6.4(A). To do so, it uses:

the best available science and supporting studies conducted in accordance with sound and objective scientific practices, including, when available, peer reviewed science and supporting studies; and (ii) data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies the use of the data).

Id.

Commenters (6137, 9227) assert that, given that the Proposed Rule eliminates from consideration any scientific study where the underlying data cannot be made publicly available, it undoubtedly precludes the use of the best available science in certain situations.

Commenter (6194) states that EPA’s guidance directs that “influential scientific, financial, or statistical information” should be held to a higher degree of quality and transparency standards³⁵⁹⁷ and that the EPA Guidelines clarify that “if access to data and methods cannot occur due to compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections, EPA should, to the extent practicable, apply especially rigorous robustness checks to analytic results and carefully document all checks that were undertaken.”³⁵⁹⁸

Commenter (6160) adds that the EPA Guidelines already address the transparency of data and methodology, including “(1) the source of the data used, (2) various assumptions employed, (3) the analytic methods applied, and (4) the statistical procedures employed.” The commenter asserts that, because the EPA already has these methods in place, the proposed rule does nothing to improve upon them while creating unnecessary obstacles for EPA’s consideration of the best available evidence for policy and rulemaking.

Response: This proposed rule will not prevent consideration of the best available science and will complement existing executive orders and other policies that focus on transparency. As stated in the preamble, this rulemaking is not intended to develop the Agency’s interpretation of best available science. The EPA will continue to consider all peer-reviewed science evaluated in the EPA’s influential scientific information and significant regulatory actions, consistent with existing study quality assessment factors and the statutory mandates specific to that rulemaking.

³⁵⁹⁷ Id. at 20-21.

³⁵⁹⁸ Id. at 21.

Additionally, EPA agrees that it is important not to categorically exclude any study because the data underlying a study at the stage required by this rulemaking may not be available for independent validation. Therefore, EPA is not finalizing the proposed option in the 2020 SNPRM that would categorically require that for studies to be considered pivotal science the underlying data would need to be available for independent validation. Because the final rule does not categorically exclude any studies from EPA's consideration, the Agency will not be prevented from evaluating and considering all quality, relevant studies when promulgating significant regulatory actions and developing influential scientific information. Further, the final rule only applies to dose-response data; therefore, all quality, relevant studies will continue to inform other aspects of the EPA's evaluations.

Comment: Commenter (6915) states that the rule provisions are inconsistent with the EPA's Information Quality Guidelines.³⁵⁹⁹ The commenter asserts that the guidelines direct the EPA to "ensure reproducibility according to commonly accepted scientific, financial, or statistical standards. . . . [I]f access to data and methods cannot occur due to compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections, EPA should, to the extent practicable, apply especially rigorous robustness checks to analytic results and carefully document all checks that were undertaken." Id. at 21.

Commenter (6188) states that, according to EPA's own IQGs, EPA "maintain[s] a robust quality system that addresses [information collected through contracts with EPA; information collected through grants and cooperative agreements with EPA; and information submitted to EPA as part of a requirement under a statute, regulation, permit, order or other mandate] by including regulatory requirements for quality assurance for EPA contracts, grants, and assistance agreements. This includes an Agency-wide Quality System that requires, among other things, a quality assurance manager and Quality Assurance Project Plan (QAPP) for projects and tasks that involve the use of environmental data, and a Peer Review System that requires major scientifically- and technically-based Agency work product to be peer reviewed.

Commenter (6145) asserts that the EPA's Information Quality Guidelines demonstrate that EPA is already required to have transparency in its reliance on scientific studies used in the establishment of regulations. The commenter notes that these safeguards are sufficient to ensure that the science relied upon by EPA is the best available science and that it is subject to peer review and available to the public. According to commenter for example, with regard to ensuring and maximizing the quality of "influential" information (which includes information in support of agency actions including rules).

Commenter (9227) asserts that, pursuant to EPA's guidelines, EPA must ensure that the information it disseminates "is accurate, reliable and unbiased." EPA Guidelines 6.4(A). The commenter contends that, given that the Proposed Rule eliminates from consideration any

³⁵⁹⁹ U.S. Env'tl. Prot. Agency, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency (Oct. 2002) [hereinafter Information Quality Guidelines], available at <https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf>.

scientific study where the underlying data cannot be made publicly available, it undoubtedly precludes the use of the best available science in certain situations.

Response: The EPA disagrees that the provisions of this rule are inconsistent with the EPA's IQGs or that the guidelines accomplish the same goals as the rule. As detailed in the preamble to the final rule, the rule requirements for the EPA's independent evaluation of the availability of data are necessary and critical to prioritizing data transparency in the pivotal science underlying its significant regulatory actions and influential scientific information. The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency.

Comment: Commenter (6147) asserts that EPA already has many policies in place that assure the best available science is used in all elements of its analysis, including the following:

- Risk Characterization Policy (USEPA, 1995).³⁶⁰⁰
- USEPA's Information Quality Guidelines (IQG) (USEPA, 2002).³⁶⁰¹
- USEPA Quality Policy (2008).³⁶⁰²

Response: The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. For example, the EPA's 2016 Plan to Increase Access to Results of EPA-Funded Scientific Research noted that "transparency is a core EPA value" and that increased availability of research data would accelerate scientific breakthroughs that support the Agency's mission and policymaking efforts. The EPA's Open Government Plan 5.0 also details the EPA's progress in implementing the tenets of the numerous data transparency initiatives in the federal government prior to 2018, including OMB M-10-06, the Office of Science and Technology Policy Memorandum of February 22, 2013, and OMB M-13-13.

The scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals and the emergence of organizations, such as the Center for Open Science, and international initiatives like Findable, Accessible, Interoperable, and Reusable (FAIR) data principles; Facilitate Open Science Training in European Research (FOSTER); and Guidelines for Transparency and Openness Promotion (TOP) in Journal Policies and Practices that incentivize greater transparency in research.

The EPA supports these efforts and is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes

³⁶⁰⁰ U.S. Environmental Protection Agency (USEPA). 1995. Policy for risk characterization. Science Policy Council, Washington, DC. USEPA. 2002.

³⁶⁰¹ <https://www.epa.gov/quality>

³⁶⁰² <https://www.epa.gov/sites/production/files/2015-10/documents/21060.pdf>

unintended consequences, and informs future transparency requirements. As more fully discussed in the preamble of the final rule, the EPA also agrees with commenters that the scientific community and government agencies are making great strides in data transparency; however, improvements can still be made over existing policies and mechanisms. Many scientific publications, for example, require authors to make a data availability or data access statement, which discloses where and under what conditions the underlying study data are available. Yet the EPA cannot solely rely on data availability statements made in published research because initiatives toward greater data sharing and transparency amongst scientific journals and international organizations are still being implemented, are inconsistently enforced, and the true accessibility of data in a public repository is still limited. Further, as detailed in OMB's Final Information Quality Bulletin for Peer Review, "the intensity of peer review is highly variable across journals" and "prior peer review and publication is not by itself sufficient grounds for determining that no further review is necessary." Peer review by either journals or independent advisory committees, such as the EPA's Science Advisory Board, is typically conducted without access to the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information). Should peer reviewers have access to the underlying data, they could conduct a more in-depth review that may include independently reanalyzing the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of uncertainty in the original study. Thus, peer review is not considered a replacement for the data availability requirements of this rule and implementation of this rule could provide independent peer reviewers as well as subject matter experts within the EPA and the public with the opportunity to evaluate pivotal science in ways that otherwise would not have typically occurred with existing EPA or peer review processes.

16.3 OMB Circular A-110, Freedom of Information Act

Comment: Commenters (0569, 6194, 6915, 9227) provide that, in 1999, the Shelby Amendment or Data Access Act (attached as a rider to the Omnibus Appropriations Act of fiscal year 1999, P.L. 105-277), mandated that OMB Circular A-110³⁶⁰³ be amended to ensure that all published data from federally sponsored research used for policy and rulemaking be made available through procedures established under the FOIA. Commenter (0569) asserts that this process accomplishes EPA's goal of allowing the public to verify the soundness of science underlying policy decisions. According to commenter (6915), the law promotes public access while protecting privacy by excluding medical and business-related confidential data from disclosure. See 2 C.F.R. § 200.315 (which superseded OMB Circular A-110, which has now been incorporated into the Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards). Specifically, commenter (6194) states that OMB Circular A-110 guidance defines "research data" in part as "recorded factual material commonly accepted in the scientific community as necessary to validate research findings," but exempts from disclosure any "medical information and similar information the disclosure of which would

³⁶⁰³ The referenced language is now located at 2 CFR 200.337, the corresponding section of Uniform Administrative Requirements for Grants and Agreements with Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations (the successor regulations that incorporate the contents of OMB Circular A-110).

constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study.”³⁶⁰⁴

Response: EPA does not agree that FOIA mechanisms already achieve the goals of this rule. Availability via FOIA mechanisms does not mean that these data are immediately or easily available to the public. Some commenters cited the EPA’s Freedom of Information Act Annual Report Fiscal Year 2019 (2020), which lists a median response time for “expedited processing” of FOIA requests by the EPA as 493 days (Ref. 42). Also, FOIA applies to federal agencies and cannot be used to compel other entities to release information. For these reasons, the EPA is modifying the definition in the final rule to add the following at the end of the definition: “the public must be able to access the information on the date of publication of the proposed rule for the significant regulatory action or dissemination of the draft influential scientific information for public review and comment” to increase the opportunity for independent validation to occur closer in time to the development of significant regulatory actions and influential scientific information.

Comment: Commenter (6955) states that there is no discussion of FOIA provisions of OMB Circular A-110 for obtaining research data. Hence, according to the commenter, there is no discussion of the differences between the two approaches and no claim that the new proposal offers any added value. The commenter asserts that the omission of discussion of OMB’s FOIA provisions, as covered (briefly) in OMB Circular A-110 (OMB 1999, Fischer 2013), is an indication that the proposed rule is incomplete and another indication that it would be best if it were withdrawn. The commenter asserts that it appears that the proposed public-access part of the proposal is only needed, if the restriction of all studies to compliant ones survives to the final rule. In any case, according to the commenter, by omitting mention of the OMB and IQA FOIA options, the proposed rule gives the impression it is a public-access rule, rather than a study exclusionary rule.

Response: EPA disagrees that the final rule is incomplete because there is no discussion of FOIA. The final rule also does not require the categorical exclusion of studies which was included in the 2018 proposal. The Agency will consider all studies relevant to the development of a significant regulatory action or influential scientific information but will give greater consideration to the studies identified as pivotal science when the underlying dose-response data are available for independent validation. Also see the preceding comment response.

16.4 Open Data Policy

³⁶⁰⁴ OMB, Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, 78 Fed. Reg. 78,590, at 78,631, 2 C.F.R. § 200.315(e)(3) (Dec. 26, 2013) (guidance incorporated from OMB, OMB Circular A-110, Uniform Administrative Requirements for Grants and Agreements With Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations § 36(d) (as amended Sept. 30, 1999) [hereinafter “OMB, OMB Circular A-110”]) [hereinafter “OMB, Uniform Administrative Requirements”].

Comment: Commenter (6915) states that OMB Memorandum 13-13,³⁶⁰⁵ mandates, among other things, broader public access to federal and federally funded data and information and provides that information collection should be done in a way to support information dissemination. The commenter states that this includes building redaction, slicing, and exporting into how data are collected to reduce the cost of public access later on. The commenter states that the memorandum also requires agencies to create data catalogs to include datasets “that can be made publicly available but have not yet been released.” Id.

Response: As EPA states in the preamble, this rule builds upon prior EPA actions in response to government-wide data access and sharing policies, including OMB Memorandum 13-13. However, improvements can still be made over existing policies and mechanisms. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions.

³⁶⁰⁵ Memorandum from Sylvia M. Burwell, Dir., Steve VanRoekel, Fed. Chief Info. Officer, Todd Park, U.S. Chief Tech. Officer & Dominic J. Mancini, Acting Administrator of the Office of Info. & Regulatory Affairs, Exec. Office of the President, Office of Mgmt. and Budget, Open Data Policy—Managing Information as an Asset (May 9, 2013), available at <https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/memoranda/2013/m-13-13.pdf>.

Chapter 17: Consistency with Recommendations of Third-Party Organizations Who Advocated for Open Science and Policies Adopted by Major Scientific Journals

The proposal states that it “takes into consideration the policies or recommendations of third-party organizations who advocated for open science” and “the policies recently adopted by some major scientific journals, spurred in some part by the ‘replication crisis.’” 83 Fed. Reg. at 18,770. The proposal specifically cites to web sites for proceedings of the *National Academy of Sciences*, *PLOS ONE (Public Library of Science)*, *Science*, *Nature* and *The Economist*. The proposal also states that “[t]hese include policies and recommendations from: The *Administrative Conference of the United States’ Science in the Administrative Process Project*; *National Academies’ Reports on Improving Access to and Confidentiality of Research Data, Expanding Access to Research Data, and Access to Research Data in the 21st Century*; the *Health Effects Institute*; *Center for Open Science*; members of the *Risk Assessment Specialty Section of the Society of Toxicology*, the *Dose Response Section of the Society for Risk Analysis*, and the *International Society for Regulatory Toxicology and Pharmacology*; and the *Bipartisan Policy Center’s Science for Policy Project*.” 83 Fed. Reg. at 18,770 n.10.

Comments were received on the notice of proposed rulemaking’s claim that the EPA took into consideration the policies and recommendations of cited third-party organizations and the scientific community. Some commenters provide specific comments on third-party organizations and scientific journals cited as supporting the proposal where as others supported or opposed the proposal’s claims more generally. Commenters also highlighted third-party and scientific community work and expertise and recommend that these experts be consulted in the development of the Policy on Regulatory Transparency. In this section these comments are organized according to the following topics:

- Clarification of “takes into consideration the policies or recommendations”
- Misrepresentation of Third-Party and Major Scientific Journal Recommendations

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

17.1 Clarification of “takes into consideration the policies or recommendations”

Comment: Commenters (6133, 6137, 6194, 6448, 6915, 6916, 9227) request clarification of the basis of how the cited third-party organizations and major journals are considered in the proposal.

Commenters (6133, 6194, 6448, 6915, 6916, 9227) note that the proposed rule states that it “takes into consideration the policies or recommendations of third-party organizations who advocated for open science,” but it is not clear which policies or recommendations were included as a basis for the rule beyond listing names of institutions.

Specifically, commenter (6133) states that the proposal does not explain how it takes into consideration the sources cited in footnotes 10-12. The commenter explains that, to the extent EPA is relying on these policies or recommendations, it has not provided enough information to evaluate that reliance and it must withdraw the proposed rule. The commenter further states that, consistent with the proposed rule’s other citations, EPA points to nothing in the policies or recommendations from these third-party organizations that supports the proposed rule’s preclusion of peer-reviewed science from consideration in regulatory decision making.

Commenter (6137) asserts that, not only is the proposed rule a drastic departure from EPA’s prior policies, positions, and procedures, but it likewise is predicated on irrational and unsupported conclusions. The commenter states that a close examination of generally applicable data access policies and guidelines – including policies and recommendations of third-party organizations and major scientific journals upon which EPA allegedly relies – reveals that EPA’s proposed rule is not based on a reasoned explanation and has no rational connection to facts in the record, but rather is entirely baseless.

Commenter (6194) argues that even when a specific report is referenced, such as the *National Academies’ Reports on Improving Access to and Confidentiality of Research Data, Expanding Access to Research Data, and Access to Research Data in the 21st Century*, the proposed rule fails to cite the specific sections EPA purportedly considered or relied upon or the specific policies embodied in these reports that are allegedly advanced by the proposed rule. *Id.* at 18,770 n.10. The commenter states that other references are similarly vague.

Commenters (6915, 9227) state that the proposal does not identify any groups or reports that advocate precluding consideration of non-public data in regulatory decision-making.

Commenter (9227) expresses that the EPA does not explain how EPA’s current use of science is inconsistent with any recommendations from third-party organizations or inadequate considering them. The commenter concludes that the EPA’s failure to provide any specific information or citations in support of its conclusory statements make it impossible to meaningfully comment on the support for EPA’s Proposal.

Response: EPA notes that the articles and third-party organizations cited in the April 30, 2018, notice of proposed rulemaking are not cited in the preamble of the final rule.

However, EPA referenced those sources in the April 30, 2018 notice of proposed rulemaking because EPA agrees with the general proposition advanced therein that increasing public access to the data underlying scientific studies is beneficial. The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

17.2 Misrepresentation of Third-Party and Major Scientific Journal Recommendations

17.2.1 General Comment Positions on Misrepresentation

Comment: Commenters (0670, 1589, 2787, 4591, 4831, 5172, 6046, 6125, 6126, 6133, 6137, 6155, 6166, 6168, 6880, 6912, 6915, 6916, 6924, 8281-PH20, 9227) assert that EPA misrepresents one or more of the third-party organizations and scientific journals/scientific sources cited by the EPA as supporting the proposed rule. One commenter (6155) notes that EPA does not actually state that the references support the rule, but only that they are "consistent" with it. Commenter (6125) notes that the proposal has included only an undifferentiated data dump of citations without identifying passages of relevance or explaining references to policies of other federal agencies. Commenters (6924, 6133, 6137, 6125, 6155, 6880) assert that the policies and recommendations of many of the cited third-party organizations do not support the EPA's proposal to preclude the consideration of peer-reviewed studies in regulatory decision making. They contend that in addition to misrepresenting these sources, the proposal rejects the policies or recommendations of many of the cited third-party organizations. Commenter (6133) asserts that all the cited scientific journal policies are for prospective publication, do not suggest disregarding consideration of studies without public data, and have exceptions to protect confidential or private information.

Commenters (2787, 6912, 6192, 6155) state that the proposal invokes policies from *Science*, and the *Proceedings of the National Academies of Science as being consistent with the proposed rule*, but each of these organizations has argued against, criticized, or distanced themselves from the rule. Commenter (6912) adds that, in addition to the criticism EPA received from the individuals, organizations, and publications it cited as supporting the proposed rule, virtually the entire scientific community opposed the proposed rule. The American Association for the Advancement of Science, sixty-nine public health and scientific groups, and almost 1000 individual scientists publicly opposed the rule. Many of these commenters note that the editors of all the scientific journals cited by EPA stated apropos of the proposed rule that "[e]xcluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes." Commenter (6912) further states that a co-author of the scientific articles cited by EPA stated that "[i]f the proposed rule is approved, science will be practically eliminated from all decision-making processes. Regulation would then depend uniquely on opinion and whim."

Commenter (6125) states that, upon examination, the other Executive Branch and EPA documents cited by EPA's proposal provide little support for its conclusions. According to the commenter, many of them expressly recognize that disclosure may not be possible, and no agency of the federal government that funds scientific research involving confidential health information provides for the automatic unfettered disclosure of data even when funding new studies. Instead, the commenter states that they make this a balancing judgment with the balancing factors being the added cost of disclosure, the feasibility of providing for disclosure, and the marginal gain in accuracy from disclosure. For example, the commenter states that the National Institutes of Health (NIH) policy allows investigators to promise subjects that their data will not be shared with other researchers, but only if the application provides an adequate justification.

Response: EPA agrees with the third-party organizations referenced in the April 30, 2018, notice of proposed rulemaking because EPA agrees with the general proposition that increasing public access to the data underlying scientific studies is beneficial. EPA notes that the articles and third-party organizations cited in the April 30, 2018, notice of proposed rulemaking are not cited in the preamble of the final rule.

The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

The articles and third-party organizations cited in the April 30, 2018, notice of proposed rulemaking are not cited in the final rule. The preamble of the final rule provides discussion (with citations) of how the scientific community has embraced greater data transparency.

17.2.2 Administrative Conference of the United States' Study

Comment: Commenters (6125, 6133, 6137, 6912, 6916) specifically refer to the study for the *Administrative Conference of the United States (ACUS)* as not supporting the EPA's proposal.

Commenters (6125, 6133, 6192) report that the author of the *ACUS' Science in the Administrative Process Project and the Bipartisan Policy Center's Science for Policy Project*,

Wendy Wagner, a law professor at the University of Texas, addressed EPA's use of her study as follows:

I really don't know what the problem is that they think they're fixing," she said, adding that many of her co-authors "would laugh and hoot" at some of the scientific ideas expressed in the rule.

They don't adopt any of our recommendations, and they go in a direction that's completely opposite, completely different," she told me after reading the rule. "They don't adopt any of the recommendations of any of the sources they cite. I'm not sure why they cited them.

For example, the commenters state that the *ACUS Science in the Administrative Process Project*, which EPA listed, recommends that agencies take a flexible approach to data disclosure: "To the extent practicable and in compliance with applicable legal restrictions, privileges, protections, and authorities, agencies should seek to provide disclosure of data underlying scientific research[.]" 78 Fed. Reg. 41,352, 41,358 (July 10, 2013). This recommendation thus states only that agencies should "seek to provide disclosure" of data "to the extent practicable" and acknowledges that many legitimate barriers to disclosure of data may exist. *Id.* Furthermore, ACUS contemplates scenarios where "data are not subject to legal or other protections" but where "the data's owners nonetheless will not provide such access." *Id.* In these cases, ACUS does not recommend that agencies deprive themselves of data. Rather, ACUS writes, "agencies should note [that the data's owner did not provide access] and explain why they used the results if they chose to do so." *Id.* Thus, the ACUS's policy in no way supports exclusion of studies simply because the underlying data is not publicly available.

According to the commenters, this recommendation thus states only that agencies should "seek to provide disclosure" of data "to the extent practicable" and acknowledges that many legitimate barriers to disclosure of data may exist. *Id.* Furthermore, ACUS contemplates scenarios where "data are not subject to legal or other protections" but where "the data's owners nonetheless will not provide such access." *Id.* In these cases, ACUS does not recommend that agencies deprive themselves of data. Rather, ACUS writes, "agencies should note [that the data's owner did not provide access] and explain why they used the results if they chose to do so." *Id.* Thus, the ACUS's policy in no way supports exclusion of studies simply because the underlying data is not publicly available. <https://intranet.ord.epa.gov/sites/default/files/2020-01/Creating%20a%20Dataset%20in%20ScienceHub%20for%20EPA%20Public%20Access.pdf>

Commenters (6137, 6916) state that the EPA contends that its proposed requirement to make data available is supported by the *ACUS' Science in the Administrative Process Project*. The commenters argue that the ACUS' policy does not support the exclusion of studies simply because the underlying data is not publicly available. The commenters assert that ACUS' policy supports the use of studies even when the underlying data cannot be made publicly available, including in cases where there are factors other than legal restrictions that limit the ability to publicly disclose data.

Response: The final rule does not reference the *Administrative Conference of the United States (ACUS) Science in the Administrative Process Project* or the *Bipartisan Policy Center's Science for Policy Project*.

With regard to concerns for cases that underlying data cannot be made publicly available, the Agency supports the use of restricted or tiered access for data and models that have confidential business information (CBI), proprietary data, or personally identifiable information (PII). Restricted or tiered access in this rule means that the underlying data or models are be available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

17.2.3 National Academies of Science (NAS) Reports

Comment: Commenters (4831, NAS, et al.) and other commenters (4591, 5172, 6046, 6924) express that EPA's contention that the *National Academies of Science (NAS) Report(s)* [Innovations in Federal Statistics: Combining Data While Protecting Privacy (NASEM, 2017b), and Federal Statistics, Multiple Data Sources, and Privacy Protections: Next Steps (NASEM, 2017c).] support the proposal is misleading. The commenters contend that there are important differences between the type of data that is the subject of the proposed rule and the data that is used strictly for statistical purposes that is the subject of the reports.

Commenter (4831) explains that the EPA's proposed rule references the NAS reports to identify current approaches for protecting confidentiality while providing data for statistical purposes, such as those used by the *Federal Statistical Research Data Centers*. The commenter states that the reports consider the kinds of data that are typically collected and acquired under pledges of confidentiality for exclusively statistical purposes – pledges that are backed by strong statutory protections, with criminal penalties for violations.

According to the commenters (4831), there are several differences in the confidential microdata collected from individuals and businesses by federal statistical agencies through surveys, versus data and results from the kinds of studies that are within the scope of the EPA proposed rule. The commenters assert that these differences have important implications about making data publicly accessible. The commenters state that what works well in the federal statistical environment may not translate effectively to EPA, where stakeholders might be strongly motivated to discount study results that run counter to their regulatory preferences.

In addition, the commenters (4831) assert that the EPA's proposed rule ignores the inherent risks involved in data disclosure, the everchanging risk landscape, and the efforts needed to mitigate those risks – all of which are discussed in the cited National Academies reports. For example, the commenters provide that the security of data held by federal agencies is exposed to new and evolving threats. In addition to cybersecurity concerns, the commenters state that computer scientists and cryptographers have demonstrated that statistical analyses of data sets that generate highly precise results – such as geographic specificity or other characteristics that identify

respondents – may result in privacy breaches (NASEM, 2017b; NASEM 2017c). The commenters report that this presents a new challenge that federal statistical agencies are just beginning to address.

Commenter (6924) asserts that the rule is not consistent with the principles of open science, inappropriately codifies how science should be conducted, and codifies science-policy decisions in direct conflict with consensus reports from the NAS. The commenter reports that the EPA cites NAS studies and deliberations on the very important issue of data sharing and transparency as supporting the proposal, but the commenter asserts that the NAS reports contain conclusions that are in contradiction to the rule, such as:

- Clear statements that unfettered public access to data for any purpose, as proposed in the rule, is inappropriate, risky and unjustified. For example their reports state: “Since unrestricted access can cause harm to individuals and also conflicts directly with respect for individual autonomy, it is not an appropriate policy,”³⁶⁰⁶ and “The panel concludes that no one way is optimal for all data users or all purposes,”³⁶⁰⁷ and “The actual data collected for statistical purposes from households, individuals, business establishments, and other organizations through censuses and surveys under a pledge of confidentiality are never made available to users.”³⁶⁰⁸
- Acknowledgement that all parties’ interests in and purposes for performing an analysis and/ or validation of data would not be beneficial, as assumed in the rule, and thus protections are required. For example: “If not carefully considered, a reanalysis may be used as a tool to delay action. It also requires the participation of the original investigators,”³⁶⁰⁹ and “[The panel recommends] restriction of access to public-use data to those who agree to abide by the confidentiality protections governing such data and the institution of meaningful penalties for willful misuse of those data.”³⁶¹⁰ This recommendation is meant to address potential use of data for non-research purposes, such as by marketers and companies for advertising.
- Assertion that simple de-identification of private information is not enough to protect an individual’s data, which is counter to statements in the rule: “Statistical disclosure

³⁶⁰⁸ Id. Pg. 66

³⁶⁰⁹ National Research Council. 2002. Access to Research Data in the 21st Century: An Ongoing Dialogue Among Interested Parties: Report of a Workshop. Washington, DC: The National Academies Press.
<https://doi.org/10.17226/10302>. Pg. 22

³⁶¹⁰ National Research Council. (2005). Expanding Access to Research Data: Reconciling Risks and Opportunities. Panel on Data Access for Research Purposes, Committee on National Statistics, Division of Behavioral and Social Sciences and Education. Washington, DC: The National Academies Press. Pg. 4

involves using data available outside the survey to breach the protection thought to have been afforded a survey data set by various data deletion and masking techniques.”³⁶¹¹

Commenter (4591) reports that the recommendations from one report cited in the proposed rule of the *National Academies of Science, Engineering, and Medicine*, “*Optimizing the Nation’s Investment in Academic Research*,” were incorporated into the *21st Century Cures Act* and discusses the potential burdens of data sharing policies, but it does not suggest that a policy such as the one being proposed by the EPA would be beneficial.

Commenters (5172, 6046) report that the proposed regulation cites a panel report published by the *National Academies*: “*Expanding Access to Research Data: Reconciling Risks and Opportunities*.” According to the commenters, rather than providing support for the proposal, the *National Academy Report* conflicts with the proposal. The commenters explain:

- The executive summary of the report makes an important statement: “Research using detailed confidential data is needed ... for well- informed policy making ...” EPA’s proposal conflicts with this statement; the proposal would deny the agency the use of studies that rely on confidential data.
- None of the report’s 19 recommendations call for the government to stop relying on studies that involve confidential data.

Response: EPA supports making data and model publicly accessible to allow for reanalysis for independent validation. EPA is also committed to protecting CBI and PII according to all existing rules and regulations. The Agency supports the use of restricted access for data and models that have CBI, proprietary data, or PII. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The EPA would like to emphasize that this rule does not impose requirements on any entity outside of EPA. This is a rule of internal procedures and does not direct or require any outside entity or EPA to establish data sharing mechanisms. Further, the rulemaking does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

The studies noted in these comments above and/or referenced in the 2018 proposed rule are not cited in the final rule or its preamble.

Panel on Data Access for Research Purposes, Committee on National Statistics, Division of Behavioral and Social Sciences and Education. Washington, DC: The National Academies Press. Pp. 59-60

17.2.4 National Research Council Reports

Comment: Commenter (6916) contends that two *National Research Council Reports* EPA cites also fail to support requiring release to the public of “data and models underlying scientific studies that are pivotal to the regulatory action.” According to the commenter, far from supporting the concept of allowing reliance on studies only where the data are available to the public, these reports suggest “exploiting the research potential of microdata and maintaining acceptable levels of confidentiality” and advocate “nuanced case-by-case judgment[s]” for releasing underlying data. Nor, according to the commenter, do the articles the Agency cites on the reproducibility of studies support its Proposal, and EPA does not explain why it thinks they do. In fact, the commenter asserts that at least one of the cited articles, by Steven Goodman,³⁶¹² is entirely irrelevant - it does not demonstrate that there is a problem with the reliability of science in support of Agency decision making, nor does it attempt to. Rather, the commenter states it discusses the confusion in the lexicon about reliability and attempts to more properly define the term “reproducibility.” The commenter asserts that in no way does it support eliminating consideration of studies because the underlying data is not publicly available.

Response: EPA shares with the National Research Council, support for making data and models publicly accessible to allow reanalysis for independent validation. The Agency supports the use of restricted access for data and models that have CBI, proprietary data, or PII. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. See Section III.A.1 of the preamble to the final rule for a full discussion of how the scientific community has embraced greater data transparency and numerous cited examples that support data transparency.

17.2.5 Health Effects Institute (HEI)

Comment: Commenter (5015) agrees with the continuing need to enhance transparency and data access, but notes that these issues are not new, and have been addressed now for over 15 years by administrations from both parties and by the scientific community:

- This has included *Guidelines for the Information Quality Act* adopted by the *Office of Information and Regulatory Affairs (OIRA)* in 2002, numerous actions by the scientific community and journals to enhance access, and most recently the requirements for enhanced data access across the Federal Government promulgated by the *Office of Science and Technology Policy (OSTP)* in February 2013
- The commenter would strongly urge EPA to review the progress already made under these several major initiatives, and to carefully consider whether or not there are

³⁶¹² Steven N. Goodman, et al., What does research reproducibility mean?, 8 SCI. TRANSLATIONAL MED. 341 (June 1, 2016).

additional efforts that could further enhance transparency, before proceeding with a final rule.

Commenter (6912) states that the president of the *Health Effects Institute* noted that because it is costly and difficult to protect patient privacy, the kind of data reanalysis the rule promotes should only be done sparingly.³⁶¹³ According to the commenter, while the *Health Effects Institute* has a policy not to take public positions on regulatory questions, its president stated that the *Institute's* own data policy, which EPA claims supports the proposed rule, is "not quite what 's being proposed here."^{3614,3615}

Response: As discussed in the preamble to the final rule, the EPA's *Open Government Plan 5.0* also details the EPA's progress in implementing the tenets of the numerous data transparency initiatives in the federal government prior to 2018, including the Office of Management and Budget (OMB) M-10-06, the Office of Science and Technology Policy Memorandum of February 22, 2013, and OMB M-13-13. The journal articles and their underlying data resulting from intramural and extramural research funded by EPA are made available to the public.

EPA is committed to protecting CBI and PII according to all existing rules and regulations. The Agency supports the use of restricted access for data and models that have CBI, proprietary data, or PII. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information. The EPA would like to emphasize that this rule does not impose requirements on any entity outside of EPA. This is a rule of internal procedures and does not direct or require any outside entity or EPA to establish data sharing mechanisms. Further, the rulemaking does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

It should be noted that this final rule does not require reanalysis of a study's underlying data. Lewandowsky et al. (2020) evaluated the cost-effectiveness of reanalysis studies under various scenarios and concluded that reanalysis studies are most cost-effective when they are focused on studies of the greatest interest to the scientific community (in this study, the number of citations

³⁶¹³ The *Health Effects Institute* has extremely relevant expertise with respect to the cost and difficulty of reanalysis, as it was chosen to reanalyze the Harvard Six Cities study and the American Cancer Society study on the mortality rates associated with fine particulate matter that the fossil fuel industry was so desperate to discredit. The reanalysis confirmed the studies' original findings. See, Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality, pgs. iii - iv, *Health Effects Institute* (June 2000).

³⁶¹⁴ Francie Diep, "Opponents Show Up in Force at a Hearing for the EPA's Controversial 'Secret Science' Rule," *Pacific Standard* (July 17, 2018), <https://psmag.com/environment/opponents-show-up-in-force-at-a-hearing-for-the-epas-controversial-secret-science-rule>

³⁶¹⁵ The *Health Effects Institute* receives roughly half of its funding from EPA and half from industry, including ExxonMobil. It is therefore unlikely to expect this group to be too critical of EPA or industry for fear of losing its funding. See, Sponsors *Health Effects Institute*, <https://www.healtheffects.org/about/sponsors> (viewed on July 30, 2018)

was a surrogate for interest)³⁶¹⁶. This finding is consistent with results in other studies that found and encouraged narrowing the focus of attempted reanalysis studies to those studies of greater significance (see preamble of final rule). In this final rule, rather than considering all studies that support the assessment of the relationship of a dose or exposure of a pollutant, contaminant, or substance to the magnitude of a predicted health or environmental impact as “pivotal science,” the EPA is balancing transparency and feasibility by focusing on those studies that inform the quantitative relationship between the dose or exposure of a pollutant, contaminant, or substance and an effect.

17.2.6 Center for Open Science

Comment: Commenter (6137) provides that the *Center for Open Science* does not advocate for excluding science merely because the underlying data is not public, but rather counsels flexibility in determining what level of transparency is appropriate for a given study. The commenter explains that its Transparency and Openness Promotion (TOP) Guidelines for journals “recognize[] that not all of the standards are applicable to all journals or all disciplines. Therefore, the commenter explains that rather than advocating for a single set of guidelines, the TOP Committee defined three levels for each standard.” These levels “provide flexibility for adoption depending on disciplinary variation.” The commenter further explains that the *Center for Open Science* has invited journals to “suggest revisions that improve the guidelines or make them more flexible or adaptable for the needs of particular subdisciplines.” As with other organizations upon which EPA relies, it too has adopted a flexible approach to transparency and thus provides no support for EPA’s rigid exclusion.

Commenter (6912) states that the executive director of the *Center for Open Science*, whose policies were cited as supporting the proposed rule, stated that it was “20 percent off the rails.”³⁶¹⁷

Commenter (1589) states that the proposed rule cites open science advocates in footnote 10 and changes made in scientific journals in footnote 11, without understanding them or discussing their recommendations and conclusions.

Commenter (6360) states that, while all EPA applications of science should be covered by this rulemaking, they recommend that EPA draw from (or adopt) existing transparency screening tools developed by consensus in the scientific community to further define the scope and applicability of the rule’s requirements.

Specifically, the commenter (6360) states that, many scientific institutions have developed requirements that scientists must follow to publish their claims in participating journals. The commenter states that there are several examples of such systems that have been developed with minimum levels of transparency to ensure a claim can be objective and reproducible.

³⁶¹⁶ Lewandowsky, S. and Oberauer, K. (2020). Low replicability can support robust and efficient science. *Nat Commun* 11, 358. <https://doi.org/10.1038/s41467-019-14203-0>.

³⁶¹⁷ Daniel Engber, “Could Scott Pruitt Have a Point,” *Slate* (May 14, 2018), <http://www.slate.com/technology/2018/05/does-the-epas-call-for-transparency-in-science-make-any-sense.html>

The commenter (6360) points out that one important, open source system, the TOP guidelines, has adopted by over 5,000 major scientific organizations and journals. The commenter states that the TOP guidelines include eight standards, each with three levels of increasing stringency. The commenter states that Journals select which of the eight transparency standards they wish to adopt for their journal and select a level of implementation for each standard. For example, the commenter states that the scientific journal *Science* adopted most of the Level III TOP standards effective January 1, 2017. According to the commenter, claims made in a journal requiring Level III disclosure are more likely to be recognized as scientific facts than those published to Level I standards and the TOP Level II and Level III requirements mirror somewhat the applicability of the proposed standards in EPA's rulemaking. The commenter recommends that EPA require Level III transparency for all significant regulatory actions, and that all other EPA policy decisions have at least Level II standards for transparency to the public. The commenter states that as EPA takes comment on a proposed decision and notes that the underlying judgements in the applied science meet Level II criteria, the public could evaluate the claims and provide valuable feedback to EPA regarding the appropriate rigor of its data transparency procedures.

The commenter (6360) asserts that the TOP criteria require researchers to post data, analytic methods, and research materials to a trusted depository. The commenter recommends that for EPA applications of science, this depository should be the public docket of a proposed rule or the accompanying administrative record associated with a proposed decision. However, for sensitive information, the commenter recommends that EPA adopt the depository standards in common use by other federal agencies, journals, and EPA itself.

Response: EPA shares with the third-party organizations, support for making data publicly accessible to allow reanalysis for independent validation.

The Agency agrees that it is important not to categorically exclude any study because the underlying dose-response data at the stage required by this rulemaking may not be available for independent validation. EPA acknowledges and agrees with commenters that there may be pivotal science where the underlying data are not publicly available or available through restricted access. The final rule is limited to dose-response data and, as no studies are categorically excluded from consideration, the EPA will continue to rely on the full body of the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. The EPA will also consider the degree to which pivotal science is available and will give greater consideration to pivotal science for which the underlying dose-response data are available, as described in the rule.

The Agency supports the use of restricted access for data and models that have CBI, proprietary data, or PII. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (6362) suggests that EPA revise its statement that the proposed rule “takes into consideration the policies or recommendations of third-party organizations who [sic] advocated for open science.” The commenter states that the recommendations referenced by EPA actually emanate from a survey of the members of three professional organizations whose memberships represent repositories of knowledge and experience in regulatory assessment. As such, the commenter requests that reference 10 in EPA’s proposal be revised to also cite the publication, *Expert Opinion on Regulatory Risk Assessment, A Survey by the Center for Media and Public Affairs (CMPA) and Center for Health and Risk Communication (CHRC) at George Mason University* (December 6, 2013).

Response: Thank you for the recommendation. The final rule does not cite these references.

17.2.7 Risk Assessment Specialty Section of the Society of Toxicology and Dose-Response Specialty Group (DRSG) of the Society for Risk Analysis (SRA)

Comment: Commenters (1945, 1949, 6137) dispute that the EPA cites “policies and recommendations from . . . members of the Risk Assessment Specialty Section of the Society of Toxicology, the Dose Response Section of the Society for Risk Analysis, and the International Society for Regulatory Toxicology and Pharmacology[.]” 83 Fed. Reg. at 18,770, n.10. The commenters assert that responses to an online poll by individuals do not represent endorsement of Society of Toxicology (SOT), Dose-Response Specialty Group (DRSG) of the Society for Risk Analysis (SRA).

Commenter (6137) asserts that, in reality, these “policies and recommendations” are merely responses to an online questionnaire by a limited number of members of the three societies. The commenter recommends that the EPA not rely on a limited set of responses to an online poll, especially when the Agency does not possess information about conflicts of interest among respondents.

Commenter (1945, SOT) objects to Footnote 10. The commenter argues that the footnote ascribes support for the proposed rule from “members of the *Risk Assessment Specialty Section of the Society of Toxicology*.” The commenter states that this is incorrect. The commenter, who represents the *SOT*, asserts that while our individual members are free to support or oppose issues as they see fit, it is not appropriate to infer that this constitutes an endorsement from either the *Specialty Section* or the *SOT* as a whole. The commenter respectfully requests that any and all references to “members of the *Risk Assessment Specialty Section of the Society of Toxicology*” be removed from the Final Rule.

Commenter (1949), the current Chair of the DRSG of the SRA, reports that the DRSG has never adopted any “policies or recommendations” on this or any other topic (see <http://www.sra.org/drsg>). According to the commenter, although “members of” the DRSG may have made statements on this topic in their personal or professional capacities, views of individual members should not be misconstrued as representing the view of the DRSG or of the SRA. Moreover, the commenter explains that the DRSG has a broad membership (including employees of the Environmental Protection Agency) that may have diverse views on this topic.

Commenter (1949) requests the following:

- In the Final Rule and any accompanying preamble text, EPA removes any and all references to the “Dose-Response Section [sic] of the Society for Risk Analysis.”
- In the comment response prepared for the rule, EPA clarify the record that “third party organizations” whose policies and recommendations were considered do not include the Society for Risk Analysis or the Dose-Response Specialty Section.

Response: The final rule does not include references to the members of the Risk Assessment Specialty Section of the Society of Toxicology, the Dose Response Section of the Society for Risk Analysis, and the International Society for Regulatory Toxicology and Pharmacology.

17.2.8 Bipartisan Policy Center Report

Comment: The *Bipartisan Policy Center (BPC)* (0670, 6126) and other commenters (6133, 6137, 6166, 6880, 6915, 6916, 9227) assert that the proposed rule is not consistent with the *BPC Report*. The commenter suggests that EPA follow the procedures the BPC took to developing the report and consider the recommendations in the report which are relevant to EPA.

Commenter (0670, BPC)) reports that the EPA’s press release for the proposed rule states that “Strengthening Transparency in Regulatory Science” is “consistent with ... recommendations from” the *BPC Report*. The commenter further reports that the “Background” section of the *Federal Register* notice for the proposed rule states: “The proposed rule takes into consideration the policies or recommendations of third-party organizations who advocated for open science” and cites the *BPC Report*, among others. The commenter states that they want to be clear that the proposed rule is not consistent with the *BPC Report* in substance or intent. Other commenters (6133, 6166, 6915, 9225, 9227) referred to the BPC comment stating that EPA had mischaracterized the *BPC Report*. One of these commenters (6915) states that EPA’s false assertion of consistency with the policies and positions of leading science groups misleads the public and inhibits their informed participation

Several commenters (0670, 6166, 9225, 9227, 6125, 6137) assert that while the *Science for Policy Project* panel encouraged greater transparency and access to data, the report never suggested excluding studies from consideration in developing regulations if data from those studies were not publicly available. The commenters assert that the BPC notably concluded in its comments on this proposal that the proposal misrepresented its conclusions:

While the *Science for Policy Project* panel encouraged greater transparency and access to data:

The report never suggested excluding studies from consideration in developing regulation if data from those studies were not publicly available. Indeed, the panel’s overarching recommendation for assembling the “best available science” reads: “Agencies and their scientific advisory committees should cast a wide net (emphasis added) in reviewing studies relevant to regulatory policy, and should make their methods for filtering and evaluating those studies more transparent.”

Commenter (6880) states that the *BPC's Science for Policy Project* states “[s]tudies used in the formulation of regulation should be subject to data access requirements equivalent to those under the Data Access Act (Shelby Amendment) and its implementing circular regardless of who funded the study.” The commenter asserts that the implementing circular is *OMB Circular A-110* (<https://www.gpo.gov/fdsys/pkg/FR-1999-10-08/pdf/99-26264.pdf>), which directs federal agencies to use and share research data but specifically notes that “research data” do not include trade secrets and “[p]ersonnel and medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.” (<https://bipartisanpolicy.org/wpcontent/uploads/sites/default/files/BPC%20Science%20Report%20fnl.pdf>.)

Commenter (6916) states that the *BPC Report* cited by the Agency recommends that decisionmakers should “cast a wide net” and “base policy on a thorough review of all relevant research and provisions of the relevant statutes,” giving peer reviewed papers “great weight,” but nowhere promotes the idea that sensitive or confidential raw data should be publicly released as suggested by EPA’s proposed rule. According to the commenter, to the contrary, the paper recommends reliance on existing authorities and guidance, such as the *Data Quality Act* and the *OMB Guidelines*.

Commenter (6103) references the fact that the think tanks whose research was used to justify this new rule have said that they do not support the proposal. As an example, the commenter states that the BPC, whose research was used to support the supposed need for transparency, has stated in their comments on this proposal that the substance and intent of their research is not consistent with the administration's new policy. The commenter states that the BPC report from 2009 cited by EPA in the proposed rule supports looking at a wide array of data and making the method of evaluation more transparent, which does not coincide with the 'transparency' the EPA proposed rule seeks to promote. The commenter asserts that the EPA should use the best available science in the most effective way to truly fulfill its mission of protecting human health and the environment.

Response: The final rule does not reference the Bipartisan Policy Center’s Science for Policy Project for policies and recommendations from third party organizations that were taken in consideration. The Bipartisan Policy Center is mentioned once, but only in noting that the Center was mentioned by a public commenter.

The Agency agrees that it is important not to categorically exclude any study because the underlying dose-response data at the stage required by this rulemaking may not be available for independent validation. EPA acknowledges and agrees with commenters that there may be pivotal science where the underlying data are not publicly available or available through restricted access. The final rule is limited to dose-response data and, as no studies are categorically excluded from consideration, the EPA will continue to rely on the full body of the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. The EPA will also consider the degree to which pivotal science is available and will give greater consideration to pivotal science for which the underlying dose-response data are available, as described in the rule.

The Agency supports the use of restricted access for data and models that have CBI, proprietary data, or PII. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

17.2.9 EPA’s Proposal is inconsistent with policies adopted by major scientific journals

Comment: Commenters (4877, 4596, 6103, 6109, 6125, 6133, 6137, 6144, 6153, 6166, 6168, 6351, 6358, 6891, 6912, 6937, 8275, 9224, 9227) state that EPA’s claim that the proposed rule is informed by the policies recently adopted by some major scientific journals (EPA cites *Proceedings of the National Academy of Sciences*, *PLoS ONE*, *Science*, and *Nature*) is incorrect and that the EPA’s proposal is inconsistent with policies adopted by major scientific journals.

Commenter (9227) notes that while scientific journals and other institutions have encouraged making data and models publicly available, there is widespread recognition in the scientific community that doing so is often legitimately constrained due to legal and ethical protections on the confidentiality and privacy of data, or because the data is unavailable. Moreover, the commenter states that no scientist or scientific organization supports the Proposal’s approach of excluding research for which the underlying data cannot be disclosed. According to the commenter, none of the materials EPA cites support such an extreme approach. To the contrary, the commenter states that the scientific community recognizes that the quality of a study is not determined by whether the underlying data is publicly available and has long utilized a variety of tools for ensuring the integrity and rigor of research findings. For all these reasons, the commenter notes that numerous representatives of the scientific community—including editors of the very scientific journals whose policies EPA cites to in the Proposal, the American Association for the Advancement of Science, members of the Science Advisory Board (SAB), and other scientists cited to by EPA—have already voiced serious concerns about the Proposal.³⁶¹⁸

Commenter (6133) contends that these various journal policies are more flexible in their terms for data sharing and nuanced in their practical approaches than what EPA fundamentally

³⁶¹⁸ E.g., Anne Q. Hoy, Scientific Leaders Speak Out on EPA’s Proposed “Transparency Rule,” <https://www.aaas.org/news/scientific-leaders-speak-out-epas-proposed-transparency-rule>; Jeremy Berg et al., Joint Statement on EPA Proposed Rule and Public Availability of Data, *Science* (Apr. 30, 2018), <http://science.sciencemag.org/content/early/2018/04/30/science.aau0116>; Letter to Acting Administrator Wheeler from Marcia McNutt, President of the National Academy of Sciences, C.D. Mote, Jr., President of the National Academy of Engineering, and Victor J. Dzau, President of the National Academy of Medicine (July 16, 2018) (Warning that “overly stringent requirements for transparency may cause valid evidence to be discarded and thereby pose a threat to the credibility of regulatory science,” and stating that “The National Academies have developed a long-standing body of work that demonstrates scientific literature can be evaluated in a transparent and objective manner without complete disclosure of the underlying data.”).

misrepresents in the Proposal and that an examination of these sources indicates, in fact, that the language of the Proposal is not consistent with best practices and is unworkable in practice.

Commenter (6137) asserts that EPA provides no information as to how these journals' policies supposedly informed the data access guidelines and policies.

Commenter (4877) states that the data sharing policies that these journals use explicitly recognize the wide variety of workflows in use across scientific disciplines and provides for data sharing at different levels of openness. The commenter notes that they expressly state that not in every case can all data be shared, and in some cases, it is permissible for data to not be shared at all for legitimate and stated reasons. According to the commenter, as these journals – and the research community as a whole – well knows, this does not mean that the data underpinning these studies cannot be assessed. Commenters (6153, 6358, 6874) assert that reviewers can judge the merits of studies relying on non-public data, because “scientists are trained in assessing research publications by judging the articulation and logic of the research design, the clarity of the description of the methods used for data collection and analysis, and appropriate citation of previous results.”

Commenter (6109) contends that EPA is proposing to dismiss from consideration research that would be admissible to these major scientific journals based upon an incorrect interpretation of their data-sharing policy and a disregard for the rigors of peer review.

Several commenters (4596, 6103, 6109, 6125, 6137, 6144, 6153, 6166, 6168, 6351, 6358, 6891, 6912, 6937, 8275, 9224, 9227) refer and/or support a statement submitted by the editors-in-chief of *Science*, *Nature*, *PLOS*, *Proceedings of the National Academy of Sciences*, and *Cell* issued in response to this proposed rule stating that this policy will exclude important studies from consideration in the rule-making process, thus adversely impacting the decision-making process. They note that these organizations concluded in their issued joint statement on the proposal:

[I]t does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them; rather, it is paramount that the full suite of relevant science vetted through peer review, which includes ever more rigorous features, inform the landscape of decision making. Excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes.

(<http://science.sciencemag.org/content/early/2018/04/30/science.aau0116>)

Commenter (6125) states that, clearly, the joint statement indicates that their policies on publication offer no support for the premise that studies are unreliable unless their underlying data is made publicly available.

Commenter (6144) argues that the EPA is incorrect in claiming that they are following accepted practice on open science that major science journals and the NAS have adopted. The commenter states that the open data initiatives adopted by these journals acknowledge that Transparency and Openness of Promotion (TOP) standards “recognize the array of workflows across scientific fields and make the case for data sharing at different levels of stringency; in not every case can

all data be fully shared.” The commenter states that these standards are in accordance with OSTP’s 2013 memo *Increasing Access to the Results of Federally Funded Scientific Research*, which notes the importance of making data available in realizing the goal of increased transparency in the federal government, while protecting confidentiality, personal privacy, CBI, and “preserving the balance between the relative value of long-term preservation and access and the associated cost and administrative burden.”

Commenter (6163) states that the journal policies and the TOP standards do not inhibit the use of research if the underlying data is not able to be published, such as sensitive PII and CBI.

Commenter (6164) asserts that the proposed policy wrongly claims to parallel TOP guidelines adopted by peer-reviewed scientific journals like those managed by the commenter (American Geophysical Union (AGU)). According to the commenter, unlike EPA’s proposal, the TOP standards encourage open data while recognizing that each scientific discipline has its own constraints, as expressed by editors-in-chief of peer-reviewed publications cited in the proposed rule. The commenter states that, at times, underlying scientific information cannot be made public, particularly when it includes personal identifiable information that ethically and/or legally cannot be shared. The commenter states that even in these cases, the merits of a scientific study can still be evaluated by reviewers during the peer-review process and by scientists who are trained to assess scientific conclusions.

The commenter (6168) states that, at the very least, transparency requires careful and explicit discussion of the data, assumptions and boundary conditions, sources of error, accuracy, precision, and statistical significance. The commenter states that scientific journals also require introductory sections to orient the reader to the purpose of the study and the evidence from which the study is designed, methods sections to precisely define and describe the study design, and discussion sections to articulate results, their limitations, and their implications. Scientific journals also require extensive contextualization, and to take their data transparency requirements out of context is disingenuous and damaging. According to the commenter, providing raw data without context can cloak scientific research as much as providing no data; providing raw data encourages not transparency but even greater manipulation, which can be used to produce false uncertainty.

Commenter (6133) asserts that the proposed rule is not, as it claims, “consistent with requirements for many scientific journals.” (EPA cites Taylor & Francis, Elsevier, PLOS and Springer Nature) Specifically, the commenter points out that the *Taylor and Francis* journal policy for data transparency is much more nuanced than EPA claims and offers a range of options for data submission, demonstrating the need for flexibility and discipline-specific concerns with respect to the public sharing of sensitive data. Additionally, the commenter states that the *Springer Nature Research Data Policy* is similarly flexible, describing requirements across a spectrum for four types of underlying research data. The commenter states that for only one of four types of research data is data sharing required as a condition for publication. The commenter states that the frequently asked questions document for the *Springer Nature Data Policy* notes that “[t]he policies apply to all research that support publications but reasonable restrictions on data availability are permitted to protect human privacy, biosafety or respect reasonable terms of use for data obtained under license from third parties.” The proposed rule’s

categorical exclusion and prohibition are thus, according to the commenter, flatly inconsistent with the *Springer Nature Research Data* policy cited in the proposed rule.

The commenter (6133) also states that the *Springer Nature* policies began during the first quarter of 2016 and did not apply retroactively, as the Proposal would.

Commenter (6133) asserts *Elsevier's* corresponding policy is optional for authors, and states that the journal: “will . . . [e]ncourage and support researchers to share research data where appropriate and at the earliest opportunity, for example by enhancing our submission processes to make this easier.” The commenter reports that a frequently asked questions page further explaining this policy says that the “policy is clear in that we encourage and support authors to share their research data rather than mandating them to do so and provide tools and services to enable them to do this effectively. Where there is community support for (often discipline-specific) mandates regarding data deposit, submission and sharing, some of our journals may reflect this with their own mandatory data sharing policies.” The commenter states that this same supporting frequently asked questions resource from *Elsevier* says that *Elsevier* “respect[s] authors who need to keep research data under embargo.” The proposed rule, by contrast, according to the commenter, does not allow researchers to keep their research data under embargo. Nor does the proposed rule offer such discipline-specific flexibility and, as a result, is neither practically workable nor consistent with the policies of the world’s leading scientific journals.

Commenter (6133) explains that the *Elsevier* policy does not apply strict data release requirements to include publicly accessible information. It says that “[r]esearch data should be made available free of charge to all researchers wherever possible and with minimal reuse restrictions.” It further states that “[r]esearchers should remain in control of how and when their research data is accessed and used, and should be recognized and valued for the investments they make in creating their research data and making it available.” The commenter states that, under the proposed rule, researchers retain no such control over their data; the proposed rule ignores these harmful ramifications.

Commenter (6133) contends that the *PLOS Data Availability Policy* notes that, for studies involving human participants, “data must be handled so as to not compromise study participants’ privacy.” The *PLOS Policy* itself links to the *National Institutes of Health Data Sharing Workbook*, which states that:

It is rarely sufficient to simply remove names, addresses, telephone numbers, Social Security Numbers, and the like. Deductive disclosure of individual subjects becomes more likely when there are unusual characteristics or the joint occurrence of several unusual variables. Samples drawn from small geographic areas, rare populations, and linked datasets can present particular challenges to the protection of subjects’ identities.

To the extent data availability, even broadly defined, is contemplated in the Proposal, the commenter (6133) contends that it is done so prospectively, not retroactively. Unlike the Proposal, the *PLOS Policy* does not apply retroactively to all relevant studies: “[t]he data policy was implemented on March 3, 2014. Any paper submitted before that date will not have a data

availability statement. However, for all manuscripts submitted or published before this date, data must be available upon request.”

Response: The EPA agrees with commenters that the scientific community and government agencies are making great strides in data transparency; however, improvements can still be made over existing policies and mechanisms. Many scientific publications, for example, require authors to make a data availability or data access statement, which discloses where and under what conditions the underlying study data are available. Yet the EPA cannot solely rely on data availability statements made in published research because initiatives toward greater data sharing and transparency amongst scientific journals and international organizations are still being implemented, are inconsistently enforced, and the true accessibility of data in a public repository is still limited (Refs. 28, 29, 30, 31, 32, 33). For example, Christensen et al. (2019) evaluated 1,072 peer-reviewed articles and “found that rates of data availability for empirical articles published after journals adopted data-sharing policies differ widely between journals, from 0 percent to 83 percent, with a mean of 35 percent” (Ref. 32). Stodden et al. (2018) noted they were only able to retrieve the dataset and code for 44 percent of the 204 computational studies published in *Science* in the 16 months after the publisher instituted its data availability requirements (Ref. 34). Therefore, the rule requirements for the EPA’s independent evaluation of the availability of data are necessary and critical to prioritizing data transparency in the pivotal science underlying its significant regulatory actions and influential scientific information. Finally, focusing the final rule requirements on the underlying dose-response data is intended to address public comments concerning clarity of the rule, potential unintended consequences, and the potential for far-reaching impacts. The requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

The Agency supports the use of restricted access for data and models that have CBI, proprietary data, or PII. Restricted access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

The Agency agrees that it is important not to categorically exclude any study because the underlying dose-response data at the stage required by this rulemaking may not be available for independent validation. EPA acknowledges and agrees with commenters that there may be pivotal science where the underlying data are not publicly available or available through restricted access. The final rule is limited to dose-response data and, as no studies are categorically excluded from consideration, the EPA will continue to rely on the full body of the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. The EPA will also consider the degree to

which pivotal science is available and will give greater consideration to pivotal science for which the underlying dose-response data are available, as described in the rule.

The EPA would like to emphasize that this rule does not impose requirements on any entity outside of EPA. This is a rule of internal procedures and does not direct or require any outside entity or EPA to establish data sharing mechanisms. Further, the rulemaking does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

This final rule applies prospectively to significant regulatory actions and influential scientific information and has no retrospective effect on existing significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data.

The final rule and preamble do not cite *PLoS ONE*, *Science*, and *Nature* are mentioned once, but only in noting that each were mentioned by a public commenter.

17.2.10 Not Representative of Scientific Community Recommendations

Comment: The commenters (6891) assert that the EPA apparently did not consult with the individuals and organizations it cited in support of its proposed rule, and ignored the scientific community, essentially all of which opposed the rule. According to the commenters, the disconnect between EPA's proposed rule and the scientific community suggests one of two things. At best, EPA didn't understand the scientific community's recommendations for handling challenges related to reproducibility. At worst, EPA understood perfectly well that the scientific community was not proposing to exclude public health studies from rulemaking; but chose to distort the scientific community's efforts for its own industry-championed; anti science. campaign. The commenter asserts that, in either case, EPA's justification for the proposed rule "runs counter to the evidence."

Commenter (6144) expresses concern that among those not consulted in the crafting of this rule was the National Academies of Science, Engineering, and Medicine (NASEM), which has held several committee meetings and carried out a series of reports detailing how scientific literature can be evaluated transparently without the full disclosure of underlying datasets. The commenter reports that, in a comment on the rule, NASEM urged EPA to seek objective and expert guidance on the rule and its implementation and offered itself as an independent review body. The commenter also states that the BPC was also cited in EPA's proposed rulemaking and had to clarify in a comment to the agency that "the proposed rule is not consistent" with its report on the use of science in policymaking that EPA cited in "substance or intent." The commenter states that, while BPC supports enhanced transparency, "the report never suggested excluding studies from consideration in developing regulation if data from those studies were not publicly available."

According to the commenter (6144), the proposal has faced widespread opposition from the scientific community, academic institutions, states, and decisionmakers. In fact, the comment

reports that nearly 1,000 scientists asked former EPA Administrator Scott Pruitt to abandon this proposal, arguing it “would greatly weaken EPA’s ability to comprehensively consider scientific evidence,” and undermine the agency’s capacity to protect Americans from serious health threats.

Commenter (6909) states that there has been robust discussion in the scientific community about how to improve both reproducibility and replicability, and numerous recent articles and papers have addressed this topic. The commenter reports that various entities – including groups of researchers, scientific societies, funders, and the federal government – have begun to develop policies to facilitate data sharing and improve both reproducibility and replicability. For example, the commenter reports that the *American Association of Universities* and the *Association of Public Land Grant Universities* convened a working group on public access for federal agencies and universities. Peer reviewed scientific journals have joined this effort as well, with many adopting policies designed to encourage data sharing. As an example, the commenter reports that in 2015 the *Center for Open Science* developed a set of *Transparency and Openness Promotion (TOP)* guidelines, which were published in *Science Magazine*.

In addition to the TOP standards, the commenter (6909) reports that scientific journals have begun to develop other innovative techniques for encouraging data-sharing, such as affixing “open-data badges” to articles whose data are available. Notably, the commenter states that the EPA itself has had an *Open Government Policy* since 2010. The most recent iteration of this plan includes efforts to increase public access to EPA-funded research publications and their related data. The commenter reports that other federal agencies have also developed and implemented policies aimed at increasing public access to the results of research funded by the federal government.” The commenter adds that there is an active and ongoing dialogue about what policies to put in place in order to improve transparency and reproducibility while simultaneously protecting confidentiality and intellectual property. The commenter (6909) concludes that, if EPA is truly concerned about improving transparency and reproducibility while protecting confidentiality and intellectual property, it should engage in this dialogue and with the scientists who are having it, and it should leave room for a realistic and appropriate transition period.

Response: Most public commenters on the purpose of the 2018 proposed rule and the 2020 SNPRM supported the concept of greater transparency, but questioned the “problem” the EPA was trying to fix. The EPA continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA’s scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency’s mission, and the public’s health and safety. This rule is designed to build upon OMB M-19-15, which highlights the need to characterize the sensitivity of an agency’s conclusions to analytic assumptions, as well as other federal guidance documents that require greater data transparency. The EPA’s attention to data transparency is also responsive to the broader interest in greater data and model transparency observed in the numerous transparency initiatives in the scientific community and federal government, as well as the criticism the EPA has received from members of the public, scientific community, and Congress on the transparency of the scientific basis for EPA’s decisions in previous influential scientific information assessments and regulatory

actions^{3619,3620,3621,3622,3623}. The EPA’s continued progress toward maximizing transparency is vital to building and maintaining trust with the public and credibility in the Agency’s decisions.

The EPA’s SAB reviewed the proposed rulemaking and issued a letter to the Administrator on April 24, 2020. The letter recognized the importance of establishing transparency and enhancing public access to data and models. The report stated it supported the adoption of the precept of, “of sharing accurate data and information to increase credibility, high-quality outcomes and public confidence in science.”

17.2.11 Cited *Economist* Article Does Not Support EPA’s Proposal

Comment: Commenter (6125) asserts that the *Economist* article cited by EPA in the proposed rule does not endorse EPA’s proposal. The commenter contends that the *Economist* discusses the importance of the verification of scientific studies and how it is problematic that much current science cannot be replicated due to many causes. The article’s proposed solutions include: tightening standards, particularly in statistics, registering research protocols in advance and monitoring them, and: “[w]here possible, trial data also should be open for other researchers to inspect and test.” The commenter supports these statements.

Response: In the 2018 proposed rule, the EPA used the term “replicate” in the proposed regulatory text at 40 CFR 30.5 but did not define it at 40 CFR 30.2. The term replicate is no longer used as the EPA has decided, based on public comment and as discussed in the preamble, that the intent of the term in the proposed regulatory text at 40 CFR 30.5 was “reanalyze” rather than “replicate.” In the 2020 SNPRM, the EPA proposed using the term “reanalyze” instead of “replicate” and proposed at 40 CFR 30.2 a definition for “reanalyze.” Given that proposed 40 CFR 30.5 also included the term “independent validation” and that this term directly relates to “replicate,” the EPA also proposed a definition at 40 CFR 30.2 for this term.

Comment: Commenter (6360) asserts that another advantage of using an existing system is that EPA would reduce the burden on researchers and applied science developers. The commenter explains that since TOP and other systems are widely-adopted now and are growing in their reach, scientists understand their obligations under these systems if they want to be published in

³⁶¹⁹ Calabrese, E. J. (2019). EPA transparency proposal: testimony of Edward J. Calabrese, PhD, October 3, 2018. *J Cell Commun Signal*. 13(1): 145–147. <https://doi.org/10.1007%2Fs12079-018-0497-8>.

certain journals. The commenter states that if they must turn in their data to be published in *Science*, for example, turning it over to EPA for public review is not a significant additional burden.

Response: This final rule describes how the EPA will determine the consideration to afford pivotal science of the EPA's final significant regulatory actions and influential scientific information for which the conclusions are driven by the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect based on the availability of the underlying dose-response data and other applicable factors. This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. The final rule does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. Rather, EPA is describing how it will handle studies based on whether the underlying data and models are publicly available.

Chapter 18: Alternative Approaches to the Proposed Rule

The proposed rule preamble solicited public comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation. The proposal further states that the EPA believes that a generally applicable regulatory provision of the type proposed here is the appropriate vehicle to establish and implement the policies articulated in the proposal, in the interests of consistency, predictability, and transparency across the functions that EPA performs. The EPA specifically solicits comment on whether alternative or additional regulatory or other policy vehicles are appropriate to establish and implement these policies, and whether further regulatory or other policy vehicles at the programmatic or statutory level would be appropriate as alternative or additional steps the Agency may take to further the policies articulated in the proposal.

Several comments were received in response to EPA's solicitations. In this section these comments are organized according to the following topics:

- Base Policies and Requirements on Existing Guidance
- Approaches Specific to EPA-Funded Research
- Suggested Changes to the Rule Approach
- Alternative Policies to Increase Transparency in EPA Rulemaking without Releasing Private Data to Public
- Facilitate Data Publication/Accessibility
- Implement, Emulate or Work with Federal Programs

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

18.1 Base Policies and Requirements on Existing Guidance

Comment: Commenters (0559, 6125, 6126, 6156, 6161, 6357, 6360, 6924, 6955) suggest that EPA base any transparency in science policies or requirements on existing guidelines, or industry-developed guidance/protocols instead of proceeding with the proposed rulemaking. Commenter (6360) suggests that adopting an existing system would reduce the burden on researchers and applied science developers since they already understand their obligations under these systems. Commenter (6924) lists three example protocols and guidelines that can be followed to improve the scientific basis of evaluating studies without releasing data to the public:

CONSORT,³⁶²⁴ ARRIVE³⁶²⁵ and STROBE.³⁶²⁶ The other commenters suggest that EPA base policies or requirements on the specific guidance or practices below.

Response: While EPA intends to build upon existing data sharing and peer review efforts both in the Federal government and broader scientific community, this rulemaking intentionally goes further. The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

EPA disagrees with the commenter that, if EPA were to adopt an existing data sharing system in place of the requirement of this rule, it would then reduce the burden on researchers. This final rule does not impose any burdens or requirements on external parties.

18.1.1 National Academy Guidance

Comment: Commenters (0559, 6357) urge EPA to follow guidance from the National Academy of Sciences (NAS) when constructing rules and policies governing data transparency and access.

Commenter (0559) urges EPA to construct rules governing transparency and data access that are consistent with the NAS report, *Science and Decisions: Advancing Risk Assessment*.³⁶²⁷ The commenter states that this document has numerous recommendations related to transparency in regulatory actions, including recommendations regarding how scientific information should be collected, evaluated, and assimilated in risk assessments.

Commenter (6357) states that the National Academies of Sciences, Engineering, and Medicine (NASEM) have convened independent panels of experts to develop multiple comprehensive documents outlining robust standards and methods for systematic reviews and decision-making, including several guidance documents focused on the environment and human health.^{3628,3629,3630} The commenter encourages EPA to utilize systematic review methods and decision-making

processes consistent with the relevant recommendations stemming from National Academies reports. The commenter also recommends that the review process be clearly established prior to the review being conducted, including criteria determining inclusion of studies and how studies would be weighted regarding the strength of evidence. According to the commenter, such transparency about the process would help meet the EPA's stated goal of strengthening "public confidence in the health and environmental protections underpinning EPA's regulatory actions."

Response: The EPA acknowledges the valuable recommendations and standards provided by the National Academies, and their impact on EPA practices. The EPA has considered recommendations from the National Academies of Sciences³⁶³¹, and the Agency continues to believe that codifying internal procedures aimed at prioritizing transparency in significant regulatory actions and influential scientific information into regulation will improve the opportunity for the public to access the EPA's scientific analyses and resulting regulatory actions in a way that is beneficial to the scientific process, the Agency's mission, and the public's health and safety.

EPA notes that this rule does not establish new requirements for systematic review protocols. In general, EPA intends to continue to follow its existing practices for identifying, reviewing, and evaluating available scientific evidence under the different environmental statutes EPA implements. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science. Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of personally identifiable information (PII), confidential business information (CBI), or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

Comment: Commenter (6125) states that if EPA has issues with its current risk assessment and benefit analysis procedures that currently follow NAS recommendations and its own existing guidelines, a more straightforward and fruitful approach would be to update the guidelines as needed, showing in far more detail than provided in the Proposal the details of their reasoning, the conditions in which they should be employed, and the scientific bases for requiring consideration of alternative models in all risk assessments. The commenter suggests that draft guidelines should then undergo peer review by expert panels of the NAS and/or its own Science Advisory Board (SAB) and Science Advisory Panel (SAP). While guideline development is

³⁶³¹ NAS (National Academies of Sciences, Engineering, and Medicine). (2019). Reproducibility and replicability in science. Washington, DC: The National Academies Press. Available at <https://www.nationalacademies.org/our-work/reproducibility-and-replicability-in-science>.

arduous and time consuming, the commenter notes that it has several advantages over rulemaking, including 1) guidance is developed by experienced risk assessors; 2) it is a science-based process that involves consensus building across the EPA as well as with the broader science community; and, 3) critically, it maintains the separation between risk assessment and risk management so that EPA's decision makers benefit from the availability of science that is produced in an independent and objective fashion. The commenter states that this has been the practice at EPA since 1983 when the NAS published *Risk Assessment in the Federal Government: Managing the Process*.

Response: EPA disagrees with the commenter's assessment that this rule is meant to address issues with the Agency's current risk assessment and benefit analysis procedures that currently follow NAS recommendations and its own existing guidelines. Rather, the purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. EPA intends to continue to follow its existing guidance and practices for identifying, reviewing, and evaluating available scientific evidence under the different environmental statutes EPA implements.

The Agency will develop internal guidelines as necessary to further develop the implementation of this rulemaking, and will do so in a manner consistent with Agency procedure. EPA notes for the commenter that it did consult with its SAB on the scientific and technical basis of this rule.³⁶³²

18.1.2 U.S. Commission on Evidence-Based Policymaking Recommendations

Comment: Commenter (6126) suggests that EPA carefully consider adoption of the recommendations from the U.S. Commission on Evidence-Based Policymaking, their relevance to EPA, and opportunities to request new statutory authority to implement these recommendations.³⁶³³ The commenter states that the recommendations of the commission are directly relevant to the context of this proposed rule because the commission offered recommendations focused on the agencies that fall within the jurisdiction of the Chief Financial Officers Act (CFO Act). According to the commenter, the recommendations have been endorsed by 36 former heads of federal statistical agencies (leaders who are charged with protecting government-collected confidential data)³⁶³⁴ and numerous professional associations that

³⁶³² Science Advisory Board. (2020). Science Advisory Board Consideration of the Scientific and Technical Basis of EPA's Proposed Rule Titled "Strengthening Transparency in Regulatory Science." EPA-SAB-20-005.

³⁶³³ U.S. Commission on Evidence-Based Policymaking (CEP). (2017). The Promise of Evidence-Based Policymaking. Washington, D.C.: Government Printing Office. Available at: <https://cep.gov/cep-final-report.html>

³⁶³⁴ Bipartisan Policy Center. (2018). Former Government Statistical Agency Heads Call for Better Use of Data in Policymaking. Press Release. Washington, D.C.: Bipartisan Policy Center. Available at: <https://bipartisanpolicy.org/press-release/former-government-statistical-agency-heads-call-for-better-use-of-data-in-policy-making/>

represent more than 120,000 members of the U.S. evidence-building community.³⁶³⁵ The commenter states that the implementation of the recommendations could also be valuable precursors to regulatory actions that affect how EPA will use scientific research in the future.

Commenter (6126) also encourages EPA to ensure any further actions related to the proposed regulation adhere to five principles that the commission unanimously agreed on for evidence-based policymaking:

1. *Privacy*. Individual privacy and confidentiality must be respected in the generation and use of data and evidence.
2. *Rigor*. Evidence should be developed using well-designed and well implemented methods tailored to the questions being asked.
3. *Transparency*. Those engaged in generating and using data and evidence should operate transparently, providing meaningful channels for public input and comment and ensuring that evidence produced is made publicly available.
4. *Humility*. Care should be taken not to over-generalize from findings that may be specific to a particular study or context.
5. *Capacity*. The capacity to generate and use data and evidence should be integrated within government institutions and adequately funded and staffed.³⁶³⁶

Response: EPA takes seriously its charge to make evidence-based policy, and invites the commenter to learn more about EPA’s implementation of the Foundations for Evidence-Based Policymaking Act of 2018 at <https://www.epa.gov/data>. The scope of this final rule is more narrowly focused than the five principles from the commission, as it does not alter how the Agency collects or handles data. Rather, the purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information.

18.1.3 Good Laboratory Practice

Comment: Commenter (6161) recommends that the Agency adopt a requirement that studies that warrant consideration as key or pivotal studies conform with Good Laboratory Practice (GLP) or “the spirit of GLP” to help ensure quality, rigor, transparency, and reproducibility. The commenter provides the following explanation:

Whether in the “pure” sciences or regulatory sciences, the principal reason for requiring transparency of scientific data is to enable reproducibility studies and validation. For the Agency to require transparency but ignore findings of

³⁶³⁵ Nick Hart and Sandy Davis. (2017). Fact Sheet: Foundations for Evidence-Based Policymaking Act. Washington, D.C.: Bipartisan Policy Center. Available at: <https://bipartisanpolicy.org/blog/fact-sheet-foundations-for-evidence-based-policymaking-act/>

³⁶³⁶ CEP, 2017 [U.S. Commission on Evidence-Based Policymaking (CEP). (2017). The Promise of Evidence-Based Policymaking. Washington, D.C.: Government Printing Office. Available at: <https://cep.gov/cep-final-report.html>, p. 17.

irreproducibility defeats the purpose. The Agency requires that scientific testing data submitted by industry as the basis for product registrations, hazard evaluations, or other purposes comply with GLP.³⁶³⁷ The reason for the requirement is to ensure that the Agency's evaluations are based on data of sufficient quality, rigor and reproducibility.³⁶³⁸ Recognizing that not all provisions specified by formal GLP programs can be applied to all studies, the concept of the spirit of GLP is often adopted by regulatory agencies and study sponsors. This concept should also be adopted by the Agency.

The Organization of Economic Cooperation and Development (OECD) defines GLP as: (...a quality system concerned with the organisational process and the conditions under which non-clinical health and environmental safety studies are planned, performed, monitored, recorded, archived and reported.)³⁶³⁹

The definition of GLP makes clear that the principles of GLP are applicable to all scientific studies, not just to "guideline studies."³⁶⁴⁰ In the environmental sciences, the regulated community often adopts a requirement that a laboratory, contractor, or grantee follow "the spirit of GLP" as a condition of funding a study that may serve a regulatory purpose. In practice, conforming with the spirit of GLP involves preparation of a protocol that describes the details of a study. This description includes safety precautions, lists of required equipment, sampling procedures, chains of custody, analytical methods, sample archiving, QA and QC measures, calculating and reporting results, and predefining and documenting criteria for including or excluding data to help avoid bias. As a study progresses, changes may be required. A GLP-compliant protocol describes procedures for amending the protocol to record the changes. In this way, protocols promote successful study replication and assist in the types of detailed peer reviews that can (and should) be a feature of regulatory science.

In the environmental sciences, adherence to GLP principles is not uniform. Scientific studies sponsored by the regulated community to meet regulatory requirements are likely to conform with GLP. However, it has been PCTC's experience that studies in the environmental sciences conducted in some academic institutions and non-regulatory government agencies show little or no evidence of conforming with GLP. We have found protocols prepared by government agencies that would be rejected out-of-hand by EPA if submitted by industry in support of product registration or evaluation. Scientist-to-scientist requests and FOIA [Freedom of Information Act] responses sometimes demonstrate the complete absence of protocols or even something as simple as an outline of a study design. Quality control measures for analytical chemistry are generally in

³⁶³⁷ <https://www.epa.gov/compliance/policy-good-laboratory-practices-advisories-compliance-monitoring>

³⁶³⁸ <http://www.oecd.org/chemicalsafety/testing/oecdseriesonprinciplesofgoodlaboratorypracticeglpandcompliance>
[monitoring.htm](#)

³⁶³⁹ Id.

³⁶⁴⁰ Such as guidelines for pesticide registration studies, <https://www.epa.gov/pesticide-registration/data-requirements-pesticide-registration#auep>

place, but quality management for other aspects of environmental studies seems to be the exception rather than the rule.

The lack of quality and integrity management in the environmental sciences in many government and academic research institutions indicates a lack of rigor in the discipline. While this may have been accepted during the 1970s and 1980s when many fields in the environmental sciences were in their infancy, it is unacceptable today. The Agency should not be making policy that impacts the lives and livelihoods of citizens based on science of unacceptably low quality or doubtful integrity.

Response: EPA disagrees with the commenter that the Agency makes policy based on science of unacceptably low quality or doubtful integrity, and further disagrees that this rule is the venue by which to establish GLP requirements for pivotal science EPA considers in its final significant regulatory actions and influential scientific information. Assessing study quality is an essential part of EPA's existing systematic review practices. However, this rulemaking is more narrowly focused on improving the transparency of EPA assessment and regulatory decision-making, and therefore establishes how EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information.

18.1.4 Transparency and Openness Promotion Guidelines

Comment: Commenter (6360) recommends that while all EPA applications of science should be covered by this rulemaking, EPA should draw from (or adopt) existing transparency screening tools developed by consensus in the scientific community to further define the scope and applicability of the rule's requirements. The commenter specifically recommends adopting the Transparency and Openness Promotion (TOP) guidelines, requiring Level III transparency for all significant regulatory actions and Level II for all other EPA policy decisions.³⁶⁴¹ The commenter further suggests that when EPA takes comment on a proposed decision and notes that the underlying judgements in the applied science meet Level II criteria, the public could evaluate the claims and provide valuable feedback to EPA regarding the appropriate rigor of its data transparency procedures. Based on these comments, EPA could decide that the final agency action requires Level III transparency. The commenter provides the following background on TOP guidelines:

The TOP guidelines have been recently adopted by over 5,000 major scientific organizations and journals. Published in *Science* in 2015, the TOP guidelines include eight standards, each with three levels of increasing stringency. Journals select which of the eight transparency standards they wish to adopt for their journal and select a level of implementation for each standard. For example, the scientific journal *Science* adopted most of the Level III TOP standards effective January 1, 2017.

³⁶⁴¹ <https://cos.io/our-services/top-guidelines/>

By clearly adopting a particular level to a specific application, a participating journal or organization allows the public to evaluate how likely claims made under its banner are scientific fact. Researchers know they must strive to meet Level III requirements and must take due care in their research to receive the benefits of publication in a high-impact journal with Level III requirements. Therefore, claims made in a journal requiring Level III disclosure are more likely to be recognized as scientific facts than those published to Level I standards.

The Level II and Level III requirements mirror somewhat the applicability of the proposed standards in EPA's rulemaking. The tiered levels and specific requirements in TOP offers an existing, widely-used approach for EPA to consider that would allow it to prioritize its resources and its requirements with respect to applied science developers. EPA can calibrate the transparency requirements of particular science applications with the magnitude of the policy decision in question.

Response: The EPA appreciates advances in transparency made in the scientific community, and believes that the requirements set out in this final rule are compatible with the TOP system. However, the EPA notes that this rule does not have a categorical prohibition on finalization of the significant regulatory action or influential scientific information if it does not meet Level III requirements. Rather, this rule requires that the EPA shall give greater consideration to pivotal science where the underlying dose-response data are publicly available in a manner sufficient for independent validation. The Agency shall also give greater consideration to pivotal science based on dose-response data that include CBI, proprietary information or PII if these data are available through restricted access in a manner sufficient for independent validation. For pivotal science where there is no access to dose-response data, or access is limited, the Agency may still consider these studies but will give them lesser consideration unless the Administrator grants an exemption under 40 CFR 30.9. These flexibilities are necessary to enhance the implementability of this rule, which is an incremental step in increased transparency for the Agency.

18.1.5 Radiation Effects Research Foundation

Comment: Commenter (6955) suggests that one option to consider with individualized health or other count data is the approach taken by the Radiation Effects Research Foundation (RERF) in its handling of the A-bomb survivor data. The commenter explains that the raw data is binned into multiple covariate categories and used for RERF papers, as well as for study public access which allows for considerable post-hoc analysis and protects individual identification of subjects, while limiting data dredging somewhat.

Response: The EPA acknowledges the example the Radiation Effects Research Foundation provides for handling A-bomb survivor data, but notes that this final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available.

18.1.6 Federal Data Strategy

Comment: Commenter (6126) encourages EPA to explore opportunities to use the proposed Federal Data Strategy³⁶⁴² (being developed as part of the President’s Management Agenda³⁶⁴³) for improving its activities related to data infrastructure, management, and use. The commenter states that the OMB and working groups are requesting extensive feedback about how to develop the strategy and what it should contain, including partnerships with external organizations to host public forums.

Response: This rule is independent but complementary to the broader Federal Data Strategy. The EPA supports this and other data-sharing efforts and is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA’s most impactful actions, minimizes unintended consequences, and informs future transparency requirements. The EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency.

18.1.7 National Center for Health Statistics Research Data Centers

Comment: Commenter (6924) proposes providing secure access to data for research purposes also improves data sharing as an alternative to requiring publicly available data.³⁶⁴⁴ The commenter suggests that EPA consider the National Center for Health Statistics Research Data Centers³⁶⁴⁵ as a model—these centers have successfully provided access to sensitive information without breaches of privacy/confidentiality.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available.

18.2 Approaches Specific to EPA-Funded Research

Commenters (1994, 2180, 2234, 6141, 6924, 6937) made suggestions for actions EPA could take to improve transparency in EPA-funded research instead of proceeding with the proposed rule. The suggestions provided fall into three categories: (1) suggestions to enforce existing requirements, (2) suggestions for updates to grant awards or cooperative agreements, and (3) suggestions for how research funding could be used to improve data transparency.

18.2.1 Enforce Existing Requirements

³⁶⁴² See additional information at <http://strategy.data.gov>

³⁶⁴³ Nick Hart. (2018). Trump’s Management Agenda Proposes Data as a Strategic Asset. Washington, D.C.: Bipartisan Policy Center. Available at: <https://bipartisanpolicy.org/blog/fact-sheet-trumps-management-agenda-proposes-data-as-a-strategic-asset/>

³⁶⁴⁴ National Research Council (2000). Improving Access to and Confidentiality of Research Data: Report of a Workshop. Committee on National Statistics, Christopher Mackie and Norman Bradburn, Eds. Commission on Behavioral and Social Sciences and Education. Washington, D.C.: National Academy Press.

³⁶⁴⁵ CDC. NCHS Research Data Center (RDC). December 2015. Available: <https://www.cdc.gov/rdc/index.htm>

Comment: Commenter (1994) suggests that EPA can take incremental actions to improve the transparency of scientific studies sponsored through EPA research grants. For example, the commenter suggests that EPA can continue to improve how it enforces requirements for awardees of EPA grants to document research protocols and data management plans.

Commenter (6937) suggests that EPA could more vigorously implement the existing requirements for transparency and submission to data archives where possible for grant programs.

Response: In addition to this rule, the EPA is actively implementing its Open Access Plan and invites the commenter to learn more about how the EPA is improving access to the research it funds.³⁶⁴⁶ This rule is focused on strengthening the transparency of the science the Agency considers in its significant regulatory actions and influential scientific information. The scope of this rule consequently expands beyond only the science which the EPA funds.

18.2.2 Update Grant Awards/Cooperative Agreements

Comment: Commenter (6924) suggests that EPA reference data sharing guidelines from the National Institutes of Health (NIH)³⁶⁴⁷ in its grants and/or cooperative agreements. The commenter explains that the NIH guidelines are applicable to the sharing of final research data for research purposes and they have already undergone an extensive deliberative process with input from the scientific community.

Response: In addition to this rule, the EPA is actively implementing its Open Access Plan and invites the commenter to learn more about how the EPA is improving access to the research it funds.³⁶⁴⁸ This rule is focused on strengthening the transparency of the science the Agency considers in its significant regulatory actions and influential scientific information. The scope of this rule consequently expands beyond only the science which the EPA funds.

18.2.3 Use EPA Funding to Enact Change

Comment: Commenter (2180) finds that the proposed rule will block peer-reviewed, high-quality scientific studies from being used in environmental decision making and suggests that instead, EPA could improve the rigor of science that is used in rulemaking by increasing the funding from the Agency to conduct scientific research.

Commenter (2234) states that the federal government's most significant roles in promoting a body of reliable science in the service of public well-being and economic opportunity has been, and should continue to be, through the funding of born-open data collection programs (e.g. systematic environmental monitoring) and information technology infrastructure to make those

³⁶⁴⁶ U.S. EPA. 2020. Increasing Access to Results of EPA - Funded Scientific Research. Online at <https://www.epa.gov/data/increasing-access-results-epa-funded-scientific-research>. Accessed December 15, 2020.

³⁶⁴⁷ NIH. Data Sharing Policy and Implementation Guidance. March 5, 2003. Available: https://grants.nih.gov/grants/policy/data_sharing/data_sharing_guidance.htm#app

³⁶⁴⁸ U.S. EPA. 2020. Increasing Access to Results of EPA - Funded Scientific Research. Online at <https://www.epa.gov/data/increasing-access-results-epa-funded-scientific-research>. Accessed December 15, 2020.

data easily findable, available, interpretable, and reusable. The commenter suggests that policies that would truly strengthen transparency in regulatory science include (1) ensuring the continued public availability of government-held datasets such as the Toxics Release Inventory (TRI); (2) ensuring continued public investment in environmental monitoring programs such as those for radon-detection and water quality; and (3) providing funds for EPA scientists and external researchers supported by EPA grants to manage, preserve, and disseminate their data in trusted repositories.

Commenter (6141) suggests that EPA should show preference for the funding and development of studies for which underlying data and models are publicly available or otherwise transparent.

Commenter (6955) cautions that if the proposed rule goes forward and data sets are made available, EPA should have funding for new research available to dig into the questions that will inevitably be raised by critics about earlier research products.

Commenter (6955) also suggests that funding parallel studies on other populations is usually the best way of validating models.

Response: The EPA disagrees that this final rule will block peer-reviewed, high-quality scientific studies from being used in environmental decision making. This rule is focused on strengthening the transparency of the science the Agency considers in its significant regulatory actions and influential scientific information. The scope of this rule consequently expands beyond only the science which the EPA funds. The EPA disagrees with the commenter that this rule will block scientific studies from being used in environmental decision making. The rule makes clear no studies are categorically excluded from consideration, the EPA will continue to rely on the full body of the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Further, in addition to this rule, the EPA is actively implementing its Open Access Plan and invites the commenter to learn more about how the EPA is improving access to the research it funds.³⁶⁴⁹

18.3 Suggested Changes to the Rule/Approach

18.3.1 Make the Rule More General

Comment: Commenters (6151, 6356) propose that the scope of the rulemaking should be more general. Commenter (6151) cautions against using a single approach for the various EPA programs and statutes and suggests that EPA consider setting a foundation of transparency

³⁶⁴⁹ U.S. EPA. 2020. Increasing Access to Results of EPA - Funded Scientific Research. Online at <https://www.epa.gov/data/increasing-access-results-epa-funded-scientific-research>. Accessed December 15, 2020.

expectations that would apply to all programs and provide specific policies and/or approaches at the programmatic or statutory levels.

Commenter (6356) states that codifying the proposed rule at 40 C.F.R., Chapter 1, Subchapter B at Section 30 would limit the rule applicability to “Grants and other Federal Assistance.” Therefore, the commenter suggests that this rule should--like other general administration issues such as “Cross-media Electronic Reporting,” “Nondiscrimination,” “NEPA [National Environmental Policy Act] Procedures,” and “Small Business” --be codified under Subchapter A, potentially under 40 C.F.R. § 25, entitled “Public Participation.” The commenter elaborates that since the proposed regulation is broad and general in nature and should include for instance, EPA’s own research as well as other research that is not produced pursuant to an EPA grant, it should not be codified in 40 C.F.R Part 30, titled “Uniform Administrative Requirements for Grants and Agreements with Institutions of Higher Education, Hospitals and Other Non-Profit Organizations” which would limit the action’s impact if it is adopted.

Response: The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. The EPA disagrees that placement of the final rule in 40 CFR Part 30 will limit the impact of the action. Further, the EPA plans to promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers.

18.3.2 Applicability of Science Covered by the Rule

Comments: Commenter (6155) encourages EPA to focus this rulemaking or any future proposed rulemaking on the specific issue of increasing transparency in risk assessments that use dose-response relationship studies to help establish appropriate thresholds or standards, noting that strategies for establishing complete and comprehensive data management policies for risk assessment include how to identify uncertainties, how to perform uncertainty analyses, how to identify and address variability (including exposure variability and variability in human susceptibility), how to deal with problems of aggregation (including exposure routes and types of non-threshold risk), and how to use and do peer review in various contexts and programs administered by EPA under federal law. The commenter provides examples of several regulations and guidance that already exist to assist in identifying scientifically based dose-response thresholds, including relevant provisions from the many regulations and guidance (listed below). According to the commenter, these reports, guidelines, and memoranda address the elements of risk assessment (e.g., identification, dose-response assessment, exposure assessment, and risk characterization) and suggest policies for improving data availability and quality, for validation of data bases and data collection priorities and other data needs.

- The regulatory analysis and report that the National Research Council (NRC) did under Clean Air Act (CAA) section 112(o) to review the risk assessment methods used by the EPA to assess hazardous air pollutants and to instruct revisions to EPA's risk-assessment

guidelines. This NRC report was required to be made to both the Senate and the House³⁶⁵⁰ and was also published by the NRC in its final form as a book entitled *Science and Judgment in Risk Assessment* (National Academy Press 1994 — Copyright 1994 by the National Academy of Sciences).

- The Guidelines for Carcinogen Risk Assessment that were promulgated in response CAA section 112(o)(7). These final regulations were published in the *Federal Register* at 70 Fed. Reg. 17766 (April 7, 2005). The "Proposed Guidelines for Carcinogen Risk Assessment' at 61 Fed. Reg. 17960 (April 23, 1996) were published almost nine years earlier.
- The original NRC risk assessment guidance document: *Risk Assessment in the Federal Government: Managing the Process* (National Academy Press 1983).
- *Understanding Risk: Informing Decisions in a Democratic Society* (National Academy Press, 1996).
- "Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency," U.S. Environmental Protection Agency Office of Environmental Information, EPA/260R-02-008 (October 2002) <https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf>.
- OMB "Final Information Quality Bulletin for Peer Review," (December 16, 2004) issued by Joshua B. Bolten, Director. ("The bulletin includes guidance to federal agencies on what information is subject to peer review, the selection of appropriate peer reviewers, opportunities for public participation, and related issues. The bulletin also defines a peer review planning process that will permit the public and scientific societies to contribute to agency dialogue about which scientific reports merit especially rigorous peer review.") Available at http://www.cio.noaa.gov/services_programs/pdfs/OMB_PeerReviewBulletin_m05-03.pdf.

Commenter (6375) states that the regulatory language that EPA proposes provides general requirements that apply to the Agency's use of science under the many statutes that it implements and contends that the scientific analyses required for these different programs and the sources of the scientific information underlying those analyses differ. Therefore, the commenter suggests that the Agency consider supplementing the general language that it has proposed with statutory specific regulations, concluding that a statutory-specific rulemaking would provide greater certainty going forward.

Conversely, commenters (6141, 6161, 6360) suggest the rule be expanded to apply to all science applications and all EPA rulemakings or regulatory proceedings. Commenter (6141) points out that significant efforts are now being made by the scientific community to make data available wherever possible and to develop studies based on publicly available data where appropriate. The commenter suggests that EPA's proposed rule could strengthen and expand upon this trend by further requiring the public availability of the underlying studies as a prerequisite for EPA relying on the findings of those studies in any future EPA rulemakings or other regulatory proceedings. Commenter (6161) suggests that the Agency should expand the proposed

³⁶⁵⁰ Clean Air Act § 112(o)(4), 42 U.S.C.A. § 7412(o)(4).

transparency rule to encompass all science (not just dose-response data and models) considered in development of regulations, guidance, or policies.

Response: The EPA is promulgating this procedural rule under its housekeeping authority. The EPA plans to develop internal implementing guidance and promulgate either statute-specific transparency regulations or programmatic actions implementing this procedural rule, as appropriate, to clarify how the Agency will implement the provisions from this final rule for specific programs authorized under the statutes the EPA administers. This action is consistent with Executive Orders 13777 and 13783, and the focus on transparency in the OMB Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies and OMB Memorandum 13-13: Open Data Policy – Managing Information as an Asset. This rule is designed to build upon prior EPA actions in response to government-wide data access and sharing policies. The EPA supports these efforts and is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA’s most impactful actions, minimizes unintended consequences, and informs future transparency requirements.

18.3.3 Additions to the Proposed Rule

If the proposed rule goes forward, commenters (2119, 2479, 2746, 2792, 6112, 6141, 6161, 6360, 6873, 6955, 9227) propose additions to the proposed rule. Their comments and proposed additions are included in the following paragraphs.

18.3.3.1 Disclosure of the Funding Source of Research Would Improve Transparency

Comment: Commenters (2119, 2479, 2746, 2792) suggest that the rule require disclosure of the funding source for research. Commenter (2792) asserts that a scientific report by a company might easily skew the result to favor one of their products, whereas a similar report by an independent lab would, hopefully, present the objective results without any bias.

Commenter (2119) states that the greatest improvement in transparency would come from requiring all research used in policy decisions to have all funding sources disclosed. The commenter states that this, more than anything else, will help policy makers to decide about the likely veracity of the data used. The commenter adds that one big problem with the proposed rule is that it does nothing to address the problem of selectively reporting only the data that supports a particular position. The commenter states that, although there is no foolproof way for policy makers to determine that (the truth or accuracy of the data presented), disclosing funding sources is probably the best method available.

Commenters (2479, 2746) propose that EPA incorporate a funding transparency requirement for all studies to allow for evaluation of potential bias or conflict of interest.³⁶⁵¹ Commenter (9227)

³⁶⁵¹ EPA, Scientific Integrity Policy, https://www.epa.gov/sites/production/files/2014-02/documents/scientific_integrity_policy_2012.pdf (seeking to protect agency reliance on science from political interference, personal motivations, conflicts of interest, bias, etc.).

notes that undisclosed financial bias³⁶⁵² is an area of concern for study transparency that EPA should address.

Response: The EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or more pollutants, contaminants, or substances are integral to the Agency's mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. The EPA does not find that requiring disclosure of the funding source of a study should be necessary for the EPA to grant that study full consideration because reanalysis of the underlying dose-response data would be sufficient to validate the results. The EPA would like to emphasize that this final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms.

18.3.3.2 Suggested Rule Changes Related to Usage of Published Datasets

Comment: Commenter (6955) offers several suggestions for additions to the rule related to usage of the published datasets. The commenter suggests that any user of public data in an EPA proceeding should be required to:

- List any a-priori hypotheses planned to be tested
- Carry out a multiple comparison analysis for any regulatory filing that uses post-hoc analysis of accessible study data
- Report sources of funding and conflicts of interests
- Include a statistician on the team
- Include "post-hoc analysis" in the title of any submission that relies on post-hoc analysis, as is done in scientific literature for drug testing
- Certify that neither they nor other sponsor consultants did additional post-hoc analyses other than reported or listed in the paper, thereby facilitating the accuracy of correction of statistical tests for multiple comparisons
- Ideally, only queries of the data in the database would be allowed and stored by the agency to allow counting of the amount of data dredging that took place, facilitating correction for multiple comparisons.

Commenter (6955) defines a post-hoc analysis in this context as analysis carried out with full knowledge of the results of the original study whose data is being used; analysis that amounts to more than simply checking that the original results follow from the original method of analysis. The commenter also suggests that exemptions to the access rule should be automatically granted (i.e., no public access to the dataset) when there are multiple studies covering the same issue, because tests on multiple datasets provide the standard form of validation.

³⁶⁵² *Id.*

Commenter (6955) cautions that even with the precautions described above, problems can still be expected with post-hoc analysis. The commenter provides an example from the experience of the Radiation Effects Research Foundation (RERF) datasets:

There have been two papers that came to opposite conclusions about the low-dose radiation region using different statistical methods: one³⁶⁵³ found a hormesis dose response (although with no uncertainty analysis of the outcome parameters) and one³⁶⁵⁴ found a supralinear response (with uncertainty analysis). These conflicting studies actually confirm what is well known, namely that dose response at low doses in the A-bomb data is uncertain.³⁶⁵⁵ But, suppose that only one of the two non-RERF studies had appeared. It would have looked like the default dose response had been challenged. Taken together, they give a different impression, namely that the default lies in the middle of an error range. Stakeholders, of course, will find ways to prefer and promote the one whose result they like.

Response: The EPA disagrees that the rule should impose requirements on users of published datasets, as this is a rule of internal procedure that does not impose requirements on any party other than the EPA. This rule imposes no requirements on researchers or their institutions. In its own dose-response assessments, this rule requires that the EPA describe critical assumptions and methods used and shall characterize the variability and uncertainty of the assessment. The EPA shall evaluate the appropriateness of using default assumptions on a case-by-case basis. The EPA shall clearly explain the scientific basis for critical assumptions used in the dose-response assessment that the EPA relied on for the significant regulatory action or influential scientific information. Further, the EPA disagrees that it should automatically exempt some studies from this rule, but notes that the Administrator may consider whether a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis when determining whether to exempt a study from this final rule.

18.3.3.3 Modernize the Conceptual Framework for Making Regulatory Decisions

Comment: Commenters (6112, 6115) suggest that in addition to the proposed rule, the Agency should modernize its entire conceptual framework for making regulatory decisions, including how the Agency manages its risk assessment methods, assumptions, models, uncertainty, and non-risk factors at the risk management stage.

Commenter (9227) suggests that if EPA proceeds with the proposed rule, the Agency should also address other significant transparency-related concerns across the spectrum of peer-reviewed science instead of just focusing on the area of concern targeted by regulated industries. The commenter states that EPA appears to assume that the only way to enhance transparency in

³⁶⁵³ Sasaki MS, Tachibana A, Takeda S. Cancer risk at low doses of ionizing radiation: artificial neural networks inference from atomic bomb survivors. *J Radiat Res* 55: 391-406; 2014.

³⁶⁵⁴ Dropkin G. Low dose radiation risks for women surviving the a-bombs in Japan: generalized additive model. *Environmental Health* 15: 112; 2016.

³⁶⁵⁵ Furukawa K, Misumi M, Cologne JB, Cullings HM. A Bayesian Semiparametric Model for Radiation Dose Response Estimation. *Risk Analysis* 36: 1211-1223; 2016.

regulatory science is to ensure that the underlying data and modeling for individual studies are publicly available. The commenter notes that significant concerns have been raised about other non-public aspects of the modern scientific research and publication process that may undermine the accuracy of scientific results such as the rising concerns about the increasing numbers of predatory pay-to-publish journals, which provide little-to-no guarantee of scientific integrity of their published studies.³⁶⁵⁶

Response: This rule does require that the EPA: describe critical assumptions and methods used in its dose-response assessment and characterize the variability and uncertainty of the assessment; evaluate the appropriateness of using default assumptions on a case-by-case basis; and clearly explain the scientific basis for critical assumptions used in the dose-response assessment that the EPA relied on for the significant regulatory action or influential scientific information. The EPA notes that this rule marks an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements.

Modernizing the entire conceptual framework for making regulatory decisions is outside of the scope of this rulemaking. Rather, the EPA is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements.

18.3.4 Subtractions from the Proposed Rule

Comment: Commenter (6881) suggests that the proposed rule is not the appropriate mechanism to effect change in risk assessment modeling practice at the Agency and that instead, EPA should address questions related to uncertainty in dose response modeling in a different venue, such as the Risk Assessment Forum and National Academies guidance. The commenter elaborates that:

The science associated with dose response modeling within risk assessment, ranging from better understanding of biological mechanisms to statistical modeling and risk estimation methods, continues to evolve. Because of the complexity of risk assessment and the fact that it operates at the science-policy interface, EPA regularly seeks guidance from the National Academies on where

³⁶⁵⁶ See Gina Kolata, Many Academics are Eager to Publish in Worthless Journals, N.Y. Times (Oct. 30, 2017), <https://www.nytimes.com/2017/10/30/science/predatory-journals-academics.html>; Publish and Don't Be Damned, The Economist (June 23, 2018), <https://www.economist.com/science-and-technology/2018/06/23/some-science-journals-that-claim-to-peer-review-papers-do-not-do-so>

the field is and where it is going.^{3657,3658,3659,3660} EPA also has the Risk Assessment Forum, where senior scientists grapple with difficult issues related to risk assessment to allow for consistent implementation across the Agency, as well as periodic reports and guidance documents that provide best practices for cancer and non-cancer risk assessment (e.g., <https://www.epa.gov/risk/risk-assessment-guidelines>). These all represent deliberative processes that carefully examine the state of the science and offer conclusions regarding best practices. In contrast, this paragraph within the proposed rule is highly prescriptive in a manner that would add very little that is constructive and would most serve to lengthen and delay the risk assessment process. If the Agency wishes to re-examine questions related to how uncertainty is best characterized in dose response modeling, there are ample mechanisms to do so beyond a short paragraph with no citations tucked into a proposed “transparency” rule.

Commenter (5173) suggests that Rulemaking should not cover scientific methods or approaches which are constantly advancing with scientific innovations and discoveries. The commenter states that to use the best available science, the Agency needs to be able to adapt and implement changing science, which this rule would prevent it from doing.

Response: The EPA has determined that rulemaking is the appropriate venue for this action. The EPA will continue to use established guidelines for identifying and integrating evidence. This rule establishes additional requirements for how the EPA should consider the availability of dose-response data that constitutes pivotal science. The EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. The EPA does not find that this rule will categorically prevent the Agency from using the best available science in its significant regulatory actions or influential scientific information.

18.3.5 No Action Necessary

Comment: Commenter (0671) states that no other alternative or additional regulatory or other policy vehicles are appropriate for the stated purpose because the stated purpose is counter to the CAA and its amendments.

Commenters (2427, 4840) suggest that the proposed rule is not necessary because there are already various means for public access to studies that EPA uses, and in some cases their underlying data, without the release of confidential information, including the FOIA, which provides an avenue to request raw data, including a process ensuring that sensitive data is protected. Commenter (2427) elaborates that many health studies are based on highly private

³⁶⁵⁷ Committee on Improving Risk Analysis Approaches Used by the U.S. EPA. Science and Decisions: Advancing Risk Assessment. Washington, DC: National Academies Press, 2008.

³⁶⁵⁸ Committee on the Institutional Means for Assessment of Risks to Public Health. Risk Assessment in the Federal Government: Managing the Process. Washington, DC: National Academies Press, 1983.

³⁶⁵⁹ Committee on Risk Characterization. Understanding Risk: Informing Decisions in a Democratic Society. Washington, DC: National Academies Press, 1996.

³⁶⁶⁰ Committee on Toxicity Testing and Assessment of Environmental Agents. Toxicity Testing in the 21st Century: A Vision and a Strategy. Washington, DC: National Academies Press, 2007.

information, which cannot be publicly released without the risk of identifying the individuals that participated in the studies. But that does not mean those studies can't be verified. For example, the data underlying the Harvard "Six Cities" Studies has been extensively re-analyzed by independent institutions, confirming the essential findings.³⁶⁶¹ However, researchers found that public disclosure of the personal data underlying the studies – if it included enough data to be useful for research purposes – would violate the privacy of study participants.³⁶⁶²

Commenters (6373, 6937, 9227) state that EPA will better achieve the stated goals through internal guidance and controls and suggest EPA withdraw the proposed rule. Commenter (6373) states that EPA has existing strict guidance and controls that achieve consistency, predictability, and transparency in the science that has historically supported its regulatory actions and notes that the Rule imposes new requirements that would make EPA regulation inconsistent, unpredictable, and opaque. Commenter (6937) states that regulation is not needed because internal EPA policies, which can be more flexible, and can do the job more effectively. Commenter (9227) states that the proposed rule's provisions addressing dose-response models unnecessarily and inappropriately memorialize highly complex and technical scientific issues into regulation, and that these issues are more appropriately dealt with in guidance, a more flexible vehicle better equipped for adapting to new scientific understanding and in this way supporting use of best available science.

Response: In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. As this rule makes clear, if implementing this procedural rule would result in conflicts with existing environmental statutes, and their implementing regulations, this rule will yield to the EPA statutes and regulations. Further, this rule does not require that sensitive data containing PII, CBI, or proprietary data be made publicly available. The EPA disagrees that the goals of this rulemaking could be better achieved through internal guidance. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

18.3.6 Delay Rulemaking

Comment: Commenters (6126, 6873, 6944, 6955) suggest that the rulemaking be delayed.

Commenter (6126) suggests that prior to pursuing further regulatory action, EPA could first issue and implement policies that establish the requisite data, policy, and analytical infrastructure such as developing policies and procedures to enable a statistical unit authorized by OMB under the legal framework of the Confidential Information Protection and Statistical Efficiency Act

³⁶⁶¹ National Research Council, *Access to Research Data in the 21st Century: An Ongoing Dialogue Among Interested Parties*, at 11-12 (2002), available at: <https://www.nap.edu/catalog/10302/access-to-research-data-in-the-21st-century-an-ongoing>

³⁶⁶² *Id* at 11

(CIPSEA).³⁶⁶³ The commenter states that the use of CIPSEA authority at EPA would require the unit that collects confidential data to fulfill a pledge of confidentiality and comply with existing guidance on how to do so. According to the commenter, as of the date of the proposed rule, EPA has no such CIPSEA-eligible or CIPSEA-designated unit and establishing such a unit prior to further action on the regulation would help fulfill an expectation that any confidential, identifiable data collected by EPA would indeed remain confidential. The commenter further states that the designation of a CIPSEA unit could also build public trust in EPA's ability to maintain and protect the described data, if identifiable data will be maintained by the agency.

Commenter (6944) suggests that the rulemaking process start over and involve all interested and concerned parties, including a gathering of pertinent career EPA staff, a selection of concerned business and industry representatives, scientific research and educational representatives, and knowledgeable environmental and regulatory organizations, all equally represented, to discuss actual problems that need to be corrected in the research and regulatory process. The commenter suggests that the group be given several months to work together on this and then present a new rule with clear descriptions regarding:

1. How the scientific process will be protected.
2. How studies will be made available.
3. A clear – transparent and understandable – process established by which various affected entities may access the decision process in a manner that will satisfy privacy concerns at many levels.
4. A clear understanding that the use of the term “pivotal regulatory science” is a smoke screen. If something is “pivotal”, it is policy driven. The science is objective and fact driven. The Regulation is based upon Policy, determined by Congress and EPA staff and Administrator. Application of the Policy is supported by scientific study.
5. How all parties will provide input to ensure that EPA understands needs of the private sector and reasonably incorporates them into policy and regulatory process with the agreement of environmental and scientific community in a transparent manner.

Commenter (6944) contends that the above suggested process is the best way to implement and work to “focus on transparency in OMB’s Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies” (pg2, clm3, 2) in the performance of the very important mission for which the EPA was created in 1970.

Commenter (6955) suggests that EPA defer consideration of such a proposal while the academic community is working out issues with public access to underlying data.

Commenter (6873) suggests that an alternative, short-term approach could be for EPA to work diligently with investigators to try to get the data they need, which would allow for more time to consider any broader and more ambitious effort. The commenter acknowledges that working with investigators to collect the data could prove challenging and may involve providing funding to try to reconsent study participants from work done 20 years ago, for instance. The commenter

³⁶⁶³ Confidential Information Protection and Statistical Efficiency Act of 2002. Title V, Pub. L. 107-347, 2002. Available at: <https://www.gpo.gov/fdsys/pkg/STATUTE-116/pdf/STATUTE-116-Pg2899.pdf>

states that this would provide more time to consider any broader and more ambitious open efforts.

Response: The EPA issued a supplemental notice of proposed rulemaking (SNPRM) in 2020 to clarify, modify and supplement certain provisions included in the 2018 proposed rulemaking in response to some of the public comments received on the 2018 proposed rulemaking. The EPA finds that the two-year interval between proposal and finalization of the rule has given the Agency time to improve the rule and incorporate recommendations based on extensive public comment. The EPA notes that it is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures and does not direct or require any outside entity or the EPA to establish data sharing mechanisms. Further, the rule does not require the EPA to collect, store, or publicly disseminate data and models underlying pivotal science.

18.4 Alternative Policies to Increase Transparency in EPA Rulemaking without Releasing Private Data to Public

18.4.1 Other Effective Ways to Vet Scientific Results that Do Not Require Public Access to Research Data

Comment: Commenter (6168) reminds EPA that robust transparency requires not only consistency in requirements for data but also requires recognizing the right to privacy and anonymity for research participants. The commenter elaborates: researchers, particularly in the fields of epidemiology and other environmental health sciences, have navigated the narrow path of transparent yet protected data for decades; much academic environmental health research is conducted with integrity. Yet it is these fields that are the vulnerable for attack from industry due to the delicate balance of protection and openness.

Commenters (1008, 1994, 2429, 4831, 6128, 6182, 6906, 6955) suggest that there are other effective ways to vet scientific results that do not require public access to research data.

Commenter (1994) references a recent article published by John Ioannidis in *PloS Medicine* on why "[a]ll science should inform policy and regulation." The commenter states that Mr. Ioannidis notes that there are a variety of ways to judge the credibility of scientific findings, and that many worthy scientific studies lacking transparency in a strict sense are otherwise highly credible, due to the fact that they followed stringent research protocols and were replicated by many other subsequent independent studies.

Commenter (6128) suggests that even if the data is not made openly available, reviewers can be given confidential access to key data where appropriate. The commenter also notes that researchers are trained to assess the logic and articulation of a study's research design, its

methodology for data collection and analysis, as well as the appropriate citation of previous results, which helps to ensure rigorous quality control throughout the research lifecycle even when data cannot be made available.

Commenter (6182) provides an excerpt from the United States Department of Energy's (DOE's) "Energy Literacy" guide³⁶⁶⁴ to support the idea of transparency through evaluation of research components other than the dataset:

Part of scientific inquiry is to evaluate the results of scientific investigations, experiments, observations, theoretical models, and the explanations proposed by other scientists. Evaluation includes reviewing the experimental procedures, examining the evidence, identifying faulty reasoning, pointing out statements that go beyond the evidence, and suggesting alternative explanations for the same observations. Although scientists may disagree about explanations of phenomena, interpretations of data, or the value of rival theories, they do agree that questioning, response to criticism, and open communication are integral to the process of science.

Commenter (4831) suggests that EPA could improve transparency by documenting its procedures and methods for collecting, evaluating, and analyzing data, by specifying assumptions, and by characterizing uncertainties, as described in numerous reports issued by the National Academies. Examples of reports include:

- Application of Systematic Review Methods in an Overall Strategy for Evaluating Low-Dose Toxicity from Endocrine Active Chemicals (NASEM, 2017a),
- Review of EPA's Integrated Risk Information System (IRIS) Process (NRC, 2014),
- Critical Aspects of EPA's IRIS Assessment of Inorganic Arsenic: Interim Report (NRC, 2013),
- Review of the Environmental Protection Agency's Draft IRIS Assessment of Formaldehyde (NRC, 2011),
- Finding What Works in Health Care: Standards for Systematic Reviews (IOM, 2011),
- Science and Decisions: Advancing Risk Assessment (NRC, 2009), and
- Models in Environmental Regulatory Decision Making (NRC, 2007).

Commenter (2429) suggests that the Agency could encourage the registration of research protocols, which would help improve the quality of the science used in the regulatory process and allow the Agency to make strong evidence-based regulations that would protect public health and the environment.

Commenter (6906) notes that verifiable science does not always include underlying data sets due to confidentiality, convention at the time of publication (for older studies) or unavailability of data. The commenter states that the scientific community would use a variety of factors to evaluate conclusions in such studies when dose response and modeling data is not available. This would include evaluation of methods, evaluation of mechanisms and related logical inferences,

³⁶⁶⁴ Energy Literacy: [Energy Literacy.pdf](#).

converging evidence of conclusions from multiple sources and replicability of the study and its conclusions based on provided information and similar published studies.

Commenter (6955) suggests that instead of requiring access to the datasets, EPA should focus on any statistical weaknesses in the papers and studies that are considered in regulatory analysis. The commenter explains that unidentified or uncorrected post-hoc analysis can also appear in published studies, particularly when no evidence is available about hypotheses planned before data collection, and notes that adding more post-hoc analysis from stakeholders to the mix is likely to make the problem worse.

Response: This rule is not meant to be at the exclusion of other transparency initiatives, but rather build upon open data initiatives in the federal government and scientific community. This rule is meant to advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to national ambient air quality standards (NAAQS), risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

18.4.2 Weight Studies According to Data Transparency

Comment: Commenters (1006, 5185, 6141, 6179, 6875, 6955) suggest that EPA preferentially weight studies, data, and/or models with available underlying data when considering the study, data, and/or model for use in rulemaking instead of disqualifying studies without available underlying data.

Commenter (6179) suggests that EPA could qualify discussion of such a study with a statement to the effect that "due to sensitive underlying dose response data and models, the robustness of this study's results could not be subjected to outside replicability and verification." The commenter further states that while the study would remain in a rulemaking's record, the Administrator would be free to consider uncertainties in the study arising from the lack of external review when making regulatory decisions. The commenter notes that administrators

have taken similar methodological considerations into account when weighting studies in past NAAQS reviews.³⁶⁶⁵

Commenter (5185) suggests that in certain situations—particularly when relevant publicly available data is limited—the Agency may want to consider a flexible and non-binary approach to transparency requirements, including assigning greater decision-making weight to publicly available data while still allowing for the consideration of non-available data. The commenter notes that such an approach may be particularly useful for retrospective studies in which it is impossible or impractical to make data available and proposes that this concept be concurrently explored and addressed through the agency’s proposed rule to increase the consistency and transparency of consideration of costs and benefits in the rulemaking process.

Commenter (6955) suggests that in a regulatory proceeding, EPA should preferentially weight studies whose data has been made publicly available as well as studies that meet recent recommendations for improvement put forth in the scientific literature. In that way, the commenter contends that all the available information can be considered, while still promoting public access of research data.

Commenter (6141) suggests that EPA should give some increased weight or value to studies, data, and/or models for which the underlying data are available and evaluate the validity of other studies lacking such transparency based on the various qualitative factors. The commenter provides examples of such qualitative factors: the type of peer view, the charge questions provided to the reviewers, how relevant peer review comments were integrated into the planned action, and information about qualifications of the reviewers. The commenter concludes that this approach gives added meaning and weight to EPA’s commitment for transparency by reducing or diminishing the value of those studies to the extent that they lack the criteria for scientific transparency.

Response: The EPA broadly agrees with the commenters. In this final rule, the EPA will not categorically exclude any studies from consideration. Rather, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. See 40 CFR 30.5(d) for the factors the EPA shall consider in determining the degree of consideration to afford pivotal science for which the dose-response data are not available for independent validation. The Agency will identify the pivotal science that was given lesser consideration and provide a short description of why lesser consideration was given.

³⁶⁶⁵ See e.g., National Ambient Air Quality Standards for Ozone, 80 Fed. Reg. 65,292, 65,326 (explaining that then Adm’n. McCarthy’s “determination to attach less weight to the epidemiologic-based risk estimates reflected her *consideration of key uncertainties*, including the heterogeneity in effect estimates between locations, the potential for exposure measurement errors, and uncertainty in the interpretation of the shape of concentration-response functions for O₃ concentrations in the lower portions of ambient distributions.”) (emphasis added).

18.4.3 Encourage Scientific Community-Led Efforts to Self-Improve Transparency

Comment: Commenters (2429, 6875, 6937) note that the scientific community is already engaged in efforts to improve study transparency and EPA should encourage and support these efforts instead of proceeding with the proposed rule. Commenters (2911, 5164) suggest that any changes to EPA's transparency process should be made with the full consultation with and support of the scientific community.

Commenter (2429) suggests that the Agency could promote the resources that are currently being implemented within the scientific community such as promotion of the STROBE statement, aimed at Strengthening the Reporting of Observational studies in Epidemiology by providing authors a checklist of requirements necessary for complete and adequate reporting of research.³⁶⁶⁶

Commenter (6937) suggests that EPA could achieve the actual stated goal of replication, improve transparency, maintain the ability to protect public health using the best-available science, and do so without excessive litigation and at lower cost to EPA and to the public by fostering dialog and protocol development on transparency, openness, and replication by fostering scientific town hall meetings, research, special journal issues, and/or focused conferences involving the stakeholders and brokers -- scientific associations, industrial associations, journals, the National Academy, and the Health Effects Institute.

Commenter (6875) states that EPA should work to encourage the continuation of journals requiring authors to submit their data to public repositories.

Response: The transparency provisions in this final rule are intended to build upon existing efforts within and outside the federal government and provide incremental progress toward the Agency's goal of greater transparency. The EPA acknowledges that the scientific community has embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals³⁶⁶⁷ and the emergence of organizations, such as the Center for Open Science, and international initiatives like Findable, Accessible, Interoperable, and Reusable (FAIR) data principles; Facilitate Open Science Training in European Research (FOSTER); and Guidelines for Transparency and Openness Promotion (TOP) in Journal Policies and Practices that incentivize greater transparency in research^{3668,3669}.

The EPA supports these efforts and is pursuing an incremental approach to maximizing transparency in the science that it relies upon to ensure that implementation is done in a thoughtful and deliberate way that focuses on the EPA's most impactful actions, minimizes unintended consequences, and informs future transparency requirements. As further described in

³⁶⁶⁶ STROBE Statement: Home, 2009, www.strobe-statement.org/index.php?id=strobe-home

³⁶⁶⁷ McNutt, M. (2016). Taking up TOP. *Science* 352, 1147. Available at <https://doi.org/10.1126/science.aag2359>.

³⁶⁶⁸ NAS (National Academies of Sciences, Engineering, and Medicine). (2019). Reproducibility and replicability in science. Washington, DC: The National Academies Press. Available at <https://www.nationalacademies.org/our-work/reproducibility-and-replicability-in-science>.

³⁶⁶⁹ Nosek, B. A. et al. (2015). Promoting an open research culture. *Science* 348, 1422-1425. Available at <https://doi.org/10.1126/science.aab2374>.

Section II.B, the EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or more pollutants, contaminants, or substances are integral to the Agency's mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. In addition, the data underlying the dose-response assessment are more distinct than the broad range of data informing an entire risk assessment. Therefore, the EPA is concentrating its current efforts to increase transparency on a well-defined step in the quantitative assessment of risk supporting specific Agency actions. This final rule provides an important step in furthering the progress already being made toward maximizing transparency and will provide important insight for developing future statute-specific requirements.

18.4.4 Use Independent Third-Party to Evaluate Study Components, Results, Rules, Data Disclosure Issues

Comment: Commenters (4840, 5118, 6141, 6168, 6355, 6937, 6955) propose using a qualified independent third-party to evaluate the study components and/or the results when the data cannot be automatically made publicly available instead of disqualifying the study or results from the rulemaking process. Commenters (6357, 8178) suggest having a third-party be involved with all proposed regulations (new and updated). Commenter (2336) suggests using a third-party to resolve data disclosure issues.

Commenter (2336) notes that historically, for dose response function estimates that imply a need for major changes in allowable levels of a particular pollutant, a qualified independent third party free of potential conflicts of interest would be recruited to reanalyze the dose response function at issue, on the condition that the third-party analysts maintain the confidentiality of the input data necessary to perform the reanalysis. The commenter states that this procedure is consistent with the Notice of Proposed Rulemaking's statement that some data may be fully accessible through "public data repositories," and other data may have "controlled access in federal research data centers," meaning, presumably, that the public may have to apply for access and sign "nondisclosure agreements" to access the data. [83 FR 18771].

Commenter (4840) notes that one option to address the importance of transparency and access to the data underlying important studies without injuring the scientific enterprise or discouraging scientists from pursuing pressing scientific questions is to require reanalysis by third parties. The commenter notes that this would not require new regulation and that certain journals, for example, require authors to agree to make their data available to editors and others upon request.

Commenter (6355) states that restricting what scientific evidence can be used to inform policy does not strengthen policy; instead it undermines confidence in the scientific underpinnings of regulations and opens the door to misinformed or weakened regulations. The commenter suggests that the transparency and scientific underpinnings of EPA's policy and regulatory decisions could instead be improved through external review by objective and independent scientists with current knowledge of the 'best available science', and public dissemination of resulting comments and recommendations; scientists should be vetting science-based regulatory

decisions, rather than the public vetting the science; while data accessibility is desirable, objectivity and neutrality are essential.

Commenter (5118) suggests that instead of the proposed rule, an independent council should review the analyses used in rulemaking and the report of this council could be released for public scrutiny. Specifically, the commenter proposes that:

An Epidemiology Peer Review Council with the goal of creating a transparent document reflecting a thorough review be established by EPA. This Council will consist of six independent sub-committees with relevant experts as follows:

- Ethics: All aspects of assuring the personal safety and identities of the individuals in the cohorts are protected. Will state clearly why individual protected personal data is or is not needed to make a decision.
- Endpoint evaluation: Relevant experts knowledgeable about the endpoint will discuss factors like how many in a cohort are needed to make a meaningful difference. Identify what is known about how this endpoint can be altered by environment and any known chemicals.
- Exposure evaluation
- Statistical evaluation
- Analytical Chemistry
- Animal Toxicity and Structure Activity Correlations

Each sub-committee will articulate why additional data are or are not needed. The Council will consist of qualified individuals from EPA, U.S. Food and Drug Administration (FDA) or other agencies and consultants as needed. The Council will consider the reports of the six sub-committees and make their recommendations especially with regard to additional data needed to support transparent regulatory decisions.

The report of the Council will append each of the six subcommittee reports as well as any dissenting opinions.

The Council owns the decisions and since all responsible individuals will be identified, the report is thus transparent. Science Advisory Panels may further review the Council report.

In conclusion, controversies associated with epidemiological reports may not be eliminated but the Council should contribute to minimizing these controversies.

Commenter (6937) suggests that in cases where making data public is very difficult due to privacy or other concerns, the EPA employ third party trusted replication such as that done for the Harvard Six Cities Study (Six City Study) on air pollution by the Health Effects Institute.

Commenter (6168) suggests that scientific rigor, contextualization, transparency, and accessibility all can be improved through the incorporation of multiple, “third party”

perspectives in study design and analyses. The commenter states that this means seeking ways to include -- rather than exclude -- cutting edge scientific research and expanding participatory knowledge making. The commenter asserts that incorporating participant-centered values and research design will improve both scientific rigor and public health outcomes. The commenter also states that inclusion of only scientist or industry perspectives has resulted in regulations that exclude public health concerns, such as the removal of the neurotoxic gas hydrogen sulfide from EPA's initial list of Hazardous Air Pollutants in 1991 despite evidence that low dose, chronic exposure is detrimental to human health.³⁶⁷⁰ The commenter concludes that development, sharing, and stewardship of science and data with the public, including marginalized communities, will increase real transparency and accessibility while improving knowledge of the true costs and benefits of both chemicals and regulations.

Commenter (6955) states that if the goal is to make sure that the data and methods of analysis lead to the results stated, which has been a lot of the scientific motivation for public access, the approach taken with the Six Cities studies could be followed. The commenter specifically suggests that one of the hypothetical EPA approved organizations would be given the data solely for auditing purposes and to repeat the analysis, and not to change it. In this way, the commenter states, the original peer review would not be bypassed.

Commenter (6141) cautions that the peer-review process is subject to shortcomings such as adophenia (interpreting patterns in random or unrelated data), confirmation bias, and hindsight bias.³⁶⁷¹ The commenter suggests that EPA should consider post-publishing verification of studies and including a broader cross-section of those affected by the regulatory activity in its analysis of studies that it relies on.

Commenter (8178) suggests having a shadow agency (at the regulated industries' expense) do an independent investigation of all proposed regulations, similar to the shadow cabinets in Britain.

Commenter (6357) recommends the establishment of an independent scientific advisory committee composed of experts in the field, including those funded by EPA, to guide improvements in transparency and validation of research included in the regulatory process. The commenter suggests that the advisory committee be tasked with summarizing their findings and distributing them directly to the public so that updates to the EPA's rules can be made in a way that supports as much transparency as is practically and ethically possible, while ensuring the inclusion of relevant studies that inform the agency's actions and protect human health.

Commenter (2336) suggests that EPA follow the example of the Clean Air SAB's role for resolving data disclosure issues. The commenter explains:

The EPA is a line agency generally subject to direct political oversight, but there are some aspects of its duties that need to be insulated from political

³⁶⁷⁰ Initial List of Hazardous Air Pollutants with Modifications (<https://www.epa.gov/haps/initial-list-hazardous-air-pollutants-modifications>)

³⁶⁷¹ Munafò, M.R., Nosek, B.A., Bishop, D.V., Button, K.S., Chambers, C.D., du Sert, N.P., Simonsohn, U., Wagenmakers, E.J., Ware, J.J. and Ioannidis, J.P., 2017. A manifesto for reproducible science. *Nature Human Behaviour*, 1, p.0021 (<https://www.nature.com/articles/s41562-016-0021?source=sciencecodex.com>).

considerations, at least to the extent that the scientific integrity of a study can be judged independently of the political ramifications of using it to formulate regulations. To fill that need, Congress provided for a 48-member Science Advisory Board in the Clean Air Act. Although the Board's recommendations are advisory, the EPA Administrator, as a practical matter, is obligated to provide a cogent and convincing rationale for rejecting the Board's determinations.

This is the approach that should be followed in resolving data disclosure issues. The extent to which the use of input data that is not public detracts from the scientific validity of an estimated dose response function depends heavily on the circumstance of each study. The centrality of confidential data to the study's findings, and the various forms of limited disclosure that might allow the study to be independently analyzed without sacrificing privacy interests, are factual, technical matters. Such issues should, in the first instance, be decided by an expert, objective technical board that might include lawyers and as scientists. If a political appointee overrules the findings of such a board, he or she should be required to provide specific technical reasons for doing so. There should also be a right of appeal from a political decision to overrule to the appropriate Federal district court.

Response: The EPA notes that in this final rule, no studies will be categorically excluded from consideration in significant regulatory actions or influential scientific information. Further, this final rule does not require the EPA or any third party to reanalyze scientific studies; rather, it requires the Agency to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. However, in 40 CFR 30.7(4) the rule does allow the Administrator to consider whether a third-party has conducted independent validation of the study's underlying dose-response data through reanalysis when the Administrator is determining whether to exempt the study from the requirements of this final rule.

18.4.5 Increase Financial Incentive Transparency

Comment: Commenter (2429) suggests that the Agency could encourage the registration of research protocols and create a public repository where environmental scientists from industry and academia can declare sources of funding. The commenter notes that these tasks would help improve the quality of the science used in the regulatory process and allow the Agency to make strong evidence-based regulations that would protect public health and the environment.

Commenter (8178) suggests that given that the ostensible purpose of the proposed regulation is to increase the transparency in EPA decision making, a reasonable alternative would be to require each person expressing a position on a EPA action to disclose her or his salary and/or compensation for that statement and for any supporting study. The commenter explains that this could be similar to what a party may discover about an expert witness offered in federal court, which would allow the public to act as more informed participants in any debate.

Response: This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government.

18.4.6 Other

Comment: Commenter (6868) suggests several discrete actions the Agency could take to increase transparency and public trust in how EPA develops policy other than the proposed rule:

- Making the schedule of the EPA Administrator/Acting Administrator available to the public,
- Granting media representatives full access to public meetings,
- Ensuring public access to factual information on the environmental and public health effects of climate change,
- Minimizing the role regulated industry representatives play on EPA advisory committees, and
- Meeting court ordered deadlines for promulgation of major regulatory actions and providing full cooperation with any pending federal investigations of agency staff misuse of office.

Response: These suggestions are outside the scope of this rule. The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

Comment: Commenter (6875) states that EPA released a document titled Plan to Increase Access to Results of EPA - Funded Scientific Research in 2016 in response to a 2013 memo released by the White House Office of Science and Technology Policy (OSTP).³⁶⁷² The commenter states that the OSTP memorandum entitled "Increasing Access to the Results of Federally Funded Scientific Research" directs Federal departments and agencies that spend more than \$100 million per year on research and development (R&D) to develop and submit a plan to OSTP to increase public access to peer-reviewed, scientific research publications and research data resulting from agency-funded R&D.³⁶⁷³ The commenter asks: What is the status of this plan and what does this rule cover that this document does not regarding data funded and produced by EPA?

³⁶⁷² Environmental Protection Agency. (2016). Plan to Increase Access to Results of EPA - Funded Scientific Research Version 1.1.

³⁶⁷³ Office of Science and Technology Policy, Executive Office of the President. (2013, February 22). Memorandum for the Heads of Executive Departments and Agencies: Increasing Access to the Results of Federally Funded Research. Retrieved from https://obamawhitehouse.archives.gov/sites/default/files/microsites/ostp/ostp_public_access_memo_2013.pdf

Response: The EPA's Public Access Plan is specific to scientific research that the EPA produces and funds, and is distinct in scope from this rulemaking. The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. The commenter can learn more about the EPA's Public Access Plan at <https://www.epa.gov/data/increasing-access-results-epa-funded-scientific-research>.

Comment: Commenter (6098) states that the Proposal verbiage suggests that "public" refers to "general public" i.e. all citizens, giving the impression that the average citizen conduct validation of data and methods. The commenter asserts that validation of scientific studies require a number of criteria and should only be performed by those that can meet or exceed said criteria:

1. Validation must be conducted in a manner free of bias, i.e. objective.
2. Validation must replicate the conditions and methods of the study.
3. Validators must possess education and experience in the field of study; i.e. a geologist would not perform an independent review of a purely biological study.
4. Validation must meet the same rigorous standards of the study and be available for review and subsequent validation.

Validation of processes and data accuracy within a scientific system requires appropriate skills commensurate with the subject at hand. It would be more appropriate to submit the study to peer review and then publish the findings in the appropriate journal with a supplemental publication designed for public consumption and understanding to be openly available.

Response: This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. It therefore does not direct any member of the public or EPA to validate data or methods. Instead, this rule establishes internal procedure for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information.

Comment: Commenter (6892) cites the article *A Real, Not Faux, Transparency Proposal for Regulatory Science*, " by Professors Rena Steinzor and Wendy Wagner (August 1, 2018):³⁶⁷⁴

Of all the problems that plague EPA today, ensuring scientific transparency is not all that difficult. A real transparency proposal, as opposed to the Pruitt EPA's faux proposal, would closely track the standards developed by the scientific community and include the following five features.

³⁶⁷⁴ Available at <http://www.progressivereform.org/CPRBlog.cfm?idBlog=68AA0645-9FD2-0F41E60CF8E0BC5F7372> [Includes cited article as attachment].

1. “Rebuttable Presumption. A commitment to transparency must not compromise the agency’s ability to use the very best information possible. ...
2. “Broad Conception of Scientific Transparency. In contrast to the crabbed conception of transparency as applying only to “data” in the current, faux proposal, a real proposal embraces the conceptions of transparency developed by the premier scientific journals.
3. “Prospective Application. In contrast to the faux proposal, real transparency requirements would not apply retrospectively to research already completed. ...
4. “Coverage of All Research. Unpublished research submitted by industries in support of a license or permit is at least as susceptible to bias and error as prominent academic research published in the top journals. Yet the faux transparency proposal — which applies only to an ill-defined set of “pivotal” research — would likely only reach the latter and leave most industry research untouched. ...
5. “Disclosure of Exclusions. When information is excluded from consideration in the agency’s analysis, the public should be able to learn about those exclusions. ...”

Response: The EPA disagrees with the commenter that the 2018 proposed rule promoted “faux” transparency, but also notes that through revisions in response to public comments, this final rule resolves the concerns noted. First, under this final rule the Agency will continue to consider all relevant scientific information in its significant regulatory actions and influential scientific information. Second, this rule is not in conflict with scientific journals, but rather reflects that the scientific community has also embraced greater data transparency, as evidenced by data sharing and availability requirements for many high-impact journals³⁶⁷⁵ and the emergence of organizations, such as the Center for Open Science, and international initiatives like Findable, Accessible, Interoperable, and Reusable (FAIR) data principles; Facilitate Open Science Training in European Research (FOSTER); and Guidelines for Transparency and Openness Promotion (TOP) in Journal Policies and Practices that incentivize greater transparency in research^{3676,3677}. Third, this final rule applies prospectively to significant regulatory actions and influential scientific information developed after the effective date of the final rule and has no retrospective effect on existing significant regulatory actions or influential scientific information. For future, significant regulatory actions and influential scientific information, the final rule applies equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. Fourth, the commenter is incorrect; this rule applies to all dose-response data, regardless of the source of funding or identity of the party who generated the

³⁶⁷⁵ McNutt, M. (2016). Taking up TOP. *Science* 352, 1147. Available at <https://doi.org/10.1126/science.aag2359>.

³⁶⁷⁶ NAS (National Academies of Sciences, Engineering, and Medicine). (2019). Reproducibility and replicability in science. Washington, DC: The National Academies Press. Available at <https://www.nationalacademies.org/our-work/reproducibility-and-replicability-in-science>.

³⁶⁷⁷ Nosek, B. A. et al. (2015). Promoting an open research culture. *Science* 348, 1422-1425. Available at <https://doi.org/10.1126/science.aab2374>.

data. Fifth, the Agency will identify the pivotal science that was given lesser consideration and provide a short description of why lesser consideration was given.

Comment: Commenter (6168) requests that EPA strengthen real transparency and accessibility by incorporating and contextualizing the full range of evidence, stating that transparency can only be achieved through privacy, accessibility, and scientific rigor, which in turn require contextualized and participatory knowledge making carried out in a timely manner. The commenter notes that the point of regulatory science is to provide the information necessary for making timely decisions, and regulators must be able to use a body of scientific evidence that is imperfect; they must be enabled to act even in the face of uncertainty. The commenter suggests that any rulemaking by EPA recognize that transparency does not mean certainty, which is a tool for regulatory delay; rather, transparency requires contextualizing uncertainty in order to move forward with environmental and human health protections.

Response: The EPA disagrees with the commenter that the requirements of this rule will result in any meaningful delay in promulgating regulations. While this final rule requires the Agency to evaluate the availability of dose-response data for pivotal science, the incremental burden to the Agency to carry out these requirements is expected to be small given (1) the extensive scientific review the EPA already conducts regularly and (2) that the requirement is limited to pivotal science (i.e., typically a small, though highly important, subset of the studies the EPA would review). Further, with this final rule, the EPA is maintaining language in 40 CFR 30.3 stating that the statutes that the EPA administers, or their implementing regulations, will control in the event of any conflicts with the requirements of this rule. The Agency will continue to comply with and abide by the requirements in those statutes and implementing regulations, including regulatory deadlines. The EPA does not represent transparency as a source of certainty in this final rule, but rather argues that transparency lends incremental improvement in the strength and clarity of EPA significant regulatory actions and influential scientific information.

Comment: Commenter (6937) proposes that EPA consider reward leaders and teams at EPA that do an exemplary job with transparency instead of proceeding with the proposed rule.

Response: The EPA is promulgating this rule in order to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. Employee awards are outside of the scope of this rulemaking.

Comment: Commenter (8178) suggests that an alternative to the proposed rule would be to authorize the EPA inspector general to expeditiously review any claims of bias.

Response: The EPA is promulgating this rule in order to codify internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. By enabling greater transparency in regulatory decision-making to the public, this may reduce the instances of alleged bias in the EPA's regulatory decision-making.

Comment: Commenter (4541) suggests that the EPA assumes that association equals causation, administering massive doses of chemicals to laboratory animals predicts the human health impacts of much lower levels of exposure, natural causes of cancer and other diseases are nonexistent, current ambient levels of air pollution can cause disease or death without clinical evidence, and more. All of these assumptions violate the Bradford Hill Criteria and other requirements of the scientific method that the commenter supports (see section 10.3.2 of Chapter 10 for a list of criteria and a summary of the commenters' discussion on how EPA's analyses differ), rendering, in their opinion EPA's science an unreliable guide for researchers and policymakers.

Response: The comments are out of scope of the rule, and thus EPA is not responding to the comments.

18.5 Facilitate Data Publication/Accessibility

18.5.1 Public Accessibility to Environmental Databases and Websites that are Easy to Navigate

Comment: Commenter (6168) states that industry proprietorship has been coddled by a government ensnared by business interests to such an extent that it has prevented government scientists from being able to efficiently analyze the health effects of particular compounds such as per- and polyfluoroalkyl substances (PFAS)³⁶⁷⁸ and glyphosate³⁶⁷⁹ (both receiving public attention currently), or to investigate water quality impacts from activities like hydraulic fracturing.³⁶⁸⁰ The commenter asserts that people have the right to know about the status of and factors influencing their environment and its management;³⁶⁸¹ this includes uninterrupted, public access to environmental databases and websites that are easy to navigate, providing valid and contextualized information aimed towards laypersons.

Response: The main benefits of this rule spring from greater transparency in significant regulatory actions and influential scientific information. By placing greater emphasis on the availability of dose-response data underlying pivotal science, the rule will allow for greater scientific scrutiny as EPA decision makers are developing significant regulatory actions and influential scientific information and increases the likelihood that any errors will be identified and corrected. Greater transparency is also inherently valuable as a principle of good government and provides benefits to the public at large, including reducing the risk of errors in EPA analyses and in the science such analyses rely upon. The ability for independent subject matter experts to validate pivotal science will facilitate more effective comment and engagement with the public during development of future significant regulatory actions and influential scientific information. While the EPA supports public access to environmental databases and websites, this final rule does not require the EPA or any other entity to disclose or host data.

³⁶⁸¹ EDGI Mission, Vision, Values

18.5.2 Improve Public Accessibility

Comment: Commenters (2003, 2746, 4840, 6126, 6924) suggest that EPA should work to develop or improve public data repositories.

Commenter (2003) states that while there are many good reasons why some studies do not publish their full datasets online, such as protecting the identity of participants or shielding CBI from disclosure, many researchers do not publish their datasets online for the simple reason that there is not a convenient, widely-used scientific data repository. The commenter suggests that instead of proceeding with the proposed rule, EPA invest in developing a national data repository, looking to many existing data repositories that could serve as good models for a national data repository. The commenter acknowledges that a national data repository would still not solve the problem that not all data would end up being posted online; researchers from other countries, for example, may choose not to put their data in a U.S. repository. The commenter states that restricting EPA's access to foreign studies would not benefit public health and the environment, concluding that ultimately, if EPA wants to improve the transparency of scientific data, it should focus on efforts that will do so, without restricting its ability to use data that some consider not to be transparent as needed.

Commenters (2746, 6126, 6924) suggest that EPA should invest in research and development of systems and methods that would allow secure data sharing while still protecting the privacy of study participants.

Commenter (6126) states that government must do more to ensure that information about how it uses data is easy for the American public to access and understand.³⁶⁸² The commenter finds that EPA's proposed rule falls short of this call, and substantial improvements can be made to both current practices at EPA and the details of the proposed rule. The commenter offers to provide advice and consultation to improve EPA's use of science and evaluation at the agency moving forward.

Commenter (6126) elaborates that the challenge for EPA is that the infrastructure does not yet exist for EPA to collect, maintain, and analyze the data and models described by EPA as necessary for transparency in this regulation. The commenter states that EPA's experience implementing the e-Enterprise system over the last decade and of building the hazardous waste electronic manifest system have, if anything, demonstrated that ensuring the systems are in place can be time consuming; but perhaps more importantly, these systems have demonstrated that the investment of time can help ensure systems are useful, relevant, and secure.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. However, the transparency provisions in this final rule are intended to build upon existing federal government efforts. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government

³⁶⁸² Hart and Wallman, 2018, p. 3.

that is inherently valuable to the public. For example, The EPA's 2016 *Plan to Increase Access to Results of EPA-Funded Scientific Research* noted that "transparency is a core EPA value" and that increased availability of research data would accelerate scientific breakthroughs that support the Agency's mission and policymaking efforts³⁶⁸³. The EPA's *Open Government Plan 5.0* also details the EPA's progress in implementing the tenets of the numerous data transparency initiatives in the federal government³⁶⁸⁴. Together with these initiatives, this final rule will provide incremental progress toward the Agency's goal of greater transparency.

The Agency may continue to use foreign research studies regardless of whether the underlying data has been made available.

18.5.3 Make Use of Existing Data Repository (e.g., Rulemaking Docket)

Comment: Commenter (6360) suggests that for EPA applications of science, the data depository should be the public docket of a proposed rule or the accompanying administrative record associated with a proposed decision. The commenter further suggests that for sensitive information, EPA should adopt the data repository standards in common use by other federal agencies, journals, and EPA itself. Examples standards provided by the commenter include:

- The Census Department has established stringent criteria for researchers seeking to review data that could allow individual responses to be identified.
- Similar procedures are in place to protect data from new drug trials in journal repositories.
- EPA has procedures for its contractors to review CBI – procedures that could be modified for non-government public commenters to use to review applied science that relies on sensitive data.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. However, 40 CFR 30.4 does require the EPA to clearly identify all science that serves as the basis for informing a significant regulatory action, and make all such science that serves as the basis for informing a significant regulatory action publicly available to the extent permitted by law. The EPA clarifies that this requirement at 40 CFR 30.4 is equivalent to the Agency's current practice of including science in the public docket as part of a rulemaking.

18.5.4 Transparency of Published Data

Comments: Commenter (6168) suggests that metadata stored with published data should include the sample or data location, institution responsible for data collection and analysis, type of sampling conducted, time and frequency of sample or data collection, suite of parameters

³⁶⁸³ U.S. EPA. (2016). Plan to Increase Access to Results of EPA-Funded Scientific Research. (EPA/601-R-16-005). Washington, DC: U.S. Environmental Protection Agency. Available at <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf>.

³⁶⁸⁴ U.S. EPA. (2018). Open Government Plan 5.0. Washington, DC: U.S. Environmental Protection Agency. Available at https://www.epa.gov/sites/production/files/2018-10/documents/epaopengovplanversion5_0final.pdf.

measured, basic assumptions, sources of error, and uncertainties. The commenter also suggests that the population and/or geography relevant to the study, why and how the study was executed, who funded the study, proposed studies that were rejected and the justifications, and potential values, biases, and uncertainties of the study should also be stored with the data. The commenter explains that proper contextualization of environmental data takes into account data provenance and the circumstances under which data has been collected and stored, which addresses the public's right to know and improves scientific rigor.

Response: The final rule establishes that dose-response data is considered “publicly available in a manner sufficient for independent validation” when it includes the information necessary for the public to understand, assess, and reanalyze findings and may include, for example:

- (1) Data (data would be made available subject to access and use restrictions);
- (2) Associated protocols necessary to understand, assess, and extend conclusions;
- (3) Computer codes and models involved in the creation and analysis of such information;
- (4) Recorded factual materials; and
- (5) Detailed descriptions of how to access and use such information.

The EPA is focusing on the underlying dose-response data for this rulemaking because of the influence these data have on particularly impactful decisions at the Agency. Risk assessments and regulations that target emissions and risk reduction of one or more pollutants, contaminants, or substances are integral to the Agency's mission and the underlying dose-response data that inform the quantitative value used to evaluate and mitigate potential risk are critical to understanding the assessment or regulatory action. In addition, the data underlying the dose-response assessment are more distinct than the broad range of data informing an entire risk assessment. Therefore, the EPA is concentrating its current efforts to increase transparency on a well-defined step in the quantitative assessment of risk supporting specific Agency actions. This final rule provides an important step in furthering the progress already being made toward maximizing transparency and will provide important insight for developing future statute-specific requirements.

18.6 Implement, Emulate or Work with Federal Programs

18.6.1 Environmental Protection Agency Policy and Guidance

Comments: Commenters (6125, 6126) suggest that instead of proceeding with the proposed rule, EPA update or improve enforcement of existing EPA guidelines.

Commenter (6125) suggests that if EPA has issues with its current risk assessment and benefit analysis procedures that currently follow NAS recommendations and its own existing guidelines, EPA should update the existing guidelines as needed, showing in far more detail than provided in the proposed rule the details of their reasoning, the conditions in which they should be employed,

and the scientific bases for requiring consideration of alternative models in all risk assessments. The commenter continues that the draft guidelines should then undergo peer review by expert panels of the NAS and/or its own SAB and Science Advisory Panel. The commenter states that while guideline development is arduous and time consuming, it has several advantages over rulemaking, including 1) guidance is developed by experienced risk assessors; 2) it is a science-based process that involves consensus building across the EPA as well as with the broader science community; and, 3) critically, it maintains the separation between risk assessment and risk management so that EPA's decision makers benefit from the availability of science that is produced in an independent and objective fashion. The commenter provided background on EPA's current risk assessment and benefit analysis procedures:

For assessing human health risk based on animal toxicology studies, EPA has developed a publicly-available, widely-used and accepted tool (the Benchmark Dose software (BMDS)) that can perform these calculations. BMDS currently contains thirty different models that are appropriate for the analysis of dichotomous (quantal) data, continuous data, nested developmental toxicology data, multiple tumor analysis, and concentration-time data. There also are many other open source and proprietary tools available to use as well. The agency has access to most of them.

Because air quality standards have been based in large measure on human clinical and community epidemiology studies, EPA adopted an "acceptable risk" interpretation of the requirement for "an adequate margin of safety" early in the initial reviews of the NAAQS.^{3685,3686} The approach for conducting formal risk assessments for NAAQS criteria and standards reviews evolved over time, but has remained consistent with the principles and practices outlined above, namely that quantitative dose or concentration-response approach should flow from the available scientific data. As the NAS noted in 2009, the more recent human clinical and epidemiologic evidence available for fine particles and ozone risk analyses has involved fairly low-level exposures, and extrapolation below the level of observation to any great degree is less important than for compounds for which evidence is derived from animal bioassays or occupational (high dose) epidemiology.³⁶⁸⁷

The most recent risk assessments for the ozone³⁶⁸⁸ and fine particle NAAQS³⁶⁸⁹ include examples of a non-linear threshold approach based on human clinical

³⁶⁸⁵ Richmond, H.M. A Framework for Assessing Health Risks Associated with National Ambient Air Quality Standards; Environ. Prof. 1981, 3,225-234.

³⁶⁸⁶ Bachmann, J.D. 2007. Critical Review: Will the circle be unbroken: A history of the U.S. national ambient air quality standards. J. Air Waste Manag. Assoc. 57(6):652-697. doi:10.3155/1047-3289.57.6.650

³⁶⁸⁷ The NAS Silver book also stated that "Fine PM (PM_{2.5}) belongs to a family of pollutants (including ozone) with noncancer end points for which the evidence points to a linear or other non-threshold population response at low doses."

³⁶⁸⁸ EPA, 2014. Final Report: Health Risk and Exposure Assessment for Ozone, EPA-452/R-14-004a August 2014 <https://www3.epa.gov/ttn/naaqs/standards/ozone/data/20140829healthrea.pdf>

³⁶⁸⁹ EPA, 2010. Quantitative Health Risk Assessment for Particulate Matter. EPA-452/R-10-005 June 2010. https://www3.epa.gov/ttn/naaqs/standards/pm/data/PM_RA_FINAL_June_2010.pdf

studies, and no-threshold concentration-response models based on short and long-term epidemiology studies of premature mortality. These risk assessments, which are peer reviewed by the Clean Air Scientific Advisory Committee, form the primary basis for benefits estimates for the NAAQS as well as for cost-benefit analyses of regulations that reduce NAAQS pollutants. The proposal would force both risk assessment and cost benefit analyses to include thresholds and/or other non-linear concentration-response functions, regardless of what the review of the scientific information concludes.”

Commenter (6126) suggests that EPA could consider severing the connection between the availability of information to support replication and the use of scientific evidence in policymaking activities. As EPA notes in the proposed rule, “EPA has not consistently followed previous EPA policy” about scientific integrity.³⁶⁹⁰ The commenter concludes that instead of seeking culture change through a regulatory mechanism that intends to address availability and use concurrently, EPA could instead seek to better, more consistently implement the existing policy the rule critiques.

Response: The requirements provide a workable framework for evaluating pivotal science in the context of the availability of its underlying dose-response data, while balancing important technical considerations in order to ensure the Agency maintains a strong scientific basis for its decision-making. This framework provides direction that is consistent with Agency guidelines. For example, when evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science, and trigger the requirements of this rule outlined in 40 CFR 30.5. The incremental progress made possible by this rule provides an important step towards prioritizing transparency in particularly impactful EPA rules and assessments and will inform future statute-specific rulemakings.

18.6.2 Collaborate with Other Agencies/Departments

Comment: Commenter (1008) suggests that the EPA should continue to work in concert with other federal research funding agencies to carefully develop policies and procedures for providing access to research data, noting that the EPA’s efforts and challenges in furthering

³⁶⁹⁰ See footnote 13 in EPA 2018a, p. 18770: “EPA has not consistently followed previous EPA policy (e.g, EPA’s Scientific Integrity Guidance, referenced above) that encouraged the use of non-proprietary data and models.”

transparency to research results are not unique to the agency; ‘going it alone’ will not serve the EPA or its core mission.

Response: The EPA disagrees with the commenter that this rule requires the Agency to “go it alone,” and notes that the transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency’s goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. For example, in 2002 the OMB released its Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies, which includes discussion of the importance of the reproducibility of analyses underlying influential information³⁶⁹¹. that “transparency is a core EPA value” and that increased availability of research data would accelerate scientific breakthroughs that support the Agency’s mission and policymaking efforts³⁶⁹². The EPA’s Open Government Plan 5.0³⁶⁹³ also details the EPA’s progress in implementing the tenets of the numerous data transparency initiatives in the federal government prior to 2018, including the OMB M-10-06³⁶⁹⁴, the Office of Science and Technology Policy Memorandum of February 22, 2013³⁶⁹⁵, and OMB M-13-13³⁶⁹⁶. In 2019, Congress passed the Foundations for Evidence-Based Policymaking Act of 2018 (or OPEN Government Data Act, Pub. L. 115-435) into law, which included requirements for federal agencies to prioritize making their data available to the public, and OMB has released additional guidance for implementing the Act.^{3697,3698}.

18.6.2.1 Office of Science and Technology Policy

Comment: Commenter (6924) suggests that EPA should focus on implementing existing initiatives and guidelines for improving data sharing and transparency at federal agencies, including ensuring that EPA is in full compliance with the provisions of a 2013 memo from the Office of Science and Technology Policy that discusses policy principles and the development of federal agency plans to increase public access to federally funded research.³⁶⁹⁹ The objectives were developed in consultation with the National Science and Technology Council and with input from the public. To increase public access to science funded and used by the government, EPA should ensure it is in full compliance with the provisions of this memo.

Response: EPA is in compliance with the OSTP memo directing federal research agencies to develop public access plan. The EPA's 2016 Plan to Increase Access to Results of EPA-Funded Scientific Research noted that "transparency is a core EPA value" and that increased availability of research data would accelerate scientific breakthroughs that support the Agency's mission and policymaking efforts³⁷⁰⁰. While the EPA's Public Access Plan is distinct from this rulemaking, the EPA notes that the transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency.

18.6.2.2 Department of Energy (DOE)

Comment: Commenter (6182) suggests that EPA try to emulate the best practices of DOE's "Process Rule" while avoiding the lessons learned. The commenter also recommends that common rules and procedures (perhaps coordinated by OMB) be established lest counter-productive conflicts and confusion arise in areas with overlapping jurisdictional interest. The commenter concludes that, in other words, agencies should try to coordinate Process Rule best practices through OMB.

Response: The EPA notes that it does not have authority to direct OMB to coordinate Process Rule best practices and these comments are outside the scope of this rulemaking.

The transparency provisions in this final rule are intended to build upon existing federal government efforts and provide incremental progress toward the Agency's goal of greater transparency. The EPA and the federal government have long encouraged open data initiatives, as the principle of transparency in regulatory decision-making and the other operations of government agencies is a fundamental behavior of good government that is inherently valuable to the public. For example, in 2002 the OMB released its Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies, which includes discussion of the importance of the reproducibility of analyses

³⁶⁹⁹ Executive Office of the President, Office of Science Technology and Policy. Memorandum for the Heads of Executive Departments and Agencies: Increasing Access to the Results of Federally Funded Scientific Research. February 22, 2013. Available:

https://obamawhitehouse.archives.gov/sites/default/files/microsites/ostp/ostp_public_access_memo_2013.pdf

³⁷⁰⁰ U.S. EPA. (2016). Plan to Increase Access to Results of EPA-Funded Scientific Research. (EPA/601-R-16-005). Washington, DC: U.S. Environmental Protection Agency. Available at <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf>.

underlying influential information³⁷⁰¹. The EPA’s 2016 Plan to Increase Access to Results of EPA-Funded Scientific Research noted that “transparency is a core EPA value” and that increased availability of research data would accelerate scientific breakthroughs that support the Agency’s mission and policymaking efforts³⁷⁰². The EPA’s Open Government Plan 5.0³⁷⁰³ also details the EPA’s progress in implementing the tenets of the numerous data transparency initiatives in the federal government prior to 2018, including OMB M-10-06³⁷⁰⁴, the Office of Science and Technology Policy Memorandum of February 22, 2013³⁷⁰⁵, and OMB M-13-13³⁷⁰⁶. In 2019, Congress passed the Foundations for Evidence-Based Policymaking Act of 2018 (or OPEN Government Data Act, Pub. L. 115-435) into law, which included requirements for federal agencies to prioritize making their data available to the public, and OMB has released additional guidance for implementing the act.^{3707,3708}

18.6.2.3 FDA

Comment: Commenter (5041) suggests that instead of requiring all scientific research used to make EPA policy, regulation, or guidance be based on publicly available datasets, EPA can easily adopt the long established and proven processes and procedures used by FDA. The commenter states that this ensures that privacy laws and concerns are met while having the most robust numbers of studies to ensure sound scientific policy/regulation/guidance making where the public may bear the cost or harm of said policy/regulation/guidance.

Response: The EPA disagrees with the commenter, as this final rule does not require all scientific research used to make EPA policy, regulation, or guidance be based on publicly available datasets. Instead, the purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying

³⁷⁰¹ Office of Mgmt. & Budget, Exec. dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information.

18.6.2.4 Department of Interior (DOI) Transparency and Reproducibility Standards

Comment: Commenter (6161) recommends that EPA combine implementation of transparency and reproducibility standards with re-organized Information Quality³⁷⁰⁹ and Scientific Integrity (SI)³⁷¹⁰ functions modeled on the U.S. DOI example within the Office of the Science Advisor, perhaps to be called the Office of Regulatory Science. The commenter states that this is because information quality complaints submitted to EPA overwhelmingly address science-based issues (including data transparency and reproducibility)³⁷¹¹ and provides the following background on the DOI decision to consolidate the functions of the two programs in a single office.³⁷¹²

Response: The organizational changes recommended by the commenter are outside of the scope of this rulemaking.

³⁷⁰⁹ Section 515 of the Treasury and General Government Appropriations Act for Fiscal Year 2001 (Public Law 106554); February 22, 2002 (67 FR 8453) OMB's Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information (2002) <https://www.federalregister.gov/documents/2002/02/22/R2-59/guidelines-forensuring-and-maximizing-the-quality-objectivity-utility-and-integrity-of-information>

Chapter 19: Comparison of Approach to Hazard, Exposure and Risk Assessment Guidance

The proposed rule preamble (83 FR 18771) solicited comment on all aspects of the proposed regulation (specifically, the notice of proposed rulemaking (NPRM)) and the bases provided in the preamble. This section provides comments received on hazard, exposure and risk assessment guidance. In this section these comments are organized as follows:

- Science and Judgement in Risk Assessment
- Request for Inclusion of Discussion on How EPA Proposes to Address Exposure Assessments and Risk Characterization Data and Models in the Future
- Request Guidance on How to Use Human Data in Risk Assessments Under the Proposed Rule
- Industry Toxicology Study and Epidemiological Study Review and Acceptance Differ
- Public's Interest Best Served When Science is Replicable, Transparent and Explainable with Other Toxicology Information

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

19.1 Science and Judgement in Risk Assessment

Comment: Commenter (6155) asserts that the Executive Summary in *Science and Judgment in Risk Assessment* summarizes essential aspects of identifying and communicating uncertainty when doing dose-response assessments through the risk assessment process:

- EPA should conduct formal uncertainty analyses, which can show where additional research might resolve major uncertainties and where it might not.
- EPA should consider in its risk assessments the limits of scientific knowledge, the remaining uncertainties, and the desire to identify errors of either overestimation or underestimation.
- EPA should develop guidelines for quantifying and communicating uncertainty (e.g., for models and data sets) as it occurs into each step of the risk-assessment process.
- Despite the advantages of developing consistent risk assessments between agencies by using common assumptions..., EPA should indicate other methods, if any, that might be more accurate.
- When ranking risks, EPA should consider uncertainties in each estimate, rather than ranking solely on the basis of point estimate value. Risk managers should not be given only a single number or range of numbers. Rather, they should be given risk

characterizations that are as robust (i.e., complete and accurate) as can be feasibly developed.

- Communicating risk: [T]he process of assessing probabilities is difficult. Because substantial disagreement and misunderstanding concerning the reliability of single numbers or even a range of numbers can occur, the basis for the numbers should be set forth clearly and in detail.
- Risk assessment is a set of tools, not an end in itself. The limited resources available should be spent to generate information that helps risk managers to choose the best course of action among the available options.³⁷¹³

The commenter adds that *Science and Judgment in Risk Assessment* also summarized the importance of recognizing uncertainty in the risk assessment process:

The very heart of risk assessment is the responsibility to use whatever information is at hand or can be generated to produce a number, a range, a probability distribution—whatever expresses the best present state of knowledge about the effects of some hazard in some specific setting. Simply to ignore the uncertainty in any process is almost sure to leave critical parts of the process incompletely examined, and hence to increase the probability of generating a risk estimate that is incorrect, incomplete, or misleading.³⁷¹⁴

Response: The EPA agrees that identifying and communicating uncertainty is important for any scientific assessment, including dose-response assessments. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. The final rule requires the EPA to describe critical assumptions and methods used in its dose-response assessment and characterize the variability and uncertainty of the assessment. The final rule also requires that the EPA evaluate the appropriateness of using default assumptions on a case-by-case basis and to clearly explain the scientific basis for critical assumptions used in the dose-response assessment that the EPA relied on for the significant regulatory action or influential scientific information.

19.2 Request for Inclusion of Discussion on How EPA Proposes to Address Exposure Assessments and Risk Characterization Data and Models in the Future

Comment: Commenter (6362) requests that EPA include a discussion in the final rule regarding how it proposes to address exposure assessments and risk characterization data and models in the future extensions of related rules on Transparency in Regulatory Science. The commenter provides specific rule language suggestions in a redline version of the proposed rule regulatory text included in Appendix A of their comment letter for EPA to consider

³⁷¹³ The above bullets are all from the "Executive Summary to Science and Judgment in Risk Assessment, pp.12-15.

³⁷¹⁴ Science and Judgment in Risk Assessment, p. 162.

Response: Based on the comments on the 2018 proposed rule and the 2020 SNPRM and as described more fully in the preamble to the final rule, the EPA determined that the Agency should pursue an incremental approach to maximizing transparency in the science that it relies upon by focusing the final rule requirements on dose-response data and, in particular, only those studies that are integral to characterizing dose-response relationships (e.g., identifying candidate PODs). This rule does not apply to exposure assessments and risk characterization data and models, but future rulemakings may be more expansive as the EPA continues to make incremental progress toward maximizing transparency.

19.3 Request Guidance on How to Use Human Data in Risk Assessments Under the Proposed Rule

Comment: Commenter (6942) requests that EPA provide clarification and guidance for implementing the proposed regulation when human data are utilized for dose-response modeling and development of a chemical-specific cancer slope factor, reference dose, or reference concentration (e.g., risk assessments by the Integrated Risk Information System (IRIS)).

Response: As detailed in the preamble to the final rule, the EPA is finalizing an approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. Therefore, any guidance developed by the EPA for implementing the rule would be intended for use by EPA staff. The EPA also intends for the final rule to be implemented in a transparent manner and will identify pivotal science in proposed significant regulatory actions or external review drafts of influential scientific information, which will allow the public, if they so choose, to independently validate the pivotal science and provide comment to the EPA.

19.4 Industry Toxicology Study and Epidemiological Study Review and Acceptance Differ

Comment: Commenter (6862) asserts that there is a great discrepancy in the review of the toxicology studies that industry is required to submit in order to register their chemical products. According to the commenter, these studies follow strict protocol guidelines and are conducted under stringent good laboratory practices (GLP), quality assurance (QA) and animal ethics reviews as well as rigid reporting standards. These studies in the Office of Pesticide Programs (OPP) have multiple layers of primary and secondary review most often by contractors at a very significant expenditure of taxpayer funds and program resources. The commenter notes that studies are essentially transcribed into Data Evaluation Records (DERs) that have to state what was done and what the results were since the reviewers cannot misrepresent what the study reported. According to the commenter, the reviewers, however, can indicate study deficiencies and identify responses not already indicated by the report. The commenter states that the reviewers responsible for the reviews are clearly identified and responsible for their decisions.

In marked contrast, the commenter (6862) states that epidemiological studies appearing in the open literature (or otherwise) follow a mixed bag of study designs, GLP, QA, ethics and

reporting practices. According to the commenter, these studies are most often accepted at their face value without evidence of a critical review or identification of the responsible individuals.

The commenter (6862) contends that this practice is unfair to the public and that studies used for risk assessment should have the same level of critical review no matter what their source is.

Response: The EPA agrees that data transparency is vital for individuals who have not contributed to the study to be able to verify the quality and strength of published studies and that the opportunity to independently validate the pivotal science that the EPA relies upon is important in furthering scientific understanding and the Agency's mission. As discussed in the preamble to the final rule, peer review does not typically include reanalysis of the underlying data (i.e., the proper stage of data where the data that are ready to be analyzed to extract relevant information) and, thus, peer review is not considered a replacement for the data availability requirements of this rule. Further, the EPA determined that it cannot solely rely on data availability statements made in published research because initiatives toward greater data sharing and transparency amongst scientific journals and international organizations are still being implemented, are inconsistently enforced, and the true accessibility of data in a public repository is still limited. Therefore, the rule requirements for the EPA's independent evaluation of the availability of data are necessary and critical to prioritizing data transparency in the pivotal science underlying its significant regulatory actions and influential scientific information.

19.5 Public's Interest Best Served When Science is Replicable, Transparent and Explainable with Other Toxicology Information

Comment: Commenter (6105) notes that the publication of a series of studies on a single human group from exposure to a commonly used insecticide shows an unexpected effect at extremely low exposures (apparently an outlier amongst the pattern of available data). The commenter states that this finding has not been replicated in other human studies and is in contrast to extensive animal and other limited human studies that all point to changes in a blood enzyme as sentinel, at much higher exposures. The commenter provides that, in this case, EPA scientists asked the authors of studies from this single human group for the underlying data in order to confirm the results at the lower exposure. According to the commenter, the authors refused the release of data citing confidentiality concerns. As a result of this refusal, the commenter states that the EPA was not able to conduct its own analysis of all the study data. According to the commenter, since EPA had neither confirmatory studies, nor consistent information that made sense in light of the multitude of available studies of the chemical, nor the ability to conduct its own analysis, it chose not to use the incompletely published information from this single human group.

In one sense, the commenter contends that McCarthy and McCabe (2018) are spot on: the judgment should be left to risk scientists over which epidemiology and/or toxicology data to use for risk or safety assessment purposes. The commenter notes that from our perspective as risk scientists, EPA's decision not to use studies with incomplete information is correct. The commenter adds that the public's interest is best served when science is replicable, transparent, and explainable with other toxicology information (both experimental animal and human). The

commenter states that when studies cannot be replicated or when such studies are not consistent or explainable with other information, using such studies then depends on having access to the underlying data for independent analysis. When the underlying data are not provided to EPA scientists, especially those adept in the receipt and protection of confidential information, the commenter contends that it is difficult to use these studies with confidence to make a credible risk judgment for public health, much less national rulemaking.

In short, the commenter states that the public is often worried about chemical exposure, as they should be, when the chemical exposure exceeds a safety level. The commenter states that the public's interest is best served by trusting EPA's experts dedicated to public health protection and withholding scientific data from EPA's independent analysis is not in the public's best interest.

Response: The EPA agrees that scientific openness benefits both scientific and government processes. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. Although this rulemaking is not intended to remedy a particular issue, it does provide important incremental progress toward the Agency's overarching goal of greater transparency. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for the EPA or independent subject matter experts to validate pivotal science, and as data are better understood through independent reanalysis the Agency can make stronger, data-driven decisions and the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

The EPA would like to emphasize that the final rule does not impose requirements on any entity outside of the EPA. This is a rule of internal procedures. The rule does not direct or require any outside entity or the EPA to establish data sharing mechanisms, nor does it require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science.

Chapter 20: Chemical/Pollutant Specific Comments

As support for the proposal and need for transparency in regulatory science, several commenters provide chemical specific examples that they contend support the need for the proposal. These comments are organized as follows:

- Chlorpyrifos
- Formaldehyde
- Lead
- Particulate Matter
- Trichloroethylene

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

20.1 Chlorpyrifos

Comment: Commenter (1974) supports the development of sound science standards in order to prevent what they believe to be “sham” science from affecting EPA rulings. As an example, the commenter cites EPA’s proposal to ban chlorpyrifos. The commenter notes that due to a federal court order that EPA had not addressed the scientific bases for its action, the EPA’s own science board found that the single study the Agency sought to rely on to justify a regulatory ban was “premature and possibly inappropriate.”

Commenter (6137) states that pesticide manufacturers, such as Dow Chemical Company, have long opposed the use of epidemiological studies that collect human health data that must be kept confidential. For example, the commenter provides that they vigorously challenged EPA’s proposal to revoke tolerances for chlorpyrifos, one of the country’s most widely used pesticides, which in effect would have prohibited the use of chlorpyrifos on food crops. The commenter notes that the EPA had found that it could not conclude that exposure to this pesticide in food and drinking water was safe based on a risk assessment that included a safety factor mandated under the Food Quality Protection Act to protect the health of infants and children whose developing bodies are uniquely vulnerable to toxic pesticides. See 80 Fed. Reg. 69,079, 69,090 (Nov. 6, 2015); see also NAS, *Pesticides in the Diets of Infants and Children* (1993). The commenter adds that the EPA retained the safety factor over industry objections because epidemiologic studies indicate that prenatal exposure to chlorpyrifos can harm the developing nervous system. So the commenter states that industry attacked those studies, claiming they

needed to see the underlying medical information,³⁷¹⁵ even though the studies – conducted by highly reputable institutions including Columbia University, University of California-Berkeley, and Mt. Sinai School of Medicine – were all published peer-reviewed articles in scientific journals. While the Columbia scientists who authored the study have allowed EPA scientists to analyze the data in a secure setting on Columbia’s campus, the commenter notes that they have refused to make the raw data publicly available in order to protect the privacy of the mothers and children who participated in the research.³⁷¹⁶ Not satisfied, the commenter states that the pesticide industry is pressing EPA to exclude the study so that it can continue to sell a pesticide known to cause severe harm to children and EPA is playing along.

Response: The final rule is not intended to remedy a particular instance in which the EPA allegedly relied on a poor-quality study or a study for which the conclusions could not be independently validated. Rather, the transparency provisions of the final rule are intended to build upon existing federal government efforts and provide incremental progress toward the EPA’s goal of greater transparency.

20.2 Formaldehyde

Comment: Commenters (6362, 6369) assert that the EPA’s formaldehyde assessment is an example of the long-term problems where there is a lack of consistent, transparent application of modern scientific knowledge regarding chemical exposures and human health risk. Commenter (6362) asserts that, while knowledge regarding formaldehyde is much greater today, it does not appear that this new knowledge has been applied in the EPA’s assessment of formaldehyde risk. The commenter notes that EPA continues to revise its assessment while not disclosing how emerging scientific evidence or modern risk assessment methods are being employed.

Response: The final rule is not intended to remedy a particular instance in which the EPA allegedly relied on a poor-quality study or a study for which the conclusions could not be independently validated. Rather, the transparency provisions of the final rule are intended to build upon existing federal government efforts and provide incremental progress toward the EPA’s goal of greater transparency.

20.3 Lead

Comment: Commenter (6365) states that the experience of the lead national ambient air quality standards (NAAQS) rulemaking demonstrates the salutary purpose that transparency would serve

³⁷¹⁵ CropLife, Petition EPA to halt regulatory decisions that are highly influenced/determined by results of epidemiological studies that do not meet well-defined data quality standards, and that are not integrated into the health risk assessment in a transparent, well-defined manner (Nov. 29, 2016), https://www.eenews.net/assets/2018/08/23/document_gw_01.pdf; CropLife, Comments Re: Chlorpyrifos; Tolerance Revocations; 80 FR 69080, November 6, 2015; Docket ID: EPA-HQ-OPP-2015-0653 (Jan. 25, 2015), <https://www.regulations.gov/document?D=EPA-HQ-OPP-2015-0653-0342>

³⁷¹⁶ Letter from Linda P. Fried, Columbia University Medical Center, to Jack E. Housenger, EPA OPP Director, Re: Columbia Center for Children’s Environmental Health Epidemiology Study Data (May 18, 2016), <https://www.regulations.gov/document?D=EPA-HQ-OPP-2008-0850-0928>.

in the regulatory process.³⁷¹⁷ The commenter states that, in that rule, EPA relied heavily on the Lanphear study³⁷¹⁸ in its analysis of the health effects of lead exposure. The commenter states that the underlying data for the Lanphear study was not available to EPA or to stakeholders for replication and validation at the time of publication and it took stakeholders years, including litigation under the FOIA, to obtain that data. The commenter states that, due to the lack of availability, there was no complete reanalysis of that data for nearly a decade and EPA relied on the study in both the 2008 and 2016 lead NAAQS reviews. The commenter states that the lack of available data has been noted in the scientific literature as preventing alternative statistical analyses to be performed, which is particularly important given that key confounding factors such as parental education, intelligence, birthweight, smoking, and race were not controlled in several of the Lanphear cohorts and may contribute to an overestimation of health effects.³⁷¹⁹ The commenter provides that, when the data underlying Lanphear was reanalyzed,³⁷²⁰ numerous errors that were not discovered in the peer-review process and that were not previously known to EPA were uncovered and analyzed. The commenter notes that, although EPA ultimately determined that these errors did not materially affect the NAAQS review documents that relied on the Lanphear study, the Agency considered the errors and their potential impact on EPA's regulatory efforts to be sufficiently substantial so as to include a memorandum in the subsequent NAAQS rulemaking docket acknowledging those errors and considering their impact on the regulatory process.³⁷²¹

Response: The final rule is not intended to remedy a particular instance in which the EPA allegedly relied on a poor-quality study or a study for which the conclusions could not be independently validated. Rather, the transparency provisions of the final rule are intended to build upon existing federal government efforts and provide incremental progress toward the EPA's goal of greater transparency.

20.4 Particulate Matter

Comment: In support of the EPA's proposal for strengthening transparency in regulatory science, some commenters (6124, 6945) assert that certain studies supporting NAAQS found no significant relationship between PM_{2.5} and total mortality. Commenter (6945) notes that their reanalysis and the extensive null evidence on PM_{2.5} deaths support the importance of the EPA's "Strengthening Transparency in Regulatory Science" rule, which would make possible independent reanalysis of the "pivotal regulatory science" used as the primary basis for EPA regulations.

³⁷¹⁷ See National Ambient Air Quality Standards for Lead, 73 Fed. Reg. 66,964 (Nov. 12, 2008)

³⁷¹⁸ Lanphear et al. (2005), "Low-Level Environmental Lead Exposure and Children's Intellectual Function: An International Pooled Analysis"

³⁷¹⁹ See Wilson IH, Wilson SB. 2016. Confounding and causation in the epidemiology of lead. *International Journal of Environmental Health Research* 26(56):467-482.

³⁷²⁰ Crump, KS et al., "A statistical reevaluation of the data used in the Lanphear et al. (2005)

³⁷²¹ See Memorandum from Ellen F. Kirrane et al. to Stephen Dutton, Identification and consideration of errors in Lanphear et al (2005), "Low-Level Environmental Lead Exposure and Children's Intellectual Function: An International Pooled Analysis."

Commenter (6124) states that the commenter's null CPS II findings basically agree with the null findings in the April 2016 EHP Thurston article,³⁷²² which analyzed the National Institutes of Health (NIH)-AARP Diet and Health Cohort and found no significant relationship between PM_{2.5} and total mortality during 2000-2009. The commenter states that, since Thurston obtained these deidentified data from NIH, he should make his analytic data set available for additional analyses. The commenter states that Science Advisory Board (SAB) should request the publicly available Medicare data that was used by Schwartz for his recent NEJM and JAMA articles on PM_{2.5} deaths.

Commenter (6124) states that, since repeated requests to Pope, ACS, HEI, and other CPS II investigators have been rejected, EPA formally should ask ACS to cooperate with transparent analyses of the CPS II data, such as, the analyses that the commenter has conducted and requested. The commenter states that, if ACS fully cooperates with EPA, then it might be useful to modify the EPA Transparency Rule to include a full cooperation option that does not require releasing actual data. The commenter states that, if ACS fails to cooperate with EPA and other legitimate investigators like myself, then their CPS II research results should not be used for EPA regulations.

Commenter (3134) opposes the PM_{2.5} regulations and asserts they are based upon secret studies. The commenter provides a brief analysis and contends that the regulations prevent a public exposure of PM_{2.5} equivalent to five cigarettes spread over 80 years. The commenter asserts there have been zero serious medical investigations on PM_{2.5} air pollution in the United States because such a study would require at a minimum:

- A biologically plausible toxicity mechanism—how does the toxin cause death or disease, and reliable data on exposure.
- An appropriate endpoint, which could be death if it is determined to be premature (impossible to do with observational population studies).
- An adequate size association to get past the confounders in an observational population study.

Response: The final rule is not intended to remedy a particular instance in which the EPA allegedly relied on a poor-quality study or a study for which the conclusions could not be independently validated. Rather, the transparency provisions of the final rule are intended to build upon existing federal government efforts and provide incremental progress toward the EPA's goal of greater transparency.

Comment: Other commenters emphasize the strength of the data used to support the development of particulate matter NAAQS. Commenters (5178, 6153, 6874, 8272) state that EPA's 2011 policy assessment for review the particulate NAAQS noted that in addition to epidemiologic studies, toxicological and controlled human exposure studies identify potential biological pathways for cardiovascular and respiratory effects associated with particulate

³⁷²² doi:10.1289/ehp.1509676

exposures was sufficient and that the proposed rule is unnecessary.³⁷²³ According to commenters, there is also evidence accumulating on the effects of PM_{2.5} exposure on low birthweight and infant mortality.

Commenters (5178, 6125, 6153, 6446, 6874, 6939, 8272) add that some of the most recent research adds to knowledge on susceptible populations to air pollution as well, including the analysis of 2000-2012 data on 61 million Medicare beneficiaries and zip-code level information on PM_{2.5} and ozone pollution.³⁷²⁴ The commenters state that they found increased mortality risks — including higher risks for black beneficiaries and those eligible for Medicaid, who are disproportionately women with low incomes³⁷²⁵ — at pollutant levels below the current limits. Commenter (6446) notes that, because these studies rely on confidential information about each person in the cohort, the proposed rule would either require publishing data so thoroughly redacted as to be effectively useless for validation, or preclude EPA from considering these studies and others like them in the NAAQS standard-setting process.

Commenters (5178, 6153, 6874, 8272) state that Mingyu Zhang and colleagues analyzed local air pollution data as well as data from the Boston Birth Cohort, which began recruiting pregnant women in 1998 and followed their children for several years after birth.³⁷²⁶ The commenters provide that the study found that the children of women who were exposed to the highest PM_{2.5} levels during their third trimesters had a greater risk of elevated blood pressure at ages three to nine. The commenters state that both studies involve data that can be obtained by investigators who apply to use it and are approved by the relevant institutional review board (IRB) or Privacy Board,³⁷²⁷ but their data sets are not publicly available.

Response: The EPA clarified in the final rule how the Agency will evaluate scientific studies when promulgating significant regulatory actions and finalizing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of personally

³⁷²³ Environmental Protection Agency. (2011). Policy Assessment for the Review of the Particulate Matter National Ambient Air Quality Standards. EPA 452/R-11-003. Accessed May 20, 2018 at <https://www3.epa.gov/ttn/naaqs/standards/pm/data/20110419pmpafinal.pdf>

identifiable information (PII), confidential business information (CBI), or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator under 40 CFR 30.7.

The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

20.5 Trichloroethylene (TCE)

Comment: Commenter (1944) supports EPA's proposed rule and points to the use of the 2003 Johnson study³⁷²⁸ in EPA's derivation of toxicological values for TCE as an example of why the rule is needed. The commenter asserts that, as noted in the proposed rule, both transparency and independent validation of key findings of a study (reproducibility) are necessary in EPA's scientific assessments to ensure "that the quality of published information meets the standards of the scientific and technical community." The commenter notes that, in 2011 EPA derived a reference concentration (RfC) and a reference dose RfD for TCE,³⁷²⁹ based, in part, on a 2003 Johnson study. The commenter states that this assessment was subsequently adopted in the Toxic Substances Control Act (TSCA) Chemicals Work Plan Assessment for TCE. The commenter asserts that the Johnson et al. (2003) study should not be used to develop toxicological values that serve as the basis for regulation because the data records for Johnson et al. (2003) are inadequate or non-existent and Johnson et al. (2003) is not reproducible. The commenter provides detailed information regarding the TCE assessment, which is summarized below:

- Halogenated Solvents Industry Alliance (HSIA), the commenter, reports that attempts to see the raw data which formed the basis of the Johnson et al. (2003) study report have been unsuccessful. A direct appeal to Dr. Johnson failed to make the data available for public scrutiny. And a FOIA request pursuant to the Shelby Amendment was denied by the NIH.
- Information contained in Makris, et al. (2016) constitutes a transparency as well as a data quality concern sufficient to preclude Johnson et al. (2003) from being used as the basis for regulation. The transparency problem with Johnson et al. (2003) was pointed out by the peer review of the TSCA Chemicals Work Plan assessment for TCE.
- The data reported in Johnson et al. (2003), even as amended in two subsequent errata, do not allow for data analysis generally accepted as essential to interpreting outcomes of developmental toxicity study findings. The lack of data availability and clarity sufficient to construct key analyses associated with a key study should disqualify the use of that study in important decisions such as RfC/RfD derivations used for regulatory purposes.

³⁷²⁸ Johnson et al., Threshold of Trichloroethylene Contamination in Maternal Drinking Waters Affecting Fetal Heart Development in the Rat, *Environ. Health Perspect.* 111: 289-92 (2003).

³⁷²⁹ Toxicological Review of Trichloroethylene (CAS No. 79-01-6) in Support of Summary Information on the Integrated Risk Information System (2011).

- At least two Good Laboratory Practice (GLP)-compliant studies³⁷³⁰ conducted under both EPA and Organization for Economic Coordination and Development (OECD) guidelines have been unable to reproduce the effect seen by Johnson et al. (2003). In one of these studies, Carney et al. (2006), all stages of the testing, from development of the protocol to the final report, underwent extensive peer review by scientists from three separate governmental agencies (ASTDR, EPA, and the National Toxicology Program), as well as external experts. In addition, the protocol and study report (which includes the raw data) are available to the public.

Response: The final rule is not intended to remedy a particular instance in which the EPA allegedly relied on a poor-quality study or a study for which the conclusions could not be independently validated. Rather, the transparency provisions of the final rule are intended to build upon existing federal government efforts and provide incremental progress toward the EPA's goal of greater transparency.

Comment: Commenters (4878, 9227) express concern that, under the proposal, EPA would exclude important studies regarding TCE exposure.

Commenter (4878) states that, to exclude evidence that TCE exposure is a risk factor for Parkinson's disease is illogical and does not serve the best health interests of the American public. According to the commenter, the original recommendation was based on hundreds of studies, many of which would not be considered under the proposed rule due to data confidentiality.

Commenter (9227) states that EPA has proposed two regulations regarding TCE and the scientific basis for these proposed regulations is provided in the Agency's 2014 risk assessment: TSCA Work Plan Chemical Risk Assessment, Trichloroethylene: Degreasing, Spot Cleaning and Arts & Crafts Uses³⁷³¹ which drew heavily from the 2011 EPA IRIS Toxicological Review of TCE.³⁷³² The commenter states that development of TCE's hazard and dose-response assessments considered the principles set forth by the various risk assessment guidelines issued by the National Research Council and the U.S. EPA.³⁷³³ According to the commenter, EPA found the TCE IRIS assessment to be scientifically rigorous. The commenter provides that EPA

³⁷³⁰ Carney, E.W., Thorsrud, B.A., Dugard, P.H., and Zabloutny, C.L, Developmental toxicity studies in Crl:CD (SD) rats following inhalation exposure to trichloroethylene and perchloroethylene. Birth Defects Res. (Part B) 77: 405-412 (2006). Fisher, J.W., Channel, S.R., Eggers, J.S., Johnson, P.D., MacMahon, K.L., Goodyear, C.D., Sudberry, G.L., Warren, D.A., Latendresse, J.R., and Graeter, L.J., Trichloroethylene, trichloroacetic acid, and dichloroacetic acid: do they affect fetal rat heart development? Int. J. Toxicol. 20: 257-267 (2001).

³⁷³¹ EPA, Office of Chem. Safety & Pollution Prevention, EPA Doc. No. 740-R1-4002, "TSCA Work Plan Chemical Risk Assessment: Trichloroethylene: Degreasing, Spot Cleaning and Arts & Crafts Uses" (2014) [hereinafter TCE Work Plan Risk Assessment], https://www.epa.gov/sites/production/files/2014-11/documents/tce_opptworkplanchemra_final_062414.pdf.

³⁷³² EPA, EPA/635/R-09/011F, "Toxicological Review of Trichloroethylene" (2011), https://cfpub.epa.gov/ncea/iris/iris_documents/documents/toxreviews/0199tr/0199tr.pdf.

³⁷³³ TCE Work Plan Risk Assessment at 65

made this determination without the data underlying the key, peer-reviewed studies³⁷³⁴ used in the assessment being publicly available.

Response: The EPA clarified in the final rule how the Agency will evaluate scientific studies when promulgating significant regulatory actions and finalizing influential scientific information. As described in the preamble to the final rule, the EPA is not categorically excluding any studies from consideration when promulgating significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information.

As described in the preamble to the final rule, the transparency provisions of the final rule apply to dose-response data underlying pivotal science. Under this rule, the EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of PII, CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation. In cases where dose-response data underlying pivotal science are not available in a manner sufficient for independent validation, the EPA may still use the pivotal science after either giving it lesser consideration or receiving an exemption from the requirements of this rule from the Administrator under 40 CFR 30.7.

The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

³⁷³⁴ The key studies used by EPA to derive the noncancer toxicity values for TCE are Deborah E. Keil et al., Assessment of Trichloroethylene (TCE) Exposure in Murine Strains Genetically-Prone and Non-Prone to Develop Autoimmune Disease, 44 J. Env'tl. Sci. & Health, Part A 443 (2009); Margie M., Peden-Adams et al., Developmental Immunotoxicity of Trichloroethylene (TCE): Studies in B6C3F1 Mice, 41 J. Env'tl. Sci. & Health, Part A 249 (2006), and Paula D. Johnson et al., Threshold of Trichloroethylene Contamination in Maternal Drinking Waters Affecting Fetal Heart Development in the Rat, 111 Env'tl. Health Persp. 289 (2003). The key studies used by EPA to derive the cancer toxicity values for TCE are B. Charbotel et al., Case-control Study on Renal Cell Cancer and Occupational Trichloroethylene Exposure in the Arve Valley (France) (2006); and Ole Raaschou-Nielsen et al., Cancer Risk Among Workers at Danish Companies Using Trichloroethylene: A Cohort Study, 158 Am. J.

Chapter 21: Miscellaneous and Out of Scope Comments

In addition to the topic-specific comments included in Chapters 1 through 21 of this document, several miscellaneous and out of scope comments were received. Comments provided in this Chapter include several of those comments. These comments are organized as follows:

Section 21.1 Miscellaneous and Out of Scope Comments (NPRM)

- Miscellaneous Comments
- Out of Scope Comments

Section 21.2 Miscellaneous and Out of Scope Comments (SNPRM)

- Miscellaneous Comments
- Out of Scope Comments

The specific comments provided in this Chapter reflect the comment letters that provide arguments supported by detailed rationale, examples, and references/documentation. The Docket ID numbers for these commenters are cited throughout this Chapter. In addition, some general comment letters may also include comments related to comments included and responded to in this Chapter. These comments are summarized in Appendix B. Note that points and issues raised in these general comment letters may also be raised by the more detailed comments summarized in this Chapter. The responses provided in this Chapter adequately address these more general comments.

21.1 NPRM Miscellaneous Comments and Out of Scope Comments

Comments received that are ancillary to the Proposal, such as requests for comment period extensions/public hearings and comments that provide support for other commenters' comments; and comments received that are considered out of scope, are provided in this Chapter.

21.1.1 Miscellaneous Comments

21.1.1.1 Requests for Comment Period Extension

Comment: Commenters express concern that the initial 30-day comment period was too short. Some commenters simply request additional time to comment beyond the 30-day period. Other commenters request comment period extensions to a total comment period of 60, 90, 120, or 180 days. Commenters are generally concerned that EPA is soliciting comments on many complex scientific and technical issues that require careful and in-depth analysis, but the 30-day comment period does not provide sufficient time for the broad range of stakeholders to prepare thoughtful, detailed responses. Additional reasons commenters seek an extension include the following concerns:

- EPA has provided no analysis of the potential impacts of its proposal.

- The mechanics of the proposed rule are not described, including cooperative agreements, technology platforms, and methods and technologies to protect confidential data – including identifiable and sensitive data such as individual health data.
- Implementation issues such as effective date, exemptions, retroactive applicability, impact on previous rulemaking records and studies are not addressed by the proposal.

Commenters (0557, 0564, 0598, 0570, 0573-0578, 0580-0583, 0585-0592, 0599, 0600, 0601, 0603, 0606, 0607, 0609-0613, 0616-0619, 0621, 0623-0626, 0628-0644, 0647, 0649-0654, 0657, 0658, 0661-0668, 0670, 0673-0678, 0681-0683, 0686, 0689, 0691, 0695-0702, 0704, 0706-0710, 0712, 0714-0716, 0778, 0780, 0781, 0786, 0788-0790, 0792-0794, 0796, 0798, 0800-0802, 0804, 0807, 0808-0811, 0993, 0995-1000, 1003, 1005, 1331, 1334, 1338, 1343, 1345, 1347, 1369, 1638, 1639-1642, 1779, 1797, 1942, 1948, 2006, 2048, 2067, 2485, 2561, 2737, 2739, 2983, 3053, 3074, 3079, 3081, 3100, 3115, 3229, 3273, 3276, 3279, 3282, 3283, 3292, 3300, 3302, 3323, 3341, 3346, 3350, 3353, 3355, 3356, 3358, 3364-3374, 3376-3381, 3564-3567, 3569, 3571, 3573, 3575, 3576, 3578, 3582-3586, 3589, 3590, 3592, 3594, 3599, 3600, 3608-3610, 3612, 3661-3668, 3675, 3679, 3682, 3685-3690, 3692-3697, 3834, 3972, 3974, 3976, 3977, 3979, 4120, 4124, 4394-4397, 4399, 4473, 4488, 4539, 4543-4545, 4770, 4867, 4868, 4875, 4980, 5129) request additional time to comment beyond the 30-day period.

Commenters (0042, 0058, 0546, 1340, 1380) request an additional 30-day extension. Commenter (0546) states that Executive Order 13563 recommends a comment period of at least 60 days to ensure adequate public participation in the regulatory process.

Commenters (0014, 0015, 0016, 0018, 0020, 0021, 0022, 0023, 0024, 0025, 0026, 0027, 0028, 0029, 0030, 0031, 0032, 0033, 0034, 0035, 0036, 0037, 0038, 0046, 0047, 0048, 0049, 0051, 0052, 0059, 0060, 0065, 0066, 0071, 0072, 0184, 0185, 0496, 0545, 0553, 0554, 0559, 0566, 0568, 0669, 1008, 1009, 1011, 1339, 1359, 1876, 2131, 3128, 3642, 3643, 4400) request an additional 60-day extension. Commenters (0026, 0051, 0545) assert that, while Executive Order 12866 indicates that a 60-day comment period is the minimum necessary to afford the public a meaningful opportunity to comment, in this proposal, where foundational and complex issues are at stake, a significantly longer comment period is appropriate.

Commenters (0565, 1948, 2014, 5009) request an additional 90-day extension.

Commenter (5009) is concerned that the proposal considers fundamental changes in policy that could affect many of EPA's rulemaking activities and about the vagueness and potentially detrimental consequences of the proposal for those activities. The commenter states that, given the extremely broad scope and impact of this proposal, the 30 days allowed for public comment in the advance notice is insufficient to give the affected public adequate opportunity to participate in the rulemaking and comment on the proposal as required by the Administrative Procedure Act. 5 U.S.C. § 553(c). The commenter states that, under section (2)(b) of Executive Order 13563, a standard comment period should be at least 60 days, but this tremendously consequential proposal calls for an even more deliberate pace given the profound potential impacts on the regulatory processes for many of the statutes EPA implements and enforces. The commenter states that a full four-month comment period would be consistent with past practice for matters of similar importance and complexity, and is necessary to provide the public and

other stakeholders a meaningful opportunity to evaluate the proposal and its implications for the agency's ability to meet its obligation to protect public health and the environment under federal environmental laws.

Commenters (0057, 0063) request an additional 150-day extension.

Commenter (0063) suggests that, in developing this rule, EPA should use a process more like the one employed in 2006, when the Office of Management and Budget (OMB) under President George W. Bush asked the National Academy of Sciences (NAS) for peer review of its proposed bulletin on risk assessment and allowed six months for submission of public comments.³⁷³⁵ The commenter states that a rule with such substantial implications for public health merits considerable time for input from the public and the scientific community.

Response: The EPA extended the public comment period for the 2018 proposed rule until August 16, 2018.³⁷³⁶ This constituted a 108-day comment period.

21.1.1.2 Requests for Public Hearing(s)

Comment: Commenters express concern that the proposal does not include a public hearing. Some commenters simply request the EPA to set at least one public hearing. Other commenters request multiple public hearings. Commenters are generally concerned that public input on this proposed rule, which could have significant consequences on the ability of EPA to adequately protect the public from the impacts of air pollution, unsafe chemicals, and other public health and environmental hazards, is of critical importance. Some commenters argue that the Clean Air Act (CAA) requires a public hearing for applicable rulemakings, and CAA rulemakings would be directly impacted by this proposal. Commenter (0046) states that among the CAA regulatory decisions subject to §307(d) that would be affected in this manner are the national ambient air quality standards (NAAQS) (§307 (d)(1)(A)), residual risk determinations for hazardous air pollutants (§307 (d) (1)(C)), standards for mobile source air toxics (§307 (d)(1)(K)), and residual risk standards for municipal solid waste combustors (§307 (d)(1)(D)).

Commenters (0020, 0023, 0025, 0026, 0031, 0033, 0034, 0037, 0038, 0046, 0051, 0059, 0557, 0598, 0568, 0570, 0574-0578, 0581-0583, 0585-0592, 0599, 0600, 0601, 0603, 0606, 0607, 0609-0613, 0616-0619, 0621, 0629-0626, 0628-0645, 0647, 0649-0654, 0656, 0657, 0658, 0661-0668, 0673-0678, 0681-0683, 0686, 0689, 0691, 0695-0702, 0704, 0706-0710, 0712, 0714-0716, 0778, 0780, 0781, 0782, 0786, 0788-0790, 0792-0794, 0796, 0798, 0800-0802, 0804, 0807, 0809-0811, 0993, 0995-1000, 1003, 1005, 1011, 2902, 2983, 3053, 3074, 3081, 3100, 3642) request a public hearing.

Commenters (0016, 0024, 0028, 0032, 0047, 0052, 0071, 0072, 2014, 3644) request multiple public hearings. Commenters (0014, 0022, 0030, 0035, 0048, 0060, 0554, 0566, 1009, 3128)

³⁷³⁵ Executive Office of the President. OMB Requests Peer Review of Proposed Risk Assessment Bulletin. January 9, 2006..

³⁷³⁶ U.S. EPA. Strengthening Transparency in Regulatory Science; Proposed Rule, 83 FR 24,255 (May 25, 2018) (FRL-9978-31), available at <https://www.federalregister.gov/documents/2018/05/25/2018-11316/strengthening-transparency-in-regulatory-science-extension-of-comment-period-and-notice-of-public>.

request at least three public hearings. Commenters (0048, 0566) state that, because many scientists do not have experience with the rulemaking process and may not be prepared to submit written comments, EPA should supplement such comments with public hearings at locations across the country.

Commenters (3644, 6123, 8281-PH82) express concern about the inadequate opportunity for public engagement on the public hearing due to EPA's refusal to accommodate remote participation.

Commenter (3644) urges EPA to reverse its position and ensure that the public hearing provides an opportunity for testimony and other meaningful participation by all interested members of the public, including those unable to attend the hearing in person. The commenter states that EPA's refusal to allow for remote participation in the public hearing is inconsistent with the agency's recent practice.³⁷³⁷ The commenter states that EPA's commitment to providing a verbatim transcript of the public hearing is an inadequate substitution for remote participation, for several reasons:

- Many people are more comfortable providing oral testimony than they are submitting written comments—for example, because they are fluent in spoken but not written English.
- Although EPA has promised to provide a transcript, it has not committed to do so by any particular date. Unless EPA makes the transcript available several weeks before the proposed rule's comment deadline, those who submit written comments will lack the opportunity to respond to opposing viewpoints expressed at the hearing.
- Certain potential commenters who would otherwise fully participate in the public hearing, including some people with learning disabilities, may struggle to read, understand, or respond to a verbatim transcript.

Response: The EPA hosted a public hearing on the 2018 proposed rule on July 17, 2018.³⁷³⁸

21.1.1.3 Support for Other Commenters' Comments

Comment: The following commenters (5179, 6112, 6115, 6369, 6907, 6908, 6911) express support for other comments:

Commenter (5179) supports the comments submitted to date on this proposed rule by the Association of American Medical Colleges, the Association of American Universities, the Association of Public and Land-Grant Universities (plus, the Council on Government Relations, by joint letter dated July 11, 2018; attached to their comment letter), and, separately, Public

³⁷³⁷ Assignment and Application of the "Unique Identifier" Under TSCA Section 14; Notice of Public Meeting and Opportunity to Comment, 82 Fed. Reg. 21,386, 21,389 (May 8, 2017); New Chemicals Review Program Implementation and Approaches for Identifying Potential Candidates for Prioritization for Existing Chemical Risk Evaluations Under the Amended Toxic Substances Control Act (TSCA); Notice of Public Meetings and Opportunity for Public Comment, 82 Fed. Reg. 51,415, 51,415 (Nov. 6, 2017).

Responsibility in Medicine and Research (PRIM&R) (by letter dated August 1, 2018; attached to their comment letter).

Commenters (6112, 6115) support the National Stone, Sand & Gravel Association's (NSSGA) comments on the Proposal.

Commenter (6369) supports the separate comments submitted by the American Chemistry Council on the Proposal.

Commenter (6907) supports the comments provided to this docket by the American Association of Pesticide Safety Educators (AAPSE), the National Academies of Sciences, Engineering and Medicine, Physicians for Social Responsibility, the Association of State Wetland Managers, the Vice Chancellors of Research at the University of California, the Entomological Society of America (ESA), and the joint comment made by the Association of American Medical Colleges (AAMC), Association of American Universities (AAU), Association of Public and Land-grant Universities (APLU), and Council on Governmental Relations (COGR).

Commenter (6908) incorporates by reference the comments submitted by CropLife America under Docket Number EPA-HQ-OA-2018-0259.

Commenter (6911) endorses the comments submitted by the NAAQS Implementation Coalition and the American Chemistry Council's Formaldehyde Panel.

Response: The EPA notes the commenters' support, and has addressed those comments elsewhere in this response document.

21.1.2 Out of Scope Comments

21.1.2.1 Use of the LNT Models and Radiation Studies

21.1.2.1.1 Oppose/Support Use of the LNT Model for Radiation

Oppose Use of LNT Model for Radiation

Comment: Commenters (0039, 0050, 0062, 4357, 6148) are opposed to continued use of the linear no-threshold (LNT) model for radiation. Commenters (0039, 0050, 4537, 6148) state that the LNT is based on a flawed scientific study or non-scientific assumptions. Commenters (0050, 0062) state that the LNT model is inappropriate for setting radiation protection rules and guidelines because low doses of radiation have been shown to be beneficial yet are not considered by the LNT model.

Commenters (0039, 4537) state that the prominence of the LNT model stems from the June 29, 1956, *Science* paper "Genetic Effects of Atomic Radiation" authored by the NAS Committee on the Biological Effects of Atomic Radiation.³⁷³⁹ The commenters continue that this paper is now

³⁷³⁹ Genetics Panel of the Biological Effects of Atomic Radiation (BEAR) I Committee of the National Academy of Sciences, "Genetic Effects of Atomic Radiation," *Science* 123 (29 June 1956), pp. 1157-64.

widely questioned and has been seriously critiqued in many peer-reviewed publications, including two detailed 2015 papers, as summarized in a December 2, 2015, *Wall Street Journal* commentary.³⁷⁴⁰

Commenter (0039) states that in December 2015, the National Association of Scholars called upon the NAS and the American Association for the Advancement of Science to revisit the 1956 *Science* paper³⁷⁴¹; both declined. The commenter states that there are fairly well-known serious questions about ethical improprieties that may have contributed to flawed and overstated conclusions in the *Science* paper.³⁷⁴² The commenter states that due to the complacency of the scientific establishment and, no doubt, the prestige of some of the scientific bodies implicated in the cover-up, no one in a position of authority until now has been willing to challenge the linear no threshold dose-response orthodoxy.

Commenter (6148) states that restrictions imposed by LNT has left the U.S. behind in developing alternative uses for otherwise useful materials, primarily due to EPA's imposition of overly conservative safety factors by using the LNT, which in turn discourages continuing U.S. research, and in turn leaves U.S. standards stagnating at status quo. The commenter concludes that the use of scientifically developed linear dose response models, where appropriate, is needed to achieve transparency because they employ actual defensible data and risks, rather than non-scientific assumptions.

Commenter (0062) states that use of the LNT model as the default model for radiation-induced cancers by the EPA and other regulatory agencies worldwide during the past several decades, in spite of accumulating evidence supporting radiation hormesis, has not served the public well because of the unjustified fear of even small amounts of radiation it has generated, and the resulting expensive and harmful defensive actions. The commenter adds that it has increased regulatory burden on the enterprises that utilize radiation without any corresponding benefit of avoided diseases and that there are many adverse effects due to the use of the LNT model.³⁷⁴³

Commenter (0050) states that the LNT model is deeply flawed and scientifically worthless, and that there are no valid data supporting it. The commenter states that while there are many scientific papers purporting to support it, careful study shows that this so-called science is based upon flawed statistics (using only one-sided statistics to show harm, with no possibility of showing benefit), inappropriate controls, and poor experimental design. According to the commenter, the LNT model of radiation damage began as purposeful lies told by the genetics community in the 1950's, as a ploy to attract increased government funding for genetics

research; it has spawned many useless (and dangerous) federal and state regulatory jobs, businesses, radiation damage lawsuits, and politicians who secure votes with an antinuclear and antiradiation agenda. The commenter continues, stating that the LNT radiation model is now more of a religion than a scientific theory, and getting rid of it is difficult. The American public has been lied to for over three generations, media assume the truth of the LNT model, and despite some 3000 scientifically valid papers showing that low levels of radiation are harmless or beneficial (hormesis), the EPA radiation scientists will not budge an inch, and are grasping the dead LNT myth with bloody fingernails; their jobs and programs are at risk, and they will never change their minds.

Commenter (0050) states that low and moderately low radiation doses have been shown to be harmless or beneficial. The commenter explains that the reason is that these doses of radiation stimulate the production of enzymes involved in radiation repair; these enzymes, once stimulated, repair not only any damage caused by the radiation, but damage caused by other noxious agents, the most important of which is oxygen (the use of oxygen for energy metabolism generates damage that is qualitatively similar to the damage caused by ionizing radiation). The commenter adds that so far, over 150 genes have been identified that repair radiation and oxygen damage and the Nobel Prize in Chemistry in 2015 went to Paul Modrich, Tomas Lindahl, and Aziz Sancar “for mechanistic studies of DNA repair”. The commenter states that an essential component of the LNT is that there is no such thing as radiation repair and concludes that this is absurd and fraudulent.

In support of the above comments, Commenter (0050) submitted their February 9, 2015, petition sent to Annette L. Vietti-Cook, Secretary, USNRC, Attention: Rulemakings and Adjudications Staff, U.S. Nuclear Regulatory Commission. The petition preface paragraph follows:

I am submitting this petition for rulemaking pursuant to 10 CFR Part 2.802. The petitioner requests that the NRC amend 10 CFR Part 20, Standards for Protection Against Radiation, based on new science and evidence that contradicts the Linear No-Threshold (LNT) hypothesis, a model that has served as the basis for radiation protection regulations. I will present scientific data as reported in study after study to justify that safety regulations and policies should no longer be derived from the LNT model in order to ensure these requirements are more risk-informed. This ultra-simplistic concept assumes that all radiation absorbed doses, no matter how small, have a finite probability of causing a fatal cancer. The lower the quantity of radiation absorbed dose, the lower the probability of cancer induction, but the probability is never zero, let alone negative (i.e. beneficial or hormetic). The rate of radiation delivery is irrelevant, and all absorbed doses are additive; this is demonstrably false as evidenced by the practices of radiation oncology and of radionuclide therapy. Use of the LNT assumption enables regulators to feel justified in ratcheting down permissible worker and public radiation levels, either through actual dose limits or use of the “as low as reasonably achievable” (ALARA) principle, giving the illusion that they are making everyone safer (and creating ever-increasing workload for themselves and their licensees). There has never been scientifically valid support for this LNT hypothesis since its use was recommended by the U.S. National Academy of Sciences Committee on

Biological Effects of Atomic Radiation (BEAR I)/Genetics Panel in 1956. The costs of complying with these LNT-based regulations are enormous. Prof. Dr. Gunnar Walinder has summed it up: “The LNT is the greatest scientific scandal of the 20th century.”³⁷⁴⁴

Support Use of Linear Non-Threshold Model for Radiation

Conversely, commenters (0776, 2159, 2687, 6133, 6149, 6169, 6882, 6924, 6928) state that the NAS has repeatedly confirmed that there is no safe dose of radiation and that the LNT model is the best option for setting radiation protection standards. Commenter (6169) states that the NAS review constitutes peer-review of the LNT, and that the public was also included in the multi-year process. The commenter states that the public provided written and verbal comments and that at least two panelists were removed due to conflicts of interest that were pointed out by public comment.

Commenters (6133, 6169, 6928) elaborate that the NAS Biological Effects of Ionizing Radiation VII (BEIR VII) committee released a report in 2006 on the impact of low doses of radiation, *Health Risks from Exposure to Low Levels of Ionizing Radiation: BEIR VII Phase 2*, concluding that the LNT was the best model for protection against radiation. Commenters 6133 and 6149 cite the National Council on Radiation Protection and Measurements’ (NCRP’s) Commentary No. 27, “Implications of Recent Epidemiologic Studies for the Linear-Nonthreshold Model and Radiation Protection” (2018), which concluded that the LNT is the most practical model for implementing radiation protection for workers and the public.

Commenter (6169) states that more than 50 years of peer-reviewed, validated, and repeatable in vivo, not just laboratory studies, underlie the LNT model. The commenter adds that to its credit, despite pressure from special interests, EPA continues to recognize the model’s pervasive scientific underpinnings, recently stating:

Of all the agents demonstrated to be carcinogenic, the evidence for LNT is particularly strong for ionizing radiation...[g]iven the continuing wide consensus on the use of LNT for regulatory purposes as well as the increasing scientific confirmation of the LNT model, it would be unacceptable to the EPA to ignore the recommendations of the NAS and other authoritative sources on this issue. The EPA cannot endorse basing radiation protection on poorly supported and highly speculative proposals for dose thresholds or doubtful notions concerning protective effects from low-level ionizing radiation.

Commenter (6915) states that to “evaluate the appropriateness” of the linear, non-threshold approach for low-dose extrapolation by also considering non-linear and threshold models would provide no cognizable benefit in modeling accuracy or clarity, but instead could result in the manipulation of results, delay, and obfuscation.

³⁷⁴⁴ Muckerheide, James: Apply radiation health effects data to contradict and overturn radiation protection policies and rules. Proceedings of ICONE 8 (8th International Conference on Nuclear Engineering) April 2-6, 2000, Baltimore, MD.

Commenter (6133) provided a detailed argument for retaining the LNT model for radiation protection:

As it does in every other instance and under every other environmental statute, EPA relies on independent, authoritative scientific bodies to provide analyses and evaluations of scientific evidence in support of its radiation standard-setting policies. EPA bases its regulatory limits and nonregulatory guidelines for population exposures to low-level ionizing radiation on the LNT dose-response model.³⁷⁴⁵ EPA's radiation protection standards are based on the premise that any radiation dose carries some risk, and that risk increases directly with dose. This method of estimating risk is called the "linear no-threshold dose-response model (LNT)".

This longstanding and well-supported assumption presumes that the risk of cancer due to a low dose exposure is proportional to dose, with no threshold. For over 40 years the LNT dose-response model has been commonly utilized when developing practical and prudent guidance on ways to protect workers and members of the public from the potential for harmful effects from radiation in balance with the commercially justified and optimized uses of radiation. EPA derives the LNT model from reports by authoritative scientific bodies including the NAS, the NCRP, and the International Commission on Radiological Protection (ICRP). There is strong scientific consistency by these authoritative groups that an LNT model is the best at the current time (and has been for the past half century).^{3746,3747} Indeed, EPA noted as recently as late 2015, "[o]ver the last half century, numerous authoritative national and international bodies have convened committees of experts to examine the issue of LNT as a tool for radiation regulation and risk assessment... Again and again, these bodies have endorsed LNT as a reasonable approach to regulating exposures to low dose radiation."³⁷⁴⁸

Studies in support of the LNT dose-response model

The NAS BEIR VII committee has studied and published its report on risk models for estimating the relationship between exposure to low levels of ionizing radiation and harmful health effects.³⁷⁴⁹ The data used in the BEIR VII study are: atomic bomb survivor studies, medical radiation studies, occupational radiation studies, and environmental radiation studies. The committee judged that the LNT model provided the most reasonable description of the relation between low dose

exposure to ionizing radiation and the incidence of solid cancers that are induced by ionizing radiation.

The NCRP published its latest commentary on the LNT issue only months ago, in April 2018.³⁷⁵⁰ The specific purpose of its commentary is to provide a review of recent epidemiologic data from studies with low doses or low dose rates and the Life Span Study (LSS) of atomic bomb survivors to determine whether these epidemiologic studies broadly support the LNT dose-response model as a reasonable basis for radiation protection. Epidemiologic studies of humans provide evidence that is critically important in establishing potentially causal associations of environmental factors with the disease. The studies were selected by a consensus of experts who have a broad purview of the recent radiation epidemiology literature, and they ensured that the largest and most important eligible studies were included.

Examples of studies of radiation-exposed populations evaluated are:

1. Japanese atomic-bomb survivors

The LSS is a research program investigating life-long health effects based on epidemiologic studies. The study being conducted by the Radiation Effects Research Foundation (RERF)³⁷⁵¹ is used by standard-setting bodies in establishing a recommendation for radiation protection. The LSS cohort³⁷⁵² includes both a large proportion of survivors who were within 2.5 km of the hypocenters at the time of the bombings and a similar-sized sample of survivors who were between 3 and 10 km from the hypocenters whose radiation doses were negligible.

The major objective of the study is to investigate the long-term effects of atomic-bomb radiation on causes of death and incidence of cancer. The atomic-bomb survivors of Hiroshima and Nagasaki are subject to follow-up study^{3753, 3754} for their remaining lives, starting from 1950. The LSS cohort of atomic-bomb survivors has provided important data because it is a large cohort (~87,000 survivors of all ages) with relatively accurate dosimetry, a wide dose range over 60 years of high-quality follow-up for mortality and over 50 years of follow-up for cancer incidence, and nearly

1,000 excess solid-cancer cases, besides excess leukemias. The study provides strong indirect support for the use of an LNT model.

2. Worker exposure studies

Radiation worker studies assess risks in worker groups exposed largely to many low doses received at a low dose rate, providing direct evidence regarding the validity of the LNT model. INWORKS is an example of these studies.³⁷⁵⁵ INWORKS is the latest international collaboration for examining the health of workers in more than one country who were exposed occupationally to ionizing radiation. INWORKS included dosimetry for 20 different nuclear sites/organizations in three countries. Dosimetry was based on individual personal dosimeter readings at the start of the workers beginning their radiation work (at earliest, between 1944 and 1952) through 2005. The U.S. cohort of INWORKS consisted of 119,195 nuclear workers at four Department of Energy nuclear weapons facilities (Hanford site, Idaho National Laboratory, Oak Ridge National Laboratory, and Savannah River site) and at the Portsmouth Naval Shipyard. This large study³⁷⁵⁶ provides one of the strongest pieces of epidemiologic evidence that the LNT quantitative model is useful for radiation protection.

3. Environmental exposure studies

An example of environmental exposure studies for low doses and low dose rate is the Chernobyl resident cohorts.^{3757, 3758} The 1986 accident at the Chernobyl nuclear power plant in northern Ukraine resulted in the exposure of substantial proportion of Belarus, Ukraine, and the Russian Federation to radioactive fallout. The most notable apparent health consequence of the accident has been the large increase in thyroid cancer among those exposed as children or teenagers starting 4-5 years after the accident. Studies of cohorts of children in Ukraine and Belarus who had thyroid measurements of iodine activity shortly after the Chernobyl accident and systematic thyroid screenings were conducted. The data on exposure to radioactive iodine have added considerable information relative to the dose-response relationship. The thyroid cancer experienced

by children in exposed areas of the Ukraine, Belarus, and Russia conforms to the LNT model.

4. Medical exposure studies

Patients treated with lung collapse for TB in the 1930s to 1960s are one of the few medically exposed populations that provide consistent evidence for dose-response relationships. Patients on average would receive on the order of 100 chest fluoroscopies over several years.

Since the 1970s, studies³⁷⁵⁹ of TB patients who received repeated chest x-ray fluoroscopies to monitor lung collapse have provided valuable information relevant to the LNT hypothesis. The TB fluoroscopy studies provide strong support for the LNT model for breast cancer.

NCRP commentary in conclusion of its epidemiology studies states that, based on current epidemiologic data, the LNT model should continue to be used for radiation protection purposes, and “no alternative dose-response relationship appears more pragmatic or prudent for radiation protection purposes than the LNT model.”³⁷⁶⁰

Response: These comments are outside the scope of this rule. This is a rule of internal agency procedure, and does not describe the Agency’s position on scientific debate over the LNT model. Instead, under this rule the EPA continue to implement existing Agency practice and review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information.³⁷⁶¹ The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review.^{3762,3763} When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality,

most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

21.1.2.1.2 Public Transparency of National Academy of Sciences (NAS) Process and Availability of Report/References Illustrated Greater Harm to Women

Comment: Commenter (6169) notes that, although EPA instituted a peer review for radiation models by tasking the NAS to conduct a review of radiation science, including the linear, no threshold, and other models, and it supported the use of the LNT, it failed to point out the increased harm to women and children in the data. The commenter notes that this is due to its averaging of damage across genders and ages. The commenter notes that the only reason to revisit is to un-average the results and provide additional protection for women and children. The commenter provides extensive arguments in support of the use of the LNT model for radiation.

Response: This comment is unrelated to the current rulemaking and therefore out of scope. This is a rule of internal agency procedure and does not relate to peer review for radiation models.

21.1.2.1.3 EPA Should Incorporate Uncertainty and Stochastic (Random) Impacts of Radiation

Comment: Commenter (6169) notes that one major recognized category of uncertainty in radiation is the stochastic (random) impacts of radiation, including the probability that random impacts will increase with an increasingly radiologically contaminated environment. The commenter notes that any model that incorporates uncertainty must incorporate our ever-increasing probability of exposure, in addition to the non-threshold nature of stochastic cancer and non-cancer impacts.

Response: This comment is unrelated to the current rulemaking and therefore out of scope. This is a rule of internal agency procedure and does not concern radiation studies.

21.1.2.1.4 EPA Needs to Rely on Radiation Health Studies that are Independent and Scientifically Substantiated

Comment: Commenter (6169) suggests that the EPA rely on radiation health studies that are independent and scientifically substantiated; and shun those that are not applicable to radiation protection, suffer from well-known and documented pseudo-scientific assumptions, or harbor conflicts of interest. The commenter notes that even report conclusions that are generally accepted, such as those found in NAS BEIR VII, can still reference, and be influenced by, inappropriate studies. The commenter contends that this is perhaps one of the reasons why women, children and pregnancy are not afforded the protection they require.

Commenter (6169) states that improper hypothesis formation and research design have been baked into, and continue to plague, studies on radiation's impact on health. According to the commenter, this improper methodology has, unfortunately, evolved to be the only accepted way of examining health impacts. The commenter notes that this rigid study design presupposes a conclusion of no impact before any health data are actually examined, a huge scientific faux pas. The commenter explains that design does this by relying on error-ridden dose reconstruction,

which almost always concludes that environmental exposure was too low to cause health impacts. Therefore, the commenter notes that even though this research often finds increase in disease, associating it with radiation exposure becomes impossible, not because radiation isn't the cause, but because it was falsely vindicated from the beginning.

Further, commenter (6169) provides that there are a number of studies regarded as reliable by international radiation committees, such as ICRP or NCRP, which find no health impact, or claim no discernable impact. According to the commenter, many of these studies were actually funded or influenced by industry and often used in court to counter claims of health damage from radiation. Worse still, the commenter notes that these studies also received funding from Federal agencies, giving them the appearance of independence. The commenter contends that studies like these skew the overall balance of radiation damage assessment when committees, such as those from NAS, try to review the literature examining radiation's impact on health.

Response: These comments are outside the scope of this rule. This is a rule of internal agency procedure and does not describe the Agency's position on which radiation health studies to rely. Instead, under this rule the EPA continue to implement existing Agency practice and review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information.³⁷⁶⁴ The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information: soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review.^{3765,3766} When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

21.1.2.1.5 Radiation Protections Insufficient

Comment: Commenter (6882) states that the proposed rule would apply to radioactive substances, for which Environmental Protection Agency protection is already not protective enough and that the few protections that EPA regulations do offer must remain intact, or, better yet, strengthened. Commenter (6928) states that the EPA believes the official radiation models which underestimate harm.

Commenters (0776, 2159, 2678, 6882) note that radiation protections must be more protective for sensitive females since their cancer risk from radiation exposure is higher.

³⁷⁶⁴ U.S. EPA. (2002). Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency. (EPA/260R-02-008). Washington, DC: U.S. Environmental Protection Agency. Available at https://www.epa.gov/sites/production/files/2020-02/documents/epa-info-quality-guidelines_pdf_version.pdf.

³⁷⁶⁵ U.S. EPA. (2014). Framework for Human Health Risk Assessment to Inform Decision Making. (EPA/100/R-14/001). Washington, DC: U.S. Environmental Protection Agency, Office of the Science Advisor, Risk Assessment Forum. Available at <https://www.epa.gov/sites/production/files/2014-12/documents/hhra-framework-final-2014.pdf>.

³⁷⁶⁶ U.S. EPA. (2003). A Summary of General Assessment Factors for Evaluating the Quality of Scientific and Technical Information. (EPA 100/B-03/001). Washington, DC: U.S. Environmental Protection Agency. Available at <https://www.epa.gov/sites/production/files/2015-01/documents/assess2.pdf>.

Commenters (0776, 2159, 6882) provide that the EPA doesn't specifically protect against non-cancer impacts of radiation exposure and should establish a hazard index for radionuclides—something the Environmental Protection Agency already has for toxic chemicals.

Commenter (2687) expresses that radiation protections do not cover all of the various nuclides that are contaminating public and tribal water and are not strict enough considering that children and women are affected up to seven times more than the standard 35-year old white man.

Commenter (2159) adds that the EPA should also figure out how much radiation exposure is costing us, including loss of salary from impaired neural development and lower IQ, cost of treating radiation-induced cancers, and cost of accumulating radiation damage across generations.

Commenter (2159) provides that ICRP, the United Nations Scientific Committee on Effects of Atomic Radiation (UNSCEAR), the International Atomic Energy Agency (IAEA), the U.S. National Academies of Sciences, BEIR VII, and the UK National Radiological Protection Board (NRPB) are regularly quoted on radiation risk impacts on people. The commenter notes that they utilize a model of radiation risk assessment based on physics, calculating average energy impacts on a given mass or population, developed before the discovery of DNA and based on high-dose acute external irradiation by gamma rays of a large number of Japanese inhabitants of Hiroshima and Nagasaki. The commenter adds that these studies were begun 5 or more years after the atomic bombing and that the reference was to impact on a 25 year old, healthy white male. According to the commenter, left out of consideration are alpha and beta particle radiation which is not highly penetrating like gamma rays but, breathed in or ingested, become very damaging internal emitters. Also, the commenter notes that women are 45% more susceptible to radiation than men, children more than adults, girls more than boys and the younger the child, the greater the damage. Furthermore, the commenter notes that ionizing radiation is variable and individual susceptibility is as well.

Commenter (2159) provides that the European Committee on Radiation Risk (ECRR), in its 2010 Recommendations, considered methodology for evaluating radiation risk and presented the following:

The Committee concludes that the present cancer epidemic is a consequence of exposures to global atmospheric weapons fallout in the period 1959-63 and that more recent releases of radioisotopes to the environment from the operation of the nuclear fuel cycle will result in significant increases in cancer and other types of ill health. The ECRR model predicts 61,600,000 deaths from cancer, 1,600,000 infant deaths and 1,900,000 foetal deaths. In addition, the ECRR predicts a 10% loss of life quality integrated over all diseases and conditions in those who were exposed over the period of global weapons fallout. The total maximum permissible dose to members of the public arising from all human practices should not be more than 0.1mSv, with a value of 2mSv for nuclear workers. This would severely curtail the operation of nuclear power stations and reprocessing plants, and this reflects the Committees belief that nuclear power is a costly

way of producing energy when human health deficits are included in the overall assessment.

Response: These comments are out of scope, as the current rulemaking does not establish or modify radiation protections.

21.1.2.2 EPA Climate Change Model Forecasting Flawed

Comment: Commenter (4541) states that EPA has tried to develop elaborate models forecasting the effect of increasing atmospheric carbon dioxide (CO₂) on global temperatures 100 years into the future, but the commenter notes that those projections have already departed far from reality. According to the commenter, the models upon which EPA relies have often hidden stubborn falsehoods within their underlying structure. The commenter contends that increased model complexity has allowed modelers to hide problems where no one can find them. The commenter states that we are expected to believe the models because they are “state of the art,” but even with a large amount of funding it would be impossible to test all their assumptions. The commenter contends that there needs to be a focus on simpler models with traceable and reproduceable assumptions and results. And, when the models disagree with observations (evidence), they need to be corrected.

Commenter (4541) asserts that the EPA’s scientific foundation for potentially catastrophic anthropogenic global warming is based on the temperature projections of dozens of the supposedly more sophisticated global climate models. According to the commenter, those climate models are not sound science and are merely speculative scenarios about climate, *none of which has been validated by the historical temperature record*. The commenter states that scientific method involves testing a falsifiable hypothesis with experiments and evidence and climate model projections do not involve any such falsifiable hypothesis, so they are not an exercise of the scientific method.

Commenter (4541) notes that even the modelers themselves recognize and admit their models are not designed to produce predictions of future temperatures, only “what if” scenarios of results assuming the accuracy of unproven assumptions. The commenter provides that the *Summary for Policymakers of Climate Change Reconsidered II: Physical Science* states, “The science literature is replete with admissions by leading climate modelers that forcings and feedback are not sufficiently well understood, that data are insufficient or too unreliable, and that computer power is insufficient to resolve important climate processes.”³⁷⁶⁷

Moreover, according to the commenter (4541), none of the models adequately accounts for the Pacific and Atlantic Ocean temperature cycles (PDO and AMO). The commenter notes that none takes into account solar activity cycles indicated by variations in the number and size of sunspots, variations in solar magnetic fields, or cosmic rays flux, all of which are known to significantly affect climate. The commenter states that natural cycles have produced major climate changes in the past, such as the Minoan (peak at 1300 BC), Roman (peak at 100 BC)

³⁷⁶⁷ Craig D. Idso, et al., *Climate Change Reconsidered II: Physical Science, Summary for Policymakers* (Chicago, IL: The Heartland Institute for the Nongovernmental International Panel on Climate Change, 2013), p. 6

Medieval Warm Period (about AD 950 to 1250 – during which “global temperatures” were higher than they are today), and the early twentieth century warm period from 1915 to 1945.

Commenter (4541) states that design flaws explain why the projections of *all* climate models have now diverged dramatically from the actual temperatures experienced over the past two decades. The commenter provides a figure in their commenter letter (Figure 1) that illustrates that there has been no global warming for nearly 20 years. The commenter adds that projections of the models, and their increasing divergence from real-world temperature observations are illustrated in a figure in their comment letter (Figure 2). According to the commenter, the graph presented in Figure 2 was created by NASA scientist John Christy, Ph.D., who, with his colleagues at the University of Alabama in Huntsville, monitors atmospheric temperatures as computed from the data collected by U.S. satellites. The commenter further points out that Figure 2 illustrates the actual atmospheric temperatures recorded by U.S. weather satellites and weather balloons as compared to the average of the climate models, where the average projection is well above the observed real-world temperatures, with the divergence growing over time.

Commenter (4541) asserts that this growing divergence of the models from reality invalidates and falsifies them, as does:

- the inability of the models to account for the natural global temperature cycles and changes of the past century;
- the inability of the models to account for the Little Ice Age and Medieval Warm Period over the past 1,000 plus years; and
- the projection by all models of a tropical hotspot produced by CO₂ that doesn’t exist in the real world.

According to the commenter, what is most shocking is how weak the models are as any sort of “evidence” at all for the idea of catastrophic anthropogenic global warming.

Response: These comments are outside the scope of this rulemaking. This is a rule of internal agency procedure and does not pertain to climate change models.

21.1.2.3 Particulate Matter NAAQS Supporting Information

Comment: Several commenters contend that the supporting data for particulate matter NAAQS is strong, results have been replicated, and increasing supporting information adds to the supporting data for the NAAQS.

Commenters (5178, 6874, 8272) state that the ACS Study linked air pollution data from 151 U.S. metropolitan areas to data on risk factors and mortality in 552,138 adults residing in these areas who enrolled in 1982 and were followed through 1989. The commenters state that the authors found increased mortality to be associated with sulfate and fine particulate air pollution “at levels commonly found in U.S. cities.”

Commenters (1791, 5178, 6109, 6114, 6125, 6874, 6895, 6939, 8272) assert that the results of the Six Cities Study and the ACS Study have stood up to extensive subsequent analysis,

including the “Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality,”³⁷⁶⁸ which highlights the strength of such research.

Commenter (5015) provides a detailed synopsis of the Particle Epidemiology Reanalysis Project (which is not repeated here). The commenter states, in conclusion, the Reanalysis Team interpreted their findings to suggest that increased relative risk of "mortality may be attributed to more than one component of the complex mix of ambient air pollutants in urban areas in the United States". In the alternative analyses of the ACS Study cohort data, the commenter states that the Reanalysis Team identified relatively robust associations of mortality with fine particles, sulfate, and sulfur dioxide, and they tested these associations in nearly every possible manner within the limitations of the datasets.

Response: These comments are outside the scope of this rulemaking. In this final rule the EPA is not categorically or specifically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. This includes those studies supporting the NAAQS cited by the commenter. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

21.1.2.4 National Primary Drinking Water Regulations Arsenic Standard

Comment: Commenter (6172) asserts that EPA should identify public health levels for all National Primary Drinking Water Regulations (NPDWR), including arsenic. The commenter states that levels of regulated substances that are unsafe in drinking water as referenced in the Safe Drinking Water Act (SDWA) are: an “unreasonable risk to health,” section 1415 and “protective of public health,” section 1412. The commenter states that, while the EPA established a standard of 10 parts per billion (ppb) for arsenic in drinking water, in 2002, EPA did not find that arsenic concentrations above their standard necessarily present an “unreasonable risk to health.” The commenter states that, in their reply to a Congressional inquiry, EPA stated that it is “determining what does not pose an unreasonable risk to health with respect to arsenic, rather than address the much more complex issue of what does constitute an unreasonable risk to health.”³⁷⁶⁹

Commenter (6172) urges EPA to release all data used to craft SDWA policy including risk assessments of inorganic arsenic. The commenter states that this would allow for further assessment and demonstrate the repeatability of conclusions and comparisons to similar studies. The commenter states that a regulation that strengthens the transparency of science utilized by EPA will result in improved federal public policy and SDWA implementation. The commenter

³⁷⁶⁸ Krewski, D., Burnett, R. T., Goldberg, M. S., Hoover, K., Siemiatycki, J., Abrahamowicz, M., & White, W. H., Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality,” A Special Report of the Health Effects Institute’s Particle Epidemiology Reanalysis Project, Cambridge, MA, Health Effects Institute (2000). available at <https://www.healtheffects.org/publication/reanalysis-harvard-six-cities-study-and-american-cancer-society-study-particulate-air>

³⁷⁶⁹ Exemptions & the Arsenic Rule, August 2002, Appendix G-2 Arsenic Guidance

states that, for example, a recent study³⁷⁷⁰ could influence the current Integrated Risk Information System (IRIS) program that is developing an updated assessment of inorganic arsenic, however, the study includes some data that is available to government agencies but not to the general public.

Response: The comments are outside the scope of this rulemaking. This is a rule of internal agency procedure, and does not pertain to national primary drinking water regulations. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule.

21.1.2.5 Oppose EPA's Lack of Regulation of Perchlorate

Comment: Commenter (6172) states that the lack of a clear principle or interpretation of SDWA section 1412 allowed EPA to decide not to regulate perchlorate on October 10, 2008 and a subsequent affirmative EPA decision on February 11, 2011, that perchlorate meets the section 1412 criteria for regulation as a contaminant. The commenter asserts that such ambiguity in decision-making does not provide for regulatory certainty or persuasive reasoning for the local governments. The commenter notes that regulations should result in public disclosure of a clear principle for implementing the discretion provided to the Administrator for selecting new contaminants for regulations under SDWA Section 1412.

Response: The comments are outside the scope of this rulemaking. This is a rule of internal agency procedure, and does not describe the Agency's position on perchlorate. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers.

21.1.2.6 1,2,3-Trimethylbenzene (TMB) IRIS Assessment

Comment: Commenter (6362) states that EPA's 2016 IRIS assessment of 1,2,3-Trimethylbenzene (TMBs) does not accurately represent the health effects associated with exposure to TMBs because it fails to utilize a consistent and transparent data evaluation procedure for evaluating and weighing the full body of evidence.

Response: This comment is outside the scope of this rulemaking. This is a rule of internal agency procedure and does not pertain to the TMB IRIS Assessment .

21.1.2.7 Cost of Exposure to Radioactivity

Comment: Commenter (6169) suggests EPA should account for the true costs of exposure to radioactivity. The commenter states that internal costs to the nuclear industry are not the only consideration. The commenter states that allowing more radiation exposure externalizes costs to

³⁷⁷⁰ William M. Mendez Jr.; Sorina Eftim; Jonathan Cohen; Isaac Warren; John Cowden; Janice S. Lee; Reeder Sams, Relationships between arsenic concentrations in drinking water and lung and bladder cancer incidence in U.S. counties (Journal of Exposure Science and Environmental Epidemiology (2016) 00, 1-9)

other industries, to individual members of the public, and to the population experiencing collective effects of radiation from the nuclear power and weapons industries. The commenter states that like non-cancer health impacts of radioactivity, EPA does not account for the economic impact of radiation exposures. The commenter states that any benefit to the nuclear industry of noncompliance or non-protection is a cost borne by the exposed public, other industries, and current and future inhabitants (human and non-human species and gene pools) of contaminated environments.

Response: This comment is outside the scope of this rulemaking. This is a rule of internal agency procedure and does not pertain to radioactivity.

21.1.2.8 Interagency Review

Comment: Commenters (8281-PH39, 9227, 8272, 6125, 6126, 6194, 6144, 6916, 9227) questioned the Executive Order 12866 interagency review process for the proposed rule.

Response: Comments on deliberative processes, including interagency review and Executive Order 12866, are out of the scope of this rulemaking.

21.1.2.9 Federal Guidelines

Comment: Commenter (6915) provided interpretations of OMB Memorandum 13-13.

Response: OMB documents are not open to public comments and are out of the scope of this rulemaking. EPA maintains that the rule is designed to build upon federal guidelines.

Comment: Commenter (6133) asserts that greater clarity is needed in the process for determining which actions are identified as “significant regulatory actions” under Executive Order 12866.

Response: The determination of significant regulatory actions under Executive Order 12866 is not open to public comments and is outside the scope of this rulemaking.

21.1.2.10 Industry Should Be Required to Disclose Data

Comment: Commenter (5290) states that in the world of industrial chemicals, EPA should stop allowing corporations to self-report and start requiring them to disclose internal studies regarding the tens of thousands of existing and proposed chemicals that assault our health and ecosystem. For reference, the commenter suggests that EPA review an article discussing the discrepancy between DuPont's public statements about the safety of its *Perfluorooctanoic Acid* (PFOA) chemicals with the conclusions of its own confidential health studies, which included decades of evidence pointing to harm to public health (see <https://www.nytimes.com/2016/01/10/magazine/the-lawyer-who-became-duponts-worst-nightmare.html>)

Response: This comment relates to practices outside the scope of this rulemaking. This rule does not impose requirements on outside parties. This rule describes how the EPA will determine the

consideration to afford pivotal science in its final significant regulatory actions and influential scientific information for which the conclusions are driven by the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect based on the availability of the underlying dose-response data, in addition to other factors.

21.2 SNPRM Miscellaneous Comments and Out of Scope Comments

21.2.1 Miscellaneous Comments

21.2.1.1 General Opposition/Support

Comment: While several commenters provided comments that detailed specific support and/or opposition to the rule with detailed comments on specific aspects of the initial proposal and supplemental proposal, several thousand commenters (including, but not limited to 10045, 10048, 10866, 10974, 11176, 11182, 11183, 11184, 11192, 11243, 11403, 11408, 11479, 11484, 11894, 11918, 12403, 12412, 12415, 12423, 12427, 12430, 12450, 12456, 12458, 12464, 12474, 12540, 12715, 12719, 12727, 13549, 14397) provided general opposition to the proposal. Some examples of general statements of opposition include the following:

- Commenter expresses strong opposition to the criteria proposed in the Supplemental Notice of Proposed Rulemaking (SNPRM, or supplemental proposal) put forth by the EPA relative to its rule, “Strengthening Transparency in Regulatory Science.” (10866)
- The main provisions of this proposed rule are either unnecessary, duplicative, burdensome, or likely to be confusing in their application. The proposed rule will not deliver significant improvements in EPA’s current regulatory processes or improve the public’s confidence in science. In fact, the proposed rule is likely to slow the advancement of science in the U.S. and increase political interference in the conduct of science. (11182)
- One of the stated purposes of this SNPRM is to clarify vague, inaccurate, or inconsistent language in the 2018 proposed rule. The “clarifications” offered in the SNPRM demonstrate the intention to undermine science through the façade of increasing transparency. While the EPA frames the rule as reflecting “recent innovations and policies surrounding information access,” and there is indeed a widespread movement for open data and open science (which the commenter supports), this proposed rule and its modifications in the attendant SNPRM are disingenuous to that spirit. (11192)
- While the commenter supports transparency pursuant to data and information accessibility and expanding public knowledge, the proposed rule would likely restrict public knowledge by dismissing and devaluing scientific input to the EPA’s decisions. Neither the 2018 proposed rule nor this SNPRM offer potentially meaningful advances in the EPA’s decision-making or the public’s engagement with the decision-making process. (11361)
- The Agency uses best practices that allow for a weight of the evidence approach, and this rule would not only change the process but codify it, making it much harder to reverse. Part of that codification would be to add the nonscientific criterion “data availability” to the list of assessment factors that the EPA will use to determine the quality of a study. These factors have been guiding EPA’s data quality procedures since 2003 and include

soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. They help the Agency to assess the context surrounding the objectiveness and integrity of scientific information and to determine how to use it in its weight of the evidence approach. (11479)

- The EPA received thousands of comments on the initial rule in 2018, did not respond to those comments, nor hold any sort of engagement with scientists, community members, nor organizations who submitted comments is reflected in the Strengthening Transparency in Regulatory Science SNPRM. In fact, the Supplemental Notice does not reflect any of the technical or legal comments submitted in 2018. (12540)
- The EPA's proposed rule and supplemental proposal attempts to implement a mechanism to shortcut its own guidance, guidance reports from the National Academy of Sciences, and guidance reports mandated by congressional actions for the implementation of national environmental statutes for the past 50 years. (12403)
- The Transparency Rule and the modifications included in the SNPRM will negatively impact important public health research and endanger public health, limiting the use of critical research that has formed the basis for improved understanding of risks, particularly risks associated with environmental exposure to toxic substances. (11918)

Conversely, there were also commenters (10973, 11358, 11388, 11899, 11915, 12612, 12692) that provided general statements of support for the initial proposal/supplemental proposal. Some examples of these statements include the following:

- Commenter supports transparency in all EPA actions (both regulatory and non-regulatory), including making the data and information used to inform EPA decision-making public in most situations. In taking steps to improve the transparency of current EPA rulemaking processes, it is important that the Agency appropriately balance three major considerations: EPA's statutory obligations, transparency of influential (pivotal) decision-making processes, and the public and business communities' rights to privacy. (10973)
- Commenter appreciates EPA's work to clarify the proposed rulemaking, as the Agency's initial proposal was too vague and missing key components, which would have made it difficult to understand and to put into practice. The commenter would like to thank the Agency for adding and clarifying many definitions for key terms within the supplemental notice. These modifications to the proposal are critical in assuring any final rule is implementable and defensible. (11358)
- Commenter supports transparency in both regulatory and non-regulatory EPA actions, including the data and information used to inform EPA decision-making; and appreciates the additional information and definitions provided in the supplemental notice, as this information is critical to understanding the scope and meaning of the rule. (11388)
- Full transparency, as proposed by EPA and in accordance with their further recommendations, would go a long way toward eliminating incompetence, fraud and politics substituting for science – and thereby reducing the number of costly, burdensome regulations that have severely impacted American businesses, communities and families, for few benefits. The commenter asserts that, in reality, public health and safety depend on ensuring that research and data purportedly supporting it are made public and carefully reviewed by multiple experts, to ensure accuracy, replicability and integrity.

The commenter concludes that EPA will take full advantage of all available research that passes these tests. (11899)

- The rule is necessary to encourage and enforce the use of the scientific method among the investigators who are conducting research, particularly epidemiologic research, that is relevant to EPA regulatory policy. (12612)

Response: The EPA is providing response to the comments received for both the 2018 notice of proposed rulemaking and 2020 supplemental notice of proposed rulemaking as part of the submission of the final rule. The 2020 SNPRM was developed to clarify issues noted by comments on the 2018 NPRM.

The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

The EPA considered these comments when finalizing this rulemaking, and the EPA does not agree that its approach is "unnecessary, duplicative, burdensome, or likely to be confusing." As described in the rule and preamble, the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. When characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, the EPA will identify pivotal science and give greater consideration to pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation. Including this review of dose-response data availability for pivotal

science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties. This approach will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

21.2.1.2 Cannot Make Claim That Comments Are Out of Scope

Comment: Commenters (11403, 12427) assert that EPA cannot consider comments involving the 2018 proposed rule out of scope. The reasoning includes:

Commenter (11403) states that because EPA failed to address so many of the problems with the 2018 proposed rule, the commenter has readdressed several in this comment. The commenter notes that EPA has suggested in this proposed rule that comments "that address aspects of the 2018 proposed rulemaking that are not addressed, altered, or replaced by this SNPRM will be deemed outside the scope of this supplemental action." Rather than risk EPA deeming any comment "outside the scope," the commenter reminds EPA that when reopening a rule for public comment, the rule is "challengeable anew," and therefore nothing from the 2018 Proposal may be deemed outside the scope.³⁷⁷¹

Commenter (12427) provides that, although EPA is requesting comments now only on the supplemental notice, the overall effect of the SNPRM cannot be disentangled from that of the proposed rule, since one builds on the other. Thus, the commenter contends that it will be unreasonable, arbitrary, and capricious for EPA to refuse now to accept comments that pertain to the joint interactive effect of the Proposed Rule and SNPRM.

Response: Responses to comments have been provided for both the comments on the 2018 NPRM and the 2020 SNPRM. The only comments found to be out of scope are those found not to be relevant to the rule.

21.2.1.3 Alternative Options for Achieving Transparency

Comment: Commenter (10039) contends that EPA may find the Administrative Conference of the United States (ACUS) Recommendation 2013-3, Science in the Administrative Process, 78 Fed. Reg. 41,357 (July 10, 2013), especially relevant to this proposed rulemaking. The commenter notes that recommendation 2013-3 highlights innovative Agency practices to "enhance the transparency of their scientific decision-making practices" and offers "proposals to bring greater congruity to the treatment of publicly and privately funded scientific research." The commenter provides that all ACUS recommendations and their accompanying reports are available online at www.acus.gov.

³⁷⁷¹ *Public Citizen v. Nuclear Regulatory Com.*, 901 F.2d 147, 150 (D.C. Cir. 1990).

Response: Thank you for the recommendation. The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions. Where underlying dose-response data in pivotal science are available, subject matter experts could independently reanalyze the data to affirm original research conclusions, check for errors, test alternative assumptions, and better understand and evaluate the implications of the uncertainty. Such independent reanalyses will subsequently enable the EPA to make stronger, data-driven decisions in future rulemakings or in revisions to existing rules or influential scientific information. This could occur through standard cyclical reviews (e.g., revisions to NAAQS, risk and technology reviews, national primary drinking water regulations), ad hoc revisions, or revisions through the information quality guidelines or other petition processes. Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

Comment: Commenter (10740) reiterates Steinzor and Wagner's proposal for transparent science³⁷⁷² in that:

Transparent science should make publicly available

- a conflict of interest disclosure statement if the study was privately sponsored, as well as the underlying contract governing that research, in order to ensure that researchers' independence to determine study design and report results was preserved;
- a clear statement of the methods for data collection and analysis used in the study to allow for scrutiny and even replication of the study; and
- all of the underlying data, presumably in digital form (e.g., not original specimens, etc.).

A proposal for transparent science should

- apply the same standards to all scientific research and analyses used by the Agency, particularly research that is not published and that has escaped rigorous peer review;
- require that a list of all excluded research be shared with the public as the decisions are made. Such disclosure could be accomplished by listing excluded—or presumptively excluded—information on a dedicated website in the course of a rulemaking or Agency decision.

³⁷⁷² Wendy E. Wagner and Rena Steinzor, <https://www.theregreview.org/2018/07/31/wagner-steinzor-real-not-faux-transparency-proposal/> and [Deconstructing Regulatory Science](#)

- be applied to *all* technical analyses prepared by the Agency.

According to the commenter, this proposed rule neither conforms with the principles above nor meets the requirements of a proposal for real transparent science.

Response: The EPA disagrees with the commenter. The application of the principles discussed in their comments are a decision made by a researcher. This final rule does not regulate any entity outside the EPA. Rather, in this action, the EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. In doing so, the final rule provides greater transparency on the consideration the EPA will give pivotal science where the underlying dose-response data are or are not available for independent validation.

Consistent with existing Agency practice³⁷⁷³, the EPA will review and evaluate all relevant scientific studies when developing significant regulatory actions and influential scientific information. The EPA will continue to use the following, established factors to assess the quality of studies used to develop significant regulatory actions and influential scientific information:

- Soundness – The extent to which the scientific and technical procedures, measures, methods or models employed to generate the information are reasonable for, and consistent with, the intended application.
- Applicability and Utility – The extent to which the information is relevant for the Agency’s intended use.
- Clarity and Completeness – The degree of clarity and completeness with which the data, assumptions, methods, quality assurance, sponsoring organizations and analyses employed to generate the information are documented.
- Uncertainty and Variability – The extent to which the variability and uncertainty (quantitative and qualitative) in the information or in the procedures, measures, methods or models are evaluated and characterized.
- Evaluation and Review – The extent of independent verification, validation and peer review of the information or of the procedures, measures, methods or models.

When evaluating potential links between exposure to a pollutant, contaminant, or substance and effects and the nature of the dose-response relationship, the EPA will follow best practices and rely on the highest quality, most relevant studies in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well-substantiated evidence (consistent with Agency guidelines on hazard identification and dose-response assessment) to support a relationship between exposure and effect, the EPA will identify a subset of those studies for use in characterizing the quantitative relationship between

³⁷⁷³ U.S. EPA. (2002). Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency. (EPA/260R-02-008). Washington, DC: U.S. Environmental Protection Agency. Available at https://www.epa.gov/sites/production/files/2020-02/documents/epa-info-quality-guidelines_pdf_version.pdf.

the amount of dose or exposure to a pollutant, contaminant, or substance and an effect. This will be based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements, quantitative analyses, or both will be identified as pivotal science. Once the EPA has identified pivotal science—for either significant regulatory actions or influential scientific information—the EPA will then evaluate if the underlying dose-response data are available in a manner sufficient for independent validation. The EPA will give greater consideration to pivotal science for which the underlying dose-response data are either publicly available in a manner sufficient for independent validation or, in the case of personally identifiable information (PII), CBI, or proprietary data, available through restricted access that affords privacy in a manner sufficient for independent validation.

The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Finally, Part 30.4 of the rule states, “The EPA shall clearly identify all science that serves as the basis for informing a significant regulatory action. The EPA shall make all such science that serves as the basis for informing a significant regulatory action publicly available to the extent permitted by law.”

Comment: Commenter (10974) notes that improvements to developing health-based benchmark values used in state air toxics and permitting reviews can be made with certain data practices, but EPA would be better served supporting state efforts to make existing data easier to understand, to help better communicate research results and conclusions, and to help states develop third-party partnerships.

Response: This final rule does not regulate any entity outside the EPA. Rather, in this action, the EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. In doing so, the final rule provides greater transparency on the consideration the EPA will give pivotal science where the underlying dose-response data are or are not available for independent validation. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Comment: Commenter (11192) states that while they support transparency pursuant to data and information accessibility and expanding public knowledge, the proposed strengthening

transparency in regulatory science (STRS) rule would likely restrict public knowledge by dismissing and devaluing scientific input to the EPA's decisions. The commenter asserts that it is important to note that there are several ways the EPA could actually make its regulatory decision-making more clear to the public and support public access to data, including: (1) funding researchers to de-identify data, (2) creating a user-friendly data repository with de-identified data, (3) conducting scientific assessments for all proposed regulations, and (4) providing syntheses and summaries of science assessments at multiple levels of detail to be comprehensible by various interested parties. According to the commenter, neither the 2018 Proposed Rule nor this SNPRM offer potentially meaningful advances in the EPA's decision-making or the public's engagement with the decision-making process.

Response: The EPA disagrees with the commenter, the Agency believes that this final rule will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

The EPA is not categorically excluding any studies from consideration - even studies where the underlying dose-response data are not available for independent validation - when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

Comment: Commenter (12427) contends that the proposed rule and SNPRM fail to address a more pressing issue, publication ethics. The commenter notes that in the context of publication ethics,³⁷⁷⁴ "Transparency" has a different meaning. According to the commenter, transparency means that sources of funding for research or publication should always be disclosed. The commenter states that authors should disclose role of the funding source in designing the research, recruiting investigators/authors, collecting the data, analyzing the data, preparing the manuscript, or controlling the publication process; and that, in fact, many journals require this. Furthermore, the commenter provides that conflicts of interest should be disclosed by authors

³⁷⁷⁴ Graf C, Wager E, Bowman A, Fiack S, Scott-Lichter D, Robinson A, Best Practice Guidelines on Publication Ethics: a Publisher's Perspective, International Journal of Clinical Practice, 200, 61 (Suppl. 152), 1-26 (2007). Also: <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC1804120/#bx1>

and evaluated by reviewers. The commenter notes such disclosures should include “information about financial (for example, patent ownership, stock ownership, consultancies, speaker's fees), personal, political, intellectual, or religious interests relevant to the area of research or discussion. According to the commenter, publication ethics include respecting confidentiality: “In the majority of cases, editors should only consider publishing information and images from individual participants/subjects or patients where the authors have obtained the individual's explicit consent.”³⁷⁷⁵.

Response: This final rule does not regulate any entity outside the EPA. Rather, in this action, the EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information. As stated in Part 30.3, “The provisions of this part apply to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.”

Comment: Commenter (12546) states that the 2016 *Plan to increase access to results of EPA-funded scientific research*.³⁷⁷⁶ (2016 Plan) is scientifically and technically sound; thus, EPA should focus on implementing the 2016 EPA Plan instead of the proposed rule and associated SNPRM.

Response: EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, Office of Science and Technology Policy (OSTP) memorandum “Increasing Access to the Results of Federally Funded Scientific Research” and the 2016 EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research.” EPA researchers, grantees and contractors are required to make peer-reviewed journal articles and the underlying data and models resulting from EPA-funded research accessible to the public. The EPA “Plan to Increase Access to Results of EPA-Funded Scientific Research” requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible.

However, this final rule, as stated in Part 30.3, applies “to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science.”

It should also be noted that the EPA’s 2016 *Plan to Increase Access to Results of EPA-Funded Scientific Research* noted that “transparency is a core EPA value” and that increased availability of research data would accelerate scientific breakthroughs that support the Agency’s mission and policymaking efforts.

³⁷⁷⁵ *Id.*

³⁷⁷⁶ EPA (2016) *Plan to increase access to results of EPA-funded scientific research*. Available: <https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf>.

Comment: Commenter (12422) states that many in the scientific and regulatory communities recognize the importance of transparency and access to the data underlying important studies. The commenter asserts that addressing these issues can be accomplished without injuring the scientific enterprise or discouraging scientists from pursuing pressing scientific questions. According to the commenter, mechanisms to accomplish this that do not require new regulation include development of public access databases, use of the Freedom of Information Act (FOIA), and reanalysis by third parties. The commenter provides that certain journals, for example, require authors to agree to make their data available to editors and others upon request.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

Many scientific publications do require authors to make a data availability or data access statement, which discloses where and under what conditions the underlying study data are available. Yet the EPA cannot solely rely on data availability statements made in published research because initiatives toward greater data sharing and transparency amongst scientific journals and international organizations are still being implemented, are inconsistently enforced, and the true accessibility of data in a public repository is still limited. For example, Christensen et al. (2019) evaluated 1,072 peer-reviewed articles and “found that rates of data availability for empirical articles published after journals adopted data-sharing policies differ widely between journals, from 0 percent to 83 percent, with a mean of 35 percent.”³⁷⁷⁷

Comment: Commenter (11921) notes that while access to underlying data for a particular study can be valuable, the systematic assessment of all of the available scientific evidence is the most important component of environmental policy making. The commenter provides that evidence integration (NRC 2014) is used by a wide variety of organizations when evaluating the information for the potential harm caused by environmental agents. Given the diverse nature of disciplines and methods that can shed light on health effects, the commenter states that most data synthesis procedures evaluate the findings from myriad studies using different approaches, even if they might place different weights on them. Ideally, according to the commenter, the degree of confidence in the findings of an effect increases along a spectrum of results that progressively converge with one other, beginning with the technical and growing to a more conceptual level.

Commenter (11921) states that recognizing that each discipline, method and study has its own limitations, a key step in verification of any particular finding is through “triangulation” (Cite:

³⁷⁷⁷ Christensen, G., Dafoe, A., Miguel, E., Moore, D. A., and Rose, A. K. (2019). A study of the impact of data sharing on article citations using journal policies as a natural experiment. *PLoS ONE* 14(12): e0225883. Available at <https://doi.org/10.1371/journal.pone.0225883>.

Lawlor, 2016, Pearce, 2019), that is, addressing the same question using multiple lines of evidence from disparate approaches to compensate for the inherent limitations in any one approach -- the more different such approaches, the better. The commenter notes that a different population, also possibly with a different design or strategy (*e.g.*, examination of the impact of air pollution reduction vs. observations based on existing patterns alone) is more persuasive than solely testing if the results of the original study were valid. The commenter adds that the convergence of findings from experimental exposure of human subjects and epidemiologic findings can provide confirmation. The commenter further adds that mechanistic insights, based on animal, cellular and in vitro studies, can provide the biological underpinnings and plausibility of clinical or epidemiological observations.

Commenter (11921) states that the EPA approach to evidence synthesis - before the current proposal - has usefully relied on a form of evidence integration provided by examining all evidence from a variety of sources to reach final determination of exposure and health effects (US EPA 2015). The commenter adds that other federal agencies, such as the Office of Health Assessment and Translation within National Institute of Environmental Health Sciences (NIEHS) (OHAT, 2015), have also applied similarly comprehensive and systematic approaches.

There are, of course, according to the commenter (11921), opportunities to improve the systematic review processes at EPA and other agencies, and there is active discussion about the best way to conduct systematic reviews.³⁷⁷⁸ The commenter notes that the use of evidence from the widest range of study types and designs is by far the most effective and widely accepted way to draw scientific conclusions. The commenter contends that while reproduction of the results of single studies is sometimes helpful in such systematic reviews, limiting evidence synthesis and assessment to only studies that have accessible data would seriously circumscribe the Agency's decision making and the robustness of such decisions.

Commenter (11176) states that a broader approach to ensuring valid findings, especially in complex areas like regulatory environmental science, is needed. The commenter notes that rather than focusing on single studies, evidence experts look at bodies of evidence and seek triangulation of data from a diverse set of research approaches to evaluate consistency of results and enhance confidence in findings above that of any individual study. The commenter states that as a regulatory Agency, EPA work is constantly under scrutiny, putting its scientific justifications under a microscope with legal challenges an ever-present possibility. The commenter states that as a result, EPA, with the expertise of its scientific and other professional staff and with the consultation of its scientific advisory panels, has an effective and advanced system of scientific checks and considerations that have evolved and improved over the decades. The commenter suggests that as an example of EPA's rigorous scientific processes, consider the rigor, detail, and transparency of the EPA program for managing the quality of its environmental data. The commenter suggests also considering the EPA Integrated Science Assessments which rate evidence for certain hypotheses on a causal spectrum and carefully consider a body of evidence without undue emphasis on any one study. The commenter states that this rule reverses

³⁷⁷⁸ Cf. The Problem with Mechanistic Risk of Bias Assessments in Evidence Synthesis of Observational Studies and a Practical Alternative: Assessing the Impact of Specific Sources of Potential Bias (Savitz 2018)

that progress by having it revert to a more narrow check and also freezes EPA's scientific validation process around this narrow check. The commenter concludes that the rule should be withdrawn so that EPA scientists can use the most recent and rigorous methods for determining the best science to use in supporting the EPA's mission to protect the environment and the health of the U.S. population.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

The Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. The EPA will continue to use established guidelines for identifying and integrating evidence.

The EPA continues to believe that the opportunity to independently validate the pivotal science that the EPA relies upon is important in furthering scientific understanding and the Agency's mission. A presenter in a 2016 NAS workshop on Principles and Obstacles for Sharing Data from Environmental Health Research stated more directly that "for environmental policy making to be legitimate, the scientific reasoning behind a given decision—including the data supporting it—must be transparent."³⁷⁷⁹ When data are widely available, researchers can validate research results and help identify and correct unintended errors, as well as reanalyze the data for new and different purposes, examine novel questions, provide new scientific insights, and improve model development.

Comment: Commenter (11103) recommends the EPA invest in the research and development of open-source, usable tools, and infrastructure that produce statistically sound, reproducible, and verifiable results. The commenter suggests the EPA consider the entire body of cumulative evidence on any given subject and implement policies that aid in overcoming technological barriers to reproducibility rather than excluding studies. The commenter states that scientific research today is largely computationally heavy and follows a workflow, such as the intricate numerical modeling of climate and weather. The commenter states that scientists need standards-based workflow systems that better document, track, and detail their research and enable them to map the complex process from data to results.³⁷⁸⁰ The commenter states that this will make it

³⁷⁷⁹ NAS (National Academies of Sciences, Engineering, and Medicine). (2016). Principles and obstacles for sharing data from environmental health research: Workshop summary. Washington, DC: The National Academies Press. Available at <https://doi.org/10.17226/21703>.

³⁷⁸⁰ Yolanda Gil et al., "Examining the Challenges of Scientific Workflows," Computer (December 2007), 24-30. <https://doi.org/10.1109/MC.2007.421>

easier for other researchers to independently verify any claims. The commenter states that, instead of enforcing strict transparency rules on the underlying data—which cannot always be transparent either to protect the privacy of identifiable data or to protect the intellectual property of proprietary data—the EPA should encourage transparency through initiatives aimed at methodology.

Commenter (11103) supports the recommendation from the National Academic of Sciences, Engineering, and Medicine (NASEM) that the National Science Foundation (NSF) consider creating code and data repositories for the long-term archiving of digital artifacts and believe the EPA should endorse this.³⁷⁸¹ The commenter states that not being able to access legacy data in a usable format presents an obstacle for reproducibility. The commenter states that what is needed are data archives that provide long term stewardship such as the U.S Department of Energy’s (DOE) Environmental Systems Science Data Infrastructure for a Virtual Ecosystem (ESSDIVE). The commenter states that this data repository stores, expands access to, and improves usability of data from DOE’s research in terrestrial and subsurface environments.³⁷⁸² The commenter states that researchers in all fields of environmental studies could benefit from such resources and EPA could benefit from the increased openness of their data.

Response: This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (10945) asserts that the proposal would fail to assure that the best possible science is available for regulatory decision making. The commenter suggests that the American Economic Association’s Data and Code Availability Policy demonstrates an alternative that assures scientific credibility without restricting good science because it is conducted with data that cannot, for proprietary, statistical, or legislative purposes, be widely distributed. The commenter states that the importance of sharing data (and computational instructions, “code”) for the purpose of transparency and reproducibility of science is paramount to the American Economic Association (AEA) and for science in general. The commenter states that the AEA’s Data and Code Availability Policy³⁷⁸³ emphasizes this importance, but also exhibits flexibility by explicitly recognizing the scientific credibility of research performed with restricted data, and prescribing alternative approaches to replicability in that case:

If data are subject to any access restriction that prevents authors from depositing the files in an openly accessible data repository, additional information is required. Authors shall provide detailed information on how, where, and under what conditions an independent

³⁷⁸¹ National Academies of Sciences, Engineering, and Medicine (NASEM), *Reproducibility and Replicability in Science*, (Washington, DC: The National Academies Press 2019). <https://doi.org/10.17226/25303>

³⁷⁸² “ESS-DIVE, Environmental Systems Science Data Infrastructure for a Virtual Ecosystem”, accessed April 11, 2020, <https://ess-dive.lbl.gov/>

³⁷⁸³ <https://www.aeaweb.org/journals/policies/data-code>.

researcher can access the data. This information shall be provided to the editors upon submission... and the AEA Data Editor will verify the information, and may contact the data providers identified by the authors.

Commenter (10945) states that, if data contain confidential information - identifiable person or firm/establishment information – de-identification and anonymization are required both for ethical as well as legal reasons Health Insurance Portability and Accountability Act (HIPAA). The commenter states that such data can and regularly are made available at archives that support relevant access controls. The commenter states that a prime example is the government's own Federal Statistical Research Data Center (FSRDC) system, which currently houses confidential data from five agencies, is used at any time by several hundred researchers (as of the end of 2018, 760 researchers were active), on hundreds of approved projects (as of the end of 2018, there were 315 active projects). The commenter states that using this highly restricted, confidential data on businesses, people, their health, their taxes, researchers each year publish in top journals. The commenter states that, in 2018, the latest available numbers show at least 82 publications, most of those in peer-reviewed journals, often in the top journals in economics and other social disciplines. The commenter states that many of those researchers and those publications use the same underlying data repeatedly, demonstrating that an active scientific discussion can happen in the presence of confidential data, in an ethical and privacy-preserving fashion. The commenter states that, while data is restricted from publication, it is available to a very large community of researchers under proper safeguards. The commenter states that the FSRDC system is but one of many systematic, objective, and non-discriminatory systems of accessing confidential health, business, and demographic data in the United States. The commenter states that the Foundations for Evidence-Based Policymaking Act of 2018 (P.L. 115-435) explicitly calls for making data available “while protecting such assets from inappropriate access and use”, and mandates OMB to “establish a process” by which a large and diverse cadre of stakeholders can access the data under those conditions, with explicit mention of researchers.

Commenter (10945) states that, at the AEA, if access to the data used is restricted, the Editor needs to be alerted to such situations at the time of submission. The commenter states that, in all such cases, the AEA policy still requests provision of the code, and a description of how the data could be accessed or reproduced by another researcher. The commenter states that the Data Editor may test the access protocol prior to acceptance, and may ask for support by third parties in running the provided code. The commenter states that it is likely that this will not always be possible, and the ultimate decision about whether to go forward with the submission, and whether to accept an article that uses restricted data rests with the journal's Editor or Co-Editor. The commenter states that the AEA has been successful in asking independent third-parties with access to the same data to conduct verification and reproducibility tests, subject to a stringent protocol, and to the satisfaction of the Data Editor. The commenter states that the AEA is firmly of the opinion that reliable, verifiable, high-quality science can be conducted when using confidential data. The commenter states that reliable, reproducible, credible science can be done and has long been done, using non-public data. The commenter states that, because non-public data will remain a feature over the future, for ethical and competitive reasons, policy decisions should be based on the conclusions of knowledge arising from its use. The commenter states that the proposal's rigid and restrictive interpretation of transparency – that anyone in the public requesting the data can obtain it – is unnecessary when restricted access facilities of trusted

intermediaries and associated protocols are in place, widely used, and scientifically acceptable. The commenter states that the EPA's policy needs to recognize and accommodate these contemporary approaches.

Response: The EPA has finalized the approach that gives greater consideration to pivotal science whose underlying data or models are publicly available or available through restricted access. Restricted or tiered access in this rule means that the underlying data or models are be available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

Comment: Commenter (11176) suggests that, for the EPA to continue improving access to its data and the data it uses, it may be helpful to consult the insightful, constructive and comprehensive 2019 Bipartisan Policy Center technical paper, *Meaningful Transparency at EPA: A Framework for Rationalizing Approaches to Promote Open Science and Data Sharing for Evidence-Based Policymaking*.

Response: The EPA supports making data and model publicly accessible to allow for reanalysis for independent validation. EPA is also committed to protecting CBI and PII according to all existing rules and regulations. The Agency supports the use of restricted or tiered access for data and models that have CBI, proprietary data, or PII. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

Comment: Commenter (12731) states that study evaluation criteria used in leading systematic review frameworks that have been developed for environmental health, such as the University of California San Francisco Navigation Guide³⁷⁸⁴ and the U.S. Toxicology Program Office of

³⁷⁸⁴ Tracy J. Woodruff, & Patrice Sutton, The Navigation Guide Systematic Review Methodology: A Rigorous and Transparent Method for Translating Environmental Health Science into Better Health Outcomes, 122 *Envtl. Health Persp.* 1007 (2014), <https://ehp.niehs.nih.gov/doi/10.1289/ehp.1307175>.

Health Assessment and Training systematic review handbook,³⁷⁸⁵ have been adapted from prominent systematic review methods in medicine, namely the Cochrane Reviews.³⁷⁸⁶ The commenter states that Cochrane Review study evaluation criteria have been developed and refined over decades, and are supported by empirical evidence³⁷⁸⁷ and experience in application.³⁷⁸⁸ The commenter states that, in contrast, the EPA’s failure to provide any factual support for assigning the availability of underlying data controlling weight in its assessment of studies renders the proposal arbitrary.³⁷⁸⁹

Response: The EPA disagrees with the commenters statement that the Agency has failed to “provide any factual support . . .” The SNPRM asked for comment on this issue and the final rule addresses these concerns.

The EPA agrees that it is important not to categorically exclude any study because the data underlying a study at the stage required by this rulemaking may not be available for independent validation. Such an approach could have resulted in the systematic exclusion of valid studies. Therefore, the EPA is not finalizing the primary proposal in the 2020 SNPRM that would have categorically required that for studies to be considered pivotal science the underlying data would need to be available for independent validation. However, given that transparency is an important aspect of EPA’s regulatory actions and assessments, it should be an important consideration in how the Agency considers pivotal science. As described in 40 CFR 30.5 of the final rule, the EPA will rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. Where there is convincing and well substantiated evidence to support a relationship between exposure and effect, the EPA will identify those studies— based on the exposure situation being addressed, the quality of the studies, the reporting adequacy, and the relevance of the endpoints—that would inform a dose-response assessment for those effect endpoints. From that subset, the specific dose-response studies or analyses that drive the requirements or quantitative analyses of an EPA significant regulatory action or influential scientific information will be identified as pivotal science.

In the final rule the EPA also provides additional clarification regarding the other scientific factors that the EPA will consider. Although the EPA is prioritizing transparency in pivotal

³⁷⁸⁹ *State Farm*, 463 U.S. at 43.

science, the Agency also recognizes that there will be instances where the underlying dose-response data of pivotal science is unavailable for independent validation. In order to ensure that the Agency maintains a strong scientific basis for its decision-making, the availability of underlying dose-response data should be considered as long as other significant technical considerations can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability, even in the absence of maximum transparency. Though not exhaustive or exclusive, the EPA has identified several factors that balance some of the important technical considerations the EPA will consider in addition to data availability and that are particularly relevant to the stage of the analysis where dose-response data are used. The EPA will thus consider the following factors:

- (1) the quality of the study relative to other studies for which the dose-response data are available;
- (2) the extent to which there are other studies for which the dose-response data are available;
- (3) the sensitivity of the conclusions in the significant regulatory action or influential scientific information based on the use of the study;
- (4) the extent to which the study is fit for the purpose or intended use relative to other studies for which the dose-response data are available;
- (5) the use of exposures or doses in a range and duration that is relevant for the intended use and that minimizes the need for extrapolations;
- (6) the extent to which the study is supported by other scientific evidence;
- (7) the extent to which the study accounts for unique scientific considerations;
- (8) the extent to which the study minimizes the use of defaults and assumptions, uses appropriate and strong statistical methods, and includes a robust representation of uncertainty and confidence intervals; and
- (9) the study's consideration of a broad range of parametric dose-response or concentration-response models, a robust set of potential confounding variables, nonparametric models that incorporate fewer assumptions, various threshold models across the dose or exposure range, and models that investigate factors that might account for spatial heterogeneity.

These factors are intended to assist the EPA in determining the consideration to afford to pivotal science with underlying dose-response data that are not available for independent validation. The final rule requirements and the consideration of these factors apply to any data used in characterizing the relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, regardless of the direction of that effect. Because study quality factors (including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review) would have already been evaluated at an earlier stage in the assessment process, the studies evaluated with these additional factors are presumed to be of the highest quality available.

Some of the factors described above are intended to be evaluated for pivotal science with underlying data that are not available for independent validation relative to pivotal science with underlying data that are available for independent validation. For example, when assessing studies, the EPA may determine that greater consideration should be given to a study with underlying data that are unavailable for independent validation when that study is of higher quality compared to a medium-quality study with underlying data that are available for

independent validation (factor 1), the conclusions of the significant regulatory action or influential scientific information are or are not highly sensitive to the exclusion of the study for which the underlying data are not available for independent validation (factor 3), the study with data unavailable for independent validation was better fit for the purpose of the EPA assessment (factor 4), or the results of the study for which the underlying data are not available are supported by other scientific evidence, such as mechanistic data (factor 6).

Importantly, these factors do not apply to other stages in the assessment process. For example, the consideration for exposures that were conducted at more environmentally relevant exposure concentrations (factor 5) does not suggest that epidemiological studies will automatically be given greater weight than laboratory studies. The EPA will continue to use established guidelines for identifying and integrating evidence and will only use the factors in 40 CFR 30.5 studies in evaluation of the data availability requirements of this rule. In addition, not all of these factors will be applicable to all studies or assessments. For example, some pollutants, chemicals, or substances may have unique scientific considerations (factor 7), such as the valence state of a metal compound or endogenous contributions to internal concentrations, that may not be relevant for other pollutants, chemicals, or substances. Therefore, the weight afforded to each factor by the EPA may vary by assessment, and how those factors were considered will be documented in the assessment. If two studies, one with and one without available data and are relatively equal with respect to the study quality factors in 30.5(b), the study where the underlying data is available will be given greater consideration and the weight of the other study will be based on an assessment of the factors in 30.5(d). In this way, the EPA will balance the importance of transparency with the need to maintain a strong scientific basis for its assessments.

This final rule requires the consideration of these factors in assessing pivotal studies for which the dose-response data are not available for independent validation. The EPA may adapt these factors in upcoming statute-specific rulemakings, as appropriate, for significant regulatory actions under the different environmental statutes that the EPA administers. How scientific information is to be considered varies among the different environmental statutes and sometimes within an individual statute. Interpretation of the assessment factors will be tailored to the specific circumstances and the specific environmental statutes.

Comment: Commenter (11490) states that various systems have been devised to rate the quality of scientific evidence, perhaps the most widely accepted of which is the Grading of Recommendations Assessment, Development, and Evaluation (GRADE) system. The commenter states that GRADE assesses the quality of a study based on study design (with randomized controlled trials starting as high quality and observation studies as low quality), and then considers various factors that may lower the quality of evidence (*e.g.*, risk of bias, inconsistency, indirectness, imprecision, publication bias) or increase the quality of evidence (*e.g.*, large effect size, dose-response relationship). The commenter suggests the EPA should rely on these factors, rather than just one aspect—availability of raw data—to assess to what extent a study should inform policy decisions.

Response: The EPA is not relying solely on data availability. Part 30.5 of the final rule states, “When determining the consideration to afford to pivotal science that lacks available data and

models, EPA shall consider factors including soundness, applicability and utility, clarity and completeness, uncertainty and variability, and evaluation and review. The Agency will identify the pivotal science that was given lesser consideration and provide a short description of why lesser consideration was given.”

Comment: Commenter (10048) states that the systematic review process in place for IRIS and other review processes already includes consideration of the quality of a research study and methods. The commenter states that best professional judgement of data quality should be left to subject matter experts and not assigned solely on the basis of data availability.

Response: The EPA is not categorically excluding any studies from consideration - even studies where the underlying dose-response data are not available for independent validation - when promulgating final significant regulatory actions or developing influential scientific information. Rather, as discussed in Part 30.5 of the final rule, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. The EPA will continue to use established guidelines for identifying and integrating evidence.

The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions.

Implementation guidelines and statute-specific transparency regulations or programmatic regulations are forthcoming and may be more expansive than the procedural rule.

Comment: Commenter (10339) recommends that the EPA consider journals published by scientific societies that have established guidelines and standards for the submission of datasets to repositories should be considered trusted sources for EPA scientific reviews. Commenter (10865) contends that the research on which the EPA relies on to make most of its policy determinations is already transparent in most cases given that many scientific journals and research agencies now have policies governing the sharing of data among researchers and with appropriate access by the public at large.

Commenter (12405) states that, as overall justification for the proposed rule, the EPA claims it is following the accepted practice of many science organizations including many scientific journals. The commenter asserts that this is misleading. The commenter states that major journals in the field only require data be made confidentially available to other researchers for the purposes of reproducing or extending analysis. No major journal requires scientists to publish raw data to the public in all cases.

Response: Many scientific publications have guidelines that require authors to make a data availability or data access statement, which discloses where and under what conditions the underlying study data are available. Yet the EPA cannot solely rely on data availability statements made in published research because initiatives toward greater data sharing and transparency amongst scientific journals and international organizations are still being implemented, are inconsistently enforced, and the true accessibility of data in a public repository is still limited. For example, Christensen et al. (2019) evaluated 1,072 peer-reviewed articles and “found that rates of data availability for empirical articles published after journals adopted data-sharing policies differ widely between journals, from 0 percent to 83 percent, with a mean of 35 percent.”³⁷⁹⁰

The EPA is finalizing the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

This final rule does not require scientists to publish their “raw data” nor does it regulate any entity outside the EPA. Rather, in this action, the EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information.

Comment: Commenter (11400) asserts that independent validation of public health studies is not the only means of determining credibility of studies; the National Academy of Sciences also lists other accepted methods of improving the rigor and credibility of studies, such as peer review, systematic reviews, and meta-analyses. The commenter states that the scientific merit of studies is what should be given greatest consideration, and scientific value should be evaluated by scientists.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by

³⁷⁹⁰ Christensen, G., Dafoe, A., Miguel, E., Moore, D. A., and Rose, A. K. (2019). A study of the impact of data sharing on article citations using journal policies as a natural experiment. *PLoS ONE* 14(12): e0225883. Available at <https://doi.org/10.1371/journal.pone.0225883>.

prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

The EPA is a leader in the evaluation of human and ecological impacts of environmental pollution and methods to cost-effectively mitigate these impacts. The selection and use of quality, peer-reviewed literature is a critical part of this work. However, the strength of the review conducted as part of the study's acceptance and publication in a scientific journal has received increased attention in the scientific community due to the lack of transparency and consistency, potential for bias, and the difficulty that independent researchers have had in reproducing published results.^{3791,3792,3793,3794,3795,3796} Jamieson et al. (2019) state, "Journals play a key role in ascertaining the quality of the evidence in work submitted for publication through peer review. However, that practice is neither uniform nor free of exploitation. While it can select for trustable results, its existence alone is not sufficient to verify the quality of the evidence used to back claims."³⁷⁹⁷ Because of the potential impact of significant regulatory actions, independent validation of studies that are pivotal to the EPA's significant regulatory actions and influential scientific information may increase public confidence in the findings and conclusions presented in those studies. As Jamieson et al. (2019) states, publication alone (including the typical peer review necessary for publication) is insufficient to verify a study's quality, and additional confidence could be gained from third-party reanalyses that independently validate the study results³⁷⁹⁸.

Finally, as described in the rule and preamble, the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance. When characterizing the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect, the EPA will identify pivotal science and give greater consideration to

³⁷⁹⁸ Ibid

pivotal science for which the underlying dose-response data are available in a manner sufficient for independent validation. Including this review of dose-response data availability for pivotal science is critical to the EPA's progress toward increased transparency and providing increased opportunity for scientific reanalysis and review by independent third parties. This approach will result in significant regulatory actions and influential scientific information that are based on the highest quality, most relevant studies and ensure adequate human health and environmental protections, while maximizing transparency and maintaining consistency with the statutes the EPA administers.

Comment: Commenter (10339) states that the proposal and SNPRM fail to explain how publicly funded, peer-reviewed studies that comply with National Institutes of Health (NIH) data deposition and access policies will be considered. Commenter (10339) urges the EPA to instead adopt policies governing data sharing and access that are consistent with those of other research agencies such as the NIH. Commenter (11408) suggests that rather than making all raw data available, the Agency should instead establish a database that "registers studies and obtains systematic sets of parameters and results", such as the NIH's clinical trials database.

Response: As described in the rule and preamble, the EPA is not categorically excluding any studies from consideration when promulgating final significant regulatory actions or developing influential scientific information. Rather, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for hazard due to exposure to a pollutant, contaminant, or substance.

EPA has implemented the public access requirements for EPA researchers, grantees and contractors as required by the February 22, 2013, OSTP memorandum "Increasing Access to the Results of Federally Funded Scientific Research" and the 2016 EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research." EPA researchers, grantees and contractors are required to make peer-reviewed journal articles and the underlying data and models resulting from EPA-funded research accessible to the public. The EPA "Plan to Increase Access to Results of EPA-Funded Scientific Research" requires the data underlying a journal article resulting from research funded by EPA be made publicly accessible.

However, this final rule, as stated in Part 30.3, applies "to science that serves as the basis for informing a significant regulatory action or influential scientific information, as well as to dose-response data underlying pivotal science, regardless of the source of funding or identity of the party conducting the science."

Comment: Commenter (11890) states that the Science Advisory Board (SAB) identified reasonable approaches the EPA can take to improve transparency without violating privacy rights of study participants under federal and state law.³⁷⁹⁹ The commenter states that these included use of data sharing agreements, use of trusted third parties (*e.g.*, Federal Statistical Research Data Centers, Health Effects Institute (HEI)), and working in concert with the National Academies of Science and other federal partners to adopt evolving but achievable transparency

³⁷⁹⁹[https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebReportsLastMonthBOARD/41042C652229CA398525848500595458/\\$File/EPA-SAB-19-005.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebReportsLastMonthBOARD/41042C652229CA398525848500595458/$File/EPA-SAB-19-005.pdf).

standards in health research going forward. The commenter states that all these are preferable to the current proposal.³⁸⁰⁰

Response: The EPA notes that this final requires EPA to make underlying public data available, if EPA chooses to do so, in a fashion that is consistent with the law and retains required protections. The EPA has considered the SAB's September 30, 2019 comments and finalized the approach that gives greater consideration to pivotal science whose underlying dose-response data are publicly available or available through restricted access. Restricted or tiered access in this final rule means that the underlying dose-response data are available through a data sharing mechanism, such as through an agreement with the originating author or institution, access to a refined or redacted dataset that anonymizes the more sensitive portions of the analyzable dataset, a restricted access data repository or secure data enclave, or some other mechanism (e.g., Data Use Agreements) that allows a qualified subject matter expert access to enough data to support independent validation while still protecting sensitive information.

21.2.1.4 Consultation with the Scientific Community

21.2.1.4.1 Importance of Consultation

Comment: Commenters (10041, 11490, 12472) highlight the importance of consultation in the decision-making process, including the development of this rule. Specific comments include:

Commenter (10041) provides that in July 2018, they sent a comprehensive comment letter in response to the previous version of this proposed rule. In the letter the commenter stated, that the “best available evidence” should be considered when developing regulations specifically aimed at protecting human health. The commenter asserts that the current COVID-19 pandemic is showing us in real time the necessity of scientific expertise in decision-making.

Commenter (11490) asserts that in sum, open data is a positive trend in science and EPA is right in seeking to support and encourage this trend, but this proposed rule serves to undermine science-based policymaking processes rather than to elevate the worthy cause of increased transparency. The commenter notes that in this SNPRM, EPA solicited input on how to ensure that, over time, more of the data and models underlying the science that informs significant regulatory decisions and influential scientific information are available to the public for independent validation. The commenter contends this is accomplished by working together with stakeholders in the scientific community to build infrastructure for data sharing, not by ignoring all science—archival and forthcoming—that has not achieved these new and ambitious (and in many cases, unreachable) transparency aspirations.

Commenter (12472) states that when finalizing this proposed rulemaking, the EPA should consider comments by states, scientific advisors, and other experts so that access to data and models used by the EPA is ensured while preserving CBI, PII, and proprietary data.

³⁸⁰⁰ Principles and obstacles for sharing data from environmental health research: Workshop summary. Washington, DC: The national Academies Press. Retrieved from: <https://doi.org/10.17226/21703>.

Response: In development of this final rule, EPA considered the public comments on the 2018 NPRM, the 2020 SNPRM, and the advice of the SAB.

21.2.1.4.2 Utilization of the EPA's SAB

Comment: Commenters (11183, 11479, 11894, 11919, 12427, 12464, 12720, 12727, 13788) contend that the SAB was not properly consulted in the development of the proposed rulemaking. Specific concerns include:

Commenter (11183) states that given the importance of this rule, EPA should have also consulted with scientific experts via EPA's SAB, which issued a report earlier this year finding "key considerations that should inform the proposed rule have been omitted from the proposal or presented without analysis." The commenter notes that even though they have identified important flaws in the proposal the SAB has also not been consulted.

Commenter (11402) notes that with the original rule, this proposed supplemental rule was not reviewed by the EPA's own SAB before its release for public comment. The commenter states that a minimum, the Agency should consult with its own scientific experts regarding the proposed supplemental rule's potential short and long-term human and environmental health effects.

Commenter (11479) provides that SAB wrote a memo recommending that the SAB review the merits of the rule because "it deals with a myriad of scientific issues for which the Agency should seek expert advice from the Science Advisory Board." According to the commenter, some of the areas flagged by the memo include the lack of assessment of the impact of data restrictions on current or future rulemaking, the fact that EPA did not solicit input from the scientific community, and that the rule does not acknowledge the strides in transparency that have already been made by the epidemiologic science community.³⁸⁰¹ The commenter notes that after a near-unanimous vote concurring with the memo, the SAB wrote in a June 28, 2018 letter to former administrator Scott Pruitt that "[the] SAB urges the Agency to ... request, receive, and review scientific advice from the SAB before revising the proposed rule."³⁸⁰² The commenter states that instead of tasking the SAB with review of the full rule, Administrator Wheeler waited nearly a year and finally asked that the SAB look into a narrow slice of the rule, CBI and PII in April 2019.³⁸⁰³ The commenter contends, because the SAB was concerned with many other

³⁸⁰³ Wheeler, A. 2019. Letter Re: SAB Discussions about EPA Planned Actions in the Fall 2017 Unified Agenda, Spring 2017 Unified Agenda, "Strengthening Transparency in Regulatory Science" and its Supporting Science; and

aspects of the rule and what its implementation would mean for EPA's ability to use the best available science in decision-making, it also reviewed the full rule as a body.

Commenter (11894) states that 42 U.S.C. § 4365(b) requires EPA to submit this SNPRM to EPA's SAB for review at the time it is sent to OMB for inter-agency review. The commenter notes that EPA ignored this requirement twice over: for both the initial proposal and the SNPRM. The commenter asserts that the error is especially troubling given the Agency's pledge to provide the SAB with ample notice, an evidently hollow pledge made after the Agency signally failed to comply with these statutory requirements with respect to the initial proposal. The commenter provides that, deprived of proper notice, the SAB never met publicly regarding the supplemental proposal, and necessarily excluded the public from its undocumented deliberations. In spite of these limitations, the commenter recommends the Agency should take heed of the SAB's warning:

There appears to be consistency among analyses of how to address transparency that are orthogonal to the Proposed Rule. There is minimal justification provided in the Proposed Rule for why existing procedures and norms utilized across the U.S. scientific community, including the federal government, are inadequate, and how the Proposed Rule will improve transparency and the scientific integrity of the regulatory outcomes in an effective and efficient manner. It is plausible that in some situations, the Proposed Rule will decrease efficiency and reduce scientific integrity, determining if in fact that will be the case requires a thorough and thoughtful examination that is currently absent in the Proposed Rule. Moving forward with altered transparency requirements beyond those already in use, in the absence of such a robust analysis, risks serious and perverse outcomes.³⁸⁰⁴

Commenter (12427) queries why EPA has failed to involve EPA career scientific staff in the development of the proposed rule and its supplemental notice and why EPA has failed to meaningfully engage external experts via existing EPA scientific Federal advisory committees.³⁸⁰⁵

Commenter (12464) asserts that EPA's consultation with the SAB has also been inadequate, in violation of Environmental Research, Development and Demonstration Authorization Act (ERDDAA). The commenter notes that EPA is required to consult with the SAB on the Proposal,³⁸⁰⁶ a fact that EPA has now acknowledged. The commenter states that even though the SAB has now been able to offer a belated report on the Proposal—something it was not able to do before the initial notice in 2018—EPA's consultation with the SAB is nevertheless

Review of EPA's report titled Screening Methodologies to Support Risk and Technology Review (RTR): A Case Study Approach and Framework for Assessing Biogenic CO₂ Emissions from Stationary Sources (2014). ³⁸⁰⁶ 42 U.S.C. § 4365

inadequate. First, the commenter contends that EPA has not allowed adequate time for the SAB to review the SNPRM. According to the commenter, the SAB last met as a group to discuss the Proposal in a public teleconference on January 21, 2020, when it reviewed a draft report that commented on the initial version of the proposal from 2018. The commenter notes that the SNPRM was not issued until March 3, 2020, after this meeting. As such, the commenter provides that, although the SAB subsequently issued its final report on April 24, 2020, it had no opportunity to hold a meeting to discuss the supplemental proposal. The commenter states that therefore, it is not clear that the SAB was genuinely able to consult as a body on the contents of the supplemental proposal. In addition, the commenter notes that even the SAB Report itself indicates only that it addresses certain “aspects of the supplemental notice.”³⁸⁰⁷ In other words, the commenter provides that the SAB indirectly acknowledges that it was not able to provide input on all parts of the supplemental proposal. Additionally, the commenter contends that the multiple gaps and ambiguities in the Proposal, as described above, also made it impossible for the SAB to weigh in adequately. The commenter notes that the SAB itself indicated, “[g]iven the relatively skeletal nature of the Proposed Rule, it is not possible to define the implications of the rule with confidence.”³⁸⁰⁸

Commenter (12720) states that in a major deviation from standard process under ERDDAA, EPA did not seek consultation from the SAB on the full 2018 rule proposal or supplement. According to the commenter, the SNPRM does not address numerous critical issues identified by the SAB including:

- the purpose of the rule;
- the costs and resources required to implement the proposal;
- the recommendation that application should not be retroactive;
- the need for tailored approaches to different types of data;
- and the protection of CBI and PII.

The commenter (12720) asserts that EPA did not consult with the SAB prior to publication of the original rule in 2018 nor the current supplement, despite the SAB’s urging in June 2018 that EPA “request, receive, and review scientific advice from the SAB before revising the proposed rule.”³⁸⁰⁹ The commenter contends that this failure to consult is emblematic of a larger disregard for SAB input at EPA.³⁸¹⁰ The commenter also notes that to date, EPA has only asked the SAB for input on one issue related to this proposal-existing mechanisms for secure access to CBI and

³⁸⁰⁷ EPA SAB, EPA-SAB-20-005, Science Advisory Board (SAB) *Consideration of the Scientific and Technical Basis of EPA’s Proposed Rule Titled Strengthening Transparency in Regulatory Science* 3, at 1 (Apr. 4, 2020), [https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebProjectsCurrentBOARD/2DB3986BB8390B308525855800630FCB/\\$File/EPA-SAB-20-005.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebProjectsCurrentBOARD/2DB3986BB8390B308525855800630FCB/$File/EPA-SAB-20-005.pdf)

³⁸¹⁰ Rice, Mary B., Thomas A. Burke, Deborah L. Swackhamer, and Jonathan M. Samet. 2020. “Threats to Science Advising at the Environmental Protection Agency.” *Annals of the American Thoracic Society* 17 (3): 267–70. <https://doi.org/10.1513/AnnalsATS.201909-724PS>.

PII. The commenter provides that further, even on this narrow issue, EPA did not seek a consensus report but instead asked only for individual comments from members.³⁸¹¹ Additionally, the commenter contends that because of the significant scientific and technical issues raised in the rule, in June 2019 SAB identified the rule as a planned action that merited its review and elected to review the full proposed rule beyond EPA's narrow request on CBI and PII.³⁸¹²

Overall, the commenter (12720) contends that EPA's SAB consultation on the transparency proposal and supplement is notable in its departure from standard ERDDAA process in that:

- EPA did not request SAB review of the full original rule proposal or supplement; and
- EPA did not request a consensus SAB review.

Furthermore, the commenter (12720) states that in response to its request for consultation on existing mechanisms for secure access to CBI and PII, EPA received comments from 22 individual SAB members in Sept 2019. Of these, seven (30%) noted serious concerns with this process. The commenter asserts that these comments raise significant concerns about the consultation process for the original proposal, yet EPA made no changes in the process with this supplement. The commenter notes that EPA has not requested SAB review on the supplement. Furthermore, the commenter provides that the SAB's reports, received by EPA in September 2019³⁸¹³ and October 2019, identified critical issues which the supplemental proposal does not address.

Commenter (12727) notes that as with the original proposal,³⁸¹⁴ EPA failed to submit the SNPRM to the SAB. The commenter states that this failure is particularly troubling given that the SAB requested review of the original proposal,³⁸¹⁵ noting that "the precise design of the rule appears to have been developed without a public process for soliciting input from the scientific community."³⁸¹⁶ According to the commenter, the failure to timely consult with the SAB is contrary to statute. The commenter provides that EPA must submit its Proposal to the SAB

³⁸¹⁵ Memorandum from Alison Cullen, Chair of the SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science, to Members of the Chartered SAB and SAB Liaisons, at 2 (May 12, 2018) [https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/\\$File/WkGrp_memo_2080-AA14_final_05132018.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/E21FFAE956B548258525828C00808BB7/$File/WkGrp_memo_2080-AA14_final_05132018.pdf) ("This action merits further review by the SAB.").

³⁸¹⁶ *Id.* at 3.

pursuant to the requirements of the Environmental Research, Development, and Demonstration ERDDAA.³⁸¹⁷ Additionally, the commenter states that ERDDAA requires the Administrator to submit to the SAB any “proposed criteria document, standard, limitation, or regulation, together with relevant scientific and technical information in the possession of the [EPA] on which the proposed action is based” at the time it provides that proposal to another Agency of the government for formal review.³⁸¹⁸ The commenter contends that not only does EPA’s repeated disregard of ERDDAA requirements evince troubling contempt for congressionally mandated procedures; it is also consequential. The commenter notes that although the Final SAB Report mentions the SNPRM, it does so only fleetingly. Moreover, the commenter provides that there was no opportunity for actual SAB discussion of the Supplemental Notice, and there was consequently no public input into the SAB process, since there was no process—be it a public meeting or any other type of face-to-face deliberation of the SAB. According to the commenter, the SAB pre-proposal review requirement in fact exists to forestall proposals as deficient as the SNPRM. As such, the commenter asserts that EPA’s arbitrary failure to adhere to its legal obligation under ERDDAA renders the Supplemental Notice unlawful.

Commenter (13788) states that while the SAB conducted a review of the 2018 Proposal that includes some discussion of the SNPRM, the board did not receive the text in time to have a meeting to fully deliberate on the SNPRM. The commenter asserts that substantive deliberations for a review of the SNPRM would have required an open meeting under the Federal Advisory Committee Act.³⁸¹⁹ Also, the commenter notes that under ERDDAA, the Administrator “shall” make any regulation under the CAA available to the SAB when it is provided to any other Agency for formal review and comment.³⁸²⁰ The commenter contends that to the extent this proposal is meant to impact any CAA rule outcomes, EPA therefore was required to provide the SAB information when the SNPRM was sent to the OMB but it did not.

Response: The EPA has consulted with and reviewed the SAB advice three different times during the development of this final rule.

- In 2018, as part of its statutory duties, the SAB considered the science supporting the proposed action. The SAB met once and issued a final report on April 28, 2018.³⁸²¹
- In 2019, at the request of the Administrator and EPA's Office of Research and Development the SAP discussed existing mechanisms for secure access to PII and CBI as discussed in the proposed rule. The SAB met once and issued a final report on September 30, 2019³⁸²²
- In 2019/2020, as part of its statutory duties, the SAB reviewed the science supporting the proposed rule. The SAB met four times and issued a final report on April 24, 2020.³⁸²³

Comment: Commenter (12465) notes the recently completed “SAB Consideration of the Scientific and Technical Basis of EPA’s Proposed Rule Titled Strengthening Transparency in Regulatory Science” and that the recommendations therein should be addressed before proceeding with the rule making.

Response: In development of this final rule, EPA considered the public comments on the 2018 NPRM, the 2020 SNPRM, and the advice of the SAB. Numerous scientific organizations, health organizations, and other interested stakeholders provided comment on the NPRM and SNPRM during the public comment periods.

The EPA received comments from the SAB on the 2018 NPRM and 2020 SNPRM on April 24, 2020. The EPA considered these comments in development of the final rule. In brief, the SAB consensus was that it supported the precept of enhancing public access to scientific data and analytical methods to ensure scientific integrity, consistency, and robust analysis and their consensus recommendations were that the EPA develop additional policy and/or guidance documents; further describe how pivotal science would be selected, made available, and peer reviewed; consider establishing an office on data sharing with the support of a peer review panel; provide greater clarity in the definitions of key terms, including data, independent validation, and publicly available; develop specific criteria for the Administrator’s exemptions under the rule; consider applying rule requirements only to information developed after the effective date of the rule; seeking input from experts to identify best practices to ensure efficiency, utility, and protection of data that are made available; and consider funding reanalysis work.

As noted in the preamble for the final rule, this rule sets the overarching structure and principles for transparency of pivotal science in significant regulatory actions and influential scientific information and technical considerations, including those noted by the SAB, could be addressed in subsequent implementation guidelines and/or statute-specific rulemakings. Further, in response to comments from SAB and the public, the EPA clarified and modified several key definitions, including data, independent validation, and publicly available, in the final rule. The EPA also provided criteria for the Administrator’s exemption in 40 CFR 30.7 of the final rule. The EPA would like to clarify that this rule does not direct or require any outside entity or the EPA to establish data sharing mechanisms and does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. Comments related to making data available and future funding opportunities are not within the scope of this rulemaking. Finally, the EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. However, in consideration of instances where data cannot be made available, the EPA amended the rule to provide technical considerations (40 CFR 30.5(d)) that can provide some level of certainty or confirmation of a study’s conclusions, importance, and applicability in the absence of maximum transparency and included an exemption criterion—that the development of the dose-response data was completed or updated before the effective date of the rule—to 40 CFR 30.7 to account for the concerns raised by the SAB and other public commenters.

Comment: Commenter (12720) states that the SAB recommends that EPA consult with library science and data management experts, as well as consider establishing a data sharing office to

assist with rule implementation. The supplemental proposal makes no mention of cost or resource issues, leaving the SAB's concerns of unreasonable burdens on researchers, and subsequent exclusion of their data, unaddressed. The commenter contends that EPA did not consult with data management or library science experts, and in fact to date has not engaged with the research, scientific or medical community for input on the rule or supplement.

Furthermore, the commenter (12720) provides that the SAB letter notes that “[a]ssumptions are often made about (a) error distributions for exposure estimates (most commonly, that they can be ignored); (b) model specification errors and uncertainties; and (c) causal interpretations of modeling results. These assumptions should be explicitly stated, and results of tests presented. The commenter states that epidemiologists (*e.g.*, Sander Greenland), statisticians, and risk analysts have written at length over several decades about how to test, validate, and document assumptions and methods for dose-response modeling and uncertainty and variability characterization, and these modern methods should be applied to make the factual and assumption-based foundations of pivotal studies as clear as possible. However, the SAB finds that there are scientific and technical challenges to be overcome and provides suggestions to implement this requirement.”³⁸²⁴ The commenter contends that again, the SAB confines its comment to environmental epidemiology studies, despite the significant expansion of scope within the Supplemental Proposal.³⁸²⁵ According to the commenter, no consideration for other types of “data and models” outside of that field is made in the letter, reflective of EPA’s Supplemental Proposal that does not substantively engage with the scope and complexity of scientific information that would be ensnared by the SNPRM. The commenter provides that the “scientific and technical challenges” that are highlighted here are fundamental to the Supplemental Proposal’s impracticability and arbitrary nature, especially in light of the fact that EPA has not offered any convincing rationale for the Supplemental Proposal nor the original Proposal.³⁸²⁶ The commenter asserts that as the SAB notes, the specific assumptions and methods utilized in high quality studies are already included in published, peer-reviewed studies. The commenter contends that EPA has not given any rationale for this requirement in the proposal, nor has it identified any systematic deficiency in the peer-reviewed literature that prevents a reasonable ascertainment of study assumptions and methods.

Response: In development of this final rule, EPA considered the public comments on the 2018 NPRM, the 2020 SNPRM, and the advice of the SAB. Numerous scientific organizations, health organizations, and other interested stakeholders provided comment on the NPRM and SNPRM during the public comment periods.

The EPA received comments from the SAB on the 2018 NPRM and 2020 SNPRM on April 24, 2020. The EPA considered these comments in development of the final rule. In brief, the SAB consensus was that it supported the precept of enhancing public access to scientific data and analytical methods to ensure scientific integrity, consistency, and robust analysis and their consensus recommendations were that the EPA develop additional policy and/or guidance

³⁸²⁴ EPA Science Advisory Board letter to Administrator Wheeler. EPA-SAB-20-005. 2020. “Science Advisory Board (SAB) Consideration of the Scientific and Technical Basis of EPA’s Proposed Rule Titled Strengthening Transparency in Regulatory Science,” April 24, 2020.

³⁸²⁵ See EPA-HQ-OA-2018-0259-12720 at section IV

³⁸²⁶ *Id.* at Section VI.

documents; further describe how pivotal science would be selected, made available, and peer reviewed; consider establishing an office on data sharing with the support of a peer review panel; provide greater clarity in the definitions of key terms, including data, independent validation, and publicly available; develop specific criteria for the Administrator's exemptions under the rule; consider applying rule requirements only to information developed after the effective date of the rule; seeking input from experts to identify best practices to ensure efficiency, utility, and protection of data that are made available; and consider funding reanalysis work.

As noted in the preamble for the final rule, this rule sets the overarching structure and principles for transparency of pivotal science in significant regulatory actions and influential scientific information and technical considerations, including those noted by the SAB, could be addressed in subsequent implementation guidelines and/or statute-specific rulemakings. Further, in response to comments from SAB and the public, the EPA clarified and modified several key definitions, including data, independent validation, and publicly available, in the final rule. The EPA also provided criteria for the Administrator's exemption in 40 CFR 30.7 of the final rule. The EPA would like to clarify that this rule does not direct or require any outside entity or the EPA to establish data sharing mechanisms and does not require the EPA to collect, store, or publicly disseminate dose-response data underlying pivotal science. Comments related to making data available and future funding opportunities are not within the scope of this rulemaking. Finally, the EPA is maintaining that the rule provisions apply equally to all dose-response data underlying studies used as pivotal science, regardless of when the study or the data was created. Scientific transparency is important regardless of the age of the study or the dose-response data. However, in consideration of instances where data cannot be made available, the EPA amended the rule to provide technical considerations (40 CFR 30.5(d)) that can provide some level of certainty or confirmation of a study's conclusions, importance, and applicability in the absence of maximum transparency and included an exemption criterion—that the development of the dose-response data was completed or updated before the effective date of the rule—to 40 CFR 30.7 to account for the concerns raised by the SAB and other public commenters.

This final rule does not require the EPA to disclose or host data, but to determine if dose-response data are available and to give greater consideration to those studies for which such data are available. Hence, this rule does not impose costs on the EPA or any other party to make data available, including costs to ensure that PII and CBI are not disclosed. The Agency may opt, at its discretion, to incur the costs associated with making data available when it is in the public interest to do so, but that will be decided on a case-by-case basis and is not a requirement of the final rule.

As Jamieson et al. (2019) state, "Journals play a key role in ascertaining the quality of the evidence in work submitted for publication through peer review. However, that practice is neither uniform nor free of exploitation. While it can select for trustable results, its existence alone is not sufficient to verify the quality of the evidence used to back claims."³⁸²⁷ Because of the potential impact of significant regulatory actions, independent validation of studies that are

³⁸²⁷ Jamieson, K. H., McNutt, M., Kiermer, V., and Sever, R. (2019). Signaling the trustworthiness of science. *Proceedings of the National Academy of Sciences in the United States of America* 116(39):19231-19236. <https://doi.org/10.1073/pnas.1913039116>.

pivotal to the EPA's significant regulatory actions and influential scientific information may increase public confidence in the findings and conclusions presented in those studies. As Jamieson et al. (2019) states, publication alone (including the typical peer review necessary for publication) is insufficient to verify a study's quality, and additional confidence could be gained from third-party reanalyses that independently validate the study results³⁸²⁸.

Comment: Commenter (11919) refers to an April 24 letter to the Administrator in which the SAB noted its "concerns about the scientific and technical challenges of implementing some requirements of the Proposed Rule." The commenter states that the Board listed several factors that it says the EPA needs to resolve in the proposed rule to protect privacy, including addressing the legal, ethical, professional, and financial reasons for research confidentiality. The commenter encourages the EPA to address the Board's input before finalizing this rule given that the Board is charged with providing advice and recommendations on "the adequacy and scientific basis of any proposed criteria document, standard, limitation, or regulation."

Response: In development of this final rule, EPA considered the public comments on the 2018 NPRM, the 2020 SNPRM, and the advice of the SAB. Numerous scientific organizations, health organizations, and other interested stakeholders provided comment on the NPRM and SNPRM during the public comment periods.

21.2.1.4.3 Consultation with Major Research Organizations/Scientists

Comment: Commenters (10974, 11183, 11479, 11890, 12465, 12645) contend that EPA has inadequately consulting with various major research organizations and scientific societies, including the NIH, American Association for the Advancement of Science), the National Academies of Sciences, Engineering, and Medicine (NASEM), and several premier scientific journals. Specific concerns include:

Commenter (10974) contends that the supplemental proposal does not integrate, nor does it provide solutions for or improvements to, the current work on data reproducibility within the scientific community. The commenter provides that, similar to how the supplemental proposal does not address an extant need for rulemaking regarding data transparency, the supplemental proposal (and 2018 proposal) do not support nor adequately address the existing efforts by all types of institutions to improve data transparency and availability issues.

Commenter (12645) suggests that, before potentially excluding from consideration a large percent of relevant scientific literature, the EPA could have surveyed these non-US scientists to find out whether they would have cooperated with their new rule or its extension in the SNPRM. The commenter states that they could have done a far more intensive analysis of the sources of the studies that they cite in existing regulations, or have responded to my and others previously expressed concerns. For example, the commenter notes that the International Society of

³⁸²⁸ Ibid

Environmental Epidemiology³⁸²⁹ has made this point very strongly. EPA’s failure to do any such analysis, or to submit consideration of this new rule to the NAS or even their own SAB, is a dereliction of their duty to the American public and to Congressional mandates for basing environmental regulations on the best available science.

Commenter (11183) states that EPA has still not consulted with critical stakeholders, including scientists, health professionals and communities. In the 2 years since the 2018 Proposal, the commenter states that EPA still has not consulted with the premier federal Agency for health research – the NIH – “the nation’s medical research agency” “the largest source of funding for medical research in the world”, the American Association for the Advancement of Science (AAAS), the world's largest multidisciplinary scientific society and the largest scientific organization in the US, and also a leading publisher of cutting-edge research through its Science family of journals, or the National Academies of Science or Medicine (NAS or NASM), “private, nonprofit institutions that work outside of government to provide objective independent, evidence-based scientific advice on matters of science, technology, and health”. In particular, the commenter contends that EPA should have consulted with the NIH as this rule has implications for the research that is funded by NIH, numerous studies considered by EPA in all of their regulations that are funded by NIH and NIH has stringent rules about participant confidentiality.

Commenter (11479) contends that it is clear from the number of questions posed by the Agency in its 2018 Proposal and SNPRM about how the rule might be implemented, and from the outcry and alarm from the scientific community, that the Agency did not consult with scientists or respected national scientist organizations as it crafted the rule.³⁸³⁰ The commenter also asserts that EPA incorrectly claims that the rule follows accepted practices on open science that major science journals and the NAS have adopted. The commenter notes that the editors-in-chief of Science, Nature, PLoS, Proceedings of the National Academy of Sciences (PNAS), Cell, and The Lancet issued a statement in 2018 and again in 2019 that this policy would exclude important studies from consideration in the rulemaking process, thus adversely impacting the decision-making process. Furthermore, the commenter contends that among those not consulted in the crafting of this rule was NASEM, which has held several committee meetings and carried out a series of reports detailing how scientific literature can be evaluated transparently without the full disclosure of underlying datasets.³⁸³¹ The commenter notes that in a comment on the rule,

³⁸²⁹ Comments of the International Society for Environmental Epidemiology on EPA’s proposed rule on Strengthening Transparency in Regulatory Science (EPA-HQ-OA-2018-0259-0001) May 2019. https://www.iseepi.org/Public/About_Us/Advocacy/Public/About_Us/Advocacy.aspx?hkey=ba9675be-a51b-4b9d-bc7c-2683e1af3c9b.

³⁸³⁰ Letter to the Honorable Scott Pruitt. 2018. Re: Don’t Restrict EPA’s Ability to Rely on Science. Online at <https://s3.amazonaws.com/ucs-documents/science-and-democracy/secret-science-letter-4-23-2018.pdf>

³⁸³¹ National Academies of Science, Engineering, and Medicine. 2017. Application of Systematic Review Methods in an Overall Strategy for Evaluating Low-Dose Toxicity from Endocrine Active Chemicals. Washington, DC: The National Academies Press. DOI: 10.17226/24758; National Academies of Science, Engineering, and Medicine. 2014. Review of EPA’s Integrated Risk Information System (IRIS) Process. Washington, DC: The National Academies Press. DOI: 10.17226/18764.; Institute of Medicine. 2011. Finding What Works in Health Care: Standards for Systematic Reviews. Washington, DC: The National Academies Press. DOI: 10.17226/13059; National Research Council. 2009. Science and Decisions: Advancing Risk Assessment. Washington, DC: The

NASEM urged EPA to seek objective and expert guidance on the rule and its implementation and offered itself as an independent review body.³⁸³² The commenter provides that the Bipartisan Policy Center (BPC) was also cited in EPA's proposed rulemaking and had to clarify in a comment to the Agency that "the proposed rule is not consistent" with its report on the use of science in policymaking that EPA cited in "substance or intent." The commenter states that while BPC supports enhanced transparency, "the report never suggested excluding studies from consideration in developing regulation if data from those studies were not publicly available."³⁸³³

Commenter (11890) contends that EPA should first consult with NAS and other independent scientists and science organizations in a meaningful manner before deciding whether any changes to EPA's current use of scientific evidence is needed. Additionally, the commenter notes that this would include a full evaluation by the EPA SAB once a complete proposal has been developed.

Commenter (12546) contends that throughout this process, EPA has not consulted with critical stakeholders, including scientists, health professional and communities. The commenter has grave concerns with the fact that since the 2018 proposal, EPA still has not consulted with the stakeholders or organizations facing serious, long-term implications from this rule: scientists; medical researchers and health professionals; universities; hospitals; peer-reviewed journals/publishers; and communities who participate in research studies. Further, the commenter notes that there are numerous studies considered by EPA that are funded by NIH, which has stringent rules around participant confidentiality. Therefore, the commenter asserts that EPA should have consulted with the NIH. Additionally, the commenter states that given the importance of this rule, EPA should have also consulted with scientific experts via the NASEM. The commenter states that if EPA has consulted with these critical stakeholders, it should publicly release a report akin to an Interagency Scientific Assessment regarding how it addressed any comments or concerns around the impacts of this rule.

Commenter (12645) notes that EPA's heavy reliance on the NAS is ironic in that the current EPA leadership has steadfastly refused to consult the Academies on any of the issues related to its attempts to change the scientific processes at EPA. The commenter contends that similarly, in violation of congressional mandates, it has not involved its external scientific committees in considering the rationale for any of its major proposed changes in EPA's scientific processes.

Response: In development of this final rule, EPA considered the public comments on the 2018 NPRM, the 2020 SNPRM, and the advice of the SAB. Numerous scientific organizations, health

organizations, and other interested stakeholders provided comment on the NPRM and SNPRM during the public comment periods.

21.2.1.4.4 EPA Should Seek Comment from Various Advisory Panels

Comment: Commenter (12464) contends that the SNPRM is inconsistent with the requirements of Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). The commenter notes that the SNPRM continues to rely on the rulemaking provision of FIFRA as a source of authority for the Proposal.³⁸³⁴ The commenter provides that this provision mandates that EPA seek comments from the Secretary of Agriculture and the FIFRA Scientific Advisory Panel on draft regulations,³⁸³⁵ yet there is no evidence in the rulemaking docket that EPA has sought such input.

Response: In this action, the EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information for independent validation. The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers (including FIFRA). If implementing this procedural rule would result in conflicts with existing environmental statutes, the procedural rule will yield to the existing statutes. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. Some of these subsequent actions will be substantive rules issued under the associated environmental statutes and will be subject to any applicable procedural and analytical requirements in those statutes and judicial review.

Comment: Commenter (12727) states that it was arbitrary under the CAA not to consult with the Clean Air Scientific Advisory Committee (CASAC). The commenter notes that CASAC is charged with reviewing NAAQS and recommending any new standards.³⁸³⁶ The commenter provides that in turn, the NAAQS are to be based on criteria that “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare.”³⁸³⁷ To this end, the commenter asserts that CASAC’s task of reviewing the NAAQS would be complicated and perhaps rendered impossible by the SNPRM. According to the commenter, CASAC could be required to recommend a change to the NAAQS based on their evaluation of valid research that EPA now seems to find objectionable,³⁸³⁸ which suggests that this enterprise is not what Congress intended. Further, the commenter notes that because the SNPRM would apply to influential scientific information, such as integrated science assessments prepared by Agency staff,³⁸³⁹ EPA might itself deprive CASAC of the information it needs to fulfill its statutory duty. The commenter contends that EPA should have considered these complexities in its rulemaking and consulted with CASAC on its implications for CASAC’s

³⁸³⁴ 85 Fed. Reg. at 15,397

duties. For these reasons as well, the commenter states that finalizing the proposed rule would be arbitrary and unlawful under the CAA.

Response: In this action, the EPA is finalizing a rule of internal agency procedures, including how the Agency will consider the availability of dose-response data underlying pivotal science used in its significant regulatory actions and influential scientific information for independent validation. The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers (including the CAA). If implementing this procedural rule would result in conflicts with existing environmental statutes, the procedural rule will yield to the existing statutes. The EPA will undertake such efforts in forthcoming actions, which will be either statute-specific science transparency regulations or programmatic regulations implementing this procedural rule. Some of these subsequent actions will be substantive rules issued under the associated environmental statutes and will be subject to any applicable procedural and analytical requirements in those statutes and judicial review.

Comment: Commenter (10974) states that EPA's revisions do not clarify how this proposed rule enhances the public's ability to understand or meaningfully participate in the regulatory process. The commenter suggests that although EPA purports that the 2018 NPRM and the SNPRM would benefit "the public", EPA is actually demonstrating that "the public" is not the intended audience for this rulemaking, further confusing the issue. The commenter states that although the new definition of the term "independent validation" at 40 CFR § 30.2 and the context provided in the supplemental proposal purports to uphold the validation of data and models by "subject matter experts", the supplemental proposal contains references to "the public" as the primary entity that would be interested in independently validating research. The commenter states that it is unclear who represents "the public" in these statements. In fact, by defining "subject matter experts", EPA seems to be backtracking on the idea that increased transparency of underlying data and models will have any impact at all on the ability of "the public" to either understand or meaningfully participate in EPA's regulatory process. The commenter notes that the proposed definition at 40 CFR 30.2 in the supplemental proposal limits the reanalysis to individuals with expertise (industry, academia, or government organizations) – not "the public" as a whole. The commenter states that this clarification makes sense in the context of EPA's attempts to regulate its judgement of scientific information, but it contradicts EPA's broader argument that this proposed rule would benefit "the public's" understanding of science and EPA's deliberative and rulemaking processes.

Commenter (10974) states that proposing rulemaking to allow "subject matter experts" to reanalyze a specific study or data set – based solely on the premise that those "experts" disagree with the results of a given study – is redundant of the scientific peer review process. The commenter notes that published studies are often reviewed by public agencies and the data revisited to understand statistical power, relevance to the policy decision, and data quality. The commenter notes that, even in these instances, the underlying data are not made public, but are instead provided at the discretion (and legal authority) of the institution that owns the data. The commenter notes that individual researchers do not typically own the data they collect, nor the

results of their research. The commenter states that institutions that conduct research and subsequently own data sets and models (e.g. federal, state, local, and tribal governments, universities, or private industry) are frequently bound by their own rules and guidelines for conducting that research. The commenter suggests that it is governmental overstep that EPA holds the authority to influence how these entities collect and share their data. The commenter asserts that it is unfathomable that EPA overturn privacy agreements and protections between study participants, as originators of a given data set, studies, or models. The commenter finds that the proposed changes to 40 CFR 30.2 are not effective at addressing their concerns, and are, in fact, contradictory to the communicated motivation of this rule to help the public understand, and participate in, the rulemaking process.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

Implementation of this rule will more effectively share pivotal science for external consideration and increase the opportunity for independent validation of pivotal science by subject matter experts. As data are better understood through independent reanalysis, the public will, if they so choose, be able to more effectively comment, engage, and hold the EPA accountable during the development of future significant regulatory actions and influential scientific information.

The EPA expects to identify pivotal science, and the consideration afforded to pivotal science, in proposed significant regulatory actions and external review drafts of influential scientific information, which will allow the subject matter experts, if they so choose, to independently validate the pivotal science and provide comment to the EPA. The EPA believes that this approach will allow the public to more effectively comment, engage, and hold the EPA accountable during the future development of specific significant regulatory actions and influential scientific information.

Given their expertise, the use of subject matter experts is key to effectively determine if the results of a study can be produced when the study data are reanalyzed. Because this rule is about scientific data, the EPA finds it unlikely that without the necessary expertise, one could reasonably reanalyze the dose-response data underlying pivotal science. This final rule does not preclude the public from engaging subject matter experts to determine whether a study can be independently validated. Also, the definition cannot be considered solely in isolation. The regulatory text in which the term is used informs the extent of the availability of dose-response data underlying studies. Specifically, 40 CFR 30.5 requires, in part, that the dose-response data underlying studies that the EPA will consider as pivotal science be available in a manner sufficient for independent validation. Scientific information is considered available in a manner

sufficient for independent validation when it includes the information necessary to understand, assess, and reanalyze findings. The efficacy of the reanalysis will depend on the expertise of the person conducting the reanalysis.

Comment: Commenter (12720) contends that retroactive application of new data release requirements would newly allow industry lobbyists to petition the Agency for rulemakings under EPA's IQGs³⁸⁴⁰ to review or refine rules on grounds that some subset of studies do not meet the supplemental proposal's public data release requirements.

Commenter (11190) asserts the rule would open the door for special interests (polluters) to legally challenge regulations protecting the public from dangerous pollutants.

Response: The rulemaking applies prospectively to significant regulatory actions and influential scientific information. The rulemaking has no retrospective effect on either significant regulatory actions or influential scientific information. For future final significant regulatory actions and influential scientific information, it applies equally to all the data and models underlying studies used as pivotal science. Scientific transparency is important regardless of the age of the study or the dose-response data.

21.2.1.5 Request for Extension of Comment Period/Public Hearing

Comment: Several commenters (including, but not limited to, 9336, 9337, 9338, 9339, 9359, 9455, 9493, 10041, 10048, 10742, 10752, 10861, 10969, 10972, 11184, 11186, 11402, 11576, 12715, 12727) requested an extension of the comment period for the supplemental proposal, asserting that the 30-day comment period as inadequate given the complexity of the supplemental proposal and the ongoing COVID-19 pandemic. Most requests wanted a minimum of an additional 30 to 90 days to comment beyond the initial 30-day comment period. Support provided for extension requests included:

- Executive Order 12866, which provides regulatory planning and review guidance for federal agencies, states that the public's opportunity to comment on any proposed regulation, "in most cases should include a comment period of not less than 60 days." (9338, 9359, 9493, 10048, 11184, 11186)
- The Administrative Procedure Act (APA) "requires that the public have a meaningful opportunity to submit data and written analysis regarding a proposed rulemaking."³⁸⁴¹ The purposes of the APA's notice and comment requirements are "(1) to ensure that agency regulations are tested via exposure to diverse public comment, (2) to ensure fairness to affected parties, and (3) to give affected parties an opportunity to develop

³⁸⁴⁰ U.S. Environmental Protection Agency. 2017. "EPA Information Quality Guidelines." Collections and Lists. US EPA. December 12, 2017. <https://www.epa.gov/quality/epa-information-quality-guidelines>.

³⁸⁴¹ *Prometheus Radio Project v. FCC*, 652 F.3d 431, 453 (3d Cir. 2011) (citing 5 U.S.C. § 553(c)); see also *Rural Cellular Ass'n v. FCC*, 588 F.3d 1095, 1101 (D.C. Cir. 2009) ("The opportunity for comment must be a meaningful opportunity.").

evidence in the record to support their objections to the rule and thereby enhance the quality of judicial review.”³⁸⁴² (11576, 12727)

- The APA requires agencies to “give interested persons an opportunity to participate in the rule making” through the submission of written comments or oral presentation. 5 U.S.C. § 553(c). The importance of this public comment process—the purposes of which include ensuring informed Agency decision-making, encouraging public participation in the administrative process, and ensuring that agencies keep an open mind towards their rules—“cannot be overstated.” *N.C. Growers’ Ass’n v. United Farm Workers*, 702 F.3d 755, 763 (4th Cir. 2012). In order to achieve these purposes, “the opportunity to comment ‘must be a meaningful opportunity.’” *Id.* (quoting *Prometheus Radio Project v. FCC*, 652 F.3d 431, 450 (3d Cir. 2011)). (12715)
- The CAA requires that the public be permitted to meaningfully comment on EPA’s proposed rulemakings.³⁸⁴³ (12727)
- There are numerous reasons beyond the COVID-19 emergency for granting an extension: the uncertain meaning or implications of new provisions in the supplemental notice, how the new and older provisions will interact, and the unprecedented proposed reliance on the federal Housekeeping statute (5 U.S.C. § 301) as legal authority for limiting the use of science in rulemaking (and in an unspecified range of other circumstances) under eight EPA statutes. (9359)
- Under these circumstances [COVID-19 pandemic], a thirty-day comment period would not fulfill the requirements of the Administrative Procedure Act—which requires agencies to “give interested persons an opportunity to participate in ... [a] rule making through [the] submission” of comments—insofar as the national emergency and its consequences would prevent critically impacted constituencies, such as scientists and health professionals, from participating and being heard.³⁸⁴⁴ (9493)
- It is absurd to set a comment deadline while citizens are subject to local, state and federal states of emergency and/or safer at home orders that have been adopted during the COVID-19 crisis. See, e.g., President Trump Declares State of Emergency for COVID-19 (discussing the March 13, 2020 emergency declaration). At a bare minimum, the public comment period for the SNPRM should not begin until after the COVID-19 crisis has ended. (10752)

Commenter (10752) requested more than a 30- or 90-day extension to the initial 30-day comment period. The commenter states that since the EPA improperly claims that separate

³⁸⁴² *Int’l Union, United Mine Workers of Am. v. Mine Safety & Health Admin.*, 407 F.3d 1250, 1259 (D.C. Cir. 2005); *United States v. ³⁸⁴⁴ 5 U.S.C. § 553(c).

comments on the SNPRM are necessary, it is necessary for EPA to reopen comments on the SNPRM for a minimum of 360 days. A 360-day review period, according to the commenter, would give the public a chance to review the hundreds of thousands of public comments and how they apply to and/or are affected by the SNPRM.

Commenter (9336) requested that EPA suspend the public comment period while President Trump's national emergency declaration remains in effect and provide at least 90 days for comment once the national emergency is lifted. It is essential that EPA afford the public adequate time to thoughtfully consider the effects of this supplemental proposal and an opportunity to be publicly heard on key issues.

Response: The comment period on the 2020 SNPRM was extended thirty days to May 18, 2020, through EPA-HQ-OA-2018-0259-10743. In total, the comment period on the SNPRM, including prepublication availability, lasted 76 days.

Comment: Several commenters (including, but not limited to, 9336, 9338, 9359, 10084, 12727) also requested that EPA conduct a public hearing or several hearings to provide opportunity for the public to provide oral testimony on the supplemental proposal. Support provided for the need for a public hearing included:

- The scope of the rule has been expanded from the original rule, and the SNPRM would impact rulemaking under several of the EPA's major environmental acts. (10084)
- The SNPRM cites the CAA as a source of authority for this proposal. We note that the SNPRM would pertain to several of the rulemakings listed in CAA section 307(d)(1). CAA section 307(d)(5) provides that "In promulgating a rule to which this subsection applies...the Administrator shall give interested persons an opportunity for the oral presentation of data, views, or arguments, in addition to an opportunity to make written submissions." (10084)
- Section 307(d) of the CAA requires EPA to hold a public hearing on this Supplemental Notice, and to hold the record open for at least 30 days after the hearing.³⁸⁴⁵ Because the Supplemental Notice—like the original proposal—would "pertain[] to" many EPA rulemakings enumerated in section 307(d)(1), this proposal is clearly subject to the procedural requirements of section 307(d).³⁸⁴⁶ That EPA relied on the CAA as a source of authority for the original proposal, and indicates in the Supplemental Notice that it is still considering that possibility, only reinforces EPA's obligation to comply with the public hearing requirements of section 307(d).³⁸⁴⁷ EPA's failure to do so thus far is unlawful, and wrongly denies the public an important and legally-required opportunity to weigh in on this sweeping and harmful proposal. (12727)
- EPA must hold public hearings on the supplemental proposal. At this time, virtual hearings are appropriate. These virtual hearings should include both the option for video conferencing and call in. This technology is readily available to ensure the public has the same opportunity as in an in-person hearing to testify face-to-face with EPA's experts and "see" the other witnesses offering testimony. Even as we ask for virtual hearings for

³⁸⁴⁵ 42 U.S.C. § 7607(d)(5).

³⁸⁴⁶ See, e.g., id. § 7607(d)(1)(E), (R).

³⁸⁴⁷ See 85 Fed. Reg. at 15,397.

this proposal, however, virtual hearings are not a replacement for in-person hearings and should not become the norm for EPA rulemakings. (9338)

- Requested that EPA provide three public hearings once the national emergency is lifted. It is essential that EPA afford the public adequate time to thoughtfully consider the effects of this supplemental proposal and an opportunity to be publicly heard on key issues. (9336)
- The SNPRM also cites the Clean Water Act (CWA), the Resource Conservation and Recovery Act (RCRA), and the SDWA as sources of authority. 40 CFR Part 25 sets forth requirements for public participation under CWA, RCRA, and SWDA, the scope of which includes EPA rulemaking, such as the SNPRM. 40 CFR 25.3(c) includes the following objectives of EPA:

(1) To assure that the public has the opportunity to understand official programs and proposed actions, and that the government fully considers the public's concerns;

(2) To assure that the government does not make any significant decision on any activity covered by this part without consulting interested and affected segments of the public;

(3) To assure that government action is as responsive as possible to public concerns;

(4) To encourage public involvement in implementing environmental laws;

(5) To keep the public informed about significant issues and proposed project or program changes as they arise;

(6) To foster a spirit of openness and mutual trust among EPA, States, substate agencies and the public; and

(7) To use all feasible means to create opportunities for public participation, and to stimulate and support participation. (10084)

Response: A public hearing was not hosted for the 2020 SNPRM, but a public hearing was hosted to gather public comment on the 2018 NRPM. Besides this public hearing, interested stakeholders had a total of 185 days to comment on both the April 2018 NPRM and the 2020 SNPRM. The EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural final rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers.

Comment: Commenters (including, but not limited to, 11354, 11393, 11407, 11479, 11496, 11894, 12412, 12423, 12427, 12435, 12442, 12464, 12465, 12474, 12701, 12715, 12720, 13549, 14397) believe that the public comment period for the supplemental rulemaking, as extended to 60 days from 30 days, is still inadequate to provide opportunity for the public to meaningfully comment on the supplemental proposal. Several of the commenters cite the complexity and magnitude of changes set out in the supplemental proposal in the midst of the COVID-19 pandemic as reasoning for the need for additional time. Examples of reasons for the need for additional time to comment include:

- Many of the public health and medical experts whose research is most affected by the proposal and who are best positioned to comment on it are on the front lines of the

response to the COVID-19 pandemic. The commenter states that given their expertise in public health, the signatories (medical experts) are uniquely positioned to guide government offices and advise the public on how to respond to this unprecedented pandemic and implies that their full attention should be on responding to the pandemic. Public health experts whose input is essential to the evaluation of this proposal are the same experts responding to the public health emergency. (11479, 12456)

- Even if now were an appropriate time to hold a comment period, Executive Order 12866 suggests that a 60-day comment period is the minimum necessary to afford the public a meaningful opportunity to comment during normal times. This is especially true for a rule that would significantly impact nearly every aspect of EPA’s scientific and regulatory work. The supplemental notice is substantially different from the 2018 draft rule. For example, by expanding the rule’s applicability from only dose-response research to all research, and from only “pivotal regulatory science” to all “influential science,” the supplemental notice dramatically widens the scope of the rule and the research affected by it. Further, the draft rule was vaguely written, limiting the ability of commenters to assess and articulate impacts of such a policy change. (11479)
- More time is needed because the administrative record for this rulemaking fails to address impacts of the proposed rule as modified by the supplemental notice, including the types and number of studies that would be affected, the costs that the proposed rule would impose on the Agency and individual researchers, and how the rule would impact the Agency’s mission to protect public health and safety. Despite this dearth of analysis, the Administration has deemed this proposal not economically significant. Thus, additional time and more avenues for public comment, including public hearings, are crucial to provide the public and experts with the opportunity to assess the rule’s impacts, since the Agency has failed to do so. (11479)
- The SNPRM would significantly impact every facet of EPA’s work. EPA is required to provide the public with notice of a proposed rule, followed by a meaningful opportunity to comment on the rule’s content. 5 U.S.C. § 553 (b)-(c). Executive Order 12,866 directs EPA to “afford the public a meaningful opportunity to comment on any proposed regulation, which in most cases should include a comment period of not less than 60 days.”³⁸⁴⁸ The opportunity to comment must be meaningful under the APA, which “means enough time with enough information to comment.” *Prometheus Radio Project v. FCC*, 652 F.3d 431, 450 (3d Cir. 2011) (citing *Rural Cellular Ass’n v. FCC*, 588 F.3d 1095, 1101 (D.C. Cir. 2009)). (11393, 11407, 12412, 12474, 12715, 13549)
- At a normal time, 60 days would be insufficient for the public to meaningfully review and comment on the SNRPRM with such wide-ranging proposed changes and impacts. However, this is not a normal time: The national emergency due to the COVID-19 pandemic necessitates additional time for the commenter to review and evaluate the potential impacts of the SNPRM. (11393)

³⁸⁴⁸ Executive Order 12,866, 58 Fed. Reg. 51735 (Sep. 30, 1993).

Response: The comment period on the SNPRM was extended 30 days to a total of 60 days. The Agency believes the current 60 day period was sufficient time to submit comments. This fact is confirmed by the many comments already received by the Agency. Interested stakeholders had a total of 185 days to comment on both the April 2018 NPRM and the 2020 SNPRM.

Comment: Commenter (12720) states that the EPA summarily denied stakeholders' requests for a virtual public hearing, despite the immense public interest the supplemental proposal has garnered. To-date, the commenter notes that thousands of public comments have already been submitted regarding the supplemental proposal in the short 60-day comment period the Agency has allowed. The commenter notes that their members will submit over 114,000 comments expressing deep concern about the Proposal, and its harmful effects on science and the regulatory process. By the close of the comment period, the commenter states that the Agency will receive hundreds of thousands of comments from environmental advocates, scientists, and professors, alike, asking that the Agency reconsider the proposal and supplemental proposal. Yet, the commenter states that instead of recognizing this substantial public interest, the Agency has refused to schedule a virtual public hearing regarding the supplemental proposal, completely ignoring the public's requests that it do so. *See, e.g.,* Email correspondence, C. Hawkins to A. Mesnikoff, Mar. 23, 2020.³⁸⁴⁹

According to the commenter (12720), a virtual public hearing is necessary to allow those who would be affected by the supplemental proposal, were it to become final, to explain the basis of their objections to EPA's experts and policy makers. Likewise, the commenter asserts that a hearing would also allow opponents of the supplemental proposal to experience other witnesses offering testimony, consider their positions, and respond. The commenter adds that a virtual hearing will ensure that all parties have an opportunity to learn about the supplemental proposal, consider its impacts, and provide meaning comments to assist the Agency in the rulemaking process.

The commenter (12720) contends that the need for a virtual public hearing is particularly critical now, when many who would ordinarily comment on the supplemental proposal are facing unprecedented limitations, due to the coronavirus pandemic. The commenter states that the entire country—including scientists and researchers who would be directly affected by the Supplemental Proposal—has had their way of life uprooted and is still adjusting. The commenter notes that without a virtual public hearing, the voices of scientists, professors, and regular people who are deeply concerned about the effects of this Supplemental Proposal, will not be adequately heard.

The commenter (12720) states that the EPA's refusal to hold a virtual public hearing regarding the proposal is puzzling, in light of its willingness to do so for other critical proposed rules. For example, the commenter notes that the Agency has announced plans to hold two virtual public hearings for a proposed action titled "Review of National Ambient Air Quality Standards for Particulate Matter." The commenter provides that the virtual hearings were announced on May 5,

³⁸⁴⁹ Hawkins, Cheryl A. 2020. "RE: Request for Extension of the Public Comment Period/Hearings Docket ID No. EPA-HQ-OA-2018-0259," March 23, 2020.

2020, and are set to occur later this week, on May 20, 21 and 22, 2020,³⁸⁵⁰ proving that the Agency can act relatively quickly to plan to hold virtual hearings as part of the rulemaking process. Clearly, according to the commenter, the Agency has the technological wherewithal, organizational experience, and staffing capacity to hold virtual public hearings on major proposed rules. The commenter states, however, that the EPA has not explained why it cannot do so here.

Commenter (12720) adds, the Agency is well-aware that public hearings are an important tool in making the public's voice heard regarding significant proposed rulemakings, like the supplemental proposal. For example, the commenter notes that when the original proposed rule was issued in 2018, EPA not only held a public hearing, but extended the comment period to 90 days. The commenter states that the hearing on the 2018 Proposal was critical because it allowed the public to express their concerns about the limitations of the proposed rule. The commenter notes that the Agency made sweeping changes to its proposal, in part, as a result of those concerns. Nonetheless, the commenter states that the EPA refuses to explain why the original proposed rule—part of the very same rulemaking proceeding—required a public hearing, but the instant, much more expansive proposal merits none at all. Instead, the commenter complains that the EPA has summarily denied stakeholders' request for a hearing.

Response: A public hearing was not hosted for the 2020 SNPRM, but a public hearing was hosted to gather public comment on the 2018 NRPM. The Agency believes the 60-day period was sufficient time to submit comments. Interested stakeholders had a total of 185 days to comment on both the April 2018 NPRM and the 2020 SNPRM.

21.2.1.6 Other Miscellaneous Comments

21.2.1.6.1 Scope

State Activities

Comment: Commenters (12472, 11892) state that it is unclear whether the rule applies to state programs that are authorized or delegated by EPA, and that it should be clarified that this will not be the case.

Response: This final rule describes how the EPA will determine the consideration to afford pivotal science of the EPA's final significant regulatory actions and influential scientific information for which the conclusions are driven by the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and an effect based on the availability of the underlying dose-response data and other applicable factors. This rule exclusively pertains to the internal practices of the EPA and does not regulate the conduct or determine the rights or obligations of any entity outside the federal government. If implementing

³⁸⁵⁰ U.S. Environmental Protection Agency. 2020. "Public Hearing on Proposal to Retain the National Ambient Air Quality Standards for Particulate Matter." Announcements and Schedules. US EPA. April 22, 2020. <https://www.epa.gov/pm-pollution/public-hearing-proposal-retain-national-ambient-air-quality-standards-particulate>.

this procedural rule would result in conflicts with existing environmental statutes, the procedural rule will yield to the existing statutes. Implementation guidelines and statute-specific transparency regulations or programmatic regulations are forthcoming. Attainment Demonstrations.

Comment: Commenter (12472) express that the rule should also not apply to “other regulatory decisions, such as attainment demonstrations,” as this would cause difficulties with compliance.

Response: Transparency is important in ensuring that the decisions the EPA makes are based on sound science. The EPA is finalizing the applicability of this rulemaking to significant regulatory actions and influential scientific information because of the potential broad impact of these actions and assessments on American lives and livelihoods. The EPA is not applying this rulemaking to permit proceedings, site-specific actions, or enforcement actions because these actions are typically focused on individual regulated entities.

EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers. The EPA will undertake such efforts in forthcoming actions, which will be either.

Individual Permits

Comment: Commenter (11892) notes that “the statement in Section §30.5 ‘except where explicitly stated otherwise that provisions of this subpart do not apply to any other type of Agency action, including individual party adjudications, enforcement activities or permit proceedings’ should be interpreted to mean that that individual permits are not covered by this rule” because there are already “adequate appeal processes and public involvement steps in place for challenging the validity of an agency’s decision without adding the additional steps and criteria in the proposed rule.”

Response: EPA is relying exclusively on its housekeeping authority to promulgate this purely procedural rule. In this final procedural rule, the EPA does not interpret or apply provisions of a particular statute or statutes that it administers.

The EPA is finalizing the applicability of the rulemaking to final significant regulatory actions and influential scientific information because of the broad impact of these actions and assessments. The EPA will not expand the applicability of this rulemaking beyond these categories of regulations and assessments to permit proceedings, site-specific actions, and enforcement actions because of the focused nature of these actions.

As stated in the final rule, Part 30.4. “The provisions of this part do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses, and influential scientific information or pivotal science that meet one or more of the exemptions identified in Section IX of the OMB Final Information Quality Bulletin for Peer Review. In the event the procedures outlined in this

part conflict with statutes the EPA administers, or their implementing regulations, the statutes and regulations will control. Except where explicitly stated otherwise, the provisions of this part do not apply to any other type of Agency action, including individual party adjudications, enforcement activities, site-specific actions, or permit proceedings.”

21.2.1.6.2 Public Trust in Science

Comment: Commenter (11403) expresses that:

Critical analysis does not require a re-analysis of raw data every time a study is relied upon because scientists correctly know that the scientific process, through peer review and objectivity, creates knowledge that can then be interpreted using explanations that build on previous science. Part of that knowledge is that peer review is an ethical component of science that is centered on truthful reporting of methods and outcomes. If violations occur, the scientists responsible are censured by their peers, and other studies will reveal the errors.

The commenter adds that the proposed rule would undermine public trust in the scientific process by “implying that the thorough scientific process including peer review does not provide information for the public to trust and understand.”

Response: This final rule does not require the EPA or third parties to reanalyze, rather, the purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions.

As Jamieson et al. (2019) state, “Journals play a key role in ascertaining the quality of the evidence in work submitted for publication through peer review. However, that practice is neither uniform nor free of exploitation. While it can select for trustable results, its existence alone is not sufficient to verify the quality of the evidence used to back claims.”³⁸⁵¹ Because of the potential impact of significant regulatory actions, independent validation of studies that are pivotal to the EPA’s significant regulatory actions and influential scientific information may increase public confidence in the findings and conclusions presented in those studies. As Jamieson et al. (2019) states, publication alone (including the typical peer review necessary for

³⁸⁵¹ Jamieson, K. H., McNutt, M., Kiermer, V., and Sever, R. (2019). Signaling the trustworthiness of science. *Proceedings of the National Academy of Sciences in the United States of America* 116(39):19231-19236. <https://doi.org/10.1073/pnas.1913039116>.

publication) is insufficient to verify a study's quality, and additional confidence could be gained from third-party reanalyses that independently validate the study results³⁸⁵².

Comment: Several commenters (11497, 11498, 12458) express concern that the supplemental proposal's expansion to cover influential scientific information will undermine public health and confidence in the EPA. Comments include the following:

- Commenter (11497) states that the widened scope of the rule would further erode public confidence in EPA decisions and deeply undermine the ability of EPA to use all the best available science in its regulatory decision, which, in turn, will undermine public health.

Commenter (11498) provides that the fact that EPA would risk prohibiting or severely limiting important studies related to contaminants, exposure, and protections of human health sends a chilling message to the scientific community and risks breaching the confidence of the American public on whether they can trust EPA decisions to protect their health.

Commenter (12458) states that influential scientific information could include scientific outreach and educational information produced by the Agency, as well as guidance and Agency statements of scientific fact that could influence public and private action.³⁸⁵³ According to the commenter, excluding or minimizing the role of certain kinds of research from Agency activities will almost inevitably result in a divergence between EPA's public health recommendations and those of some segments of the scientific community, potentially causing public confusion and delegitimization of the Agency.

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA's mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA's assessments and regulatory actions.

The EPA is not categorically excluding any studies from consideration - even studies where the underlying dose-response data are not available for independent validation - when promulgating final significant regulatory actions or developing influential scientific information. Rather, as discussed in Part 30.5 of the final rule, the Agency will continue to evaluate the quality of all relevant studies, consistent with the intended use of the information. The EPA will also continue to rely on the highest quality, most relevant studies available in determining the potential for

³⁸⁵² Ibid

³⁸⁵³ The SNPR provides that "the term "influential scientific information" means scientific information the Agency reasonably can determine will have or does have a clear and substantial impact on important public policies or private sector decisions (OMB M-05-03)." Strengthening Transparency in Regulatory Science, 85 Fed. Reg. at 15399-15400 (proposed March 18, 2020) (to be codified at 29 C.F.R. 30).

hazard due to exposure to a pollutant, contaminant, or substance. The EPA will continue to use established guidelines for identifying and integrating evidence

21.2.1.6.3 Lab Practices

Comment: Commenter (12399) provides that:

Section 30.3 explicitly states that the rule does not apply to physical objects such as lab samples. This... raises some issues about how the rule might include provisions to promote sound research lab practices. One approach might be to require that the agency place greater weight on studies that can demonstrate the application of ‘Good Laboratory Practices’ (GLP).

The commenter (12399) suggests that “greater transparency related to the handling and management of lab samples should be included as part of the transparency rule.”

Response: The Agency has considered the commenters suggestion and does not believe that lab samples and other physical objects are appropriate for the scope of this final rule. Availability of such physical objects requires a different set of considerations, including shelf-life, preservation and accessibility. The final rules states, at Part 30.3 that “The provisions of this section do not apply to physical objects (like laboratory samples) . . .”

21.2.1.6.4 Rule is Inconsistent with Scientific and Public Health Practice

Comment: Commenter (12435) states that demonstrable environmental public health protections have been achieved by EPA for decades utilizing scientific studies submitted and reviewed without the proposed stultifying disclosure requirements. Moreover, the commenter notes that other federal regulatory agencies, including but not limited to the Food and Drug Administration, the Occupational Safety and Health Administration, the Department of Housing and Urban Development, the Consumer Product Safety Commission, and the Department of Agriculture, have likewise accepted and used for regulatory purposes human health studies that have been generated, published, and submitted without meeting the proposed criteria. The commenter adds that the same practice applies to nonregulatory, albeit authoritative, guidelines issued by the World Health Organization, the Centers for Disease Control and Prevention, the US Preventive Services Task Force, the American Heart Association, and the American Cancer Society. The commenter states that these agencies will continue to accept for consideration scientific findings that have fulfilled consensus standards of peer review that already enjoy widespread acceptance by the academic, scientific, public health, and medical communities. If the proposed supplemental rule were adopted, the commenter asserts that the EPA would operate outside the mainstream of scientific and public health practice.”

Response: The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific

information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions.

The EPA is a leader in the evaluation of human and ecological impacts of environmental pollution and methods to cost-effectively mitigate these impacts. The selection and use of quality, peer-reviewed literature is a critical part of this work. However, the strength of the review conducted as part of the study’s acceptance and publication in a scientific journal has received increased attention in the scientific community due to the lack of transparency and consistency, potential for bias, and the difficulty that independent researchers have had in reproducing published results.^{3854,3855,3856,3857,3858,3859} Jamieson et al. (2019) state, “Journals play a key role in ascertaining the quality of the evidence in work submitted for publication through peer review. However, that practice is neither uniform nor free of exploitation. While it can select for trustable results, its existence alone is not sufficient to verify the quality of the evidence used to back claims.”³⁸⁶⁰ Because of the potential impact of significant regulatory actions, independent validation of studies that are pivotal to the EPA’s significant regulatory actions and influential scientific information may increase public confidence in the findings and conclusions presented in those studies. As Jamieson et al. (2019) states, publication alone (including the typical peer review necessary for publication) is insufficient to verify a study’s quality, and additional confidence could be gained from third-party reanalyses that independently validate the study results³⁸⁶¹.

21.2.1.6.5 Regulatory Language Correction

Comment: Commenter (12710) writes that the proposal repeatedly uses the word “section” when the word “part” should be used. For example, the commenter states that section 30.3 begins, “[t]he provisions of this part apply...” but in the next sentence states, “The provisions of this

³⁸⁶¹ Ibid

section do not apply...” and concludes by referencing the “provisions of this part.” The commenter adds that this same mistake is made in both versions of section 30.5.

Response: The final rule uses the word “part” rather than “section.”

21.2.1.6.6 Request for Redline Strikeout Document

Comment: Commenter (10084) notes that federal agencies, including EPA, normally include a redline strikeout document that represents the proposed changes to a rule. The commenter notes that a redline document is not included in the SNPRM docket folder, which makes an expedited review even more difficult. The commenter suggests that a redline document would be very useful for review and documentation purposes and the commenter requests a redline document showing the changes made to the SNPRM.

Response: The preambles to the NPRM, SNPRM and final rule are so significantly different that a redline document would not be very useful. A redline document of the regulatory text can be provided.

Comment: Commenter (12410) asserts that the rules set forth should be dependable and give the EPA good cause for making decisions that do not overreach regulatory authority or give way to obstructionist looking to delay development. The commenter provides that the rules should be the rules and not subject to further challenge on those not acting in good faith or wishing to contemplate insufficient data sets with unreasonable uncertainty, *i.e.* reanalyze data not capable of being substantially reproduced.

Response: If implementing this procedural rule would result in conflicts with existing environmental statutes, the procedural rule will yield to the existing statutes.

Comment: Commenter (11899) asserts that critical issues such as temperature and climate fluctuations, threats to plant and animal species from fossil fuels versus from wind turbines, solar panels and other replacement energy sources, the enormous benefits of using fossil fuels – and much more – could and should have been addressed in open, robust discussions at EPA and throughout America, before EPA’s Endangerment Finding was made. The commenter contends that would have happened at an Agency governed by transparency rules of the kind proposed by the Agency’s “Strengthening Transparency in Regulatory Science” formulation. The commenter states that America’s industries, communities and families would all be better off today if it had been in force when the Endangerment, Clean Power, Particulate Matter (PM) 2.5µm and other EPA policy decisions were being made.

Response: The rulemaking applies prospectively to final significant regulatory actions and influential scientific information. This rulemaking has no retrospective effect on either final significant regulatory actions or influential scientific information. For future final significant regulatory actions and influential scientific information, it applies equally to all the data and models.

21.2.1.6.7 Science Community Bias

Comment: Commenter (10834) suggests bias in the science community and contends that there is substantial evidence that shows that organizations, like the American Association for the Advancement of Science (AAAS) and the *Science* editors have repeatedly rejected and refused to publish articles in support of the proposed rule and instead, continue to publish (prefer) articles that speak out in opposition to the rule. The commenter provides a brief description of the process they underwent in an attempt to publish their own manuscript through *Science*. The manuscript entitled, “The EPA Transparency Rule is Scientifically Justified and Necessary” was submitted as part of the commenter’s official comments on the supplemental proposal, along with copies of email exchanges between him/her and the journal editors, as support. In general, the manuscript argues in support of the 2018 proposed rule and takes the position that the rule is completely consistent with publication policies set by science journals, despite the science community’s ongoing opposition to the rule. The commenter provides examples where science-based communities/organizations (AAAS and *Science*) have openly criticized and aggressively opposed the rule. The commenter concludes that the rejection of their manuscript, coupled with these organizations’ statements is evidence of partiality within the scientific community and urges the EPA to consider these predispositions when weighing decisions.

Response: EPA appreciates the commenter’s support of this rule. EPA agrees that this rule is a necessary incremental step in the path to increased transparency.

21.2.2 Out of Scope Comments

21.2.2.1 Critiques of EPA Regulations and Science

Comment: Commenter (11899) suggests that epidemiological studies are faulty by design and incapable of accurately assessing (or reliably identifying) the impacts (causes and effects) of air pollution by specific source(s) on human health. The commenter indicates that the Agency has historically supported, preferred (or selected) epidemiologic studies with outcomes that back pre-convinced, faulty epidemiological assertions. As an example, the commenter provides a brief discussion on the assessment of impacts on public health associated with particulate matter (PM). In this case, the commenter argues that the Agency failed to present a plausible biological explanation for why or how super-tiny particles can cause multiple diseases and deaths simply by getting into lungs or bloodstreams. The commenter notes that many of the studies used to assess the impacts of particulates illegally and unethically involved human test subjects, which according to the commenter, violates U.S. laws – e.g., the Nuremberg Code, the Helsinki Accords and EPA Rule 1000.17 – all of which make it unethical or illegal to conduct toxicity experiments on humans. The commenter claims that during these studies EPA-contracted researchers failed to disclose to volunteers that they (the Agency) were adamant in the assertion that the polluted air the test subjects were about to breathe was toxic, carcinogenic, and deadly. Instead, according to the commenter, volunteers were led to believe that they would face only “minimal risks,” –i.e., the level of risk ordinarily encounter in daily life, in performing routine physical activities. While other volunteers were told they might experience claustrophobia in the

small study chambers, or some minor degree of airway irritation, shortness of breath, coughing or wheezing. The commenter also highlights the point that volunteers recruited to participate in these particulate matter/toxicity experiments were also the demographic deemed most at-risk by the EPA – i.e., the elderly, asthmatics, diabetics, people with heart disease, children. In addition, the commenter notes that study participants was often exposed to eight, thirty or sometimes sixty times more particulates per volume – for up to two hours – than they would normally breathe outdoor.

The commenter lists the following issues/questions that they believe were not adequately addressed by the EPA regarding the PM/toxicity experiments:

- How can it be that PM_{2.5} are dangerous or lethal for Americans in general, every time they step outside – but harmless to human test subjects who were intentionally administered pollution dozens of times worse than what they would encounter outdoors?
- How can it be, as EPA-funded researchers asserted at the time, that “acute, transient responses seen in clinical studies cannot necessarily be used to predict health effects of chronic or repeated exposure” – when that is precisely what EPA was claiming the studies can and do show, in order to justify its expensive, punitive PM_{2.5} regulations?
- If PM_{2.5} is lethal and there is no safe threshold, weren’t EPA officials and its hired researchers deliberately misleading volunteers in order to persuade them to breathe deadly, carcinogenic poisons?
- Weren’t the EPA-contracted researchers violating laws and ethical guidelines when they experimented on children, in violation of EPA’s own rules banning such experiments – and later deleting evidence describing those tests?
- If no one died, doesn’t that mean EPA falsely claimed that there is no safe level, that all PM_{2.5} particulates are toxic, that its regulations would save countless lives, and that the direct and ancillary benefits vastly outweigh their multi-billion-dollar annual costs of its particulate regulations? If that is the case, didn’t EPA impose those costs not only for no real benefits, but at great harm to the overall health and welfare of Americans?
- Doesn’t all this mean there really are safe levels for airborne soot – and PM_{2.5} particles are not really toxic or lethal?
- Doesn’t it mean EPA’s draconian standards should be significantly modified, and companies, communities and consumers should be compensated for their costs in complying with excessive, unjustified particulate regulations?

The commenter concludes that the results/outcomes of these studies could not be used to lead to an “informed consent,” and that the EPA should rescind PM_{2.5} requirements and instead develop an entirely new rulemaking process under EPA’s new transparency regulations, with full disclosure and scrutiny of all relevant data, models, claims, analyses and conclusions.

Commenter (4541) notes that the Bradford Hill Criteria are endorsed by the Federal Judicial Center (FJC), an education and research agency of the United States federal courts established by an Act of Congress (28 U.S.C. §§ 620–629) in 1967, at the recommendation of the Judicial

Conference of the United States. The commenter states that FJC's reference manual for judges, titled the *Reference Manual on Scientific Evidence*, provides expert advice for determining admissibility of scientific evidence in U.S. federal courts, and advises federal judges and lawyers practicing in federal courts to adhere to that advice in complying with the rules of evidence. The commenter adds that the latest (third) edition is co-published by the National Research Council of the National Academies.

Commenter (4541) asserts that existing EPA science violates BHC:

- EPA assumes that association equals causation, administering massive doses of chemicals to laboratory animals predicts the human health impacts of much lower levels of exposure, natural causes of cancer and other diseases are nonexistent, current ambient levels of air pollution can cause disease or death without clinical evidence, and more. All these assumptions violate the BHC and other requirements of the scientific method, rendering EPA's science an unreliable guide for researchers and policymakers.
- A major shortcoming of observational studies is the lack of control that results in their failure to replicate results, a violation of BHC #2 requiring consistency of the observed association. Observational studies cited by EPA and other air quality regulators are not designed to test hypotheses and cannot establish causation. Most observational studies cannot be replicated, and in nearly one case in ten, efforts to replicate results find *benefits* where the previous study found harms or vice versa.
- EPA assumes without providing clinical evidence that exposure to ambient levels of air pollution causes disease and mortality. This violates BHC #6, requiring biological plausibility, and #8, requiring experimental evidence. Another violation of the BHC is EPA's reliance on animal experiments in which mice and rats are exposed to near-toxic doses of toxins. EPA assumes such experiments produce reliable evidence of the risk to humans of exposure to far lower levels of those toxins in daily life. But this assumption is contradicted by current toxicological knowledge (BHC #7).

Response: This internal procedural rule governs EPA procedures for considering dose-response data underlying pivotal science to be used in EPA's significant regulatory decisions and influential scientific information. It does not pertain to individual EPA studies. Therefore, the comment is out of scope of the rule.

Comment: Commenter (12645) stresses that biological plausibility is not a one-way street leading to regulation. The commenter states, that in the case of ascribing causality to the epidemiologically, as an example, observed linkage between sulfur dioxide and respiratory health effects needed to be reconsidered when it was found that sulfur dioxide was usually absorbed in the upper airways rather than penetrating to the lung.

Response: This internal procedural rule governs EPA procedures for considering dose-response data underlying pivotal science to be used in EPA's significant regulatory decisions and influential scientific information. It does not pertain to biological plausibility. Therefore, the comment is out of scope of the rule.

21.2.2.2 Politicization of EPA

Comment: Commenter (11894) argues that there is a strong disconnect/disparity between the “transparency” requirements proposed by EPA (e.g., when data and models are used as influential scientific information that might affect policy or decisions by the private sector) and methods used by the White House (current Administration), for example, when presenting estimates of the potential number of U.S. deaths from COVID-19. The commenter claims that these disparities illustrate the hypocrisy of the decision processes and attitudes toward science. As support, the commenter cites an excerpt from an April 2nd article from *The Washington Post* as support, which states that, “A White House representative said the task force has not publicly released the models it drew from *out of respect for the confidentiality of the modelers*, many of whom approached the White House unsolicited and simply want to continue their work without publicity.”

Response: These comments are outside the scope of this rule. The purpose of this action is to increase transparency by codifying internal procedural requirements for how the EPA will consider the availability of the underlying dose-response data that it relies upon to promulgate significant regulatory actions and develop influential scientific information. These requirements build upon open data initiatives in the federal government and scientific community and advance the EPA’s mission and commitment to the public by prioritizing transparency of the underlying dose-response data in pivotal science for the most impactful of EPA’s assessments and regulatory actions.

Comment: Commenter (11903) urges the EPA to consider how the Agency evaluates comments received as it proceeds to finalize the proposed rule.

Reliance on Appointed Managers

Commenter (11903) expresses concerns over the Agency reliance on managers (who are often appointed) to assess the merits of the proposal and stresses the need for the EPA to appropriately evaluate those managers’ past performance when making predictions. The commenter underscores the point that since the Trump Administration took office in January 2017, Federal Courts have found, repeatedly, that the EPA has violated a statutory duty, failed to meet a statutory deadline, or otherwise acted unreasonably. The commenter maintains that this trend is largely due to the change in administration and the change in direction of environmental policy, and warns the EPA to address these influences, if the notice of proposed rulemaking (NPRM) and the supplemental notice of proposed rulemaking (SNPRM or supplemental proposal) are going to have a different fate than previous rules.

The commenter (11903) maintains that each of the managers tasked to this rulemaking has some responsibility to ensure that its outcome protects public health and the environment. To meet that responsibility, the commenter believes that each must estimate the likelihood that EPA – due to its reliance on poor predictions, improper assumptions, or misinterpretation of the law – is pursuing a policy failure. To do so, the commenter believes that each should remain mindful that, since January 2017, courts have repeatedly ruled against the EPA. The commenter references an attached document entitled, “Cases Finding that the Trump Administration’s EPA Violated a

Statutory Duty, Failed to Meet a Statutory Deadline, or Otherwise Acted Unreasonably,” as support and notes that the cases described in the attachment illustrate a dismal record that the commenter urges the EPA, and any reviewing Court, to consider moving forward.³⁸⁶² In addition to the list of cases discussed in the attached document, the commenter also provides a number of examples where courts issued a decision to vacate EPA’s rule – e.g., EPA’s April 2018 rule seeking to suspending the entire list of hydrofluorocarbons deemed unsafe substitutes for ozone depleting substances. According to the commenter, the lessons learned from these cases should include: EPA has become poor at promulgating rules, EPA undervalues analyses showing that proposes polices are suboptimal, unreasonable or otherwise unlawful, and predicting the future is difficult, in particular, the courts’ likely response to rulemaking efforts.

In light of litigation outcomes referenced above, as EPA moves forward, the commenter (11903) strongly recommends that the Agency should give greater weight to the opinions of individuals (managers) who argued against EPA’s proposed rules (later deemed unlawful actions), and lesser weight to individuals that were proponents of those actions. The commenter recommends that the EPA evaluate remarks supporting its proposal, as well as the comments opposing its proposal, in light of past performance and challenges the Agency to change its culture of decision-making. The commenter also requests that the Agency consider and make part of this rulemaking record the article, Tollefson J, *Science under siege*, Nature 559:316-319 (July 19, 2018) when deliberating.³⁸⁶³

How to Perceive Comments Received from Red States vs Blue State

Commenter (11903) warns the EPA that remarks received on the proposed rule may present conflicting predictions concerning the rule’s merits and associated consequences (i.e., offering predictions regarding how best to advance the public interest vs. predictions for the purpose of influencing governmental decisions).³⁸⁶⁴ The commenter states that conflicting predictions about

³⁸⁶² The Supreme Court’s decision in *County of Maui v. Hawaii Wildlife Fund*, No. 18-260, 590 U.S. __ (Apr. 23, 2020), provides further evidence of the Federal courts’ low regard for EPA’s recent decision making. There, the United States, participating as amicus, offered an EPA-authored “Interpretive Statement” in support of the Government’s argument seeking to limit the Clean Water Act’s jurisdiction. *Id.*, at 5, and 11-13. The Court disposed of the United States’ argument with the observation that “to follow EPA’s reading would open a loophole allowing easy evasion of the statutory provision’s basic purposes. Such an interpretation is neither persuasive nor reasonable.” *Id.*, at 12. EPA may disagree with opinions – mine and others’ – of the quality of its decision making. After considering the Courts’ opinions cited in the Attachment, if EPA concludes that its performance since January 2017 has been satisfactory, and EPA intends to maintain that level of performance in the future. The commenter urges that EPA make those findings in its response to comments in this rulemaking.

³⁸⁶³ Available at <https://www.nature.com/articles/d41586-018-05706-9>. Noting that the journal’s representatives conducted dozens of interviews with current and former staffers, Tollefson writes: “What most troubles many EPA scientists is the Trump administration’s systematic and unprecedented effort to undermine the way in which science is used by the agency. Scientists there say they and their work have been largely ignored by senior EPA leadership.”; and, offers an observation that seems particularly germane to this rulemaking: “By bypassing EPA scientists and ignoring their findings, [Administrator Pruitt’s] team ran the risk of weakening the EPA’s defense in the many lawsuits that states and environmental groups were filing against the agency.”

³⁸⁶⁴ Accordingly, the commenter states that such parties have a track record for making predictions that, at least theoretically, could be analyzed to determine if that party is a good predictor, or not.

regulatory activity are weighed differently by officials in “Red States”³⁸⁶⁵ vs. “Blue States,”³⁸⁶⁶ specifically in the area of environmental protection and public health intervention, which according to the commenter are the two of the most polarizing topics addressed by states.

The commenter (11903) anticipates that the EPA will receive comments from all interested parties – *i.e.*, repeat players (State, regulated companies, etc.) familiar with administrative proceeding or the legislative process, submitters that prefer one option over another and provide data to support their position, and stakeholders that offer predictions that very depending on the commenter type – *e.g.*, industry group, environmental group, etc. The commenter notes that the current Administration has created a political environment with polarizing effect amongst federal and state agencies; and heightened political polarization has created obstacles to good governmental decision-making. According to the commenter collectively, an administrative Agency’s or legislator’s response to competing analyses is far from unpredictable, because these individuals have track records. The commenter adds that it is a government official’s predictability that allows interest groups to make and use scorecards and rankings of those officials, to identify those officials mostly likely to be receptive to the group’s analyses, and to identify those most likely to be skeptical of them.³⁸⁶⁷ The commenter claims that a quick scan of the scorecards and rankings confirms the conclusion that virtually any participant in this rulemaking has already reached – *i.e.*, predictions given to agencies and legislatures are heard by different audiences depending on whether the Administration or legislature is Republican- or Democratic- controlled; and those differences have consequences. Based on this assumption, the commenter proclaims that the analyses offered by the proponents of EPA’s current proposal will be found to be more persuasive, and will receive greater weight, by officials in states with Republican administrations and Republican-controlled legislatures. The commenter adds that we should not be surprised that predictions indicating that such a proposal inadequately protects public health and the environment will be viewed more skeptically and given lesser weight by the officials in those States.³⁸⁶⁸

³⁸⁶⁵ A “Red State” according to the commenter, is a state with a Cook Partisan Voting Index (“PVI”) of “R+1” or higher. The commenter identifies the following states as a “Red State”: Wyoming, Oklahoma, Idaho, West Virginia, Arkansas, Kentucky, Alabama, Nebraska, South Dakota, Tennessee, Kansas, Louisiana, Montana, Alaska, Indiana, Mississippi, Missouri, South Carolina, Texas, Georgia, Ohio, North Carolina, Iowa, and Florida.

³⁸⁶⁶ A “Blue State” according to the commenter, is a state with a PVI of “D+1” or higher. The commenter identifies the following states as a “Blue State”: Hawaii, Vermont, California, Maryland, Massachusetts, New York, Rhode Island, Illinois, New Jersey, Washington, Connecticut, Delaware, Oregon, Colorado, Michigan, Virginia, and Minnesota.

³⁸⁶⁷ See, *e.g.*: The U.S. Chamber of Commerce’s scores, at <https://www.uschamber.com/how-they-voted/2018#all> ; The American Conservative Union’s ratings of Federal and State legislators, at <http://acuratings.conservative.org/> ; Americans for Prosperity’s Scorecard, at <https://afpscorecard.org/> ; FreedomWorks’s Scorecard, at <http://congress.freedomworks.org/> ; Heritage Action’s Scorecard, at <https://heritageaction.com/scorecard> ; National Taxpayers Union’s congressional ratings scorecard, at <https://www.ntu.org/ratecongress/> ; as well as the League of Conservation Voters’ Scorecard, at <http://scorecard.lcv.org/>; and the various State legislative scorecards identified at the Ballotpedia website, at https://ballotpedia.org/State_legislative_scorecards.

³⁸⁶⁸ Likewise, the commenter contends that we should expect the opposite in a Democratic-controlled state. If additional evidence is needed to show that governmental officials’ views differ substantially and predictably, EPA need look no further than the comments filed by the governmental officials from the various States in this

Commenter (11903) contends that when evaluating a prediction, it is unreasonable and unwise to ignore the predictor's past performance. The commenter poses the question whether the differences between Red States' and Blue States' methods for evaluating predictions regarding public health and environmental protection has gotten too large. Regardless of the answer, the commenter states that the fact that there are differences should not be ignored. According to the commenter the choices that each state made when it determined to rely on a prediction that appeared to be persuasive, and rejected or gave less weight to conflicting predictions because they seemed inferior, when coupled with the subsequent outcomes to the state's citizens, provide evidence that determines whose predictions were, in fact, more accurate.

Accordingly, the commenter (11903) believes that if there are substantial differences in the public health outcomes of Americans, and those differences can be predicted by living in a "Red State" versus a "Blue State", those differences suggest that one of those groups of States is better at recognizing accurate predictions, and acting upon them, than the other group. The commenter further asserts that if there are substantial differences in the public health outcomes of Americans, and those differences can be predicted by living in a "Red State" versus a "Blue State," the practices of the more successful states should be emulated, not ignored.

When evaluating conflicting predictions in the comments for this rulemaking, the commenter (11903) urges the EPA not to ignore useful evidence for identifying those predictions which are reliable vs. those predictions which are not reliable – i.e., based on past performance.³⁸⁶⁹ The

rulemaking. Based upon my scan of the docket, comments opposing EPA's proposal have been submitted by officials from the "Blue States" of: New York (Docket Nos. EPA-HQ-OA-2018-0259-0057; -5009; -5018; 6895; -6915; and -9405); California (EPA-HQ-OA-2018-0259-0057; -6446; -6915; and -9405); Massachusetts (EPA-HQ-OA-2018-0259-6872; -6915; and -9405); New Jersey (EPA-HQ-OA-2018-0259-6915; and -9405); Connecticut (EPA-HQ-OA-2018-0259-6915; and -9405); Illinois (EPA-HQ-OA-2018-0259-6915; and -9405); Maryland (EPA-HQ-OA-2018-0259-6915; and -9405); Washington (EPA-HQ-OA-2018-0259-6130; -6193; -6915; -6920; -6953; and -9405); Oregon (EPA-HQ-OA-2018-0259-6359; 6915; -9405; and 10853); Delaware (EPA-HQ-OA-2018-0259-0057; and -9405); Minnesota (EPA-HQ-OA-2018-0259-0057; -2171; -2564; -4410; -6915; -9405; and 10974); Colorado (EPA-HQ-OA-2018-0259-10048); and Maine (EPA-HQ-OA-2018-0259-0057; -6915; and -9405); as well as Pennsylvania's Democratic attorney general and Democratic secretary of Pennsylvania's Department of Environmental Protection (EPA-HQ-OA-2018-0259-0057; and -6915); the Democratic attorney general of Iowa (EPA-HQ-OA-2018-0259-6915; and -9405), and the Democratic attorney general of North Carolina (EPA-HQ-OA-2018-0259-6915; and -9405). Comments opposing EPA's proposal were also filed by the District of Columbia (EPA-HQ-OA-2018-0259-0057); and the cities of New York, Chicago, Los Angeles, New York, Oakland, Philadelphia, and San Francisco (EPA-HQ-OA-2018-0259-6373; 6915; and -9405). On the other hand, comments supporting EPA's proposal have been submitted by the "Red States" of Louisiana, Alabama, Arkansas, Indiana, Kansas, Nebraska, Oklahoma, South Carolina, Texas, and Utah, as well as by the Republican, former attorney general of Wisconsin (EPA-HQ-OA-2018-0259-6867; and -6900).

³⁸⁶⁹ According to the commenter, common sense is probably enough to show that knowing a forecaster's past performance helps a decision maker decide how much weight to give that forecast. If more is needed, please see: Colson AR, Cooke RM, Expert elicitation: Using the classical model to validate experts' judgments, *Review of Environmental Economics and Policy* 12(1):113-132 (2018) (describing the "classical model" for aggregating experts' judgments, in which the weight given each expert's prediction is determined by that expert's past performance; "This recent work on the classical model's out-of-sample performance further demonstrates the validity of performance-based weighting of experts.", p. 129; "Thus, for decisions or policies with a large potential impact on society, we would argue that the classical model and its validated assessments are the best tool for incorporating expert judgments when they are needed.", p. 132); Atanasov P, Witkowski J, Ungar L, Mellers B, Tetlock P, Small

commenter recommends that the EPA not inutility or blindly guess which predictor will do a better job of predicting actions that will benefit the public. The commenter maintains that identifying those actions and selecting among them is EPA's, and each state's, core responsibility; each of them are repeat players, and their past performance can be compared.

The commenter (11903) states that scientific literature has been able to predict the public health and welfare outcomes of the people living within a particular state and based on the literature Democratic states produce better outcomes. The commenter offers a few questions which they believe, when answered, would help inform EPA on how much, and upon whom, it should rely when evaluating the conflicting predictions in this rulemaking – e.g., What happened to the citizens in [Red] States as a result of their governmental officials' reliance on those predictions [from repeat player supporting this proposal]: Did the public at large share in that success, as those interest groups surely predicted as they sought to influence those officials? and What has happened to the citizens in Blue States, the jurisdictions more skeptical of conservative interest groups' rosy predictions? The commenter provides a list of studies with summaries that covers more than 50 pages and includes, for example:

- Fenelon A, Geographic divergence in mortality in the United States, *Population and Development Review* 39(4):611-634 (2013)³⁸⁷⁰;

The commenter (11903) urges the EPA to consider the referenced studies which quantify the disparate performance of the states' performance on a variety of health and welfare outcomes, while remaining mindful of the degree to which a state's performance can be predicted by whether it is a "Red State" or a "Blue State", and the speed by which the gap between the two groups of states is widening. The commenter recommends that the EPA pay particular attention to studies that examine the relationship between the differing outcomes among the states and the governmental decisions that contributed to those differences.

Response: EPA evaluated all relevant comments and accompanying information received as appropriate when developing this final rule.

21.2.2.3 Previously-Submitted Comments

Comment: Commenters (10861, 11191) provided comments previously-submitted on the initial proposal as part of their comments on the supplemental proposal.

Response: Comments submitted on the NPRM, as well as comments submitted on the SNPRM, were considered during the development of the final rule. Comments previous submitted on the NPRM are addressed in the sections related to those comments.

21.2.2.4 Interagency Review

Comment: Commenter (13788) questioned the Executive Order 12866 interagency review process for the supplemental proposed rule.

Response: Comments on deliberative processes, including interagency review and Executive Order 12866, are out of the scope of this rulemaking.

Comment: Commenter (13788) asserted that OMB added in provisions related to the IQA during Executive Order 12866 review.³⁸⁷³

Response: Comments on deliberative processes, including interagency review and Executive Order 12866, are out of the scope of this rulemaking.

21.2.2.5 Federal Guidelines

Comment: Commenter (12453) provides that the definition for "influential scientific information" is drawn directly from OMB's December 16, 2004 "Final Information Quality Bulletin for Peer Review" and offered an interpretation of exemptions under OMB M-05-03. Commenter (11360) provides an interpretation of the intention of OMB M-19-15.

Response: OMB documents are not open to public comments and are out of the scope of this rulemaking.

³⁸⁷³ OMB, "Documentation of EO 12866 Review, Strengthening Transparency in Regulatory Science; Supplemental Proposed Rule (RIN 2080-AA14)," Doc. ID No. EPA-HQ-OA-2018-0259-9321.

Comment: Commenter (11479) asserts that greater clarity is needed in the process for determining which actions are identified as “significant regulatory actions” under Executive Order 12866.

Response: The determination of significant regulatory actions under Executive Order 12866 is not open to public comments and is outside the scope of this rulemaking.
